// Perform an indexscan WITHOUT the decodeindexedfields parameter.
// Three rows are returned, one for each element in the Phones[] array.
// The output contains no values for the indexed fields.
maprdb root:> indexscan /apps/indexExample --indexname idx3
{"_id":"10000"}
{"_id":"10000"}
{"_id":"10000"}
3 document(s) found

// Perform an indexscan WITH the decodeindexedfields parameter set to true.
// The output includes the values in the indexed fields.
maprdb mapr:> indexscan /apps/indexExample --indexname
idx3 --decodeindexedfields true
{"_id":"10000","$idx":["Home","555-555-1234"]}
{"_id":"10000","$idx":["Mobile","555-555-5678"]}
{"_id":"10000","$idx":["Work","555-555-9012"]}
3 document(s) found.
```

Troubleshooting Use Cases

Situations where you can use this command are as follows:

- List the contents of an index.
- Resolve encoding errors encountered inserting into an index.

See Troubleshooting Secondary Indexes on page 1460 for more information on these use cases.

dbshell insert

Description

The dbshell `insert` command adds documents to JSON tables. Specify the ID of the document in one of two ways:

- As the value of the `_id` field in the document
- As the value of the `--id` parameter in the `insert` command

If a document with the specified ID already exists, the command replaces the document with the new one.

Parameters

insert Options	Description
`*`, `--t`, `--table` (Required)	Table path
`--id`	ID of the document to insert or replace
`--v`, `--value` (Required)	JSON document to insert or replace
`--c`, `--where`	OJAI condition, in JSON format The condition must qualify to perform the insert. See OJAI Query Condition Syntax on page 3387 for a description of the syntax.

Syntax

```
insert --table <table path> --value '{"_id": "<row-key", < table field >}'
```

```
insert --table <table path> --id <row-key> --value '{"_id": "<row-key", <
table field >}'
```

Example: Insert with `_id` Field

The following examples insert a document into a table using an `_id` field value:

```
insert /data/movies --value '{"_id":"movie0000002",
                              "title":"Developers on the Edge",
                              "studio":"Command Line Studios"}'
```

```
insert /tables/users --value '{"_id":"user001",
                               "first_name":"John",
                               "last_name":"Doe"}'
```

Example: Insert with `--id` Parameter

The following examples insert a document into a table using the `--id` parameter in the insert command:

```
insert /data/movies --id movie0000003 --value '{"title":"The Golden
Master",
                                                "studio":"All-Nighter"}'
```

```
insert /tables/users --id user002 --value '{"first_name":"Jane",
                                            "last_name":"Dane"}'
```

dbshell jsonoptions

Description

The `jsonoptions` command sets the JSON output and displays the output appropriately.

last-updated: Jun 06, 2024

Parameters

Table

jsonoptions Options	Description
`--pretty`	Enables or disables pretty printing mode Value: `true`|`false` Default: `true` Pretty print mode displays the content of the documents as an indented hierarchy of field/value pairs. For example, if the value is `true`, the DATE data type appears as a Map: `"dob" : {"$dateDay":"2012-10-20"}`
`--withtags`, `--withTags`	Enables or disables printing with extended JSON data type tags Value: `true`|`false` Default: `true` For example, if the value is `false`, the DATE data type appears as a simple value: `"dob" : "2012-10-20"`

Syntax

```
jsonoptions --pretty <true|false>
jsonoptions --withTags <true|false>
```

Example

```
jsonoptions --pretty true
jsonoptions --withTags false
```

dbshell list

Description

Lists all JSON tables in a folder or that matches a specific file pattern where the table resides.

Parameters

Table

list Options	Description
`*`, `--p`, `--patternOrPath`	A path and/or a file pattern

Syntax

```
list <path>
```

last-updated: Jun 06, 2024

Example and Output

```
maprdb root:>list /demo
/demo/user
/demo/checkin
/demo/review
/demo/business
/demo/tip
5 table(s) found.
```

dbshell replace

Description

The dbshell `replace` command replaces a document in a JSON table. You can specify a condition with the command.

Parameters

replace Options	Description
`*`, `--t`, `--table` (Required)	Table path
`--id` (Required)	ID of the document to replace If the specified ID does not exist, the command inserts a new document with the values provided in the command. **NOTE:** You can specify this parameter only once.
`--v`, `--value` (Required)	JSON document to insert or replace
`--c`, `--where`	OJAI condition, in JSON format The condition must qualify to perform the replace. See OJAI Query Condition Syntax on page 3387 for a description of the syntax.

Syntax

```
replace /tbl --id <id> --v {<document to replace>} [--c <condition>]
```

Example

```
replace /tables/users --id user002 --value '{"first_name":"Jane",
"last_name":"Doe"}'
```

dbshell update

Description

The dbshell `update` command updates JSON documents using OJAI mutations. An OJAI mutation allows you to append, decrement, delete, increment, combine, replace, and update fields in a JSON document.

The following table lists the mutations OJAI supports. See Using OJAI Mutation Syntax on page 3342 for a detailed description of all operations. Each operation in the table links to examples in this topic.

Mutation Operation	Description
Append	Appends values to binary, string, and array fields
Decrement	Decrements field values
Delete	Deletes fields
Increment	Increments field values
Merge	Combines nested documents with existing documents
Put	Replaces field values or adds new fields
Set	Updates field values or adds new fields

Parameters

update Options	Description
`*`, `--t`, `--table` (Required)	Table path
`--id` (Required)	ID of the document to update **NOTE:** You can specify this parameter only once.
`--m`, `--mutation` (Required)	OJAI document mutation in JSON format See Using OJAI Mutation Syntax on page 3342 for a description of the syntax.
`--c`, `--where`	OJAI condition, in JSON format The condition must qualify to perform the update. See OJAI Query Condition Syntax on page 3387 for a description of the syntax.

Syntax

```
update <table path> --id <id> --m <mutation> [ --c <condition> ]
```

NOTE: If the mutation provided as a part of the `--m` parameter has spaces, then you must enclose it within single quotes.

Sample JSON Document

The dbshell update examples in this topic use the following sample JSON document:

```
{
  "_id": "id1",
  "a": {
       "b": [{"boolean":false}, {"decimal": 123.456}],
       "c":{
             "d":10,
             "e":"Hello"
           }
       },
  "m":"MapR wins"
}
```

last-updated: Jun 06, 2024

Append Operation

This example performs append operations on fields `a.b` and `a.c.e`:

```
update /tbl --id id1 --m {
      "$append":[{"a.b":{"appd":1}},{"a.c.e":" MapR"}]
      }
```

When you apply this update command to the sample JSON document, the following is the resulting document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false }, { "decimal" : 123.456 }, { "appd" : 1 }
],
    "c" : {
      "d" : 10,
      "e" : "Hello MapR"
    }
  },
  "m" : "MapR wins"
}
```

For more details about the `$append` operation, see OJAI Append Mutations on page 3343.

Decrement Operation

This example performs a decrement operation:

```
update /tbl --id id1 --m {
      "$decrement":{"a.c.d":5}
      }
```

When you apply this update command to the sample JSON document, the following is the resulting document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false }, { "decimal" : 123.456 } ],
    "c" : {
      "d" : 5,
      "e" : "Hello"
    }
  },
  "m" : "MapR wins"
}
```

NOTE: To decrement multiple fields, use an an array to specify the fields.

For more details about the `$decrement` operation, see OJAI Decrement Mutations on page 3343.

Delete Operation

With the following example, the operation deletes multiple field paths in the document in a single command:

```
update /tbl --id id1 --m {
      "$delete": ["a.b[1]","a.c.e"]
      }
```

last-updated: Jun 06, 2024

When you apply this update command to the sample JSON document, the following is the resulting document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false } ],
    "c" : {
      "d" : 10
    }
  },
  "m" : "MapR wins"
}
```

The following example shows that if you need to delete only a single field, do not use the array notation:

```
update /tbl --id id1 --m {
      "$delete":"a.b[1]"
      }
```

For more details about the `$delete` operation, see OJAI Delete Mutations on page 3344.

Increment Operation

This example performs an increment operation:

```
update /tbl --id id1 --m {
      "$increment":{"a.c.d":5}
      }
```

When you apply this update command to the sample JSON document, the following is the resulting document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false }, { "decimal" : 123.456 } ],
    "c" : {
      "d" : 15,
      "e" : "Hello"
    }
  },
  "m" : "MapR wins"
}
```

NOTE: To increment multiple fields, use an an array to specify the fields.

For more details about the `$insert` operation, see OJAI Increment Mutations on page 3345.

Merge Operation

This example performs a merge operation:

```
update /tbl --id id1 --m {
      "$merge":{"a.c":{"d":11,"y":"yo"}}
      }
```

When you apply this update command to the sample JSON document, the following is the resulting document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false }, { "decimal" : 123.456 } ],
    "c" : {
      "d" : 11,
      "e" : "Hello",
      "y" : "yo"
    }
  },
  "m" : "MapR wins"
}
```

NOTE: `$merge` does not support the array format for merging two maps at two different field paths in the document.

For example, the following syntax is incorrect:

```
// WRONG Syntax
update /tbl --id id1 --m {"$merge":["a":{"b":1},{"a":{"d":"MapR"}}]}
```

The following syntax is correct:

```
// CORRECT Syntax
update /tbl --id id1 --m {"$merge":{"a":{"b":1,"d":"MapR"}}}
```

It results in the following document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : 1,
    "c" : {
      "d" : 10,
      "e" : "Hello"
    },
    "d" : "MapR"
  },
  "m" : "MapR wins"
}
```

To merge multiple field paths that are non-overlapping, use the syntax described at either Multiple Mutation Operations on page 5493 or Updates Without Explicit Mutation Operation Names on page 5495.

For more details about the `$merge` operation, see OJAI Merge Mutations on page 3345.

Put Operation

This example performs a put operation. Unlike the set operation, the put *replaces* field values. Like the set operation, you do not need an array representation for a single field.

```
update /tbl --id id1 --m {
      "$put":[{"a.b":{"boolean":true},{"a.c.d":"eureka"},{"a.x":1}]
      }
```

When you apply this update command to the sample JSON document, the following is the resulting document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : { "boolean" : true },
    "c" : {
      "d" : "eureka",
      "e" : "Hello"
    },
    "x" : 1
  },
  "m" : "MapR wins"
}
```

For more details about the `$set` operation, see OJAI Put Mutations on page 3346.

Set Operation

With this example, the command updates the document fields `a.b[0].boolean`, `a.c.d`, and `a.x`. If the field does not exist, the update command creates and sets it. The update fails if the existing field type does not match the new value. If the field exists and is the same type, the value is updated.

```
update /tbl --id id1 --m {
       "$set":[{"a.b[0].boolean":true},{"a.c.d":11},{"a.x":1}]
       }
```

When you apply this update command to the sample JSON document, the following is the resulting document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : true }, { "decimal" : 123.456 } ],
    "c" : {
      "d" : 11,
      "e" : "Hello"
    },
    "x" : 1
  },
  "m" : "MapR wins"
}
```

NOTE: If you need to set only a single field, the command looks like the following:

```
update /tbl --id id1 --m {
         "$set": {"a.b[0].boolean":true}
         }
```

For more details about the `$set` operation, see OJAI Set Mutations on page 3347.

Multiple Mutation Operations

You can combine more than one mutation operation in a single OJAI mutation by specifying each operation separated by a comma.

last-updated: Jun 06, 2024

The following is an example that combines multiple operations:

```
update /tbl --id id1 --m
        '{
        "$set":{"x":[1,2,3]},
        "$put":{"a.c.e":{"$binary":"AAAADg=="}},
        "$increment":"a.b[1].decimal",
        "$delete":"a.b[0]",
        "$merge":{"newDoc":{"k":"MapR DBShell rocks!!"}},
        "$append":{"m":"!!!"}
        }'
```

The following is the resulting output:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "decimal" : 124.456 } ],
    "c" : {
      "d" : 10,
      "e" : { "$binary" : "AAAADg==" }
    }
  },
  "m" : "MapR wins!!!",
  "newDoc" : { "k" : "MapR DBShell rocks!!" },
  "x" : [ 1, 2, 3 ]
}
```

The operations behave in the following manner:

- The `$set` operation adds a new array `[1,2,3]` with field path `x` into the document.
- The `$put` operation replaces the existing string `"Hello"` with a nested document `{"$binary":"AAAADg=="}`.
- The `$delete` operation deletes the field path `a.b[0]` from the document.
- The `$merge` operation merges a new nested document `{"newDoc":{"k":"MapR DBShell rocks!!"}}`.
- The `$append` operates appends the string `"!!!"` to the end of the string `"MapR wins"`.
- The `$increment` and `$delete` operate on different elements of the array `a.b`:
  - The `$increment` operation increments the value `123.456` in the second element of the array `a.b`.
  - The `$delete` operation deletes the field path `a.b[0]`, resulting in a single element array `a.b`.

Conflicting Operations

When you specify a mutation with field paths that are overlapping, HPE Ezmeral Data Fabric Database detects the conflict, discards the previous conflicting operation, and proceeds with the next operation.

For example, suppose you have the following document:

```
{"_id":"id1", "a":{"b":{"c":5}}}
```

The following mutation has two operations with overlapping fields `a.b`:

```
{"$delete":"a.b","$set":{"a.b.d":10}}
```

last-updated: Jun 06, 2024

You may have intended for the mtuation to first delete `a.b` and then to replace it with `a.b.d` as follows:

```
{"_id":"id1", "a":{"b":{"d":"10"}}}
```

But the *actual* result is the following:

```
{"_id":"id1", "a":{"b":{"c":5,"d":"10"}}}
```

In this case, the set operation on **`a.b.d`** causes the delete operation on **`a.b`** to be discarded.

NOTE: In the earlier example in this section, the `$increment` and `$delete` operations are not conflicting because one operates on `a.b[1]`, while the other operates on `a.b[0]`. On the other hand, the following are conflicting operations:

```
{"$increment":"a.b[1].decimal","$delete":"a.b"}
```

Updates Without Explicit Mutation Operation Names

As part of the update command, you can merge a nested document with a document without specifying a mutation operation name. When applying this type of update, the behavior is the same as the merge operation.

For example, suppose you run the following command:

```
update /tbl --id id1 --m {
      "k":"eureka",
      "a":{"c":{"d":1234}}
      }
```

If the document with key `"id1"` exists, the update command merges the nested document with the original document. If the document does not exist, the update creates a new document with the input provided.

Application of the command to the sample document results in the following:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false }, { "decimal" : 123.456 } ],
    "c" : {
      "d" : 1234,
      "e" : "Hello"
    }
  },
  "k" : "eureka",
  "m" : "MapR wins"
}
```

For the following update command:

```
update /tbl --id id1 --m {
      "k":"eureka",
      "a":{"c":{"d":null}}
      }
```

This is the resulting document:

```
{
  "_id" : "id1",
  "a" : {
```

```
    "b" : [ { "boolean" : false }, { "decimal" : 123.456 } ],
    "c" : {
      "d" : null,
      "e" : "Hello"
    }
  },
  "k" : "eureka",
  "m" : "MapR wins"
}
```

NOTE: In this example, field `a.c.d` remains in the document and is set to null.

Utilities for HPE Ezmeral Data Fabric Database JSON Tables

HPE Ezmeral Data Fabric Database JSON provides utilities to copy, export, and import data, compare table content, and verify the consistency of secondary indexes.

You can use the following utilities with HPE Ezmeral Data Fabric Database JSON tables:

HPE Ezmeral Data Fabric Database JSON CopyTable
Copies data from one HPE Ezmeral Data Fabric Database JSON table to another HPE Ezmeral Data Fabric Database JSON table.

If the destination table does not exist, `mapr copytable` creates the destination table with the same metadata (column families and access control expressions) as the source table, and then copies data.

If the destination table exists, `mapr copytable` copies data only.

Required Permissions

The user that runs `mapr copytable` must have the following permissions, which you can grant with access-control expressions:

- The permission `readAce` on the volume where the source table is located, and the permission `writeAce` on the volume where the destination table is or will be located.
- The permission `adminperm` on the source table.
- The permission for column-family and column reads (`readperm`) on the data in the source table that you want to copy.
- When bulkload = `false`, the permission for column writes (`writeperm`) on the destination table.
- When bulkload = `true` (default), the permission to load the destination table with bulk loads (`bulkloadperm`).
- If the destination table does not yet exist: `createrenamefamily` on the source table.

For information about how to set permissions on volumes, see Setting Whole Volume ACEs on page 1365.

For information about how to set permissions on tables, see Enabling Table and Stream Authorizations with ACEs on page 1363.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr copytable
-src <source table path>
-dst <destination table path>
[-fromID <start key>]
[-toID <end key>]
[-bulkload <true|false> (default: false)]
[-mapreduce <true|false> (default: true)]
[-cmpmeta <true|false> (default: true)]
[-numthreads <number of threads> (default: 16)]
[-maxsplits <integer> (default: 2000)]
```

Parameters

Parameter	Description
src	The path of the table that you want to copy from.
dst	The path of the table that you want to copy to.
fromID	The value of the `_id` field in the first document of the range of documents to copy. `startRow` is an alias for this parameter.
toID	The value of the `_id` field in the last document of the range of documents to copy. `stopRow` is an alias for this parameter.
bulkload	A Boolean value that specifies whether or not to perform a full bulk load of the table. The default is not to use bulk loading (`false`). To use bulk load, you must set the `-bulkload` parameter of the table to `true` by running the command `maprcli table edit -path <path to table> -bulkload true`.
`mapreduce`	A Boolean value that specifies whether or not to use a MapReduce program to perform the copying operation. The default, preferred method is to use a MapReduce program (`true`). When this parameter is set to `false`, a client process uses multiple threads to read rows of the source table and write rows to the destination table.
cmpmeta	A Boolean value that specifies whether or not to compare table metadata such as column families and ACEs. The default is to compare metadata (`true`). Such comparisons are done when the destination table exists before `mapr copytable` is run and checks that the user ID that runs `mapr copytable` has the proper permissions on the destination table. Set the value of this parameter to `false` before copying a table that contains a single column family to a table that contains two or more column families.
`numthreads`	When `-mapreduce` is `false`, this parameter specifies the number of threads allocated to perform the copying of data. The default is 16. If additional CPU resources are available, you might want to increase the number of threads to achieve better performance.

last-updated: Jun 06, 2024

Parameter	Description
maxsplits	Sets the maximum number of destination table presplit tablets. Default is 2000. If `copytable` fails with an Error NO ENTry message during table creation, the operation could not complete within the timeout (10 minutes). Reduce the value of `-maxsplits`. This functionality requires a patch. See Applying a Patch.

Example

The following example copies documents starting from ID `user000001` to ID `user009999`:

```
[user@hostname ~]$ mapr copytable -src /user1/tableA -dst
/mapr/clusterB/vol1/tableB -fromID user000001 -toID user009999
```

Monitoring `mapr copytable` Operations

Use one of the following methods to monitor the progress of the copying of table data:

- If the copy table operation runs as a MapReduce v2 application, monitor the application using the ResourceManager UI.
- If the copy table operation runs as a client process, go to the Tables view of the destination table in the MapR Control System. Then, on the Region tab, monitor the pace at which the number of rows increases.

HPE Ezmeral Data Fabric Database JSON DiffTables

Compares the row keys, column families, and field values in two JSON tables. Then, generates two directories that contain sequence files that you can use to merge the rows from the two JSON tables.

Sequence files are binary flat files. For more detail, see Sequence File. To convert a sequence file into a format that you can read, use the `mapr formatresult` utility.

This utility considers both the source table and the destination table to be a master table. Therefore, it generates two directories with sequence files. These sequence files contain the puts required to update each table so that it contains a superset of the rows defined in both tables at the time at which the utility was run.

This utility generates both of the following output directories in the output directory that you specify:

opsForDst	A directory containing sequence files that correspond to each put and delete required to make the destination table identical to the source table.
opsForSrc	A directory containing sequence files that correspond to each put and delete required to make the source table identical to the destination table.

A user with write permissions on a table can run the `mapr importtable` utility to implement the changes that are specified in the sequence files.

Required Permissions

The user that runs the `mapr difftables` utility must have the following permissions:

- The permission `readAce` on the volumes where the tables are located.
- The permission for column reads (`readperm`) on each table.

For information about how to set permissions on volumes, see Setting Whole Volume ACEs on page 1365.

last-updated: Jun 06, 2024

For information about how to set permissions on tables, see Enabling Table and Stream Authorizations with ACEs on page 1363.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr difftables
-src <source table path>
-dst <destination table path>
-outdir <output directory>
[-first_exit Exit when first difference is found. ]
[-columns comma-separated list of field paths ]
[-mapreduce] <true|false> (default: true)]
[-numthreads <numThreads> (default:16, valid only when -mapreduce is false)]
[-cmpmeta <true|false> (default: true)]
```

Parameters

Parameter	Description
src	The path of the first table to include in the comparison.
dst	The path of the second table to include in the comparison.
`first_exit`	By default, the utility compares all the table cells in the specified tables. Use this parameter if you want to exit after the first difference is identified between the tables. The parameter takes no value.
`outdir`	The path to a directory in which to place the generated sequence files. The utility creates the specified directory. If the specified directory already exists, the command fails.
`columns`	By default, the utility compares all fields in JSON tables. If you do not want to compare all fields, you can specify specific fields to include in the comparison. For example, suppose that want to compare a source table in table replication with a replica of that table. When you set up replication, you chose to replicate the default column family and two additional column families: `cf1` and `cf2`. For the -columns parameter, you would specify the value `",cf1,cf2"`, where the default column family is represented by the empty string.
`mapreduce`	A Boolean value that specifies whether or not to use a MapReduce program to perform the comparison. The default, preferred method is to use a MapReduce program (`true`). When this parameter is set to false, a client process uses multiple threads to perform the comparison.
`numthreads`	When `-mapreduce` is `false`, this parameter specifies the number of threads allocated to perform the comparison. The default is 16. If additional CPU resources are available, you might want to increase the number of thread to achieve better performance.

last-updated: Jun 06, 2024

Parameter	Description
`cmpmeta`	A Boolean value that specifies whether or not to compare table metadata such as column families and ACEs. The default is to compare metadata (`true`).

Example

The following example shows a comparison of two JSON tables

```
[user@hostname ~]$ mapr difftables -src /source_JSON_table -dst /
destination_JSON_table -outdir output/comparison1 -columns
"dateRange.endYear","contributors.date"
Header: hostName: maprdemo, Time Zone: Pacific Standard Time, processName:
null, processId: null

```

HPE Ezmeral Data Fabric Database JSON DiffTablesWithCrc

This utility uses a cyclic redundancy check to detect differences between sets of rows in the specified HPE Ezmeral Data Fabric Database JSON tables. Then, for each set of non-identical rows, it performs a detailed comparison. Finally, it generates one or more directories of sequence files. You can use these files either to merge the rows from two HPE Ezmeral Data Fabric Database JSON tables.

Sequence files are binary flat files. You can learn more about them here. To convert a sequence file into a format that you can read, use the HPE Ezmeral Data Fabric Database JSON FormatResult on page 5502 utility.

This utility requires less network bandwidth than the `mapr diffTables` utility because it performs a detailed table comparison only on the sets of rows where the CRC algorithm detected a difference. Therefore, consider using this utility when the tables you compare are very similar and you are concerned about the data transfer rate.

This utility considers both the source table and the destination table to be a master table. Therefore, it generates two directories with sequence files. These sequence files contain the puts required to update each table so that each table can contain a superset of the rows in both tables at the time at which the utility was run.

This utility generates the following output directories:

last-updated: Jun 06, 2024

- **opsForDst.** A directory containing sequence files that correspond to each put and delete required to make the destination table identical to the source table.
- **opsForSrc.** A directory containing sequence files that correspond to each put and delete required to make the source table identical to the destination table.

Run the `mapr importtable` command to implement the puts and deletes specified in the sequence files.

A user with write permissions on a table can run the `mapr importtable` utility to implement the changes that are specified in the sequence files.

Requirements

- When the cluster runs YARN, it must use zero configuration failover for the ResourceManager.
- The user that runs the `mapr difftableswithcrc` utility must have the following permissions:
  - The permission `readAce` on the volumes where the tables are located.
  - The permission for column reads (`readperm`) on each table.

  For information about how to set permissions on volumes, see Setting Whole Volume ACEs on page 1365.

  For information about how to set permissions on tables, see Enabling Table and Stream Authorizations with ACEs on page 1363.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr difftableswithcrc
-src <source table path>
-dst <destination table path>
-outdir <output directory>
[-first_exit] Exit when first difference is found.
[-columns <comma separated list of field paths> ]
[-exclude_embedded_families <true|false>] (default: false)
  Don't include the  other column families with path embedded in specified
columns
[-cmpmeta <true|false> (default: true)]
```

Parameters

Parameter	Description
src	The path of the first table to include in the comparison.
dst	The path of the second table to include in the comparison.
`outdir`	The path to a directory in which to place the generated sequence files. The utility creates the specified directory. If the specified directory already exists, the command fails.

last-updated: Jun 06, 2024

Parameter	Description
`first_exit`	By default, the utility compares all the table cells in the specified tables. Use this parameter if you want to exit after the first difference is identified between the tables. The parameter takes no value.
`columns`	By default, the utility compares all fields in JSON tables. If you do not want to compare all fields, you can specify specific fields to include in the comparison. For example, suppose that want to compare a source table in table replication with a replica of that table. When you set up replication, you chose to replicate the default column family and two additional column families: `cf1` and `cf2`. For the -columns parameter, you would specify the value `",cf1,cf2"`, where the default column family is represented by the empty string.
`cmpmeta`	A Boolean value that specifies whether or not to compare table metadata such as column families and ACEs. The default is to compare metadata (`true`).

HPE Ezmeral Data Fabric Database JSON FormatResult

Parses a sequence file generated by the difftables utility for JSON tables and converts the results into a format that makes the results easier to understand.

Required Permissions

The user that runs the `FormatResult` utility must have the `readAce` and `writeAce` permissions on the volumes where the input and output paths are located.

For information about how to set permissions on volumes, see Setting Whole Volume ACEs on page 1365.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr formatresult
-indir <input file path>
-outdir <output file path>
[-mapreduce <true|false> (default: false)]
```

Parameters

Parameter	Description
indir	The path to a file or directory of files that contains the output of the `mapr difftables` utility.
outdir	The path to a file or a directory for the output. If the file or directory already exists, the utility fails. When a single sequence file is provided as input, the utility generates a single output file. When a directory of sequence files is provided as input, the utility generates a directory with output files.
`mapreduce`	A Boolean value that specifies whether or not to use a MapReduce program to perform the copying operation. The default, preferred method is to use a MapReduce program (`true`).

last-updated: Jun 06, 2024

Example

This example shows the results of the following actions that followed a comparison by difftables of two JSON tables:

1. Formatting the sequence file for the source JSON table.
2. Formatting the sequence file for the destination JSON table.
3. Viewing the content of the first sequence file.
4. Viewing the content of the second sequence file.

This is the command that was used for `maprdb difftables`:

```
mapr difftables -src /src_table -dst /dest_table -outdir
output/diffs -columns dateRange.endYear
```

Here is the command that was used for `mapr formatresult` and the resulting output:

```
[user@hostname ~]$ mapr formatresult -indir output/diffs/
OpsForSrcTable -outdir output/outputForSrcTable5
Header: hostName: maprdemo, Time Zone: Pacific Standard Time, processName:

HPE Ezmeral Data Fabric Database JSON ExportTable and ImportTable
Use these utilities together to export data from JSON tables into binary sequence files, and then import the data from the binary sequence files into other JSON tables. You can also use the `mapr importtable` utility to import changes that are specified in sequence files output by the `mapr difftables` utility.

- Syntax of `mapr exporttable`
- Parameters of `mapr exporttable`
- Syntax of `mapr importtable`
- Parameters of `mapr importtable`
- Example of using `mapr exporttable` and `mapr importtable` together

Required Permissions

- The `readAce` permission on the volume where the source table for `mapr exporttable` is located.
- The `writeAce` permission on the volume in which to save the output from `mapr exporttable`.
- The `readAce` permission on the volume where the files output by `mapr exporttable` is located.
- The `writeAce` permission on the volume in which the destination table is located.

For information about how to set permissions on volumes, see Setting Whole Volume ACEs on page 1365.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run these utilities unless that user is given the relevant permission or permissions with access-control expressions.

Syntax of `mapr exporttable`

```
mapr exporttable
(option)
-src Name of table
-dst Directory path
[-columns Fields to include]
[-mapreduce : <true|false>, default is true]
```

Parameters of `mapr exporttable`

Parameter	Description
src	The path of the JSON table to export from.
dst	The directory within the MapR filesystem to export the files to.

last-updated: Jun 06, 2024

Parameter	Description
columns	A comma-delimited list of fields to include in the exported files. **Example** `a,b,c` Do not use quotation marks and do not include spaces after commas.
`mapreduce`	The cluster must have YARN installed and configured for this option to work. A Boolean value that specifies whether or not to use a MapReduce program to perform the operation. The default, preferred method is to use a MapReduce program (`true`). When this parameter is set to `false`, a client process uses multiple threads.

Syntax of `mapr importtable`

```
mapr importtable
(option)
-src Input binary file or directory path
-dst Destination table
[-bulkload <true|false>, default is false ]
[-mapreduce : <true|false>, default is true]
```

Parameters of `mapr importtable`

Parameter	Description

src	The path of the binary file or files to import.
	Examples
	`-src /temp/part0`
	`-src /temp/*`

dst	The JSON table to import the data into.
bulkload	A Boolean value that specifies whether or not to perform a full bulk load of the table. The default is not to use bulk loading (`false`). To use bulk load, you must set the `-bulkload` parameter of the table to `true` by running the command `maprcli table edit -path <path to table> -bulkload true`.
`mapreduce`	The cluster must have YARN installed and configured for this option to work. A Boolean value that specifies whether or not to use a MapReduce program to perform the operation. The default, preferred method is to use a MapReduce program (`true`). When this parameter is set to `false`, a client process uses multiple threads.

last-updated: Jun 06, 2024

Example of using `mapr exporttable` and `mapr importtable` together

```
[user@hostname ~]$ mapr exporttable -columns contributors,creditLine -src /
collection/artworks -dst /tempExport
Header: hostName: hostname, Time Zone: Pacific Standard Time, processName:
null, processId: null

[user@hostname ~]$
```

HPE Ezmeral Data Fabric Database JSON ImportJSON
Imports one or more JSON documents into a HPE Ezmeral Data Fabric Database JSON table. The JSON documents must be flat text files.

Required Permissions

- The `readAce` permission on the volume where the JSON documents to import are located.
- The `writeAce` permission on the volume in which the destination table is located.

For information about how to set permissions on volumes, see Setting Whole Volume ACEs on page 1365.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr importJSON
[-idfield <Name of ID field in JSON Data>]
[-bulkload <true|false>, default is false]
[-mapreduce : <true|false>, default is true]
-src <text file or directory>
-dst <JSON table>
```

Parameters

-

last-updated: Jun 06, 2024

Parameter	Description
idfield	The name of the field that contains the value to use for each document's `_id` field. An `_id` field is inserted into each document that is imported into a table, if the document does not already contain one. Documents that do not already contain an `_id` field must contain a field with a value that can be used for the inserted `_id` field. For example, each document might have a `product_ID` field with a value that would be suitable for the `_id` field. Use quotation marks around the name.
bulkload	A Boolean value that specifies whether or not to perform a full bulk load of the table. The default is not to use bulk loading (`false`). To use bulk load, you must set the `-bulkload` parameter of the table to `true` by running the command `maprcli table edit -path <path to table> -bulkload true`. This parameter cannot be set to `true` when the `-mapreduce` parameter is set to `false`.
`mapreduce`	A Boolean value that specifies whether or not to use a MapReduce program to perform the copying operation. The default, preferred method is to use a MapReduce program (`true`).
src	The path of a JSON document in text format or a directory of such documents. If you specify a directory and that directory contains only the JSON files to import, use an asterisk at the end of the path, as in this example: `/user/data/*` If you specify a directory and that directory contains both the JSON files to import and other files, use a more specific wildcard, such as `*.json` . The path must be in the MapR filesystem. To move files there from the Linux filesystem, use the command `hadoop fs -copyFromLocal`.
dst	The path of the destination HPE Ezmeral Data Fabric Database JSON table.

Example

Suppose you have the following three JSON documents in the `/tmp/users` directory in your MapR filesystem:

```
$ hadoop fs -cat /tmp/users/bcummings.json
{"_id":"bcummings","first_name":"Bettie","last_name":"Cummings"}

$ hadoop fs -cat /tmp/users/gjones.json
{"_id":"gjones","first_name":"Gilberto","last_name":"Jones"}

$ hadoop fs -cat /tmp/users/jdoe.json
{"_id":"jdoe","first_name":"John","last_name":"Doe"}
```

last-updated: Jun 06, 2024

The following command imports the three documents into the JSON table in the path `/apps/users`:

```
$ mapr importJSON -idField _id -src /tmp/users/* -dst /apps/users
```

You can run `mapr dbshell` to see the imported documents:

```
maprdb mapr:> find /apps/users
{"_id":"bcummings","first_name":"Bettie","last_name":"Cummings"}
{"_id":"gjones","first_name":"Gilberto","last_name":"Jones"}
{"_id":"jdoe","first_name":"John","last_name":"Doe"}
3 document(s) found.
```

HPE Ezmeral Data Fabric Database JSON verifyindex

Describes how to use the HPE Ezmeral Data Fabric Database JSON `verifyindex` command to verify that the data in a secondary index is consistent with its JSON table.

Syntax

```
mapr verifyindex
        -path < table path >
        -index < index name >
        -first_exit < true | false >
        -numthreads < thread number >
```

Parameters

Parameter	Description
path	(Required) Path to where the table exists.
index	(Required) Name of the secondary index on the table.
first_exit	(Optional) Exit when the first difference is found. Options: true or false. Default: false.
numthreads	(Optional) Number of parallel threads to use for the verification. Default: 16

Example

The following example creates a table, creates a secondary index on the table, inserts some documents, and then runs the `verifyindex` command to verify that there is data consistency between the JSON table and the secondary index. See Troubleshooting Secondary Indexes on page 1460 for an example where `verifyindex` detects data inconsistency.

```
// Create a table using dbshell add
# mapr dbshell

maprdb root:> create /t1
Table /t1 created.

// Create an index using maprcli table index add
# maprcli table index add -path /t1 -index i1 -indexedfields a -json
{
"timestamp":1499788406380,
"timeofday":"2017-07-11 08:53:26.380 GMT-0700",
"status":"OK",
"total":0,
"data":[ ]
```

```
}

// Insert documents into the table using dbshell insert
# mapr dbshell

maprdb root:> insert /t1 --v {"a":1,"b":2} --id 1
Document with id: "1" inserted.

maprdb root:> insert /t1 --v {"a":"mapr","b":3} --id 2
Document with id: "2" inserted.

maprdb root:> insert /t1 --v {"a":{"$numberLong":3},"b":4} --id 4
Document with id: "4" inserted.

// Run verifyindex to verify indexed data
# mapr verifyindex -path /t1 -index i1

Number of rows in table but not in index: 0
Number of rows in index but not in table: 0
Mismatch row count: 0
```

Troubleshooting Use Cases

Situations where you can use this command are as follows:

- Examine details on updates that have not yet propagated from a JSON table to one of its indexes.
- Detect if there are documents that are missing from an index.
- Detect other data consistency issues between an index and its parent JSON table.

See Troubleshooting Secondary Indexes on page 1460 for more information on these use cases.

HPE Ezmeral Data Fabric Database HBase Shell (Binary Tables)

You can manage HPE Ezmeral Data Fabric Database tables using HBase shell commands and additional HBase shell commands included in the HPE Ezmeral Data Fabric distribution of Hadoop.

The HBase shell command is used on binary tables only. To run this command, execute the following:

```
hbase shell
```

NOTE: Before running the shell, ensure that your user ID has both the `readAce` and `writeAce` permissions on the volume. For information about these permissions, see Managing Whole Volume ACEs.

When you specify a table in HBase shell, use the following syntax:

- For a table on the local cluster, start the path at the volume mount point. For example, for a table named test under a volume with a mount point at /volume1, specify the following path as the table name: “/volume1/test”
- For a table on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customer under volume1 in the sanfrancisco cluster, specify the following path as the table name: “/mapr/sanfrancisco/volume1/customer”

NOTE: You can access a table on a remote cluster when the remote cluster has an entry in the mapr-clusters.conf file on the node where the HBase shell is running.

last-updated: Jun 06, 2024

The following table lists the supported HBase shell commands that you can use to manage HPE Ezmeral Data Fabric Database tables:

Command	Description
alter	Performs the following actions on HPE Ezmeral Data Fabric Database tables: • Adds a new table or column family • Modifies the following table-level attributes: • • BULKLOAD - A Boolean value that specifies whether to perform a full bulk load of the table. The default is false. For more information, see Bulk Loading and HPE Ezmeral Data Fabric Database Tables. • MAX_FILESIZE • AUTOSPLIT - A Boolean value that specifies whether to split the table into regions automatically as the table grows. The average size of each region is determined by the `regionsizemb` parameter. The default value is true. If you set the value to false, you can manually split tables into regions by using the maprcli table region split command. • Modifies the following attributes of a column family: • • TTL • VERSIONS (max or min) • COMPRESSION • IN_MEMORY Aside from the attributes listed above, no other attributes apply to HPE Ezmeral Data Fabric Database tables. Unlike HBase, you do not need to disable a table before altering a table.
alter_async	On HPE Ezmeral Data Fabric Database tables, this has the same behavior as the alter command.
count	Counts the number of rows in a specified table.
create	Creates a table in the specified path.
delete	Deletes a value in a specified table, row, and column. Optionally, you can also specify the timestamp associated with the value that you want to delete.
deleteall	Delete all values in a row based on the table name and row. Optionally, you can also specify the timestamp associated with the values that you want to delete.
describe	Describes a specified table.
disable	Marks a specified table as disabled. This state is recorded only in the client process (HBase shell) memory and does not actually disable any operations on a HPE Ezmeral Data Fabric Database table.

last-updated: Jun 06, 2024

Command	Description
disable_all	Marks tables as disabled if they have names matching the specified regular expression. This state is recorded only in the client process (HBase shell) memory and does not actually disable any operations on the HPE Ezmeral Data Fabric Database tables.
drop	Drops a specified table that is marked as disabled.
drop_all	Drops all tables that are marked as disabled.
enable	Marks a specified table as enabled. This state is recorded only in the client process (HBase shell) memory.
enable_all	Marks tables as enabled if they have a table name that matches the specified regular expression. This state is recorded only in the client process (HBase shell) memory.
exists	Returns boolean value true if the specified table exists.
exit	Exits the HBase shell.
get	Gets the contents of a row or cell.
get_counter	Returns the value of a counter at a specified table, row, and column.
incr	Increments a value at a specified table, row, and column.
is_disabled	Returns a value that indicates if a specified table is disabled. You can perform operations on HPE Ezmeral Data Fabric Database tables that are disabled.
is_enabled	Returns a value that indicates if a specified table is enabled. You can perform operations on HPE Ezmeral Data Fabric Database tables even if they are not enabled.
list	For HBase 1.1 or above, if the mapr.hbase.default.db property is set to maprdb, this command returns the HPE Ezmeral Data Fabric Database tables under the user's home directory.
list_perm	Lists all permissions set by Access Control Expressions for a specified table. This HBase shell command only operates on HPE Ezmeral Data Fabric Database tables. For more information, see list_perm.
put	Puts a value at a specified table, row, and column. Optionally, you can also specify the timestamp for that value.
scan	Scans a specified table. Optionally, you can also specify a dictionary of scanner specifications.
set_perm	Sets permissions with Access Control Expressions on a specified table, column family, or column qualifier. This Hbase shell command only operates on HPE Ezmeral Data Fabric Database tables. For more information, see set_perm.
show_filters	Shows all the filters supported by the Hbase or HPE Ezmeral Data Fabric Database tables. Provide the link to 4.1 supported filters doc
truncate	Disables, drops, and recreates a specified table.
version	Returns the HBase client version.
whoami	Returns the current user.

last-updated: Jun 06, 2024

HPE Ezmeral Data Fabric Database does not support the following HBase shell commands:

- add_peer
- alter_status
- assign
- balance_switch
- balancer
- close_region
- compact
- disable_peer
- enable_peer
- flush
- grant
- hlog_roll
- list_peer
- major_compact
- move
- remove_peer
- start_replication
- stop_replication
- status
- split
- revoke
- unassign
- user_permission
- zk_dump

For more information about the HBase shell commands, see the Apache HBase documentation.

list_perm

Lists all permissions set by Access Control Expressions for a specified HPE Ezmeral Data Fabric Database table

Syntax

```
list_perm "<table path>"
```

last-updated: Jun 06, 2024

Example

```
hbase(main):006:0> list_perm "/table/"
        Scope Permission Access Control Expression
        defaultappendperm u:jon
        createrenamefamilyperm u:jon
        deletefamilyperm u:jon
        bulkloadperm u:jon
        defaultreadperm u:jon
        defaultwriteperm u:jon
        packperm u:jon
        replperm u:jon
        defaultmemoryperm u:jon
        adminaccessperm u:jon
        splitmergeperm u:jon
        defaultversionperm u:jon
        defaultcompressionperm u:jonr
        13 row(s) in 0.0070 seconds
```

set_perm
Set permissions with access control expressions on a MapR Database table, column family, or column qualifier.

Set permissions with *ACE* on a HPE Ezmeral Data Fabric Database table, column family, or column qualifier.

Syntax

To set the permission on a table:

```
set_perm "<table path>", "<permission>", "<ACE expression>"
```

To set the permission on a column family or column qualifier:

```
set_perm "<table path>", {COLUMN => "column family[:qualifier]", PERM =>
          "<permission>", EXPR => "<ACE expression>"}
```

Examples

Assigns user `jon` and user `mapr04` the `defaultreadperm` permission on table `/table`:

```
hbase(main):004:0> set_perm "/table/","defaultreadperm","u:jon|u:mapr04"
```

Assigns user `jon` and user `mapr05` the `compressionperm` permission on the `cf1` column family in table `/table`:

```
hbase(main):005:0> set_perm "/table/",{COLUMN => "cf1",PERM =>
"compressionperm", EXPR =>"u:jon|u:mapr05"}
```

Assigns user `jon` and user `mapr05` the `writeperm` permission on the `col1` column qualifier in `cf1` column family in table `/table`:

```
hbase(main):009:0> set_perm "/table/",{COLUMN => "cf1:col1",PERM =>
"writeperm", EXPR =>"u:jon|u:mapr05"}
```

Utilities for HPE Ezmeral Data Fabric Database Binary Tables

HPE Ezmeral Data Fabric Database provides utilities to copy and compare data in HPE Ezmeral Data Fabric Database binary tables.

last-updated: Jun 06, 2024

You can use the following utilities with HPE Ezmeral Data Fabric Database binary tables:

HPE Ezmeral Data Fabric Database Binary CopyTable

Copies data from one HPE Ezmeral Data Fabric Database binary table to another HPE Ezmeral Data Fabric Database binary table.

The HPE Ezmeral Data Fabric Database `CopyTable` utility is different from Apache HBase's `CopyTable` utility. This utility has the following capability:

- If the destination table does not exist, `CopyTable` creates the target table with the same metadata (column families and access control expressions) as the source table, and then copies data.
- If the destination table exists, `CopyTable` copies data only.
- If you manually set up replication to a HPE Ezmeral Data Fabric Database table, `CopyTable` can be used to perform an initial load of source data to the replica before table replication begins.

NOTE: When copying data to HPE Ezmeral Data Fabric Database tables, it is recommended that you use the HPE Ezmeral Data Fabric Database version of `CopyTable`.

Required Permissions

The user that runs the `CopyTable` utility must have the following permissions:

- The permission `readAce` on the volume where the source table is located, and the permission `writeAce` on the volume where the destination table is or will be located.
- The permission `adminperm` on the source table.
- The permission for column-family and column reads (`readperm`) on the data in the source table that you want to copy.
- When bulkload = `false`, the permission for column writes (`writeperm`) on the destination table.
- When bulkload = `true` (default), the permission to load the destination table with bulk loads (`bulkloadperm`).
- If the destination table does not yet exist: `createrenamefamily` on the source table.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

If `CopyTable` is run between tables on different clusters, the user that runs the command must have the required permissions on each cluster.

For information about how to set permissions on volumes, see Setting Whole Volume ACEs on page 1365.

For information about how to set permissions on tables, see Enabling Table and Stream Authorizations with ACEs on page 1363.

Syntax

```
hbase com.mapr.fs.hbase.tools.mapreduce.CopyTable
    -src <source table path> -dst <destination table path>
    [-columns cf1[:col1],...] [-maxversions <max number of versions to
copy>]
    [-starttime <time>]
    [-endtime <time>]
    [-mapreduce <true|false> (default: true)]
```

last-updated: Jun 06, 2024

```
    [-bulkload <true|false> (default: true)]
    [-numthreads <numThreads> (default:16, valid only when -mapreduce is
false)]
```

Parameters

Parameters	Description
src	The path to the source table that you want to replicate. • For a path on the local cluster, start the path at the volume mount point. For example, for a table named `testsrc` under a volume with a mount point at /volume1, specify the following path: `/volume1/testsrc` • For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named `customersrc` under `volume1` in the `sanfrancisco` cluster, specify the following path: `/mapr/sanfrancisco/volume1/customersrc`
dst	The path to the replica. • For a table on the local cluster, start the path at the volume mount point. For example, for a table named `testdst` under a volume with a mount point at /volume1, specify the following path: `/volume1/testdst` • For a table on another cluster, you must also specify the cluster name in the path. For example, for a table named `customerdst` under `volume1` in the `sanfrancisco` cluster, specify the following path:`/mapr/sanfrancisco/volume1/customerdst`
columns	By default, all columns in the source table are copied. If you do not want to copy all columns in the table, you can specify columns to copy. Provide a comma-separated list of column families or columns from a certain column family (column family:qualifier). For example, use the following syntax to copy only the purchases column family and the stars column in the reviews column family: `-columns purchases,reviews:stars`
maxversions	By default, all versions from the source table are copied. If you do not want to copy all versions, use this parameter to specify the number of versions to copy.
starttime	By default, all table values regardless of their associated timestamp are copied. You can specify a timestamp to indicate the table cell version at which to start the copy. The timestamp is a long integer value that is either user-defined or system-defined (epoch in milliseconds). Values with timestamps lower than the specified timestamp will not be copied to the destination.

last-updated: Jun 06, 2024

Parameters	Description
endtime	By default, all table values regardless of their associated timestamp are copied. You can specify a timestamp to indicate the table cell version at which to end the copy. The timestamp is a long integer value that is either user-defined or system-defined (epoch in milliseconds). Values with timestamps greater than or equal to the specified timestamp will not be copied to the destination.
`mapreduce`	A Boolean value that specifies whether or not to use a MapReduce program to perform the copying operation. The default, preferred method is to use a MapReduce program (`true`). When this parameter is set to `false`, a client process uses multiple threads to read rows of the source table and write rows to the destination table.
bulkload	A Boolean value that specifies whether or not to perform a full bulk load of the table. The default is to use bulk loading (`true`). When you use bulk loading, the utility automatically unsets the bulk load mode on the table to restore normal client operations at the end of the table copy operation. For more information, see Bulk Loading and HPE Ezmeral Data Fabric Database Tables.
`numthreads`	When `-mapreduce` is `false`, this parameter specifies the number of threads allocated to perform the copying of data. The default is 16. If additional CPU resources are available, you might want to increase the number of threads to achieve better performance.

Monitoring the CopyTable Operation

Use one of the following methods to monitor the progress of the copying of table data:

- If the copy table operation runs as a MapReduce v2 application, monitor the application using the ResourceManager UI.
- If the copy table operation runs as a client process, go to the Tables view of the destination table in the MapR Control System. Then, on the Region tab, monitor the pace at which the number of rows increases.

Example

Copies table data with timestamp greater than 1423226300000 (Fri, 06 Feb 2015 12:38:20 GMT) from one HPE Ezmeral Data Fabric Database table to another HPE Ezmeral Data Fabric Database table:

```
[user@hostname ~]$
hbase com.mapr.fs.hbase.tools.mapreduce.CopyTable -src /t1 -dst /
t1_copy7  -starttime 1423226300000
```

HPE Ezmeral Data Fabric Database Binary DiffTables

Compares the row key, column family, timestamp, and value of each table cell in each specified HPE Ezmeral Data Fabric Database table. Then, it generates one or two directories with sequence files that you can use to either make a HPE Ezmeral Data Fabric Database table identical to its master or merge the rows from two HPE Ezmeral Data Fabric Database tables.

Sequence files are binary flat files. To convert the sequence file into a format that is easier to understand, use the FormatResults utility.

last-updated: Jun 06, 2024

By default, the DiffTables utility considers both the source table and the destination table to be a master table. Therefore, it generates two directories with sequence files. These sequence files contain the puts required to update each table so that it contains a superset of the rows defined in both tables at the time at which the utility was run.

When you specify a master table, the DiffTables utility generates one of the following output directories:

- **opsForDst.** A directory containing sequence files that correspond to each put and delete required to make the destination table identical to the source table.
- **opsForSrc.** A directory containing sequence files that correspond to each put and delete required to make the source table identical to the destination table.

A user with write permissions on a table can run the `hbase org.apache.hadoop.hbase.mapreduce.Import` command to implement the puts and deletes specified in the sequence files.

Required Permissions

The user that runs the DiffTables utility must have the following permissions:

- The permission `readAce` on the volumes where the tables are located.
- The permission for column reads (`readperm`) on each table.

For information about how to set permissions on volumes, see Setting Whole Volume ACEs on page 1365.

For information about how to set permissions on tables, see Enabling Table and Stream Authorizations with ACEs on page 1363.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
hbase com.mapr.fs.hbase.tools.mapreduce.DiffTables
  -src <source table path>
    -dst <destination table path>
      -outdir <output directory>
    [-master <src|dst> ] The master table to use for the diff.
    [-first_exit] Exit when first difference is found.
    [-columns <comma separated list of family[:column]> ]
    [-starttime <start diff at timestamp>]
    [-endtime <end diff at timestamp>]
    [-maxversions] <max number of versions to diff>
    [-mapreduce] <true|false> (default: true)]
    [-numthreads <numThreads> (default:16, valid only when -mapreduce is
      false)]
      [-cmpmeta <true|false> (default: true)]
```

last-updated: Jun 06, 2024

Parameters

Parameter	Description
src	The path to the source table. • For a path on the local cluster, start the path at the volume mount point. For example, for a table named `testsrc` under a volume with a mount point at /volume1, specify the following path: `/volume1/testsrc` • For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customersrc under volume1 in the sanfrancisco cluster, specify the following path:`/mapr/sanfrancisco/volume1/customersrc`
dst	The path to the destination table. • For a table on the local cluster, start the path at the volume mount point. For example, for a table named `testdst` under a volume with a mount point at /volume1, specify the following path: /volume1/testdst • For a table on a remote cluster, you must also specify the cluster name in the path. For example, for a table named `customerdst` under volume1 in the sanfrancisco cluster, specify the following path:`/mapr/sanfrancisco/volume1/customerdst`
master	The table that is considered to be the master table. The values are `src` and `dst`. By default, both the source table and the destination tables are considered to be a master.
`first_exit`	By default, the utility compares all the table cells in the specified tables. Use this parameter if you want to exit after the first difference is identified between the tables. The parameter takes no value.
`outdir`	The path to a directory in which to place the generated sequence files. The utility creates the specified directory. If the specified directory already exists, the command fails.
columns	By default, the utility compares all columns. If you do not want to compare all columns in the table, you can specify specific columns to include in the comparison. Provide a comma-separated list of column families or columns from a certain column family (column family:qualifier). For example, use the following syntax to include the column family purchases and the column stars in the reviews column family: `-columns purchases,reviews:stars`
starttime	By default, the utility compares all table values regardless of their associated timestamp. You can specify a timestamp to indicate the table cell version at which to start the comparison. The timestamp is a long integer value that is either user-defined or system-defined (epoch in milliseconds). Values with timestamps lower than the specified timestamp will not be included in the comparison.

last-updated: Jun 06, 2024

Parameter	Description
endtime	By default, the utility compares all table values regardless of their associated timestamp. Values with timestamps greater than or equal to the specified timestamp will not be included in the comparison.
maxversions	By default, all versions from the master table are included in the comparison. If you do not want to compare all versions, use this parameter to specify the number of recent versions to include in the comparison.
`mapreduce`	A Boolean value that specifies whether or not to use a MapReduce program to perform the comparison. The default, preferred method is to use a MapReduce program (`true`). When this parameter is set to `false`, a client process uses multiple threads.
`numthreads`	When `-mapreduce` is `false`, this parameter specifies the number of threads allocated to perform the comparison. The default is 16. If additional CPU resources are available, you might want to increase the number of thread to achieve better performance.
`cmpmeta`	A Boolean value that specifies whether or not to compare table metadata such as column families and ACEs. The default is to compare metadata (`true`).

Examples
The following example compares two HPE Ezmeral Data Fabric Database tables:

```
[user@hostname ~]$ hbase com.mapr.fs.hbase.tools.mapreduce.DiffTables -src /
customerTableA -dst /customerTableB -outdir /customerTableABCompare
2015-03-04 18:04:52,059 INFO  [main] Configuration.deprecation:
hadoop.native.lib is deprecated. Instead, use io.native.lib.available
DiffTablesMeta completed. Metadata of the two tables is same.
...
Mapreduce job completed. The tables mismatch.
NUM_ROWS_MISMATCH_IN_SRC:32; NUM_ROWS_MISMATCH_IN_DST:30. Please check diff
in /customerTableABCompare
```

HPE Ezmeral Data Fabric Database Binary DiffTablesWithCrc

This utility uses a cyclic redundancy check to detect differences between sets of rows in the specified HPE Ezmeral Data Fabric Database binary tables. Then, for each set of non-identical rows, it performs a detailed comparison. Finally, it generates one or more directories of sequence files. You can use these files either to make a HPE Ezmeral Data Fabric Database binary table identical to its master or merge the rows from two HPE Ezmeral Data Fabric Database binary tables.

Sequence files are binary flat files. You can learn more about them here. To convert a sequence file into a format that you can read, use the HPE Ezmeral Data Fabric Database Binary FormatResult on page 5522 utility.

This utility requires less network bandwidth than the `DiffTables` utility because it performs a detailed table comparison only on the sets of rows where the CRC algorithm detected a difference. Therefore, consider using this utility when the tables you compare are very similar and you are concerned about the data transfer rate.

Requirements

- When the cluster runs YARN, it must also use zero configuration failover for the ResourceManager.

last-updated: Jun 06, 2024

By default, the utility considers both the source table and the destination table to be a master table. Therefore, it generates two directories with sequence files. These sequence files contain the puts required to update each table so that it can contain a superset of the rows defined in both tables at the time at which the utility was run.

When you specify a master table, the `mapr difftableswithcrc` utility generates one of the following output directories:

- **opsForDst.** A directory containing sequence files that correspond to each put and delete required to make the destination table identical to the source table.
- **opsForSrc.** A directory containing sequence files that correspond to each put and delete required to make the source table identical to the destination table.

A user with write permissions on a table can run the `hbase org.apache.hadoop.hbase.mapreduce.Import` command to implement the puts and deletes specified in the sequence files.

Required Permissions

The user that runs the `mapr difftableswithcrc` utility must have the following permissions:

- The permission `readAce` on the volumes where the tables are located.
- The permission for column reads (`readperm`) on each table.

For information about how to set permissions on volumes, see Setting Whole Volume ACEs on page 1365.

For information about how to set permissions on tables, see Enabling Table and Stream Authorizations with ACEs on page 1363.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
hbase com.mapr.fs.hbase.tools.mapreduce.DiffTablesWithCrc
-src <source table path>
-dst <destination table path>
-outdir <output directory>
[-master src|dst ] The master table to use for the diff.
[-first_exit] Exit when first difference is found.
[-cf <comma separated list of column families>]
[-starttime <start diff at timestamp>]
[-endtime <end diff at timestamp>]
[-maxVersions <max number of versions to copy>]
[-cmpmeta <true|false> (default: true)]
```

last-updated: Jun 06, 2024

Parameters

Parameter	Description
src	The path to the source table. • For a path on the local cluster, start the path at the volume mount point. For example, for a table named `testsrc` under a volume with a mount point at /volume1, specify the following path:`/volume1/testsrc` • For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named `customersrc` under volume1 in the sanfrancisco cluster, specify the following path:`/mapr/sanfrancisco/volume1/customersrc`
dst	The path to the destination table. • For a table on the local cluster, start the path at the volume mount point. For example, for a table named `testdst` under a volume with a mount point at /volume1, specify the following path: `/volume1/testdst` • For a table on a remote cluster, you must also specify the cluster name in the path. For example, for a table named `customerdst` under volume1 in the sanfrancisco cluster, specify the following path:`/mapr/sanfrancisco/volume1/customerdst`
master	The table that is considered to be the master table. The values are `src` (the source table) and `dst` (the destination table). By default, both the source table and the destination table are considered to be the master.
first_exit	By default, the utility compares all the table cells in the specified tables. Set this parameter if you want to exit after the first difference is identified between the tables.
outdir	The path to a directory for the sequence files. The utility will create the specified directory. If the specified directory already exists, the command will fail.
cf	By default, the utility compares all columns from the master table. If you do not want to compare all columns in the table, you can specify specific columns to include in the comparison. Provide a comma-separated list of column families or columns from a certain column family (column family:qualifier). For example, use the following syntax to include the column family purchases and the column stars in the reviews column family: `-columns purchases,reviews:stars`
starttime	By default, the utility compares all table values regardless of their associated timestamp. You can specify a timestamp to indicate the table cell version at which to start the comparison. The timestamp is a long integer value that is either user-defined or system-defined (epoch in milliseconds). Values with timestamps lower than the specified timestamp will not be included in the comparison.

last-updated: Jun 06, 2024

Parameter	Description
endtime	By default, the utility compares all table values regardless of their associated timestamp. You can specify a timestamp to indicate the table cell version at which to end the comparison. The timestamp is a long integer value that is either user-defined or system-defined (epoch in milliseconds). Values with timestamps greater than or equal to the specified timestamp will not be included in the comparison.
maxVersions	By default, the utility compares all versions from the master table. If you do not want to diff all versions, use this parameter to specify the number of recent versions to include in the comparison.
cmpmeta	A Boolean value that specifies whether or not to compare table metadata such as column families and ACEs. The default is to compare metadata (`true`).

Example
Compares two HPE Ezmeral Data Fabric Database tables:

```
[user@hostname ~]$
hbase com.mapr.fs.hbase.tools.mapreduce.DiffTablesWithCrc -src /
customerTableA -dst /customerTableB -outdir /customerTableCompare
2015-03-04 17:52:40,912 INFO  [main] Configuration.deprecation:
hadoop.native.lib is deprecated. Instead, use io.native.lib.available
DiffTablesMeta completed. Metadata of the two tables is same.
....
Mapreduce job completed. The tables mismatch.
NUM_ROWS_MISMATCH_IN_SRC:32; NUM_ROWS_MISMATCH_IN_DST:30. Please check diff
in /customerTableCompare
```

HPE Ezmeral Data Fabric Database Binary FormatResult

Parses a sequence file generated by the `DiffTables` utility or the `DiffTablesWithCrc` utility and converts the results into a format that makes the results easier to understand.

Required Permissions
The user that runs the `FormatResult` utility must have the `readAce` and `writeAce` permissions on the volumes where the input and output paths are located.

For information about how to set permissions on volumes, see Setting Whole Volume ACEs on page 1365.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
hbase com.mapr.fs.hbase.tools.mapreduce.FormatResult
-input <input file path>
-output <output file path>
[-mapreduce <true|false> (default: false)]
```

Parameters

Parameters	Description
input	The path to a file or directory of files that contains the output of either the DiffTables utility or the DiffTablesWithCrc utility.
output	The path to a file or a directory for the output. If the file or directory already exists, the utility fails. When a single sequence file is provided as input, the utility generates a single output file. When a directory of sequence files is provided as input, the utility generates a directory with output files.
mapreduce	A Boolean value that specifies whether or not to use a MapReduce program to perform the FormatResult operation. The default is not to use a MapReduce program (false).

Example
Formats a sequence file:

```
[user@hostname ~]$ hbase
com.mapr.fs.hbase.tools.mapreduce.FormatResult -input /dif1/tf4/opsForDst/
opsForDst-m-00001 -output /dif1/tf4/opsForDst_single/nomr -mapreduce false
2015-03-06 18:58:56,210 INFO  [main] Configuration.deprecation:
fs.default.name is deprecated. Instead, use fs.defaultFS
2015-03-06 18:58:57,492 INFO  [main] mapreduce.FormatResult: Translated
sequence file maprfs:///dif1/tf4/opsForDst/opsForDst-m-00001 to text file /
dif1/tf4/opsForDst_single/nomr
2015-03-06 18:58:57,527 INFO  [main] mapreduce.FormatResult: Total 1
text files created.
```

HPE Ezmeral Data Fabric Streams Utilities

You can use the following utilities to with HPE Ezmeral Data Fabric Streams streams:

`mapr copystream`
This utility copies data from one HPE Ezmeral Data Fabric Stream to another HPE Ezmeral Data Fabric Stream. You can use it, for example, if you want to set up replication manually from one stream to another.

If the destination stream does not exist, `mapr copystream` creates the destination stream with the same metadata as the source stream, and then copies data.

If the destination stream exists, `mapr copystream` copies data only.

Requried Permissions

To use this utility, you must have the following permissions:

- The permission `readAce` on the volume where the source stream is located, and the permission `writeAce` on the volume where the destination stream is located.
- On the source stream: either `consumeperm` or `copyperm`.
- On the destination stream: either `copyperm` or all three of the following permissions: `produceperm`, `consumeperm`, `topicperm`

For information about how to set permissions on volumes, see Setting Whole Volume ACEs on page 1365.

last-updated: Jun 06, 2024

For information about how to set permissions on streams, see Enabling Table and Stream Authorizations with ACEs on page 1363.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr copystream
-src <srcStream>
-dst <dstStream>
[-mapreduce true/false default:false]
[-numthreads <nthreads> default:16]
```

Parameters

Parameter	Description
`src`	The path and name of the stream to copy messages from.
`dst`	The path and name of the stream to copy messages to.
`mapreduce`	A Boolean value that specifies whether or not to use a MapReduce program to perform the copying operation. The default, preferred method is to use a MapReduce program (`true`). When this parameter is set to `false`, a client process uses multiple threads to read from the source stream and write to the destination stream. The MapReduce program runs as a MapReduce version 2 application based on the MapReduce mode that is configured on this node.
`numthreads`	When `-mapreduce` is `false`, this parameter specifies the number of threads allocated to perform the copying of data. The default is 16. If additional CPU resources are available, you might want to increase the number of threads to achieve better performance.

`mapr diffstreams`

This utility compares the message IDs, metadata, and data in two HPE Ezmeral Data Fabric Streams. Then, generates two directories that contain sequence files that you can use to merge the rows from the two HPE Ezmeral Data Fabric Streams.

Sequence files are binary flat files. You can learn more about them here. To convert a sequence file into a format that you can read, use the HPE Ezmeral Data Fabric Database JSON FormatResult on page 5502 utility.

This utility considers both the source stream and the destination stream to be a master stream. Therefore, it generates two directories with sequence files. These sequence files contain the puts required to update each stream so that it contains a superset of the rows defined in both tables at the time at which the utility was run.

This utility generates both of the following output directories in the output directory that you specify:

opsForDst	A directory containing sequence files that correspond to each put and delete required to make the destination stream identical to the source stream.
opsForSrc	A directory containing sequence files that correspond to each put and delete required to make the source stream identical to the destination stream.

Required Permissions

To use this utility, you must have the following permissions:

last-updated: Jun 06, 2024

- The permission `readAce` on the volumes where the tables are located.
- On the source stream: either `consumeperm` or `copyperm`.
- On the destination stream: either `consumeperm` or `copyperm`.

For information about how to set permissions on volumes, see Setting Whole Volume ACEs on page 1365.

For information about how to set permissions on streams, see Enabling Table and Stream Authorizations with ACEs on page 1363.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr diffstreams
-src <srcStream>
-dst <dstStream>
-outdir <output directory>
[-first_exit] Exit when first difference is found
[-mapreduce true/false default:false]
[-numthreads <nthreads> default:16]
```

Parameters

Parameter	Description
`src`	The path of the first stream to include in the comparison.
`dst`	The path of the second stream to include in the comparison.
`outdir`	The path to a directory in which to place the generated sequence files. The utility creates the specified directory. If the specified directory already exists, the command fails.
`first_exit`	By default, the utility compares all the data in the specified streams. Use this parameter if you want to exit after the first difference is identified between the streams. The parameter takes no value.
`mapreduce`	A Boolean value that specifies whether or not to use a MapReduce program to perform the comparison. The default, preferred method is to use a MapReduce program (`true`). When this parameter is set to `false`, a client process uses multiple threads. The MapReduce program runs as a MapReduce version 2 application based on the MapReduce mode that is configured on this node.
`numthreads`	When `-mapreduce` is `false`, this parameter specifies the number of threads allocated to perform the comparison. The default is 16. If additional CPU resources are available, you might want to increase the number of thread to achieve better performance.

`mapr diffstreamswithcrc`

This utility uses a cyclic redundancy check to detect differences between sets of messages in the specified HPE Ezmeral Data Fabric Streams. Then, for each set of non-identical messages, it performs a detailed comparison. Finally, it generates one or more directories of sequence files.

You can use these files either to make a HPE Ezmeral Data Fabric Stream identical to its master or merge the messages from two HPE Ezmeral Data Fabric Streams.

last-updated: Jun 06, 2024

Sequence files are binary flat files. You can learn more about them here. To convert a sequence file into a format that you can read, use the HPE Ezmeral Data Fabric Database JSON FormatResult on page 5502 utility.

This utility requires less network bandwidth than the `mapr diffstreams` utility because it performs a detailed table comparison only on the sets of messages where the CRC algorithm detected a difference. Therefore, consider using this utility when the streams you compare are very similar and you are concerned about the data transfer rate.

This utility considers both the source stream and the destination stream to be a master stream. Therefore, it generates two directories with sequence files. These sequence files contain the puts required to update each stream so that each stream can contain a superset of the messages in both streams at the time at which the utility was run.

These are the directories that the utility generates:

opsForDst	A directory containing sequence files that correspond to each put and delete required to make the destination stream identical to the source stream.
opsForSrc	A directory containing sequence files that correspond to each put and delete required to make the source stream identical to the destination stream.

Requirements

- When the cluster runs YARN, it must also use zero configuration failover for the ResourceManager.
- To use this utility, you must have the following permissions:
  - The permission `readAce` on the volumes where the tables are located.
  - On the source stream: either `consumeperm` or `copyperm`.
  - On the destination stream: either `consumeperm` or `copyperm`.

  For information about how to set permissions on volumes, see Setting Whole Volume ACEs on page 1365.

  For information about how to set permissions on streams, see Enabling Table and Stream Authorizations with ACEs on page 1363.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Run the `mapr importstream` command to implement the puts and deletes specified in the sequence files.

Syntax

```
mapr diffstreamswithcrc
-src <srcStream>
-dst <dstStream>
-outdir <output directory>
[-first_exit] Exit when first difference is found
```

Parameters

Parameter	Description
`src`	The path of the first stream to include in the comparison.
`dst`	The path of the second stream to include in the comparison.
`outdir`	The path to a directory in which to place the generated sequence files. The utility creates the specified directory. If the specified directory already exists, the command fails.
`first_exit`	By default, the utility compares all the data in the specified streams. Use this parameter if you want to exit after the first difference is identified between the streams. The parameter takes no value.

`mapr exportstream` and `mapr importstream`

Use these utilities together to export data from HPE Ezmeral Data Fabric Streams into binary sequence files, and then import the data from the binary sequence files into other HPE Ezmeral Data Fabric Streams. You can also use the `mapr importstream` utility to import changes that are specified in sequence files output by the `mapr diffstreams` utility.

- Syntax of `mapr exportstream`
- Parameters of `mapr exportstream`
- Syntax of `mapr importstream`
- Parameters of `mapr importstream`

Required Permissions

To use the `mapr exportstream` utility, you must have the following permissions:

- The `readAce` permission on the volume where the source stream for `mapr exportstream` is located.
- The `writeAce` permission on the volume in which to save the output from `mapr exportstream`.
- On the source stream: either `consumeperm` or `copyperm`
- On the destination directory: write permission

To use the `mapr importstream` utility, you must have the following permissions:

- The `readAce` permission on the volume where the files output by `mapr exportstream` is located.
- The `writeAce` permission on the volume in which the destination stream is located.
- On the source directory: read permission on the directory and all of the files within it
- On the destination stream: either `copyperm` or all three of the following permissions: `produceperm`, `consumeperm`, `topicperm`

For information about how to set permissions on volumes, see Setting Whole Volume ACEs on page 1365.

For information about how to set permissions on streams, see Enabling Table and Stream Authorizations with ACEs on page 1363.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run these utilities unless that user is given the relevant permission or permissions with access-control expressions.

last-updated: Jun 06, 2024

Syntax of `mapr exportstream`

```
mapr exportstream
-src <srcStream>
-dst <dstDir>
[-mapreduce true/false default:false]
```

Parameters of `mapr exportstream`

Description	Parameter
`src`	The stream to export data from.
`dst`	The directory within the Data Fabric file system to export the files to. This directory must already exist before you run the utility.
`mapreduce`	A Boolean value that specifies whether or not to use a MapReduce program to perform the operation. The default, preferred method is to use a MapReduce program (`true`). When this parameter is set to `false`, a client process uses multiple threads.

Syntax of `mapr importstream`

```
mapr importstream
-src Input binary file or directory path
-dst Destination stream
[-mapreduce true/false default:false]
```

Parameters of `mapr importstream`

Description	Parameter

`src`	The path of the binary file or files to import.
	Examples
	`-src /temp/part0`
	`-src /temp/*`

`dst`	The stream to import data into.
`mapreduce`	A Boolean value that specifies whether or not to use a MapReduce program to perform the operation. The default, preferred method is to use a MapReduce program (`true`). When this parameter is set to `false`, a client process uses multiple threads.

`mapr perfconsumer`

This utility runs a consumer reading messages from topics in a HPE Ezmeral Data Fabric Stream. Use this utility to run consumers when you want to estimate the performance of consumers for your HPE Ezmeral Data Fabric Streams applications, given your network configuration.

This utility works in conjuction with the `mapr perfproducer` utility. When starting this utility, you can specify how many topics to read from, how many partitions to read from in each topic, and how many messages to read.

The `mapr perfconsumer` utility uses the default values for all of the configuration parameters that apply to consumers. For a list of these parameters, see HPE Ezmeral Data Fabric Streams Configuration Parameters.

The utility uses the default values for all of the configuration parameters that apply to consumers.

last-updated: Jun 06, 2024

Each consumer runs as a single thread. You can run multiple instances of the utility at the same time. However, because consumers can be CPU-intensive, it is recommended to run at most 4 or 5 on a single cluster node.

When you run multiple instances of this utility, you can use the `-group` parameter to create consumer groups.

Monitor the performance of the running instances of the `mapr perfconsumer` utility by following the instructions that are given in Monitoring Consumers.

Prerequisites for running this utility

- Ensure that there is a HPE Ezmeral Data Fabric Stream that one or more instances of `mapr perfproducer` have already published messages to or are actively publishing messages to.
- Ensure that the user ID that runs the `mapr perfconsumer` utility has the `consumeperm` permission on the stream.
- Ensure that the user ID that runs the `mapr perfconsumer` utility has the `readAce` and `writeAce` permissions on the volume where the stream is located.

For information about how to set permissions on volumes, see Setting Whole Volume ACEs on page 1365.

For information about how to set permissions on streams, see Enabling Table and Stream Authorizations with ACEs on page 1363.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr perfconsumer
-path <stream-full-name>
[ -ntopics <num topics> (default: 2) ]
[ -npart <numpartitions per topic> (default: 4)
[ -nmsgs <num messages per topicfeed> (default: 100000) ]
[ -group <consumer group id> (default: null)
[ -topicsubscription <true/false> (default: false) ]
```

Parameters

Parameter	Description
`path`	The path to the stream.
`ntopics`	The number of topics for the consumer to subscribe to. The default is 2. If the number that you specify is greater than the number of topics that are in the stream, the utility hangs.

last-updated: Jun 06, 2024

Parameter	Description
`npart`	The number of partitions to read from in each topic that is subscribed. The default is 4. If the number that you specify is greater than the number of partitions that are in each topic, the utility hangs. If you specify a group ID with the `-group` parameter, the consumer's committed cursors are saved. If you do not specify a group ID, then the consumer's committed cursors are not saved. If you use the `-group` parameter to specify a group ID and you set the `-topicsubscription` parameter to `true`: • If the consumer fails, it's partitions can be redistributed among other consumer in the same group. If the consumer is the only consumer within a group, restarting the consumer with the same group ID causes the consumer to begin reading from the offsets of the saved committed cursors. • If the consumer fails and is then restarted, it starts at the oldest message in each partition.
`nmsgs`	The number of messages to read from each partition. The default is 100,000.
`group`	The identifier of a consumer group. When two or more consumers belong to a consumer group, they must read from the same number of topics. HPE Ezmeral Data Fabric Streams distributes the partitions for those topics among the consumers in the group. The default is null.
`topicsubscription`	A vaue of `true` subscribes the consumer to topics. A value of `false` subscribes the consumer to topic partitions. The default is `false`.

`mapr perfproducer`

This utility runs a producer, generating messages and publishing them to a HPE Ezmeral Data Fabric Stream. Use this utility to run producers when you want to estimate the performance of producers for your HPE Ezmeral Data Fabric Streams applications, given your network configuration.

This utility starts a producer and generates data for the producer to publish in messages to a HPE Ezmeral Data Fabric Stream. When starting the utility, you can specify how many topics the producer publishes to, how many partitions to create for each topic, and how many messages to publish to each partition. You can also specify the method for distributing messages among the partitions in each topic.

For example, suppose you run the utility by issuing this command:

```
mapr perfproducer -path /myVolume/myDirectory/stream_a -ntopics
40 -npart -5
-nmsgs 100000 -rr true
```

The producer automatically creates 40 topics in the stream, creating each topic as it writes the first message to that topic. Each topic is created with 5 partitions. The producer writes 100,000 messages to each partition for a total of 20,000,000 messages. After publishing all of the messages, the utility terminates.

The `mapr perfproducer` utility uses the default values for all of the configuration parameters that apply to producers. For a list of these parameters, see HPE Ezmeral Data Fabric Streams Configuration Parameters.

last-updated: Jun 06, 2024

Each producer runs as a single thread. You can run multiple instances of the utility at the same time. However, because producers can be CPU-intensive, it is recommended to run at most 4 or 5 on a single cluster node.

When multiple instances of the `mapr perfproducer` utility publish to a single stream, the separate instances share topics. For example, if -ntopics is set to 40 for each instance that publishes to a single stream, together those instances create no more than 40 topics in the stream and they share those topics.

It is recommended that all producers that publish to a single cluster publish to the same number of topics and partitions within those topics. Therefore, use the same values for -ntopics and -npart for each instance of the `mapr perfproducer` utility that shares a stream with other instances.

Monitor the performance of the running instances of the `mapr perfproducer` utility by issuing the `maprcli` command `stream topic info` at intervals, as described in Monitoring Producers. The command `stream topic info` shows statistics for single topics. Because all of the topics that `mapr perfproducer` creates have the same number of partitions, and because `mapr perfproducer` writes the same number of messages to each partition, you can assume that the statistics that the command `stream topic info` displays for any one topic are close to the statistics for any other topic. The naming convention that `mapr perfproducer` uses when creating topics is simply `topic`*n*, which produces the names `topic0`, `topic1`, and so on. You can run the command `stream topic info` with any one of these names as the value of the `-topic` parameter.

To simulate consumers to estimate the performance of HPE Ezmeral Data Fabric Streams in your network configuration, run one or more instances of the `mapr perfconsumer` utility against the stream.

Prerequisites for running this utility

- Create a HPE Ezmeral Data Fabric Stream in a Data Fabric cluster for the `mapr perfproducer` utility to publish messages to. See stream create on page 2368.

  If you plan to replicate the stream for the purposes of the performance estimate, create the replica stream. Then, start replication from the first stream to the replica stream. For instructions on setting up replication between streams, see Managing Stream Replication on page 1501.

- Ensure that the user ID that runs the `mapr perfproducer` utility has the `readAce` and `writeAce` permissions on the volume where the stream is located.

- Ensure that the user ID that runs the `mapr perfproducer` utility has the `produceperm` and `topicperm` permissions on the stream.

For information about how to set permissions on volumes, see Setting Whole Volume ACEs on page 1365.

For information about how to set permissions on streams, see Enabling Table and Stream Authorizations with ACEs on page 1363.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr perfproducer
-path <stream-full-name>
[ -ntopics <num topics> (default: 2) ]
[ -npart <numpartitions per topic> (default: 4) ]
[ -nmsgs <num messages per topicfeed> (default: 100000) ]
[ -msgsz <msg value size> (default: 200) ]
[ -rr <round robin true/false> (default: false) ]
[ -hashkey <true/false> (default: false) ]
```

last-updated: Jun 06, 2024

Parameters

Parameter	Description
`path`	The path to the stream.
`ntopics`	The number of topics for the producer to publish to in the stream. The default is 2.
`npart`	The number of partitions to create for each topic. The default is 4.
`nmsgs`	The number of messages to publish to each partition. The default is 100,000.
`msgsz`	The size of each message in bytes. The default is 200 bytes.
`rr`	Specifies to publish messages to partitions within a topic in round-robin fashion. See How Partitions are Chosen for Messages for detail about this method of distributing messages among topic partitions. **NOTE:** This parameter is incompatible with the `-hashkey` parameter. You must set one or the other to true, but not both. The default is `false`.
`hashkey`	Specifies to distribute messages among topic partitions according to the hash of each message key. See How Partitions are Chosen for Messages for detail about this method of distributing messages among topic partitions. **NOTE:** This parameter is incompatible with the `-rr` parameter. You must set one or the other to true, but not both. The default is `true`.

`mapr streamanalyzer`

This light-weight utility, which is a sample application for the `Streams` Java class for analytics on HPE Ezmeral Data Fabric Streams, lets you count the messages in a stream or a subset of the topics in a stream. The utility also lets you print either whole retrieved messages or a subset of the fields in each message.

You can download the source code for this utility here: `StreamAnalyzer.java`

For information about the `Streams` Java class and building applications that use it, see HPE Ezmeral Data Fabric Streams Java API Library on page 3548. See Logical Schema of Messages on page 774 for information about how messages are structured.

Ensure that the user ID that runs the utility has the `readAce` permission on the volume where the stream is located. For information about how to set permissions on volumes, see Setting Whole Volume ACEs on page 1365.

NOTE: The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this utility unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

```
mapr streamanalyzer -path <stream-full-name>
[ -topics <comma separated topic names> ]
```

last-updated: Jun 06, 2024

```
[ -regex  <regular expression representing topic names> ]
[ -countMessages <true/false> (default: true) ]
[ -printMessages <true/false> (default: false) ]
[ -projectFields <comma separated field names> (default: all fields) ]
```

Parameters

Parameter	Description
`path`	The path and name of the stream.
`topics`	A comma-separated list of the names of topics to retrieve. If you do not specify this parameter or the `-regex` parameter, all of the topics in the stream are retrieved. Do not use this parameter if you use the `-regex` parameter.
`regex`	A regular expression that represents the names of the topics to retrieve. If you do not specify this parameter or the `-topics` parameter, all of the topics in the stream are retrieved. Do not use this parameter if you use the `-topics` parameter.
`countMessages`	Prints the number of retrieved messages to the standard output.
`printMessages`	Prints the contents of retrieved messages to the standard output.
`projectFields`	If the `-printMessages` parameter is set to `true`, this parameter causes only the specified fields to be printed to the standard output for each message. In the list of field names, separate the names with commas. Default: all fields. Valid field names: key, value, topic, offset, partition, and producer. If the `-printMessages` parameter is set to `false`, this parameter has no effect.

YARN Commands

This section describes the YARN commands.

Commands

All YARN commands are invoked by the `/usr/bin/yarn` script.

```
Usage: yarn [--config confdir] [COMMAND] [COMMAND_OPTIONS]
```

COMMAND_OPTION	Description
`--config confdir`	Overrides the default Configuration directory. Default is `${HADOOP_HOME}/conf`.
`COMMAND`	Commands
`COMMAND_OPTIONS`	Command options

The following `yarn` commands may be run on the HPE Ezmeral Data Fabric distribution of Apache Hadoop:

Command	Description
`application`	Lists applications, or prints the status or kills the specified application.
`classpath`	Prints the class path needed to get the Hadoop jar and the required libraries

last-updated: Jun 06, 2024

Command	Description
`debugcontrol`	Saves additional DEBUG logs for scheduling to a separate file without restarting the RM
`daemonlog`	Gets and sets the log level for each daemon
`jar`	Runs jar file
`logs`	Dumps container logs
`node`	Prints node report(s)
`queue`	Prints queue information
`rmadmin`	Performs administrative tasks for Resource Manager
`version`	Print the version

The following yarn commands are not supported on the HPE Ezmeral Data Fabric distribution of Apache Hadoop:

- `yarn applicationattempt`
- `yarn cluster`
- `yarn container`
- `yarn nodemanager`
- `yarn proxyserver`
- `yarn resourcemanager`
- `yarn sharedcachemanager`
- `yarn scmadmin`
- `yarn timelineserver`

You can use the maprcli node services command or the Control System to start the services. For more information, see Managing Services on page 1136.

yarn application
The `yarn application` lists applications, or prints the status or kills the specified application.

Syntax

```
yarn application
   [-list [<-appStates States>] [<-appTypes Types>] ]
   [-status ApplicationId]
   [-kill ApplicationId]
```

Parameters

The following commands parameters are supported for `yarn application`:

last-updated: Jun 06, 2024

Parameter	Description
-list [<-appStates States>] [<-appTypes Types>]	Lists applications. Optionally, you can filter the applications based on type or state. • Use `-appTypes` to filer applications based on a comma-separated list of application types. • Use`-appStates` to filter applications based on a comma-separated list of the following valid application states:ALL, NEW, NEW_SAVING, SUBMITTED, ACCEPTED, RUNNING, FINISHED, FAILED, KILLED
-status ApplicationId	Prints the status of the application.
-kill ApplicationId	Kills the application.

yarn classpath

The `yarn classpath` command prints the class path needed to access the Hadoop jar and the required libraries.

Syntax

```
yarn classpath
```

Output

```
$ yarn classpath
/opt/mapr/hadoop/hadoop-<version>/etc/hadoop:/opt/mapr/hadoop/
hadoop-<version>/etc/hadoop:/opt/mapr/hadoop/hadoop-<version>/etc/
hadoop:/opt/mapr/hadoop/hadoop-<version>/share/hadoop/common/lib/*:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/common/*:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/hdfs:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/hdfs/lib/*:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/hdfs/*:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/yarn/lib/*:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/yarn/*:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/mapreduce/lib/*:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/mapreduce/*:
/contrib/capacity-scheduler/*.jar:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/yarn/*:
/opt/mapr/hadoop/hadoop-<version>/share/hadoop/yarn/lib/*
```

yarn daemonlog

Gets or sets the log level for each daemon.

Syntax

```
yarn daemonlog
[-getlevel <host:port> <name>] | [-setlevel <host:port> <name> <level>]
```

Parameters

Parameter	Description
-getlevel <host:port> <name>	Prints the log level of the daemon running at <host:port>. This command internally connects to `http://<host:port>/logLevel?log=<name>`.
-setlevel <host:port> <name> <level>	Sets the log level of the daemon running at <host:port>. This command internally connects to `http://<host:port>/logLevel?log=<name>`.

yarn debugcontrol
used to save additional DEBUG logs for scheduling in YARN to a separate file without restarting the RM.

The logs are saved in /opt/mapr/Hadoop/Hadoop<version>/logs/yarn-mapr-scheduling-debug.log

Syntax

```
yarn debugcontrol
[-addapp <application_name>] | [-addqueue <queue_name> ]| [-removeapp
<application_name> ] | [-removequeue <queue_name> ] | [-getapps ] |
[-getqueues ]
```

Parameters

Parameter	Description
-addapp <application_name>	enables additional scheduling DEBUG on the application
-addqueue <queue_name>	enables additional scheduling DEBUG on the queue
-removeapp <application_name>	disable addition scheduling DEBUG on the application
-removequeue <queue_name>	disable addition scheduling DEBUG on the queue
-getapps	lists the applications with additional scheduling DEBUG
-getqueues	lists the queues with additional scheduling DEBUG

yarn jar

Runs a jar file that contains YARN code.

Syntax

```
yarn jar <jar> [<mainClass>] [<arguments>]
```

Parameters

The following commands parameters are supported for `yarn jar`:

Parameter	Description
`<jar>`	The JAR file.
<mainClass>	Sets the applications entry point.
`<arguments>`	Arguments to the program specified in the JAR file.

yarn logs
Dumps the YARN container logs.

last-updated: Jun 06, 2024

Syntax

```
yarn logs -applicationId <application ID> [OPTIONS]

general options are:
 -appOwner <Application Owner>   AppOwner (assumed to be current user if
                                 not specified)
 -containerId <Container ID>     ContainerId (must be specified if node
                                 address is specified)
 -help                           Displays help for all commands.
 -nodeAddress <Node Address>     NodeAddress in the format nodename:port
                                 (must be specified if container id is
                                 specified)
```

Parameters

Parameter	Description
-applicationId	Specifies an application ID.
-appOwner <Application Owner>	Specifies the application owner. Defaults to the current user if this option is not specified.
-containerId <Container ID>	Specifies the container ID. Required when `-nodeAddress` is specified.
-nodeAddress <Node Address>	Specifies the node address in the following format: `nodename:port`. Required when `-containerId` is specified.

yarn node

Prints node report(s)

Syntax

```
yarn node
     [-list [-states <States>] | [-all]]
     [-status NodeId]
```

Parameters

Parameter	Description
-list [-states <states>] | [-all]]	Lists all running nodes. Optionally, filter nodes based on state or choose to list all the nodes. • Use `-states <states>` to filter nodes based on a comma-separate list of node states. • Use `-all` to list all nodes.
-status NodeId	Prints the status report of the node.

yarn queue

Prints queue information

Syntax

```
yarn queue -status <queue name>
```

last-updated: Jun 06, 2024

Parameters

The following command parameter is supported for `yarn queue`:

Parameter	Description
`status`	The queue name.

yarn rmadmin

Runs the ResourceManager admin client.

Syntax

```
yarn rmadmin
    [-refreshQueues]
    [-refreshNodes]
    [-refreshUserToGroupsMapping]
    [-refreshSuperUserGroupsConfiguration]
    [-refreshAdminAcls]
    [-refreshServiceAcl]
    [-getGroups <username>]
    [-help <cmd>]
    [-transitionToActive <serviceId>]
    [-transitionToStandby <serviceId>]
    [-getServiceState <serviceId>]
    [-checkHealth <serviceId>]
```

Parameters

Parameter	Description
-refreshQueues	Reloads the queues' acls, states, and scheduler specific properties. The ResourceManager reloads the mapred-queues configuration file.
-refreshNodes	Refreshes the host information at the ResourceManager.
-refreshUserToGroupsMappings	Refreshes user-to-groups mappings.
-refreshSuperUserGroupsConfiguration	Refreshes superuser proxy groups mappings.
-refreshAdminAcls	Refreshes acls for administration of ResourceManager.
-refreshServiceAcl	Reloads the service-level authorization policy file. The ResourceManager reloads the authorization policy file.
-getGroups <username>	Gets the groups that the user belongs to.
-help <cmd>	Displays help for the given parameter or all parameters if no parameter is specified.
-transitionToActive <serviceId>	Transitions the service into the Active state. You can use this parameter when the ResourceManager is configured to failover manually.
-transitionToStandby <serviceId>	Transitions the service into Standby state. You can use this parameter when the ResourceManager is configured to failover manually.
-getServiceState <serviceId>	Returns the service state. You can use this parameter when the ResourceManager is configured to failover manually or automatically but not with the zero configuration failover option.

last-updated: Jun 06, 2024

Parameter	Description
-checkHealth <serviceId>	Requests a health check for the service. If the health check fails, the RMAdmin tool exits with a non-zero exit code. You can use this parameter when the ResourceManager is configured to failover manually or automatically but not with the zero configuration failover option.

yarn version

Prints the YARN version.

Syntax

```
yarn version
```

Output

```
$ yarn version
Hadoop 2.7.6.100-eep-800
Subversion git@github.com:mapr/private-hadoop-common -r
80dc89ae5df3a2cd01089f192c5d8a886e4788c9
Compiled by root on 2021-10-08T11:26Z

Source Code for HPE Ezmeral Data Fabric Software

HPE releases source code to the open-source community for enhancements that HPE has made to the Apache Hadoop project and other ecosystem components.

HPE regularly releases updates to Apache Hadoop ecosystem projects as the projects are released by Apache, after HPE can verify that the changes do not impact product stability. Releases of ecosystem components are independent of the release cycle for the core data-fabric software, so that new updates can be released quickly and efficiently.

Source code developed by HPE can be found on GitHub at http://github.com/mapr as of March 2013, coincident with version 2.1.2 of the data-fabric distribution. HPE may also release source code for other data-fabric projects at github.com/mapr. For each release that HPE includes in its distribution, HPE branches and tags the release on GitHub using the underlying project release number appended by `-mapr`.

Component Repositories on GitHub

The following repositories are available on GitHub for components that HPE has enhanced, patched, or created.

- oozie
- hcatalog
- pig
- hive
- mahout
- hbase

last-updated: Jun 06, 2024

- flume
- whirr
- opentsdb

  NOTE: Select the highest MEP version supported by the HPE Ezmeral Data Fabric version that you are using.

- sqoop
- scribe

Finding Source Changes Prior to February 2013

GitHub is the single, central location for tracking changes that HPE applies to components in releases of the data-fabric distribution. Prior to February 2013, HPE included a list of patches in each component directory, as shown below. This information is no longer stored in the installation directory for recent releases, and instead is available at GitHub.

Example: Location of Information about Patches to HBase Prior to February 2012

```
$ ls /opt/mapr/hbase/hbase-0.92.1/
bin          hbase-0.92.1.jar        LICENSE.txt         pom.xml
CHANGES.txt  hbase-0.92.1-tests.jar  logs                README.txt
conf         hbase-webapps           mapr-hbase-patches  security
conf.new     lib                     NOTICE.txt          src

$ ls /opt/mapr/hbase/hbase-0.92.1/mapr-hbase-patches/
0000-hbase-with-mapr.patch                  0006-hbase-6285-fix.patch
0001-hbase-wait-for-fs+set-chunksize.patch  0007-hbase-6375-fix.patch
0002-hbase-source-env-vars.patch            0008-hbase-6455-fix.patch
0003-hbase-6158-fix.patch                   0009-bug-7745-fix.patch
0004-hbase-6018-fix.patch                   Readme.txt
0005-hbase-6236-fix.patch
```

Hadoop Commands

This section describes the Hadoop commands.

All Hadoop commands are invoked by the `bin/hadoop` script.

Hadoop Command Overview

This section contains the following:

Hadoop Syntax Summary

The following syntax summary applies to all commands.

```
hadoop [--config confdir] [COMMAND] [GENERIC_OPTIONS] [COMMAND_OPTIONS]
```

Hadoop has an option parsing framework that employs parsing generic options as well as running classes.

COMMAND_OPTION	Description
`-mode`	For both the hadoop and hadoop2 commands, setting this option is no longer valid. Both commands default to `yarn`, the only valid mode for the current Data Fabric version.

last-updated: Jun 06, 2024

COMMAND_OPTION	Description
`--config confdir`	Overwrites the default Configuration directory. Default is `${HADOOP_HOME}/conf`.
`COMMAND`	Various commands with their options are described in the following sections.
`GENERIC_OPTIONS`	The common set of options supported by multiple commands.
`COMMAND_OPTIONS`	Various command options are described in the following sections.

NOTE: Running the `hadoop` script without any arguments prints the help description for all commands.

Supported Commands for Hadoop

HPE Ezmeral Data Fabric supports the following `hadoop` commands:

Command	Description
`archive -archiveName NAME <src>* <dest>`	Creates a Hadoop archive, a file that contains other files. A Hadoop archive always has a `.har` extension.
CLASSNAME	The hadoop script can be used to invoke any class. `hadoop CLASSNAME` runs the class named CLASSNAME.
`classpath`	Prints the class path needed to access the Hadoop JAR and the required libraries.
`conf`	The `hadoop conf` command prints the configuration information for the current node.
`daemonlog`	The `hadoop daemonlog` command may be used to get or set the log level of Hadoop daemons.
`distcp <source> <destination>`	The `hadoop distcp` command is a tool for large inter- and intra-cluster copying. It uses MapReduce to effect its distribution, error handling and recovery, and reporting. It expands a list of files and directories into input to map tasks, each of which will copy a partition of the files specified in the source list.
`fs`	The `hadoop fs` command runs a generic filesystem user client that interacts with the MapR filesystem.
`jar <jar>`	The `hadoop jar` command runs a JAR file. Users can bundle their MapReduce code in a JAR file and execute it using this command.
`mfs`	The `hadoop mfs` command performs operations on directories in the cluster. The main purposes of `hadoop mfs` are to display directory information and contents, to create symbolic links, and to set compression and chunk size on a directory.
`version`	The `hadoop version` command prints the Hadoop software version.

last-updated: Jun 06, 2024

For example, if you run the `hadoop job` command, you see this message:

```
# hadoop job
DEPRECATED: Use of this script to execute mapred command is deprecated.
Instead, use the mapred command for it.
```

The syntax for the `mapred` command is:

```
mapred [--config confdir] [--loglevel loglevel] COMMAND
```

Commands used with `mapred` include:

Command	Description
`historyserver`	Runs job history servers as a standalone daemon
`hsadmin`	The job history server admin interface
`job`	Manipulates MapReduce applications
`pipes`	Runs a `pipes` job
`queue`	Gets information regarding `JobQueues`

Generic Options

Implement the Tool interface to make the following command-line options available for many of the Hadoop commands.

Generic Option	Description
`-conf <filename1 filename2 ...>`	Add the specified configuration files to the list of resources available in the configuration.
`-D <property=value>`	Set a value for the specified Hadoop configuration property.
`-fs <local|filesystem URI>`	Set the URI of the default filesystem.
`-jt <local|jobtracker:port>`	Specify a ResourceManager for a given host and port. This command option is a shortcut for `-D mapred.job.tracker=host:port`
`-files <file1,file2,...>`	Specify files to be copied to the map reduce cluster.
`-libjars <jar1,jar2,...>`	Specify JAR files to be included in the classpath of the mapper and reducer tasks.
`-archives <archive1,archive2,...>`	Specify archive files (JAR, tar, tar.gz, ZIP) to be copied and unarchived on the task node.

Hadoop 3 API Changes

Summarizes the API changes introduced in Hadoop 3.

EEP 9.0.0 supports Hadoop 3 for use with release 7.1.0. The following table describes command changes that accompany Hadoop 3:

Notes	See for more information . . .
Even though EEP 9.0.0 includes Hadoop 3, the Hadoop 2 commands continue to be supported.	Supported Commands for Hadoop on page 5541

Notes	See for more information . . .
Hadoop 3 includes a new package for metrics instrumentation: `org.apache.hadoop.metrics2` replaces the previous package, `org.apache.hadoop.metrics`.	Package org.apache.hadoop.metrics2
The mapreduce and jhs APIs are unchanged in Hadoop 3.	N/A
The YARN Application Timeline Service (ATS v2) has a new API. Because ATS v2 was not supported for Hadoop 2, this API is completely new.	YARN Timeline Service v2
The Resource Manager (RM) has a new endpoint.	ResourceManager REST APIs
The Node Manager (NM) has a new auxiliary services endpoint.	NodeManager REST APIs

hadoop archive

The `hadoop archive` command creates a Hadoop archive, a file that contains other files. A Hadoop archive always has a `*.har` extension.

Syntax

```
hadoop [ Generic Options ] archive
    -archiveName <name>
    [-p <parent>]
    <source>
    <destination>
```

Parameters

Parameter	Description
`-archiveName <name>`	Name of the archive to be created.
`-p <parent_path>`	The parent argument is to specify the relative path to which the files should be archived to.
`<source>`	Filesystem pathnames, which work as usual with regular expressions.
`<destination>`	Destination directory, which would contain the archive.

Examples

Archive within a single directory

```
hadoop archive -archiveName myArchive.har -p /foo/bar /outputdir
```

The above command creates an archive of the directory `/foo/bar` in the directory `/outputdir`.

Archive to another directory

```
hadoop archive -archiveName myArchive.har -p /foo/bar a/b/c e/f/g
```

The above command creates an archive of the directory `/foo/bar/a/b/c` in the directory `/foo/bar/e/f/g`.

last-updated: Jun 06, 2024

hadoop classpath
The `hadoop classpath` command prints the class path needed to access the Hadoop jar and the required libraries.

Syntax

```
hadoop classpath
```

Output Example

```
$hadoop classpath
/opt/mapr/hadoop/hadoop-2.7.0/etc/hadoop:/opt/mapr/hadoop/hadoop-2.7.0/
share/hadoop/common/lib/
*:/opt/mapr/hadoop/hadoop-2.7.0/share/hadoop/common/*:/opt/mapr/hadoop/
hadoop-2.7.0/share/hadoo
p/hdfs:/opt/mapr/hadoop/hadoop-2.7.0/share/hadoop/hdfs/lib/*:/opt/mapr/
hadoop/hadoop-2.7.0/shar
e/hadoop/hdfs/*:/opt/mapr/hadoop/hadoop-2.7.0/share/hadoop/yarn/lib/*:/opt/
mapr/hadoop/hadoop-2
.7.0/share/hadoop/yarn/*:/opt/mapr/hadoop/hadoop-2.7.0/share/hadoop/
mapreduce/lib/*:/opt/mapr/h
adoop/hadoop-2.7.0/share/hadoop/mapreduce/*:/contrib/capacity-scheduler/
*.jar:/opt/mapr/lib/kvs
tore*.jar:/opt/mapr/lib/libprotodefs*.jar:/opt/mapr/lib/baseutils*.jar:/opt/
mapr/lib/maprutil*.
jar:/opt/mapr/lib/json-20080701.jar:/opt/mapr/lib/flexjson-2.1.jar
```

hadoop daemonlog
The `hadoop daemonlog` command gets and sets the log level for each daemon.

Hadoop daemons all produce logfiles that you can use to learn about what is happening on the system. You can use the `hadoop daemonlog` command to temporarily change the log level of a component when debugging the system.

Syntax

```
hadoop daemonlog
    -getlevel | -setlevel
    <host>:<port>
    <name>
    [ <level> ]
```

Parameters

The following command options are supported for `hadoop daemonlog` command:

last-updated: Jun 06, 2024

Parameter	Description
`-getlevel <host:port><name>`	Prints the log level of the daemon running at the specified host and port, by querying `http://<host>:<port>/logLevel?log=<name>` • `<host>`: The host on which to get the log level. • `<port>`: The port by which to get the log level. • `<name>`: The daemon on which to get the log level. Usually the fully qualified classname of the daemon doing the logging. For example, `org.apache.hadoop.yarn.server.resourcemanager.resourcemanager` for the ResourceManager daemon.
`-setlevel <host:port> <name> <level>`	Sets the log level of the daemon running at the specified host and port, by querying `http://<host>:<port>/logLevel?log=<name>` * `<host>`: The host on which to set the log level. • `<port>`: The port by which to set the log level. • `<name>`: The daemon on which to set the log level. • `<level`: The log level to set the daemon.

Examples

Getting the log levels of a daemon

To get the log level for each daemon enter a command such as the following:

```
hadoop daemonlog -getlevel 10.250.1.15:50030
org.apache.hadoop.yarn.server.resourcemanager.resourcemanager
Connecting to http://10.250.1.15:50030/logLevel?
log=org.apache.hadoop.yarn.server.resourcemanager.resourcemanager
Submitted Log Name:
org.apache.hadoop.yarn.server.resourcemanager.resourcemanager
Log Class: org.apache.commons.logging.impl.Log4JLogger
Effective level: ALL
```

Setting the log level of a daemon

To temporarily set the log level for a daemon enter a command such as the following:

```
hadoop daemonlog -setlevel 10.250.1.15:50030
org.apache.hadoop.yarn.server.resourcemanager.resourcemanager DEBUG
Connecting to http://10.250.1.15:50030/logLevel?
log=org.apache.hadoop.yarn.server.resourcemanager.resourcemanager&level=DEBU
G
Submitted Log Name:
org.apache.hadoop.yarn.server.resourcemanager.resourcemanager
Log Class: org.apache.commons.logging.impl.Log4JLogger
Submitted Level: DEBUG
Setting Level to DEBUG ...
Effective level: DEBUG
```

last-updated: Jun 06, 2024

Using this method, the log level is automatically reset when the daemon is restarted.

To make the change to log level of a daemon persistent, enter a command such as the following:

```
hadoop daemonlog -setlevel 10.250.1.15:50030
log4j.logger.org.apache.hadoop.yarn.server.resourcemanager.resourcemanager
DEBUG
```

hadoop distcp

The `hadoop distcp` command is a tool used for large inter- and intra-cluster copying.

It uses MapReduce to effect its distribution, error handling and recovery, and reporting. It expands a list of files and directories into input to map tasks, each of which will copy a partition of the files specified in the source list.

Syntax

```
hadoop [ Generic Options ] distcp
    [-p[erbugp] ]
    [-i ]
    [-log ]
    [-m ]
    [-overwrite ]
    [-update  ]
    [-f <URI list> ]
    [-filelimit <n> ]
    [-sizelimit <n> ]
    [-delete ]
    <source>
    <destination>
```

Parameters

Command Options

The following command options are supported for the `hadoop distcp` command:

Parameter	Description
`<source>`	Specify the source URL.
`<destination>`	Specify the destination URL.
`-blocksperchunk <number-of-blocks-per-chunk>`	Number of blocks per chunk. When specified, this option splits files into chunks to copy the files in parallel. If the option is set to a positive value, files with more blocks than this value are split into chunks of `<number-of-blocks-per-chunk>` blocks to be transferred in parallel and reassembled at the destination. By default, `<number-of-blocks-per-chunk>` is 0 and files are transmitted in their entirety without splitting.
`-p[erbugp]`	Preserve e: ACE r: replication number b: block size u: user g: group p: permission `-p` alone is equivalent to `-perbugp`. Modification times are not preserved. When you specify `-update`, status updates are not synchronized unless the file sizes also differ.
`-i`	Ignore failures. As explained in the below, this option will keep more accurate statistics about the copy than the default case. It also preserves logs from failed copies, which can be valuable for debugging. Finally, a failing map will not cause the job to fail before all splits are attempted.

last-updated: Jun 06, 2024

Parameter	Description
`-log <logdir>`	Write logs to `<logdir>`. The `hadoop distcp` command keeps logs of each file it attempts to copy as map output. If a map fails, the log output will not be retained if it is re-executed.
`-m <num_maps>`	Maximum number of simultaneous copies. Specify the number of maps to copy data. Note that more maps may not necessarily improve throughput. See *Map Sizing*.
`-overwrite`	Overwrite destination. If a map fails and `-i` is not specified, all the files in the split, not only those that failed, will be recopied. As discussed in the *Overwriting Files Between Clusters*, it also changes the semantics for generating destination paths, so users should use this carefully.
`-update`	Overwrite if `<source>` size is different from `<destination>` size. As noted in the preceding, this is not a "sync" operation. The only criterion examined is the source and destination file sizes; if they differ, the source file replaces the destination file. See *Updating Files Between Clusters*.
`-f <URI list>`	Use list at <URI list> as source list. This is equivalent to listing each source on the command line. The value of <URI list> must be a fully qualified URI.
`-filelimit <n>`	Limit the total number of files to be <= n. See *Symbolic Representations*.
`-sizelimit <n>`	Limit the total size to be <= n bytes. See *Symbolic Representations*.
`-delete`	Delete the files existing in the `<destination>` but not in `<source>`. The deletion is done by FS Shell.

Generic Options

The `hadoop distcp` command supports the following generic options: `-conf <configuration file>`, `-D <property=value>`, `-fs <local|file system URI>`, `-jt <local|jobtracker:port>`, `-files <file1,file2,file3,...>`, `-libjars <libjar1,libjar2,libjar3,...>`, and `-archives <archive1,archive2,archive3,...>`. For more information on generic options, see Generic Options.

Symbolic Representations

The parameter <n> in `-filelimit` and `-sizelimit` can be specified with symbolic representation. For example,

- 1230k = 1230 * 1024 = 1259520
- 891g = 891 * 1024^3 = 956703965184

Map Sizing

The `hadoop distcp` command attempts to size each map comparably so that each copies roughly the same number of bytes. Note that files are the finest level of granularity, so increasing the number of simultaneous copiers (i.e. maps) may not always increase the number of simultaneous copies nor the overall throughput.

If `-m` is not specified, `distcp` will attempt to schedule work for `min (total_bytes / bytes.per.map, 20 * num_task_trackers)` where `bytes.per.map` defaults to 256MB.

Tuning the number of maps to the size of the source and destination clusters, the size of the copy, and the available bandwidth is recommended for long-running and regularly run jobs.

last-updated: Jun 06, 2024

Examples

For all of the below examples, the cluster name must be specified in the mapr-clusters.conf on page 2983 configuration file.

Basic inter-cluster copying

The `hadoop distcp` command is most often used to copy files between clusters:

```
hadoop distcp maprfs://cluster1/foo \
maprfs://cluster2/bar
```

The command in the example expands the namespace under `/foo/bar` on cluster1 into a temporary file, partitions its contents among a set of map tasks, and starts a copy on each NodeManager node from cluster1 to cluster2. Note that the `hadoop distcp` command expects absolute paths.

Only those files that do not already exist in the destination are copied over from the source directory.

Updating files between clusters

Use the `hadoop distcp -update` command to synchronize changes between clusters.

```
$ hadoop distcp -update maprfs://cluster1/foo maprfs://cluster2/bar/foo
```

Files in the `/foo` subtree are copied from cluster1 to cluster2 only if the size of the source file is different from that of the size of the destination file. Otherwise, the files are skipped over.

Note that using the `-update` option changes distributed copy interprets the source and destination paths making it necessary to add the trailing `/foo` subdirectory in the second cluster.

Overwriting files between clusters

By default, distributed copy skips files that already exist in the destination directory, but you can overwrite those files using the `-overwrite` option. In this example, multiple source directories are specified:

```
$ hadoop distcp -overwrite maprfs://cluster1/foo/a \
maprfs://cluster1/foo/b \
maprfs://cluster2/bar
```

As with using the `-update` option, using the `-overwrite` changes the way that the source and destination paths are interpreted by distributed copy: the contents of the source directories are compared to the contents of the destination directory. The distributed copy aborts in case of a conflict.

Intra-cluster copying of files and directories

The `hadoop distcp` command can be used to copy files and directories in a cluster to another directory in the same cluster.

- Copy a file into an existing target directory:

```
$ hadoop distcp /test/file.log /test/dir1

#verify the result of the distcp command with the hadoop fs -ls command

$ hadoop fs -ls -R /test
drwxr-xr-x   - username username          1 2022-10-14 10:37 /test/dir1
-rw-r--r--   3 username username         15 2022-10-14 10:37 /test/dir1/
file.log
-rwxr-xr-x   3 username username         15 2022-10-14 10:29 /test/
file.log
```

last-updated: Jun 06, 2024

- Copy a file and a directory to an existing target directory:

```
$ hadoop distcp /test/file.log /test/dir1 /test/dir2

#verify the result of the distcp command with the hadoop fs -ls command

$ hadoop fs -ls -R /test
drwxr-xr-x   - username username          1 2022-10-14 10:37 /test/dir1
-rw-r--r--   3 username username         15 2022-10-14 10:37 /test/dir1/
file.log
drwxr-xr-x   - username username          2 2022-10-14 10:40 /test/dir2
drwxr-xr-x   - username username          1 2022-10-14 10:40 /test/dir2/
dir1
-rw-r--r--   3 username username         15 2022-10-14 10:40 /test/dir2/
dir1/file.log
-rw-r--r--   3 username username         15 2022-10-14 10:40 /test/dir2/
file.log
-rwxr-xr-x   3 username username         15 2022-10-14 10:29 /test/
file.log
```

Migrating Data from HDFS to file system

The `hadoop distcp` command can be used to migrate data from an HDFS cluster to a file system where the HDFS cluster uses the same version of the RPC protocol as that used by MapR. For a discussion, see Copying Data from Apache Hadoop.

```
$ hadoop distcp namenode1:50070/foo maprfs:///bar
```

You must specify the IP address and HTTP port (usually 50070) for the namenode on the HDFS cluster.

hadoop fs

The `hadoop fs` command runs a generic file system user client that interacts with the file system. Starting from EEP 7.1.0, all `hadoop fs` commands support operations on symlinks.

WARNING: On the Windows client, make sure that the `PATH` contains the following directories:

- `C:\Windows\system32`
- `C:\Windows`

If they are not present, the `hadoop fs` command might fail silently.

Syntax

```
hadoop [ Generic Options ] fs
        [-cat <src>]
        [-chgrp [-R] GROUP PATH...]
        [-chmod [-R] <MODE[,MODE]... | OCTALMODE> PATH...]
        [-chown [-R] [OWNER][:[GROUP]] PATH...]
        [-copyFromLocal <localsrc> ... <dst>]
        [-copyToLocal [-ignoreCrc] [-crc] <src> <localdst>]
        [-count[-q] <path>]
        [-cp <src> <dst> -p[e]]
        [-df <path>]
        [-du <path>]
        [-dus <path>]
        [-expunge]
        [-get [-ignoreCrc] [-crc] <src> <localdst>]
        [-getfattr [-R] {-n name | -d} [-e <encoding>] <path>]
        [-getmerge <src> <localdst> [addnl]]
```

last-updated: Jun 06, 2024

```
        [-help [cmd]]
        [-ls <path>]
        [-lsr <path>]
        [-mkdir <path>]
        [-moveFromLocal <localsrc> ... <dst>]
        [-moveToLocal <src> <localdst>]
        [-mv <src> <dst>]
        [-put <localsrc> ... <dst>]
        [-rm [-skipTrash] <src>]
        [-rmr [-skipTrash] <src>]
        [-setfattr -n name [-v value] | -x name <path>]
        [-stat [format] <path>]
        [-tail [-f] <path>]
        [-test -[ezd] <path>]
        [-text <path>]
        [-touchz <path>]
```

Parameters

Command Options

The following command parameters are supported for `hadoop fs`:

Parameter	Description
`-cat <src>`	Fetch all files that match the file pattern defined by the `<src>` parameter and display their contents on *stdout*.
`-chmod [-R] <MODE[,MODE]... | OCTALMODE> PATH...`	Changes permissions of a file. This works similar to shell's `chmod` with a few exceptions. `-R` modifies the files recursively. This is the only option currently supported. `MODE` Mode is same as mode used for `chmod` shell command. Only letters recognized are `rwxXt`. That is, `+t,a+r,g-w,+rwx,o=r` `OCTALMODE` Mode specifed in 3 or 4 digits. If 4 digits, the first may be 1 or 0 to turn the sticky bit on or off, respectively. Unlike shell command, it is not possible to specify only part of the mode E.g. 754 is same as u=rwx,g=rx,o=r If none of 'augo' is specified, 'a' is assumed and unlike shell command, no umask is applied.
`-chown [-R] [OWNER] [:[GROUP]] PATH...`	Changes owner and group of a file. This is similar to shell's `chown` with a few exceptions. `-R` modifies the files recursively. This is the only option currently supported. If only owner or group is specified then only owner or group is modified.The owner and group names may only consists of digits, alphabet, and any of `-.@/'` *i.e.* `[-.@/a-zA-Z0-9]`. The names are case sensitive. **WARNING:** Avoid using '.' to separate user name and group though Linux allows it. If user names have dots in them and you are using local file system, you might see surprising results since shell command `chown` is used for local files.
`-chgrp [-R] GROUP PATH...`	This is equivalent to `-chown ... :GROUP ...`
`-copyFromLocal <localsrc> ... <dst>`	Identical to the `-put` command.
`-copyToLocal [-ignoreCrc] [-crc] <src> <localdst>`	Identical to the `-get` command.

last-updated: Jun 06, 2024

Parameter	Description
`-count[-q] <path>`	Count the number of directories, files and bytes under the paths that match the specified file pattern. The output columns are: `DIR_COUNT FILE_COUNT CONTENT_SIZE FILE_NAME` or `QUOTA REMAINING_QUATA SPACE_QUOTA REMAINING_SPACE_QUOTA DIR_COUNT FILE_COUNT CONTENT_SIZE FILE_NAME`
`-cp <src> <dst> [-p[e]]`	Copy files that match the file pattern `<src>` to a destination. When copying multiple files, the destination must be a directory. Specifying `-p` with the e option preserves an ACE applied to the file. Specifying `-p` without an argument preserves the ACE by default.
`-df [<path>]`	Shows the capacity, free and used space of the file system. If the file system has multiple partitions, and no path to a particular partition is specified, then the status of the root partitions will be shown.
`-du <path>`	Show the amount of space, in bytes, used by the files that match the specified file pattern. Equivalent to the Unix command `du -sb <path>/*` in case of a directory, and to `du -b <path>` in case of a file. The output is in the form name(full path) size (in bytes).
`-dus <path>`	Show the amount of space, in bytes, used by the files that match the specified file pattern. Equivalent to the Unix command `du -sb`. The output is in the form `name(full path)` size (in bytes).
`-fs [local | <filesystem URI>]`	Specify the file system to use. If not specified, the current configuration is used, taken from the following, in increasing precedence: `core-default.xml` inside the hadoop jar file `core-site.xml` in `$HADOOP_CONF_DIR`. The `local` option means use the local file system as your DFS. `<filesystem URI>` specifies a particular file system to contact. This argument is optional but if used must appear appear first on the command line. Exactly one additional argument must be specified.
`-get [-ignoreCrc] [-crc] <src> <localdst>`	Copy files that match the file pattern <src> to the local name. <src> is kept. When copying multiple files, the destination must be a directory.
`getfattr [-R] -n <name> | -d [-e <encoding>] <path>`	Retrieve all the extended attribute values (if any) for a file or directory. Here: **`-R`** Recursively list the attributes for all files and directories. **`-n <name>`** The name of the extended attribute to retrieve. **`-d`** Retrieve all extended attributes associated with the pathname. Extended attributes to which the calling process does not have access may be omitted from the list. **`-e <encoding>`** Encode values after retrieving them. Valid encodings are text (enclosed in double quotes), hex (prefixed with 0x), and base64 (prefixed with 0s). **`<path>`** The file or directory.
`-getmerge <src> <localdst>`	Get all the files in the directories that match the source file pattern and merge and sort them to only one file on local fs. `<src>` is kept.
`-help [cmd]`	Displays help for given command or all commands if none is specified.

last-updated: Jun 06, 2024

Parameter	Description
`-ls <path>`	List the contents that match the specified file pattern. If path is not specified, the contents of `/user/<currentUser>` will be listed. Directory entries are of the form `dirName (full path) <dir>` and file entries are of the form `fileName(full path) <r n>`. size where n is the number of replicas specified for the file and size is the size of the file, in bytes.
`-lsr <path>`	Recursively list the contents that match the specified file pattern. Behaves very similarly to `hadoop fs -ls`, except that the data is shown for all the entries in the subtree.
`-mkdir <path>`	Create a directory in specified location.
`-moveFromLocal <localsrc> ... <dst>`	Same as `-put`, except that the source is deleted after it's copied.
`-moveToLocal <src> <localdst>`	Not implemented yet
`-mv <src> <dst>`	Move files that match the specified file pattern `<src>` to a destination `<dst>`. When moving multiple files, the destination must be a directory.
`-put <localsrc> ... <dst>`	Copy files from the local file system into fs. To copy files, user must have write permission on the directory or the `addchild`, `deletechild`, and `writefile` access set using ACEs.
`-rm [-skipTrash] <src>`	Delete all files that match the specified file pattern. Equivalent to the Unix command `rm <src>`. The `-skipTrash` option bypasses trash, if enabled, and immediately deletes `<src>`
`-rmr [-skipTrash] <src>`	Remove all directories which match the specified file pattern. Equivalent to the Unix command `rm -rf <src>` The `-skipTrash` option bypasses trash, if enabled, and immediately deletes `<src>`
`-setfattr -n <name> [-v <value>] | -x <name> <path>`	Set or remove an extended attribute name and value. Here: **`-n <name>`** The name of the extended attribute to set. **`-v <value>`** The value of the extended attribute to set. **`-x <name>`** The name of the extended attribute to remove. **`<path>`** The file or directory.
`-stat [format] <path>`	Print statistics about the file/directory at `<path>` in the specified format. Format accepts filesize in blocks (%b), filename (%n), block size (%o), replication (%r), modification date (%y, %Y)
`-tail [-f] <file>`	Show the last 1KB of the file. The `-f` option shows appended data as the file grows.
`-touchz <path>`	Write a timestamp in `yyyy-MM-dd HH:mm:ss` format in a file at `<path>`. An error is returned if the file exists with non-zero length.
`-test -[ezd] <path>`	If file { exists, has zero length, is a directory then return 0, else return 1.
`-text <src>`	Takes a source file and outputs the file in text format. The allowed formats are zip and TextRecordInputStream.

Generic Options

last-updated: Jun 06, 2024

The following generic options are supported for the `hadoop fs` command: `-conf <configuration file>`, `-D <property=value>`, `-fs <local|file system URI>`, `-jt <local|jobtracker:port>`, `-files <file1,file2,file3,...>`, `-libjars <libjar1,libjar2,libjar3,...>`, and `-archives <archive1,archive2,archive3,...>`. For more information on generic options, see Generic Options.

Examples

Set an extended attribute on a file, file1.txt:

```
hadoop fs -setfattr -n user.key1 -v val1 /xattrs/m7user1/file1.txt
```

Remove an extended attribute specified by name:

```
hadoop fs -setfattr -x user.key1 /xattrs/m7user1/dir1
```

Retrieve an extended attribute for a file encoded in text:

```
[root@qa-node110 ~]# hadoop fs -getfattr -n user.key1 -e text /xattr/file1
# file: /xattr/file1
user.key1="value1"
```

Retrieve an extended attribute for a file encoded in hex:

```
[root@qa-node110 ~]# hadoop fs -getfattr -n user.key1 -e hex /xattr/file1
# file: /xattr/file1
user.key1=0x76616c756531
```

Retrieve an extended attribute for a file encoded in base64:

```
[root@qa-node110 ~]# hadoop fs -getfattr -n user.key1 -e base64 /xattr/file1
# file: /xattr/file1
user.key1=0sdmFsdWUx
```

Retrieve an extended attribute specified by name:

```
[root@qa-node110 ~]# hadoop fs -getfattr -n user.key1 /xattr/file2
# file: /xattr/file2
user.key1="value1"
```

Retrieve all the extended attributes associated with the given file:

```
[root@qa-node110 ~]# hadoop fs -getfattr -d /xattr/file2
# file: /xattr/file2
user.key2="value2"
user.key1="value1"
```

Retrieve extended attributes recursively:

```
[root@qa-node110 ~]# hadoop fs -getfattr -R -d /xattr/
# file: /xattr
# file: /xattr/file1
user.key2="value2"
# file: /xattr/file2
user.key2="value2"
user.key1="value1"
```

last-updated: Jun 06, 2024

Retrieve a specific extended attribute recursively on a directory:

```
[root@qa-node110 ~]# hadoop fs -getfattr -R -n user.key1 /xattr/
# file: /xattr
user.key1="value1"
# file: /xattr/file1
getfattr: No such attribute
# file: /xattr/file2
user.key1="value1"
```

Suppressing Warning Messages for the hadoop fs Command

After an upgrade to 4.0.x, the `hadoop fs` command returns the following warning message:

```
WARNING: org.apache.hadoop.metrics.jvm.EventCounter is deprecated. Please
use
org.apache.hadoop.log.metrics.EventCounter in all the log4j.properties
files.
```

This message does not cause any problems, but you can suppress it by modifying the following file:

```
/opt/mapr/hadoop/hadoop-0.20.2/conf/log4j.properties
```

In this file, replace the following line:

`log4j.appender.EventCounter=org.apache.hadoop.log.EventCounter`

with this line:

`log4j.appender.EventCounter=org.apache.hadoop.log.metrics.EventCounter`

hadoop jar
The `hadoop jar` command runs a program contained in a JAR file. Users can bundle their MapReduce code in a JAR file and execute it using this command.

Syntax

```
hadoop jar <jar>
     [<arguments>]
```

Parameters

The following commands parameters are supported for `hadoop jar`:

Parameter	Description
`<jar>`	The JAR file.
`<arguments>`	Arguments to the program specified in the JAR file.

Examples
Streaming Application

Hadoop streaming applications are run using the `hadoop jar` command. The Hadoop streaming utility enables you to create and run MapReduce applications with any executable or script as the mapper and/or the reducer.

```
$ hadoop jar $HADOOP_HOME/hadoop-streaming.jar \
    -input myInputDirs \
```

```
    -output myOutputDir \
    -mapper org.apache.hadoop.mapred.lib.IdentityMapper \
    -reducer /bin/wc
```

The `-input`, `-output`, `-mapper`, and `-reducer` streaming command options are all required for streaming jobs. Either an executable or a Java class may be used for the mapper and the reducer. For more information about and examples of streaming applications, see *Hadoop Streaming* at the Apache project's page.

Running from a JAR file

The simple Word Count program is another example of a program that is run using the `hadoop jar` command. The `wordcount` functionality is built into the `hadoop-0.20.2-dev-examples.jar` program. You pass the file, along with the location, to Hadoop with the `hadoop jar` command and Hadoop reads the JAR file and executes the relevant instructions.

The Word Count program reads files from an input directory, counts the words, and writes the results of the application to files in an output directory.

```
$ hadoop jar /opt/mapr/hadoop/hadoop-0.20.2/hadoop-0.20.2-dev-examples.jar
wordcount /myvolume/in /myvolume/out
```

hadoop job

The `hadoop job` command enables you to manage MapReduce jobs.

WARNING: This command is deprecated.

Syntax

```
hadoop job [Generic Options]
        [-submit <job-file>]
        [-status <job-id>]
        [-counter <job-id> <group-name> <counter-name>]
        [-kill <job-id>]
        [-unblacklist <job-id> <hostname>]
        [-unblacklist-tracker <hostname>]
        [-set-priority <job-id> <priority>]
        [-events <job-id> <from-event-#> <#-of-events>]
        [-history <jobOutputDir>]
        [-list [all]]
        [-list-active-trackers]
        [-list-blacklisted-trackers]
        [-list-attempt-ids <job-id> <task-type> <task-state>]
        [-kill-task <task-id>]
        [-fail-task <task-id>]
        [-blacklist-tasktracker <hostname>]
        [-showlabels]
```

Parameters

Command Options

The following command options are supported for `hadoop job`:

Parameter	Description
`-submit <job-file>`	Submits the job.
`-status <job-id>`	Prints the map and reduce completion percentage and all job counters.

last-updated: Jun 06, 2024

Parameter	Description
`-counter <job-id> <group-name> <counter-name>`	Prints the counter value.
`-kill <job-id>`	Kills the job.
`-unblacklist <job-id> <hostname>`	Removes a tasktracker job from the jobtracker's blacklist.
`-unblacklist-tracker <hostname>`	Admin only. Removes the TaskTracker at `<hostname>` from the JobTracker's global blacklist.
`-set-priority <job-id> <priority>`	Changes the priority of the job. Valid priority values are `VERY_HIGH`, `HIGH`, `NORMAL`, `LOW`, and `VERY_LOW`. The job scheduler uses this property to determine the order in which jobs are run.
`-events <job-id> <from-event-#> <#-of-events>`	Prints the events' details received by jobtracker for the given range.
`-history <jobOutputDir>`	Prints job details, failed and killed tip details.
`-list [all]`	The `-list all` option displays all jobs. The `-list` command without the `all` option displays only jobs which are yet to complete.
`-list-active-trackers`	Prints all active tasktrackers.
`-list-blackisted-trackers`	Prints the TaskTracker nodes that JobTracker blacklisted with the reason for blacklisting.
`-list-attempt-ids <job-id><task-type>`	Lists the IDs of task attempts.
`-kill-task <task-id>`	Kills the task. Killed tasks are *not* counted against failed attempts.
`-fail-task <task-id>`	Fails the task. Failed tasks are counted against failed attempts.
`-blacklist-tasktracker <hostname>`	Pauses all current tasktracker jobs and prevent additional jobs from being scheduled on the tasktracker.
`-showlabels`	Dumps label information of all active nodes.

Generic Options

The following generic options are supported for the `hadoop job` command: `-conf <configuration file>`, `-D <property=value>`, `-fs <local|file system URI>`, `-jt <local|jobtracker:port>`, `-files <file1,file2,file3,...>`, `-libjars <libjar1,libjar2,libjar3,...>`, and `-archives <archive1,archive2,archive3,...>`. For more information on generic options, see Generic Options.

Examples

Submitting Jobs

The `hadoop job -submit` command enables you to submit a job to the specified jobtracker.

```
$ hadoop job -jt darwin:50020 -submit job.xml
```

last-updated: Jun 06, 2024

Stopping Jobs Gracefully

Use the `hadoop kill` command to stop a running or queued job.

```
$ hadoop job -kill <job-id>
```

Viewing Job History Logs

Run the `hadoop job -history` command to view the history logs summary in specified directory.

```
$ hadoop job -history output-dir
```

This command will print job details, failed and killed tip details.

Additional details about the job such as successful tasks and task attempts made for each task can be viewed by adding the `-all` option:

```
$ hadoop job -history all output-dir
```

Blacklisting Tasktrackers

The `hadoop job` command when run as root or using `sudo` can be used to manually blacklist tasktrackers:

```
hadoop job -blacklist-tasktracker <hostname>
```

Manually blacklisting a tasktracker pauses any running jobs and prevents additional jobs from being scheduled.

hadoop mfs

The `hadoop mfs` command displays directory information and contents, creates symbolic links and hard links, sets, gets, and removes Access Control Expressions (ACE) on files and directories, and sets compression and chunk size on a directory.

Syntax

```
hadoop mfs
  [ -count <path> ]
  [ -delace [-R] <path> ]
  [ -getace [-R] <path> ]
  [ -help <command> ]
  [ -ln <target> <symlink> ]
  [ -lnh <target> <hardlink> ]
  [ -ls <path> ]
  [ -lsd <path> ]
  [ -lsf <path> ]
  [ -lso <path> ]
  [ -lsor <path> ]
  [ -lsr <path> ]
  [ -Lsr <path> ]
  [ -lsrv <path> ]
  [ -lss <path> ]
  [ -offload <file_path> [-v] ]
  [ -recall <file_path> [-v] ]
  [ -rmr <path> ]
  [ -setace [-R]
     [-readfile <ace>] [-writefile <ace>] [-executefile <ace>]
     [-addchild <ace>] [-deletechild <ace>] [-lookupdir <ace>] [-readdir
<ace>]
     [-aces "[rf:<ace>],[wf:<ace>],[ef:<ace>],[ac:<ace>],[dc:<ace>],
[rd:<ace>],[ld:<ace>]"]
```

last-updated: Jun 06, 2024

```
     [-preservemodebits <true|false>] [-setinherit <true|false>] <path> ]
  [ -setaudit  on|off <dir|file|table> ]
  [ -setcompression  on|off|lzf|lz4|zlib <dir|table> ]
  [ -setchunksize <size> <dir> ]

  [ -setnetworkencryption on|off <target> ]
  [ -stat <path> ]
  [ -tierstatus <file_path> [-v] ]
  [ -addsecuritypolicytag [-R] <comma-separated list of security policy
tags> <path> ]
  [ -getsecuritypolicytag [-R] <path> ]
  [ -removesecuritypolicytag [-R] <comma-separated list of security policy
tags> <path> ]
  [ -removeallsecuritypolicytag [-R] <path> ]
  [ -setsecuritypolicytag [-R] <comma-separated list of security policy
tags> <path> ]
```

Parameters

The normal command syntax is to specify a single option from the following table, along with its corresponding arguments. If you do not set compression and chunk size for a given directory, the values are inherited from the parent directory.

Parameter	Description
`-count <path>`	Counts and returns the number of directories and (regular, symbolic link, volume link, kvstores, and device) files in the specified path (recursively).
`-delace [-R] <path>`	Deletes all ACEs associated with the specified file or directory and sets *ACE*s for the specified file or directory to the default value, which is the empty string. Here: • `[-R]` — Enables recursion allowing you to perform the operation in subdirectories as well. • `<path>` — Specifies the path to the file or directory. You cannot delete specific access types with this parameter. Instead, if necessary, reset the value for the specific access type to an empty string using the `-setace` parameter. If you use an empty string to deny a specific type of access, then that type of access is denied to all users. To deny specific types of access to specific users only, use the negation operator (`!`). The mode bits corresponding to the *ACE*s being deleted, do not change.

last-updated: Jun 06, 2024

Parameter	Description
`-getace [-R] <path>`	Returns the permissions -- POSIX mode bits and ACEs -- for the given file or (recursively) for the directory. Recursion is enabled only if -R is specified; if -R is not specified, this parameter returns the permissions only for the given directory. Here: • `[-R]` — (Optional) Enables recursion allowing you to perform the operation in subdirectories as well. • `<path>` — (Required) Specifies the path to the file or directory. If one or more *ACE*s are available for the file or directory, a plus sign (+), which indicates that both *ACE*s and POSIX mode bits are set for the given file or directory, is returned. If the *ACE* on the file or directory is an empty string, the plus sign is not returned.
`-help <command>`	Displays help for the `hadoop mfs` command.
`-ln <target> <symlink>`	Creates a symbolic link `<symlink>` that points to the target path `<target>`, similar to the standard Linux `ln -s` command.
`-lnh <target> <hardlink>`	Creates a hardlink that associates a new name or a file path with an existing file. You must specify the following: **`<target>`** — File name, including the full path, of the file to link to. **`<hardlink>`** — New name, including the full path, of the file to link with.
`-ls <path>`	Lists files in the directory specified by `<path>`. The `hadoop mfs -ls` command corresponds to the standard `hadoop fs -ls` command, but provides the following additional information: • Chunks used for each file • Server where each chunk resides • Whether compression is enabled for each file • Whether encryption is enabled for each file • Whether audit is enabled (A) or disabled (U) for each file
`-lsd <path>`	Lists files in the directory specified by `<path>`, and also provides information about the specified directory itself: • Whether compression is enabled for the directory (indicated by `z`) • The configured chunk size (in bytes) for the directory.

last-updated: Jun 06, 2024

Parameter	Description
`-lsf <path>`	Lists just the file ID (fid) and the file name, for each file present in the specified path. The output is not sorted. Use this option when there are millions of files in a directory. In this scenario. using this option results in the fastest listing of files, as only the fids and the file names are returned. All other file attributes are ignored.
`-lso <path>`	Lists files in the directory specified by `<path>`. The `hadoop mfs -lso` command corresponds to the standard `hadoop fs -ls` command, but provides the following additional information: • Whether compression is enabled for each file • Whether encryption is enabled for each file • Whether audit is enabled (A) or disabled (U) for each file This command is faster than `hadoop fs -ls` as it uses an optimized printing method to dump data on screen.
`-lsor <path>`	Recursively lists files in the directory specified by `<path>`. This command is the recursive variant of the `hadoop mfs -lso` command.
`-lsr <path>`	Recursively lists files in the directory and subdirectories specified by `<path>`. The `hadoop mfs -lsr` command corresponds to the standard `hadoop fs -lsr` command, but provides the following additional information: • Chunks used for each file • Server where each chunk resides
`-Lsr <path>`	Equivalent to `lsr`, but additionally dereferences symbolic links
`-lsrv <path>`	Lists all paths recursively without crossing volume links.
`-lss <path>`	Lists files in the directory specified by `<path>`, with an additional column that displays the number of disk blocks per file. Disk blocks are 8192 bytes.
`-offload <file_path> [-v]`	The file to offload to the storage tier. This is a blocking operation; the control is not returned until the operation is complete and the file has been offloaded. Use `-v` (for verbose) to view the status of the ongoing offload operation.
`-recall <file_path> [-v]`	The file to recall from the storage tier. This is a blocking operation; the control is not returned until the operation is complete and the file has been recalled. Use `-v` (for verbose) to view the status of the ongoing recall operation.
`-rmr <path>`	Recursively deletes files and directories in the specified path. This is a highly optimized version of the normal generic `hadoop fs rmr` command and is 10X faster for large directories. This option is useful when one or more directories in the specified path contains many (millions of) files.

last-updated: Jun 06, 2024

<table>
<tr><th>Parameter</th><th>Description</th></tr>
<tr><td><code>-setace [-R] [-readfile <ace>]
[-writefile <ace>] [-executefile
<ace>] [-addchild <ace>] [-deletechild

[-readdir <ace>] [-aces "[rf:<ace>],
[wf:<ace>],[ef:<ace>],[ac:<ace>],
[dc:<ace>],[rd:<ace>],[ld:<ace>]"]
[-preservemodebits <true|false>]
[-setinherit <true|false>] <path></code></td><td>Sets or modifies the read, write, and execute permissions for files or directories. This argument will: Overwrite existing values with new values, if specified, for access types that were previously set. Set new values for access types that have not yet been set. Not set or modify access types that were not passed in with the command, whether they were previously set or unset. Specify the ACEs immediately after the <code>-setace</code> parameter. Specify all the other parameters, after the ACE.
Here:<table><tr><td><code>-R</code></td><td>Enables recursion allowing you to perform the operation in subdirectories as well. Recursion is enabled only if <code>-R</code> is specified; if <code>-R</code> is not specified, sets or modifies the permissions for the given directory only.</td></tr><tr><td><code><ace></code></td><td>ACE Syntax on page 1855 defined using boolean expressions and sub-expressions.</td></tr><tr><td><code>-readfile</code>
<code>-writefile</code>
<code>-executefile</code></td><td>Specifies permissions (defined using ACEs) for reading, writing, or executing the file.</td></tr><tr><td><code>-readdir</code>
<code>-lookupdir</code></td><td>Specifies permissions (defined using ACEs) for accessing the directory. To permit users to read files in the directory, grant the <code>lookupdir</code> access permission. To permit users to write to or execute files in the directory, grant the <code>readdir</code> and <code>lookupdir</code> access permissions.</td></tr><tr><td><code>-addchild</code>
<code>-deletechild</code></td><td>Specifies permissions (defined using ACEs) for adding or deleting subdirectories.</td></tr><tr><td><code>-aces</code></td><td>Specifies ACEs as a single string. Specify a comma-separated list of ACEs within quotes, up to 60 KB in length. You can set the following permissions.<table><tr><td><code>rf</code></td><td>Refers to read file access.</td></tr><tr><td><code>wf</code></td><td>Refers to write file access</td></tr><tr><td><code>ef</code></td><td>Refers to execute file access</td></tr></table></td></tr></table></td></tr>
</table>

Parameter	Description
`-setaudit on|off <dir|file|table>`	Enables auditing of the specified directory, file, or HPE Ezmeral Data Fabric Database table. Enabling auditing of a directory does not enable auditing of files and subdirectories that exist in the directory. You must enable auditing on those existing files and subdirectories. However, any new files and subdirectories that you create will automatically be enabled for auditing. See How Does Auditing Work? on page 1060. For operations on the object to be logged, auditing also needs to be enabled on the cluster and the volume in which the object is located. See Managing Auditing on page 1057 for details. If auditing is enabled for a directory, new files and directories created within that directory are also enabled for auditing.
`-setchunksize <size> <dir>`	Sets the chunk size in bytes for the directory specified in `<dir>`. The `<size>` parameter must be a multiple of 65536.
`-setcompression on|off|lzf|lz4|zlib <dirtable>`	Turns compression on or off on the directory specified in `<dir>` or on the specified table, and sets the compression type to one of the following if compression is not turned off: • `on` — turns on compression using the default algorithm (LZ4) • `lzf` — turns on compression and sets the algorithm to LZF • `lz4` — turns on compression and sets the algorithm to LZ4 • `zlib` — turns on compression and sets the algorithm to ZLIB
`-setnetworkencryption on|off <target>`	Sets network encryption on or off for the filesystem object defined in `<target>`. The cluster encrypts network target to or from a file, directory, stream, or data-fabric table with network security enabled.
`-stat <path>`	Displays the statistics for the given file. Only the root user and the MAPR_USER user (user name under which data-fabric services run) have permissions to run this command. The path is required and specifies the path (to the file) on which to run the command. The output fields for this command are as follows.

last-updated: Jun 06, 2024

Parameter	Description

`tierstatus <file_path> [-v]`	The status of the offload or recall of the given file. If `-v` (for verbose) is also specified, for the given file, the command specifies whether data is local or offloaded as the final output. If the file:
	• Contains local data, returns the following final output:
	`File has local data`
	• Is completely offloaded, returns the following final output:
	`File does not have local data`
	See Output on page 5563 for more information.

Output

When used with the `-ls`, `-lsd`, `-lso`, `-lsor`, `-lsr`, or `-lss` options, `hadoop mfs` displays information about files and directories. For each file or directory `hadoop mfs` displays a line of basic information followed by lines listing the chunks that make up the file, in the following format:

```
{mode} {compression} {encryption} {audit} {diskFlush} {replication} {owner}
{group} {size} {date} {chunk size} {name} {chunk} {fid} {host} [{host}...]
{chunk} {fid} {host} [{host}...] ...
```

Volume links are displayed as follows:

```
{mode} {compression} {encryption} {audit} {diskFlush} {replication} {owner}
{group} {size} {date} {chunk size} {name} {chunk} {target volume name}
{writability} {fid} -> {fid} [{host}...]
```

The following table describes the values:

mode	A text string indicating the read, write, and execute permissions for the owner, group, and other permissions. See also Managing Permissions on page 1054.
compression	• U: uncompressed • L: LZf • Z (Uppercase): LZ4 • z (Lowercase): ZLIB
encryption	U: unencrypted; E: encrypted
audit	U: disabled; A: enabled
disk flush	U:disabled; F:enabled
replication	The replication factor of the file (directories display a dash instead)
owner	The owner of the file or directory
group	The group of the file of directory

last-updated: Jun 06, 2024

size	The size of the file or directory
date	The date the file or directory was last modified
chunk size	The chunk size of the file or directory
name	The name of the file or directory
chunk	The chunk number. The first chunk is a primary chunk labeled "p", a 64K chunk containing the root of the file. Subsequent chunks are numbered in order.
fid	The chunk's file ID, which consists of three parts: • The ID of the container where the file is stored • The inode of the file within the container • An internal version number For volume links, the first `fid` is the chunk that stores the volume link itself; the `fid` after the arrow (`->`) is the first chunk in the target volume.
host	The host on which the chunk resides. When several hosts are listed, the first host is the first copy of the chunk, while subsequent hosts are replicas.
target volume name	The name of the volume pointed to by a volume link.
writability	Displays whether the volume is writable.

When used with the `-lsf <path>`option, `hadoop mfs` displays only the file ID (fid) and the file name of each file in the path.

When used with the `-stat <path>`option, `hadoop mfs` displays statistics for the given file. For each file, it displays the following:

Output field	Description
`uid`	The user ID of the owner.
	The last access time. The may not always be updated. For more information, see the `UpdateTimeInterval` entry in volume create on page 2588.
`mtime`	The last modified time.
`nlink`	The number of hard links.

Output field	Description
`type`	The type of the file. Value can be one of: • regular • directory • symlink • vollink • kvstore • device
`size`	The size of the file or directory. Depending on the type of file, it can be the actual size or the number of entries.
`mode`	The UNIX style permission mode bits for the file/directory.
`networkencryption`	The network encryption setting. Determines whether network encryption is enabled for this file.
`subtype`	The subtype for the specified type. The following subtypes are supported for some of the types: **regular** • FSTRegBucket • FSTRegCF • FSTRegKeyMap **kvstore** • FSTKvTable • FSTKvTabletMap • FSTKvSchema • FSTKvTablet • FSTKvSegMap • FSTKvSpillMap • FSTKvKeyMap • FSTKvXattr **device** • FSTDevPipe • FSTDevSocket • FSTDevBlock • FSTDevChar For all other types, subtypes are not valid.
`gid`	The group ID.
`compression`	The compression setting.

When used with `tierstatus`, the output varies based on whether or not data is local, was offloaded, or was recalled. The output looks similar to the following if:

last-updated: Jun 06, 2024

- Data was completely offloaded:

```
File does not have local data
```

- Data could not be completely offloaded or data was recalled:

```
File has local data
```

Examples

View File Information

The `hadoop mfs` command is used to view file contents. You can use this command to check if compression is turned off in a directory or mounted volume. For example,

```
# hadoop mfs -ls /
Found 121 items

```

In the preceding example, the letter `Z` indicates LZ4 compression on the directory; the letter `U` indicates that the directory is uncompressed. In the following example, the listed item is both uncompressed (first `U`) and unencrypted (second `U`).

```
[root@node1-302 ~]# hadoop mfs -ls /hbase
Found 10 items
drwxr-xr-x  Z E U U   - root root          1 2018-08-09 19:26  268435456 /

physical22.qa.lab:5660
...
```

The following example demonstrates the usage of the `-lsf` option:

```
[root@vm5 logs]# hadoop mfs -lsf /tmp/
            2050.33.262504    /tmp/hosts1
            2050.32.262502    /tmp/hosts2
            2050.35.393704    /tmp/hosts3
```

Set ACEs

Example 1: The following command shows how to set separate read, write, and execute permissions (using *ACE*) on a file:

```
hadoop mfs -setace -readfile p -writefile 'g:group1&!u:user1' -executefile
p /file
```

When the command shown above runs, the POSIX mode bits for:

- Read access is set for owner, owning group, and others.
- Write access is set for none.
- Execute access is set for owner, owning group, others.

All other POSIX mode bits are set to 0.

Example 2: The following command shows how to set read, write, and execute permissions (using *ACE*) as a single string on the specified directory and force all files and subdirectories under the specified directory to inherit the parent *ACE*. *ACE*s that are not specified will be set to the empty string.

```
hadoop mfs -setace -aces "rf:u:root,wf:group1&!
user1,ef:p,rd:u:m7user1" -setinherit true /dir
```

When the command shown above runs, the POSIX mode bits for listing the contents (r) of the directory is set for owner/user and all other POSIX mode bits on the directory are set to 0; all new directories under this directory will inherit the parent POSIX mode bits. Also, new files in the directory will inherit the following POSIX mode bits:

- Read access is set to owner/user.
- Write access is set to none.
- Execute access set for others.

All other POSIX mode bits are set to 0.

Example 3: The following command shows how to set permissions (using *ACE*) as a single string on the specified directory and all the files and subdirectories recursively.

```
hadoop mfs -setace -R -aces "rf:p,wf:g:group1&!
u:user1,ef:p" -preservemodebits true /dir
```

When the command shown above runs, the POSIX mode bits are not modified to match the *ACE* setting.

Example 4: The following command shows how to deny a specific type of access, `writefile`, which was set in the first example above, without removing all other access types associated with the file. The empty string used in the following example will deny write access to all users, *role*s, and groups.

```
hadoop mfs -setace -writefile "" -preservemodebits false /file
```

When the command shown above runs, the POSIX mode bit for writing to the file is set to 0.

Get ACEs

The following command shows the *ACE*s and POSIX mode bits for the specified file only.

```
hadoop mfs -getace /m7user1/file1.txt
```

Output

```
Path: /m7user1/file1.txt
  readfile: !u:m7user1
```

last-updated: Jun 06, 2024

```
  writefile: !u:m7user1
  executefile: !u:m7user1
  mode: ---------
```

Delete ACEs

The following command deletes all *ACE*s associated with the specified file and sets the ACE for the file to the empty string.

```
hadoop mfs -delace /file
```

The following command deletes all *ACE*s associated with the specified directory.

```
hadoop mfs -delace /dir
```

The following command deletes all *ACE*s associated with the specified directory and *ACE*s associated with the files and directories (recursively) below the specified directory.

```
hadoop mfs -delace -R /dir
```

Create a Hard Link to File

The following command shows how to create a hard link to the file, file1, using a new name, file2.

```
# hadoop mfs -lnh /madvol1/file1 /madvol1/file2
Creating Hardlink: /madvol1/file2 -> /madvol1/file1
```

Retrieve the Number of Hard Links

The following command shows how to retrieve the number of hard links (and other statistics) associated with a given file.

```
# hadoop mfs -stat /vol1/file1
Path: /vol1/file1
  fid: 23185.32.131232
  uid: root
  gid: root
  atime: 2016-06-29 18:49:03
  mtime: 2016-07-01 18:01:54
  nlink: 2
  type: FTRegular
  subtype: FSTInval
  size: 1024000000
  blocksize: 268435456
  mode: 644
  networkencryption: false
  compression: off
```

View the status of the offload or recall operation for the file named file2 in volume named vol1:

```
# hadoop mfs -tierstatus  /vol1/file2
File has local data.
```

View the status of file named test1 in volume named vol1:

```
# hadoop mfs -tierstatus /vol1/test1 -v
        FID          Has Local Data
2154.109.1049824        Yes
2172.143.524906         Yes
2172.153.524926         Yes
2172.166.524952         Yes
```

last-updated: Jun 06, 2024

```
2172.167.524954         Yes
File has local data.
```

Tag a file with a security policy:

The following command tags the file `/user/root/javax.servlet-3.0.jar` with three security policies, namely `pci`, `hippa`, and `new`

```
hadoop mfs -setsecuritypolicytag pci,hippa,new /user/root/
javax.servlet-3.0.jar
```

Retrieve security policy tags from a file:

```
hadoop mfs -getsecuritypolicytag /user/root/javax.servlet-3.0.jar
            [hippa, new, pci]
```

Remove all security policy tags from a file:

```
hadoop mfs -removeallsecuritypolicytag /user/root/javax.servlet-3.0.jar
```

hadoop mradmin

The `hadoop mradmin` command runs Map-Reduce administrative commands.

WARNING: This command is deprecated.

Syntax

```
hadoop [ Generic Options ] mradmin
      [-refreshServiceAcl]
      [-refreshQueues]
      [-refreshNodes]
      [-refreshUserToGroupsMappings]
      [-refreshSuperUserGroupsConfiguration]
      [-help [cmd]]
```

Parameters

The following command parameters are supported for `hadoop mradmin`:

Parameter	Description
`-refreshServiceAcl`	Reload the service-level authorization policy file Job tracker will reload the authorization policy file.
`-refreshQueues`	Reload the queue acls and state JobTracker will reload the mapred-queues.xml file.
`-refreshUserToGroupsMappings`	Refresh user-to-groups mappings.
`-refreshSuperUserGroupsConfiguration`	Refresh superuser proxy groups mappings.
`-refreshNodes`	Refresh the hosts information at the job tracker.
`-help [cmd]`	Displays help for the given command or all commands if none is specified.

The following generic options are supported for `hadoop mradmin`:

last-updated: Jun 06, 2024

Generic Option	Description
`-conf <configuration file>`	Specify an application configuration file.
`-D <property=value>`	Use value for given property.
`-fs <local|filesystem URI>`	Specify a filesystem.
`-jt <local|jobtracker:port>`	Specify a job tracker.
`-files <comma separated list of files>`	Specify comma separated files to be copied to the map reduce cluster.
`-libjars <comma seperated list of jars>`	Specify comma separated jar files to include in the classpath.
`-archives <comma separated list of archives>`	Specify comma separated archives to be unarchived on the computer machines.

hadoop pipes

The `hadoop pipes` command runs a pipes job.

WARNING: This command is deprecated.

Hadoop Pipes is the C++ interface to Hadoop Reduce. Hadoop Pipes uses sockets to enable tasktrackers to communicate processes running the C++ map or reduce functions.

Syntax

```
hadoop [GENERIC OPTIONS ] pipes
    [-output <path>]
    [-jar <jar file>]
    [-inputformat <class>]
    [-map <class>]
    [-partitioner <class>]
    [-reduce <class>]
    [-writer <class>]
    [-program <executable>]
    [-reduces <num>]
```

Parameters

Command Options

The following command parameters are supported for `hadoop pipes`:

Parameter	Description
`-output <path>`	Specify the output directory.
`-jar <jar file>`	Specify the jar filename.
`-inputformat <class>`	InputFormat class.
`-map <class>`	Specify the Java Map class.
`-partitioner <class>`	Specify the Java Partitioner.

last-updated: Jun 06, 2024

Parameter	Description
`-reduce <class>`	Specify the Java Reduce class.
`-writer <class>`	Specify the Java RecordWriter.
`-program <executable>`	Specify the URI of the executable.
`-reduces <num>`	Specify the number of reduces.

Generic Options

The following generic options are supported for the `hadoop pipes` command: `-conf <configuration file>`, `-D <property=value>`, `-fs <local|filesystem URI>`, `-jt <local|jobtracker:port>`, `-files <file1,file2,file3,...>`, `-libjars <libjar1,libjar2,libjar3,...>`, and `-archives <archive1,archive2,archive3,...>`. For more information on generic options, see Generic Options.

hadoop queue

The `hadoop queue` command displays job queue information.

WARNING: This command is deprecated.

Syntax

```
hadoop [ Generic Options ] queue
    [-list] | [-info <job-queue-name> [-showJobs]] | [-showacls]
```

Parameters

Command Options

The `hadoop queue` command supports the following command options:

Parameter	Description
`-list`	Gets list of job queues configured in the system. Along with scheduling information associated with the job queues.
`-info <job-queue-name> [-showJobs]`	Displays the job queue information and associated scheduling information of particular job queue. If `-showJobs` option is present, a list of jobs submitted to the particular job queue is displayed.
`-showacls`	Displays the queue name and associated queue operations allowed for the current user. The list consists of only those queues to which the user has access.

Generic Options

The following generic options are supported for the `hadoop queue` command: `-conf <configuration file>`, `-D <property=value>`, `-fs <local|filesystem URI>`, `-jt <local|jobtracker:port>`, `-files <file1,file2,file3,...>`, `-libjars <libjar1,libjar2,libjar3,...>`, and `-archives <archive1,archive2,archive3,...>`. For more information on generic options, see Generic Options.

last-updated: Jun 06, 2024

hadoop version
The `hadoop version` command prints the hadoop software version.

Syntax

```
hadoop  version
```

Output

```
$ hadoop version
Hadoop 2.7.6.100-eep-800
Subversion git@github.com:mapr/private-hadoop-common -r
80dc89ae5df3a2cd01089f192c5d8a886e4788c9
Compiled by root on 2021-10-08T11:26Z
Compiled with protoc 3.11.1
From source with checksum 124ac1b54c81145154c71d2be2a66fc
This command was run using /opt/mapr/hadoop/hadoop-2.7.6/share/hadoop/
common/hadoop-common-2.7.6.100-eep-800.jar
```

hadoop conf
The `hadoop conf` command outputs the configuration information for this node to standard output.

Syntax

```
hadoop [ generic options ] conf
```

Examples

Displaying the configured value of a specific parameter

```
[user@hostname ~]$ hadoop conf | grep mapreduce.map.memory.mb
<property><name>mapreduce.map.memory.mb</name><value>1024</
value><source>mapred-site.xml</source></property>
```

The above command returns 1024 as the configured value of the `mapreduce.map.memory.mb` parameter.

Dumping a node's configuration to a text file

```
[user@hostname ~]$ hadoop conf | grep ... >nodeconfiguration.txt
```

The above command creates a text file named `nodeconfiguration.txt` that contains the node's configuration information.

The following information displays when you use the `tail` utility to examine the last few lines of the file:

```
[user@hostname ~]# tail nodeconfiguration.txt
            <property><name>yarn.app.mapreduce.am.resource.mb</
name><value>1536</value><source>mapred-default.xml</source></property>
            <property><name>mapreduce.framework.name</name><value>yarn</
value><source>mapred-default.xml</source></property>
            <property><name>mapreduce.job.reduce.slowstart.completedmaps</
name><value>1.00</value><source>mapred-default.xml</source></property>
            <property><name>yarn.resourcemanager.client.thread-count</
name><value>50</value><source>yarn-default.xml</source></property>

<property><name>mapreduce.cluster.temp.dir</name><value>${hadoop.tmp.dir}/
mapred/temp</value><source>mapred-default.xml</source></property>
```

```
            <property><name>yarn.resourcemanager.staging</name><value>/var/
mapr/cluster/yarn/rm/staging</value></property>
            <property><name>fs.mapr.working.dir</name><value>/user/
$USERNAME/</value></property>
            <property><name>mapreduce.jobhistory.intermediate-done-dir</
name><value>${yarn.app.mapreduce.am.staging-dir}/history/done_intermediate</
value><source>mapred-default.xml</source></property>
            <property><name>fs.s3a.attempts.maximum</name><value>10</
value><source>core-default.xml</source></property>
            </configuration>
```

API Documentation

HPE Ezmeral Data Fabric supports public APIs for file system, HPE Ezmeral Data Fabric Database, and HPE Ezmeral Data Fabric Streams. These APIs are available for application-development purposes.

IMPORTANT: Development using HPE Ezmeral Data Fabric non-public (private or internal) APIs is not supported.

Table

Feature	Language	Link to Location	Description
HPE Ezmeral Data Fabric Streams Administration	Java	For source Java APIs, see: • Java OJAI Client API • Java APIs • Apache Kafka 2.1 APIs used with HPE Ezmeral Data Fabric Streams See HPE Ezmeral Data Fabric Streams Java Applications on page 3546 for streams and topics information for application development.	HPE Ezmeral Data Fabric Streams Java API for performing administrative tasks on streams and topics, setting values for the attributes of streams, and accessing streams for analytics purposes. HPE Ezmeral Data Fabric modified Kafka interfaces, classes, and packages used for HPE Ezmeral Data Fabric streams API. This library is a HPE Ezmeral Data Fabric modified version of the open source Kafka library.
HPE Ezmeral Data Fabric Database JSON Client	Java	HPE Ezmeral Data Fabric Database JSON Client API **NOTE:** Beginning with core version 6.0, the HPE Ezmeral Data Fabric Database `Table` interface in the HPE Ezmeral Data Fabric Database JSON Client API is deprecated and replaced by the `DocumentStore` interface in the OJAI API library. For details, see the next row.	Java API for administration and management of HPE Ezmeral Data Fabric Database JSON tables.
Java OJAI Client	Java	Java OJAI Client API	OJAI is a general-purpose JSON access layer that sits on databases, file systems, and message streams and enables access to structured, semi-structured and unstructured data using a common API. Used for working with HPE Ezmeral Data Fabric Database JSON.
Java OJAI Thin Client	Java	Java OJAI Client API	Allows you to write OJAI applications in Java to access HPE Ezmeral Data Fabric Database JSON. This is the thin client version of the Java OJAI Client.

last-updated: Jun 06, 2024

Table (Continued)

Feature	Language	Link to Location	Description
OJAI REST API	REST	Using the HPE Ezmeral Data Fabric Database JSON REST API on page 3478	Provides an alternative to writing a Java OJAI application. Using HTTP calls, you can perform basic operations on HPE Ezmeral Data Fabric Database JSON tables.
Node.js OJAI Client	Node.js	Node.js OJAI Client API provides the Node.js API documentation.	Allows you to write OJAI applications in Node.js to access HPE Ezmeral Data Fabric Database JSON.
Python OJAI Client	Python	Python OJAI Client API provides the Python API documentation.	Allows you to write OJAI applications in Python to access HPE Ezmeral Data Fabric Database JSON.
C# OJAI Client	C#	C# OJAI Client API provides the C# documentation.	Allows you to write OJAI applications in C# to access HPE Ezmeral Data Fabric Database JSON.
Go OJAI Client	Go	Go OJAI Client API Go OJAI Client API provides the Go documentation.	Allows you to write OJAI applications in Go to access HPE Ezmeral Data Fabric Database JSON.
HPE Ezmeral Data Fabric Database Binary tables	C	Creating C Apps - Binary Tables on page 3238	C API library (`libMapRClient`) for creating and accessing HPE Ezmeral Data Fabric Database binary tables. This library is a HPE Ezmeral Data Fabric Database-specific version of `libhbase`.
HPE Ezmeral Data Fabric Database JSON MapReduce	Java	HPE Ezmeral Data Fabric Database	Java API library that extends the Apache Hadoop MapReduce framework. Used to create MapReduce applications that write data from one JSON table to another.
File Access Control Expressions	Java	File ACE APIs	APIs to grant different permissions to multiple users, groups, and roles for files, directories, and whole volume data using boolean expressions and subexpressions.
	C	FileACE C APIs on page 1864	
File System	C	Accessing the File System with C Applications on page 3162	HPE Ezmeral Data Fabric Database `libMapRClient` library supports access to the HPE Ezmeral Data Fabric Database filesystem. This library is a HPE Ezmeral Data Fabric Database modified version of `libhdfs`. Used to manage file system files.
	Java	Accessing HPE Ezmeral Data Fabric File Store in Java Applications on page 3219	HPE Ezmeral Data Fabric Database's native maprfs library for accessing the HPE Ezmeral Data Fabric Database filesystem.
Extended Attributes	Java	Extended Attribute Java API	APIs to associate additional metadata with a regular file or directory.

Other Docs

This section contains release-independent information, including: Installer documentation, Ecosystem release notes, interoperability matrices, security vulnerabilities, and links to other data-fabric version documentation.

last-updated: Jun 06, 2024

Products Covered in the HPE Ezmeral Data Fabric Documentation

This section lists the products covered in the HPE Ezmeral Data Fabric documentation portal and provides links to the related product documentation.

The HPE Ezmeral Data Fabric documentation portal provides information and instructions for the following HPE Ezmeral Data Fabric components and features:

HPE Ezmeral Data Fabric File Store

File Store Documentation

Most of the file store conceptual and overview documentation is located in the HPE Ezmeral Data Fabric File Store on page 488 section of the documentation portal. Additional file store documentation, including installation and upgrade, configuration, and administration is located in the 7.7.0 Installation on page 79, 7.7.0 Administration on page 1026, and 7.7.0 Development on page 3143 sections of the documentation portal.

The following list provides some direct links to file store topics:

- Distributed datastore for files and persistent storage for containers
- POSIX Client
- Platinum POSIX Client
- Container Client including Flex Volume Plugin and CSI
- NFSv4 and NFSv3
- Multiple file server instances per node
- Support for HDD and SSD
- HDFS API and HttpFS
- Quotas
- Snapshots
- Data Topologies
- Data Protection Replication
- Multi-site volume mirroring
- Data tiering (Cold) to 3rd party external stores
- Data tiering (Warm) to erasure coding
- Global Namespace
- Compression
- Unified Security including authentication, authorization, encryption (wire and data-at-rest) and auditing
- Policy-based security
- External KMIP Keystore

last-updated: Jun 06, 2024

- HPE Ezmeral Data Fabric Management using CLI, REST, and GUI
- Rolling Upgrades
- HPE Ezmeral Data Fabric Monitoring
- HPE Ezmeral Data Fabric Installer
- Resiliency and self-healing
- Auto-balancing
- Disaster recovery - See also Mirror Volumes on page 501.
- Multitenancy on File System on page 533

HPE Ezmeral Data Fabric Document Database

Document Database Documentation

Most of the document database conceptual and overview documentation is located in the HPE Ezmeral Data Fabric Database on page 631 section of the documentation portal. Additional document database documentation, including installation and upgrade, configuration, and administration is located in the 7.7.0 Installation on page 79, 7.7.0 Administration on page 1026, and 7.7.0 Development on page 3143 sections of the documentation portal.

The following list provides some direct links to document database topics:

- Column-Oriented Database using HBase API
- JSON document database using OJAI API
- Multi-master table replication
- Secondary indexes
- Multiple file server instances per node
- Change Data Capture (CDC)
- HPE Ezmeral Data Fabric DB Data Access Gateway
- Strong consistency - See also Mirroring and Replication and High Availability on page 636.
- Resiliency and self-healing - See also High Availability on page 636.
- Disaster recovery - See also Mirroring and Replication and High Availability on page 636.
- Automatic compactions
- Multitenancy
- Unified Security including authentication, authorization, encryption (wire and data-at-rest) and auditing
- Policy-based security
- HPE Ezmeral Data Fabric Administration
- HPE Ezmeral Data Fabric Monitoring
- HPE Ezmeral Data Fabric Installer

- Rolling upgrades
- Apache HBase

HPE Ezmeral Data Fabric Event Data Streams

Event Data Streams Documentation

Most of the event data streams conceptual and overview documentation is located in the HPE Ezmeral Data Fabric Streams on page 766 section of the documentation portal. Additional event data streams documentation, including installation and upgrade, configuration, and administration is located in the 7.7.0 Installation on page 79, 7.7.0 Administration on page 1026, and 7.7.0 Development on page 3143 sections of the documentation portal..

The following list provides some direct links to event data streams topics:

- Distributed publish-subscribe messaging infrastructure
- Support for Kafka API
- Kafka Connect
- Kafka REST Proxy
- KSQL
- Kafka Streams
- Kafka Schema Registry
- Multi-site Stream replication
- Automatic partition balancing
- Multi Tenancy
- Unified Security including authentication, authorization, encryption (wire and data-at-rest) and auditing
- HPE Ezmeral Data Fabric Administration
- HPE Ezmeral Data Fabric Monitoring
- HPE Ezmeral Data Fabric Installer
- Rolling upgrades

HPE Ezmeral Data Fabric Analytics with Hadoop

Analytics with Hadoop Documentation

Most of the documentation related to analytics with Hadoop is located in the Ecosystem Components on page 3893 section of the documentation portal.

The following list provides some direct links to analytics with Hadoop topics:

- Apache YARN
- Apache MapReduce v2
- Apache Hive

last-updated: Jun 06, 2024

- Apache Oozie
- Apache Hue
- HPE Ezmeral Data Fabric DB OJAI Connector for Apache Hive

HPE Ezmeral Data Fabric Advanced Analytics with Spark

Advanced Analytics with Spark Documentation

Most of the documentation related to analytics with Spark is located in the Apache Spark on page 4603 section of the documentation portal.

The following list provides some direct links to analytics with Spark topics:

- Apache YARN
- Apache Spark
- Apache Spark SQL
- Apache Spark Streaming
- Apache Spark MLlib
- GraphX
- SparkR
- Support for Spark Standalone and Spark on YARN
- HPE Ezmeral Data Fabric DB OJAI Connector for Apache Spark
- HPE Ezmeral Data Fabric DB Binary Connector for Apache Spark
- HPE Ezmeral Data Fabric Streams Integration

HPE Ezmeral Data Fabric Interactive SQL Engine with Drill

Drill Interactive SQL Engine Documentation

Most of the documentation related to the Drill interactive SQL engine is located in the Apache Drill on page 3920 section of the documentation portal. You may also want to refer to the Apache Drill documentation at https://drill.apache.org/docs/.

The following list provides some direct links to Drill topics in the documentation portal and on the Apache Drill site:

- Schema-less ANSI-compliant distributed SQL query engine
- Queries on File
- Queries on HPE Ezmeral Data Fabric Document Database tables and secondary indexes
- Queries on Hive tables and views - See also CREATE VIEW.
- File formats (Text,JSON,Parquet)
- Multiple data type support
- Impersonation

HPE Ezmeral Data Fabric Platform Bundle

Platform Bundle Documentation

The following list provides some direct links to platform documentation topics:

- HPE Ezmeral Data Fabric File Store
- HPE Ezmeral Data Fabric Analytics with Hadoop
- HPE Ezmeral Data Fabric Advanced Analytics with Spark
- HPE Ezmeral Data Fabric Interactive SQL Engine with Drill
- HPE Ezmeral Data Fabric Document Database
- HPE Ezmeral Data Fabric Event Data Streams

Installer

You must download and run the Installer setup script before you can start the Installer web interface or issue Installer Stanza commands.

The Installer web interface simplifies the installation of an HPE Ezmeral Data Fabric cluster. After taking you through the process of selecting services and configuring the cluster, the installer installs data-fabric software. You can use the Installer to install:

- New-feature releases, such as 7.6.1 and 7.7.0
- Ecosystem components, such as Spark, Hive, and HBase – or other components contained in an Ecosystem Pack (EEP)

Before you begin, review the Installer Prerequisites and Guidelines on page 5581, which describe user, node, and security requirements for using the Installer. For cluster-planning information, see Planning the Cluster on page 79.

Steps for Setting Up and Running the Installer

To set up and run the installer, complete the following steps:

1. **Select a node from which to run the Installer.** The node from which you run the Installer does not need to be one of the nodes on which you plan to install the cluster.

last-updated: Jun 06, 2024

2. **Download the mapr-setup.sh script.** You can download the setup script directly from package.ezmeral.hpe.com to the node that will run the Installer:

   IMPORTANT: To access the Data Fabric internet repository, you must specify the email and token of an HPE Passport account. For more information, see Using the HPE Ezmeral Token-Authenticated Internet Repository on page 102.

   ```
   wget --user=<email> --password=<token> https://package.ezmeral.hpe.com/
   releases/installer/mapr-setup.sh -P /tmp
   ```

3. **Change the file permissions so that you can run the file.**

   ```
   chmod +x /tmp/mapr-setup.sh
   ```

4. **Run the `mapr-setup.sh` script to configure the node to run the Installer**. Run the following command as the `root` user from the directory that contains the script. You must include your HPE Passport email and token and specify the name of the internet repository. The Installer remembers this information for later use. The script prompts you for some information. If you have not used this script before, consider reviewing Using mapr-setup.sh on page 5589 to be prepared.

   ```
   /tmp/mapr-setup.sh -r https://<email>:<token>@package.ezmeral.hpe.com/
   releases/
   ```

5. **Start the Installer.** Open the Installer URL:

   ```
   https://<Installer Node hostname/IPaddress>:9443
   ```

   You are prompted to log in as the cluster administrator user that you configured while running the `mapr-setup.sh` script.

Other Tasks You Can Perform with the Installer

Once the initial installation completes, you can use the same Installer URL to upgrade the cluster, apply a patch, or add nodes and additional services:

Use this option	To
Extend Cluster	Add a host to an existing cluster.
Incremental Install	Add or upgrade services that are already installed on the cluster.
Maintenance Update	Update your cluster to a new patch version of core or apply a patch.
Version Upgrade	Upgrade the cluster to a newer data-fabric release, apply a patch, and upgrade services that are already installed on the cluster.
Shutdown	Stop the data-fabric services on the cluster.
Uninstall	Remove existing data-fabric software before proceeding with a new installation.

NOTE: The Installer definitions are updated frequently. See Updating the Installer on page 5595 to get the latest ecosystem components and data-fabric software.

HPE Privacy Statement

To learn how HPE uses, shares, transfers, and manages personal information, see the HPE Privacy Statement.

last-updated: Jun 06, 2024

Getting Started with the Installer

This section describes things you need to do to start using the Installer.

Installer Prerequisites and Guidelines

The node on which you run the installer and the nodes you plan to include in your cluster must meet certain user, connectivity, and security requirements.

Installer Requirements

The node that runs the Installer must meet the following requirements:

Installer Node	Beginning with Installer 1.6, the node that runs the Installer does not need to be one of the nodes you plan to install the cluster on. Ensure that the default umask for the root user is set to `0022` on all nodes in the cluster. You can change the umask setting in the `/etc/profile` file, or in the `.cshrc` or `.login` file. The `root` user must have a `0022` umask because the cluster admin user requires access to all files and directories under the `/opt/mapr` directory, even those initially created by `root` services. Note also that the Installer is not FIPS compliant, and is not supported to run on a FIPS-enabled node.
Package Dependencies	Depending on the operating system, the Installer requires the following packages. If these packages are not found, the Installer attempts to download them from Internet repositories:

Ubuntu Nodes	Red Hat / CentOS Nodes	SLES Nodes
• ca-certificates • curl* • debianutils • dnsutils • iputils-arping • libnss3 • libssl1.0.0 • libsysfs2 • netcat • nfs-common • ntp • ntpdate • openssl • python-dev • python-pycurl • sdparm • sudo • syslinux • sysstat • uuid-runtime • wget	• curl* • device-mapper • iputils • libsysfs • lvm2 • nc • nfs-utils • ntp • nss • openssl • python-devel • sdparm • sudo • syslinux • sysstat • wget • which • yum-utils • compat-openssl10 (required only when running MapR 6.1.x on RHEL version 8 and above)	• ca-certificates • curl* • device-mapper • iputils • libopenssl1_0_0 • sysfsutils • lvm2 • mozilla-nss • nfs-client • ntp • sdparm • sudo • syslinux • sysstat • util-linux • wget • libfreebl3

*The curl version must be greater than 7.51.0.

Repository Connectivity

The Installer requires connectivity to valid repositories for the:

- Linux operating system
- Core
- Ecosystem Pack (EEP)

The Installer can connect to an Internet repository or to a preinstalled local repository, as described in Using a Local, Shared Repository With the Installer on page 5603. If the Installer dependencies and

last-updated: Jun 06, 2024

packages are present, but there is no connectivity to an OS repository, the Installer fails with the following message:

```
ERROR: Unable to install dependencies
(installer). Ensure that a core
OS repo is enabled and retry
mapr-setup.sh
```

Java

Installer 1.14 and later require Java JDK 11 or an equivalent Java distribution. Before using Installer 1.14 on Ubuntu 16.04 nodes, you must manually install the JDK. If you are using Installer 1.14 on RHEL/CentOS or SLES, the Installer installs OpenJDK 11 for you.

For more information about the supported Java JDK versions, see the Java Support Matrix on page 5764 and Java on page 172.

SSH Access

The Installer must have SSH access to all nodes that you want to include in the cluster.

Port Availability

Port 9443 or the non-default port that you configure using `mapr-setup.sh` must be accessible on the Installer node to all nodes that you want to include in the cluster.

Files Extracted into /tmp Require Execute Privileges

Do not mount `/tmp` with the `noexec` option. The HPE Ezmeral Data Fabric extracts certain files into `/tmp` and must run them from `/tmp`. Some processes can fail if `noexec` is set for `/tmp` because some files extracted into `/tmp` require execute privileges. In addition, if you use the `java.io.tmpdir` variable to change the location of the temporary directory used by Java processes, then the newly specified temporary directory must not be mounted with the `noexec` option.

Perform the following steps to change the location of the temporary directory used by Java processes using java.io.tmpdir variable:

1. Create a custom tmp directory for mapr and set its permission similar to /tmp.

   ```
   # mkdir /opt/mapr/tmp
   # chmod 1777 /opt/mapr/tmp
   ```

2. Set the custom `tmp` directory as `java.io.tmpdir`.

   a. For Java version 8 and previous, append the following command to `/opt/mapr/conf/env_override.sh` location.

      ```
      export
      JAVA_OPTIONS="-Djava.io.tmpdir=
      /opt/mapr/tmp"
      ```

last-updated: Jun 06, 2024

b. For Java version 9 and later, run the following command:

```
export
JDK_JAVA_OPTIONS="-Djava.io.tmp
dir=/opt/mapr/tmp"
```

3. Restart `mapr-warden` service on the node.

NOTE: You cannot hide the `Picked up _JAVA_OPTIONS: <...>` message due to Java sources implementation.

Supported Web Browsers

Once the Installer is installed and configured, you can use the following web browsers to access the Installer web interface:

- Safari
- Firefox
- Chrome

Cluster Admin User Requirements

The installation process requires a valid cluster admin user to be present on all nodes in the cluster. The Installer can create a user (the `mapr` user) for you or use a user that you have created. If you choose to create a cluster admin user, make sure the following conditions are met:

- The user must have a home directory and a password.
- The user must be present on all nodes in the cluster.
- The numeric user and group IDs (MAPR_UID and MAPR_GID) must be configured for the user, and these values must match on all nodes.
- The `mapr` user and `root` user must be configured to use bash. Other shells are not supported.

If the user is not a valid user, installation errors can result. For information about creating the user, see Managing Users and Groups on page 1026.

If you choose to have the Installer create the user, the Installer runs the following command to add a local user to serve as the cluster admin user:

```
useradd -m -u $MAPR_UID -g $MAPR_GID -G $(stat -c '%G' /etc/shadow)
$MAPR_USER
```

In this command:

- MAPR_USER defaults to `mapr`.
- MAPR_UID defaults to 5000.
- MAPR_GID defaults to 5000.
- The home directory is typically `/home/mapr`.

last-updated: Jun 06, 2024

The installer also adds the following to the MAPR_USER `.bashrc` file:

```
[[ -f /opt/mapr/conf/env.sh ]] && . /opt/mapr/conf/env.sh
```

Node Requirements

Nodes that you want to include in the cluster must meet the following criteria:

Fully Qualified Domain Names (FQDNs)	The nodes are expressed as fully-qualified domain names (FQDNs), as described in Connectivity on page 171. DO NOT specify hostnames as aliases or IP addresses.
OS and Security Updates	Nodes are configured to accept operating system and security updates. They must also be patched with the latest security fixes. See your operating-system vendor documentation for details.
Disk Space Requirements	Nodes meet the requirements listed in Preparing Each Node. The Installer verifies the requirements prior to installation. OS-partition, disk, and swap-space requirements are the same whether you install the cluster manually or by using the Installer. See Minimum Disk Space on page 170. For data disks, Installer versions 1.12.0.0 and later require a minimum disk size that is equal to the physical memory on the node. If a data disk does not meet the minimum disk size requirement, a verification error is generated.
Access to the Installer Node	Nodes have HTTPS access to the Installer node over port 9443.
Proxy Server Requirements	If nodes in the cluster use an HTTP proxy server, the nodes must also meet the following requirements:

last-updated: Jun 06, 2024

- The no_proxy environment variable must be set.

  Nodes in the cluster need to be able to communicate without the use of a proxy. If the `https_proxy` and `http_proxy` environment variable is set for nodes in the cluster, you must also set the `no_proxy` environment variable for the cluster admin user and the `root` user on each node. Configure the `no_proxy` environment variable to the IP range of the nodes or to the sub-domain that contains the nodes.

  In addition, you must follow this guideline from the Python documentation: "The `no_proxy` environment variable can be used to specify hosts which shouldn't be reached via proxy; if set, it should be a comma-separated list of hostname suffixes, optionally with `:port` appended, for example `cern.ch,ncsa.uiuc.edu,some.host:8080`."

  For cloud-based clusters (Amazon EC2, Google Compute Engine (GCE), and Microsoft Azure), you must include this entry in the no-proxy configuration:

  ```
  169.254.169.254
  ```

- The global proxy for package repositories must be set.

  The Installer creates repository files. However, the proxy setting is not configured for each repository. Therefore, configure global proxy settings on each node in the cluster.

  - On CentOS/RedHat, set global proxy settings in `/etc/yum.conf`.
  - On Ubuntu, set global proxy settings in `/etc/apt/apt.conf`.

Enabling Package Repositories for SLES 15

Before using the Installer for a new data-fabric installation on SLES 15 SP2, run the following command on all nodes to enable the Python 2 package repository. You must also run the command on the Installer node if the Installer node is not part of the cluster and is running SLES 15 SP2 (or a later supported service pack):

```
SUSEConnect -p
sle-module-python2/15.<version>/x86_64
```

If you are developing applications on the cluster, run the following command on all nodes:

```
SUSEConnect -p
sle-module-development-tools/
15.<version>/x86_64
```

To view the available SLES modules and learn how to enable or disable them, use the `SUSEConnect -l` command.

Security Requirements

Before installing or upgrading software using the Installer, make sure that you have reviewed the list of known vulnerabilities in Security Vulnerabilities on page 6184. If a vulnerability applies to your release, contact your support representative for a fix, and apply the fix immediately, if applicable.

Cloud Requirements

When you run the Installer on nodes in the cloud, you must:

- **Verify that port 9443 is open**.

  The Installer requires that this port is available.

- **Ensure that the Installer and service UI URLs should refer to an external URL and not an internal URL.**

  For example, when you open the Installer URL, replace any internal hostname or IP address with its associated external address. For Amazon EC2 and Google Compute Engine (GCE) clusters, the Installer automatically translates internal addresses to external addresses.

- **On the Configure Nodes page of the Installer web interface, make sure that you do the following:**
  - Define each node using a fully-qualified domain name (FQDN) and internal, resolvable hostnames, as described in Connectivity on page 171.
  - For the remote authentication, use the same user ID and private key that you use to ssh into your cloud instances. This user must be `root` or a user with `sudo` permissions.

Related tasks

Checking the Installer Version on page 5597
Some Installer features require you to use the latest version of the Installer. You can check the Installer version easily from within the user interface.

Related reference

Installer Support Matrix on page 5770
The tables on this page show the operating systems that are supported by the Installer.

Selecting an Installer Version to Use

Beginning with the EEP 6.2.0 release, several Installer versions are available for use. The version that you use depends on your current core version and whether or not you need to upgrade using the Installer or Stanzas.

Choosing an Installer Version

In general, you should always use the latest available Installer version. The latest Installer version provides access to the latest Ecosystem Packs (EEPs). To download the latest version, see Installer Downloads on page 5588 later on this page. For a list of recent Installer versions, see Installer Updates on page 5674.

However, the newer Installer versions do not support Release 5.x. You must use Installer 1.11.0.0 or 1.12.0.0 if your cluster is on a 5.x release. Installer 1.11.0.0 is the last version of the Installer to support installation for Release 5.x. Installer 1.12.0.0 is the last version of the installer to support upgrades from Release 5.2.x to Release 6.x.

If your cluster runs Release 5.2.x or a lower version of core, you must use Installer 1.11.0.0 to perform the following operations:

- New installs

last-updated: Jun 06, 2024

- Incremental installs
- Patch installs
- Maintenance updates
- Extend-cluster operations

This table describes how to select the Installer version based on your current software and your upgrade plans:

Core Version	Use This Installer Version
6.x and later	Except for Ubuntu 16.04 clusters, you may use the latest Installer version for all operations. See the Special Considerations for Ubuntu 16.04 Clusters on page 5588.
5.2.x	Use Installer 1.11.0.0 until you need to upgrade to Release 6.x. To upgrade to Release 6.x using the Installer, your cluster must have Release 5.2.x with EEP 3.0.1 or later. Before upgrading, update the Installer to 1.12.0.0.
5.1	Use Installer 1.11.0.0 for all operations, including upgrades to Release 5.2.x. Note that you must upgrade to 5.2.x with EEP 3.0.1 or later if you eventually want to upgrade to Release 6.x. After upgrading to 5.2.x, if you need to upgrade to Release 6.x, update the Installer to 1.12.0.0 before upgrading.

Special Considerations for Ubuntu 16.04 Clusters

As indicated in the Installer Support Matrix on page 5770, Installer 1.17 and later are supported only on Ubuntu 18.04 and 20.04. If your cluster is installed on Ubuntu 16.04:

- The Installer version that you can use depends on whether the Installer node is part of the cluster where you plan to install data-fabric software:

If the Installer node is . . .	Do this
Part of the cluster	Use Installer 1.16.0.x for all Installer operations.You cannot use Installer 1.17 or later unless you upgrade the cluster to Ubuntu 18.04 or 20.04.
Not part of the cluster	Use the latest Installer version on a node that is running any supported version of Ubuntu, RHEL or SLES to perform Installer operations on Ubuntu 16.04 nodes.

- If you need to upgrade from core 6.1.x to core 6.2, you must first upgrade your operating system to Ubuntu 18.04 or 20.04 and then install Installer 1.17 or later to perform the core software upgrade.

Installer Downloads

This table summarizes download information for the Installer:

Installer Version	Download Location	The `mapr-setup.sh` script provided in this location installs . . . .
Latest Installer	`package.ezmeral.hpe.com/releases/installer/`	The most current version of the Installer
1.18.0.x	`package.ezmeral.hpe.com/releases/installer-v1.18.0`	Installer 1.18.0.x
1.17.0.x	`package.ezmeral.hpe.com/releases/installer-v1.17`	Installer 1.17.0.3
Installer 1.16.0.x	`package.ezmeral.hpe.com/releases/installer-v1.16`	Installer 1.16.0.2

Installer 1.12.0.0	`package.ezmeral.hpe.com/releases/installer-v1.12.0`	Installer 1.12.0.0
Installer 1.11.0.0	`package.ezmeral.hpe.com/releases/installer-v1.11.0`	Installer 1.11.0.0

Downloading Older Versions of the Installer

By default, the `mapr-setup.sh` file provided in the `installer-v<version>/` directories in `http://package.ezmeral.hpe.com/releases/` installs the most current version of the Installer – and *not* the version for which the directory is named.

However, you can download older Installer versions by using the latest `mapr-setup.sh`:

1. Download the 1.17 or later version of `mapr-setup.sh`. See Installer on page 5579.
2. Add the following environmental variable to your current shell:

   ```
   export MAPR_INSTALLER_REPO_DIR=installer-v<version>
   ```

   The `export` command tells `mapr-setup.sh` to install the Installer package from the directory you specify. For example, the following command causes `mapr-setup.sh` to install the v1.11.0 Installer:

   ```
   export MAPR_INSTALLER_REPO_DIR=installer-v1.11.0
   ```

3. Run `mapr-setup.sh` as described in Installer on page 5579 to install the Installer version you specified using the `export` command.

Using mapr-setup.sh

This topic describes how you can use and run the Installer setup script.

Before you can run the Installer, you must run the `mapr-setup.sh` script to set up the installation environment on a node that may or may not be part of the cluster. Then, you can run the Installer to perform the installation.

To download and run the `mapr-setup.sh` script, see Installer on page 5579.

last-updated: Jun 06, 2024

mapr-setup.sh

The `mapr-setup.sh` script performs the following steps to prepare the node to run the Installer:

1. Verifies and installs the operating system dependencies and Java requirements on the current node.
2. Checks for Internet connectivity to the remote repository.
   - If access to https://package.ezmeral.hpe.com/ is not available, the script prompts for the archive tarballs. Provide the full paths of these tarballs in a space-delimited list.
3. Asks for the hostname and port that cluster nodes can use to connect to the Installer node.
4. Asks for the cluster admin user account and creates the account if it does not exist. This account must exist or be created on each node in the cluster. (The cluster admin is the cluster administrator.)
5. Sets up a custom `yum` or `apt` repository.
   - If no archive file is provided, the script configures access to the https://package.ezmeral.hpe.com/ repository. For example, on RedHat / CentOS, the script creates the following remote repository: `/etc/yum.repos.d/mapr_installer.repo`
   - If archive files are provided, the script sets up a local repository.
6. Starts the Installer.

Syntax

```
/opt/mapr/installer/bin/mapr-setup.sh
[docker client]
[docker installer]
[-a <full_path_to_archive_file(s)>]
[install]
[reload]
[remove]
[update]
[-h]
[-i <full_path_to_installer_package>]
[-n]
[-p <hostname:port>]
[-r <repository_URL>]
[-y]
```

Options

In general, you should run the `mapr-setup.sh` script without using any additional options. Consider using the following options only if you have a known Internet connectivity issue, your Installer packages are not located in the default repository, or you need help with the installation process.

Option	Description
`docker client`	Use this option to create a PACC image.
`docker installer`	Use this option to create a Installer container.
`install`	Use this option to install the Installer and definition files. If you don't specify an option for `mapr-setup.sh`, the `install` option is invoked by default. **Example:** `./mapr-setup.sh install`

last-updated: Jun 06, 2024

Option	Description
`reload`	Use this option to reinstall the Installer and definition files. This option is helpful in debugging. No prompt is returned when you use this option. **Example:** `./mapr-setup.sh reload`
`remove`	Use this option to remove the Installer and definition files. This option does not remove the `mapr-setup.sh` script. **Example:** `./mapr-setup.sh remove`
`update`	Use this option to update the installer packages. The setup script checks https://package.ezmeral.hpe.com/ for new packages and installs the packages if they are available. **Example:** `./mapr-setup.sh update`

`-a|--archives`	Use this option to bypass the Internet connectivity check and directly create a local repository. Specify a space-delimited list of the full paths to the following archive files (the order of the files is important) as an argument to the option:
	• Installer archive
	• Ecosystem Pack (EEP) archive
	• MapR archive for the current release
	For more information, see Using a Local, Shared Repository With the Installer on page 5603.
	NOTE: Use this option when the Installer node does not have access to the Internet or is behind a restricted VPN or firewall.
	Example for Releases 5.2 and later:
	`./mapr-setup.sh -a mapr-installer-v1.5.201705041557.deb.tgz mapr-mep-v3.0.0.201704051422.deb.tgz mapr-v5.2.1GA.deb.tgz`
	Example for Releases 5.0 and 5.1:
	`./mapr-setup.sh -a mapr-5.0-5.1.201705082100.deb.tar.gz`
	For Releases 5.0 and 5.1, you only need to provide the core archive file.

`-h|--help`	Use this option to display the command-line help for the Installer. **NOTE:** If you use this option with other options, the Installer will ignore all options except for `-h`. **Example:** `./mapr-setup.sh -h`

last-updated: Jun 06, 2024

Option	Description
`-i|--install`	Use this option to override the Installer packages stored in the remote or local repository. This option take a space-delimited list of the two local packages needed to install the Installer (the order of the files is not important): • Installer package • Installer definitions package **Example:** `./mapr-setup.sh -i mapr-installer-definitions_1.5.201705021610_all.deb mapr-installer_1.5.201705021610_all.deb`
`-n|--noinet`	Use this option when you don't want `mapr-setup.sh` to fetch packages from the Internet. Instead of taking the files as an argument like `-a`, this option prompts you for a complete set of archive files (the order of the files is important): • Installer archive • Ecosystem Pack (EEP) archive • Core archive for the current release **NOTE:** Configure this option when the Installer node does not have access to the Internet or is behind a restricted VPN or firewall. If you use this option together with `-a`, `mapr-setup.sh` will ignore `-n`. **Example:** `./mapr-setup.sh -n`
`-p|--port`	This option specifies the `hostname:port` to use for installation-related communication between the Installer node and other nodes in the cluster. The Installer also adds the hostname provided as a default entry for the list of cluster nodes on the *Configure Nodes* page. Both the `hostname` and the `port` are not required when configuring this option; you can choose to configure one or both values. **NOTE:** Configure this option when the Installer node has multiple interfaces or hostnames and the result of `hostname` is not a value that other nodes in the cluster are able to communicate with. **Example:** `./mapr-setup.sh -p perfnode131.perf.lab:9441`
`-r|--repo`	Use the `-r` option to specify the repo (typically for a new installation). There is no longer a default repo: **Example:** `./mapr-setup.sh -r http://<email>:<token>@myrepo.download.pkgs/mapr/releases/`

Option	Description
`-R|--new_repo_url`	Specify a new repository URL for both ecosystem and core components. Use this option only with the `reload` command, including the required email and token, as indicated in Using the HPE Ezmeral Token-Authenticated Internet Repository on page 102. **Example:** `./mapr-setup.sh -R http://<email>:<token>@<new_url> reload`
`-v|--verbose`	Use this option when you want additional information about the setup process. **Example:** `./mapr-setup.sh -v`

`-x`	Use this option to run the setup script but change the cluster admin password to a value other than the default value. By default, the Installer creates the `mapr` user and sets the password to `mapr`. If the `mapr` user is present, you can use the following command to change the password. If the `mapr` user is not present, using the command creates the `mapr` user with the password that you specify:
	Example:
	`./mapr-setup.sh -x <mapr-password>`
	The following command runs the setup script, bypassing all prompts and using default values, but sets the `mapr` user password to `Adminpass`:
	`./mapr-setup.sh -x Adminpass -y`

`-y|--yes`	Use this option to bypass the Installer's usual prompts and immediately proceed with the default options. This option produces the same installation result as going through the `mapr-setup.sh` script prompts and choosing all of the default options, but with increased speed. **Example:** `./mapr-setup.sh -y`

Stopping mapr-setup.sh

If you need to stop `mapr-setup.sh` while it is running, press **Ctrl + C**. Depending on when you issue the **Ctrl + C** command, the script either stops or continues to execute until it is able to stop gracefully. You can run the script again or use the `remove` option, described earlier on this page, to remove the Installer and definition files and then rerun the script.

Another way to exit the script is to answer NO when the script prompts for a YES or NO reply. For example, when the script asks if you want to upgrade dependent packages, if you reply NO, the script exits.

After Running mapr-setup.sh

To validate that the Installer started correctly, do one of the following:

- Log in to the Installer web interface using the cluster admin user name and password.
- Run the Installer Stanza `export`command using the cluster admin user name and password.

If the Installer does not start up correctly, check the logs. See Logs for the Installer on page 5665.

last-updated: Jun 06, 2024

If you want to change any parameter that you provided to `mapr-setup.sh` on a previous run (for example, the repository URL, the cluster admin user name, or another parameter), you can safely rerun `mapr-setup.sh` with the new parameters. Doing so updates the Installer configuration to use the new parameters. However, do not rerun `mapr-setup.sh` while an installation or a `probe` command is in progress.

Installer Web Interface

When you run the Installer web interface, it performs the following tasks:

1. Displays the services and ecosystem components that you can install based on the software version that you select.
2. Provides the option to install Monitoring.
3. Guides you through node and cluster configuration.
4. Verifies that each node meets the node requirements.
5. Sets a default, configurable service layout across the nodes in the cluster based on the requirements of each service.
6. Installs or upgrades the software and associated operating-system dependencies.
7. If you chose to install a trial or community license, it will attempt to apply the license to your cluster.

Installer Stanzas

Running `mapr-setup.sh` also installs Installer Stanzas. Stanzas give you a script-based tool to perform all the installation tasks you can perform using the Installer web interface. See Installer Stanzas on page 5700. In addition, Stanza commands make it possible to probe a cluster that was installed without using the Installer and use the `import` command to set up the installer database. See Using probe and import to Generate the Installer Database on page 5671.

Installer Components

The Installer uses the following components to set up the installation environment:

Name	Filename	Description
Configuration Script	`mapr-setup.sh`	Script that configures a node to run the Installer. This includes setting up an Internet or local repository.
Installer Package	`mapr-installer-<version>`	Package that contains the Installer.
Installer Definitions Package	`mapr-installer-definitions-<version>`	Package that contains the list of software versions, services, and ecosystem components that you can install with the Installer.

Name	Filename	Description
Service Packages	various	If you use a remote repository, the Installer accesses the installation packages from https://package.ezmeral.hpe.com/. If you use a local repository, the Installer accesses the installation packages from the local repository. The `mapr-setup.sh` script creates the local repository with the packages available in the archive files that you provide to the `mapr-setup.sh` script. For more information, see Using a Local, Shared Repository With the Installer on page 5603.

Updating the Installer

Update the Installer to include the latest ecosystem packages and installer fixes. Once you update the Installer, you can install ecosystem components and software versions that were made available after you first configured the Installer.

To check the version of the Installer, see Checking the Installer Version on page 5597.

Before Updating the Installer

As a best practice, create a backup of the cluster configuration before updating the Installer. This backup can be useful if there are issues with the Installer update:

1. Using a browser, log on to the installer:

   ```
   https:://<Installer Node hostname/IPaddress>:9443
   ```

2. Click **Support > Export State**. The cluster state is downloaded as `stanza.yaml`.

For more information about importing or exporting the cluster state, see Importing or Exporting the Cluster State on page 5634.

Update the Installer Using an Internet Repository

Use the following steps to update an Installer that points to the HPE Internet repository:

1. Rename or delete the `mapr-setup.sh` script for the current version of the Installer.
2. Download the latest version of `mapr-setup.sh` using the steps in Installer on page 5579.
3. Run the `mapr-setup.sh -R reload` command to update the core and ecosystem repos in the `/opt/mapr/installer/data/properties.json` file:

   IMPORTANT: To access the Data Fabric internet repository, you must specify the email and token of an HPE Passport account. For more information, see Using the HPE Ezmeral Token-Authenticated Internet Repository on page 102.

   ```
   bash /tmp/mapr-setup.sh -R https://
   <email>:<token>@package.ezmeral.hpe.com/releases reload
   ```

4. Run the `mapr-setup.sh -r update` command to update the Installer packages:

```
bash /tmp/mapr-setup.sh -r https://
<email>:<token>@package.ezmeral.hpe.com/releases update
```

Note the following known issue related to the use of `mapr-setup.sh -r update`: Upgrading the Ezmeral Data Fabric Installer packages results in Installer GUI losing the cluster.

Once the update is complete, open the Installer URL (`https://<hostname/IPaddress>:9443`) to update the cluster.

Update the Installer Using a Local Repository

If the node that runs the Installer uses a local repository, perform the following manual steps to get the latest packages for the cluster version that you are updating or upgrading to:

1. Download the latest versions of the following archive files.

For Releases 5.2 and later	• **The Core archive file.** Download the core archive file `mapr-<version>GA.<dep|rpm>.tgz` from one of the following locations, based on the operating system of the node:
	  • https://package.ezmeral.hpe.com/releases/v<version>/redhat/
	  • https://package.ezmeral.hpe.com/releases/v<version>/ubuntu/
	  NOTE: The package `mapr-v<version>GA-upgrade.<rpm/deb>.tgz` is not for use with the Installer.
	• **The Installer archive file**. Based on the operating system of the node, download `mapr-installer-<version>.<yyyymmdd>.<dep|rpm>.tgz` from one of the following locations:
	  • https://package.ezmeral.hpe.com/releases/installer/redhat/
	  • https://package.ezmeral.hpe.com/releases/installer/ubuntu/
	• **The Ecosystem Pack (EEP) archive file**. Based on the operating system of the node, download `mapr-mep-<version>.<yyyymmdd>.<dep|rpm>.tgz` from one of the following locations:
	  • https://package.ezmeral.hpe.com/releases/MEP/MEP-<version>/redhat
	  • https://package.ezmeral.hpe.com/releases/MEP/MEP-<version>/ubuntu

2. Run the following command:

```
bash /opt/mapr/installer/bin/mapr-setup.sh -a <full path to each archive
file> update
```

For more information about `mapr-setup.sh` options, see Using mapr-setup.sh on page 5589.

last-updated: Jun 06, 2024

3. Once the update is complete, open the Installer URL (`https://<hostname/IPaddress>:9443`) to update the cluster.

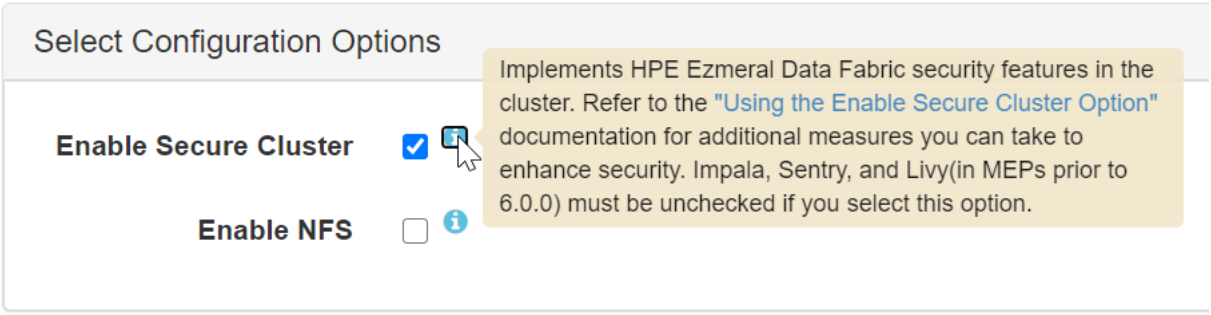
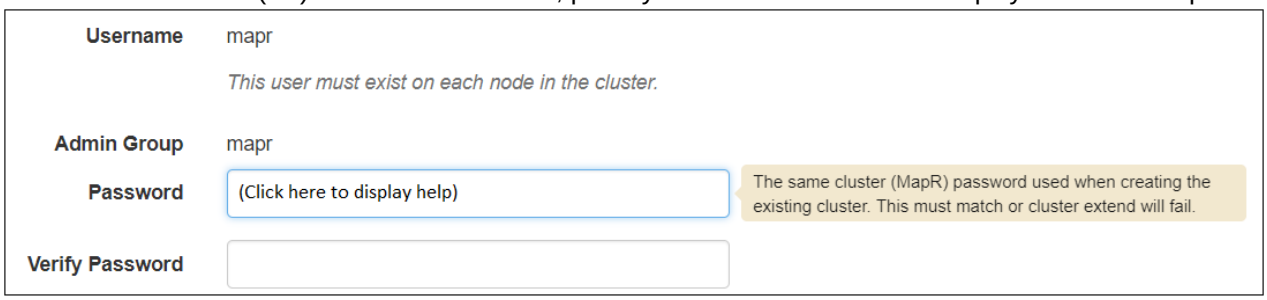
Online Help for Installer Fields

This page describes field-level help for the Installer.

To get more out of using the Installer, hold your cursor over the information icon ( ) next to each field or option. The help text can make it easier for you to use Installer options and fill in required information. For example:



If no information icon ( ) is visible near a field, place your cursor in the field to display the online help:



Checking the Installer Version

Some Installer features require you to use the latest version of the Installer. You can check the Installer version easily from within the user interface.

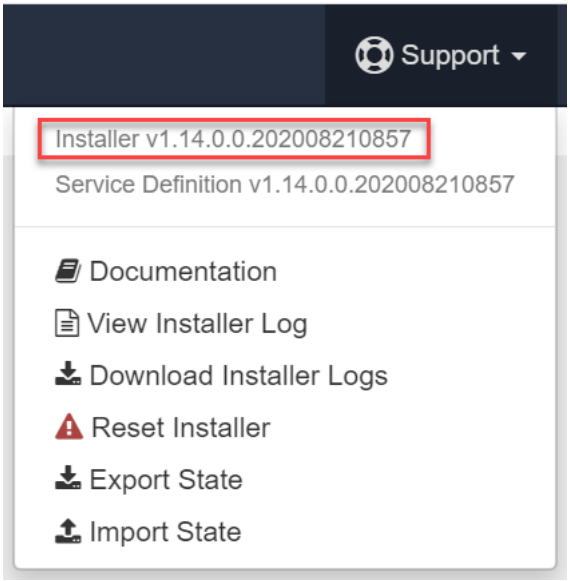
About this task

To check the version of the currently installed Installer:

Procedure

1. From the Installer web-based interface, click **Support**. The drop-down menu shows the Installer version:

last-updated: Jun 06, 2024



2. **Optional:** Check your version against the recently released versions to see if a newer version is available. To update the Installer, see Updating the Installer on page 5595.

Related concepts

Selecting an Installer Version to Use on page 5587
Beginning with the EEP 6.2.0 release, several Installer versions are available for use. The version that you use depends on your current core version and whether or not you need to upgrade using the Installer or Stanzas.

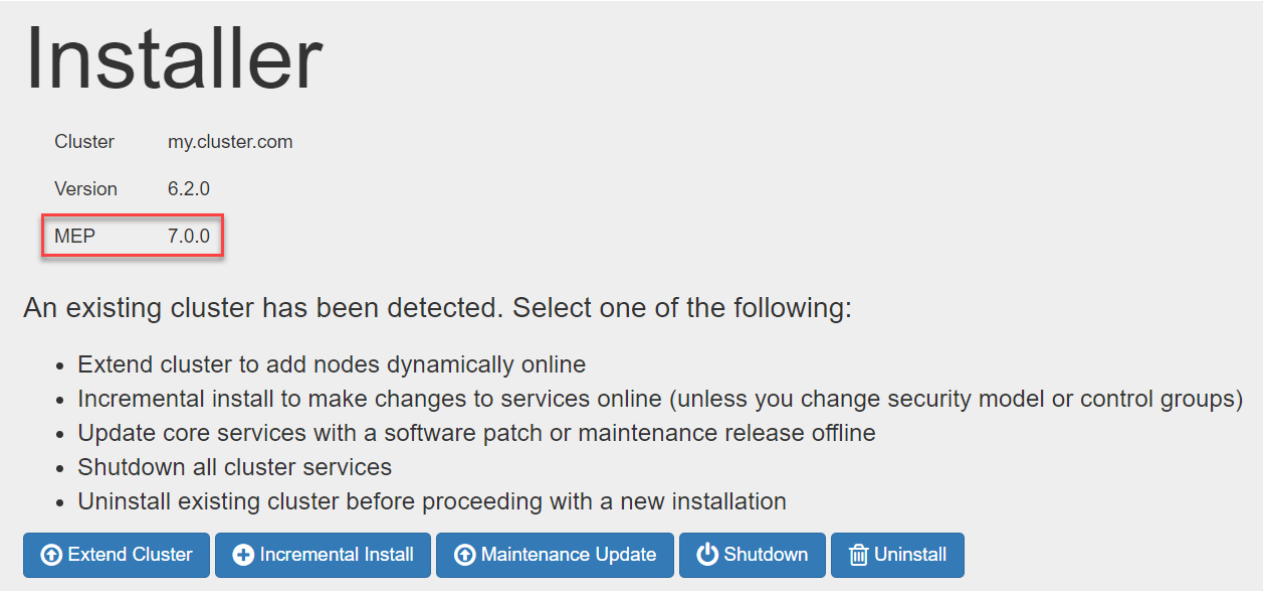
Checking the EEP Version on page 5598
Some Installer operations require you to know the version of the currently installed Ecosystem Pack (EEP). You can check the EEP version easily from within the Installer user interface or derive the EEP version from your repository information.

Checking the EEP Version

Some Installer operations require you to know the version of the currently installed Ecosystem Pack (EEP). You can check the EEP version easily from within the Installer user interface or derive the EEP version from your repository information.

Checking the EEP Version Using the Installer

The Control System does not indicate the version of the currently installed EEP. However, if you used the Installer to install the cluster, you can view the EEP version on the home page:



Checking the EEP Version in the Repository

If you installed the cluster manually, you can learn the EEP version by checking the `/etc/yum.repos.d/mapr_ecosystem.repo` file:

```
cd /etc/yum.repos.d/
ls -l
    total 52
    -rw-r--r-- 1 root root 1664 Apr 28  2018 CentOS-Base.repo
    -rw-r--r-- 1 root root 1309 Apr 28  2018 CentOS-CR.repo
    -rw-r--r-- 1 root root  649 Apr 28  2018 CentOS-Debuginfo.repo
    -rw-r--r-- 1 root root  314 Apr 28  2018 CentOS-fasttrack.repo
    -rw-r--r-- 1 root root  630 Apr 28  2018 CentOS-Media.repo
    -rw-r--r-- 1 root root 1331 Apr 28  2018 CentOS-Sources.repo
    -rw-r--r-- 1 root root 4768 Apr 28  2018 CentOS-Vault.repo
    -rw-r--r-- 1 root root  957 Dec 27  2016 epel.repo
    -rw-r--r-- 1 root root 1056 Dec 27  2016 epel-testing.repo
    -rw-r--r-- 1 root root  169 May 14 10:04 mapr_core.repo
    -rw-r--r-- 1 root root  186 May 14 10:04 mapr_ecosystem.repo
   -rw-r--r-- 1 root root  171 May 13 11:25 mapr_installer.repo
more mapr_ecosystem.repo

    [MapR_Ecosystem]
    name = MapR Ecosystem Components
    baseurl = https://package.ezmeral.hpe.com/releases/MEP/MEP-6.2.0/redhat
    gpgcheck = 1
    enabled = 1
    protected = 1
```

Checking the EEP Version Using the Installed Packages

If the `/etc/yum.repos.d/mapr_ecosystem.repo` file is not available for any reason, another way to learn the currently installed EEP version is to check the versions of the installed packages. Use one of the following commands to display the package versions:

OS	Command
On CentOS / RHEL	`yum list installed`
On SLES	`zypper packages --installed-only`

last-updated: Jun 06, 2024

On Ubuntu	`apt list --installed`

For example:

```
yum list installed
    Installed Packages
    ...
    mapr-cldb.x86_64                        6.2.0.0.20200618050710.GA-1
@MapR_Core
    mapr-client.x86_64                      6.2.0.0.20200618050710.GA-1
@MapR_Core
    mapr-core.x86_64                        6.2.0.0.20200618050710.GA-1
@MapR_Core
    mapr-core-internal.x86_64               6.2.0.0.20200618050710.GA-1
@MapR_Core
    mapr-fileserver.x86_64                  6.2.0.0.20200618050710.GA-1
@MapR_Core
    mapr-hadoop-util.x86_64                 2.7.4.0.202006180214-1
@MapR_Ecos
           ystem
    mapr-librdkafka.x86_64                  0.11.3.202006031114-1
@MapR_Core
    mapr-zk-internal.x86_64                 6.2.0.0.20200618050710.GA-1
@MapR_Core
    mapr-zookeeper.x86_64                   6.2.0.0.20200618050710.GA-1
@MapR_Core
    ...
```

Then compare the package versions against the component versions in the repository. Some package versions can be the same for multiple EEPs, so it is best to compare multiple packages to confirm the installed EEP.

You must download and run the Installer setup script before you can start the Installer web interface or issue Installer Stanza commands.

Related tasks

Checking the Installer Version on page 5597
Some Installer features require you to use the latest version of the Installer. You can check the Installer version easily from within the user interface.

Related reference

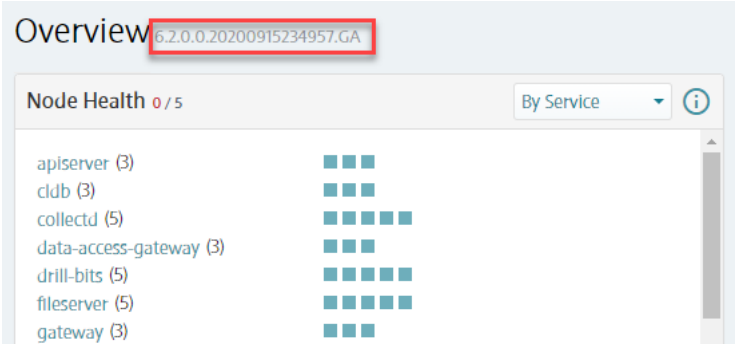
EEP Support and Lifecycle Status on page 5728
This page shows the EEPs that are supported for different core releases and the current lifecycle status for each EEP.

Checking the Core Version

Some maintenance operations require you to know the version of the currently installed HPE Ezmeral Data Fabricrelease (sometimes referred to as the "core version"). You can check the core version easily from within the Control System or Installer user interface or identify the version from your installed packages.

Checking the Core Version Using the Control System

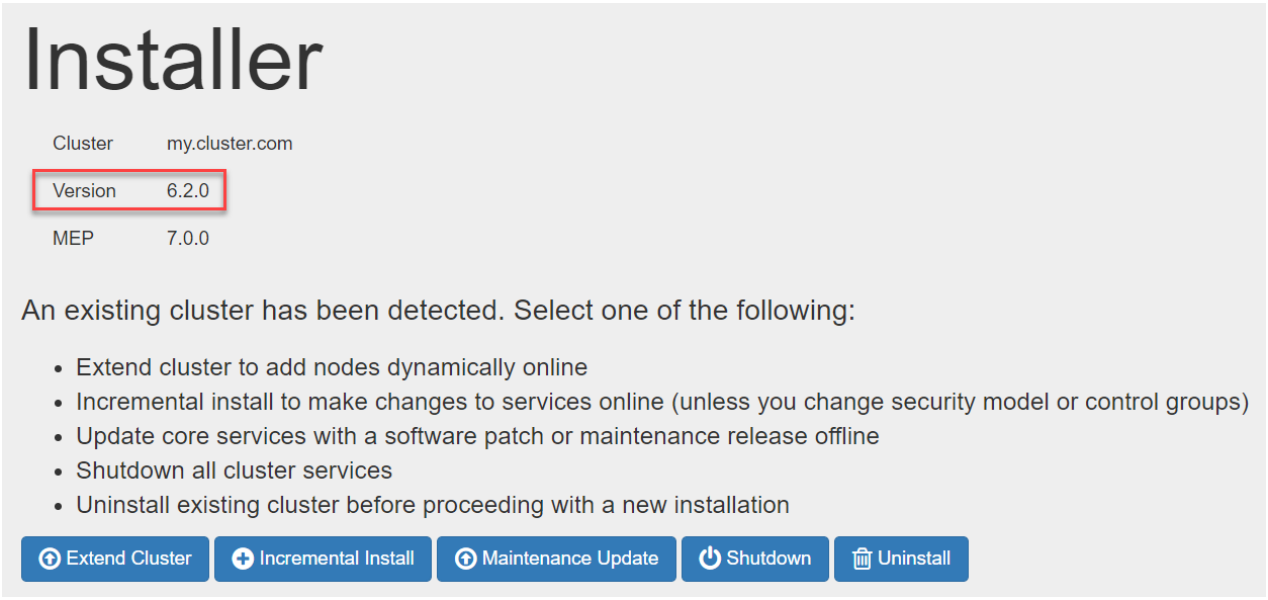
The Control System displays the core version on the **Overview** page:



To connect to the Control System, see Setting Up the Control System on page 454.

Checking the Core Version Using the Installer

If you used the Installer to install the cluster, you can view the core version on the home page:



To set up the Installer, see Installer on page 5579.

Checking the Core Version Using maprcli

Another way to view the currently installed core version is to use the `maprcli dashboard info` command:

```
cd /opt/mapr/bin
maprcli dashboard info -json
    {
        "timestamp":1586880602331,
        "timeofday":"2020-04-14 09:10:02.331 GMT-0700 AM",
        "status":"OK",
        "total":1,
        "data":[
                {
                        "version":"6.1.0.20180926230239.GA",
                        "cluster":{
                                "name":"bridget.cluster.com",
                                "secure":true,
                                "dare":false,
                                "ip":"10.10.82.24",
                                "id":"6083111376716482211",
```

last-updated: Jun 06, 2024

```
                                "nodesUsed":1,
                                "totalNodesAllowed":-1
                        },
                        "volumes":{
                                "mounted":{
                                        "total":16,
                                        "size":1543
                                },
                                "unmounted":{
                                        "total":3,
                                        "size":1
                                }
                        },
                        "utilization":{
                                "cpu":{
                                        "util":38,
                                        "total":8,
                                        "active":3
                                },
    ...
```

Checking the Core Version Using the Installed Packages

Another way to view the currently installed core version is to check the versions of the installed `mapr-core.x86_64` or `mapr-core-internal.x86_64` packages. Use one of the following commands to display the package versions:

On CentOS / Red Hat	`yum list installed`
On SLES	`zypper packages --installed-only`
On Ubuntu	`apt list --installed`

For example:

```
yum list installed
    Installed Packages
    ...
    mapr-cldb.x86_64                    6.2.0.0.20200618050710.GA-1
@MapR_Core
    mapr-client.x86_64                  6.2.0.0.20200618050710.GA-1
@MapR_Core
    mapr-core.x86_64                    6.2.0.0.20200618050710.GA-1
@MapR_Core
    mapr-core-internal.x86_64           6.2.0.0.20200618050710.GA-1
@MapR_Core
    mapr-fileserver.x86_64              6.2.0.0.20200618050710.GA-1
@MapR_Core
    mapr-hadoop-util.x86_64             2.7.4.0.202006180214-1
@MapR_Ecos
          ystem
    mapr-librdkafka.x86_64              0.11.3.202006031114-1
@MapR_Core
    mapr-zk-internal.x86_64             6.2.0.0.20200618050710.GA-1
@MapR_Core
    mapr-zookeeper.x86_64               6.2.0.0.20200618050710.GA-1
@MapR_Core
    ...
```

Related concepts

Checking the EEP Version on page 5598

last-updated: Jun 06, 2024

Some Installer operations require you to know the version of the currently installed Ecosystem Pack (EEP). You can check the EEP version easily from within the Installer user interface or derive the EEP version from your repository information.

Using a Local, Shared Repository With the Installer
The Installer can use a local repository instead of an internet repository.

When you run the `mapr-setup.sh` script, it attempts to connect to https://package.ezmeral.hpe.com/ and configures an internet repository. If there is no internet connectivity, the script asks for archive files so that it can create a local repository.

IMPORTANT: To access the Data Fabric internet repository, you must specify the email and token of an HPE Passport account. For more information, see Using the HPE Ezmeral Token-Authenticated Internet Repository on page 102.

NOTE: Passing `-a <full path each archive file>` to the `mapr-setup.sh` script bypasses the internet connectivity check and automatically creates a local repository with the provided archive files.

To install with a local, shared repository, the node that runs `mapr-setup.sh` needs the following:

- **Any OS dependencies or Java Development Kit (JDK) packages that are required.**
- **A webserver.** The script attempts to install a webserver on the node if a webserver is not available. The webserver is needed to provide the package files to each node in the cluster. Note that this webserver is not configured to start automatically after a server restart. However, you can start the webserver manually by using the `systemctl start httpd` command.
- **Archive file(s).** To install release 5.2 and later, you need to download mutiple archive files.

For release 5.2 and later	• **The Core archive file.** Download the archive file `mapr-<version>GA.<dep|rpm>.tgz` from one of the following locations, based on the operating system of the node:
	  • `https://package.ezmeral.hpe.com/releases/v.<version>/redhat/`
	  • `https://package.ezmeral.hpe.com/releases/v.<version>/ubuntu/`
	  • `https://package.ezmeral.hpe.com/releases/v.<version>/suse/`
	
	NOTE: The package `mapr-v<version>GA-upgrade.<rpm/deb>.tgz` is not for use with the Installer.
	• **The Installer archive file**. Based on the operating system of the node, download `mapr-installer-<version>.<yyyymmdd>.<dep|rpm>.tgz` from one of the following locations:
	  • `https://package.ezmeral.hpe.com/releases/installer/redhat/`
	  • `https://package.ezmeral.hpe.com/releases/installer/ubuntu/`
	• **The Ecosystem Pack (EEP) archive file**. Based on the operating system of the node, download `mapr-mep-<version>.<yyyymmdd>.<dep|rpm>.tgz` from one of the following locations:
	  • `https://package.ezmeral.hpe.com/releases/MEP/MEP-<version>/redhat`
	  • `https://package.ezmeral.hpe.com/releases/MEP/MEP-<version>/ubuntu`
	  • `https://package.ezmeral.hpe.com/releases/MEP/MEP-<version>/suse`
	
	The MEP-<version> directory can be represented by a 2-digit number or a 3-digit number. The 3-digit directory contains a fixed MEP version, including patches, and is not continuously updated. The 2-digit EEP directory points to the latest MEP and patches and is continuously updated. See Understanding Two-Digit and Three-Digit EEPs on page 5638.

- **The `mapr-setup.sh` script.**

NOTE: Red Hat clusters must have access to a local EPEL repository, as described in Adding the Data Fabric Repository on RHEL, CentOS, or Oracle Linux on page 183. The EPEL repository enables installation of these packages:

- clustershell
- pdsh
- pdsh-rcmd-ssh
- sshpass*

last-updated: Jun 06, 2024

*Before installing a cluster on a SLES image, you must install `sshpass`, as described in Adding the Data Fabric Repository on SUSE on page 184.

After downloading the `mapr-setup.sh` script and the archive files to the node that will run the Installer, run the following command from the directory that contains the `mapr-setup.sh` script:

```
bash ./mapr-setup.sh -a <full path to the archive files>
```

Installer FAQ

Review frequently asked questions about the Installer.

General

What is the difference between the Installer and the Quick Installer?	The Installer is a robust, user-friendly replacement for the Quick Installer. You can use the Installer to install a cluster with HPE Ezmeral Data Fabric services and ecosystem components. You can also use the Installer to update an existing cluster with additional nodes, HPE Ezmeral Data Fabric services, and ecosystem components. However, the Installer does not install the client.
Which versions of software can I install?	You can use the Installer to install core releases 6.x and 7.x. Earlier core releases have reached their "End of Maintenance" status. For more information about the supported versions of HPE Ezmeral Data Fabric core software, see Core Support and Lifecycle Status on page 5726. To understand which Installer versions can be used with older core versions, see Selecting an Installer Version to Use on page 5587.
Can I use the Installer to upgrade my cluster?	Yes. The Installer can be used to upgrade a cluster that was installed using the Installer or an Installer Stanza. See Upgrading Core With the Installer on page 320 for information about how to upgrade with the Installer. If the cluster was manually installed, you can install the Installer and enable it to be used with subsequent installations or upgrades by following the steps in Using probe and import to Generate the Installer Database on page 5671.
Can I use the Installer to install a patch?	Yes. See Applying a Patch Using the Installer on page 473.
Does the Installer support adding a "compute-only" node?	A compute-only node is a node that is capable of performing computational tasks but is not expected to perform long-term data storage. The Installer does not explicitly support adding a compute-only node to a cluster. However, you can effectively work around the issue by adding a node that has the file system and sufficient associated disk space. The disk space must be equal to or greater than the amount of physical memory on the node.

Preparing to Install

What are the Installer requirements?	See the Prerequisites.
What information should I have before I start?	The `mapr-setup.sh` script requests the following information:

last-updated: Jun 06, 2024

- The fully-qualified domain name for each host and the port number that other nodes in the cluster can use to connect to the Installer node.
- A user for the cluster admin user account. If the user account doesn't exist, the `mapr-setup.sh` script prompts for the UID, GID, group name, and password so that it can create the account.

The Installer requests the following information:

- The EEP that you want to install on a 5.2.x or later cluster
- The services that you want to install on the cluster
- Hostnames of the nodes that you want to include in the cluster (specify fully-qualified domain names as described in Connectivity on page 171)
- Credentials for the `root` user or a user with sudo privileges on each node in the cluster

What are the node requirements?

See the Prerequisites.

What are my options if I don't want to use an Internet repository?

See Using a Local, Shared Repository With the Installer.

Using the Installer

Which license edition applies to my installation?

As of release 5.1, licenses are categorized by new editions and modules that further define the features supported by an edition.

See the following table for descriptions of the license options. For more information about licensing, see HPE Ezmeral Data Fabric Software Licensing.

License Edition	Description
Community Edition	An unlimited, free, community-supported edition with one free NFS Gateway. This edition includes Hadoop, HPE Ezmeral Data Fabric Database, and HPE Ezmeral Data Fabric Streams. However, real-time global replication of HPE Ezmeral Data Fabric Database tables orHPE Ezmeral Data Fabric Streams is not included.
Enterprise Edition	Edition that enables enterprise-class features such as high availability, multi-tenancy, and disaster recovery. Each of the following modules for the Enterprise Edition unlocks a portion of the total platform capabilities:

last-updated: Jun 06, 2024

License Edition	Description
	Analytics Enables enterprise-class features for analytic use cases, such as highly-available NFS and support for services like YARN and MapReduce. **Database** Enables enterprise-class features for operational NoSQL database, with HPE Ezmeral Data Fabric Database JSON and binary tables, and real-time global database replication. **Streams** Enables enterprise-class features for publish/subscribe event streaming, with HPE Ezmeral Data Fabric Streams and real-time global stream replication. For more information about editions, see the **ALA** link at the bottom of this page.

last-updated: Jun 06, 2024

What happened to the M3, M5, M7, or Enterprise Edition licenses?

With the release of 5.1 and Streams, the licensing model has been simplified, allowing more choice in which specific features are licensed on a cluster.

See the following table to understand how the new licenses correspond to the legacy license editions that you are familiar with. For more information about licensing, see Product Licensing on page 6199. For more information about editions, see the **ALA** link at the bottom of this page.

Legacy Edition	New Edition & Module(s)
M3 or Community Edition	Community Edition. Starting in 5.1, the Converged Community Edition includes Streams.
M5 or Enterprise Edition	Enterprise Edition with Hadoop Module
M7 or Enterprise Database Edition	Enterprise Edition with Hadoop and Database modules

What expressions can I use to specify multiple nodes?

You can enter the following types of expressions to specify nodes:

- `[0-99]` => Expands hostnames to 0, 1, 2, ...99. The second delimiter allows one or more digits.
- `[00-99]` => Expands hostnames to 00,01,02,...99. Allows two or more digits of the same length
- `[a-z] or [A-Z]` => Expands hostnames to a,b,c,...z or A,B,C,...Z

To group hosts based on racks for performance or reliability, append ":" followed by the rack name to each expression.

Examples:

- `host1, host2, host3`
- `host[A-Z][0-99]` => hostA0, hostA1, hostA2 ,...hostZ99
- `host[000-333]` => host000, host001, host002, ... host333
- `host[0-3],otherhost[00-05]` => host0, host1, host2,...host3 and otherhost00,...otherhost05
- `host[0-5]:rack1,host[6-10]:rack2` => host1, host2, host3,...host5 on rack1. host6, host7, host8,...host10 on rack2

How do I change the service layout?

The Installer uses groups to organize nodes and services. A group is a set of services that you can run on one or more nodes. A service can only be assigned to one group.

On the **Configure Service Layout** page, you can use the **Advanced Configuration** option to drag and drop

last-updated: Jun 06, 2024

services between existing groups to specify where the services are to be installed. You can also create new groups or change the list of nodes assigned to a group.

NOTE: Some services can only be assigned to one node.

Can I install a single-master service, such as Hive, on multiple nodes?

When you use the Installer, single-master services are added to the default MASTER group. By design, only one node can be assigned to the MASTER group.

To install a single-master service on more than one node:

1. On the Configure Service Layout page, create a new group.
2. Assign multiple nodes to the new group.
3. Drag the single-master service to the new group.

Can I install a secure cluster with the Installer?

Yes. Installer versions 1.10 and later support security by default.

Are there limitations to what you can do when you update an existing cluster?

See the restrictions documented in Using the Incremental Install Function on page 5630.

How do I uninstall the Installer?

See Uninstalling Software Using the Installer Uninstall Button on page 5640. If the installer node is part of the cluster, the Installer packages can remain on the installer node after the cluster is uninstalled.

If you have uninstalled the cluster, you can also run one of the following commands to uninstall the Installer packages from the installer node:

- On CentOS / Red Hat:

```
yum remove 'mapr-installer*'
```

- On Ubuntu:

```
apt-get remove 'mapr-installer*'
```

- On SLES

```
zypper remove 'mapr-installer*'
```

Troubleshooting

What can I do if I need to rerun mapr-setup.sh with a new repository URL and the script still points to the old URL?

The `/opt/mapr/installer/data/properties.json` file stores information such as the user ID of the cluster administrator, the user ID of the Installer, the OS type, Internet access information, and the repository URLs for Core and the ecosystem components. Once a repository URL has been stored in `properties.json`, the Installer assumes that the URL will not change. Rerunning the setup script does not update the URL. Even upgrading the installer packages does not update the repository URL in

last-updated: Jun 06, 2024

`properties.json`. To pass a new repository value into `properties.json`, you have two options:

Option 1

You can remove the installer files and rerun the setup script:

```
mapr-setup.sh remove
```

Using the `remove` command removes `properties.json`, the installer database, and the installer packages, but not the setup script. After the files are removed, you can rerun the setup script to specify the new repository URL. For more information about options you can use with `mapr-setup.sh`, see Using mapr-setup.sh.

Option 2

If you need to retain the installer database and the cluster state information (for example, because you need to do an upgrade), you can:

1. Edit the `properties.json` file manually to change the `repo_core_url` and the `repo_eco_url` entries to the correct values.
2. Restart the Installer:

   ```
   systemctl restart mapr-installer
   ```

What can I do if drop-down menus aren't working?

Try any or all of the following to correct the problem:

- Refresh the browser page.
- Clear the browser cache.
- Close and restart the browser or browser tab.

Why does the Installer URL not work?

Check that the URL you are trying to access is external. For example, if you install on a cluster that is in the cloud, the URL that the Installer lists may not work if it is an internal URL. Try accessing the external URL that is associated with the internal URL.

Why doesn't the Installer list the ecosystem component that I want to install?

The Installer Definitions package contains the versions and services that you can install. Once you update the Installer Definitions, you can install ecosystem components that were made available after you first configured the Installer. See Updating the Installer on page 5595.

On the Verify Nodes page, how can I get more information about a warning or error?

Hold your cursor over the warning or error in the right pane to see more information about the specific warning or error condition.

Why are the nodes listed on the Verify Nodes page different from those that I chose to install on?

If you abort an installation and then install on a different set of nodes, you must use the *Verify Nodes* page to manually remove nodes that were part of the aborted installation but are no longer part of the current installation.

last-updated: Jun 06, 2024

I can't log in to Hue. What credentials should I use to log into Hue for the first time?	Log in with the cluster administrator username that you configured while running `mapr-setup.sh` and the password `mapr`.
What should I do if rerunning mapr-setup.sh generates errors because the properties.json file has incorrect information?	See Troubleshooting Repository URL Errors on page 5672.

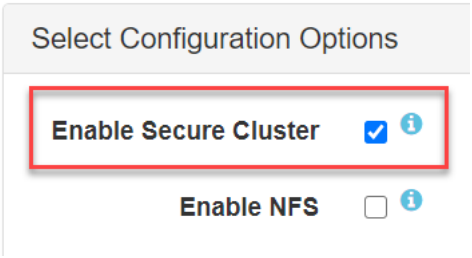
Installer Operations

This section describes operations you can perform using the Installer.

Using the Enable Secure Cluster Option

You use the Enable Secure Cluster option to control whether or not the cluster is configured as a secure cluster.

This option appears on the **Version & Services** page of the web-based Installer.



IMPORTANT: Deselecting the Enable Secure Cluster option is not supported for releases 7.0.0 and later. In releases 7.0.0 and later, security is enforced by default, and nonsecure clusters are not supported.

About the Enable Secure Cluster Option

Using this option controls platform and ecosystem security in a cluster. When you select the option, the Installer runs the `configure.sh` script on the primary container location database (CLDB) to generate security keys and then distributes the keys to all the other CLDBs. The installer also distributes certificates to all the other nodes and activates security for the ecosystem components that support security.

Certain ecosystem components either do not support security or cannot be secured by the Installer. If you enable security, you will not be allowed to select services such as Impala or Sentry.

Beginning with Release 6.1, data-on-wire encryption is enabled by default for newly created volumes when the **Enable Secure Cluster** option is selected. Data-on-wire encryption encrypts data in a volume during transmission over the wire. In a secure cluster, you can enable or disable data-on-wire encryption for individual volumes using the Control System, the maprcli, or the REST API commands.

Using the Option With New and Already Installed Clusters

You can select or deselect the **Enable Secure Cluster** option during a new installation or during an Incremental Install.

- For new installations:
  - The option is selected by default, meaning that new installations are configured with security unless you deselect the option.
  - Deselecting the option causes the cluster to be installed as a nonsecure cluster.
- For clusters that are already installed with EEP 4.0.0 or later:
  - You can select or deselect the option during an Incremental Install:

last-updated: Jun 06, 2024

- If security is not currently configured and you select the option, the cluster will be configured with security.
- If security is already configured, you can remove security by deselecting the option.

  NOTE: If Drill is installed, be sure to review the limitations described in Securing Drill on page 4016 before removing security. Additional steps must be taken so that Drill in a nonsecured cluster can access all Drill znodes.

Using the Option During an Incremental Install

Normally, **Incremental Install** operations are conducted online. However, selecting or deselecting the **Enable Secure Cluster** option during an **Incremental Install** requires the Installer to stop the Warden and Zookeeper services, bringing the cluster offline temporarily.

In some instances, the **Enable Secure Cluster** option is unavailable. For example, you cannot select this option during an upgrade of a nonsecured Release 5.x cluster to Release 6.0 or later. You must complete the upgrade to Release 6.0 or later first and then use the **Incremental Install** function to enable security.

Using the Enable DARE Option

You use the Enable DARE option to enable data-at-rest encryption for volumes.

This option appears on the **Version & Services** page of the web-based Installer when the **Enable Secure Cluster** option is selected. The **Enable DARE** option is *deselected* by default.

For more information about data-at-rest encryption, see Encryption in Data Fabric on page 838.

Considerations for Enabling DARE Using the Installer

Before using the **Enable DARE** option, review these considerations:

IMPORTANT: Once enabled, the **Enable DARE** option cannot be disabled, since disk encryption cannot be turned off without reformatting the disks.

- The **Enable DARE** option can only be used during the initial installation of a cluster or during an incremental install.
- You cannot select the **Enable DARE** option when:
  - The **Enable Secure Cluster** option is deselected.
  - You perform an upgrade operation using the Installer. Security changes are not allowed during an upgrade using the Installer.
- If you select the **Enable DARE** option, you can no longer deselect the **Enable Secure Cluster** option during an **Incremental Install** operation.

Configuring Remote Authentication for the Installer

This page describes how to specify a password or private key that enables the Installer program to perform common operations on all nodes in the cluster.

Installer Authentication Methods

Some Installer operations, such as installing, upgrading, or verifying services, require the Installer to log in (authenticate) to every cluster node with `root`-user access (or sudoer access to `root`). The Installer lets you specify one of the following methods to log in:

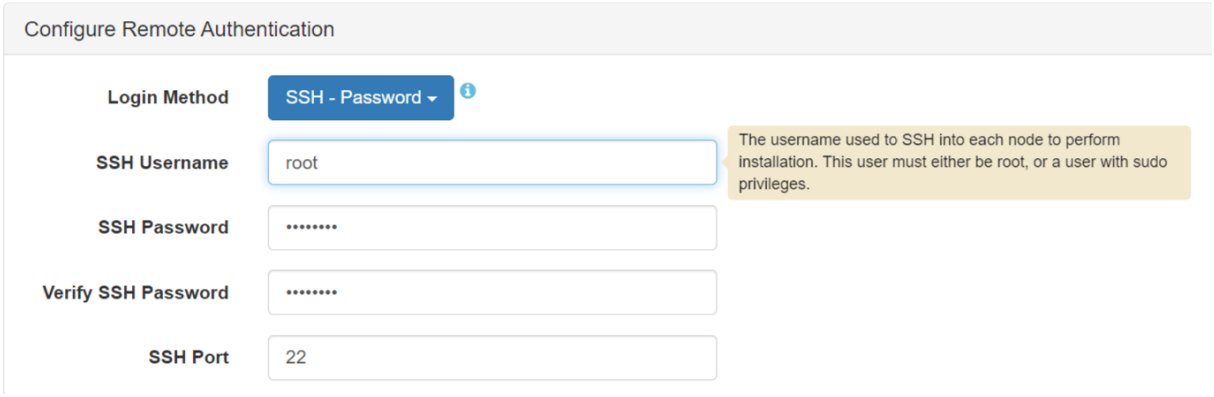
- SSH Password authentication
- SSH Private key authentication

last-updated: Jun 06, 2024

Using the SSH Password Login Method

The SSH Password login method is the default method. To use this method:

1. In the **Login Method** field of the **Configure Remote Authentication** section, select **SSH – Password** as the login method:



2. In the **SSH Username** field, specify `root` or a user with sudo privileges. The user must exist and have the same password on every node in the cluster.
3. If you plan to perform the installation with an ssh ID of `root`, go to step 4. If you plan to perform the installation with an ssh ID other than `root`, follow the instructions in If You Specify a User Other Than root on page 5613. Then continue to step 4.
4. Enter the **SSH Password** for the ssh user, and re-enter the password to verify it.
5. In the **SSH Port** field, specify a port number if your installation uses an ssh port other than the default port (22).
6. Click **Next** to advance through the remaining Installer screens.

If You Specify a User Other Than `root`

Specifying a user other than `root` for remote authentication requires an extra step. This step must be performed before you advance through the remaining Installer screens.

On every node in the cluster, create a file named `<your_login_ID>` in the `/etc/sudoers.d` directory. It doesn't matter what the file is named as long as the file is unique in the directory. Typically, the file takes the name of your logon ID. The file must contain the following entry:

```
<your_login_ID> ALL=(ALL) NOPASSWD: ALL
Defaults: <your_login_ID> !requiretty
```

This step is required only for an ssh ID other than `root`.

Using the SSH Private Key Login Method

If you decide not to use the SSH Password method, you can use the SSH Private Key login method. The private key method is more secure because:

- You do not need to provide a password to the Installer.
- Authentication is performed using an encrypted private key.

The private key method requires certain configuration steps to be performed **before** you run the Installer.

Before using the Installer:

last-updated: Jun 06, 2024

1. If you already have an ssh key pair for the login user, go to step 3.
2. If you don't already have an ssh key pair for the login user, use any node to generate a key pair that can be distributed to all the other nodes. Use a utility such as `ssh-keygen` to create the ssh key pair. For example, while logged on as `root` or a user that has sudo access to `root`, run this command:

   ```
   ssh-keygen -t rsa -N "" -f ~/.ssh/<filename>
   ```

   The utility creates a private key named `<filename>` and a public key named `<filename>.pub` and stores the files in `~/.ssh`, where ~ refers to the user's home directory. Here is an example of the `ssh-keygen` command:

   ```
   ssh-keygen -t rsa -N "" -f ~/.ssh/mykey
   Generating public/private rsa key pair.
   Your identification has been saved in /home/user/.ssh/mykey
   Your public key has been saved in /home/user/.ssh/mykey.pub
   The key fingerprint is:
   SHA256:Sg+nEojf/3idE0pCdUATwzffAvOD8WKcD9BwaYIO2TE user@install_node
   The key's randomart image is:
   +---[RSA 3072]----+
   |     oE=B=..     |
   |    o o.=+@      |
   |     o . B @ .   |
   | . .  o   B * .  |
   |. . ..o S. + o   |
   | . . o.*. . .    |
   |  . o oo.o o     |
   |     o .o +      |
   |      oo.  .     |
   +----[SHA256]-----+
   user@install_node:~$ cd .ssh
   user@install_node:~/.ssh$ ls
   known_hosts  mykey  mykey.pub
   ```

3. On the node, where you created the key pair, check the permissions and ownership of both the public- and private-key files. HPE recommends that the login user owns the private-key and public-key files. The private key should be read/writable only by the login user and have a permission of 600. The public key should be read/writable by the login user but also world-readable and have a permission of 644:

   ```
   cd ~/.ssh
   chmod 600 mykey
   chmod 644 mykey.pub
   ```

4. Copy the public-key file (`<filename>.pub`) to every node in the cluster. As you copy the public-key file to each node, ensure that the file retains the same permissions and ownership described in step 3.
5. Create and distribute the authorization file:
   a. On any node, create an authorization file named `authorized_keys` (unless the file already exists). The authorization file will contain the content of the public-key file. When you create the authorization file, make sure that the file has a permission of 600, and the login user owns the file.

   b. Append the public-key information to the authorization file by using a command such as the following:

      ```
      cat <filename>.pub >> ~/.ssh/authorized_keys
      ```

last-updated: Jun 06, 2024

c. Copy the authorization file to every node as `~/.ssh/authorized_keys`, where ~ refers to the user's home directory. Note that if any nodes already have an authorization file, do not overwrite the file. In that case, repeat step 5b to append the public-key information to the authorization file. Or use the command described in the following note to append the information.

NOTE: With newer versions of OpenSSH, it is possible to combine steps 3, 4, and 5 into a single command that:

- Uses ssh to securely copy the public key file.
- Creates a file in `~/.ssh/authorized_keys` by default and appends the public key to that file.
- Sets the default permission (`chmod 600`) on the `~/.ssh/authorized_keys` file.

For example:

```
ssh-copy-id -i ~ssh/mykey.pub user@node1
```

But this command has not been tested on all distributions.

6. Copy the private key file to the workstation where you will use a browser to run the Installer. The file must be present on the workstation so that when you click the **Browse** button in the Installer **Private Key** field, you can browse to and select the file.
7. If you plan to perform the installation with an ssh ID of `root`, go to step 8. If you plan to perform the installation with an ssh ID other than `root`, follow the instructions in If You Specify a User Other Than root on page 5613. Then continue with step 8.
8. Verify that you can use ssh and the key pair to access all the nodes without being asked for a password.
   a. For example, execute this command from the Installer node:

   ```
   ssh -i ~/.ssh/private_key <nodename>
   ```

   Running the command should enable you to log in to the node and display a prompt (without requiring a pasword) if these conditions are true:

   - The Installer node has the private and public key files in `~/.ssh`.
   - The `openssh_server` is installed and running on each cluster node.

   If you are prompted for a password, check the file permissions. If ssh access does not work for a node, the Installer will return an error when it tries to authenticate to the node.

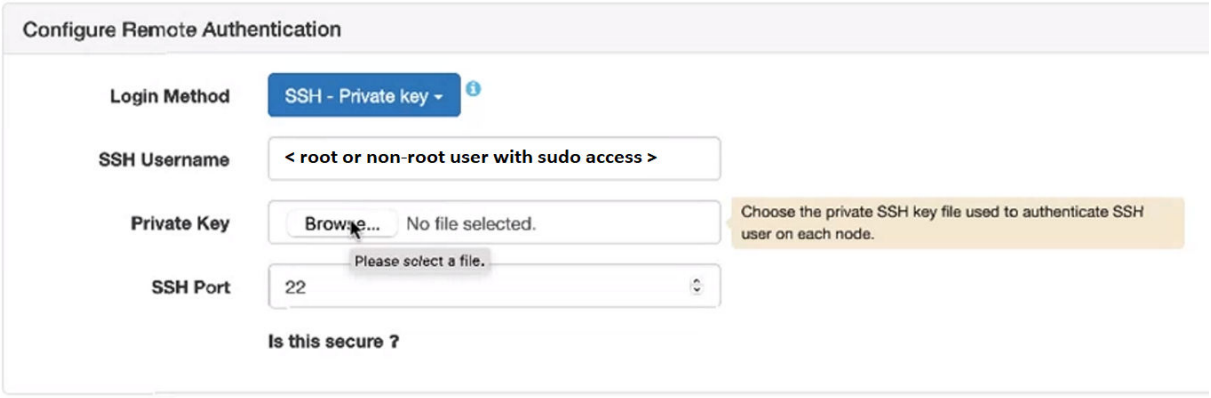
   b. Also, when you check access to each node, make sure that you can successfully run a command that requires `root` access without being asked for a password. For example:

   ```
   ssh -t <nodename> "sudo ls /root"
   ```

When you run the Installer:

1. In the **Login Method** field of the **Configure Remote Authentication** section, select **SSH – Private key** as the login method:
2. In the **SSH Username** field, specify `root` or a login user with sudo privileges. The user must exist and have the same password on every node in the cluster.

last-updated: Jun 06, 2024



Specifying a non-`root` user for the **SSH Username** requires the creation of a file in the `/etc/sudoers.d` directory, as described If You Specify a User Other Than root on page 5613.

3. In the **Private Key** field, browse to select the private ssh key file that can authenticate the ssh user on all nodes.
4. In the **SSH Port** field, specify a port number if your installation uses an ssh port other than the default port (22).
5. Click **Next** to advance through the remaining Installer screens.

Installing NFS Using the Installer

Using the web-based Installer, you can install version 3 or version 4 of the Network File System (NFS) on the cluster.

You can install NFS during a new or incremental installation of Release 6.1 or later. The **Enable NFS** option appears on the **Version & Services** page of the Installer.

Note these considerations for installing NFS using the Installer:

- Previous versions of the Installer installed NFS (version 3) by default. Installer 1.10 and later do NOT install NSF by default. You must select the **Enable NFS** option to instruct the installer to install NFS. When you select the **Enable NFS** option, the **NFS Version** option appears. NFSv3 is always selected by default. NFSv4 is available as an option for 6.1.0 or later releases.

  CAUTION: The Installer installs but does not secure NFS. Neither NSFv3 nor NSFv4 provides security by default. You can configure NFSv4 server to work with Active Directory and Kerberos servers, but you must first install Active Directory and Kerberos servers. For more information, see Configuring NFSv4 Server for Kerberos on page 1584. NFSv3 does not support security.

- With the 1.10 installer, if you specify a pre-6.1.0 release, you must select the **Enable NFS** option to install NFS. Selecting the option causes the installer to install NSFv3 by default. The **NFS Version** option is not available for pre-6.1.0 releases.
- When upgrading to Release 6.1 or later, the Installer keeps the NFS version at version 3. After a new installation of Release 6.1 in which you specified NFSv3, or an upgrade to Release 6.1 using the Installer, you can switch to NFSv4 by using the Incremental Install function of the installer.
- The software supports mixed-mode NFS configurations in which some nodes of a cluster use NFSv3 and other nodes use NFSv4, but mixed-mode configurations cannot be installed using theInstaller. The Installer installs all nodes as NFSv3 or all nodes as NFSv4.
- NFSv3 and NFSv4 cannot be used on the same node concurrently.
- A new installation using a Installer Stanza installs NFS only if you set `enable_NFS: true` in the config section of the stanza.

last-updated: Jun 06, 2024

To install NFS manually, see Installing NFS for the HPE Ezmeral Data Fabric on page 401. To learn more about managing and using NFS, see Managing the HPE Ezmeral Data Fabric NFS Service on page 1549.

Installing Ranger Using the Installer
Using the web-based Installer, you can install Apache Ranger and the Apache Ranger Hive plugin on the cluster.

Only Installer 1.18.0.0 or later can be used to install Ranger. You can install Ranger during a new or incremental installation of release 7.1.0 or later. The following options appear on the **Version & Services** page of the Installer:

- **Apache Ranger (2.3.0)**
- **Apache Ranger Hive plugin (2.3.0)**

IMPORTANT: The Installer can set up the prerequisite external database and install the Ranger packages, but some configuration steps must be completed *after* using the Installer.

To install Ranger using the Installer:

1. Set up and run Installer 1.18.0.0 or later as described in Installer on page 5579.
2. On the **Version & Services** page, select both **Apache Ranger** options.
3. After completing the installation using the Installer, perform the steps in Getting Started with Ranger on page 4584 to finish Ranger configuration.

Related concepts
Installing Ranger on page 264
This topic includes instructions for using package managers to download and install Ranger from the EEP repository.

Using Custom Playbooks
Installer 1.12.0.0 and later enable you to use custom playbooks that can run a set of predefined tasks during or after operations using the Installer or Installer Stanzas.

Using custom playbooks, you can inject specific commands into the Installer 1.12.0.0 and later workflows to make configuration changes and ensure that those changes persist even after incremental installations or upgrades. For example, suppose you want to install a specific software package on all nodes before starting an installation. Custom playbooks enable you to check for and install the software as needed.

Or suppose you want to change a configuration setting before starting Core. Custom playbooks enable you to change the setting as part of an installation or upgrade.

Restrictions to Using Custom Playbooks

Note these restrictions:

- You can use custom playbooks with any cluster as long as the Installer version is 1.12.0.0 or later. However, Installer 1.12.0.0 and later have limited functionality when used with older releases. See Selecting an Installer Version to Use on page 5587.
- Custom playbooks are not supported for manual installations. Custom playbooks are supported only for use with the Installer and Installer Stanzas on page 5700.

Prerequisite for Using Custom Playbooks

To create a custom playbook file, you must be familiar with Ansible. Ansible is a simple automation language that uses plain-text YAML files to describe the desired state of the cluster. You do not have to install Ansible. Ansible 2.7 is installed whenever you load the Installer using `mapr-setup.sh`. To begin learning Ansible, see these resources:

- Quick Start Video
- Getting Started with Ansible
- Introduction to Playbooks

Creating and Running a Custom Playbook

Follow these steps to use a custom playbook with the Installer or Installer Stanzas:

No.	Step	See for more information
1.	Prepare the roles structure and YAML files for the custom playbook.	• Predefined Roles for Custom Playbooks on page 5618 • Example Playbook Files on page 5619
2.	Test the roles using standalone Ansible.	• Testing the Roles on page 5619 • Playbook Debugger
3.	Convert the YAML files to a zipped archive file that has a `tgz` or `tar.gz` file extension.	• Creating the Zipped Archive on page 5620
4.	In the Installer or a Installer Stanza, specify the option to upload the zipped archive file.	• Installer Options for Custom Playbooks on page 5620 • Installer Stanza Parameters for Custom Playbooks on page 5622
5.	Run the Installer or Installer Stanza to invoke the playbook.	• Installer on page 5579 • Installer Stanzas on page 5700
6.	If the operation returns a syntax error, fix the error and retry the operation.	• Troubleshooting Custom Playbook Errors on page 5622

Predefined Roles for Custom Playbooks

The role structure is an important part of your custom playbook. Your custom playbook must contain one or more of the following roles, and each role must be a directory in the zipped archive. The roles do not need to follow a specific order.

Role	Tasks in this role are run *after* . . .
preinstall	The Installer has verified the nodes but before the installation workflow has begun
postecoreconfigure	`configure.sh` has run for Core but before Core has been started
postecoconfigure	Ecosystem components are configured and started
postinstall	The cluster is completely installed and running (at the end of the Installer Stage2 playbook)

Here is an example role structure:

```
preinstall
   tasks
      main.yml
```

last-updated: Jun 06, 2024

```
postcoreconfigure
   tasks
      main.yml
   vars
      main.yml
```

The uploaded tarball must contain relative path names with just the top-level role directories, and the tarball structure must adhere to the Ansible role-structure rules. If you need to configure your own roles in the tarball, you must include them as sub-roles to be run from within the pre-defined roles. For more information, see Ansible Roles.

NOTE: Because Installer maintenance updates only update Core and do not change any configuration settings on the cluster, the Installer handles them differently from other operations. This means that whenever you perform a maintenance update, the Installer does *not* run the postecoconfigure and postinstall playbooks during the maintenance update.

Example Playbook Files

This example shows a preinstall task that installs the Midnight Commander application on all nodes in the cluster before the Installer workflow is initiated. The example is contained in the `preinstall/tasks/main.yml` file:

```
---
- name: Install misc stuff - Midnight commander
  vars:
    packages_Suse: ['mc']
    packages_RedHat: ['mc', 'lsof']
    # syslinux-utils is for gethostip, libpython is required for collectd
    packages_Debian: ['mc']

  package: name={{ item }} state=present
  with_items: "{{ vars['packages_' + ansible_os_family] }}"
```

The following example shows the `postcoreconfigure/tasks/main.yml` file for the previous role structure. This example sets the number of RPC threads in `mfs.conf` from the current setting to 4 threads. The variable used to point to the file is defined in `postcoreconfigure/vars/main.yml`:

```
---
- debug: var=mapr_home

- name: Bump MFS RPC threads
  lineinfile:
    path: "{{ mapr_conf_dir }}/mfs.conf"
    regexp: '^(?P<threads>mfs.numrpcthreads=).*$'
    line: '\g<threads>4'
    backrefs: yes
```

This example shows the contents of the variables file (`postcoreconfigure/vars/main.yml`):

```
---
mapr_conf_dir: "{{ mapr_home }}/conf"
```

Testing the Roles

Before uploading your zipped archive, develop and test your role files outside the installer using the standalone Ansible 2.7 debugger. You cannot use the Ansible debugger from within the Installer. For more information, see Playbook Debugger.

last-updated: Jun 06, 2024

Testing the roles by running them using the Installer can be time-consuming. If a role contains logic errors, these errors won't be visible until the playbook is initiated. For example, a postinstall playbook that you run during a new installation does not generate an error until the installation is completed. A new installation can take 20 minutes or more, depending on the cluster size. Therefore, you can avoid having to re-run the Installer and playbook by testing the roles for logic errors before using them.

You can run the playbook debugger from the Installer node by using the `virt_runner` program in the`/opt/mapr/installer/bin/` directory. Use this command:

```
virt_runner ansible-playbook -i, -k <Playbook-file-name>
```

When you run the playbook in this fashion, you do not have access to the variables (for example, `mapr_home`) that the Installer defines. So you must set those up manually.

Creating the Zipped Archive

To create the zipped archive, you can use a tool such as 7-Zip or Linux commands. The following example uses the Linux `tar` command to create an archive of the directory structure and the `gzip` command to zip the archive.

Before using the `tar` command, change the directory to the directory in which you created the role structure. For example, if you created the role structure in the `/tmp` directory, you must issue the `tar` command from the `/tmp` directory:

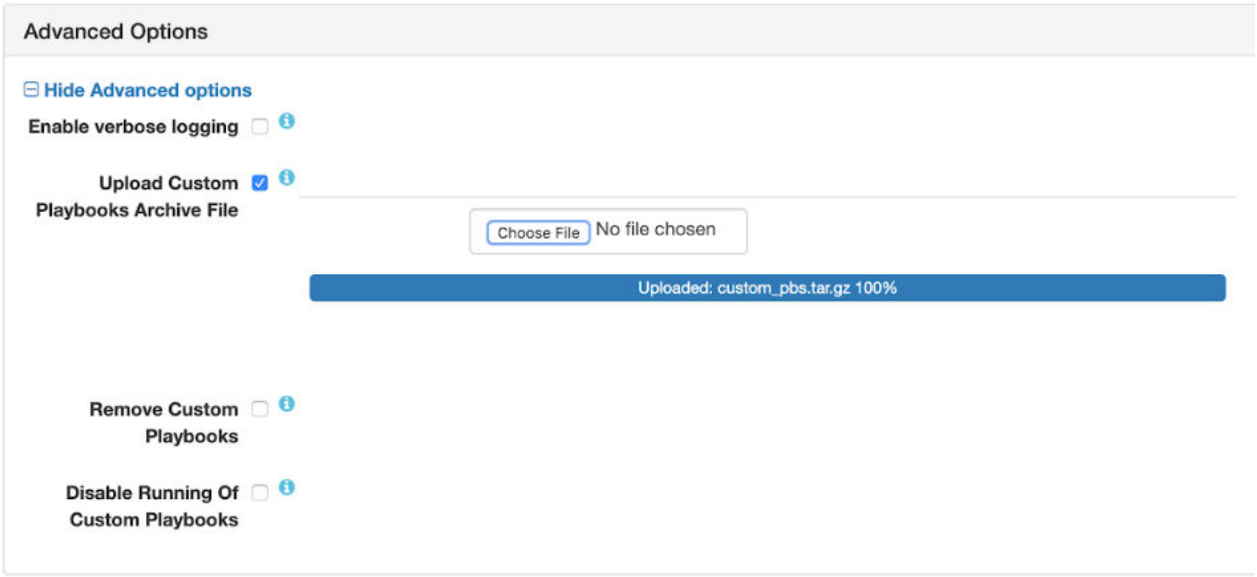
```
tar -cvf /tmp/custom_pbs.tar .
./
./preinstall/
./preinstall/tasks/
./preinstall/tasks/main.yml
./postcoreconfigure/
./postcoreconfigure/tasks/
./postcoreconfigure/tasks/main.yml
./postcoreconfigure/vars/
./postcoreconfigure/vars/main.yml
gzip /tmp/custom_pbs.tar
```

The `gzip` command creates a `custom_pbs.tar.gz` file in the `/tmp` directory. If you are using the Installer, move the zipped file to the node hosting your browser so that you can upload it using the Installer upload option.

Installer Options for Custom Playbooks

In the Installer, the custom playbook options appear on the **Version & Services** page under **Advanced Options**. The following screen shows the options that are visible when a playbooks archive file has been uploaded:

last-updated: Jun 06, 2024



To use the options, you select an option and then advance through the Installer menus to complete the Installer task. You can access these options from the following Installer tasks:

- Install
- Incremental Install
- Upgrade Version
- Maintenance Update

Whichever option you select, the Installer obeys the option *every time* you use the Installer for any operation. Therefore, if you select the option to upload a custom playbook, the Installer will run the playbook every time you use the Installer. If you select the option to disable playbooks, playbooks will be disabled until you select a different option. If a value has been set by a custom playbook and you run the same playbook again, the value is left unchanged.

Option	Description
Upload Custom Playbooks Archive File	Uploads a zipped TAR file for your custom playbook to `/opt/mapr/installer/data/tmp/custom_playbooks/`. The Installer displays the file name of the uploaded archive. An error is displayed if you upload a file that does not have a `tgz` or `tar.gz` file extension. The Installer allows you to upload one playbook at a time. If you upload a new playbook when another playbook is already loaded, the previously loaded playbook and its archive are removed, and the new playbook is loaded.
Remove Custom Playbooks	Removes the installed custom playbook and its archive from `/opt/mapr/installer/data/tmp/custom_playbooks/`. Both the playbook and the directory structure are removed.
Disable Running of Custom Playbooks	Enables you to run the Installer or Installer Stanzas on page 5700 *without* executing the uploaded custom playbook.

last-updated: Jun 06, 2024

Installer Stanza Parameters for Custom Playbooks

To upload a custom playbook using a Stanza, specify the `cpbs_location` parameter followed by the path to the playbook in quotations. For example:

```
environment:
  mapr_core_version:6.1.0
  #DOC path to tar.gz archive of custom playbooks to be installed
  #DOC to remove the custom playbooks, provide an empty string
  #DOC for the filename, or remove cpbs_location all together
  cpbs_location: "/tmp/custom_plays.tar.gz"
```

To remove a custom playbook using a Stanza, specify an empty string for the file name:

```
environment:
  cpbs_location: ""
  ...
```

Or remove `cpbs_location` from the `environment` section.

To disable a custom playbook without removing it, set the `custom_pbs_disable` parameter to `true`

```
config:
  #DOC flag to indicate if you want to skip running of installed custom
playbooks
  custom_pbs_disable: true
```

Troubleshooting Custom Playbook Errors

The Installer loads the custom roles and reports any syntax errors at execution time. The failure of a custom role causes a failure in the Installer operation. If a role has a syntax error, the Installer might report that the nodes did not install correctly or that it cannot install a custom playbook hook.

If the node detail indicates a custom playbook hook error, refer to the Installer Log for more information. Click **Support > View Installer Log**. For example:

last-updated: Jun 06, 2024

(Clicking the node log provides limited information for syntax errors.) For more information about the Installer logs, see Logs for the Installer on page 5665.

Using the Retry Button

You have several options for fixing the issue. You can fix any problems by logging on to the Installer node and making changes directly in the playbook files located at `/opt/mapr/installer/data/custom_playbooks`. Then click the **Retry** button in the Installer GUI interface. If you use this method, note that you must eventually propagate any fixes to your original tarball if you want to reuse the tarball.

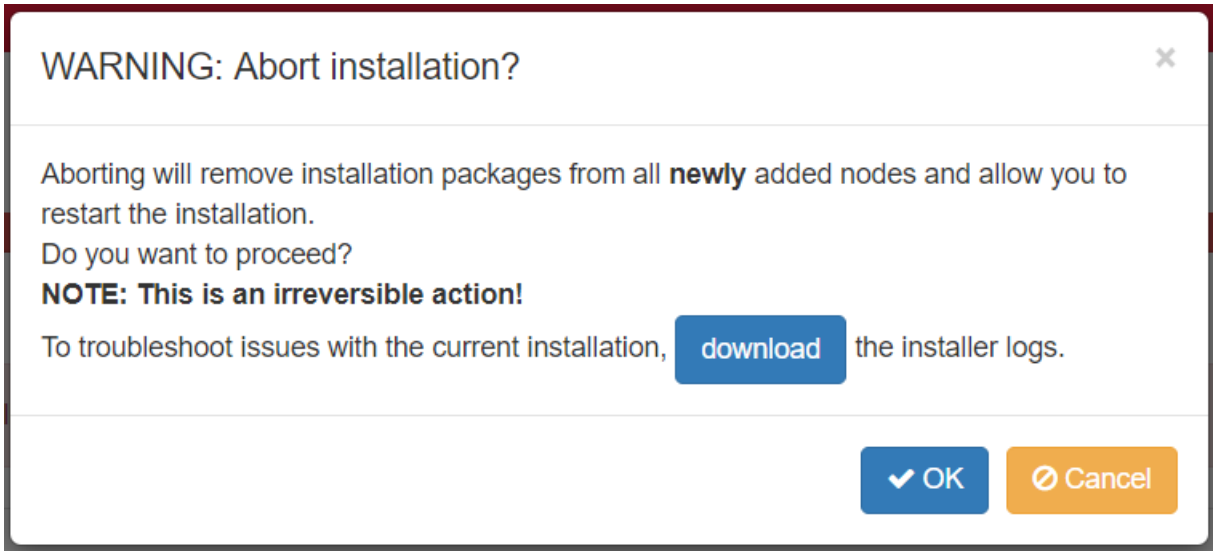
Using the Abort Installation Button

Another option is to abort the installation and repeat the operation after fixing the error and uploading a corrected playbook. Before using this option, it is important to know that using **Abort Installation** does not remove changes made to the Installer database during the operation that you aborted. After an abort, the Installer can display the desired state rather than the actual state of the nodes.

For example, if you attempted to upgrade a EEP from EEP 6.1.0 to EEP 6.2.0 and then aborted the operation, the Installer can display the currently installed EEP as EEP 6.2.0 even though EEP 6.2.0 has not been installed on the cluster nodes. This condition persists until you rerun the upgrade operation successfully or revert to the last known cluster state by using **Support > Import State**. See Importing or Exporting the Cluster State.

To abort the operation and start over, click **Abort Installation**. A confirmation dialog appears:

last-updated: Jun 06, 2024



Click **OK** to return to the Installer home page. Fix the playbook error and retry the operation.

Extending a Cluster by Adding Nodes
This section describes how to add capacity to a cluster by adding nodes.

About this task

You add nodes to a cluster by using the web-based Installer (version 1.6 or later) or Installer Stanzas. The nodes are added to a pre-existing group *online* without disturbing the running cluster. You can add nodes to on-premise clusters or to cloud-based clusters.

IMPORTANT: After completing these steps, if you added a node to a group containing a CLDB or ZooKeeper, you must also perform the Post-Expansion Steps for Extending a Cluster on page 5629.

You can add multiple nodes to a group in the same operation, and you can add nodes to custom groups. You can also add the same node to multiple groups. The Installer installs the new nodes with the same patch level as the existing nodes.

NOTE: Before adding nodes, use the Installer to ensure that your cluster uses three-digit EEPs. If your cluster uses two-digit EEPs, adding a node can result in a version mismatch between the cluster and the newly added node. To change from two-digit to three-digit EEPs you can perform an **Incremental Install** using the Installer. For more information, see Understanding Two-Digit and Three-Digit EEPs on page 5638.

Restrictions

About this task

Note these restrictions for using the **Extend Cluster** operation. When adding nodes:

- The cluster must already be installed before nodes can be added.
- You cannot add a node to a MASTER group, since these services can run only on one node.
- If you add a node to a CONTROL group that has a CLDB, you must do a manual, rolling restart of the entire cluster.
- If you add a node to a group that has OpenTSDB, you must add the same node to the group that contains AsyncHBase (currently, the Installer does not check to ensure that this dependency is met).
- You cannot add services.

last-updated: Jun 06, 2024

- You cannot change the EEP version or Core version.
- You cannot add new service groups.
- New nodes are added automatically to the DEFAULT group.
- A node added to a secure cluster will be configured for security automatically. If the cluster is custom secure, you cannot use the Installer. See Customizing Security in HPE Ezmeral Data Fabric on page 1939.

Before Adding Nodes

Procedure

1. Determine the group(s) to which new nodes will be added.
   You can add nodes to the following types of groups:
   - CLIENT
   - DATA
   - CONTROL
   - MULTI_MASTER
   - MONITORING_MASTER

   NOTE: If you add a node to a group containing a CLDB, you must restart all the nodes except for the new node. If you add a node to a group containing Zookeeper (but not CLDB), you must restart Zookeeper on all the Zookeeper nodes except for the new node. And you must restart the lead Zookeeper last.

   To gather information about groups, see Getting Information About Services and Groups on page 5709.
2. Ensure that the node(s) to be added meet the installation prerequisites described in the Installer Prerequisites and Guidelines on page 5581.

Adding Nodes Using the Installer Web Interface

Procedure

1. Use a browser to connect to the cluster using the Installer URL:

   ```
   https://<Installer Node hostname/IPaddress>:9443
   ```

2. On the status screen, click the **Extend Cluster** button. The Installer displays the **Extend Cluster** screen showing the currently configured groups and services.

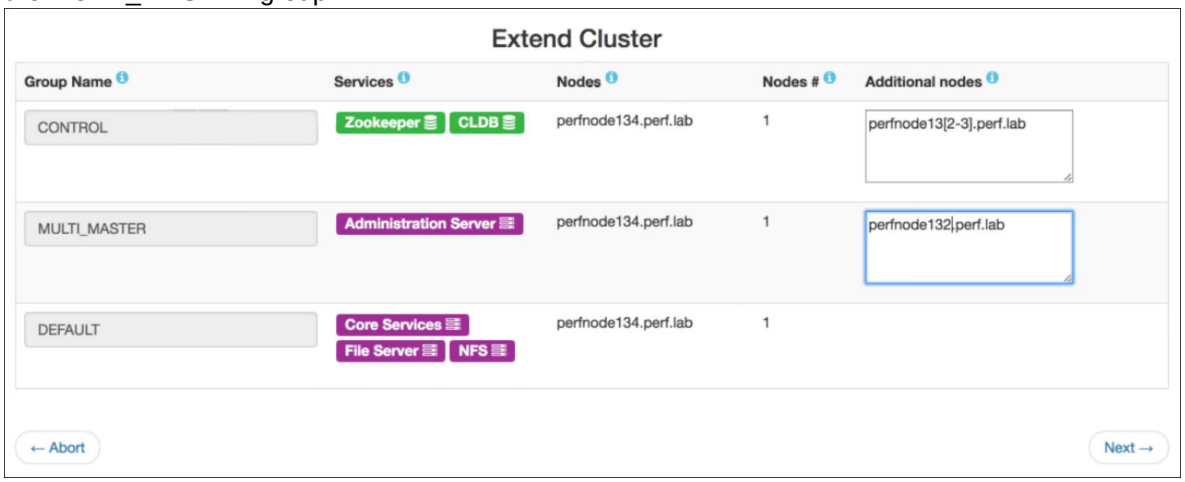
   

   NOTE: If the **Extend Cluster** button is not visible, you might need to clear your browser cache and refresh the browser page.
3. Specify the nodes to be added:
   - **On-Premise Cluster**

     In the **Additional Nodes** column, specify the host name(s) or IP address(es) of the nodes to be added. If you are adding multiple nodes, you can specify an array. The following example adds

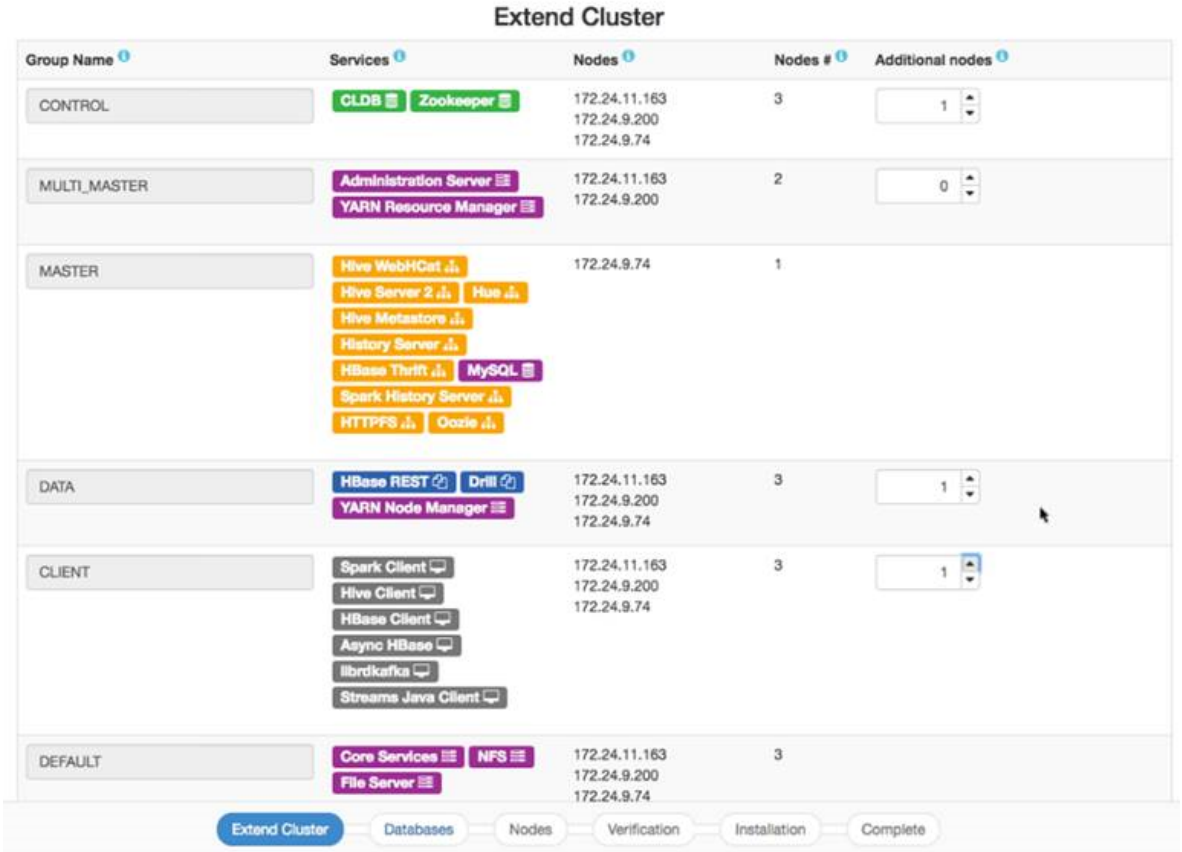
last-updated: Jun 06, 2024

perfnode132.perf.lab and *perfnode133.perf.lab* to the CONTROL group and *perfnode132.perf.lab* to the MULTI_MASTER group:



- **Cloud-Based Cluster**

  In the **Additional Nodes** column, specify the number of nodes to be added. You do not need to specify the host name or IP address. The following example adds a node to each of the CONTROL, DATA, and CLIENT groups:



4. Click **Next**. The Installer checks the nodes to ensure that they are ready for installation and displays the **Authentication** screen.

5. Enter your SSH password and other authentication information as needed, and click **Next**. The installer displays the **Verify Nodes** screen.

   NOTE: For a cloud-based cluster, the **Authentication** screen requests information that is specific to the type of cluster (AWS or Azure). Use the tooltips to learn more about the authentication information needed for your cluster.

6. Click a node icon to check the node status and see warnings or error information in the right pane. The node-icon color reflects the installation readiness for each node:
   - Green (ready to install)
   - Yellow (warning)
   - Red (cannot install)

   NOTE: If there are warnings or errors, hold your cursor over the warning or error in the right pane to see more information.

   IMPORTANT: If node verification fails, try removing the node and retrying the operation. If node verification fails and you abort the installation, you must use the **Import State** command to reset the cluster to the last known state. Otherwise, you will not be able to perform subsequent Installer operations. See Importing or Exporting the Cluster State on page 5634.

7. When you are satisfied that the nodes are ready to be installed, click **Next**. The Installer adds the nodes. After the nodes are added, you can use the control system to view the nodes in the cluster.

8. Perform any post-expansion steps. Post-expansion steps are necessary only if you added a node to a group containing a CLDB or Zookeeper.

If you added a node to a group containing . . .	Do this
Zookeeper only	One node at a time, stop and restart the Zookeeper service on all Zookeeper nodes, restarting the master Zookeeper node last. You do not need to restart the Zookeeper node that was added. See Post-Expansion Steps for Extending a Cluster on page 5629.
Zookeeper and CLDB or CLDB only	One node at a time, restart all services on all nodes following the order prescribed in Manual Rolling Upgrade Description on page 327. You do not need to restart the node that was added. See Post-Expansion Steps for Extending a Cluster on page 5629.

Adding Nodes Using a Installer Stanza

About this task

To add nodes using a Installer Stanza, you add the `scaled_hosts2:` parameter (on-premise clusters) or the `scaled_count:` parameter (cloud-based clusters) to the Stanza file for the group that you want to scale. Then you run the Stanza using the `install` command. The services contained in the group are configured for the added node.

NOTE: If the group you are trying to scale does not contain the `mapr-core-5.2.x` service, the first group containing `mapr-core-5.2.x` will automatically get scaled.

Procedure

1. In the Stanza file, add the `scaled_hosts2:` or `scaled_count:` parameter:

last-updated: Jun 06, 2024

- **On-Premise Cluster**

  Add the `scaled_hosts2:` parameter to the group that you want to scale, specifying the host name(s) or IP address(s) of the nodes to be added. In the following example, the perfnode132.perf.lab node is added to the CLIENT group:

Stanza Before Scaling	Modified Stanza with scaled_hosts2 Parameter (On-Premise Cluster)

`groups:`
`- hosts:`
`  - perfnode131.perf.lab`
`  label: CLIENT`
`- services:`
`  - mapr-spark-client-2.0.1`
`  - mapr-hive-client-1.2`
`  - mapr-hbase-1.1`
`  - mapr-asynchbase-1.7.0`
`  - mapr-kafka-0.9.0`
	`groups:`
	`- hosts:`
	`  - perfnode131.perf.lab`
	`  label: CLIENT`
	`  scaled_hosts2:`
	`  - perfnode132.perf.lab`
	`- services:`
	`  - mapr-spark-client-2.0.1`
	`  - mapr-hive-client-1.2`
	`  - mapr-hbase-1.1`
	`  - mapr-asynchbase-1.7.0`
	`  - mapr-kafka-0.9.0`

- **Cloud-Based Cluster**

  Add the `scaled_count:` parameter to the group that you want to scale. Include a number after the parameter to indicate the number of additional nodes to be added to the group. You do not need to specify the host names or IP addresses of the nodes to be added. In the following example, one additional node is added to the CLIENT group:

Stanza Before Scaling	Modified Stanza with scaled_count Parameter (Cloud-Based Cluster)

`groups:`
`- hosts:`
`  - perfnode131.perf.lab`
`  label: CLIENT`
`- services:`
`  - mapr-spark-client-2.0.1`
`  - mapr-hive-client-1.2`
`  - mapr-hbase-1.1`
`  - mapr-asynchbase-1.7.0`
`  - mapr-kafka-0.9.0`
	`groups:`
	`- hosts:`
	`  - perfnode131.perf.lab`
	`  label: CLIENT`
	`  scaled_count: 1`
	`- services:`
	`  - mapr-spark-client-2.0.1`
	`  - mapr-hive-client-1.2`
	`  - mapr-hbase-1.1`
	`  - mapr-asynchbase-1.7.0`
	`  - mapr-kafka-0.9.0`

2. Run the Stanza file using the `install` command. See Installing or Upgrading Core Using an Installer Stanza on page 5706. The Installer SDK detects the new scaled_host(s) and gives you the option to proceed with the installation or cancel.

3. Perform any post-expansion steps. Post-expansion steps are necessary only if you added a node to group containing a CLDB or Zookeeper.

If you added a node to a group containing . . .	Do this
Zookeeper only	One node at a time, stop and restart the Zookeeper service on all Zookeeper nodes, restarting the master Zookeeper node last. You do not need to restart the Zookeeper node that was added. See Post-Expansion Steps for Extending a Cluster on page 5629.
Zookeeper and CLDB or CLDB only	One node at a time, restart all services on all nodes following the order prescribed in Manual Rolling Upgrade Description on page 327. You do not need to restart the node that was added. See Post-Expansion Steps for Extending a Cluster on page 5629.

Post-Expansion Steps for Extending a Cluster
You must perform post-expansion steps if you added a node to a group containing the CLDB or Zookeeper.

About this task
For more information about extending a cluster, see Extending a Cluster by Adding Nodes on page 5624.
Restarting Zookeeper Nodes

About this task
If you used the Installer **Extend Cluster** function to add a node to a group containing Zookeeper only, you must restart Zookeeper on all Zookeeper nodes except for the added node.

One node at a time, stop and restart the Zookeeper service on all Zookeeper nodes, restarting the primary Zookeeper node last. Use the following restart steps.

Restarting All Services for Zookeeper and CLDB

About this task
If you used the Installer **Extend Cluster** function to add a node to a group containing Zookeeper and CLDB, or CLDB only, you must restart all services on all nodes.

One node at a time, restart all services on all nodes following the group upgrade order prescribed in Manual Rolling Upgrade Description on page 327. You do not need to restart the node that was added. Use the restart steps below.

Restart Steps

Procedure

1. Change to the `root` user (or use `sudo` for the following commands).
2. Stop Warden.

```
sudo service mapr-warden stop
```

3. Stop Zookeeper.

```
service mapr-zookeeper stop
```

4. Start the ZooKeeper on nodes where it is installed.

```
service mapr-zookeeper start
```

last-updated: Jun 06, 2024

5. On all nodes, start Warden. Example:

```
service mapr-warden start
```

6. Over a period of time (depending on the cluster size and other factors) the cluster comes up automatically. After the CLDB restarts, there is a 15-minute delay before replication resumes, in order to allow all nodes to register and heartbeat. This delay can be configured using the `config save` command to set the `cldb.replication.manager.start.mins` parameter.

Using the Incremental Install Function
Use the Incremental Install function of the web-based Installer to control security, add or upgrade services, upgrade Ecosystem Packs (EEPs), and perform other maintenance functions.
Things You Can Do Using the Incremental Install

About this task
Using the Incremental Install function, you can:

- Enable or disable security by using the **Enable MapR Secure Cluster** option
- Add services that are supported for your current EEP
- Apply a patch
- Delete a service from a cluster by deselecting the service
- Upgrade the Ecosystem Pack (EEP) to upgrade your services
- Change a 2-digit EEP to the equivalent 3-digit EEP (see Understanding Two-Digit and Three-Digit EEPs on page 5638)

NOTE: Before enabling security using the Incremental Install function, be sure to review the known issue (IN-1084) related to custom certificates. See MapR Installer Known Issues.

You cannot perform the following functions using an Incremental Install:

- Add a node to a cluster
- Delete a node from a cluster
- Upgrade the Core version

Online Versus Offline Operations

About this task
Most **Incremental Install** operations are performed online. However, applying a patch or selecting or deselecting the **Enable MapR Secure Cluster** option are offline operations. See Using the Enable Secure Cluster Option on page 5611. Making a change to security requires the Installer to stop the Warden and Zookeeper services, bringing the cluster offline temporarily.
Using Incremental Install

Procedure

1. Using a browser, log in to the Installer:

```
https://<Installer Node hostname/Ipaddress>:9443
```

2. Click the **Incremental Install** button. The **Version & Services** page appears.

3. Make the desired changes to add or remove security, add or delete services, apply a patch, or upgrade the EEP. Then click **Next**.
4. Advance through the Installer screens, providing the admin password or other information as needed.
5. After the **Incremental Install** finishes, if you added services, use the Control System **Services** tab or the `maprcli service list -node` command to ensure that the services are running. If the services are not running, you might need to restart the nodes. For more information, see IN-1332 in Installer Known Issues on page 5641.

Enabling or Disabling Metrics Collection or Logging

You can use the Installer to enable or disable metrics collection and logging during a new or incremental installation.

During installation using the Installer, you can configure metrics and logging using settings on the **Monitoring** page of the Installer user interface. Installing the metrics collection infrastructure is selected by default because the control system relies on these metrics to provide graphs and charts. Logging is deselected by default.

If you did not install metrics collection or logging during your initial installation, you can add it later by selecting the feature during an Incremental Install.

If you installed metrics collection or logging during your initial installation but you want to disable it, you can do so by deselecting the feature during an Incremental Install.

NOTE: If you do not install (or choose to uninstall) the metrics collection infrastructure, the control system cannot display graphs and charts.

Using the MapR Subnet and MapR External Advanced Options

Using the Installer advanced options available under Node Configuration, you can restrict the cluster to a subset of network interface cards (NICs) or specify public IP addresses that can be used with the cluster nodes.

Using these options in the Installer has the same effect as manually inserting the MAPR_SUBNETS and MAPR_EXTERNAL environment variables into the `env_override.sh` file on all nodes.

ATTENTION: The Installer does not validate the functionality of the subnets or IP addresses that you provide. If you provide incorrect values, it is possible for the installation to succeed initially and later develop connectivity issues. For this reason, it is critical that you supply accurate values for the Installer **MapR Subnet** and **MapR External** advanced options.

MapR Subnet	Allows you to set a subnet mask to restrict cluster services to certain interfaces. The values specified in this field are used to populate the MAPR_SUBNETS environment variable. Specify one or more comma-separated subnet masks. For example: `10.10.15.0/24,10.10.16.0/24` The information on this page is specific to the web-based Installer. To configure the MAPR_SUBNETS environment variable for a manual installation, see Designating NICs for HPE Ezmeral Data Fabric on page 1156.
MapR External	Allows you to specify external IP addresses for the CLDB, file system, and MAST Gateway nodes.

last-updated: Jun 06, 2024

Do NOT use DNS names. Specify a comma-separated list of tuples of host names and external IP addresses. For example:

```
node1:1.1.1.1,node2:1.1.1.2,node3:1.1.1.3
```

The specified node names need to match the host name you specified for the host earlier in Node Configuration. The information on this page is specific to the web-based Installer. To configure the MAPR_SUBNETS environment variable for a manual installation, see Designating NICs for HPE Ezmeral Data Fabric on page 1156.

Related reference

Environment Variables on page 3076
Describes the environment variables specific to the HPE Ezmeral Data Fabric.

More information

Designating NICs for HPE Ezmeral Data Fabric on page 1156
Explains how to assign IP address blocks for HPE Ezmeral Data Fabric.

Online vs. Offline Operations

Most Installer operations are offline operations, meaning that the cluster must be brought down in order to perform the operation. But there are some exceptions.

The following table shows which Installer operations are offline and online:

Offline Operations	Online Operations
Upgrading Core With the Installer on page 320	Using the Incremental Install Function on page 5630*
Performing a Maintenance Update on page 5635	Extending a Cluster by Adding Nodes on page 5624**
Applying a Patch Using the Installer on page 473	
Using the Enable Secure Cluster Option on page 5611	

*Using the **Incremental Install** function to apply a patch or change security settings is an offline operation.

**Adding a node to a CONTROL group requires a manual, rolling restart of the entire cluster.

Starting Up a Cluster Using the Installer Startup Button

You can use a single button to start software on a cluster.

About this task

The **Startup** button is a feature of Installer 1.8 or later. The **Startup** button appears on the status page of the Installer web interface when the cluster is in the shutdown state. The **Startup** button starts Warden and Zookeeper, which in turn start other running services that are part of a cluster.

NOTE: If the **Startup** button is not visible and the **Shutdown** button is present, the cluster is still running and is not in the shutdown state

The **Startup** button works differently depending on your cluster deployment:

Deployment	Startup Button Behavior
On premise	Starts the Zookeeper and Warden services on all nodes.

last-updated: Jun 06, 2024

Deployment	Startup Button Behavior
In the cloud	Starts the virtual machine nodes and then starts Zookeeper and Warden services on all nodes.

To use the **Startup** button:

Procedure

1. For a cluster deployed in the cloud, use the AWS console or the Azure portal to ensure that the nodes are shut down before you try to start them.
2. Use a browser to connect to the cluster using the Installer URL:

   ```
   https://<Installer Node hostname/IPaddress>:9443
   ```

3. On the status screen, click the **Startup** button. The Installer displays the **Authentication** screen.
4. Enter your authentication information if requested, and click **Startup**. The installer begins the startup process.
5. To shut down software on the cluster, see Shutting Down a Cluster Using the Installer Shutdown Button on page 5633.

Shutting Down a Cluster Using the Installer Shutdown Button

You can use a single button to shut down software on a cluster.

About this task

The **Shutdown** button appears on the status page of the Installer web interface when you connect to an installed cluster using Installer 1.6 or later. The **Shutdown** button shuts down Warden and Zookeeper, which in turn shut down other running services that are part of a cluster. When you use the **Shutdown** button, the Installer implements the same orderly shutdown used to perform software upgrades.

The **Shutdown** button works differently depending on where the cluster is deployed:

Deployment	Shutdown Button Behavior
On premise	Does not stop non-HPE software and does not power off the nodes.
In the cloud	Shuts down (but does not remove) all the nodes in the cluster: • If the installer node is part of the cluster, the installer node is not shut down, but Warden shuts down the services on the installer node. • To shut down the installer node, use AWS-console or Azure-portal commands to stop the instance. **CAUTION:** If a shutdown is initiated on an AWS cluster using an instance store, all data will be lost.

To use the **Shutdown** button:

Procedure

1. Review Shutting Down a Cluster on page 1101 for some pre-shutdown steps you may want to perform before shutting down Warden and Zookeeper.

last-updated: Jun 06, 2024

2. Use a browser to connect to the cluster using the Installer URL:

   ```
   https://<Installer Node hostname/IPaddress>:9443
   ```

3. On the status screen, click the **Shutdown** button. The Installer asks you if you want to continue.
4. Click **OK**. The Installer displays the **Authentication** screen.
5. Enter your authentication information if requested, and click **Shutdown**. The installer begins the shutdown process.
6. To restart software on the cluster, see Starting Up a Cluster Using the Installer Startup Button on page 5632.

   NOTE: Do not attempt to restart the cluster until you have confirmed that it is shut down. For an on-premise cluster, the presence of the **Startup** button on the Installer status page indicates that the cluster is shut down and ready to be started. For a cluster deployed in the cloud, the **Startup** button must be present, *and* you must use the AWS or Azure console to verify that the servers are down before restarting.

Importing or Exporting the Cluster State

You can use the Import State and Export State commands to upload or download a YAML configuration file (a "Stanza") that describes the state of the cluster.

About this task

In the web-based Installer, the **Import State** and **Export State** commands can be useful if you encounter a failure while using the installer and you want to revert to a previous cluster state. You can access these commands from the **Support** menu at the top of the Installer user interface.

Import State	Opens the **Cluster State** dialog box, which enables you to reset the cluster to the last known state or to a desired state recorded in a YAML configuration file that you specify. You can use the **Import State** command at any time.
Export State	Downloads a YAML file capturing the current state of the cluster. You can use the **Export State** command at any time.

For more information about using Installer Stanza files, see Installer Stanzas.

To import the cluster state, follow these steps:

Procedure

1. Using a browser, log in to the Installer:

   ```
   https://<Installer Node hostname/Ipaddress>:9443
   ```

   For more information about the Installer, see Installer on page 5579.
2. Click **Support > Import State**. The **Cluster State** dialog box appears.
3. Chose *one* of the following options:
   - Click **Reset** to revert the cluster to the last known state. (After a successful installation or Incremental Install using the Installer or Stanzas, the last known state of the cluster is saved to `/opt/mapr/installer/data/last_known_state.yaml`.)
   - Click **Choose File**, select a YAML file, and then click **Reset** to load the YAML file.

What to do next

To export the cluster state, follow these steps:

1. Using a browser, log in to the Installer:

   ```
   https://<Installer Node hostname/Ipaddress>:9443
   ```

   For more information about the Installer, see Installer on page 5579.

2. Click **Support > Export State**.

   The cluster state is downloaded as `stanza.yaml`.

Performing a Maintenance Update

Perform a maintenance update when you want to upgrade to a new patch version of core or apply a patch.

A maintenance update is an update to your installed software that does not require configuration-file changes. Performing a maintenance update has no effect on the ecosystem packages (EEP components). You perform a maintenance update when you want to do either or both of the following:

- **Update to a new patch version of core.** For example, you can perform a maintenance update to change your core version from release 6.1.0 to release 6.1.1. You cannot use a maintenance update to change your core version from a minor version, such as 6.1, to another minor version, such as 6.2. Instead, use the **Version Upgrade** button for minor-version upgrades. The **Version Upgrade** button also permits an upgrade to a patch version of core.
- **Apply a patch.** The **Maintenance Update** page is one of several installer screens that offer the **Patch file** option. See Applying a Patch Using the Installer on page 473.

You cannot perform a maintenance update if your current EEP version is incompatible with the selected core version. For example, you cannot do a maintenance update from release 6.1.0 and EEP 6.3.0 to release 6.1.1 because EEP 6.3.0 is not compatible with release 6.1.1. For EEP and core compatibility information, see EEP Support and Lifecycle Status on page 5728.

NOTE: The maintenance update is an offline update (not a rolling update).

You perform a maintenance update using the Installer. To perform a maintenance update:

1. Verify that your installed EEP is supported by the core version you plan to select for the maintenance update. To check your EEP version, see Checking the EEP Version on page 5598. For EEP and core compatibility information, see EEP Support and Lifecycle Status on page 5728.
2. Update the Installer to the latest supported version. See Updating the Installer on page 5595.
3. Prepare the cluster for a maintenance update by referring to one or both of these topics:
   - Preparing to Upgrade Core on page 315
   - Verify Cluster Readiness for a Patch
4. Start the Installer. For more information, see Installer on page 5579.
5. Click the **Maintenance Update** button.
6. Change the core version, or install a core patch, or both.

   IMPORTANT: During patch-file installation, do not refresh the browser page while the patch file is being uploaded. Doing so can interrupt the upload process.
7. Click **Next** to complete the update.

last-updated: Jun 06, 2024

Auto-Provisioning Templates

Describes the Installer auto-provisioning templates.

Auto-provisioning templates let you select from different provisioning options to address a range of computing requirements. Each template provides a different mix of services and capabilities. You can select the template you need when installing using the Installer web-based interface or Installer Stanzas

Installer 1.14 provided the following auto-provisioning templates:

Template Names in Installer	Template Name for Stanzas	Description
Batch, interactive and real-time analytics	`template-05-converged`	Deploys YARN, HPE Ezmeral Data Fabric Database, HPE Ezmeral Data Fabric Streams, Drill, and Spark.
Data Lake: Common Hadoop Services	`template-10-hadoop`	Provides the most common services deployed in an Apache Hadoop cluster for getting started with a Hadoop data lake. Includes YARN, MapReduce, Spark, and Hive on top of the HPE Ezmeral Data Fabric.
Data Exploration: Interactive SQL with Apache Drill	`template-20-drill`	Provides services needed for users to perform schema-free interactive exploration of their data, including the Apache Drill SQL engine and the Hive Metastore.
Database for Analytics	`template-30-maprdb`	Deploys the HPE Ezmeral Data Fabric Database, providing both JSON and binary data models to enable analytic applications to perform in-situ data processing.
Database for Operational Applications	`template-30-maprdb2`	Deploys the HPE Ezmeral Data Fabric Database, providing both JSON and binary data models to enable operational applications to read and write data at high rates.
Database and Distributed Query Service for Operational Applications	`template-30-maprdb3`	Deploys the HPE Ezmeral Data Fabric Database, providing both JSON and binary data models to enable operational applications to read and write data at high rates. It also deploys Drill as distributed query service performant distributed query execution.
Real-time Analytics: Apache Spark Streaming including SparkML and GraphX	`template-40-maprstreams`	Deploys Spark Streaming and HPE Ezmeral Data Fabric Streams for real-time streaming applications.
HPE Ezmeral Data Fabric File Store	`template-60-maprxd`	Provides common services for HPE Ezmeral Data Fabric File Store (core, filesystem, NFS).
Real-time and batch analytics with Apache Spark on HPE Ezmeral	`template-60-spark`	Deploys real-time and batch analytics with Apache Spark on data-fabric, including SparkML and GraphX.

last-updated: Jun 06, 2024

Template Names in Installer	Template Name for Stanzas	Description
Data Fabric including SparkML and GraphX		
Custom Services	N/A	Selecting this template allows you to customize the services that are installed. No services are selected by default.

MapR Installer 1.10 Updates to the Auto-Provisioning Templates

The following templates were renamed in MapR Installer 1.10:

Old Name (MapR Installer 1.9)	New Name (MapR Installer 1.10)
MapR Converged Cluster: Batch, interactive and real-time analytics	MapR Data Platform: Batch, interactive and real-time analytics
Analytics with MapR Database	MapR Database (MapR-DB) for Analytics
Operational Applications with MapR Database	MapR Database for Operational Applications
Operational Applications with MapR Database and Distributed Query Service	MapR Database and Distributed Query Service for Operational Applications
File Store: Cloud Scale Data Platform	MapR File System and Object Store (File Store)

For MapR Installer 1.10, these features were added to the MapR File System and Object Store (File Store) template:

- MAST Gateway
- NSFv4

MapR Installer 1.9 Updates to the Auto-Provisioning Templates

For MapR Installer 1.9, the following changes to the auto-provisioning templates were implemented:

- A new auto-provisioning template was added. The **Operational Applications with HPE Ezmeral Data Fabric Database and Distributed Query Service** template includes the MapR DataBase and the OJAI Distributed Query services.

last-updated: Jun 06, 2024

- Other templates were changed to enable the use of Drill as an optional selection with the OJAI Distributed Query Service. The following table compares the contents of the various HPE Ezmeral Data Fabric Database templates:

Template	MapR-DataBase	OJAI Distributed Query Service*	Drill
MapR Converged Cluster: Batch, interactive and real-time analytics	Y	Y	Y
Analytics with HPE Ezmeral Data Fabric Database	Y	Y	Y
Operational Applications with HPE Ezmeral Data Fabric Database	Y	N	N
Operational Applications with HPE Ezmeral Data Fabric Database and Distributed Query Service	Y	Y	N

*Prior to MapR Installer 1.9, this service was called the OJAI Query Service.

Understanding Two-Digit and Three-Digit EEPs
Understanding the differences between the EEP directories on https://package.ezmeral.hpe.com/releases/MEP/ can help you prevent versioning issues.

To install or update a Ecosystem Pack (EEP), either manually or by using the Installer, you must first choose a EEP version. The EEP version that you choose has a corresponding subdirectory on https://package.ezmeral.hpe.com/releases/MEP/ from which the ecosystem packages are retrieved.

IMPORTANT: To access the Data Fabric internet repository, you must specify the email and token of an HPE Passport account. For more information, see Using the HPE Ezmeral Token-Authenticated Internet Repository on page 102.

For each released EEP, the https://package.ezmeral.hpe.com/releases/MEP/ directory includes both two-digit and three-digit subdirectories:

Index of /releases/MEP

Name	Last modified	Size	Description
Parent Directory		-	
MEP-1.0.0/	02-Sep-2016 20:26	-	
MEP-1.0/	02-Sep-2016 20:26	-	
MEP-1.1.0/	29-Sep-2016 03:18	-	
MEP-1.1.1/	13-Dec-2016 19:24	-	
MEP-1.1.2/	05-Apr-2017 21:25	-	
MEP-6.0.2/	28-May-2019 16:26	-	
MEP-6.0/	28-May-2019 16:26	-	
MEP-6.1.0/	22-Feb-2019 06:38	-	
MEP-6.1.1/	28-May-2019 15:55	-	
MEP-6.1/	28-May-2019 15:55	-	
MEP-6.2.0/	14-Aug-2019 19:30	-	
MEP-6.2/	14-Aug-2019 19:30	-	
MEP-6.3.0/	13-Dec-2019 00:12	-	
MEP-6.3.1/	17-Sep-2020 08:44	-	
MEP-6.3.2/	02-Feb-2021 05:35	-	
MEP-6.3.3/	23-Mar-2021 20:49	-	
MEP-6.3.4/	01-Jun-2021 16:04	-	
MEP-6.3/	01-Jun-2021 16:04	-	
MEP-7.0.0/	17-Sep-2020 07:51	-	
MEP-7.0.1/	02-Feb-2021 05:37	-	
MEP-7.0/	02-Feb-2021 05:37	-	
MEP-7.1.0/	01-Jun-2021 16:08	-	
MEP-7.1/	01-Jun-2021 16:08	-	

The following table compares the two-digit and three-digit subdirectories and describes how they are used:

last-updated: Jun 06, 2024

EEP Subdirectory	Example	Continuously Updated?	Description
Two-digit	`MEP-3.0/`	Yes	Subdirectories using two digits (for example, MEP-3.0) contain the latest EEP and patches and are continuously updated. For example, if you select EEP 3.0 when using the Installer, the installer installs or upgrades your cluster with the packages from the most current version of EEP 3.0.x. If the most current version is EEP 3.0.1, EEP 3.0.1 is installed. If the most current version is EEP 3.0.2, EEP 3.0.2 is installed, and so on. If you later decide to make changes to the cluster, the Installer applies the packages from the most current version, which can be different from the version you installed originally. Two-digit EEP version numbers make new patches available automatically without the need for system reconfiguration.
Three-digit	`MEP-3.0.0/`	No	Subdirectories using three digits contain a fixed EEP version, including patches, and are not continuously updated. For example, if you select EEP 3.0.0 when using the Installer, the installer uses the packages from the MEP-3.0.0 subdirectory and continues to use the MEP-3.0.0 subdirectory until you change the specified EEP version. Three-digit EEP version numbers ensure that your cluster uses only the specified EEP version. They are best for users who install software manually and do not require automatic updates.

MapR Installer Use of Two-Digit and Three-Digit EEPs

Installer version 1.5 automatically uses two-digit EEPs. Installer versions 1.6 and later use three-digit EEP versions and do not allow you to select two-digit EEPs.

Upgrades from Installer 1.5 to 1.6 or later

If you upgrade the Installer from version 1.5 to a later version, you see both two-digit and three-digit EEPs in the EEP drop-down list for an Incremental Install. The two-digit EEPs continue to operate as they did previously, installing the latest three-digit EEP with the same first two digits. The three-digit EEPs operate as described earlier on this page. Installer version 1.7 displays and supports only three-digit EEPs.

NOTE: If your cluster uses two-digit EEPs, recommends that you upgrade to three-digit EEPs as soon as it is convenient to do so. Doing so enables you to use new features such as the "Extend Cluster" feature without introducing EEP version inconsistencies. You can upgrade by performing an Incremental Install and selecting a three-digit EEP.

Related tasks

Checking the Installer Version on page 5597
Some Installer features require you to use the latest version of the Installer. You can check the Installer version easily from within the user interface.

Uninstalling Software Using the Installer Uninstall Button

You can use a single button to uninstall data-fabric software on all nodes in the cluster.

last-updated: Jun 06, 2024

About this task

The **Uninstall** button appears on the status page of the Installer web interface when you connect to an installed cluster. The **Uninstall** button removes data-fabric software (but does not remove the Installer) from all nodes in the cluster.

NOTE: You can also use Installer Stanzas to uninstall software. See Uninstalling Core Using an Installer Stanza on page 5708.

To use the **Uninstall** button:

Procedure

1. Use a browser to connect to the cluster using the Installer URL:

   ```
   https://<Installer Node hostname/IPaddress>:9443
   ```

2. On the status screen, click the **Uninstall** button. The Installer displays the **Uninstall** screen.
3. Enter your SSH password and other authentication information as needed, and click **Next**. The installer begins the uninstall process.

Installer Troubleshooting

This section describes how to identify and solve problems when you use the Installer.

Installer Known Issues

This topic describes some Installer known issues that you should be aware of while troubleshooting.

If you are viewing this page from within the Installer application, click here to display the information in a browser.

IN-3362	EEP 9.1.1 is supported for use with core 7.2.0 or core 7.3.0. But the Installer cannot install EEP 9.1.1 on core 7.2.0 because EEP 9.1.1 includes Data Access Gateway 6.0.0, which is not supported on core 7.2.0. **Workaround:** To use EEP 9.1.1 with core 7.2.0, you must install Data Access Gateway 5.1.0 (and not Data Access Gateway 6.0.0), and you must perform the installation or upgrade using manual steps.
IN-3240	The probe command can fail in releases 7.1.0 and 7.2.0. For example: `$ /opt/mapr/installer/bin/ mapr-installer-cli probe -nv -o config.hosts='["node1.cluster.com"]' config.ssh_id=root config.ssh_password=**** > /home/ mapr/probe.yaml MapR Installer SDK Logging in to localhost /opt/mapr/installer/build/ installer/lib/python2.7/site-packages/ ansible/parsing/vault/init.py:44: CryptographyDeprecationWarning: Python 2 is no longer supported by the Python core team. Support for it is now deprecated in cryptography, and will be removed in the next release.`

last-updated: Jun 06, 2024

assuming vault does not exist
ERROR: probe command failed
'Options' object has
no attribute 'manifest'
Log files mapr-installer.log
and installer-cli.log can
be found at /opt/mapr/installer/logs
```

Workaround: None.

IN-3223

Because of an overwrite condition made possible by the presence of the new `mapr-ranger-usersync` package in EEP 9.1.0, the Installer fails to install or upgrade Ranger in the following use cases:

- A new installation of EEP 9.1.0 with the Ranger service selected.
- An incremental installation of EEP 9.1.0 to add the Ranger service.
- An upgrade to release 7.2.0 and EEP 9.1.0 from a cluster where the Ranger service was installed.

The issue affects only Ubuntu installations and is caused by RAN-260.

Workaround: Install the Ranger service manually by using `dpkg` and the `--force-overwrite` flag. See the RAN-260 known issue in Ranger 2.3.0.100 - 2301 (EEP 9.1.0) Release Notes on page 6075.

IN-3183

Using the Installer to install release 7.0.0 and EEP 8.1.0 with `mapr-patch-7.0.0.6` on Rocky Linux 8.5 fails during security configuration. Logs indicate that the `private.key` and `public.crt` files are missing.

Workaround: To enable the installation to succeed:

1. Install the release 7.0.0 cluster without the patch.
2. Perform a maintenance update to apply the patch. For more information, see Performing a Maintenance Update on page 5635.

last-updated: Jun 06, 2024

IN-2934

You may receive the following error message while running Installer on Ubuntu v1.16.0.1 or earlier versions:

```
Installing installer packages...

Executing: /tmp/tmp.ROkwOhfN5p/
gpg.1.sh -q
--keyserver-options
http-proxy=http://
web-proxy.corp.hpecorp.net:8080
--fetch-keys
https://package.ezmeral.hpe.com/
releases/pub/maprgpg.key
gpgkeys: protocol
`https' not supported
gpg: no handler
for keyserver scheme `https'
gpg: WARNING: unable to fetch
URI https://package.ezmeral.hpe.com/
releases/pub/maprgpg.key: keyserver
error

ERROR: Could not import repo
key https://package.ezmeral.hpe.com/
releases/pub/maprgpg.key
```

This error occurs because HTTPS protocols are not supported. This known issue affects Ubuntu v1.16.0.1 and earlier versons, in addition to version 1.17.0.0.

Workaround: To work around this issue, you must install the gnupg-curl package before installing the Installer, as this package is a dependency to successfully installing the Installer under this scenario. To do so, do one of the following:

- Install the the gnupg-curl package using `mapr-setup.sh`:

  ```
  mapr-setup.sh -r http://
  package.ezmeral.hpe.com/releases/
  ```

- Update and then install the gnupg-curl package on Ubuntu 16.x:

  ```
  sudo apt-get update
  ```

  ```
  sudo apt-get install gnupg-curl
  ```

IN-3120

A previously installed cluster disappears from the Installer graphical user interface, and the following error appears when you try to update the `mapr-setup.sh` Installer script:

```
ERROR : import command failed
```

This issue affects Installer 1.17.0.3.

Workaround: This issue is fixed in Installer 1.18.0.0 and later.To work around this issue, you can upgrade

last-updated: Jun 06, 2024

to Installer 1.18.0.0 or use either of the following workarounds:

- Fix the state of the cluster after the update:
  1. On the Installer node, export the cluster state by using one of these methods:
     - Use an Installer Stanza CLI command line. See Exporting a Cluster Configuration on page 5708.
     - Use the Installer interface to export the cluster state. See Importing or Exporting the Cluster State on page 5634.
  2. Update the Installer via `mapr-setup.sh`. See Updating the Installer on page 5595.
  3. Use one of the following methods to import the cluster state:
     - Use an Installer Stanza CLI command line. See Using probe and import to Generate the Installer Database on page 5671.
     - Use the Installer interface. See See Importing or Exporting the Cluster State on page 5634..
- Download a new Installer version on another host, and import the cluster state:
  1. On the currently installed Installer node, export the cluster state by using one of these methods:
     - Use an Installer Stanza CLI command line. See Exporting a Cluster Configuration on page 5708.
     - Use the Installer interface to export the cluster state. See Importing or Exporting the Cluster State on page 5634.
  2. Install the new Installer version on any other node of the cluster that satisfies the Installer prerequisites. See Installer Prerequisites and Guidelines on page 5581.
  3. On the new Installer node, use one of the following methods to import the cluster state:
     - Use an Installer Stanza CLI command line. See Using probe and import to Generate the Installer Database on page 5671.
     - Use the Installer interface. See Importing or Exporting the Cluster State on page 5634.

IN-3053

On HPE Ezmeral Data Fabric 7.0.0, `update_services.yml` fails with the following error message:

```
Unable to retrieve file contents
Could not find or access '/opt/
mapr/installer/mapr_ansible/playbooks/
```

```
configure_master.yml' on the Ansible
Controller.
```

Workaround: Run the following command to update the `update_services.yml` file:

```
sed -i 's/configure_master.yml/
configure_security_controller.yml/g'
/opt/mapr/installer/mapr_ansible/
playbooks/update_services.yml
```

IN-2985

When you install Data Fabric on Ubuntu 20.04 with Python 2 specified as the default Python package, and you choose the option to install the mysql server, the installation can fail with the following message:

```
No package matching 'python-mysqldb'
is available
```

The installation fails because Ansible is missing a dependency for communicating with MySQL.

Workaround: On the Installer node, set an option in the `ansible.cfg` file to force Ansible to use Python 3. For example, set the following option:

```
interpreter_python = /usr/bin/python3
```

Then rerun the installation.

IN-3016

On Installer 1.16 and earlier, clicking **Abort** during the **Extend Cluster** operation returns you to the verification page and does not reset the Installer database back to its initial state.

(Note that on Installer 1.17 and later, clicking **Abort** resets the Installer database automatically so that you can retry the operation.)

Workaround: On Installer 1.16 and earlier, use these steps to reset the Installer database manually and retry the **Extend Cluster** operation:

1. Click **Support > Reset Installer**. This command uninstalls the metadata from the Installer database. For more information, see Resetting the Installer Database on page 5672.
2. Click **Support > Import State**. The **Cluster State** dialog box appears, enabling you to reset the cluster to the last known state. For more information, see Importing or Exporting the Cluster State on page 5634.
3. Click **Reset** to recover the Installer to the last known state and return to the Installer home page.
4. If necessary, retry the **Extend Cluster** operation.

last-updated: Jun 06, 2024

IN-3007

During a multinode installation of core 6.2 on SLES 15 SP2, the Installer returns the following error:

```
 "msg": "user {{ ssh_id }} does
not have the ability to elevate
privileges - check for correct
sudoers config for example"
```

This issue can occur when Python is not installed on all cluster nodes.

Workaround: Check to ensure that Python is installed on all cluster nodes. Install Python, if it is not already installed.

IN-2924

Upon restart, cluster nodes running Loopback NFS do not remount `/mapr`. This issue can occur when using Installer 1.16.0.0 to perform a new or incremental installation. The issue is caused by a missing symlink.

Workaround: Manually create a symlink from `/usr/local/mapr-loopbacknfs/conf/mapr_fstab` to `/opt/mapr/conf/mapr_fstab`, and use the following commands to restart NFS and mount `/mapr`:

1. Restart the Loopback NFS service:

   ```
   maprcli node services -nodes <node
   names> -nfs restart
   ```

2. Run the `mount_local_fs.pl` script to mount `/mapr`:

   ```
   /opt/mapr/bin/mount_local_fs.pl
   ```

IN-2397

The Verify phase of the Installer can fail if the `authorized_keys` file contains a command such as the following:

```
no-port-forwarding,no-agent-forwarding
,no-X11-forwarding,command="echo
'Please login as the user \"admin\"
rather than the user
\"root\".';echo;sleep 10" ssh-rsa ...
```

Any command in the `authorized_keys` file prevents the Installer from authenticating with remote nodes.

Workaround: Verify that the `authorized_keys` file does not contain commands that prevent the Installer from authenticating with remote nodes. In addition, if you are using keys for remote authentication, you must ensure that you can ssh into all nodes in the cluster using the user and password that you specified when you configured remote authentication.

IN-2500

After a new installation, the Installer home page displays two YARN ResourceManager links, but one of the links does not work.

Workaround: This is normal. Click the YARN ResourceManager links until you find the link that works. Even if the ResourceManager is installed on

last-updated: Jun 06, 2024

	multiple nodes, the YARN ResourceManager only has one server running at a time, . If the running ResourceManager fails, a new ResourceManager is started on one of the other nodes.
SPYG-1136	During a manual installation or upgrade, Collectd provided in core 6.1.0 won't start on RHEL / CentOS 8.2 because it expects the Python 2 libraries to be installed, and RHEL / CentOS 8.2 provides the Python 3 libraries instead. This issue does not affect installations or upgrades performed using the Installer. **Workaround:** Before installing the monitoring components, check to see if Python 2 is installed. If the following error is generated, try installing Python 2 on RHEL / CentOS 8.2: `failed: libpython2.7.so.1.0: cannot open shared object file`
IN-2637	After a manual installation, Oozie and Hive services can fail to connect to a MySQL or MariaDB database because the server time-zone value is unrecognized or represents more than one time zone. The issue affects your installation if you applied the `mapr-patch` released on or after February 21, 2021 (including the latest `mapr-patch`). This issue affects manual installations but is fixed in Installer 1.14.0.0. **Workaround:** For manual installations, you must configure either the server or JDBC driver (using the `serverTimezone` configuration property) to use a more specific time-zone value if you want to utilize time-zone support. After running `configure.sh` but before starting the Oozie or Hive services, update the `serverTimezone` parameter in the `hive-site.xml` or `oozie-site.xml`. For more information, see MySQL Bug #95036.

IN-2935	On RHEL or CentOS 8.3, new installations using the Installer can fail with the following error message:
	`mount.nfs: access denied by server while mounting localhost:/mapr`
	This happens when the Installer cannot start the `mapr-loopbacknfs` service because the RHEL or CentOS NFS/NFS4 service is running.
	Workaround: Edit the `/etc/systemd/system/mapr-loopbacknfs.service` file to add the following Conflicts directive to the `nfs-mountd.service`:
	`[Unit]`
	`Description=MapR Technologies, Inc. loopbacknfs service`
	`After=rc-local.service`
	`After=network.target syslog.target`
	`Conflicts=nfs-mountd.service`
	The `Conflicts` command stops `nfs-mountd` before installation so it cannot interfere with starting `mapr-loopbacknfs`. After editing the

last-updated: Jun 06, 2024

	`loopbacknfs.service` file, perform a daemon reload using the following command, and then retry the installation: `systemctl daemon-reload`
IN-2947	For Installer 1.16.0 on Ubuntu 18.04, the **Extend Cluster** operation fails for clusters larger than three nodes. The operation fails on nodes where ZooKeeper is not installed. The failure occurs because the Installer attempts to update the ZooKeeper service file on a node that has no roles file for ZooKeeper. **Workaround:** Make sure ZooKeeper is running on every node in the cluster, and retry the **Extend Cluster** operation.
ES-77, FLUD-55	During an upgrade from EEP 6.x to EEP 7.0.0 or EEP 7.0.1, some monitoring components do not get updated because of an error in the fourth digit of the package version. This issue can occur during manual upgrades or upgrades performed using the Installer. The affected components can include any or all of the following: • Elasticsearch • Fluentd • Grafana • Kibana **Workaround:** See Reinstalling Monitoring Components After an Upgrade in the data-fabric documentation.
IN-1976	During a version upgrade from core 6.0.1 and EEP 5.0.x to a later version of core, the upgrade succeeds, but the following error message is generated: `This version of Kibana requires Elasticsearch v6.2.3 on all nodes. I found the following incompatible nodes in your cluster: v5.4.1 @ 10.10.103.231:9200 (10.10.103.231), v5.4.1 @ 10.10.102.21:9200 (10.10.102.21), v5.4.1 @ 10.10.103.230:9200 (10.10.103.230)` This happens because the Elasticsearch package script does not remove Elasticsearch completely and does not shut it down. Even though a new version of Elasticsearch is installed, the old version is still running and using the port needed by the new version. **Workaround:** 1. Use the `jps` command to find the process for the old Elasticsearch. 2. Use `kill -9` to shut down the old Elasticsearch process. Warden will restart the newly installed Elasticsearch.

last-updated: Jun 06, 2024

IN-2742

A `configure.sh` operation can hang because of a system control hang if you try to install on top of a "minimal" operating system installation and the RDMA RPM or service is not present. This issue can occur during manual installations or during installations using the Installer.

Workaround: Before running `configure.sh`, use one of the following workarounds:

Workaround #1 - Install the missing RDMA Dependencies

- **RHEL / CentOS**
  1. Install `libibverbs`:

     ```
     yum
     install
     libibverbs
     ```

  2. Enable and start the RDMA service:

     ```
     systemctl
     enable
     rdma &&
     systemctl
     start rdma
     ```

  3. Retry the HPE Ezmeral Data Fabric installation.
- **Ubuntu 18**
  1. Install the `rdma-core` package:

     ```
     apt-get
     install
     rdma-core
     ```

  2. Install `libibverbs1`:

     ```
     apt-get
     install
     libibverbs1
     ```

3. Enable and start the RDMA service:

```
systemctl enable iwpmd && systemctl start iwpmd
```

4. Retry the installation.

- **Ubuntu 16**

  Release 6.2 does not provide RDMA support for Ubuntu 16 because Ubuntu 16 does not have the `rdma-core` package.

Workaround #2 - Disable RDMA Support

1. Rename `/opt/mapr/lib/libibverbs.so`. For example:

```
mv /opt/mapr/lib/libibverbs.so /opt/mapr/libibverbs.so.sv
```

2. Restart the ZooKeeper and Warden nodes.

Workaround #3 - Install the Latest Core Patch

The latest patch contains the `export MAPR_RDMA_SUPPORT=false` environment variable, which removes RDMA support. For patch information, see "Downloading a Patch" in the data-fabric documentation.

IN-2784 & MFS-11853

Stopping a cluster by stopping ZooKeeper and Warden can cause clients that are accessing the file system through POSIX (for example, the S3 gateway) to hang if Loopback NFS is installed on a cluster node and is not stopped first. Note that beginning with Installer 1.15, the Installer installs Loopback NFS on all cluster nodes unless NFS is enabled.

Workaround: If Loopback NFS is running and you need to stop the cluster, you must first unmount `/mapr` and stop Loopback NFS on all nodes. Then, you can stop ZooKeeper and Warden. For more information,

last-updated: Jun 06, 2024

	see "Managing the mapr-loopbacknfs Service" in the data-fabric documentation.
IN-1343	In a new installation of six nodes or more using the Installer, if only data nodes fail to install, retrying the installation can fail. **Workaround:** Use the Installer uninstall feature, and retry the installation from scratch. See "Uninstalling Software Using the Installer Uninstall Button" in the data-fabric documentation.
IN-2132	On a SLES cluster, using Installer version 1.10 or earlier of the `mapr-setup.sh` script can complete successfully even if sshpass is not installed. **Workaround:** Upgrade to the latest Installer. You must use version 1.11 or later of the `mapr-setup.sh` script. If you cannot use Installer version 1.11 or later of the `mapr-setup.sh` script, install sshpass before running the `mapr-setup.sh` script on a SLES cluster.
IN-2008	When you upgrade from a secure 6.0.0 cluster to 6.0.1 using Installer 1.9, a security certificate for log monitoring is overwritten. As a result, Elasticsearch can fail to start after the upgrade. This issue is not present during a new installation of 6.0.0 or 6.0.1 or during an upgrade to 6.1.0. This issue is fixed in Installer 1.10 and later. **Workaround:** To resolve the issue, you must remove the `.keystore_password` file, re-run the command to generate new Elasticsearch certificates, and then re-distribute the certificates. Use these steps: **1.** Remove or rename the `.keystore_password` file. For example: `rm /opt/mapr/elasticsearch/elasticsearch-x.x.x/etc/elasticsearch/.keystore_password` **2.** Perform steps 3 through 7 of "Step 9: Install Log Monitoring" in the data-fabric documentation. Completing steps 3 through 7 regenerates the Elasticsearch certificates and copies them to the other nodes.
IN-2443	An internal server error that includes a NullPointerException can be generated if you install a cluster on Ubuntu 16 using a Installer Stanza. The error appears if Hive is installed but no password for Hive is included in the `.yaml` installation file. **Workaround:** Add the Hive password to the `.yaml` installation file and re-run the Stanza.
IN-18	When using the `-v` or `--verbose` options with Installer Stanzas, detailed error information is not provided on the command line. For example, if a `mapr` user or group is not present on a host during a new installation, the `mapr-installer-cli` reports "Verification Error" on the command line.

last-updated: Jun 06, 2024

	Workaround: To view more detailed error information when using the `-v` or `--verbose` options, check the `installer-cli.log[.x]` file after running the Stanza. For information about the Installer logs, see "Logs for the Installer" in the data-fabric documentation.
IN-2200	Deploying a release 6.0.1 cluster on AWS fails when the following parameters are specified: • `diskType: io1` • `installerOnitsOwn: false` **Workaround:** Try using a `diskType` of `gp2` (general-purpose SSD) instead of `io1` (provisioned IOPs SSD), or set `InstallerOnitsOwn` to `false` instead of `true`. Then retry the deployment.
IN-2152	During a Installer upgrade from any release to 6.0.1, core files can be generated for ecosystem components, which can cause alarms in the Control System following the upgrade. This happens because the upgrade sequence shuts down the cluster, then upgrades Core packages, and then restarts Core. Restarting Core is necessary to upgrade some ecosystem components. When the old ecosystem components are started, version incompatibilities with the new version of Core can cause core dumps. This is a temporary issue. Upgrading the ecosystem component, which happens later in the upgrade process, resolves the issue. The issue does not exist in 6.1 and later releases, which have the ability to prevent services from restarting during an upgrade. **Workaround:** Ignore the Control System alarms, or upgrade to 6.1 or later, which should not generate core alarms.
IN-1940	In Installer versions 1.9 and earlier, the `probe` command can fail because of a runtime error if you have installed the Operational Applications with HPE Ezmeral Data Fabric Database template. The error is caused by the presence of the `mapr-drill-internal` package. Any node running the Data Access Gateway requires the `mapr-drill-internal` package to be installed even though Drill is not installed as a service. The `mapr-drill-internal` package provides a set of client libraries used by the Data Access Gateway. **Workaround:** Before using the `probe` command, update the Installer. The `probe` command is fixed in versions 1.10 and later.
IN-1635	In Installer Stanza versions 1.9 and earlier, the `probe` command was hard coded with a cluster admin user of `mapr`. If you configured a cluster admin user other than `mapr`, the `probe`-generated YAML file could not be imported using the `import` command. **Workaround:** Before using the `probe` command, update the Installer to version 1.10 or later. Or, if you must use version 1.9 or earlier, edit the `probe`-generated YAML file to specify the correct cluster admin user.

last-updated: Jun 06, 2024

IN-2123

In a secure cluster, the **Extend Cluster** operation fails if you try to extend the control group. The new control node cannot join the cluster because it inadvertently receives a new set of keys. This issue affects versions 1.7 through 1.10 of the Installer and is fixed in Installer 1.10.0.201812181130 and later versions.

Workaround: You can resolve the issue by manually copying mapruserticket into the `/opt/mapr/conf` directory of the node to be added to the cluster.

IN-2141

The following issue applies to Installer versions 1.7 through 1.10, but not all 1.10 versions. The issue is fixed in Installer 1.10.0.201812181130 and later versions.

An extend cluster (add node) operation can fail when you:

1. Install a 6.x cluster manually with security enabled.
2. Run the Installer Stanza `probe` command on the cluster or on a node to be added to the cluster.
3. Use the `import` command to import the `probe` .yaml file into the Installer.
4. Perform an extend cluster operation immediately after the `import` operation.

The extend cluster operation fails because keystore, truststore, and server ticket (`maprserverticket`) files are not present on the installer node.

Workaround:

Before attempting the extend cluster operation, copy the keystore, truststore, and server ticket (`maprserverticket`) files from any CLDB node to `/opt/mapr/installer/data/tmp` on the installer node. The files that need to be copied are:

- `cldb.key`
- `dare.master.key*`
- `maprserverticket`
- `ssl_keystore`
- `ssl_keystore.p12`
- `ssl_keystore.pem`
- `ssl_truststore`
- `ssl_truststore.p12`
- `ssl_truststore.pem`

*The DARE primary key is required only if DARE is enabled.

If metrics monitoring is configured on the cluster, you must also copy the tickets related to Fluentd, Kibana, and Elasticsearch to the same location.

last-updated: Jun 06, 2024

IN-2217

During an upgrade to EEP 6.1.0 using the Installer, the Installer does not back up the Drill `conf`, `log`, and `jar` directories into `${MAPR_HOME}/drill/OLD_DRILL_VERSIONS`. This can happen when you upgrade Drill from an old version (for example, Drill 1.10 in EEP 3.0) to Drill 1.15.0.0 in EEP 6.1.0.

Recent packaging changes in Drill contribute to this issue. Drill 1.10 consists only of `mapr-drill-1.10` (role and binaries), whereas Drill 1.15.0.0 consists of `mapr-drill-1.15` (roles) and `mapr-drill-internal-1.15` (binaries). During the upgrade, the `mapr-drill-1.10` binaries are successfully uninstalled, but the OLD_DRILL_VERSIONS directory that is needed to back up Drill 1.10 is not created.

Workaround:

Before upgrading, perform the following steps:

1. Shut down the `mapr-drill-1.10` Drillbits.

   ```
   maprcli node services -name
   drill-bits -action stop -nodes
   <node hostnames separated by a
   space>
   ```

2. Create `${MAPR_HOME}/drill/OLD_DRILL_VERSIONS/drill-1.10`.
3. Copy the following directories of `mapr-drill-1.10` into the `OLD_DRILL_VERSIONS` directory:
   a. Copy the `conf` directory to `${MAPR_HOME}/drill/OLD_DRILL_VERSIONS/drill-1.10.0/conf`.
   b. Copy the `logs` directory to `${MAPR_HOME}/drill/OLD_DRILL_VERSIONS/drill-1.10.0/logs`.
   c. Copy the `jars/3rdparty` directory to `${MAPR_HOME}/drill/OLD_DRILL_VERSIONS/drill-1.10.0/jars`.
4. Proceed with the upgrade.
5. After successfully upgrading and starting `mapr-drill-1.15.0.0`, you may remove the `${MAPR_HOME}/drill/drill-1.10.0` directory.

IN-1915

During an upgrade using the Installer, refreshing the browser page can cause the Installer to forget upgrade parameters that were specified before the refresh.

Workaround: Avoid refreshing the browser page during an upgrade operation. If you must refresh the page, go back to the first page of the upgrade operation and start over again to ensure that the

last-updated: Jun 06, 2024

	Installer has the correct parameters before it begins the Verify phase of the upgrade.
IN-2035	During a version upgrade using the Installer, if you select the **Advanced Configuration** button and then click **Previous** (one or more times) followed by **Abort**, the Installer can indicate that the upgrade completed even though the upgrade was aborted. **Workaround:** If this happens, you must reset the installer and reload the last known state. Follow these steps to reset the cluster state: 1. Click **Support > Reset Installer**. A warning screen appears. 2. Click **OK**. 3. Click **Support > Import State**. 4. Click **Reset** to recover the cluster to the last known state. It is safe to retry the upgrade at this point. For more information about the **Reset Installer** and **Import State** commands, see "Resetting the Installer Database" and "Importing or Exporting the Cluster State" in the data-fabric documentation.

IN-2065	`/mapr` sometimes does not get mounted after you enable NFS (v3 or v4) using the Installer Incremental Install function. The Incremental Install function is an online operation. Enabling NFS using an Incremental Install can create a race condition between when the `mapr_fstab` file gets created and NFS is started by Warden. If NFS is started by Warden before the `mapr_fstab` file is created, `/mapr` does not get mounted.
	Workaround:
	If `/mapr` is not mounted, check the time stamp of the `/opt/mapr/conf/mapr_fstab` file to see if it is older than the time stamp in the `warden.log` file for starting NFS. For example:
	`[root@atsqa4-61 logs]# ls -ld /opt/mapr/conf/fstab`
	`rw-rr- 1 mapr mapr 39 Sep 26 11:31 /opt/mapr/conf/mapr_fstab`
	`[root@atsqa4-61 logs]# fgrep starting warden.log | fgrep nfs`
	`2018-09-26 11:29:33,407 INFO com.mapr.warden.service.baseservice.Service [Thread-34]: -------------Service is starting for: nfs4`
	If the time stamp of the `mapr_fstab` file is older than the Warden time stamp:

last-updated: Jun 06, 2024

1. Restart the NFS service:

```
maprcli node services -nodes <node
names> -nfs4 start
```

2. Run the `mount_local_fs.pl` script to mount `/mapr`:

```
/opt/mapr/bin/mount_local_fs.pl
```

INFO-420

The procedure for configuring storage using `disksetup` does not work for new installations of DARE-enabled 6.1 clusters. With DARE enabled, `disksetup` fails on any node that is not a CLDB node because there is no local copy of the `dare.master.key` file. When you use disksetup, non-CLDB nodes try to contact the CLDB, which must be running when the nodes attempt contact.

Workaround:

After running `configure.sh`, you must:

1. Format the disks on the CLDB nodes.
2. Start ZooKeeper on the ZooKeeper nodes.
3. Start Warden on the CLDB nodes.
4. Format the remaining node disks using `disksetup`.
5. Start Warden on the remaining nodes.

IN-2057

A fresh install of 6.0.0 using the `sample_advanced.yaml` file for Installer Stanzas (Installer version 1.9) can fail with the following error message:

```
ERROR: install command failed
Service mapr-data-access-gateway must
be a member of a template group.
Configured services require it:
['mapr-data-access-gateway']
```

The error is generated because the `.yaml` file is missing an entry for the `mapr-data-access-gateway` in the MASTER services section. The `mapr-data-access-gateway` service is needed for HPE Ezmeral Data Fabric Database installations.

Workaround:

In the MASTER services section of the `sample_advanced.yaml` file, add `mapr-data-access-gateway` to at least one of the host groups, and retry the installation.

IN-1272

During an upgrade to 6.0 or later (Drill 1.11), `configure.sh` sometimes fails to disable the storage plugin for HBase. The HBase server is not supported

	in Core 6.0 or later, so the HBase storage plugin should be disabled before a cluster is upgraded to 6.0 or later. Otherwise, Drill queries against HBase will hang. **Workaround:** Before upgrading to Drill 1.11 or later, manually disable the HBase storage plug-in. To manually disable the plug-in, you can use the Drill Web Console or Drill REST API commands. You can disable the HBase storage plugin on the **Storage** page of the Drill Web Console at `http(s)://<drill-hostname>:8047`. For more information, see this page: `https://drill.apache.org/docs/rest-api-introduction/#delete-/storage/{name}.json`
IN-1747	If you use the Installer 1.10 **Uninstall** button to uninstall software and a node is unreachable, you will not be able to uninstall the node later when the node is reachable. **Workaround:** Uninstall the software on the node manually. See "Decommissioning a Node and Uninstalling Data Fabric Software from the Command-line" in the data-fabric documentation.
IN-2015	A fresh install of 6.0.0 with EEP 4.1.1 using Installer 1.9 can fail with the following error message: `file not found: /opt/mapr/elasticsearch/elasticsearch-5.4.1/etc/elasticsearch/sg/admin-usr-clientCombo.pem` **Workaround:** Update the Installer to version 1.10 or later, and retry the operation.
IN-2018	Logging on to Kibana results in an authentication failure. This can happen on a CentOS cluster if you use Installer 1.10 to install 6.0.1 EEP 5.0.0, and then upgrade to 6.1.0 and EEP 6.0.0. **Workaround:** Try using Installer 1.9 to install the 6.0.1 cluster and Installer 1.10 to upgrade the cluster. See "Updating the Installer" in the data-fabric documentation.
CORE-150	After using the **Incremental Install** function of the Installer to apply security to an Azure-based 6.1.0 cluster, the Hue and Spark-thrift server links are not accessible in the Installer interface. This issue can occur on an Azure-provisioned cluster whose internal DNS suffix starts with a number rather than a letter. **Workaround:** Re-create the cluster in Azure so that the internal DNS suffix starts with a letter and not a number.
IN-2025	The **Extend Cluster** operation can fail during the **Verify Nodes** phase with an error indicating `Unscalable host groups found`. This error

last-updated: Jun 06, 2024

	can occur when the MASTER group is missing or a single-instance service (for example, Grafana) has been moved out of the MASTER group. The `mapr-installer.log` reveals which cluster services are supposed to be in the MASTER group. **Workaround:** Move any original MASTER services that caused the error back to the MASTER group. The `mapr-installer.log` indicates the services that need to be moved along with the `Unscalable host groups found` error.
IN-2006	On a cluster with `mapr-drill` installed, the `probe` command can return the wrong database type value. **Workaround:** After using the `probe` command, check to see if the resulting YAML file has the correct `mapr_db` setting. Possible settings are: • `QS` • `DRILL` • `DRILLQS` If necessary, change the setting in the YAML file to match the value from the probed cluster.
IN-1955	If you install cluster software using the Installer in a browser and then upgrade the installer in the same browser tab and attempt an upgrade without starting a new browser, the stale browser cache can cause upgrade errors. **Workaround:** Clear your browser cache or open a new browser tab whenever you need to update the Installer and perform a new installer operation.
IN-1983	After an upgrade from release 5.x to release 6.1 and EEP 6.0.0 using the Installer, the `kafka-connect` service fails to start. This issue has been noticed on platforms that use `systemd`. **Workaround:** Stop the `kafka-connect` service manually, and restart the service.
IN-1972	During an upgrade from release 5.x to release 6.1, the Installer prompts you for the MySQL user ID and password. If you enter a password that is different from the password you provided when you originally configured MySQL through the Installer, the upgrade fails with this error: "Unable to connect to database…." **Workaround:** When the Installer prompts you for the MySQL user ID and password, enter the password that you specified when you first installed the cluster. If you did not specify a password for MySQL when you installed release 5.x, leave the password field blank.
IN-1904	If you initiate a system startup by clicking the **Startup** button on the Installer web interface, the **Authentication** screen is displayed. If you subsequently click the **Previous** button, the following buttons are shown as active even though they are not usable during system startup:

last-updated: Jun 06, 2024

- Extend Cluster
- Incremental Install
- Maintenance Update
- Shutdown
- Uninstall

Workaround: Do not use the **Previous** button during startup.

IN-1657

After updating the Installer 1.7 or later, the Installer can lose awareness that a cluster was previously installed. For example, the Installer might indicate the need for a fresh install.

Workaround: If this happens, do NOT proceed with installation or upgrade operations. Follow these steps to reset the cluster state:

1. Click **Support > Reset Installer**. A warning screen appears.
2. Click **OK**.
3. Click **Support > Import State**.
4. Click **Reset** to recover the cluster to the last known state. It is safe to use the Installer at this point.

IN-1804

For release 6.0 or later clusters, enabling security by using the Incremental Install function can overwrite custom certificates in the `ssl_truststore` and `ssl_keystore` files. When you turn on security, the Installer runs the `configure.sh` script on the CLDB primary node to generate security keys and then distributes the keys to all the other CLDB nodes. The installer also distributes certificates to all the other nodes. This process can cause custom certificates to be overwritten. However, before enabling security, the Installer makes a backup of the existing `ssl_keystore` and `ssl_truststore` files.

Workaround:

After enabling security, locate the backup of the `ssl_keystore` and `ssl_truststore` files. The backup uses this format:

```
/opt/mapr/conf/
ssl_keystore.sv.<timestamp>
```

Extract any custom certificates from the backup files, and manually merge or add them into the new `ssl_keystore` and `ssl_truststore` files.

To merge the files, you can use the `/opt/mapr/server/manageSSLKeys.sh` utility, as shown in "Configuring Secure Clusters for Running Commands Remotely" in the data-fabric documentation.

IN-997

When using Installer 1.9 with Ubuntu distributions, an upgrade of the Installer definitions requires a restart

last-updated: Jun 06, 2024

	of the installer service. The restart is needed because the Installer services version is not updated properly when you use either of the following commands: • `mapr-setup.sh reload` • `apt-get install mapr-installer-definitions` **Workaround:** After installing or reloading the Installer definitions, issue one of these commands to fix the services version: • `service mapr-installer restart` • `systemctl restart mapr-installer`
IN-1671	For Installer 1.8 and earlier, installation on Ubuntu 16.04 can fail if Python 2 is not available or if the default is set to Python 3. The installer requires `python` and `python-yaml` to be installed on all nodes. **Workaround:** To install the Python packages manually: `sudo apt-get install python python-yaml -y`
IN-1336	The Installer **Retry** function can be affected if the installer operation fails. Suppose you deselect a service during an **Incremental Install** operation. If the **Incremental Install** fails and you need to **Retry**, it's possible that the service will not be deselected (uninstalled). **Workaround:** Manually remove (uninstall) the service by using one of these commands: • **Red Hat / CentOS:** `yum remove` • **Ubuntu:** `apt-get remove` • **SLES:** `zypper remove`
IN-1392	During an **Extend Cluster** (add node) operation using the Installer, if installation of the added node fails and you abort the operation, the installer can display the added node even though it did not get installed. **Workaround:** When the Installer indicates that a node did not get added correctly (typically during the Installation phase), select the node and click **Remove Node**. Then retry adding the node.
IN-1396	An installation using the Installer fails with the following Ansible module error: `nValueError: need more than 1 value to unpack` **Workaround:** Check for syntax errors in the `/etc/sysctl.conf` file, which can cause an Ansible error

last-updated: Jun 06, 2024

	when the Installer is attempting to set various kernel parameters.
IN-1398	In the Installer **Verify Nodes** page, if you click a host, the **Disks Selected for MapR** box in the right pane displays the disks that were specified for the host either manually or automatically. If you deselect a disk in the right pane and click **Retry**, the deselection is not always implemented. **Workaround:** Click **Previous** to go back to the **Node Configuration** page, and re-specify the disks that you want. Then continue with the operation.

IN-1386	On a secure cluster, YARN jobs can fail if you specify IP addresses rather than host names when you configure nodes using the Installer.
	Workaround:
	Do not use an IP address for node configuration with the Installer. If you already used an IP address, change the IP address in the yarn-site.xml file on all nodes. In the following example, the 10.10.10.7 IP address must be changed to a host name, such as `bld73.qa.lab`:
	`<property>`
	`<name>yarn.timeline-service.hostname</name>`
	`<value>10.10.10.73</value>`
	`</property>`

IN-1333	On Ubuntu clusters, the `mapr-setup.sh` script fails to reload the Installer definitions during an update of the installer and definitions. **Workaround:** After updating, restart the installer to load the definitions: `service mapr-installer restart`
IN-907	The Installer service fails if the `mapr` user or `root` user already exist and they are configured to use a shell other than bash. For more information about user requirements, see "Installer Prerequisites and Guidelines" in the data-fabric documentation. **Workaround:** Configure the users to use bash. For more information about user requirements, see "Installer Prerequisites and Guidelines" in the data-fabric documentation.
IN-1079	Verification fails when the installed language pack is for a language other than English. **Workaround:** Remove the non-English language pack and install the English language pack. In the following example, the non-English language pack is shown as German. Also, make sure your system locale is

last-updated: Jun 06, 2024

	set to `en_us`, as described in "Infrastructure" in the data-fabric documentation.
	`sudo apt-get install language-pack-en language-pack-en-base manpages`
	`sudo apt-get remove language-pack-de language-pack-de-base manpages-de`

IN-804	Using the Incremental Install operation to add a third node to a CONTROL group generates an error: `ERROR: configure_refresh.sh failed`. This issue applies to Installer versions 1.6 and earlier. **Workaround:** Update the Installer to version 1.7 or later, and retry the operation. See "Updating the Installer" in the data-fabric documentation.
IN-1314	When you use the Installer to install ecosystem components that require a MySQL component such as Hive, Oozie, or Hue, the passwords you provide to install the MySQL database are displayed in the `mapr-installer.log` and `<nodename>.log` files. Beginning with Installer 1.7, the permissions for the `mapr-installer.log` and `<nodename>.log` files are changed so that these passwords are not world readable. However, the passwords are still present in log files created with earlier versions of the Installer. **Workaround:** For increased security, remove the earlier logs or change the user permissions for them.
IN-1042	Installation of the 5.2.x `mapr-metrics` package on SLES 12 SP2 fails because the `libmysqulclient16` package is not present. This can happen when `mapr-metrics` is installed manually or using the Installer. This issue was detected during installations of release 5.2.x with EEP 3.0.0. **Workaround:** None.
IN-870	If your cluster uses 2-digit EEPs, and you use the Installer **Extend Cluster** button to add a node, the node can be added with a patch version that is different from the patch version of other nodes in the cluster. See "Understanding Two-Digit and Three-Digit MEPs" in the data-fabric documentation. **Workaround:** A one-time change can prevent this issue. After updating the Installer from version 1.5 to version 1.6 or later, but before performing any Installer operations, use an Incremental Install function to change your 2-digit EEP version to the equivalent 3-digit EEP version. See "Updating the Installer" in the data-fabric documentation.
ES-27, IN-1387	On a new installation of a secure cluster using the Installer, Elasticsearch fails to start, and logs indicate that Elasticsearch key generation failed. When this happens, Kibana and Fluentd also do not start. The Installer allows the installation to complete. **Workaround:** Check the installer log for a message indicating that Elasticsearch could not be secured. Use the **Incremental Install** feature of the Installer to retry installation of the Monitoring logging components.

last-updated: Jun 06, 2024

Alternatively, you can configure security for the logging components manually. See "Step 9: Install Log Monitoring" in the data-fabric documentation.

IN-1332

On clusters with less than the recommended memory configuration (16 GB per node), services added during an Incremental Install operation might fail to start because Warden allocated available memory to the filesystem. The Installer might not indicate a problem with the newly added services. If this issue occurs, the filesystem cannot relinquish memory without restarting Warden.

NOTE: This issue can also occur on clusters with more than 16 GB of memory per node if the installed services require more memory than is currently installed.

Workaround:

Use the Control System or the `maprcli service list -node` command to determine if the added services are running. If not, perform a rolling restart of the nodes to which the new services were added. The rolling restart will rebalance memory across the filesystem and services. One node at a time, restart Warden on each node following the group upgrade order prescribed in "Manual Rolling Upgrade Description" in the data-fabric documentation. Use the following steps:

1. Change to the `root` user (or use `sudo` for the following commands).
2. Stop Warden.

   ```
   sudo service mapr-warden stop
   ```

3. Restart Warden.

   ```
   service mapr-warden start
   ```

IN-1339

Installation fails with the Installer reporting an **Unexpected failure during module execution**, and the following entry is present in the "Logs for the Installer" described in the data-fabric documentation:

```
os.write(self.sshpass_pipe[1],
to_bytes(self._play_context.password)
+ b'\n')
OSError: [Errno 9] Bad file descriptor
```

Workaround: Change the ssh settings as described in known issue IN-405 later on this page, and retry the installation.

IN-553

New installations on Ubuntu 14.04 using Installer 1.6 or 1.7 can fail because of a JDK 1.8 issue.

Workaround:

If you are installing on Ubuntu 14.04, you must install Java JDK 1.8 before running the Installer. For more

last-updated: Jun 06, 2024

	information, see this website. If you are installing on RHEL/CentOS or SLES, the Installer installs Java JDK 1.8 for you.
IN-405	Installation or cluster import using the probe command fails with the error message: "Failed to resolve remote temporary directory from ansible-tmp- ...." **Workaround:** To proceed using the Installer, disable SSH connection reuse by including this entry underneath the `[ssh_connection]` property of `/opt/mapr/installer/etc/ansible.cfg`: `ssh_args=-o ControlMaster=no -o ControlPath=none -o ControlPersist=no` This workaround can lead to longer install times. We recommend that you resolve any network connectivity issues in your environment.
IN-250	An upgrade to a new core version and a new EEP using the Installer can fail if the cluster being upgraded was initially installed with Hive Metastore but not with Hive. The Hive Metastore package has an installation dependency on Hive, but the Hive Metastore definitions do not enforce the dependency, resulting in inconsistencies in the installer database. This issue has been observed on Ubuntu platforms. **Workaround:** Before upgrading, if you have Hive Metastore installed by itself, use the **Incremental Install** feature of the Installer to install Hive. Then proceed with the upgrade. Performing an upgrade without doing the **Incremental Install** of Hive will cause the upgrade to fail. In this scenario, you will have to reinstall or rebuild the database by using Stanza commands. You can use the `reset` command, followed by `probe`, and then edit the versions in the resulting YAML file. The last step is to import the edited YAML using the `import` command. See "Using probe and import to Generate the Installer Database" in the data-fabric documentation.
N/A	The Installer Web Interface can inadvertently deselect services that you have selected, preventing them from being installed. For example, if you select an auto-provisioning template on the **Select Services** page, and you also select additional services (for example, Streams Tools), and go to the next page, when you return to the **Select Services** page, Streams Tools will be deselected, and you will need to reselect it to ensure that it is installed. **Workaround:** Reselect any services that are deselected.
MAPR-20606	The Configure Service Layout page may assign services to a group with the name "Unprovisioned Services."

last-updated: Jun 06, 2024

	Workaround: In the Installer Web Interface, click **Restore Default**.
N/A	You cannot use the Installer after you upgrade the cluster using the command line. After you use the command line to upgrade a cluster that you installed with the Installer, the Installer is not aware that the cluster runs the upgraded version. Therefore, Installer does not install nodes and ecosystem components that apply to the upgraded version. **Workaround:** Use the Installer Stanzas `probe` and `import` commands to update the installer database. See "Using probe and import to Generate the Installer Database" in the data-fabric documentation.

Logs for the Installer

This topic describes the logs generated by the Installer and Installer Stanzas.

Installer logs are written to the following folder: `/opt/mapr/installer/logs`.

The following list describes each log:

`<nodename>.log[.x]`	Shows installation activities associated with a particular node. Every time you run the Installer or a Installer Stanza, a new copy of this log is created for each node in the cluster. When you encounter errors, you should check this log first, and then check the `mapr-installer.log`. The node log is created only if the software was able to run Ansible successfully on the node. If incorrect credentials were provided for the root user, or if there was an issue and Ansible quit before issuing the first logging callback, no log file is created for the node. If this happens, you must consult `mapr-installer.log`.
`installer.log[.x]`	Logs the REST calls sent to the installer and the database events that the installer runs. Every time you run the Installer or a Installer Stanza, a new copy of this log is created. If the log is not present, you might need to restart the installer (`service mapr-installer restart`).
`installer-cli.log[.x]`	Shows the progress of installation for a Installer Stanza. Every time you run a Installer Stanza, a new copy of this log is created.
`installer-process.log`	Serves as the top-level log file for the Ansible part of the installer. This log is created by the main Python script that runs the installer backend. This log typically shows the same information as `mapr-installer.log`.
`mapr-installer.log[.x]`	Shows the progress of Ansible scripts performed by the installer server. This log is useful if back-end issues prevent the creation of `<nodename>.log`. Every time you run the Installer or a Installer Stanza, a new copy of this log is created.

Creating an Archive of Installer Logs

This topic describes how you can create a .zip archive of the logs generated by the Installer and Installer Stanzas. The .zip archive is a handy way to share log information with HPE support personnel.

last-updated: Jun 06, 2024

About this task

To create a .zip archive of all the installer logs, use one of these commands:

- From the Installer web-based interface, click **Support > Download Installer Logs**.
- From a browser, specify the following URL. When prompted, supply the user name and password for the Installer:

```
https://<host_name>:9443/api/process/installer.zip
```

- From a terminal, specify the following syntax:

```
wget --no-check-certificate
https://mapr:mapr@<host_name>:9443/api/process/installer.zip
```

For information about Installer logs, see Logs for the MapR Installer.

Using Service Verification

The service verification feature provides an easy way to verify that services on all nodes in the cluster are running and functional.

IMPORTANT: Service verification is not currently implemented for all services. Support for additional services will be added in subsequent releases.

For secure or non-secure clusters, you can run the service verification feature from the Installer user interface. Service verification is useful after a new installation. For example, service verification can detect whether all services have successfully joined a cluster. You can run a service verification any time after the cluster is installed to check the general health of services on all nodes.

Before Using Service Verification

Before you can use the service verification feature:

- The cluster must be installed, and you must have installed it by using the Installer or Installer Stanzas.
- Ensure that the Installer is up to date. Service verification is supported only on Installer versions 1.15.0.0 and later.
- Service verification can only be performed from the Installer node. The Installer node is the node where you run the Installer.
- Running service verification requires `root`-user access (or sudoer access to `root`) for remote authentication. (When you perform service verification, the Installer node must ssh into each of the cluster nodes.)

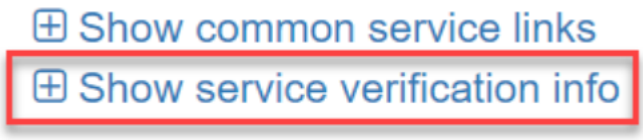
Performing Service Verification Using the Installer User Interface

To perform service verification from the Installer user interface:

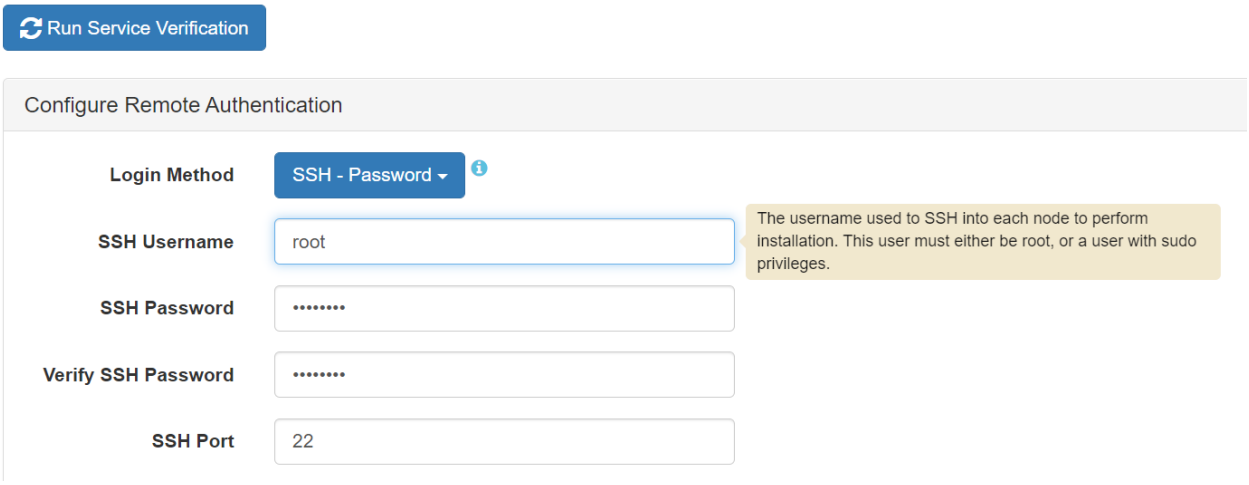
1. On the Installer node, use a browser to navigate to the Installer home page, and log on as the cluster admin:

```
https://<Installer Node hostname/IPaddress>:9443
```

2. Scroll down until you see the following links:



3. Click the **Show service verification info** link to display the list of services and nodes.
4. Click **Run Service Verification** to start the verification. The Installer prompts for the `root` user password:



5. Enter the `root` user credentials, and click **Run Service Verification**. Verification can take anywhere from a few seconds to several minutes, depending on the size of the cluster, the network, and other attributes that affect performance. When the verification activity is complete, the Installer shows a list of

last-updated: Jun 06, 2024

services with the verification output for each service. For example:

Service Name			
Apiserver	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_INSTALLED
CLDB	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_IMPLEMENTED
Collectd	VERIFIED	VERIFIED	VERIFIED
Data Access Gateway	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_INSTALLED
File Server	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_IMPLEMENTED
Gateway	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_INSTALLED
Grafana	RUNNING_NOT_RESPONDING	RUNNING_NOT_RESPONDING	NOT_INSTALLED
HBase Client	RUNNING_NOT_RESPONDING	RUNNING_NOT_RESPONDING	RUNNING_NOT_RESPONDING
HBase Thrift	NOT_INSTALLED	NOT_INSTALLED	NOT_IMPLEMENTED
History Server	NOT_INSTALLED	NOT_INSTALLED	NOT_IMPLEMENTED
Apache Kafka Java Client	RUNNING_NOT_RESPONDING	RUNNING_NOT_RESPONDING	RUNNING_NOT_RESPONDING
Apache Kafka REST API	NOT_RUNNING	NOT_RUNNING	NOT_RUNNING
Mastgateway	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_IMPLEMENTED
YARN Node Manager	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_IMPLEMENTED
Oozie	NOT_INSTALLED	NOT_INSTALLED	NOT_RUNNING
OpenTSDB	VERIFIED	VERIFIED	VERIFIED
YARN Resource Manager	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_INSTALLED
Spark History Server	NOT_INSTALLED	NOT_INSTALLED	NOT_IMPLEMENTED
Spark Thrift Server	NOT_INSTALLED	NOT_INSTALLED	NOT_IMPLEMENTED
Zookeeper	NOT_IMPLEMENTED	NOT_IMPLEMENTED	NOT_IMPLEMENTED

Possible values are:

- FAILED_TO_EXECUTE
- NOT_IMPLEMENTED
- NOT_INSTALLED
- NOT_RUNNING
- NOT_STARTED
- RUNNING_NOT_RESPONDING
- VERIFIED

6. To rerun service verification – for example, after running it once and discovering some services are not responding – click **Run Service Verification** again.

Service Verification Logs

On each node where a service is installed, logged output from the service verification feature is saved to:

```
$MAPR_HOME/<service>/<service>-<version>/var/log/<service>/
verify_service.<date>
```

For example, service verification output for OpenTSDB might be found here:

```
# pwd
/opt/mapr/opentsdb/opentsdb-2.4.0/var/log/opentsdb
```

last-updated: Jun 06, 2024

- 1 – not running

- 2 – running but not responding to a simple interaction test
- 3 – not started*

*From Warden's point of view, the service is enabled, but Warden has not started it yet.

Performing Service Verification Using the mapr-installer-cli

To perform service verification for all nodes from the command line:

1. On the Installer node, navigate to the `installer` directory:

   ```
   cd /opt/mapr/installer
   ```

2. Run the following command:

   ```
   ./bin/mapr-installer-cli verify_services -n -o config.ssh_id=root -o
   config.ssh_password=<password>
   ```

   For example:

   ```
   ./bin/mapr-installer-cli verify_services -n -o config.ssh_id=root -o
   config.ssh_password=<password>
   MapR Installer SDK
   Logging in to localhost
   Verifying Services...
   100%
   [ ============================================================================
   ============================== ]
   ```

Related concepts

Updating the Installer on page 5595
Update the Installer to include the latest ecosystem packages and installer fixes. Once you update the Installer, you can install ecosystem components and software versions that were made available after you first configured the Installer.

Installer Prerequisites and Guidelines on page 5581
The node on which you run the installer and the nodes you plan to include in your cluster must meet certain user, connectivity, and security requirements.

Starting and Stopping the Installer

Describes how and when you need to shut down and restart the Installer.

It is seldom necessary to shut down and restart the Installer, but you might need to do so in the following scenarios:

- You are troubleshooting an Installer issue, and stopping and restarting the Installer might resolve the issue.
- You need to upgrade the OS for a node. See When Upgrading Core with the Installer Requires an OS Upgrade on page 313.
- You want to run the Installer node in FIPS-compliant mode, and you cannot leave the Installer running because the Installer is not FIPS compliant.

last-updated: Jun 06, 2024

Checking the Installer Status

When you are not sure if the Installer is running, use the following command to check the status:

```
systemctl status mapr-installer
```

Starting and Restarting the Installer

To start or restart the Installer (requires `root` authentication):

```
systemctl start mapr-installer
```

Stopping the Installer

Note that if you stop the Installer while an installation is in progress, any passwords that you provided to the Installer user interface are lost. The Installer retains password information in memory and not in the Installer database. If you then restart the Installer to continue the installation, the installation fails. In this scenario, you must restart the Installer and the Installer user interface and re-enter the password information to resume the installation.

To stop the Installer (requires `root` authentication):

```
systemctl stop mapr-installer
```

Using probe and import to Generate the Installer Database

Describes how to enable a manually installed cluster to use the Installer or Installer Stanza commands.

If a cluster has data-fabric software installed but has no Installer database, you cannot install or upgrade the cluster using Installer Stanza commands. And you cannot use the web-based Installer on the cluster. However, you can generate an Installer database on a cluster by using the `probe` and `import` commands. Once the Installer database is generated, you can use the web-based Installer and all Installer Stanza commands on the cluster.

If you are not sure if your cluster has an Installer database, use the `export` command to generate a YAML file that describes the cluster configuration. See Exporting a Cluster Configuration on page 5708.

Using probe

Before using the `probe` command, you must know the host names or IP addresses of the cluster nodes and the `root` user, which must be the same on all nodes. The probe command generates a template that will be used by the `import` command.

NOTE: Do not make changes to the `probe`-generated template file. After the Installer database is created, you can use the `export` command to export a YAML for making changes.

In this example, the probing user, `mapr1`, probes an array of hosts (`config.hosts`) and generates a template file `/tmp/location.yaml`. The `-u` option provides login credentials for the Installer. Note that

last-updated: Jun 06, 2024

the probing user must be able to do rpm and pkg queries and have permission to read certain files and directories within `/opt/mapr`.

```
mapr-installer-cli probe -n -o config.ssh_id=mapr1
config.ssh_password=xyz config.hosts='["hostname[1-3]","hostname7"]' -u
mapr1:xyz@<installer_hostname>:9443 > /tmp/location.yaml
```

The `probe` command uses various methods to determine the EEP version of a node. One method checks the EEP repo URL defined on the node. If multiple EEP repos are defined on the same node, the `probe` command ignores all of them and tries to determine the EEP version based on thepackages that are present.

Using import

The `import` command prepares the Installer database based on the probed template file. This example imports the probed YAML template file from the previous example. `-t` specifies the location of the template file:

```
mapr-installer-cli import -n -t /tmp/location.yaml
```

After you use the `import` command, the Installer database should be operational. You can then use the web-based Installer or Stanzas to perform additional operations on the cluster. See Installer on page 5579.

Resetting the Installer Database

The `reset` command uninstalls the metadata from the Installer database. `reset` is for advanced users.

You can reset the Installer database by using the CLI `reset` command or by using the Installer web interface (**Support > Reset Installer**).

The reset function can be useful for testing purposes, but use reset with caution. If you reset the installer database while packages are installed on the nodes, you will need to remove the packages manually.

NOTE: If you experience a failure while installing or uninstalling, the installer prompts you to retry the operation or uninstall and then reinstall from scratch. You should always retry or uninstall before considering using `reset`.

This example resets the Installer database. The `-nv` option specifies that certfificates will not be checked and the output mode is verbose:

```
./bin/mapr-installer-cli reset -nv
```

Troubleshooting Repository URL Errors

This page describes how to troubleshoot an issue in which an incorrect repository URL is stored in the Installer `properties.json` file.

How Repository URL Errors Can Occur

The `properties.json` file stores information such as the user ID of the cluster administrator, the user ID of the Installer, the OS type, Internet access information, and the repository URL. Once the repository URL has been stored in `properties.json`, the Installer assumes that the URL will not change.

If you run `mapr-setup.sh -r <url>` and you make a mistake when typing the URL, the incorrect URL is added into the Installer `properties.json` file. If you later run `mapr-setup.sh -r <url>` again but with the correct URL, the `properties.json` is not updated. Even upgrading the installer packages does not update the repository URL in `properties.json`.

Some versions of the Installer generate a warning if you try to correct the URL by running `mapr-setup.sh -r <url>` again, but older versions of the Installer do not generate a warning. Whether

last-updated: Jun 06, 2024

or not a warning is generated, you can correct the issue, but how you do so depends on the version of the Installer that is installed.

Fix Using Installer 1.10 or Later

Installer 1.10 and later versions generate a warning if you run `mapr-setup.sh -r <url>` and provide a new URL. The warning describes two ways to change the URL currently stored in the `properties.json` file:

- You can use the `reload` or `remove` command, and then specify a new URL:
  1. Use *one* of the following commands:

     ```
     bash /tmp/mapr-setup.sh -R <new_url> reload
     ```

     or

     ```
     bash /tmp/mapr-setup.sh remove
     ```

     Using the `remove` command removes `properties.json`, the installer database, and the installer packages, but not the setup script.
  2. Specify the new URL:

     ```
     bash /tmp/mapr-setup.sh -r <new_url>
     ```

- You can manually edit the `properties.json` file:
  1. Edit the `properties.json` file to specify the new URL:

     ```
     edit /opt/mapr/installer/data/properties.json
     ```

  2. Reload the MapR Installer:

     ```
     systemctl restart mapr-installer
     ```

Fix Using Installer 1.9 or Earlier

Installer 1.9 and earlier do NOT generate a warning if you run `mapr-setup.sh -r <url>` and provide a new URL. To pass a new repository value into `properties.json` for Installer versions 1.9 or earlier, you must first remove the installer files:

```
mapr-setup.sh remove
```

Using the `remove` command removes `properties.json`, the installer database, and the installer packages, but not the setup script. After the files are removed, you can rerun `mapr-setup.sh` to specify the new repository URL:

```
bash /tmp/mapr-setup.sh -r <new_url>
```

To run `mapr-setup.sh`, see MapR Installer. For information about options you can use with `mapr-setup.sh`, see Using mapr-setup.sh.

Changing Timeout Values to Resolve Installer Errors

Change timeout values to reduce errors when using the Installer.

last-updated: Jun 06, 2024

About this task

Sometimes the Installer can return errors because the maprcli or filesystem commands that it uses time out because of network latency. For example, if logs indicate that the installer could not obtain the nodelist, or a filesystem operation timed out, changing a timeout value can enable the same Installer operation to succeed.

You can change the following timeout parameters to improve the success of Installer operations:

Timeout	Description	Default Value (minutes)
`standard`	The timeout used for maprcli commands and Hadoop filesystem operations.	2
`configure`	The timeout used for `configure.sh` operations.	10

You must specify timeout values as an integer greater than or equal to 0.

To change the `standard` or `configure` timeout values:

Procedure

1. On the Installer node, navigate to the following directory:

   ```
   /opt/mapr/installer/ansible/playbooks/group_vars/
   ```

2. Edit the `all` file to change one or both timeout values to a number greater than or equal to 0. In this example, the timeouts are set to 7 minutes and 15 minutes respectively:

   ```
   timeout:
     standard: 7
     configure: 15
   ```

3. If a Installer error prompted you to change the timeout, retry the operation that failed.

Installer Release Notes

This release of the Installer works with RedHat/CentOS, Ubuntu, and SLES.

The Installer consists of the following packages along with the `mapr-setup.sh` script:

- **Installer** - Package that contains the Installer.
- **Installer Definitions** - Package that contains the list of versions, services, and ecosystem components that you can install with the Installer.

The release notes include the following sections:

Installer Updates
Installer updates provide new features or bug fixes.

The following table shows the Installer new-feature updates by version:

Version	Updates
1.18.0.6.202405292235-1	This version: • Provides the same functionality as the previous Installer 1.18.0.6 version. • Adds support for EEP 8.1.2.

last-updated: Jun 06, 2024

Version	Updates

1.18.0.6.202404220527-1	This version:
	• Provides the same functionality as the previous Installer version.
	• Adds support for core 7.7.0 and EEP 9.2.2.
	• Can be used to upgrade clusters from the following releases to 7.7.0:
	  • 7.6.1
	  • 7.5.0
	  • 7.4.0
	  • 7.3.0
	  • 7.2.0
	  • 7.1.0
	• Can be used on RHEL 9 and Ubuntu 22.04.
	• Does not include user interface controls for configuring IPv6. However, you can configure IPv6 support by passing the `config.ipv6_support=true` Stanza option.
	• Does not support installing or configuring Keycloak through the Installer UI; however, you can install Keycloak by passing the following Stanza option: `config.sso_keycloak=true`.
	• Can install Zeppelin, but the Installer does not configure Zeppelin. All configuration and integration tasks must be done manually. See Zeppelin on page 4736.
	• Supports the new https://package.ezmeral.hpe.com/ repository. For information about the repository, see What's New in Release 7.7 on page 30.

1.18.0.5.202402102044-1	This version: • Provides the same functionality as the previous Installer version. • Adds support for core 7.6.1 and EEP 9.2.1.
1.18.0.5.202401232228-1	This version: • Provides the same functionality as the previous Installer version. • Adds support for core 7.6.0 and EEP 9.2.1. • Can be used to upgrade clusters from core 7.4.0 or 7.5.0 to 7.6.0. • Can be used on RHEL 8.8 with core 7.6.0 and core 7.5.0 (with EEP 9.2.1) and might work on older core releases but has not been tested on them. • Does not include user interface controls for configuring IPv6. • Does not support installing or configuring Keycloak through the Installer UI; however, you can install Keycloak by passing the following Stanza option: `config.sso_keycloak=true`. • Can install Zeppelin, but the Installer does not configure Zeppelin. All configuration and integration tasks must be done manually. See Zeppelin on page 4736. • Supports the new https://package.ezmeral.hpe.com/ repository. For information about the repository, see What's New in Release 7.7 on page 30.

last-updated: Jun 06, 2024

Version	Updates
1.18.0.4.202310271158-1	This version: • Provides the same functionality as the previous Installer version. • Adds support for core 7.5.0 and EEP 9.2.0. • Can be used on RHEL 8.8 with core 7.5.0 and core 7.4.0 (with EEP 9.2.0) and might work on older core releases but has not been tested on them. • Does not support installing or configuring Keycloak through the Installer UI; however, you can install Keycloak by passing the following Stanza option: `config.sso_keycloak=true`. • You can use Installer 1.18.0.4 to install Zeppelin, but the Installer does not configure Zeppelin. All configuration and integration tasks must be done manually. See Zeppelin on page 4736. • Supports the new https://package.ezmeral.hpe.com/ repository. For information about the repository, see What's New in Release 7.7 on page 30.
1.18.0.3.202309132143-1	This version: • Provides the same functionality as the previous Installer version but also supports token-based authentication for the new https://package.ezmeral.hpe.com/ repository. For more information, see Using the HPE Ezmeral Token-Authenticated Internet Repository on page 102.
1.18.0.3.202308030617-1	This version: • Adds support for core 7.4.0 and EEP 9.1.2. • Can be used on RHEL 8.8 only with core 7.2.0. • Supports the new https://package.ezmeral.hpe.com/ repository. For information about the repository, see What's New in Release 7.7 on page 30. • Does NOT support EEP 8.1.1. • Uses Python 3 instead of Python 2, providing better program readability, error handling, and an enhanced standard library. The Installer codebase has undergone syntax and language modifications to accommodate these changes. The Installer has also been refined with enhanced component integration, functionality improvements, and compatibility fixes. • Does not support installing EEP 9.1.1 on release 7.2.0. The Installer cannot install EEP 9.1.1 on core 7.2.0 because Data Access Gateway 6.0.0 – which is part of EEP 9.1.1 – is not compatible with core 7.2.0. You can still install or upgrade to EEP 9.1.1 on core 7.2.0, but only if you use manual steps to do so and you apply Data Access Gateway version 5.1.0. • Is not supported for use with JRE 17 or JDK 17 and will not install JDK 17. • Does not support single sign-on (SSO). • Does not support installing Apache Zeppelin in EEP 6.4.0 or 9.x.0. You must install Zeppelin using the manual steps. See Installing Zeppelin on page 270. For more information about Zeppelin, see Zeppelin on page 4736. • Supports core upgrades from release 7.3.0 to 7.4.0 only. Other core upgrades must be performed using manual steps. All EEP upgrades are supported. To upgrade using manual steps, see Upgrading Core With the Installer on page 320 and Upgrading the Ecosystem Pack Without the Installer on page 366.

last-updated: Jun 06, 2024

Version	Updates
1.18.0.2.202305151643-1	This version: • Adds support for core 7.3.0 and EEP 9.1.1. • Does NOT support EEP 8.1.1. • Uses Python 3 instead of Python 2, providing better program readability, error handling, and an enhanced standard library. The Installer codebase has undergone syntax and language modifications to accommodate these changes. The Installer has also been refined with enhanced component integration, functionality improvements, and compatibility fixes. • Does not support installing EEP 9.1.1 on release 7.2.0. The Installer cannot install EEP 9.1.1 on core 7.2.0 because Data Access Gateway 6.0.0 – which is part of EEP 9.1.1 – is not compatible with core 7.2.0. You can still install or upgrade to EEP 9.1.1 on core 7.2.0, but only if you use manual steps to do so and you apply Data Access Gateway version 5.1.0. • Is not supported for use with JRE 17 or JDK 17 and will not install JDK 17. • Does not support single sign-on (SSO). • Does not support installing Apache Zeppelin in EEP 6.4.0 or 9.0.0 or 9.1.0. You must install Zeppelin using the manual steps. See Installing Zeppelin on page 270. For more information about Zeppelin, see Zeppelin on page 4736. • Supports core upgrades from release 7.2.0 to 7.3.0 only. Other core upgrades must be performed using manual steps. All EEP upgrades are supported. To upgrade using manual steps, see Upgrading Core With the Installer on page 320 and Upgrading the Ecosystem Pack Without the Installer on page 366. • Fixes the following issues: • IN-3237: Migration to Python3 for installer

last-updated: Jun 06, 2024

Version	Updates

1.18.0.1.202301281358-1	This version:
	• Adds support for core 7.2.0 and EEPs 6.4.0 and 9.1.0.
	• Is not supported for use with JRE 17 or JDK 17 and will not install JDK 17.
	• Does not support installing Apache Zeppelin in EEP 6.4.0 or 9.0.0 or 9.1.0. You must install Zeppelin using the manual steps. See Installing Zeppelin on page 270. For more information about Zeppelin, see Zeppelin on page 4736.
	• Does not support upgrades. Upgrades must be performed using manual steps. See Upgrading Core With the Installer on page 320 and Upgrading the Ecosystem Pack Without the Installer on page 366.
	• Fixes the following issues:
	  • IN-3186: Projects Installer IN-3186 Security:: CVEs: mapr-installer:: found vulnerable versions of shiro-cache* binaries as part of the mapr-installer-1.18.0.0.202210181219-1.noarch.rpm
	  • IN-3187: Security :: mapr-installer:: Found vulnerable version of puma binaries mapr-installer-1.18.0.0.202210181219-1.noarch.rpm
	  • IN-3197: Security :: mapr-installer:: found vulnerable versions of gradle binaries in mapr-installer-1.18.0.0.202210181219-1.noarch.rpm
	  • IN-3207: Kafka and kafka-rest packages are incorrectly upgraded via incremental install MEP-6.3.6 -> MEP-6.4.0
	  • IN-3208: MapR Installer affected by vulnerability CVE-2000-0234 - File .htaccess Accessible
	  • IN-3217: SSH Private Key Login error - 'NoneType' object has no attribute 'decode'
	• Has some known issues:
	  • IN-3223: Can fail to install or upgrade Ranger in some use cases. See IN-3223 in Installer Known Issues on page 5641.
	  • IN-3240: Can fail to generate the Installer database when a probe command is issued. See IN-3240 in Installer Known Issues on page 5641.

last-updated: Jun 06, 2024

Version	Updates
1.18.0.0.202210181219-1	This version: • Supports release 7.1.0 and EEP 9.0.0. • Supports Apache Ranger. For more information, see Ranger on page 4583 and Installing Ranger Using the Installer on page 5617. • Supports Apache NiFi. For more information, see NiFi on page 4573. • Does not support installing or upgrading to EEP 6.4.0. • Does not support installing Apache Zeppelin. You must install Zeppelin using the manual steps. See Installing Zeppelin on page 270. For more information about Zeppelin, see Zeppelin on page 4736. • Implements security by default for new installations. It is no longer supported to install a release 7.0.0 or later cluster that is non-secure. • Does not support upgrades. Upgrades must be performed using manual steps. See Upgrading Core With the Installer on page 320 and Upgrading the Ecosystem Pack Without the Installer on page 366. • Fixes the following significant issues: • IN-3120 – Installer-17 - mapr-setup.sh update ERROR: import command failed after installer update
1.17.0.3.202203140736-1	This version: • Supports release 7.0.0 and EEPs 5.0.8, 6.3.6, 7.1.2, and 8.1.0. • Supports Airflow 2.2.1.0 beginning with EEP 8.1.0. • Provides Log4j fixes. For more information, see advisory 4916. • Fixes CVE-2021-42392 in the Installer.
1.17.0.2.202202110756-1	Internal-only release.
1.17.0.1.202201201546-1	This version: • Provides Log4j fixes. For more information, see advisory 4916. • Fixes CVE-2021-42392 in the Installer. **NOTE:** This version of the Installer cannot be used with release 7.0.0.

last-updated: Jun 06, 2024

Version	Updates

1.17.0.0.202110261002-1	This version:
	• Adds support for EEP 8.0.0, EEP 7.1.1, EEP 6.3.5, and version updates to many ecosystem components. For a list, see What's New in EEP 8.0.0 on page 6157.
	• Is built on Ubuntu 18.04 and is not supported on Ubuntu 16.04. Note that core 6.2.0 is supported on Ubuntu 16.04. You can use Installer 1.17.0.0 to install core 6.2.0 on Ubuntu 16.04 as long as the Installer node is running an OS that Installer 1.17.0.0 supports. For details, see Selecting an Installer Version to Use on page 5587. For supported OS versions, see the Installer Support Matrix on page 5770.
	• Includes some terminology updates. References to the *ecosystem pack (MEP)* have been changed to *Ezmeral Ecosystem Pack (EEP)*. For more information, see What's New in EEP 8.0.0 on page 6157.
	• Includes numerous fixes, the most significant of which are:
	  • IN-2264: Probe does not detect hive database settings like it does for hue and oozie
	  • IN-2490: Change ansible source module to mapr_ansible
	  • IN-2560: Releases installer-v1.11.0 and installer-v1.12.0 - mapr-setup.sh by default installs the most current version of the Installer
	  • IN-2848: correctly detect and report ansible syntax errors
	  • IN-2856: Installer Failing when doing incremental upgrade
	  • IN-2924: need to create symlink for mapr_fstab when using mapr-loopbacknfs
	  • IN-2934: Ubuntu16 - mapr-setup.sh gpgkeys: protocol `https` not supported
	  • IN-2935: Centos83 - fresh install failing with "mount.nfs: access denied by server while mounting localhost:/mapr"
	  • IN-2947: extend cluster on ubuntu fails on nodes that do not have zookeeper installed

1.16.0.3.202201072207-1	This version: • Provides Log4j fixes. For more information, see advisory 4916. • Fixes CVE-2021-42392 in the Installer.
1.16.0.2.202110191345-1	This version provides defect repair and enables installation for clusters running Ubuntu 16.04. See the special considerations for Ubuntu 16.04 clusters in Selecting an Installer Version to Use on page 5587. This version was released at the same time as Installer 1.17 and includes fixes for the following issues: • IN-2895: permission errors reading pid files due to systemd changes • IN-2984: SLES15 fails in verify - python3 incompatibility • IN-2989: Error during cluster installation - 'ascii' codec can't encode character • IN-2995: add check to the os prereq to check for mep-7.1.0 or above with SLES15 • IN-2996: java 11 jre is not being upgraded to jdk • IN-2997: installer does not install java11 on SLES15

last-updated: Jun 06, 2024

Version	Updates
1.16.0.1.202108210519-1	This version includes fixes for the following issues: • IN-2924: need to create symlink for mapr_fstab when using mapr-loopbacknfs • IN-2925: installer no longer correctly detects if zk are running • IN-2934: Ubuntu16 - mapr-setup.sh gpgkeys: protocol `https` not supported • IN-2935: Centos83 - fresh install failing with "mount.nfs: access denied by server while mounting localhost:/mapr" • IN-2947: extend cluster on ubuntu fails on nodes that do not have zookeeper installed • IN-2950: Bug in regex for mapr-setup.sh causes update command to fail

1.16.0.0.202105261033-1	This version:
	• Adds support for EEP 7.1.0, SLES 15 SP2, and the following ecosystem component version updates:
	  • Hadoop 2.7.5
	  • Object Store 2.1.0
	  • HTTP-FS 1.1
	  • Kafka 2.6.1
	• Includes fixes for the following issues:
	  • IN-2821: DB services fail with error - Could not connect to the database: java.sql.SQLException: The server time zone value 'PDT' is unrecognized or represents
	  • IN-2849: prereq check for services does not figure out that it needs to look for chronyd instead of ntpd for SLES 15
	  • IN-2862: Couldn't install cluster by mapr user with sudo
	  • IN-2879: FreshInstall - error while configuring mysql
	  • IN-2883: mapr-installer-cli probe fails on Ubuntu-based MapR 6.2 cluster
	  • IN-2892: mysql prereq check fails if no password is given - should only do so if not password was given on fresh install
	  • IN-2893: make sure cron is installed - both OT and ES depend on it
	  • IN-2895: permission errors reading pid files due to systemd changes

last-updated: Jun 06, 2024

Version	Updates

1.15.0.1.202103220200-1	This version:
	• Adds support for HPE Ezmeral Data Fabric maintenance release 6.1.1, EEP 6.3.3, and SLES 12 SP5.
	• Includes fixes for the following issues:
	  • IN-2669: WebUI Node Configuration - usage of 'hostname -A' value
	  • IN-2727: Support for SLES 12 SP4 and SP5 for Installer versions that support MapR 6.1
	  • IN-2782: Tez UI not configured on security correctly via UI installer
	  • IN-2784: Can't install cluster on CentOS 8.1 EEP-7.0.1
	  • IN-2787: Check that sudoers file allow all commands for certain user if non-root user selected for installing
	  • IN-2793: add check to network prereq check to make sure nodes have a domain portion in FQDN hostname
	  • IN-2805: installer fails to parse mapr-patch file pattern for ubuntu files and 6.2.0 files

last-updated: Jun 06, 2024

Version	Updates

1.15.0.0.202101220818-1	This version:
	• Adds support for installing the S3 Gateway.
	• Installs Loopback NFS (`mapr-loopbacknfs-<version>`) on all nodes in the cluster unless **Enable NFS** is specified.
	• Adds support for Oracle Enterprise Linux 8.2 on release 6.2.0.
	• Includes fixes for the following issues:
	  • IN-1289: Allow removal of installer node during verify
	  • IN-2004: Install loopbacknfs by default if customer does not install NFS
	  • IN-2232: We complain about firewall services being enabled on ubuntu
	  • IN-2608: mapr-setup.sh installing with local repository - error on mapr-installer.service start
	  • IN-2726: Installer should use HTTPS while connecting to https://package.ezmeral.hpe.com/
	  • IN-2728: Mapr-installer failed installation with "Module did not set no_log for update_password"
	  • IN-2735: Installer-master/ui1.14 - add mep506 632 701 support
	  • IN-2742: Ansible execute shell script with no TTY
	  • IN-2743: Certify Installer support for 6.2 on OEL (Oracle Enterprise Linux) 8.2
	  • IN-2744: Implement simple UI for service verification feature in the Installer UI
	  • IN-2754: Add loopbacknfs installation and configuration via MapR Installer
	  • IN-2770: Installer needs to reflect minimum cluster requirement for 4 node clusters, rather than 5 node
	  • IN-2778: need to change localhost login for root on shared mysql on ubuntu
	  • IN-2785: Installer logs plenty of 'loglevel_int' exception messages
	  • IN-2789: Centos 8 Installer with Use existing DB - database_existing.yml "No package MySQL-python available."

last-updated: Jun 06, 2024

Version	Updates
1.14.0.1.202010161154-1	This version adds support for Red Hat / CentOS 8.2 and Oracle Enterprise Linux 7.8, as indicated in Installer Support Matrix on page 5770. This version also includes fixes for the following issues: • IN-2680: mapr-setup.sh should provide option to setup Proxy preload • IN-2714: Support MapR core (no EEP) for Oracle Enterprise Linux 7.8 for MapR 6.1 • IN-2715: Installer won't start on centos 8.2 when java 8 is installed • IN-2716: mapr-setup.sh - errors via Shell Script plugin validation • IN-2717: Installer Specification for versions supported and paths navigated on OS, java, and python environments • IN-2718: mapr-setaup.sh - ERROR: environment variable is set but do not contain http[s]: prefix - fix • IN-2719: proxy setting for mapr_core, mapr_installer.repo mep rep is incorrectly set to _none_always when installer on HPE network • IN-2720: install core 6.1.0 on centos 8 • IN-2721: centos8 610_631 fresh install error on Stanza - Running task: Calling do_configure.sh from 'configure.yml' MODULE FAILURE • IN-2723: Please try an upgrade from core 6.1.0 to core 6.2.0 via installer on centos 8.x • IN-2724: Probe is broken in 1.14 - python3 and 4 digit issues
1.14.0.0.202009160311-1	This version includes the following new functionality or characteristics: • Installer 1.14.0.0 supports EEP 7.0.0. • Installer 1.14.0.0 supports Red Hat / CentOS 8.1, Ubuntu 18.04, and Ubuntu 16.04, but does not support SLES, as indicated in Operating System Support Matrix on page 5719. • Unlike Installer 1.13.0, Installer 1.14.0.0 runs on JDK 11. • The Installer can install Kafka Schema Registry 5.1.2.0.
1.13.0.0.201912130933-1	This version includes the following new functionality or characteristics: • Installer 1.13.0.0 supports EEP 6.3.0. • Installer 1.13.0.0 supports Red Hat / CentOS 7.6 and 7.7 but does not support Ubuntu 18.04, as indicated in Operating System Support Matrix on page 5719. • Installer 1.13.0.0 supports HBase 1.13.0. • Unlike Installer 1.12.0, Installer 1.13.0.0 requires Java 8 and cannot run on Java 7.

last-updated: Jun 06, 2024

Version	Updates
1.12.0.0.201905241518-1	This version includes the following new functionality or characteristics: • Installer 1.12.0.0 and later support the upload of a zipped tarball containing custom Ansible roles. These instructions can be executed in the installer workflow to customize the installation. For more information, see Using Custom Playbooks on page 5617. • You cannot use Installer 1.12.0.0 or later to perform basic installer operations with 5.2.x releases. You must use Installer 1.11.0.0 instead. See Selecting an Installer Version to Use on page 5587. • For data disks, Installer versions 1.12.0.0 and later require a minimum disk size that is equal to the physical memory on the node. If a data disk does not meet the minimum disk size requirement, a verification error is generated. • If you click a link in a Installer tooltip, the link is displayed in a new browser tab. Previously, clicking a tooltip link caused the browser to display the link in the same browser tab, and any changes made in the user interface were lost. This behavior has been corrected. • IN-2389 & INFO-1120: Sqoop2 cannot be installed using Installer 1.12. • IN-2417: Extending a secure cluster no longer fails with a `maprusterticket` error when you add a CONTROL node and DATA node at the same time.
1.11.0.0.201902141709-1	No new features. This version includes the following fixes: • IN-2254: Ran out of memory on 1.10 installer - bump memory limits. • IN-2171: Unable to install Installer from packages on SLES. • IN-2155: Restrict expanding cluster groups based on service type not on group name. • IN-2154: Installer verification phase fails with error "ValueError: zero length field name in format." • IN-2123: Unable to extend secure cluster, mapruserticket not copied into new node. • IN-2108: Adding node with Extend Cluster fails at "get list of the ECO warden config files." • IN-2094: Installer verification fails for LUKS encrypted disks. • IN-2078: AttributeError in prereq check about OS. • IN-2025: Installer Error "Unscalable Host Groups" during 'extend cluster' or 'incremental install'.

last-updated: Jun 06, 2024

Version	Updates
1.11.0.0.201901301400-1	This version includes the following new functionality or characteristics: • Support for EEP 6.1.0. • The Installer provides a new advanced option that allows you to restrict the software to a subset of network interface cards (NICs) or to specify public IP addresses that can be used with the cluster nodes. See Using the MapR Subnet and MapR External Advanced Options on page 5631. • The Installer warns you if you specify a host name using an IP address rather than a fully qualified domain name (FQDN). See Connectivity on page 171. • The Installer warns you if you run `mapr-setup.sh -r <url>` and specify a URL that is different from the URL currently stored in the `properties.json` file. See Troubleshooting Repository URL Errors on page 5672. • The installer version (1.11.0.0) now uses four digits rather than three or two digits. .
1.10.0.201812181130-1	No new features. This version includes the following fixes: • IN-2171: Unable to install Installer from packages on SLES. • IN-2155: Restrict expanding cluster groups based on service type not on group name. • IN-2154: Installer verification phase fails with error "ValueError: zero length field name in format." • IN-2123: Unable to extend secure cluster, maprusertickt not copied into new node. • IN-2108: Adding node with Extend Cluster fails at "get list of the ECO warden config files." • IN-2094: Installer verification fails for LUKS encrypted disks. • IN-2078: AttributeError in prereq check about OS. • IN-2025: Installer Error "Unscalable Host Groups" during 'extend cluster' or 'incremental install.'
1.10.0.201809200839-1	This version includes the following new functionality: • The installer provides a new option for setting Data-at-Rest Encryption (DARE). See Using the Enable DARE Option on page 5612. • The installer provides a new option for setting the NSF version. See Installing NFS Using the Installer on page 5616. • Changes have been made to the auto-provisioning templates. See Auto-Provisioning Templates on page 5636. • With Installer 1.10, metrics collection is enabled by default on 6.1 or later and cannot be disabled. Metrics collection is required for metering. To support metrics collection, collectd is installed on all nodes in the cluster. Users can specify the full collection configuration for collectd or a minimum configuration to support only metering for billing purposes. If the minimum configuration is selected, HPE Ezmeral Data Fabric Database table metrics are disabled. • With Installer 1.10, the installer no longer includes an option to support off-cluster Elasticsearch and OpenTDSDB when security is turned on. • When installing Oozie 4.3.0, MapR Installer 1.10 leverages the Hadoop credential provider API to encrypt the Oozie database user password.

<table>
<tr><th>Version</th><th>Updates</th></tr>
<tr><td>1.9.0.201803291415-1</td><td>This version includes the following new functionality:
In the Installer, password verification is implemented for every password entered.
Changes have been made to the auto-provisioning templates. See Auto-Provisioning Templates on page 5636.
The following services are renamed in Installer 1.9:<table><tr><th>Old Name</th><th>New Name</th></tr><tr><td>OJAI Query Service</td><td>OJAI Distributed Query Service</td></tr><tr><td>HBase/HPE Ezmeral Data Fabric Database Common</td><td>MapR DataBase</td></tr></table></td></tr>
<tr><td>1.8.0.201801312110-1</td><td>This version includes support for 6.0, EEP 4.1.0, and the following new features:
Support for Starting Up a Cluster Using the Installer Startup Button on page 5632.</td></tr>
<tr><td>1.7.201801021321-1</td><td>No new features. This version includes the following fixes:
IN-1417: Cannot decode unicode character running Stanza
IN-1451: CFT_converged.yml when used with customized AMI errors out while creating stack.
IN-1445: URLs not accessible in AWS Marketplace offering.
IN-1422: Hue broken on fresh Install Azure and AWS Marketplace offers.
IN-1391: Use private hostname for Azure provisioning.</td></tr>
<tr><td>1.7.201711082221-1</td><td>This version includes the following new features:
Support for Release 7.7 Release Notes on page 30 and Ecosystem Pack (EEP) Reference on page 6120 4.0.0, 3.0.2, 2.0.3, and 1.1.4.
A new option for enabling or disabling security for the cluster. See Using the Enable Secure Cluster Option on page 5611.
Import State and Export State commands that allow you to recover more easily from Installer failures. See Importing or Exporting the Cluster State on page 5634.
The ability to change timeout parameters to improve the success of Installer operations.
The ability to uninstall a service by deselecting it during an Incremental Install operation.
Support for the <code>scaled_hosts2:</code> parameter for Installer Stanzas. Installer 1.7 (which includes Installer Stanzas) no longer supports the <code>scaled_hosts:</code> parameter for adding nodes to an on-premise cluster. Instead, you need to use the <code>scaled_hosts2:</code> parameter. See Extending a Cluster by Adding Nodes.</td></tr>
<tr><td>1.6.201708241301-1</td><td>This version includes the following new features:
Support for Installing MapR in the cloud.</td></tr>
</table>

last-updated: Jun 06, 2024

Version	Updates
1.6.201708012220-1	This version includes the following new features: • Support for adding nodes. See Extending a Cluster by Adding Nodes on page 5624. • A new one-click **Shutdown** command. See Shutting Down a Cluster Using the Installer Shutdown Button on page 5633. • Support for 3-digit EEPs. See Understanding Two-Digit and Three-Digit EEPs on page 5638. • Support for creating a MapR Installer PACC using the Installer setup script. See Creating an Installer Container Using mapr-setup.sh on page 5695.
1.5.201704051050-1	This version includes the following new features: • Support for EEPs 3.0, 2.0.1, and 1.1.2. See Ecosystem Pack (EEP) Reference on page 6120. • Support for maintenance updates. See Performing a Maintenance Update on page 5635. • Enhancements to Installer Stanzas. See Using probe and import to Generate the Installer Database on page 5671. • Enhancements to `mapr-setup.sh` in support of user-created PACC containers. • Support for applying patches. See Applying a Patch Using the Installer on page 473. • Support for SLES 12 SP1.
1.4.201612081140-1	This version includes the following new features: • Support for EEP 2.0. • Support for Installer Stanzas. • Streams Tools. Note these restrictions: • Installer 1.4 prevents you from downgrading a EEP. • Installer 1.4 shows only EEP versions equal to or greater than the version currently installed on your cluster. This version includes the following updates: • 24891: Installer should not allow you to downgrade the EEP version. • 25213: Error in the process of upgrading Sentry by UI Installer 1.4. • 25277: v..swappiness should be set to "1" rather than "0" in RHEL/CentOS kernels > 2.6.32-303. • 23285: Installer leaves children behind after a stop. • 25421: mapr-setup fails to upgrade java.

last-updated: Jun 06, 2024

Version	Updates
1.3.201609291954-1	This version includes the following updates: • 23258: The installer now creates a new log for each node for each iteration of the installer. Previously, the installer overwrote the original log file. • 23868: The installer now updates the livy_server_host property on Hue nodes and restarts the live server correctly.
1.3.201608121412-1	This version includes the following new features: • When you install or upgrade to 5.2, you select a EEP version before you select ecosystem components. • When you install or upgrade to 5.2, you have the option to install Monitoring. • For local 5.2 installations, the `-a` parameter of `mapr-setup.sh` expects three archive files: Installer archive, Ecosystem Pack (EEP) archive, and the 5.2 archive. This version includes the following updates: • 23853/22267: The installer validates advanced disk layouts such as /dev/mapper/luks-sdd or /dev/mapper/<lvm_logical_volume_name>. • 22904: The installer now allows you to update the cluster license during an incremental installation. • For local 5.0 and 5.1 installations, the archive filename has changed to mapr-5.0-5.1.<yyyymmdd>.*.tgz. • 24295: The installer detects disks correctly on Red Hat 7 operating system versions. • 24340: The installer no longer points to an old package manager (RPM) for the EPEL repository.
1.2.201606140935-1	Version number change only.
1.2.201605032042-1	This version includes the following updates: • 23137: On each node in the cluster, Installer automatically applies the latest patch available for the installed JDK version. • 22892: Installer no longer fails on Red Hat operating system versions that do not support systemd.
1.2.201602260909-1	This version includes the following updates: • 21115: The installer performs a prerequisite check on the operating system version of Ubuntu and CentOS/Redhat nodes. • 21877: The `mapr-setup.sh` script provides the ability to specify a non-default hostname and port that nodes in the cluster can use to communucate with the MapR Installer node. You can set a non-default hostname or port using the new prompt that appears while mapr-setup.sh configures the Installer node or pass the script the `-p <hostname:port>` option when you run the command to execute the mapr-setup.sh script.
1.1.201601080826-1	This version includes the following updates: • 21861: The installer sets the no_proxy environment variable for http connections to the Installer node. • 21440: On Safari and Internet Explorer web browsers, the Advanced Configuration settings for the service layout are now accessible.

last-updated: Jun 06, 2024

Version	Updates
1.1.201510241120-1	This version includes the following updates: • 19850: The installer now configures the MySQL database to work with local connections. • 20115: The installer disables SELinux without requiring a reboot. • 19156: When you abort an installation, the installer provides a link to download the installation logs.
1.0.201508041436-1	This version includes the following update: • If Java is not installed on RedHat/CentOS, mapr-setup.sh installs Open JDK Java 1.8.
1.0.201507171311-1	This version includes the following updates: • 19541: The installer no longer supports SSL DHE cipher. It will also disable SSLv3. • 19465: When you use a custom service template, the installer now accurately displays service compatibility.
1.0.201507091731-1	This version includes the following updates: • 18888: You no longer need to restart the mapr-installer process after you use the package manager to upgrade the installer package.
1.0.201506081725-1	This version includes the following updates: • 18926: Installations no longer terminate due the restart of the sshd process. • Minor changes to text and layout on the Services page.
1.0.201506011415-1	Version number change only.
1.0.201505261302-1	This version includes the following fixes: • 18682: When you use package manager to update the installer definition file, you no longer need to re-run mapr-setup.sh. • 18748: The Installer no longer fails to install Hive 0.13 on Ubuntu when the repository includes Hive 1.0.

Installer Help Links

Lists topics that help you prepare for an upgrade performed through the Installer web interface.

Using the Installer

To get started using the Installer, see Installer on page 5579.

Version-Specific Topics

IMPORTANT: Installer 1.18.0.2 supports core upgrades only from release 7.2.0 to 7.3.0. All EEP upgrades are supported. To upgrade core or EEP manually, see these topics:

- Upgrading Core Without the Installer on page 322
- Upgrading the Ecosystem Pack Without the Installer on page 366

last-updated: Jun 06, 2024

Release 7.7 Links	• Upgrading Core or EEP Components on page 300

Installer Containers

This section describes how you can obtain the Installer as a Docker container.

A Installer container is a Docker container that contains the Installer. You can use a Installer container to perform basic installer operations from a node that is not necessarily a part of a cluster. For example, from a Installer container, you can perform the following actions:

- Start and run the web-based Installer to install a new cluster, apply a patch, or perform an update.
- Run Installer Stanza commands to probe an installed cluster.

You can create your own Installer container by using the `mapr-setup.sh` script. Or you can download a pre-built container image for theInstaller.

Creating an Installer Container Using mapr-setup.sh

This section describes how to create an Installer Container image by using the `mapr-setup.sh` script.

Creating the Image

To create an Installer image using `mapr-setup.sh`:

1. Download the `mapr-setup.sh` script to a Linux or Mac OS X platform where Docker 1.12.5 or later is installed and the Docker daemon is up and running. Choose *one* of the following download options:

   NOTE: Running `mapr-setup.sh` on Windows is not supported.

   - Download the setup script directly from https://package.ezmeral.hpe.com/ to the node that will run the Installer:

     ```
     wget --user=<email> --password=<token> https://package.ezmeral.hpe.com/releases/installer/mapr-setup.sh -P /tmp
     ```

   - Download to your local workstation, and copy to the node that will run the Installer:

     a. On the Download Page, click **Download**, and save the setup script to a location on your workstation.

     b. Use a tool such as SCP to copy the file to the node that will run the Installer:

     ```
     scp mapr-setup.sh user@server /tmp
     ```

2. Run the `mapr-setup.sh` script with the `docker installer` command to create the Docker image:

   ```
   ./mapr-setup.sh docker installer
   ```

3. Respond to the command-line prompts to provide the information to configure the image. The following table describes each prompt. If you press **Enter** without specifying a value, `mapr-setup.sh` uses the default value shown in the square brackets ([]):

last-updated: Jun 06, 2024

Prompt	Notes
`Build MapR UI Installer image? (y/n) [y]`	Type y to continue or n to exit the script.
`Image OS class (centos7, ubuntu16) [<local OS>]:`	Specify the base operating system on which to build the image. **NOTE:** SLES is not currently supported.
`Docker FROM base image name:tag [centos:centos7]:`	Specify the starting image used to create the new image. If necessary, you can enter your own tag and image name to choose a base image already created for your installation. If you do not enter a name, the script provides one for you.
`MapR installer image tag name [<name>]`	Accept the software-provided name for the container image, or provide your own name. This is the name you will use to run the image to create the Installer container.
`Container memory: specify host XX[kmg] or 0 for no limit [0]:`	Specify the maximum amount of memory (in kilobytes, megabytes, or gigabytes) that Docker allows the container to access. For example: • 2g • 4096m • 0 Accepting the default (0), means there is no restriction on memory, and the container can use as much memory as the platform makes available.

4. After the last prompt, press **Enter**. The script:
   - Prepares the installer
   - Installs or verifies installer package dependencies
   - Installs installer packages
   - Cleans up unneeded files
   - Creates the `mapr-docker-installer.sh` sample-run file and displays the location of the file:

     ```
     Edit '/root/docker_images/installer/mapr-docker-installer.sh' to
     configure settings and then execute it to start the container
     ```

     `mapr-docker-installer.sh` contains environment variables for the image and makes it easy for you to start the container.
5. *(Optional)* Edit the `mapr-docker-installer.sh` script file if you want to change any environmental variables. For more information about the environmental variables, see Environmental Variables for the Installer Container on page 5698.

last-updated: Jun 06, 2024

6. Run the `mapr-docker-installer.sh` file to start mapr-installer services:

```
./docker_images/installer/mapr-docker-installer.sh
```

After the installer service is started, you can issue Stanza commands or open the web-based Installer in a browser:

```
installer (380) started with log /opt/mapr/installer/logs/installer.log
Started service mapr-installer

...Success

    To continue installing MapR software, open the following URL in a
web browser

              If the address '172.17.0.2' is internal and not accessible
          from your browser, use the external address mapped to it
instead

                              https://172.17.0.2:9443
```

NOTE: The Installer maintains the state of the cluster. When the installer is run from a container, the installer database is only as persistent as the container itself. If you need the installer data to be persistent, here are some options:

- If you shut down a Installer container, use the `docker start` command (not the `docker run` command) to restart the same instance of the container. If you create a new instance of the container, the database will have no information.
- Mount the `/opt/mapr/` data directory outside the container to persistent storage to maintain the cluster state.
- Use the Stanza `export` command to export the state of the cluster before you shut down the container. See Exporting a Cluster Configuration.

Running the Installer Container Using Stanza Commands

You can also use the sample-run file to execute a Installer Stanza command. In this scenario, the command creates the installer container, runs a Stanza command, and then shuts down the container. For example, the following command runs the Stanza `probe` command on node 10.10.88.53:

```
./docker_images/installer/mapr-docker-installer.sh probe -o
config.ssh_id=root config.ssh_password=mapr
config.hosts='["10.10.88.53"]' -nv
```

For a list of the Stanza commands, see Installer Stanza Commands on page 5711.

Using the Pre-Built Installer Container Images

This section describes how to obtain and run the pre-built Installer container images.

Pre-built Installer container images are available on Docker hub. Images are available for:

- Ubuntu 16.04
- Ubuntu 14.04
- CentOS 7

last-updated: Jun 06, 2024

- CentOS 6

The pre-built images are about 200 MB. A sample-run script that you can use to start the container is available on GitHub.

To use a pre-built image:

1. Download the pre-built Installer container image and the sample-run script to a Linux or Mac OS X platform where Docker 1.12.5 or later is installed and the Docker daemon is up and running.
   - You can download the pre-built image from the data-fabric public repository.
   - You can download the sample-run script (`mapr-docker-installer.sh`) from this GitHub location.
2. *(Optional)* Edit the `mapr-docker-installer.sh` script file if you want to change any environmental variables. For more information about the environmental variables, see Environmental Variables for the Installer Container on page 5698.
3. Run the `mapr-docker-installer.sh` file to start mapr-installer services:

   ```
   $ ./docker_images/installer/mapr-docker-installer.sh
   ```

   After the installer service is started, you can issue Stanza commands or open the web-based Installer in a browser:

   ```
   installer (380) started with log /opt/mapr/installer/logs/installer.log
   Started service mapr-installer

   ...Success

       To continue installing MapR software, open the following URL in a
   web browser

                  If the address '172.17.0.2' is internal and not accessible
              from your browser, use the external address mapped to it
   instead

                                  https://172.17.0.2:9443
   ```

   The Installer maintains the state of the cluster. When the installer is run from a container, the installer database is only as persistent as the container itself. If you need the installer data to be persistent, here are some options:

   - If you shut down a Installer container, use the `docker start` command (not the `docker run` command) to restart the same instance of the container. If you create a new instance of the container, the database will have no information.
   - Mount the `/opt/mapr/` data directory outside the container to persistent storage to maintain the cluster state.
   - Use the Stanza `export` command to export the state of the cluster before you shut down the container. See Exporting a Cluster Configuration.

Environmental Variables for the Installer Container

This section describes environmental variables that you can modify to customize the sample-run script for the Installer container.

About mapr-docker-installer.sh

`mapr-docker-installer.sh` is the sample-run script for the Installer container. The script contains the `docker run` command that runs the container and environmental variables that can be passed into the container at run time. Modifying the variables is optional; the script can run without any changes to the environmental variables.

The following environmental variables can be changed in `mapr-docker-installer.sh`:

Environmental Variables in mapr-docker-installer.sh

Key	Variable	Description
`MAPR_CONTAINER_USER`	`<user-name>`	The user that the user application inside the Docker container will run as. This configuration is functionally equivalent to the Docker native `-u` or `--user`. Do not use Docker `-u` or `--user`, as the container needs to start as the `root` user to bring up FUSE before switching to the MAPR_CONTAINER_USER. The user specified here is the user that all storage operations on the cluster will be performed as. Therefore, Hewlett Packard Enterprise recommends not using `root` or `mapr`. This user also owns the `/opt/mapr` directory tree.
`MAPR_CONTAINER_UID`	`<uid>`	The UID that the application inside the Docker container will run as. This is a companion to the MAPR_CONTAINER_USER option. If a UID is not provided, the default is UID 1000. Providing a UID is strongly recommended.
`MAPR_CONTAINER_GROUP`	`<group-name>`	The group that the application inside the Docker container will run as. This is a companion to the MAPR_CONTAINER_USER option. If a group name is not provided, the default is `users`. Providing a group name is strongly recommended.
`MAPR_CONTAINER_GID`	`<gid>`	The GID that the application inside the Docker container will run as. This is a companion to the MAPR_CONTAINER_USER option. If a GID is not provided, the default is GID 1000. Providing a GID is strongly recommended.
`MAPR_PKG_URL`	`<mapr-pkg-url>`	The URL of the repository that hosts the packages (typically https://package.ezmeral.hpe.com/). If you change MAPR_PKG_URL, use the full URL to your repository (for example, `<hostname>/releases`).
`MAPR_CONTAINER_PASSWORD`	`<mapr-password>`	The password for the `mapr` user. This password must be set if the container will remaining running. The password defaults to `mapr`.
`MAPR_STANZA_FILE`	`<stanza-file>`	The path to a Installer Stanza file that needs to be mounted from the host. You must specify this field if you issue the Stanza `install` command as an argument to the script. For example: `mapr-docker-installer.sh install -nv`
`MAPR_MEMORY`	`<mapr-memory>`	Specify the maximum amount of memory (in kilobytes, megabytes, or gigabytes) that Docker allows the container to access. For example: • 2g • 4096m • 0

last-updated: Jun 06, 2024

Key	Variable	Description
		Accepting the default (0), means there is no restriction on memory, and the container can use as much memory as the platform makes available.
MAPR_TZ	<time-zone>	The time zone inside the container. For a list of time-zone settings, see this website. The default is UTC.

Installer Stanzas

This section describes how to prepare for and use Installer Stanzas to install, upgrade, or uninstall software.

Installer Stanzas enable API-driven installation of data-fabric clusters. An extension of the Spyglass Initiative, Installer Stanzas enable the creation of a YAML configuration file (a "Stanza") that describes a cluster. A command-line addition to the web-based Installer allows you to execute the configuration file programmatically to automate new deployments.

You can use Installer Stanzas when you need a script-based tool to install MapR software and you do not want to click through the menus and options provided by the Installer. Installer Stanzas provide less visual feedback than the Installer, but they can be faster and more efficient at installing software on clusters with many nodes.

To use Installer Stanzas:

1. **Review the** Installer Stanza Prerequisites.
2. **Use the steps in** Installer **to download and run the mapr-setup.sh script.** Performing these steps installs both the web-based Installer and the Installer Stanzas feature.
3. **Review or edit the Stanza file.** The Stanza file specifies the installation parameters for your cluster. See Working with Installer Stanza Files on page 5700.
4. **Run the Installer Stanza file.** See Running Installer Stanza Files.

Installer Stanza Prerequisites

This topic describes some limitations and guidelines that you must understand before using Installer Stanzas.

Most prerequisites that apply to the Installer also apply to Installer Stanzas. To review the Installer prerequisites, see Installer Prerequisites and Guidelines on page 5581.

Some additional prerequisites are unique to Installer Stanzas:

- To install Installer Stanza features, you must download version 1.4 or later of the Installer. For more information, see Installer Updates on page 5674 and Updating the Installer on page 5595.
- You can use Installer Stanzas to install, upgrade, or uninstall only Release 5.1 and later releases.
- You can use Installer Stanzas to upgrade or uninstall only clusters that were previously installed using the Installer or a Installer Stanza. If your MapR software was installed manually, you cannot use Installer Stanzas on the cluster because the cluster does not have the installer database.

Working with Installer Stanza Files

This topic describes how to use the sample Stanza files that are provided with the Installer.

The Installer Stanza file specifies how the cluster should be configured, including the configuration of nodes, disks, software versions, and services. You must configure a Stanza file before using Installer Stanzas to install or upgrade a cluster. Sample Stanza files (basic and advanced) are located in this directory:

```
/opt/mapr/installer/examples
```

To create your Stanza file:

1. Make a copy of one of the sample files. For example, make a copy of the `sample_basic` or `sample_advanced` Stanza file, and rename the copy to a name of your choosing.
2. Using any text editor, edit the Stanza file to address the needs of your installation. Comment out any instructions that you don't need.

This table describes how to complete the fields in the Stanza file:

Section	Parameter	Required/Optional	Directions
environment	mapr_core_version	Required	Specify 5.1.0 or later. Be sure to include the third digit (for example, 5.1.0 or 5.2.0).
	patch_location	Optional	Specify the location of a core patch file. The file name must use the format `mapr-patch-${mapr_core_version}`. For example: `mapr-patch-5.2.0.39122.GA-4198.x86_64.rpm` Use an absolute path to specify the patch file location.

last-updated: Jun 06, 2024

config	hosts	Required	Specify the list of hosts on which you want to install packages. You can list the hosts on a single line as follows:
			`- examplenode[1-3].example.com`
			Or you can use multiple lines:
			`- examplenode1.example.com`
			`- examplenode2.example.com`
			`- examplenode3.example.com`
			Note:
			• The installer host must be one of the hosts in this list.
			• A comma-separated list of hosts is not supported.
			• You can override hosts and disks from the command line. The following example specifies installing only on hosts 01 through 04. To pass an array into an override, use single quotes, double quotes, and brackets as follows:
			`cli install -nv -t sample_adv.yaml -o config.hosts='["lab[01-04].yourlab.com"]'`
			NOTE: In a command with an override, the `key=value` pair or pairs that follow `-o` must not contain a blank space. For more information about `key=value` pairs, see Installer Stanza Commands on page 5711.

last-updated: Jun 06, 2024

	ssh_id	Required	Specify the user ID that the installer will run under when it installs the packages. This user must have root access and must be present on every host defined in the hosts section.
	ssh_password	Optional	Specify the password (for use with the password-based login). This is the password that the installer uses to log into the node using ssh. Comment this line if you want to use a private-key-based login.
	ssh_key_file	Optional	Specify the path to a file that contains the private key (for use only with the private key-based login). Uncomment this line if you want to use a private-key-based login. If both the ssh_password and ssh_key_file lines are uncommented, the installer will default to the ssh_key_file.
	ssh_port	Optional	Uncomment this line if you need to specify a port other than the default, which is 22.
	license_type	Required	Specify M3 for the community edition or M5 for the enterprise edition.
	mep_version	Required for MapR 5.2.0 and later	Specify a currently supported EEP, such as 2.0. For EEP information, see EEP Components and OS Support on page 5734.
	disks	Required	List the disks on which the packages will be installed. The disk names should be the same on every node. This field is required, and you must use the following notation: `- /<diskname>` `- /<diskname>` `- /<diskname>` A comma-separated list of disks is not supported. Not all of the disks need to be present, but at least one disk on each node must be present.

last-updated: Jun 06, 2024

	disk_stripe	Optional	Uncomment this line if you need to specify a disk stripe value other than the default, which is 3.
	elasticsearch_path	Optional	Uncomment this line if you need to specify a path where Elasticsearch data will be stored.

last-updated: Jun 06, 2024

	services	Optional	Specify a predefined template of services. Services are the core or ecosystem components (or tools) that run on each group. The installer configures default services automatically unless you specify a "groups" section in the Stanza file. To view the predefined templates, use the `list` command with the `--type TEMPLATE` argument. **NOTE:** • Metrics are provided by default. The metrics services apply only to MapR 5.2 and later. • Logging services, if specified, apply only to 5.2 and later. • If you do not specify any services, the Installer will install only core services. • For an incremental install or upgrade, the Installer discovers any services already installed. Additional services are installed only if you request specific services, a EEP upgrade, or a core upgrade. • You can override services using a command such as the following: `-o config.services='{"mapr-oozie": {} , "mapr-hivemetastore": {"database": {"name": "hive", "user": "hive", "password": "mapr"}}}'`

groups (advanced layout only)		Optional	To provision the cluster manually, add services in groups. A group is a collection of hosts (nodes) that runs a specific set of services. The installer creates groups automatically unless you specify the groups manually (manual provisioning). To specify the groups manually, you must include a groups section and define the hosts, labels, and services that your cluster needs. For an example, see the sample_advanced Stanza file. The services you specify must not be of type GROUP. To view the type for a given service, use the `list services` command with the `--name <name-of-service>` argument. Also, when provisioning manually, you must ensure that the mapr-core service is present on every node.
	hosts	Required (if a groups section is specified)	Hosts are nodes that run a specific set of services.
	label	Optional	The label is a descriptor for each group. Use the label to describe the group function or some other aspect of the group that is meaningful to your installation. If a label is not specified, the installer will auto-generate a label based on the service names.
	services	Required (if a groups section is specified)	See the "Services" section earlier in this table.

Running Installer Stanza Files
This section describes how to install, upgrade, and uninstall MapR software and check the progress of these operations by using Installer Stanza commands.

NOTE: To run Installer Stanza commands, you must navigate to the installer directory. This applies to all the examples in this section:

```
cd /opt/mapr/installer
```

Installing or Upgrading Core Using an Installer Stanza
Use the Stanza `install` command to install Release 5.1 or later, install additional features, upgrade a cluster, perform a maintenance update, or apply a patch.

You can use the `install` command of the Installer Stanza command suite to:

last-updated: Jun 06, 2024

- Perform a fresh install of Release 5.1 or later.
- Perform an incremental install (add or upgrade services that are already installed on the cluster).
- Upgrade a cluster to a newer data-fabric software version or a newer EEP version.
- Perform a maintenance update.
- Apply a patch (see Applying a Patch Using an Installer Stanza on page 479).
- Extend the cluster by adding nodes (see Extending a Cluster by Adding Nodes on page 5624).

For the `install` command syntax and options, see Installer Stanza Commands on page 5711 later in this section.

This example installs data-fabric software using the parameters specified in the `sample_basic.yaml` Stanza file. To run this command, you should be logged in as the `mapr` user. The `-nv` option specifies that certificates will not be checked and the output mode is verbose. The `-t`option, which is required, specifies the use of a template file:

```
./bin/mapr-installer-cli install -nv -t ./examples/sample_basic.yaml
```

If you are using a Installer Stanza to install data-fabric software on a cluster that has never had data-fabric software installed (a fresh installation), it is recommended to create the `mapr` user on all nodes. You can create the `mapr` user by using the `config.cluster_admin_password` override. For example:

```
./bin/mapr-installer-cli install -nv -t ./examples/sample_basic.yaml -o
config.cluster_admin_password=mapr
```

If you use the `install` command and an existing cluster is detected, the installer attempts an incremental install or upgrade using the parameters in the specified Stanza file:

- For incremental installs, the installer does not check or verify the configuration.
- You cannot add nodes or services during a version upgrade.

NOTE: If the password in the Stanza file or in the command contains a special character, such as an exclamation point (!), you might need to escape the character with a backslash (\). For example:

```
./bin/mapr-installer-cli install -u mapr:mapr\!@localhost -nv -t ../
examples/sample_basic.yaml
```

If you do not want to include a password in the Stanza file, you can specify a value contained in a secured file. This example uses a Stanza file (`sample_nopwd.yaml`) in which the `ssh_password` line has been removed. The secured file (`installer.cfg`) stores the value of `ssh_password` as `config.ssh_password=mapr`. The contents of `installer.cfg` are piped to the `install` command via an override (`-o -`). You must include the `-` after the `-o`; otherwise, the file contents are not read.

```
cat examples/installer.cfg | ./bin/mapr-installer-cli install -nv -t
examples/sample_nopwd.yaml -o -
```

To check the progress of the installation or upgrade, see Checking the Progress of Operations. For another example of using the `install` command, see How to Build Stanzas.

New Installation of Release 6.0 Secure Cluster Using Stanzas

To install a Release 6.0 secure cluster using Stanzas, you must add two parameters to the Stanza:

- `config.security: "true"`

last-updated: Jun 06, 2024

- `config.cluster_admin_password: "<mapr_user_password>"`

For example:

```
config:
  security: "true"
  cluster_admin_password: "mapr"
```

After the installation completes, `secure=true` should be set in the `/opt/mapr/conf/mapr-clusters.conf` file. This command should print the ticket details:

```
maprlogin print -ticketfile /opt/mapr/conf/maprusertickets
```

Note these considerations for installing a Release 6.0 secure cluster:

- If you use a Stanza to perform a secure install, you must log out and then log in one time for the bashrc to take effect.
- For non-bash environments, you must manually add the above epxort to your login profile.
- You can use the `probe` command to detect whether a cluster is secure or not.

Uninstalling Core Using an Installer Stanza
Specifies how to uninstall Core from the command line.

You can use the `uninstall` command to uninstall the current data-fabric software version. The `uninstall` command requires that you specify two overrides:

- `config.ssh_id`
- `config.ssh_password` or `config.ssh_key_file`

NOTE: Using the the `uninstall` command requires `root` privileges. You can provide the `root` ID and password or the `root` ID and `ssh_key_file`.

This example uninstalls the currently installed data-fabric software. The command uses an override to provide the `ssh_id` and `ssh_password` and includes `-nv` so that certificates will not be checked, and the output mode is verbose.

```
./bin/mapr-installer-cli uninstall -nv -o config.ssh_id=root -o
config.ssh_password=mapr
```

This example uninstalls the currently installed data-fabric software. The command uses an override to provide the `ssh_id` and `ssh_key_file` and includes `-nv` so that certificates will not be checked, and the output mode is verbose. The `ssh_key_file` for root normally resides in `/root/.ssh`. In this example, the file has been copied to `/home/mapr/root` so that the `mapr` user can access the key file.

```
./bin/mapr-installer-cli uninstall -nv -o config.ssh_id=root -o
config.ssh_key_file=/home/mapr/root_user_id_rsa
```

Exporting a Cluster Configuration

If a cluster was installed using the Installer or a Installer Stanza, you can use the `export` command to generate a Stanza that captures the state of the cluster. You can then modify the Stanza to perform incremental installs or upgrades.

last-updated: Jun 06, 2024

This example uses the `export` command to generate the `tt.yaml` Stanza file. The command includes `-n` so that certificates will not be checked:

```
./bin/mapr-installer-cli export -n --file /tmp/tt.yaml
```

NOTE: The `export` command does not export the `config.ssh_password` field. When using the exported YAML file, you need to provide the password manually, pass it as an override, or specify a value contained in a secured file, as described in Installing or Upgrading Core Using an Installer Stanza on page 5706.

For another example of using the `export` command, see MapR Stanzas (blog).

Getting Information About Services and Groups
Use the Stanza `list` command to get additional information about your cluster.

You can use the `list` command and its arguments to get information about the configuration, services, groups, hosts, and services in the cluster. While the `list` command provides the state of the cluster, `list` output is not suitable for incremental installs and upgrades. You must use the `export` command if you want to generate a Stanza file that can be used for upgrading.

This example displays a listing of all the services, groups, and hosts that were installed:

```
./bin/mapr-installer-cli list installed -n
```

This example lists all the groups:

```
./bin/mapr-installer-cli list groups -n
```

This example lists all the hosts:

```
./bin/mapr-installer-cli list hosts -n
```

This example lists the installation status for all the hosts:

```
./bin/mapr-installer-cli list hosts_install_status -n -u https://
mapr:<password>@<installer_ip_addr>:9443
```

This example lists the services by template:

```
./bin/mapr-installer-cli list services -n --type TEMPLATE|more
```

You can use the `list services` command to learn about different kinds of services. For example:

Group Type	Example Command
CONTROL	`./bin/mapr-installer-cli list services -n --type CONTROL`
MULTI_MASTER	`./bin/mapr-installer-cli list services -n --type MULTI_MASTER` `./bin/mapr-installer-cli list services -n --type MONITORING_MASTER`

last-updated: Jun 06, 2024

Group Type	Example Command

DATA	`./bin/mapr-installer-cli list services -n --type DATA`
	`./bin/mapr-installer-cli list services -n --type DEFAULT`
	`./bin/mapr-installer-cli list services -n --type CLIENT`

SINGLE MASTER	`./bin/mapr-installer-cli list services -n --type MASTER`

Verifying the Nodes

You can use the `check` command to verify that the nodes specified in the Stanza file are ready to be installed. The `check` command does not check the Stanza file and does not do any provisioning or installation. The `check` command runs the same checks that the Installer runs during its Verification phase. For example, it checks that the nodes have the right OS version, that they have enough disk space, and that they have enough memory to support installation or other Installer operations.

This example verifies the nodes specified in the `sample_advanced_demo.yaml` file. The `-nv` option specifies that certificates will not be checked and the output mode is verbose. The `-t` option, which is required, specifies the use of a template file:

```
./bin/mapr-installer-cli check -nv -t sample_advanced_demo.yaml
```

Resetting the Installer Database

The `reset` command uninstalls the metadata from the Installer database. `reset` is for advanced users.

You can reset the Installer database by using the CLI `reset` command or by using the Installer web interface (**Support > Reset Installer**).

The reset function can be useful for testing purposes, but use reset with caution. If you reset the installer database while packages are installed on the nodes, you will need to remove the packages manually.

NOTE: If you experience a failure while installing or uninstalling, the installer prompts you to retry the operation or uninstall and then reinstall from scratch. You should always retry or uninstall before considering using `reset`.

This example resets the Installer database. The `-nv` option specifies that certfificates will not be checked and the output mode is verbose:

```
./bin/mapr-installer-cli reset -nv
```

Adding a License Using Stanzas

Explains how to add a license using Installer Stanzas.

In addition to using `maprcli`, REST commands, or the Control System to add a license, you can add a license using Installer Stanzas. After obtaining a valid license file from your sales representative, copy the license file to a cluster node (for example, to `/tmp/license.txt`). You can then use the `license` command to apply the license to the cluster. For example:

```
mapr-installer-cli license -n -l <path-to-license-file>
```

Checking the Progress of Operations

This topic describes how to use the Installer web interface and installer logs to check the status of Installer Stanza operations.

last-updated: Jun 06, 2024

Using the Installer to Check Status

The installer provides messages and progress bars to indicate the status of Installer Stanza operations. However, you can also use the Installer interface to check the current status of your cluster. The Installer provides a quick visual summary of the currently installed software versions and services.

To view the Installer web interface:

```
https://<Installer Node hostname/IPaddress>:9443
```

Viewing the Installer Logs

To view or understand the logs generated by the Installer or Installer Stanza operations, see Installer Log Descriptions.

Shutting Down a Cluster Using an Installer Stanza Command

Use the Stanza `shutdown` command to shut down an on-premise or cloud-based cluster.

The Stanza `shutdown` command is available with Installer 1.6 or later. The command shuts down Warden and Zookeeper, which in turn shut down other running services that are part of a data-fabric cluster. When you use the `shutdown` command, the Installer implements the same orderly shutdown that it uses to perform software upgrades.

You must supply the ssh ID and password or the ssh ID and `ssh_key_file`.

The `shutdown` command works differently for cloud-based clusters. Note these considerations for the behavior of the `shutdown` command:

Cluster Location	Shutdown Command Behavior
On premise	Does not stop non-data-fabric software and does not power off the nodes.
In the cloud	Shuts down (but does not remove) all the nodes in the cluster. If the installer node is part of the cluster, the installer node is not shut down. To shut down the installer node, use AWS-console or Azure-portal commands to stop the instance.

This example shuts down a cluster. The command uses an override to provide the `ssh_id` and `ssh_password` and includes `-nv` so that certificates will not be checked, and the output mode is verbose.

```
./bin/mapr-installer-cli shutdown -nv -o config.ssh-id=root -o
config.ssh_password=mapr
```

This example shuts down a cluster. The command uses an override to provide the `ssh_id` and `ssh_key_file` and includes `-nv` so that certificates will not be checked, and the output mode is verbose. The `ssh_key_file` for root normally resides in `/root/.ssh`. In this example, the file has been copied to `/home/mapr/root` so that the `mapr` user can access the key file.

```
./bin/mapr-installer-cli shutdown -nv -o config.ssh_id=root -o
config.ssh_key_file=/home/mapr/root_user_id_rsa
```

Installer Stanza Commands

This topic provides the syntax and options for Installer Stanza commands.

Command Usage

To use Installer Stanza commands, you must log in as the cluster administrator user that you configured while running the `mapr-setup.sh` script. For more information, see Managing Users and Groups.

`check`

last-updated: Jun 06, 2024

Use the `check` command to verify that the nodes specified in the Stanza file are ready to be installed. For more information, see Verifying the Stanza File.

```
check [-h]
     [--overrides [OVERRIDES [OVERRIDES …]]]
     [--no_check_certificate][--url URL]
     [--force][--verbose] --template TEMPLATE
```

`export`

You can use the `export` command to discover a currently installed cluster and generate a Stanza file that captures the configuration, the groups, and the hosts for the cluster. You can then modify the Stanza file to install other clusters. For more information, see Exporting a Cluster Configuration.

NOTE: The Stanza file generated by the `export` command does not contain the `ssh_password` or `ssh_key_file` values. You need to add those values manually or provide them on the command line by using an override.

```
export [-h]
     [--overrides [OVERRIDES [OVERRIDES ...]]]
     [--no_check_certificate] [--url URL]
     [--file FILE]
```

`import`

The `import` command prepares the installer database using the template generated by the `probe` command. You must specify a template (YAML file) to use the import command. For more information, see Using probe and import to Generate the Installer Database on page 5671.

```
import [-h][--no_check_certificate][--url URL][--verbose]
       --template TEMPLATE
```

`install`

You can use the `install` command to perform a fresh install, an incremental install, or an upgrade. For more information, see Installing or Upgrading Core Using an Installer Stanza on page 5706.

```
install [-h]
     [--overrides [OVERRIDES [OVERRIDES …]]]
     [--no_check_certificate][--url URL]
     [--force][--verbose] --template TEMPLATE
```

`license`

Use the `license` command to add a license from a license file. For more information, see Adding a License Using Stanzas on page 5710.

```
license [-h]
      [--no_check_certificate][--url URL]
      --license LICENSE <license-file>
```

`list`

You can use the `list` command to display information about the configuration, services, groups, and hosts that are present in the Installer database. For more information, see Getting Information About Services and Groups.

```
list [-h]
    {config,groups,hosts,hosts_install_status,installed,services} ...
```

`probe`

The `probe` command generates a template file that can be used to create an installer database on a cluster that doesn't have one. A cluster must have an installer database in order for you to use Installer Stanzas on the cluster. If the installer database is not present, you can use the `probe` command followed by the `import` command to generate one. For more information, see Using probe and import to Generate the Installer Database on page 5671.

```
probe [-h]
      [--no_check_certificate][--url URL]
      [--force][--verbose] --template TEMPLATE
      [--overrides [OVERRIDES [OVERRIDES …]][--verbose]]
```

`reset`

The `reset` command uninstalls the metadata from the installer database. For more information, see Resetting the Installer Database.

```
reset [-h] [--overrides [OVERRIDES [OVERRIDES ...]]]
      [--no_check_certificate] [--url URL]
      [--force] [--verbose]
```

`shutdown`

The `shutdown` command shuts down the cluster. For more information, see Shutting Down a Cluster Using an Installer Stanza Command on page 5711.

```
shutdown [-h] [--overrides [OVERRIDES [OVERRIDES ...]]]
      [--no_check_certificate] [--url URL]
      [--force] [--verbose]
```

`uninstall`

The `uninstall` command removes MapR software. For more information, see Uninstalling Core Using an Installer Stanza.

```
uninstall [-h]
      [--overrides [OVERRIDES [OVERRIDES ...]]]
      [--no_check_certificate] [--url URL]
      [--force] [--verbose]
```

Command Options

All of the following command options are optional except for the `TEMPLATE` option:

Option	Description
`-h` or `--help`	Show this help message and exit.
`-o [OVERRIDES[OVERRIDES …]]` or `--overrides[OVERRIDES[OVERRIDES …]]x = y list of overrides or - for stdin`	Use the specification provided on the command line instead of the Stanza file instructions. Overrides are typically used when you want to specify a host name, user ID, password, or key file on the command line.

last-updated: Jun 06, 2024

	NOTE:
	The `key=value` pair or pairs specified in a Stanza override must not include blank spaces. For example, do not use this command:
	`./mapr-installer-cli probe -o config.hosts='["host1", "host2", "host3"]' .....`
	Use this command instead:
	`./mapr-installer-cli probe -o config.hosts='["host1","host2","host3"]' .....`
	In the second command, `config.hosts` is the `key`, and `'["host1","host2","host3"]'` is the `value`. An override can specify multiple `key=value` pairs with each pair separated by a space:
	`-o <key1=value1> <key2=value2> <key3=value3>`

`-n` or `--no_check_certificate`	Do not verify SSL certifications.
`-u URL` or `--url URL`	Installer URL (user:password@host:port)
`--file FILE`	The `export` file path.
`-f` or `--force`	Force action. This option eliminates user input and answers yes to all questions returned by the software.
`-v` or `--verbose`	Verbose output.
`-t TEMPLATE` or `--template TEMPLATE`	The specified Stanza template file (required for the `install` and `import` commands). The template file can be a local file on the installer node, or it can be a remotely accessible URL.

Command Line Help

You can access online help at the command line using any of these commands:

Command	This command displays...
`./bin/mapr-installer-cli -h`	Top-level help for the installer
`./bin/mapr-installer-cli <cmd> -h` where <cmd> is one of the following: • `check` • `export` • `import` • `install` • `license`	Help for the specified command

last-updated: Jun 06, 2024

• list • probe • reset • uninstall	

Interoperability Matrices

This section provides tables that show the operating system (OS), JDK, ecosystem, and data-fabric client support for the HPE Ezmeral Data Fabric. Check these tables for information about software compatibility.

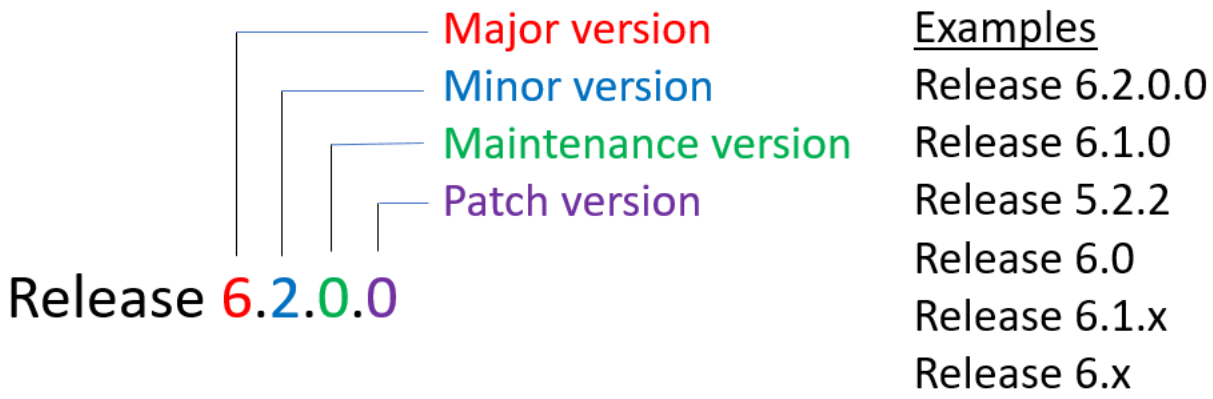
Understand Software Versions

Understanding the version numbers used by core, Ecosystem Packs (EEPs), EEP components, and patches can help you keep your software up to date and plan for upgrades.

HPE Ezmeral Data Fabric release versions generally follow the industry-standard **<major>.<minor>.<maintenance>** format, with a number representing each version. However, some Data Fabric software products use different versioning formats. The following sections describe the characteristics of the various Data Fabric versioning formats.

Core Versions

In HPE Ezmeral Data Fabric interfaces and documentation, core versions are expressed as a dot-separated string of numbers having two, three, or four places. For example:



A Change to This Version	Typically Includes	For Example
Core major version	Significant new features and API changes that can introduce incompatibilities with the previous version.	Release 6.x followed Release 5.2.x and added built-in security features, database features (secondary indexes), new APIs (Apache OJAI and Change Data Capture), a new EEP series (EEP 4.x), file-system enhancements, a new installer version, and a redesigned control system for monitoring the cluster.
Core minor version	New features, bug fixes, and API changes that are sometimes incompatible with the previous version.	Release 6.1 followed Release 6.0.1 and added security by default, a new ZooKeeper version, several new

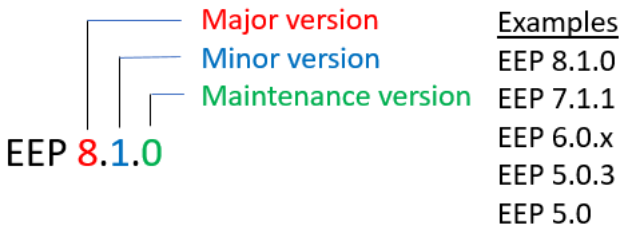
last-updated: Jun 06, 2024

A Change to This Version	Typically Includes	For Example
		database features (Node.js and Python OJAI clients, complex type support, table metrics, support for the OJAI 3.0 API), a new installer version, a new EEP series (EEP 6.x), and storage tiers for the file system.
Core maintenance version	Bug fixes only. This version typically does *not* introduce incompatibilities with the previous version.[1]	Release 5.2.2 followed maintenance releaseRelease 5.2.1 and introduced new EEPs, improvements to the disk space balancer tool, and a new Installer version, but did not include new features or API changes.
Core patch version	An emergency bug fix (EBF) patch update, which provides bug fixes and does not introduce new features.	Release 6.2.0.1 represents a patch, or EBF, on top of core release 6.2.0.0. Releases 6.2 and later add the fourth place as a patch version. Even though a core version is a string having two, three, or four places, most references to core versions in the Data Fabric documentation use two or three places.

[1]Release 6.0.1 was an exception to this rule, adding REST API access to HPE Ezmeral Data Fabric Database JSON tables, event timestamp support for stream processing, streaming audit logs for the HPE Ezmeral Data Fabric File Store, and a new EEP series (EEP 5.x).

EEP Versions

In HPE Ezmeral Data Fabric interfaces and documentation, Ecosystem Pack (EEP) versions are expressed as a dot-separated string of numbers having two or three places. For example:



A Change to This EEP Version	Typically Includes	For Example
Major version	A new EEP series that supports a new major, minor, or maintenance version of core.	EEP Support and Lifecycle Status on page 5728 shows how EEP major versions change when new versions of core are introduced.
Minor version	A significant change in features or APIs but no change in support for the current core version.	EEPs 6.0.1 and 6.1.0 both support Release 6.1.0, but EEP 6.1.0 introduced new HPE Ezmeral Data Fabric Database features, such as the C# and Go OJAI clients, as well as new features for ecosystem components (Flume, Oozie, Tez, and Apache Kafka). EEP 6.2.0, which also supports Release 6.1.0, introduced new ecosystem component versions (Hue, Impala, Spark) and updated some components (Oozie and Hive).

last-updated: Jun 06, 2024

A Change to This EEP Version	Typically Includes	For Example
Maintenance version	Bug fixes only. EEP maintenance versions do not add new features or API changes and are backward compatible in the same EEP series.	EEPs 5.0.3, 5.0.2, and 5.0.1 added bug fixes to the EEP 5.0.x line while preserving compatibility with Release 6.0.1.

About the Patch Version

Beginning with EEP 6.1.0, version numbers for some ecosystem components and Data Fabrictools use a dot-separated string having four places instead of two or three places. For example:

- Oozie 5.1.0.0
- Installer 1.11.0.0

The fourth numeral represents the patch version. The patch version adds a unique descriptor for patches that can occur between releases. In future releases, as new versions of components are released, more components and tools will transition to a version string that includes the patch version.

How the Patch Version Increments

Beginning with EEP 6.2.0, the patch version can be a number in the range 0 through 999. For a newly released component, the patch version starts at 0 and increments by 1 when there is an EBF update. For example, if the EEP 6.1.0 general availability (GA) package version for Oozie is 5.1.0.0, the first bug-fix (EBF) package version will be Oozie 5.1.0.1. The next bug fix package version will be Oozie 5.1.0.2, and so on.

If the same version of a component is present in multiple EEPs, the patch version increments by 100 to provide a range of usable version numbers for future patches. This numbering scheme ensures that all patches have a unique version. The following table shows how the Oozie patch version increments for EEPs 6.1.0, 6.1.1, and 6.2.0:

EEP	Oozie GA Version	1st Oozie Patch Version	2nd Oozie Patch Version
6.1.0	5.1.0.0	5.1.0.1	5.1.0.2
6.1.1	5.1.0.100	5.1.0.101	5.1.0.102
6.2.0	5.1.0.200	5.1.0.201	5.1.0.202

To obtain EBF patches, you must contact HPE Support. HPE Support makes EBF patch versions available for specific known issues. See Patches and Patch Documentation on page 70.

Maven Version Format

Beginning with EEP 6.2, the patch version also is present in Maven artifacts for components that use the four-place versioning. In addition, the Maven version format changes to include the associated EEP instead of the YYMM timestamp:

Old Maven format with YYMM timestamp: `maprdb-spark-2.2.1-mapr-1803.jar`

Maven format with EEP number: `maprdb-spark-2.3.3.0-mapr-602.jar`

Beginning with EEP 8.1.0, artifact naming changed again to remove `mapr` from the version string and replace it with `eep`. For example:

Maven format that replaces `mapr` with `eep`:`1.4.13.200-eep-810`

The Maven version increments in the same way that the patch version increments. This table shows how the Spark package version and Maven versions increment when new EBF patch versions become available:

EEP	EEP 6.0.2	EEP 6.1.1	EEP 6.0.3*	EEP 6.1.2*
Spark Package Version	`mapr-spark-2.3.3.0.<timestamp>`	`mapr-spark-2.3.3.100.<timestamp>`	`mapr-spark-2.3.3.200.<timestamp>`	`mapr-spark-2.3.3.300.<timestamp>`
Spark 1st EBF Package Version	`mapr-spark-2.3.3.1.<timestamp>`	`mapr-spark-2.3.3.101.<timestamp>`	`mapr-spark-2.3.3.201.<timestamp>`	`mapr-spark-2.3.3.301.<timestamp>`
Spark Maven Version	`2.3.3.0-mapr-602`	`2.3.3.100-mapr-611`	`2.3.3.200-mapr-603`	`2.3.3.300-mapr-612`
Spark 1st EBF Maven Version	`2.3.3.1-mapr-602`	`2.3.3.101-mapr-611`	`2.3.3.201-mapr-603`	`2.3.3.301-mapr-612`

*This release is not currently available and is included only for illustration purposes.

A patch release can trigger periodic updates to the Maven repository. You may notice patches in the sftp.mapr.com repository that are not updated in the Maven repository. This is normal. The Maven repository will be updated eventually. The latest patch versions are always propagated first to sftp.mapr.com. If you have questions about patches, contact your HPE support representative.

Red Hat Enterprise Linux (64-bit)

NOTE: The RHEL versions in the following table have been certified with the specified HPE Ezmeral Data Fabric versions.

HPE recommends pinning your deployment to a certified version. If your RHEL instances are not pinned to a specific version, and there is a later RHEL minor release available, then updates for packages (including security updates) come from the later release. If this later release is not certified, the new package versions might cause issues with your deployment.

[1]Supported only for EEPs 6.3.0 and later.

last-updated: Jun 06, 2024

[2]NFSv4 is not supported for core 6.1.0 on Red Hat Enterprise Linux / CentOS 8.x.

[3]Hue 4.3.0 in EEP 6.3.0 and 6.3.1 is not supported for Red Hat Enterprise Linux (RHEL) or CentOS 8.x. However, Hue 4.3.0.300 in EEP 6.3.2 can be used with RHEL or CentOS 8.x.

[4]Installing release 6.1.0 on RHEL or CentOS 8.x requires you to enable the EPEL repository. Starting in RHEL 8.x, a `mapr-core-internal` package dependency (`sdparm`) is deprecated and moved to EPEL, and installation cannot complete without enabling it. For information about adding repositories, see Adding the Data Fabric Repository on RHEL, CentOS, or Oracle Linux on page 183.

[5]May require a patch. For best results, apply the latest EBF. To install patches, see Applying a Patch on page 473.

[6]Requires a patch. Certified only for EEP 5.0.4. Other EEPs supported by release 6.0.x might work but have not been certified.

[7]Use Installer 1.10 or later with this release. Before upgrading your operating system to Red Hat Enterprise Linux 7.5, CentOS 7.5, or SLES12 SP3 or later, be sure to update the Installer to version 1.10 or later. See Updating the Installer on page 5595.

[8]Supported only for new installations. Upgrades to Release 7.7.0 on this OS version are not currently supported.

[1]Both core and ecosystem components (EEP 9.1.0 and later 9.x.x) can be used on the supported versions of Oracle Enterprise Linux.

[2]Only data-fabric core software can be used on the supported versions of Oracle Enterprise Linux. Ecosystem components are not supported.

[3]Both core and ecosystem components (EEP 7.x.x and later) can be used on the supported versions of Oracle Enterprise Linux.

[4]Requires a patch. To install patches, see Applying a Patch on page 473.

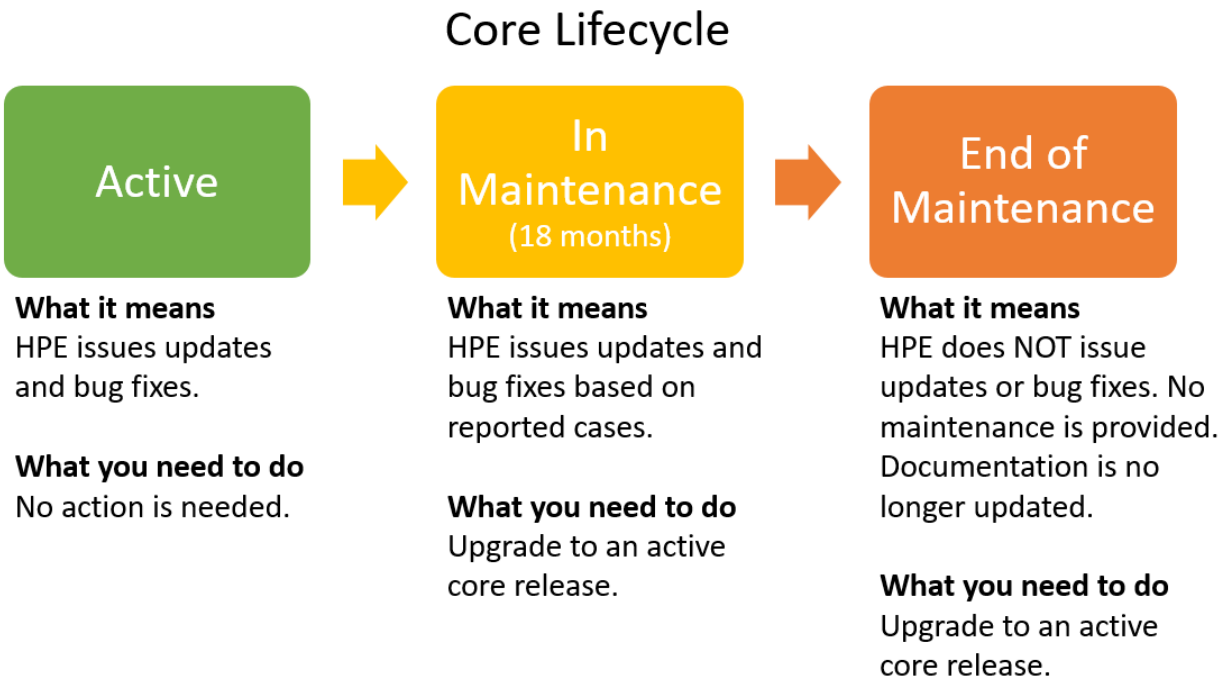
Understand the Core Lifecycle

Describes the HPE Ezmeral Data Fabric core lifecycle and defines the lifecycle stages, which are Active, In Maintenance, and End of Maintenance.

Core Lifecycle Stages

Hewlett Packard Enterprise periodically releases new core software. Each core release is supported for an amount of time that can vary depending on the new releases that follow it. When new core versions are released, older core versions are deprecated or discontinued. Each core version therefore has its own lifecycle. As shown in the diagram, a core release can transition through three lifecycle stages:

- Active
- In Maintenance (18 months)
- End of Maintenance



Typically, within six months after a new release, Hewlett Packard Enterprise issues an advisory to indicate the end of maintenance for older versions of core. Eighteen months after the advisory is issued, the In-Maintenance core version reaches the End-of-Maintenance stage and is discontinued.

To view the current lifecycle status for every core release, see Core Support and Lifecycle Status on page 5726. The following table describes the lifecycle stages:

Support and the Lifecycle Stages

Support Activity	Notes	Lifecycle Stage		
		Active	In Maintenance	End of Maintenance
Proactive Maintenance (Minor, Maintenance, Patch)	Includes proactive fixes for security vulnerabilities, critical bugs, and other issues.	Yes	No	No
Reactive Maintenance (Escalation Support + Patch)	Requires the user to open cases resulting in tactical fixes for critical bugs, where backporting is feasible.	Yes	Yes[1]	No

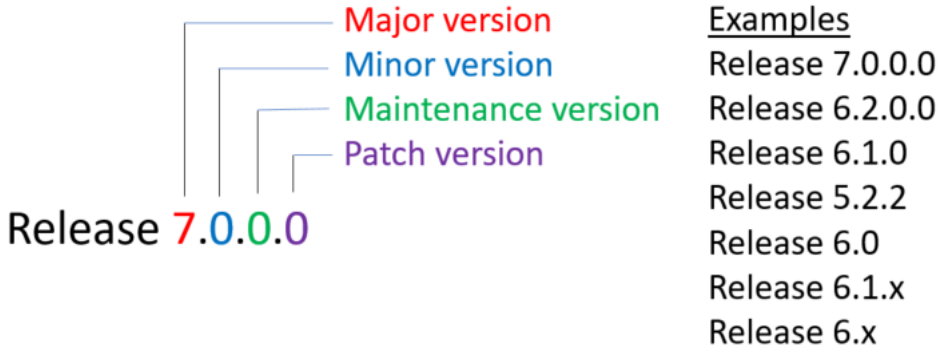
last-updated: Jun 06, 2024

Support Activity	Notes	Lifecycle Stage		
		Active	In Maintenance	End of Maintenance
Assisted Support (Usage / Debug Support)	Does not include patch fixes.	Yes	Yes	No

[1]Includes fixes for critical bugs and CVEs reported to Support. Does not include documentation updates.

Core Versions

In HPE Ezmeral Data Fabric interfaces and documentation, core versions are expressed as a dot-separated string of numbers having two, three, or four places. Updates and bug fixes result in changes to the major, minor, maintenance, and patch versions of a core



release:

Notification of Changes in Support for Released Core Versions

To notify users about changes in EEP support, Hewlett Packard Enterprise issues periodic support advisories. When core releases are deprecated or discontinued, users of those releases are encouraged to upgrade to newer versions. For more information about support advisories, see Security Vulnerabilities on page 6184 and Support Articles in the HPE Support Center on page 6197.

Understand the EEP Lifecycle

This page describes the EEP lifecycle and defines the lifecycle stages, which are Active, In Maintenance, and End of Maintenance.

EEP Lifecycle Stages

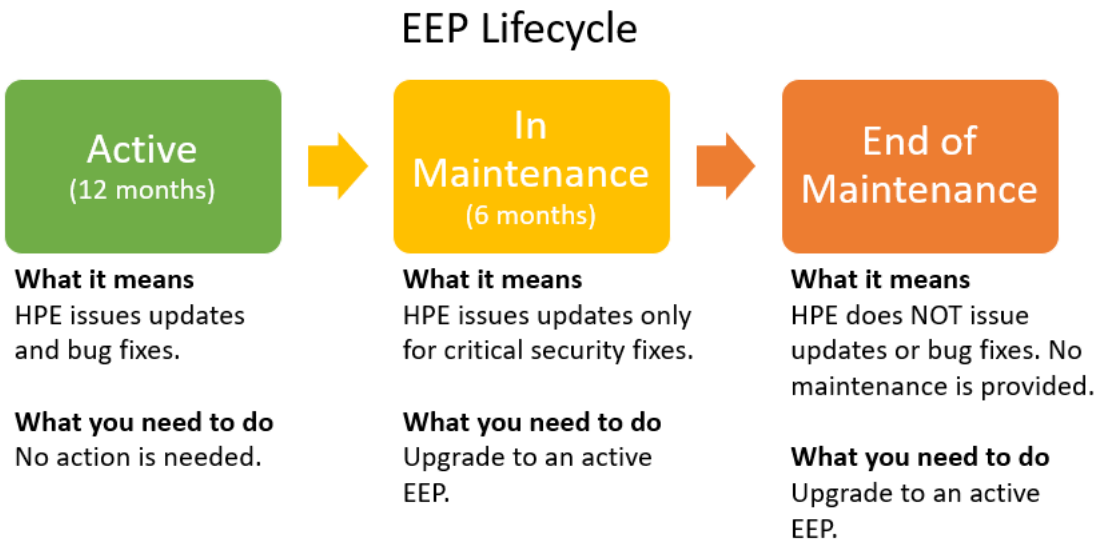
HPE periodically releases new ecosystem components as ecosystem packs (EEPs). Each EEP is supported for 18 months. When new EEPs are released, older EEPs transition to In Maintenance or End of Maintenance. Each EEP therefore has its own lifecycle.

As shown in the diagram, an EEP can transition through three lifecycle stages:

- Active (12 months)
- In Maintenance (6 months)
- End of Maintenance

The lifecycle stage determines if HPE issues updates and bug fixes for the EEP, which are reflected in changes to the major, minor, and maintenance versions of the EEP:

last-updated: Jun 06, 2024



To view the current lifecycle status for every EEP, see EEP Support and Lifecycle Status on page 5728.

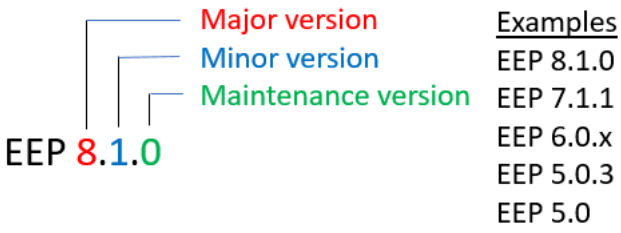
Support and the Lifecycle Stages

Support Activity	Notes	Lifecycle Stage		
		Active	In Maintenance	End of Maintenance
Proactive Maintenance (Minor, Maintenance, Patch)	Includes proactive fixes for security vulnerabilities, critical bugs, and other issues.	Yes	No	No
Reactive Maintenance (Escalation Support + Patch)	Requires the user to open cases resulting in tactical fixes for critical bugs, where backporting is feasible.	Yes	Yes[1]	No
Assisted Support (Usage / Debug Support)	Does not include patch fixes.	Yes	Yes	No

[1]Includes fixes for critical bugs and CVEs reported to Support. Does not include documentation updates.

EEP Versions

In HPE Ezmeral Data Fabric interfaces and documentation, Ecosystem Pack (EEP) versions are expressed as a dot-separated string of numbers having two or three places. For example:



last-updated: Jun 06, 2024

A Change to This EEP Version	Typically Includes	For Example
Major version	A new EEP series that supports a new major, minor, or maintenance version of core.	EEP Support and Lifecycle Status on page 5728 shows how EEP major versions change when new versions of core are introduced.
Minor version	A significant change in features or APIs but no change in support for the current core version.	EEPs 6.0.1 and 6.1.0 both support Release 6.1.0, but EEP 6.1.0 introduced new HPE Ezmeral Data Fabric Database features, such as the C# and Go OJAI clients, as well as new features for ecosystem components (Flume, Oozie, Tez, and Apache Kafka). EEP 6.2.0, which also supports Release 6.1.0, introduced new ecosystem component versions (Hue, Impala, Spark) and updated some components (Oozie and Hive).
Maintenance version	Bug fixes only. EEP maintenance versions do not add new features or API changes and are backward compatible in the same EEP series.	EEPs 5.0.3, 5.0.2, and 5.0.1 added bug fixes to the EEP 5.0.x line while preserving compatibility with Release 6.0.1.

Notification of Changes in Support for Released EEPs

To notify users about changes in EEP support, HPE issues periodic support advisories. When EEPs are deprecated or discontinued, users of those EEPs are encouraged to upgrade to newer EEPs. For more information about support advisories, see Security Vulnerabilities on page 6184 and Support Articles in the HPE Support Center on page 6197.

Core Support and Lifecycle Status

This page shows the support and lifecycle status for all versions of HPE Ezmeral Data Fabric core software.

Whenever possible, upgrade to the latest version of data-fabric core so that you can take advantage of new features, usability enhancements, and defect repair. If your installed version of core is "in maintenance," you have a limited amount of time to plan and execute a core upgrade.

For information about the core lifecycle, see Understand the Core Lifecycle on page 5722. For core compatibility with the leading Linux operating systems, see Operating System Support Matrix on page 5719.

Core Lifecycle and Maintenance Dates

Core Release	Release Date	Lifecycle Status	In Maintenance	End of Maintenance
7.7.0	April 30, 2024	Active	August 2026	February 2028
7.6.1	February 15, 2024	Active	June 2026	December 2027
7.6.0*	January 31, 2024	Deprecated	Deprecated	Deprecated
7.5.0	October 30, 2023	Active	February 2026	August 2027
7.4.0	August 1, 2023	Active	November 2025	May 2027
7.3.0	May 12, 2023	Active	September 2025	March 2027
7.2.0	Jan. 23, 2023	Active	May 2025	November 2026
7.1.0	November 1, 2022	Active	February 2025	August 2026

last-updated: Jun 06, 2024

Core Release	Release Date	Lifecycle Status	In Maintenance	End of Maintenance
7.0.0	March 7, 2022	Active	July 2024	January 2026
6.2.0	September 18, 2020	In Maintenance	January 2023	June 2024
6.1.1	March 29, 2021	In Maintenance	January 2023	June 2024
6.1.0	September 28, 2018	In Maintenance	January 2023	June 2024
6.0.1	April 6, 2018	End of Maintenance	March 2022	September 2023
6.0.0	November 21, 2017	End of Maintenance	March 2022	September 2023
5.2.2	August 2, 2017	End of Maintenance	December 13, 2017	April 30, 2019
5.2.1	April 6, 2017	End of Maintenance	N/A	April 30, 2019
5.2.0	August 19, 2016	End of Maintenance	N/A	April 30, 2019
5.1.0	February 29, 2016	End of Maintenance	N/A	April 30, 2019
5.0.0	July 20, 2015	End of Maintenance	N/A	April 30, 2019
4.1.0	April 30, 2015	End of Maintenance	N/A	January 20, 2017
4.0.2	January 30, 2015	End of Maintenance	N/A	January 20, 2017
4.0.1	September 16, 2014	End of Maintenance	N/A	January 20, 2017
4.0.0	June 23, 2014	End of Maintenance	N/A	January 20, 2017
3.1.1	June 13, 2014	End of Maintenance	N/A	February 29, 2016

This page describes the EEP lifecycle and defines the lifecycle stages, which are Active, In Maintenance, and End of Maintenance.

last-updated: Jun 06, 2024

EEP Support and Lifecycle Status

This page shows the EEPs that are supported for different core releases and the current lifecycle status for each EEP.

Whenever possible, upgrade to the latest EEP supported by your core version so that you can take advantage of bug fixes and usability enhancements. If your installed EEP is In Maintenance or has transitioned to End of Maintenance, see the corresponding upgrade recommendation and support advisory to understand your options.

To learn more about the EEP lifecycle, see Understand the EEP Lifecycle on page 5724. To view the original release date for any EEP, see Release History for EEPs on page 5788. For core lifecycle information, see Core Support and Lifecycle Status on page 5726.

Core Release 7.7.0

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
9.2.2	Active	May 1, 2025	December 31, 2025	N/A	N/A

Core Release 7.6.x

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
9.2.2	Active	May 1, 2025	December 31, 2025	N/A	N/A
9.2.1	Active	February 1, 2025	August 1, 2025	N/A	N/A

Core Release 7.5.0

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
9.2.2	Active	May 1, 2025	December 31, 2025	N/A	N/A
9.2.1	Active	February 1, 2025	August 1, 2025	N/A	N/A
9.2.0	Active	November 1, 2024	May 1, 2025	N/A	N/A

Core Release 7.4.0

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
9.2.2	Active	May 1, 2025	December 31, 2025	N/A	N/A
9.2.1	Active	February 1, 2025	August 1, 2025	N/A	N/A
9.2.0	Active	November 1, 2024	May 1, 2025	N/A	N/A
9.1.2	Active	August 1, 2024	February 1, 2025	N/A	N/A

Core Release 7.3.0

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
9.2.2*	Active	May 1, 2025	December 31, 2025	N/A	N/A
9.2.1*	Active	February 1, 2025	August 1, 2025	N/A	N/A
9.2.0*	Active	November 1, 2024	May 1, 2025	N/A	N/A

last-updated: Jun 06, 2024

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
9.1.2*	Active	August 1, 2024	February 1, 2025	N/A	N/A
9.1.1	In Maintenance	May 1, 2024	December 31, 2024	N/A	N/A

*Using this EEP with release 7.3.0 requires core patch 7.3.0.1 or newer.

Core Release 7.2.0

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
9.2.2*	Active	May 1, 2025	December 31, 2025	N/A	N/A
9.2.1*	Active	February 1, 2025	August 1, 2025	N/A	N/A
9.2.0*	Active	November 1, 2024	May 1, 2025	N/A	N/A
9.1.2**	Active	August 1, 2024	February 1, 2025	N/A	N/A
9.1.1***	In Maintenance	May 1, 2024	December 31, 2024	N/A	N/A
9.1.0	In Maintenance	January 23, 2024	July 31, 2024	N/A	N/A

*Using this EEP with release 7.2.0 requires core patch 7.2.0.4 or newer.

**Using EEP 9.1.2 with release 7.2.0 requires core patch 7.2.0.4 or newer.

***The Installer cannot install EEP 9.1.1 on release 7.2.0 because Data Access Gateway 6.0.0 – which is part of EEP 9.1.1 – is not compatible with release 7.2.0. You can still install or upgrade to EEP 9.1.1 on release 7.2.0, but only if you use manual steps to do so and you apply Data Access Gateway version 5.1.0.

Core Release 7.1.0

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
9.1.2*	Active	August 1, 2024	February 1, 2025	N/A	N/A
9.0.0	End of Maintenance	November 1, 2023	March 31, 2024	Upgrade to EEP 9.1.2	N/A

*Using this EEP with release 7.1.0 requires core patch 7.1.0.12 or newer.

Core Release 7.0.0

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
8.1.2*	Active	May 31, 2025	December 31, 2025	N/A	N/A
8.1.1	In Maintenance	May 31, 2024	December 31, 2024	N/A	N/A
8.1.0	End of Maintenance	March 6, 2023	September 30, 2023	N/A	N/A
7.1.2	End of Maintenance	September 30, 2022	September 30. 2023	Upgrade to latest EEP 8.1.x	N/A

last-updated: Jun 06, 2024

*Using Data Access Gateway 4.0.0.1 with EEP 8.1.2 requires core patch 7.0.0.24 or newer.

Core Release 6.2.0

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
8.1.1	In Maintenance	May 31, 2024	December 31, 2024	N/A	N/A
8.1.0	End of Maintenance	March 6, 2023	September 30, 2023	N/A	
8.0.0	Replaced by EEP 8.1.0				
7.1.2	End of Maintenance	September 30, 2022	September 30, 2023	Upgrade to latest EEP 8.1.x	
7.1.1	End of Maintenance	October 31, 2022	April 30, 2023	Upgrade to latest EEP 8.1.x	
7.1.0	End of Maintenance	June 30, 2022	December 31, 2022	Upgrade to latest EEP 7.1.x	
7.0.1	End of Maintenance	January 31, 2022	July 31, 2022	Upgrade to latest EEP 7.1.x	
7.0.0	End of Maintenance	September 18, 2021	March 31, 2022	Upgrade to latest EEP 7.1.x	

Core Release 6.1.1

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
6.4.0*	End of Maintenance	December 2, 2023	June 2, 2024	N/A	N/A
6.3.6*	End of Maintenance	January 31, 2023	July 31, 2023	Upgrade to latest EEP 6.x.x	N/A
6.3.5*	End of Maintenance	October 31, 2022	April 30, 2023	Upgrade to latest EEP 6.x.x	
6.3.4*	End of Maintenance	June 30, 2022	December 31, 2022	Upgrade to latest EEP 6.x.x	
6.3.3	End of Maintenance	March 31, 2022	November 1, 2022	Upgrade to latest EEP 6.x.x	

*Before using this EEP with the specified core version, you must apply the latest core patch. See Downloading a Patch on page 473.

Core Release 6.1.0

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
6.4.0*	End of Maintenance	December 2, 2023	June 2, 2024	N/A	N/A

6.3.6*	End of Maintenance	January 31, 2023	July 31, 2023	Upgrade to latest EEP 6.x.x	Change of lifecycle stage and level of support with MEP release in June 2021
6.3.5*	End of Maintenance	October 31, 2022	April 30, 2023	Upgrade to latest EEP 6.x.x	
6.3.4*	End of Maintenance	June 30, 2022	December 31, 2022	Upgrade to latest EEP 6.3.x	
6.3.3*	End of Maintenance	March 31, 2022	November 1, 2022	Upgrade to latest EEP 6.3.x	
6.3.2	End of Maintenance	January 31, 2022	July 31, 2022	Upgrade to latest EEP 6.3.x	
6.3.1	End of Maintenance	September 18, 2021	March 31, 2022	Upgrade to latest EEP 6.3.x	
6.3.0	End of Maintenance	December 16, 2020	December 31, 2021	Upgrade to latest EEP 6.3.x	
6.2.0	End of Maintenance	December 31, 2019	December 31, 2021	Upgrade to latest EEP 6.3.x	
6.1.1	End of Maintenance	December 31, 2019	December 31, 2021	Upgrade to latest EEP 6.3.x	
6.1.0	End of Maintenance	December 31, 2019	December 31, 2021	Upgrade to latest EEP 6.3.x	
6.0.2	End of Maintenance	December 31, 2019	December 31, 2021	Upgrade to latest EEP 6.3.x	
6.0.1	End of Maintenance	December 31, 2019	December 31, 2021	Upgrade to latest EEP 6.3.x	
6.0.0	End of Maintenance	December 31, 2019	December 31, 2021	Upgrade to latest EEP 6.3.x	

*Before using this EEP with the specified core version, you must apply the latest core patch. See Downloading a Patch on page 473.

Core Release 6.0.1

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
5.0.8	End of Maintenance	September 30, 2022	September 30, 2023	Upgrade to core 7.1.0 and EEP 9.0.0 or later	N/A

last-updated: Jun 06, 2024

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
5.0.7	End of Maintenance	June 30, 2022	June 30, 2023*	Upgrade to latest EEP 5.0.x	Change of lifecycle stage and level of support with MEP release in June 2021
5.0.6	End of Maintenance	April 30, 2021	December 31, 2021	Upgrade to latest EEP 5.0.x	
5.0.5	End of Maintenance	April 30, 2021	December 31, 2021	Upgrade to latest EEP 5.0.x	
5.0.4	End of Maintenance	April 30, 2021	December 31, 2021	Upgrade to latest EEP 5.0.x	
5.0.3	End of Maintenance	December 31, 2020	December 31, 2021	Upgrade to latest EEP 5.0.x	
5.0.2	End of Maintenance	December 31, 2020	December 31, 2021	Upgrade to latest EEP 5.0.x	
5.0.1	End of Maintenance	December 31, 2020	December 31, 2021	Upgrade to latest EEP 5.0.x	
5.0.0	End of Maintenance	December 31, 2020	December 31, 2021	Upgrade to latest EEP 5.0.x	

*EEP 5.0.7 is supported on core 6.0.1 until core 6.0.1 is discontinued or a newer EEP 5.0.x (with x > 7) becomes available.

Core Release 6.0.0

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
4.1.4	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to latest EEP 5.0.x	Change of lifecycle stage and level of support with MEP release in June 2021
4.1.3	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to latest EEP 5.0.x	
4.1.2	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to latest EEP 5.0.x	
4.1.1	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to latest EEP 5.0.x	
4.1.0	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to latest EEP 5.0.x	
4.0.0	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to latest EEP 5.0.x	

last-updated: Jun 06, 2024

Core Release 5.2.x

EEP	EEP Lifecycle Status	In Maintenance	End of Maintenance	EEP Upgrade Recommendation	Support Advisory
3.0.5	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	Prepare for MapR 5.x End of Maintenance by April 2019
3.0.4	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	
3.0.3	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)	
3.0.2	End of Maintenance	October 31, 2018	April 30, 2019	Upgrade to EEP 6.3.x or later (requires a core upgrade)

OpenTSDB 2.4.1.400	Yes	No	Yes	No	Yes	No

[1]Airflow is not supported on SLES 15 SP2.

[2]The Spark Notebook UI in Hue is a beta feature.

[3]Monitoring components are not supported as standalone products. They are only supported for data-fabric monitoring use cases.

[4]Rocky Linux is supported only for release 7.0.0 with EEP 8.1.0.

[5]Supported on RHEL but not on CentOS.

[6]EEP 8.1.0 is supported on RHEL 8.8, but is not certified.

EEP 8.0.0 Components and OS Support

This topic lists the ecosystem and monitoring components that are included in EEP 8.0.0 and shows the operating system support for each component.

To understand which core versions can use this EEP, see EEP Support and Lifecycle Status on page 5728.

For the Linux operating-system versions supported by data-fabric software, see Operating System Support Matrix on page 5719.

Kibana 6.8.8.320	Yes	Yes	Yes	Yes	Yes
OpenTSDB 2.4.0	Yes	Yes	Yes	Yes	Yes

[1]The Spark Notebook UI in Hue is a beta feature.

[2]Support for Sentry is limited to Impala users.

[3]Monitoring components are not supported as standalone products. They are only supported for data-fabric monitoring use cases.

[4]EEP 7.1.2 is supported for use on Ubuntu 20.04 only with core 7.0.0.

Discontinued Ecosystem Components

Provides information about discontinued ecosystem components.

Ecosystem components can be discontinued when either of the following is true:

- Newer components are available that serve the same function but provide better features or performance.
- The Open Source community decides to retire a product.

Discontinued components are either *In Maintenance* or have reached their *End of Maintenance* status. To understand what In Maintenance and End of Maintenance mean when these terms are applied to a component or EEP, see Understand the EEP Lifecycle on page 5724.

HPE uses the support advisory process to notify users in advance that a component will be In Maintenance. The last EEP version to support an In Maintenance component is the EEP version that is released at the time of the In Maintenance announcement. The following table lists the components that are either already In Maintenance or transitioning to End of Maintenance:

Component	In Maintenance	End of Maintenance	Last EEP Version Supporting Component*	Suggested Replacement	Announcement
S3 Gateway	July 31, 2022	July 31, 2023	• EEP 8.1.x** • EEP 8.0.x • EEP 7.x • EEP 6.x	HPE Ezmeral Data Fabric Object Store	February 2022
Oozie	June 30, 2022	June 30, 2023	• EEP 8.1.x • EEP 8.0.x • EEP 7.x • EEP 6.x • EEP 5.x	Apache Airflow	January 2022
Pig	October 31, 2021	October 31, 2022	• EEP 8.0.0 • EEP 6.3.5 • EEP 5.0.7	None	October 2021
Flume	October 31, 2021	October 31, 2022	• EEP 8.0.0 • EEP 6.3.5 • EEP 5.0.7	NiFi	October 2021
Sqoop	October 31, 2021	October 31, 2022	• EEP 8.0.0 • EEP 6.3.5 • EEP 5.0.7	NiFi	October 2021
Impala	June 1, 2021	December 31, 2021	• EEP 7.1.0 • EEP 6.3.4 • EEP 5.0.7	Spark or equivalent partner product. See the HPE Technology Partner website.	June 2021
Sentry	June 1, 2021	December 31, 2021	• EEP 7.1.0 • EEP 6.3.4 • EEP 5.0.7	None	June 2021
Data Science Refinery	September 18, 2020	May 31, 2022	N/A	HPE Ezmeral ML Ops	N/A
Myriad	September 2020	See note***	• EEP 5.0.x • EEP 6.3.x	Kubernetes	MapR Marketing Newsletter

last-updated: Jun 06, 2024

Component	In Maintenance	End of Maintenance	Last EEP Version Supporting Component*	Suggested Replacement	Announcement
Sqoop2	September 2020	See note***	• EEP 5.0.x • EEP 6.3.x	Equivalent partner product. See the HPE Technology Partner website.	MapR Marketing Newsletter
Mahout	October 2017	April 2019	• EEP 3.0.5	None	MapR Marketing Newsletter
Mezos	October 2017	April 2019	• EEP 3.0.2	Kubernetes	MapR Marketing Newsletter
Storm	October 2017	April 2019	• EEP 3.0.5	None	MapR Marketing Newsletter
Hue-Livy	October 2017	April 2019	• EEP 3.0.5	Livy	MapR Marketing Newsletter

*Later EEPs in the same series can include an End of Maintenance component. For example, if the last EEP version supporting an End of Maintenance component is x.y.0, the component might be present in x.y.1, x.y.2, x.y.3, and so on. This is to ensure that upgrades complete successfully. But HPE does not support using the component in later EEPs (x.y.1, x.y.2, x.y.3, and so on), and the last supported EEP version remains x.y.0.

**Not supported for production use on release 7.0.0 and later. In EEP 8.1.x, S3 Gateway packages are provided for migration purposes only.

***End of Maintenance for EEP 7.0.0 and later in September 2020. Transitions to End of Maintenance for EEP 5.0.x and EEP 6.3.x when those EEPs reach end of life.

Understand the EEP Lifecycle on page 5724
This page describes the EEP lifecycle and defines the lifecycle stages, which are Active, In Maintenance, and End of Maintenance.

Component Versions for Released EEPs

The published Ecosystem Packs (EEPs) contain different component versions with different features. Comparing the component versions can help you make decisions about installing or upgrading data-fabric software.

Components Supported by EEPs 1.x - 9.x

The following tables show the latest supported versions of each component in a EEP series. The tables reflect the component versions at release time and do not include patch versions issued between releases.

Core 7.7 with EEP 9.x

Ecosystem Component	EEP Series Versions EEP-9.2.2
Airflow	2.8.3.0
AsynchHBase	1.8.2
Drill	1.20.3.200

*Kafka Schema Registry 5.1.2.0 and later are provided as *general availability* software. Kafka Schema Registry 4.1.1 is *developer preview* software. Developer previews are not tested for production environments, and should be used with caution. Kafka Schema Registry packages are included in EEP 7.0.0 and later but not included in EEP 6.x.

**Beginning with EEP 4.0.0, Livy is included as its own package in MapR EEP repositories. Before EEP 4.0.0, Livy was included as mapr-hue-livy and released only as a part of Hue. For more information, see Livy on page 4433.

***Tez is supported only for use with Hive. Therefore, MapR documentation for Tez is limited when compared to the documentation for other ecosystem components. For release note information, see Tez Release Notes.

****Before using EEP 6.3.3 with release 6.1.0, you must apply the latest 6.1.0 patch.

6.2.x	8.1.1	2.7.6.300	9	6.2.x, 6.1.x[3]

last-updated: Jun 06, 2024

Core Version	EEP	Hadoop Version	RPC Protocol	Compatible with Data Fabric Client Version
6.2.x	8.1.0	2.7.6.200	9	6.2.x, 6.1.x[3]
	8.0.0	2.7.6.100	9	6.2.x, 6.1.x[3]
	7.1.2[1]	2.7.6.0	9	6.2.x, 6.1.x[3]
	7.1.1[1]	2.7.5.0	9	6.2.x, 6.1.x[3]
	7.1.0[1]	2.7.5.0	9	6.2.x, 6.1.x[3]
	7.0.1	2.7.4.100	9	6.2.x, 6.1.x[3]
	7.0.0	2.7.4.0	9	6.2.x, 6.1.x[3]
6.1.x	N/A	2.7.0	9	6.1.0, 6.0.x, 5.2.x
6.0.x	N/A	2.7.0	9	6.0.0, 5.2.0, 5.1.0, 5.0.0, 4.1.0, 4.0.2, 4.0.1[4]
5.2.x	N/A	2.7.0	9[2]	5.2.0, 5.1.0, 5.0.0, 4.1.0, 4.0.2, 4.0.1[4]
5.1.0	N/A	N/A	9[2]	5.1.0, 5.0.0, 4.1.0, 4.0.2, 4.0.1[4]
5.0.0	N/A	N/A	9[2]	5.0.0, 4.1.0, 4.0.2, 4.0.1[4]
4.1.0	N/A	N/A	9[2]	4.1, 4.0.2, 4.0.1[4]
4.0.x	N/A	N/A	9[2]	4.0.x[5]
3.1.x	N/A	N/A	4	3.1.x
3.0.x	N/A	N/A	5	3.0.x, 2.1.x
2.1.x	N/A	N/A	5	3.0.x, 2.1.x
2.0.x	N/A	N/A	4	3.1.x, 2.0.x

[1]Release 6.2.0.5 and later.

[2]MapReduce version 1 and version 2 use the same protocol version.

[3]Release 6.1 client support is limited if applications submitting jobs to release 6.2 clusters are developed in JDK 1.8. Jars used by the client application should not use features made obsolete in JDK 11.

[4]A release 4.0.2 client can submit MRv2 jobs to a release 4.1, 5.0, or 5.1 cluster configured with zero-configuration ResourceManager failover (RM HA) as long as the client is also configured with zero-configuration RM HA.

[5]If you want to submit MapReduce v2 jobs to a release 4.0.x cluster configured with zero-configuration RMHA, you must use a release 4.0.2 client on a release 4.0.2 cluster.

[6]Requires patch version 7.3.0.1 or newer.

[7]Requires patch version 7.2.0.4 or newer.

Hadoop Client Compatibility

Describes compatibility between Hadoop 2.x and Hadoop 3.x clients and servers.

last-updated: Jun 06, 2024

Hadoop Client-Server Compatibility Matrix

As indicated in Hadoop Protocol Versions on page 5766, EEP 9.0.0 and later include Hadoop 3, while previous EEP versions used Hadoop 2. The following table summarizes Hadoop 2 and Hadoop 3 client-server compatibility:

	Hadoop 3 Server	Hadoop 2 Server
Hadoop 3 Client	Compatible	Not Compatible
Hadoop 2 Client	Compatible[1]	Compatible

[1]Some configuration is required. Use the following step.

Using a Hadoop 2 Client with a Hadoop 3 Server

To use a Hadoop 2 client with a Hadoop 3 server, add the following properties to the `<HADOOP_HOME>/etc/hadoop/mapred-site.xml` file:

```
<property>
  <name>yarn.app.mapreduce.am.staging-dir</name>
  <value>/var/mapr/cluster/yarn/rm/staging</value>
</property>
<property>
  <name>yarn.app.mapreduce.am.env</name>
  <value>HADOOP_MAPRED_HOME=${full path of your hadoop distribution
directory on the server node}</value>
</property>
<property>
  <name>mapreduce.map.env</name>
  <value>HADOOP_MAPRED_HOME=${full path of your hadoop distribution
directory on the server node}</value>
</property>
<property>
  <name>mapreduce.reduce.env</name>
  <value>HADOOP_MAPRED_HOME=${full path of your hadoop distribution
directory on the server node}</value>
</property>
```

The first property change is needed for the Hadoop 2 client contained in EEP 8.1.0. In EEP 8.1.0, the default path was changed to `/var/mapr/cluster/yarn/hs`. In EEP 9.0.0 and later, the default was changed back to `/var/mapr/cluster/yarn/rm/staging`.

Client Support Matrix

This matrix shows which HPE Ezmeral Data Fabric releases are compatible with different data-fabric client OS versions.

For a list of the client versions that are compatible with each release, see Hadoop Protocol Versions on page 5766.

Client OS	Version	Release 7.7.0	Release 7.6.x	Release 7.5.0	Release 7.4.0	Release 7.3.0	Release 7.2.0	Release 7.1.0	Release 7.0.0	Release 6.2.x	Release 6.1.x	Release 6.0.x	Release 5.2.x	Release 5.1.0	Release 5.0.0

*Requires one of the following (or newer) client packages:

- `mapr-client-6.2.0.26.20200915234957.GA-20220725231138.amd64.zip` for release 6.2
- `mapr-client-7.0.0.2.20220209033907.GA-20220715231036.amd64.zip` for release 7.0

Change Control Notes

Updated March 29, 2024 (added a column for release 7.7.0)

Updated February 16, 2024 (to change the 7.6.0 column heading to 7.6.x)

Updated January 31, 2024 (added a column for release 7.6.0)

Updated June 13, 2023 (added a column for release 7.4.0.)

Updated March 18, 2023 (added a column for release 7.3.0).

Updated January 13, 2023 (added a column for release 7.2.0).

Updated September 14, 2022 (added a column for release 7.1.0).

Updated August 24, 2022 (added a row forWindows 2019 support).

Updated January 5, 2022 (added a column for release 7.0.0).

Updated January 8, 2021 (changed "N/A" entries to "No" entries).

Updated August 11, 2020 (added column for MapR 6.2.x).

last-updated: Jun 06, 2024

Updated June 27, 2018 (added column for MapR 6.1.x).

Installer Support Matrix

The tables on this page show the operating systems that are supported by the Installer.

OS Version Support

NOTE: This page includes some Installer versions represented as `1.<version>.0.x`. The `x` in the version string stands for the latest release of the Installer. For example, `1.18.0.x` refers to the most recent release of `1.18.0`. For a list of recently released Installer versions, see Installer Updates on page 5674.

OS Version/Installer Version		Installer 1.18.0.x Supported	Installer 1.17.0.x Supported	Installer 1.16.0.x Supported	Installer 1.15.0.x Supported	Installer 1.14.0.x Supported	Installer 1.13.0.0 Supported	Installer 1.12.0.0 Supported

	11 SP1	No	No	No	No	No	No	No

[1]Supported on RHEL but not on CentOS.

[2]The Installer only supports upgrades for this OS version. See Selecting an Installer Version to Use on page 5587.

[3]Before using Installer 1.14 on Ubuntu 16.04 nodes, you must manually install Java JDK 11. If you are using Installer 1.14 on RHEL/CentOS or SLES, the Installer installs Java JDK11 for you.

[4]Before using the Installer to install Release 6.0 or later on Ubuntu 14.04, you must upgrade to Java 1.8 on the cluster nodes. See IN-553 in Installer Known Issues.

[5]Requires Installer 1.14.0.1 or later. Installer 1.14.0.1 supports Oracle Enterprise Linux 7.8 only on release 6.1.0 and does not support ecosystem components for release 6.1.0.

[6]Supported only on Installer 1.17.0.3 and later. During the **Verify** phase of installation, a warning about an incompatible minor version of the OS can be ignored.

[7]Only Installer 1.18.0.3 or later can be used on RHEL 8.8 with Data Fabric core 7.2.0.

Core Version Support

NOTE: This page includes some Installer versions represented as `1.<version>.0.x`. The `x` in the version string stands for the most recent release of the Installer. For example, `1.18.0.x` refers to the most recent release of `1.18.0`. For a list of recently released Installer versions, see Installer Updates on page 5674.

last-updated: Jun 06, 2024

5.0	No	No	No	No	No	No	No	No	No***

*The Installer does not support new installations of release 6.1.0 on RHEL / CentOS 8.1.

**New installations of release 6.1.0 are no longer supported. Install release 6.1.1 or release 6.2.0 instead.

***The Installer only supports upgrades for this OS version. See Selecting an Installer Version to Use on page 5587.

Change Control Notes

- Updated March 29, 2024 (added support for release 7.7.0, RHEL 9.0, and Ubuntu 22.04).
- Updated February 16, 2024 (changed 7.6.0 references to 7.6.x)
- Updated January 31, 2024 (added support for release 7.6.0)
- Updated September 7, 2023 (added support for release 7.2.0 on RHEL 8.8).
- Updated June 13, 2023 (added a row for release 7.4.0 and support for RHEL 8.8).
- Updated March 18, 2023 (added a row for release 7.3.0).
- Updated August 23, 2022 (documented non-support for RHEL 8.6).
- Updated May 10, 2022 (added support for RHEL 8.5 and Rocky 8.4 and 8.5).
- Updated April 19, 2022 (added Installer 1.17.0.3 information).
- Updated January 4, 2022 (added release 7.0.0 and Installer 1.17.0.x information).

last-updated: Jun 06, 2024

- Updated October 15, 2021 (added Installer 1.17.0.0 information).
- Updated October 1, 2021 (added RHEL 8.4 support).
- Updated August 29, 2021 (added Installer 1.16.0.x information).
- Updated April 16, 2020 (added Installer 1.16.0.0 information).
- Updated February 20, 2020 (added Installer 1.15.0.1 and release 6.1.1 information).
- Updated January 16, 2020 (added Installer 1.15.0.0 information and support for Oracle Enterprise Linux 8.2).
- Updated October 28, 2020 (added support for RHEL 7.9 and removed column for Installer 1.8.0).
- Updated October 16, 2020 (added support for RHEL / CentOS 8.2 and Oracle Enterprise Linux 7.8).
- Updated September. 8, 2020 (Installer 1.14.0.0 added).
- Updated June 17, 2020 (rows added for RHEL / CentOS 7.8). Changed RHEL / CentOS 6.x values from Yes to No where only upgrades are supported.
- Updated November 30, 2019 (Installer 1.13.0.0 added, rows for RHEL / CentOS 7.7 and Ubuntu 18.04 added).
- Updated May 1, 2019 (Installer 1.12.0.0 added, rows for RHEL / CentOS 7.0, 7.1, and 7.2 removed).
- Updated January 2, 2019 (Installer 1.11.0.0 added).
- Updated Jul 27, 2018 (Installer 1.10.0 added).
- Updated March 30, 2018 (Installer 1.9.0 added). Corrected support for Ubuntu 11.04.
- Updated January 7, 2018 (Installer 1.8.0 added).
- Updated September 8, 2017 (Installer 1.7 added, release 6.0.x added).
- Updated July 31, 2017 (Installer 1.6 added, SLES 12 SP2 support added, older installer information removed).
- Updated April 6, 2017 (Installer 1.5 added, RHEL / CentOS 7.3 added, SLES 12 SP1 added, releases 2.x, 3.x, and 4.x removed).
- Updated December 8, 2016 (Installer 1.4 added).
- Updated August 19, 2016 (Installer 1.3 and release 5.2 added).
- Updated February 5, 2016 (Installer 1.2 and release 5.1 added).

Installer EEP Support

This matrix shows which Installer versions support each Ecosystem Pack (EEP) version.

Installer EEP Support

NOTE: This page includes some Installer versions represented as `1.<version>.0.x`. The `x` in the version string stands for the latest release of the Installer. For example, `1.18.0.x` refers to the most recent release of `1.18.0`. For a list of recently released Installer versions, see Installer Updates on page 5674.

last-updated: Jun 06, 2024

To understand which EEP versions are supported with different versions of data-fabric core, see EEP Support and Lifecycle Status on page 5728.

EEP	Installer 1.18.0.x	Installer 1.17.0.x	Installer 1.16.0.x	Installer 1.15.0.x	Installer 1.14.0.0	Installer 1.13.0.0	Installer 1.12.0.0	Installer 1.11.0.0	Installer 1.10.0.0
9.x.y	Yes	No	No	No	No	No	No	No	No
8.x.y*	Yes	Yes	No	No	No	No	No	No	No
7.x.y	Yes	Yes	Yes	Yes	Yes	No	No	No	No
6.x.y	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
5.x.y	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
4.x.y	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
3.x.y	No	No	No	No	No	No	No	Yes	Yes
2.x.y	No	No	No	No	No	No	No	Yes	Yes
1.x.y	No	No	No	No	No	No	No	Yes	Yes

*No Installer version currently supports EEP 8.1.1. For more information about EEP 8.1.1, see EEP 8.1.1 Reference Information on page 6150.

For a list of released Installer versions, see Installer Updates on page 5674.

FIPS Support for Ecosystem Components

If used with release 7.0.0 or later, most EEP components support the Federal Information Processing Standard (FIPS) 140-2 Level 1.

FIPS Support Matrix

The following table summarizes component support for FIPS:

Component	FIPS Support							
	EEP 9.2.2	EEP 9.2.1	EEP 9.2.0	EEP 9.1.2	EEP 9.1.1	EEP 9.1.0	EEP 9.0.0	EEP 8.1.x
Airflow	Yes*	Yes*	No	No	No	No	No	No
Data Access Gateway	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Drill	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
HBase	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes**
Hive	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
HTTPFS	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Hue	No	No	No	No	No	No	No	No
Kafka REST	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Kafka Connect HDFS	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Kafka Connect JDBC	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes

last-updated: Jun 06, 2024

Component	FIPS Support							
	EEP 9.2.2	EEP 9.2.1	EEP 9.2.0	EEP 9.1.2	EEP 9.1.1	EEP 9.1.0	EEP 9.0.0	EEP 8.1.x
KSQL	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Kafka Streams	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Livy	Yes	Yes	No	No	No	No	No	Yes***
NiFi	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Not included in EEP 8.1.x

OTel	No	No	No	Not included in EEP 9.1.2	Not included in EEP 9.1.1	Not included in EEP 9.1.0	Not included in EEP 9.0.0	Not included in EEP 8.1.x
Ranger	Yes****	Yes****	Yes****	Yes****	Yes****	Yes****	Yes****	Not included in EEP 8.1.x
Spark	Yes***	Yes***	Yes***	Yes***	Yes***	Yes***	Yes***	Yes***
Tez	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
YARN	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Zeppelin	No	No	No	No	No	No	No	Not included in EEP 8.1.x

*Installing Airflow in a FIPS environment requires extra steps. For more information, see Installation on a FIPS Node on page 235.

**HBase cannot be used in a mixed (FIPS and non-FIPS) configuration. For example, a non-FIPS client node cannot communicate with a FIPS server node.

***In a mixed (FIPS and non-FIPS) configuration, there is a known issue related to Spark and Livy applications if the Spark UI is enabled. See Spark and Livy release notes for more information.

****This version does not support mixed FIPS mode.

For more information about FIPS, see FIPS Compliance for HPE Ezmeral Data Fabric.

Security Support Matrix

The tables in this section show component support for authentication, impersonation, and wire-level encryption.

See these sections:

- Table 1 - Authentication in Release 7.0.0 and Later on page 5776
- Table 2 - Impersonation and Wire-Level Encryption in Release 7.0.0 and Later on page 5782

Table 1 shows component support for authentication using data-fabric SASL, Kerberos, and PAM.

Table 2 shows component support for impersonation and wire-level encryption.

last-updated: Jun 06, 2024

Table Symbols

The tables in this section use dashes to indicate non-support and directional arrows to convey inbound and outbound communication:

- A dash (—) indicates that the feature is currently not supported, not needed, or not applicable.
- A right arrow (A → B) means OUTBOUND from A and INBOUND to B.
- A double arrow (A ↔ B) means OUTBOUND from A and INBOUND to B, and vice versa.
- No arrow indicates OUTBOUND communication from the subcomponent to all components with which it communicates.

Authentication in Release 7.0.0 and Later

Table

Main Component	Subcomponent	Authentication

Livy	REST Client → Livy Server	Yes	Yes	Yes
NiFi	N/A	—	Yes[14]	—
OTel	MaprCli → CLDB	Yes	—	—

last-updated: Jun 06, 2024

Table (Continued)

Main Component	Subcomponent	Authentication		
		Data-Fabric SASL	Kerberos	PAM[1]
Spark	Web Clients → Spark Component UI	No, but uses Spark's shared secret with DIGEST-MD5		
	Spark Driver → Executor	No, but uses Spark's shared secret with DIGEST-MD5		
	Spark Job Using Connector for HPE Ezmeral Data Fabric Database	Yes	—	—
	Spark Job Using Connector for HPE Ezmeral Data Fabric Streams	Yes	Yes	—
	JDBC Client → Spark Thrift Server	Yes	Yes	Yes
	ODBC Client → Spark Thrift Server	–	Yes	Yes
YARN	REST/Browser → RM/JHS/ATS	–	Yes	Yes
	Internal communication (RM/NM/JHS)	Yes	Yes	—
	Containers → YARN Services (RM/NM)	No, but uses YARN's shared secret with DIGEST-MD5		
	Timeline Server	Yes	Yes	—

[1]If LDAP is required, LDAP can be supported through PAM.

[2] Kerberos support is provided by implicit conversion of Kerberos tickets to data-fabric tickets.

[3]Payload not encrypted by default.

[4]All data exchanged with CLDB is in protobufs only and hence encrypted in secure clusters.

[5]Only admin ops to CLDB are audited. NFSv3 communication with CLDB is usually not admin-related.

[6]Accessed through the data-fabric client, which reads security settings from `/opt/mapr/conf/mapr-clusters.conf`; hence, this interface follows the secure-by-default model.

[7]Data-fabric SASL is supported but not enabled during installation.

[8]The Control System is secure between client and webserver (API Server). The server may invoke other commands through the `maprcli` interface that themselves do not use secure communication.

[9]HPE Ezmeral Data Fabric uses data-fabric SASL for communication with ZooKeeper.

[10]Includes a FUSE POSIX client, YARN client, and other client components.

[11]Support for Kerberos has not been verified, but SPNEGO can be used in conjunction with HTTPS.

[12]Auditing user administration operations with Hue. Note that Oozie is deprecated. See Discontinued Ecosystem Components on page 5748.

last-updated: Jun 06, 2024

[13]The Airflow-to-S3 connection is authenticated using access and secret keys generated by the `maprcli s3keys generate` command.

[14]For more information, see NiFi Security on page 4576.

Impersonation and Wire-Level Encryption in Release 7.0.0 and Later

Table

Main Component	Subcomponent	Impersonation	Wire-Level Encryption		
			Data-Fabric SASL	Kerberos	SSL/TLS

1.1.1	1611	December 9, 2016
1.1.0	1609	September 29, 2016
1.0	1608	September 2, 2016

*The release date identifier is a four-digit number that appears in release notes and provides an approximate indication of the release date for a component. For example, in the string Hive 2.3.3 - 1808, 2.3.3 refers to the Hive version number, and 1808 indicates an August 2018 release. Note that last-minute changes in the release date can result in a slight mismatch between the release date identifier and the actual month of the release.

Ecosystem Support Matrix (Pre-5.2 releases)

This section provides support matrices for key ecosystem components for pre-5.2 releases.

The following table shows the compatibility of ecosystem products with MapR Converged Data Platform version 5.1 and below. For more recent versions of MapR, see the EEP Components and OS Support on page 5734.

NOTE: In the MapR Version column, JT stands for JobTracker.

Ecosystem Component/ MapR Version		MapR 3.0.x	MapR 3.1.x	MapR 4.0.1 (JT)	MapR 4.0.1 (YARN)	MapR 4.0.2 (JT)	MapR 4.0.2 (YARN)	MapR 4.1.0 (JT)	MapR 4.1.0 (YARN)	MapR 5.0.0 (JT)	MapR 5.0.0 (YARN)	MapR 5.1.0 (JT)	MapR 5.1.0 (YARN)
Apache MapReduce API	1.0.3	Yes	Yes	Yes	N/A	Yes	N/A	Yes	N/A	Yes	N/A	Yes	N/A
	2.4.1	N/A	N/A	N/A	Yes	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A

[1] Hue 3.7 with MapR 3.1.x does not work with MapR Security. Only CentOS 6.x and 7.x are supported.

[2] Please make sure to pick the latest patched Oozie 4.0.1 version from monthly release 1502 or later (Oozie Release Notes on page 6057).

[3] Drill 0.9 and later versions do not work with HPE Ezmeral Data Fabric Database in Version 3.1.x.

[4] The Tez development preview has been withdrawn.

[5] Impala does not use the JobTracker service, but can run in a cluster running JobTracker.

[6] You cannot run Impala as a YARN application, however Impala can run in a YARN cluster.

Change Control Notes

- This matrix was updated on February 8, 2017 (Apache MapReduce API correction).
- This matrix was updated on September 12, 2016 (Drill 1.8.0).
- This matrix was updated on April 4, 2016 (AsyncHBase 1.7).
- This matrix was updated on March 18, 2016 (Impala updates).
- This matrix was updated on February 29, 2016 (MapR 5.1 updates).
- This matrix was updated on Jan 20, 2016 (Drill 0.9 removed).
- This matrix was updated on Jan 12, 2016 (Drill 1.3, 1.4).
- This matrix was updated on Dec 21, 2015 (Spark 1.5.2).
- This matrix was updated on Oct 28, 2015 (Tez 0.5.3).
- This matrix was updated on Oct 4, 2015 (Flume 1.6 and Mahout 0.11).
- This matrix was updated on September 25, 2015 (Hive 1.2.1 and Oozie 4.2.0).
- This matrix was updated on September 9, 2015 (Pig 15 and Spark 1.4.1).
- This matrix was updated on August 4, 2015 (Hue 3.8.1 and Sqoop 2 1.99.6).
- This matrix was updated on July 24, 2015 (Sqoop and Sqoop2).

For interoperability among specific groups of ecosystem products, see the following subsections.

Drill Support Matrix
This matrix shows the interoperability between Drill and other ecosystem products.

For MapR Converged Data Platform releases beyond 5.1, you may also want to view EEP Components and OS Support on page 5734.

last-updated: Jun 06, 2024

[1] By default, Oozie 4.2.0 includes Hive 1.2.1 shared libraries. To use Oozie with other compatible versions of Hive, see MapR's Oozie documentation.

[2] When you use Spark 1.5.2 with Hive 0.13 or Hive 1.0, Spark SQL insert overwrite operations on Hive tables are not supported for the ORC, RC, and AVRO formats. For more information, see the Spark documentation.

[3] By default, Oozie 4.1.0 includes Hive 0.13 shared libraries. To use Oozie with other compatible versions of Hive, see MapR's Oozie documentation.

Change Control Notes

- This matric was last updated on April, 2017 (Drill 1.10 added)
- This matrix was last updated on February 29, 2016 (HBase 1.1, Drill 1.5, Impala 2.2, Sentry 1.6 added).
- This matrix was last updated on February 5, 2016 (Tez removed; Flume 1.6 added).
- This matrix was last updated on Jan 20, 2016 (Drill 0.9 removed).
- This matrix was last updated on Jan 12, 2016 (Drill 1.3, 1.4).
- This matrix was last updated on Dec 21, 2015 (Spark 1.5.2).
- This matrix was last updated on Sept 25, 2015 (Hive 1.2.1 and Oozie 4.2.0).
- This matrix was updated on Sept 9, 2015 (Spark 1.4.1 and Pig 15).
- This matrix was updated on August 4, 2015 (Hue 3.8.1 and Sqoop2 1.99.6).
- This matrix was updated on November 20, 2015 (Hue 3.9.0).

Hue Support Matrix
This matrix shows the interoperability between Hue and other ecosystem products.

This page shows the versions of Hue that work other ecosystem components and it applies to MapR versions 5.1 and below. For more recent versions of MapR, see the EEP Components and OS Support on page 5734.

	Hue 2.5 Beta only	**Hue 3.5**	**Hue 3.6**	**Hue 3.7**	**Hue 3.8.1**	**Hue 3.8.1**	**Hue 3.9.0**

Pig	11	12	12	12[3]	12[3]	12[3]	12[3]

last-updated: Jun 06, 2024

HBase	No	0.94.17, 0.94.21, 0.98.7	0.94.17, 0.94.21, 0.98.7	0.94.x[1], 0.98.7, 0.98.9, 0.98.12	0.98.x	0.98.x	0.98.x, 1.1
HPE Ezmeral Data Fabric Database	No	Yes	Yes	Yes	Yes	Yes	Yes
Sentry	N/A	N/A	No	No	No	No	1.6
Solr	N/A	No	No	No	No	No	No
Spark[5]	N/A	N/A	N/A	N/A	1.3.1	1.3.1	1.3.1, 1.4.1,1.5.2, 1.6.1
Sqoop2	No	No	1.99.3	1.99.3	N/A[4]	1.99.6	1.99.6

[1] Loading examples with HBase 94.x do not work (because of the difference in Thrift version between HBase 94 and Hue).

[2] Not supported on CentOS 5.x.

[3] Pig jobs in Hue are run through Oozie. Oozie 4.0.1 and 4.1.0 bundle Pig 0.12 by default.

[4] On MapR 4.1, Hue 3.8.1 does not work with Sqoop2. To use Sqoop2 and Hue on MapR 4.1, consider using Hue 3.7.

[5] The Spark Notebook UI in Hue is a Beta feature.

[6]Hue 3.8/3.9 and Hive 1.0 require MapR 5.0.0. (This combination is not supported on MapR 5.1.0.)

Change Control Notes

- This matrix was last updated on February 29, 2016 (MapR 5.1 updates).
- This matrix was last updated on September 25, 2015 (Hue 3.8.1).
- This matrix was updated on August 4, 2015 (Hue 3.8.1).

Impala Support Matrix

This matrix shows the interoperability between Impala and other ecosystem products.

This page shows the versions of Impala that work with various versions of other ecosystem products and it applies to MapR versions 5.1 and below. For more recent versions of MapR, see the EEP Components and OS Support on page 5734.

NOTE: Impala 2.2.0 is supported on MapR 5.x. Impala 2.5.0 is supported on MapR 5.1 and later.

Product	Product Version	Impala 1.1.1	Impala 1.2.3	Impala 1.4.1	Impala 2.2.0	Impala 2.5.0

- This matrix was last updated on February 29, 2016 (Impala 2.2.0).
- This matrix was last updated on September 25, 2015 (Hive 1.2.1).
- This matrix was updated on August 4, 2015 (Hue 3.8.1).

Oozie Support Matrix
This matrix shows the interoperability between Oozie and other ecosystem products.

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

This page shows the versions of Oozie that work with other ecosystem components and it applies to Release versions 5.1 and below. For more recent versions, see the EEP Components and OS Support on page 5734.

Compatible Product	Oozie 4.1.0	Oozie 4.2.0
Hive		0.13[1], 1.0[1], 1.2.1
Hue	3.8.1, 3.9.0	3.8.1, 3.9.0
Pig		0.14, 0.15
Spark	1.5.2, 1.6.1	1.3.1, 1.4.1, 1.5.2, 1.6.1
Sqoop		1.4.6

[1] By default, Oozie 4.2 includes Hive 1.2.1 shared libraries. To use Oozie with other compatible versions of Hive, see the MapR Oozie documentation.

Change Control Notes

- This matrix was last updated on February 5, 2016 (Oozie 4.1.0 column added).

Spark Support Matrix
This matrix shows the interoperability between Spark and other ecosystem products.

This page shows the version of Spark that works with other ecosystem components, and it applies to MapR versions 5.1 and below. See also Hive and HCatalog Support Matrix on page 5796. For more recent versions of MapR, see the EEP Components and OS Support on page 5734.

	0.12					No	No	No	Yes
Oozie	4.1.0					Yes	Yes	Yes	Yes
	4.2.0					Yes	Yes (5.x)	Yes (5.x)	Yes (5.x)

[1] The Spark Notebook UI in Hue is a beta feature.

[2] When you use Spark 1.5.2 with Hive 0.13 or Hive 1.0, Spark SQL insert overwrite operations on Hive tables are not supported for the ORC, RC, and AVRO formats. For more information, see the Spark documentation.

[3]This combination is supported as of Mahout 0.11.0-1601.

[4]Livy version is a snapshot.

[5]EEP 2.0 only.

Change Control Notes

- This matrix was last updated on December 8, 2016 (Mahout 0.12).

Data Access Gateway Support Matrix

The table in this section shows supported core and EEP versions for Data Access Gateway.

last-updated: Jun 06, 2024

Data Access Gateway Compatibility

Shows the HPE Ezmeral Data Fabric data access gateway versions supported for recent combinations of core and Ecosystem Pack distributions.

Core Release	Corresponding EEP	Data Access Gateway Version
7.7.0	9.2.2	6.3.0.0
7.6.x	9.2.2	6.3.0.0
	9.2.1	6.2.0.0
7.5.0	9.2.2	6.3.0.0
	9.2.1	6.2.0.0
	9.2.0	6.2.0.0
7.4.0	9.2.2	6.3.0.0
	9.2.1	6.2.0.0
	9.2.0	6.2.0.0
	9.1.2	6.1.0.0
7.3.0	9.2.2	6.3.0.0[1]
	9.2.1	6.2.0.0[1]
	9.2.0	6.2.0.0[1]
	9.1.2	6.1.0.0[1]
	9.1.1	6.0.0.0
7.2.0	9.2.2	6.3.0.0[1]
	9.2.1	6.2.0.0[1]
	9.2.0	6.2.0.0[1]
	9.1.2	6.1.0.0[1]
	9.1.0	5.1.0.0
7.1.0	9.0.0	5.0.0.0
7.0.0	8.1.2	4.0.0.1
	8.1.1	4.0.0.0
	8.1.0	4.0.0.0
	7.1.2	3.0.0.0
6.2.0	8.1.x	4.0.0.0
	7.1.x	3.0.0.0
6.1.1	6.3.x	2.0

[1]This Data Access Gateway version can be installed with core 7.2.0 and 7.3.0. However, Kafka Wire Protocol service is disabled for these core versions.

Python Support Matrix

The tables in this section show supported Python versions for EEP components and the Python OJAI Client.

Spark Compatibility

Shows the Python versions supported for Spark in recent Ecosystem Pack distributions.

Spark Version	Minimum Python Version	Maximum Python Version
3.3.3	3.7	3.10
3.3.2	3.7	3.10
3.3.1	3.7	3.10

Other EEP Component Compatibility

Shows the Python versions supported for other EEP components in recent Ecosystem Pack distributions..

EEP Component	Python Version
Airflow[1]	3.9
Hue[1]	3.8

[1]This EEP component includes its own Python build, and does not use any Python version installed on the OS.

Python OJAI Client Compatibility

The Python OJAI Client supports Python versions 2.7 or later.

See Getting Started with the Python OJAI Client on page 3458.

Third-Party Storage Solutions

Describes global-namespace support for software-defined storage technologies, including Scality, WEKA, and VAST.

The HPE Ezmeral Data Fabric global namespace (release 7.6.x and later) is compatible with the following HPE partner object-storage solutions:

	External NFS Integration with GNS		External S3 Integration with GNS	
	Using System Security (AD/LDAP)	Using Kerberos Security	Using Secret Key and Access Key	
Storage Product			HTTPS	HTTP
WEKA	Supported	See note*	Supported	Supported
VAST Data on HPE Alletra	Supported	Supported	Supported	Supported
Scality ARTESCA	See note*	See note*	Supported	Supported
Scality RING	Supported	Supported	Supported	Supported
Minio Server	See note*	See note*	Supported	Supported

Storage Product	External NFS Integration with GNS		External S3 Integration with GNS	
	Using System Security (AD/LDAP)	Using Kerberos Security	Using Secret Key and Access Key	
			HTTPS	HTTP
NFS Ganesha	Supported	Supported	See note*	See note*

*Not supported by the storage vendor.

Ecosystem Component Release Notes

The following release notes contain information for the components included in the HPE Ezmeral Data Fabric.

Note that the *MapR Ecosystem Pack (MEP)* has been renamed as the *Ezmeral Ecosystem Pack (EEP)*. For more information about HPE Ezmeral Data Fabric terminology, see Documentation Enhancements in What's New in Release 7.7 on page 30.

Be sure to review these considerations for using ecosystem component release notes:

- Ecosystem component release notes contain HPE-specific information; they do not duplicate release note information on open-source websites.
- Ecosystem component release notes are not necessarily cumulative in nature. For example, if you need to upgrade from version 1.x of a data-fabric product to version 4.x, be sure to review the release notes for versions 2.x, 3.x, and 4.x to become familiar with new features and known issues that might be relevant to version 4.x.
- To view individual product versions organized by EEP and core version, see Component Versions for Released MEPs.

EEP Release Notes

Provides release-note information for Ecosystem Packs (EEPs).

Ecosystem Pack 9.2.2 Release Notes

This topic contains information about the components included in Ecosystem Pack 9.2.2.

Release Date	May 2024
Repository Location	`https://package.ezmeral.hpe.com/releases/MEP/`[1]

[1]EEPs are contained in the `MEP-<version>` directory. The `MEP-version` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-9.1` or `MEP-9.1.0`). See Understanding Two-Digit and Three-Digit EEPs on page 5638.

EEP 9.2.2 can be used with core 7.7.0, 7.6.x, 7.5.0, 7.4.0, 7.3.0, or 7.2.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 9.2.2 did not introduce any changes that affect application backward compatibility.

EEP 9.2.2 Components

The EEP 9.2.2 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
Airflow 2.8.3.0	Airflow 2.8.3.0 - 2404 (EEP 9.2.2) Release Notes on page 5829
AsyncHBase 1.8.2	AsyncHBase 1.8.2-2009 Release Notes on page 5839
Data Access Gateway 6.3.0.0	Data Access Gateway 6.3 Release Notes on page 5839
Drill 1.20.3.200[1]	Drill 1.20.3.200-2401 (EEP 9.2.1) Release Notes on page 5848

[1]Support for this component is subject to your license agreement.

[2]The Spark Notebook UI in Hue is a beta feature.

The EEP 9.2.2 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.12.0.600
- Elasticsearch 6.8.8.700
- Fluentd 1.10.3.600
- Grafana 7.5.10.550
- Kibana 6.8.8.600
- OpenTSDB 2.4.1.600

Ecosystem Pack 9.2.1 Release Notes
This topic contains information about the components included in Ecosystem Pack 9.2.1.

Release Date	January 2024
Repository Location	`https://package.ezmeral.hpe.com/releases/MEP/`[1]

[1]EEPs are contained in the `MEP-<version>` directory. The `MEP-version` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-9.1` or `MEP-9.1.0`). See Understanding Two-Digit and Three-Digit EEPs on page 5638.

EEP 9.2.1 can be used with core 7.6.x, 7.5.0, 7.4.0, 7.3.0, or 7.2.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release,

but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 9.2.1 did not introduce any changes that affect application backward compatibility.

EEP 9.2.1 Components

The EEP 9.2.1 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
Airflow 2.7.3.0	Airflow 2.7.3.0 - 2401 (EEP 9.2.1) Release Notes on page 5830
AsyncHBase 1.8.2	AsyncHBase 1.8.2-2009 Release Notes on page 5839
Data Access Gateway 6.2.0.0	Data Access Gateway 6.2 Release Notes on page 5840
Drill 1.20.3.200[1]	Drill 1.20.3.200-2401 (EEP 9.2.1) Release Notes on page 5848
Hadoop 3.3.5.200	Hadoop 3.3.5.200 - 2401 (EEP 9.2.1) Release Notes on page 5868
HBase 1.4.14.600	HBase 1.4.14.600 - 2401 (EEP 9.2.1) Release Notes on page 5893
Hive 3.1.3.500	Hive 3.1.3.500 - 2401 (EEP 9.2.1) Release Notes on page 5912
HttpFS 3.3.5.200	See the Hadoop release note. HttpFS is now a part of Hadoop.
Hue 4.11.0.0[2]	Hue 4.11.0.0 - 2310 (EEP 9.2.0) Release Notes on page 5963
Livy 0.8.0.0	Livy 0.8.0.0 - 2401 (EEP 9.2.1) Release Notes on page 5975

- Kibana 6.8.8.600
- OpenTSDB 2.4.1.510

Ecosystem Pack 9.2.0 Release Notes
This topic contains information about the components included in Ecosystem Pack 9.2.0.

Release Date	October 2023
Repository Location	`https://package.ezmeral.hpe.com/releases/MEP/`[1]

[1]EEPs are contained in the `MEP-<version>` directory. The `MEP-version` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-9.1` or `MEP-9.1.0`). See Understanding Two-Digit and Three-Digit EEPs on page 5638.

EEP 9.2.0 can be used with core 7.5.0, 7.4.0, 7.3.0, or 7.2.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release,

last-updated: Jun 06, 2024

but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 9.2.0 did not introduce any changes that affect application backward compatibility.

EEP 9.2.0 Components

The EEP 9.2.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
Airflow 2.7.1.0	Airflow 2.7.1.0 - 2310 (EEP 9.2.0) Release Notes on page 5831
AsyncHBase 1.8.2	AsyncHBase 1.8.2-2009 Release Notes on page 5839

- OpenTSDB 2.4.1.510

Ecosystem Pack 9.1.2 Release Notes
This topic contains information about the components included in Ecosystem Pack 9.1.2.

Release Date	July 2023
Repository Location	`https://package.ezmeral.hpe.com/releases/MEP/`[1]

[1]EEPs are contained in the `MEP-<version>` directory. The `MEP-version` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-9.1` or `MEP-9.1.0`). See Understanding Two-Digit and Three-Digit EEPs on page 5638.

EEP 9.1.2 can be used with the following core releases:

- 7.4.0 (requires core patch 7.3.0.1 or newer)
- 7.3.0 (requires core patch 7.3.0.1 or newer)
- 7.2.0 (requires core patch 7.2.0.4 or newer)

last-updated: Jun 06, 2024

- 7.1.0 (requires core patch 7.1.0.12 or newer)

For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 9.1.2 did not introduce any changes that affect application backward compatibility.

EEP 9.1.2 Components

The EEP 9.1.2 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
Airflow 2.6.1.0	Airflow 2.6.1.0 - 2307 (EEP 9.1.2) Release Notes on page 5832
AsyncHBase 1.8.2	AsyncHBase 1.8.2-2009 Release Notes on page 5839

[1]Support for this component is subject to your license agreement.

[2]The Spark Notebook UI in Hue is a beta feature.

The EEP 9.1.2 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.12.0.500
- Elasticsearch 6.8.8.600
- Fluentd 1.10.3.500
- Grafana 7.5.10.500
- Kibana 6.8.8.600
- OpenTSDB 2.4.1.510

Ecosystem Pack 9.1.1 Release Notes
This topic contains information about the components included in Ecosystem Pack 9.1.1.

Release Date	April 2023
Repository Location	`https://package.ezmeral.hpe.com/releases/MEP/`[1]

[1]EEPs are contained in the `MEP-<version>` directory. The `MEP-version` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-9.1` or `MEP-9.1.0`). See Understanding Two-Digit and Three-Digit EEPs on page 5638.

EEP 9.1.1 can be used with core 7.2.0 or core 7.3.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 9.1.1 did not introduce any changes that affect application backward compatibility.

EEP 9.1.1 Components

The EEP 9.1.1 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
Airflow 2.5.1.0	Airflow 2.5.1.0 - 2304 (EEP 9.1.1) Release Notes on page 5834
AsyncHBase 1.8.2	AsyncHBase 1.8.2-2009 Release Notes on page 5839
Data Access Gateway 6.0.0.0	Data Access Gateway 6.0 Release Notes on page 5842
Drill 1.20.3.0[1]	Drill 1.20.3.0-2304 (EEP 9.1.1) Release Notes on page 5850
Hadoop 3.3.4.200	Hadoop 3.3.4.200 - 2304 (EEP 9.1.1) Release Notes on page 5875
HBase 1.4.14.400	HBase 1.4.14.400 - 2304 (EEP 9.1.1) Release Notes on page 5896
Hive 3.1.3.200	Hive 3.1.3.200 - 2304 (EEP 9.1.1) Release Notes on page 5919
HttpFS 3.3.4.200	See the Hadoop release note. HttpFS is now a part of Hadoop.
Hue 4.6.0.600[2]	Hue 4.6.0.600 - 2301 (EEP 9.1.0) Release Notes on page 5966
Livy 0.7.0.300	Livy 0.7.0.300 - 2210 (EEP 9.0.0) Release Notes on page 5976
Monitoring	Monitoring Components - EEP 9.1.1 Release Notes on page 6045
NiFi 1.19.1.0	NiFi 1.19.1.0 - 2301 (EEP 9.1.0) Release Notes on page 6055
Ranger 2.3.0.200	Ranger 2.3.0.200 - 2304 (EEP 9.1.1) Release Notes on page 6074
Spark 3.3.2.0	Spark 3.3.2.0 - 2304 (EEP 9.1.1) Release Notes on page 6086
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 5981 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 5981 HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3 - 1803 Release Notes on page 5982

last-updated: Jun 06, 2024

Component	Release Notes
Streams Tools	Kafka Streams 2.6.1.400 - 2301 (EEP 9.1.0) Release Notes on page 5988 KSQL 6.0.0.400 - 2304 (EEP 9.1.1) Release Notes on page 6001 Kafka Connect JDBC 10.0.1.300 - 2301 (EEP 9.1.0) Release Notes on page 6018 Kafka Connect 10.0.0.300 - 2301 (EEP 9.1.0) Release Notes on page 6025 Kafka REST Proxy 6.0.0.300 - 2301 (EEP 9.1.0) Release Notes on page 6030 Kafka Schema Registry 6.0.0.300 - 2301 (EEP 9.1.0) Release Notes on page 6037
Tez 0.10.2.200	Tez 0.10.2.200 - 2304 (EEP 9.1.1) Release Notes on page 6109
Zeppelin 0.10.1.0	Zeppelin 0.10.1.0 - 2210 Release Notes on page 6118

[1]Support for this component is subject to your license agreement.

[2]The Spark Notebook UI in Hue is a beta feature.

The EEP 9.1.1 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.12.0.500
- Elasticsearch 6.8.8.600
- Fluentd 1.10.3.500

- Kibana 6.8.8.600
- OpenTSDB 2.4.1.510

Ecosystem Pack 9.1.0 Release Notes
This topic contains information about the components included in Ecosystem Pack 9.1.0.

Release Date	January 2023
Repository Location	`https://package.ezmeral.hpe.com/releases/MEP/`[1]

[1]EEPs are contained in the `MEP-<version>` directory. The `MEP-version` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-9.1` or `MEP-9.1.0`). See Understanding Two-Digit and Three-Digit EEPs on page 5638.

EEP 9.1.0 can be used with core 7.2.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 9.1.0 did not introduce any changes that affect application backward compatibility.

EEP 9.1.0 Components

The EEP 9.1.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
Airflow 2.4.3.0	Airflow 2.4.3.0 - 2301 (EEP 9.1.0) Release Notes on page 5835
AsyncHBase 1.8.2	AsyncHBase 1.8.2-2009 Release Notes on page 5839
Data Access Gateway 5.1.0.0	Data Access Gateway 5.1 Release Notes on page 5843
Drill 1.20.2.100[1]	Drill 1.20.2.100-2301 (EEP 9.1.0) Release Notes on page 5850
Hadoop 3.3.4.100	Hadoop 3.3.4.100 - 2301 (EEP 9.1.0) Release Notes on page 5877
HBase 1.4.14.300	HBase 1.4.14.300 - 2301 (EEP 9.1.0) Release Notes on page 5897
Hive 3.1.3.100	Hive 3.1.3.100 - 2301 (EEP 9.1.0) Release Notes on page 5921
HttpFS 3.3.4.100	See the Hadoop release note. HttpFS is now a part of Hadoop.
Hue 4.6.0.600[2]	Hue 4.6.0.600 - 2301 (EEP 9.1.0) Release Notes on page 5966
Livy 0.7.0.300	Livy 0.7.0.300 - 2210 (EEP 9.0.0) Release Notes on page 5976
Monitoring	Monitoring Components - EEP 9.1.0 Release Notes on page 6046
NiFi 1.19.1.0	NiFi 1.19.1.0 - 2301 (EEP 9.1.0) Release Notes on page 6055
Ranger 2.3.0.100	Ranger 2.3.0.100 - 2301 (EEP 9.1.0) Release Notes on page 6075
Spark 3.3.1.0	Spark 3.3.1.0 - 2301 (EEP 9.1.0) Release Notes on page 6088
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 5981 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 5981 HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3 - 1803 Release Notes on page 5982

last-updated: Jun 06, 2024

Component	Release Notes
Streams Tools	Kafka Streams 2.6.1.400 - 2301 (EEP 9.1.0) Release Notes on page 5988 KSQL 6.0.0.300 - 2301 (EEP 9.1.0) Release Notes on page 6002 Kafka Connect HDFS 10.0.0.300 - 2301 (EEP 9.1.0) Release Notes on page 6011 Kafka Connect JDBC 10.0.1.300 - 2301 (EEP 9.1.0) Release Notes on page 6018 Kafka Connect 10.0.0.300 - 2301 (EEP 9.1.0) Release Notes on page 6025 Kafka REST Proxy 6.0.0.300 - 2301 (EEP 9.1.0) Release Notes on page 6030 Kafka Schema Registry 6.0.0.300 - 2301 (EEP 9.1.0) Release Notes on page 6037
Tez 0.10.2.100	Tez 0.10.2.100 - 2301 (EEP 9.1.0) Release Notes on page 6110
Zeppelin 0.10.1.0	Zeppelin 0.10.1.0 - 2210 Release Notes on page 6118

[1]Support for this component is subject to your license agreement.

[2]The Spark Notebook UI in Hue is a beta feature.

The EEP 9.1.0 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.12.0.500
- Elasticsearch 6.8.8.600
- Fluentd 1.10.3.500
- Grafana 7.5.10.500
- Kibana 6.8.8.600
- OpenTSDB 2.4.1.510

Ecosystem Pack 9.0.0 Release Notes
This topic contains information about the components included in Ecosystem Pack 9.0.0.

Release Date	October 2022
Repository Location	`https://package.ezmeral.hpe.com/releases/MEP/`[1]

[1]EEPs are contained in the `MEP-<version>` directory. The `MEP-version` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-6.0` or `MEP-6.0.0`). See Understanding Two-Digit and Three-Digit EEPs on page 5638.

EEP 9.0.0 can be used with core 7.1.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release,

but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 9.0.0 did not introduce any changes that affect application backward compatibility.

EEP 9.0.0 Components

The EEP 9.0.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
Airflow 2.3.3.0	Airflow 2.3.3.0 - 2210 (EEP 9.0.0) Release Notes on page 5836
AsyncHBase 1.8.2	AsyncHBase 1.8.2-2009 Release Notes on page 5839
Data Access Gateway 5.0.0.0	Data Access Gateway 5.0 Release Notes on page 5844
Drill 1.20.2.0[1]	Drill 1.20.2.0-2210 (EEP 9.0.0) Release Notes on page 5851
Hadoop 3.3.4.0	Hadoop 3.3.4.0 - 2210 (EEP 9.0.0) Release Notes on page 5879
HBase 1.4.14.200	HBase 1.4.14.200 - 2210 (EEP 9.0.0) Release Notes on page 5898
Hive 3.1.3.0	Hive 3.1.3.0 - 2210 (EEP 9.0.0) Release Notes on page 5923
HttpFS 3.3.4.0	See the Hadoop release note. HttpFS is now a part of Hadoop.
Hue 4.6.0.500[2]	Hue 4.6.0.500 - 2210 (EEP 9.0.0) Release Notes on page 5967
Livy 0.7.0.300	Livy 0.7.0.300 - 2210 (EEP 9.0.0) Release Notes on page 5976
Monitoring	Monitoring Components - EEP 9.0.0 Release Notes on page 6046
NiFi 1.16.3.0	NiFi 1.16.3.0 - 2210 (EEP 9.0.0) Release Notes on page 6055
Ranger 2.3.0.0	Ranger 2.3.0.0 - 2210 (EEP 9.0.0) Release Notes
Spark 3.3.0.0	Spark 3.3.0.0 - 2210 (EEP 9.0.0) Release Notes on page 6090
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 5981 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 5981 HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3 - 1803 Release Notes on page 5982

Ecosystem Pack 8.1.2 Release Notes
This topic contains information about the components included in Ecosystem Pack 8.1.2.

Release Date	May 2024
Repository Location	`https://package.ezmeral.hpe.com/releases/MEP/`[1]

[1]EEPs are contained in the `MEP-<version>` directory. The `MEP-version` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-6.0` or `MEP-6.0.0`). See Understanding Two-Digit and Three-Digit EEPs on page 5638.

EEP 8.1.2 can be used with core 7.0.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release,

but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 8.1.2 did not introduce any changes that affect application backward compatibility.

EEP 8.1.2 Components

The EEP 8.1.2 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
Airflow 2.5.1.100	Airflow 2.5.1.100 - 2405 (EEP 8.1.2) Release Notes on page 5833
AsyncHBase 1.8.2	AsyncHBase 1.8.2-2009 Release Notes on page 5839
Data Access Gateway 4.0.0.1	Data Access Gateway 4.0.0.1 Release Notes on page 5845
Drill 1.16.1.600[1]	Drill 1.16.1.600-2405 (EEP 8.1.2) Release Notes on page 5852
Hadoop 2.7.6.400	Hadoop 2.7.6.400 - 2405 (EEP 8.1.2) Release Notes on page 5880
HBase 1.4.14.125	HBase 1.4.14.125 - 2405 (EEP 8.1.2) Release Notes on page 5900
Hive 2.3.9.200	Hive 2.3.9.200 - 2405 (EEP 8.1.2) Release Notes on page 5928
HttpFS 1.1.0.400	HttpFS 1.1.0.400 - 2405 (EEP 8.1.2) Release Notes on page 5956
Hue 4.6.0.310[2]	Hue 4.6.0.310 - 2305 (EEP 8.1.1) Release Notes on page 5968
Livy 0.7.0.200	Livy 0.7.0.200 - 2201 (EEP 8.1.0) Release Notes on page 5977
Monitoring	Monitoring Components - EEP 8.1.0 Release Notes on page 6047
Oozie 5.2.1.400	Oozie 5.2.1.400 - 2405 (EEP 8.1.2) Release Notes on page 6058
S3 Gateway 2.2.0.0	S3 Gateway 2.2.0.0 - 2110 (EEP 8.0.0) Release Notes on page 6051
Spark 3.2.0.200	Spark 3.2.0.200 - 2405 (EEP 8.1.2) Release Notes on page 6094
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 5981 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 5981 HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3 - 1803 Release Notes on page 5982

Ecosystem Pack 8.1.1 Release Notes

This topic contains information about the components included in Ecosystem Pack 8.1.1.

Release Date	May 2023
Repository Location	`https://package.ezmeral.hpe.com/releases/MEP/`[1]

[1]EEPs are contained in the `MEP-<version>` directory. The `MEP-version` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-6.0` or `MEP-6.0.0`). See Understanding Two-Digit and Three-Digit EEPs on page 5638.

EEP 8.1.1 can be used with core 7.0.0 and core 6.2.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

last-updated: Jun 06, 2024

Backward Compatibility

EEP 8.1.1 did not introduce any changes that affect application backward compatibility.

EEP 8.1.1 Components

The EEP 8.1.1 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
Airflow 2.5.1.0	Airflow 2.5.1.0 - 2305 (EEP 8.1.1) Release Notes on page 5837
AsyncHBase 1.8.2	AsyncHBase 1.8.2-2009 Release Notes on page 5839
Data Access Gateway 4.0.0.0	Data Access Gateway 4.0 Release Notes on page 5846
Drill 1.16.1.500[1]	Drill 1.16.1.500-2305 (EEP 8.1.1) Release Notes on page 5853
Hadoop 2.7.6.300	Hadoop 2.7.6.300 - 2305 (EEP 8.1.1) Release Notes on page 5882
HBase 1.4.14.100	HBase 1.4.14.100 - 2305 (EEP 8.1.1) Release Notes on page 5902
Hive 2.3.9	Hive 2.3.9.100 - 2305 (EEP 8.1.1) Release Notes on page 5930
HttpFS 1.1.0.200	HttpFS 1.1.0.300 - 2305 (EEP 8.1.1) Release Notes on page 5957
Hue 4.6.0.310[2]	Hue 4.6.0.310 - 2305 (EEP 8.1.1) Release Notes on page 5968
Livy 0.7.0.200	Livy 0.7.0.200 - 2201 (EEP 8.1.0) Release Notes on page 5977
Monitoring	Monitoring Components - EEP 8.1.0 Release Notes on page 6047
Oozie 5.2.1.300	Oozie 5.2.1.300 - 2305 (EEP 8.1.1) Release Notes on page 6059
S3 Gateway 2.2.0.0	S3 Gateway 2.2.0.0 - 2110 (EEP 8.0.0) Release Notes on page 6051
Spark 3.2.0.100	Spark 3.2.0.100 - 2305 (EEP 8.1.1) Release Notes on page 6095

Streams Tools	Kafka Streams 2.6.1.110 - 2305 (EEP 8.1.1) Release Notes on page 5993 KSQL 6.0.0.110 - 2305 (EEP 8.1.1) Release Notes on page 6004 Kafka Connect HDFS 10.0.0.110 - 2305 (EEP 8.1.1) Release Notes on page 6013 Kafka Connect JDBC 10.0.1.110 - 2305 (EEP 8.1.1) Release Notes on page 6020 Kafka Connect 10.0.0.110 - 2305 (EEP 8.1.1) Release Notes on page 6026 Kafka REST Proxy 6.0.0.110 - 2305 (EEP 8.1.1) Release Notes on page 6031 Kafka Schema Registry 6.0.0.110 - 2305 (EEP 8.1.1) Release Notes on page 6039
Tez 0.9.2.500	Tez 0.9.2.500 - 2305 (EEP 8.1.1) Release Notes on page 6112

[1]Support for this component is subject to your license agreement.

[2]The Spark Notebook UI in Hue is a beta feature.

The EEP 8.1.1 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.12.0.400
- Elasticsearch 6.8.8.500
- Fluentd 1.10.3.400
- Grafana 7.5.10.400
- Kibana 6.8.8.500
- OpenTSDB 2.4.1.400

Ecosystem Pack 8.1.0 Release Notes

This topic contains information about the components included in Ecosystem Pack 8.1.0.

Release Date	January 2022
Repository Location	`https://package.ezmeral.hpe.com/releases/MEP/`[1]

[1]EEPs are contained in the `MEP-<version>` directory. The `MEP-version` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-6.0` or `MEP-6.0.0`). See Understanding Two-Digit and Three-Digit EEPs on page 5638.

EEP 8.1.0 can be used with core 7.0.0 and core 6.2.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

last-updated: Jun 06, 2024

Backward Compatibility

EEP 8.1.0 did not introduce any changes that affect application backward compatibility.

EEP 8.1.0 Components

The EEP 8.1.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
Airflow 2.2.1.0	Airflow 2.2.1.0 - 2201 (EEP 8.1.0) Release Notes on page 5838
AsyncHBase 1.8.2	AsyncHBase 1.8.2-2009 Release Notes on page 5839
Data Access Gateway 4.0.0.0	Data Access Gateway 4.0 Release Notes on page 5846
Drill 1.16.1.400[1]	Drill 1.16.1.400-2201 (EEP 8.1.0) Release Notes on page 5858
Hadoop 2.7.6.200	Hadoop 2.7.6.200 - 2201 (EEP 8.1.0) Release Notes on page 5884
HBase 1.4.13.200	HBase 1.4.13.200 - 2201 (EEP 8.1.0) Release Notes on page 5905
Hive 2.3.9	Hive 2.3.9.0 - 2201 (EEP 8.1.0) Release Notes on page 5936
HttpFS 1.1.0.200	HttpFS 1.1.0.200 - 2201 (EEP 8.1.0) Release Notes on page 5958
Hue 4.6.0.300[2]	Hue 4.6.0.300 - 2201 (EEP 8.1.0) Release Notes on page 5970
Livy 0.7.0.100	Livy 0.7.0.200 - 2201 (EEP 8.1.0) Release Notes on page 5977
Monitoring	Monitoring Components - EEP 8.1.0 Release Notes on page 6047
Oozie 5.2.1.200	Oozie 5.2.1.200 - 2201 (EEP 8.1.0) Release Notes on page 6062
S3 Gateway 2.2.0.0	S3 Gateway 2.2.0.0 - 2110 (EEP 8.0.0) Release Notes on page 6051
Spark 3.2.0.0	Spark 3.2.0.0 - 2201 (EEP 8.1.0) Release Notes on page 6097
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 5981 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 5981 HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3 - 1803 Release Notes on page 5982

last-updated: Jun 06, 2024

Component	Release Notes
Streams Tools	Kafka Streams 2.6.1.100 - 2201 (EEP 8.1.0) Release Notes on page 5995 KSQL 6.0.0.100 - 2201 (EEP 8.1.0) Release Notes on page 6005 Kafka Connect HDFS 10.0.0.100 - 2201 (EEP 8.1.0) Release Notes on page 6014 Kafka Connect JDBC 10.0.1.100 - 2201 (EEP 8.1.0) Release Notes on page 6021 Kafka Connect 10.0.0.100 - 2201 (EEP 8.1.0) Release Notes on page 6027 Kafka REST Proxy 6.0.0.100 - 2201 (EEP 8.1.0) Release Notes on page 6032 Kafka Schema Registry 6.0.0.100 - 2201 (EEP 8.1.0) Release Notes on page 6039
Tez 0.9.2	Tez 0.9.2 - 2201 (EEP 8.1.0) Release Notes on page 6113

[1]Support for this component is subject to your license agreement.

[2]The Spark Notebook UI in Hue is a beta feature.

The EEP 8.1.0 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.12.0.400
- Elasticsearch 6.8.8.500
- Fluentd 1.10.3.400
- Grafana 7.5.10.400
- Kibana 6.8.8.500
- OpenTSDB 2.4.1.400

Ecosystem Pack 8.0.0 Release Notes
This topic contains information about the components included in Ecosystem Pack 8.0.0.

NOTICE: Hewlett Packard Enterprise recommends using EEP 8.1.0 instead of EEP 8.0.0. For more information about EEP 8.1.0, see EEP 8.1.0 Reference Information on page 6152.

Release Date	October 2021
Repository Location	`https://package.ezmeral.hpe.com/releases/MEP/`[1]

[1]EEPs are contained in the `MEP-<version>` directory. The `MEP-version` directory can be represented by a 2-digit number or a 3-digit number (for example, `MEP-6.0` or `MEP-6.0.0`). See Understanding Two-Digit and Three-Digit EEPs on page 5638.

EEP 8.0.0 can be used with core 6.2.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 8.0.0 did not introduce any changes that affect application backward compatibility.

EEP 8.0.0 Components

The EEP 8.0.0 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.8.2	AsyncHBase 1.8.2-2009 Release Notes on page 5839
Data Access Gateway 3.0.0.0	Data Access Gateway 3.0 Release Notes on page 5847
Drill 1.16.1.300[1]	Drill 1.16.1.300-2110 (EEP 8.0.0) Release Notes on page 5862
Flume 1.9.0.200	Flume 1.9.0.200-2110 (EEP 8.0.0) Release Notes on page 5865
Hadoop 2.7.6.100	Hadoop 2.7.6.100 - 2110 (EEP 8.0.0) Release Notes on page 5886
HBase 1.4.13.100	HBase 1.4.13.100 - 2110 (EEP 8.0.0) Release Notes on page 5907
Hive 2.3.9	Hive 2.3.9 - 2110 (EEP 8.0.0) Release Notes on page 5943
HttpFS 1.1.0.100	HttpFS 1.1.0.100 - 2110 (EEP 8.0.0) Release Notes on page 5959
Hue 4.6.0.200[2]	Hue 4.6.0.200 - 2110 (EEP 8.0.0) Release Notes on page 5972
Livy 0.7.0.100	Livy 0.7.0.100 - 2110 (EEP 8.0.0) Release Notes on page 5978
Monitoring	Monitoring Components - EEP 8.0.0 Release Notes on page 6048
Oozie 5.2.1.100	Oozie 5.2.1.100 - 2110 (EEP 8.0.0) Release Notes on page 6065
Pig 0.17.0.100	Pig 0.17.0.100 - (EEP 8.0.0) 2110 Release Notes on page 6068
S3 Gateway	S3 Gateway 2.2.0.0 - 2110 (EEP 8.0.0) Release Notes on page 6051
Spark 3.1.2.0	Spark 3.1.2.0 - 2110 (EEP 8.0.0) Release Notes on page 6099
Sqoop 1.4.7	Sqoop 1.4.7 - 2110 (EEP 8.0.0) Release Notes on page 6105

last-updated: Jun 06, 2024

Component	Release Notes
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 5981 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 5981 HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3 - 1803 Release Notes on page 5982
Streams Tools	Kafka Streams 2.6.1.0 - 2110 (EEP 8.0.0) Release Notes on page 5997 KSQL 6.0.0.0 - 2110 (EEP 8.0.0) Release Notes on page 6007 Kafka Connect HDFS 10.0.0.0 - 2110 (EEP 8.0.0) Release Notes on page 6015 Kafka Connect JDBC 10.0.1.0 - 2110 (EEP 8.0.0) Release Notes on page 6021 Kafka REST Proxy 6.0.0.0 - 2110 (EEP 8.0.0) Release Notes on page 6033 Kafka Schema Registry 6.0.0.0 - 2110 (EEP 8.0.0) Release Notes on page 6040
Tez 0.9.2	Tez 0.9.2 - 2110 (EEP 8.0.0) Release Notes on page 6114

[1]Support for this component is subject to your license agreement.

[2]The Spark Notebook UI in Hue is a beta feature.

The EEP 8.0.0 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.12.0.300
- Elasticsearch 6.8.8.400
- Fluentd 1.10.3.300
- Grafana 7.5.10.300
- Kibana 6.8.8.400
- OpenTSDB 2.4.1.300

Ecosystem Pack 7.1.2 Release Notes
This topic contains information about the components included in Ecosystem Pack 7.1.2.

Release Date	March 2022
Repository Location	`https://package.ezmeral.hpe.com/releases/MEP/`[1]

[1]EEPs are contained in the `MEP-<version>` directory. The `MEP-<version>` directory can be represented by a 2-digit number or a 3-digit number (for example, MEP-6.0 or MEP-6.0.0). See Understanding Two-Digit and Three-Digit EEPs on page 5638.

EEP 7.1.2 can be used with core 6.2.0 and core 7.0.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

last-updated: Jun 06, 2024

Release Note Naming Convention

The release note naming convention is based on the version number and release date. For Hive 2.3.8-2104, 2.3.8 refers to the Hive version number, and 2104 typically indicates an April 2021 release, but last-minute changes in the release date can result in a slight mismatch between the naming convention and the actual release.

Backward Compatibility

EEP 7.1.2 did not introduce any changes that affect application backward compatibility.

EEP 7.1.2 Components

The EEP 7.1.2 repository contains the following ecosystem components that are fully supported:

Component	Release Notes
AsyncHBase 1.8.2	AsyncHBase 1.8.2-2009 Release Notes on page 5839
Data Access Gateway 3.0.0.0	Data Access Gateway 3.0 Release Notes on page 5847
Drill 1.16.1.250[1]	Drill 1.16.1.250-2201 (EEP 7.1.2) Release Notes on page 5863
Flume 1.9.0.300	Flume 1.9.0.300-2201 (EEP 7.1.2) Release Notes on page 5866
Hadoop 2.7.6.0	Hadoop 2.7.6.0 - 2201 (EEP 7.1.2) Release Notes on page 5890
HBase 1.4.13.50	HBase 1.4.13.50 - 2201 (EEP 7.1.2) Release Notes on page 5908
Hive 2.3.8	Hive 2.3.8 - 2201 (EEP 7.1.2) Release Notes on page 5950
HttpFS 1.1.0.50	HttpFS 1.1.0.50 (EEP 7.1.2) Release Notes on page 5960
Hue 4.6.0.150[2]	Hue 4.6.0.150 (EEP 7.1.2) Release Notes on page 5973
Livy 0.7.0.050	Livy 0.7.0.050 - 2202 (EEP 7.1.2) Release Notes on page 5979
Monitoring	Monitoring Components - EEP 7.1.2 Release Notes on page 6049
S3 Gateway 2.1.0.0	Object Store with S3-Compatible API 2.1.0.0 - 2104 (MEP 7.1.0) Release Notes
Oozie 5.2.1.50	Oozie 5.2.1.50 - 2201 (EEP 7.1.2) Release Notes on page 6066
Pig 0.17.0.50	Pig 0.17.0.0 Release Notes on page 6068
Spark 2.4.7.200	Spark 2.4.7.200 - 2201 (EEP 7.1.2) Release Notes on page 6103
Sqoop 1.4.7	Sqoop 1.4.7 - 2201 (EEP 7.1.2) Release Notes on page 6106
Streams Clients	HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes on page 5981 HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes on page 5981 HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3 - 1803 Release Notes on page 5982

last-updated: Jun 06, 2024

Component	Release Notes
Streams Tools	Kafka Streams 2.1.1.300 - 2201 (EEP 7.1.2) Release Notes on page 5999 KSQL 5.1.2.300 - 2201 (EEP 7.1.2) Release Notes on page 6008 Kafka Connect HDFS 5.1.2.300 - 2201 (EEP 7.1.2) Release Notes on page 6016 Kafka Connect JDBC 5.1.2.100 - 2201 (EEP 7.1.2) Release Notes on page 6022 Kafka Connect 5.1.2.300 - 2201 (EEP 7.1.2) on page 6028 Kafka REST Proxy 5.1.2.300 - 2201 (EEP 7.1.2) Release Notes on page 6035 Kafka Schema Registry 5.1.2.300 - 2201 (EEP 7.1.2) Release Notes on page 6041
Tez 0.9.2	Tez 0.9.2 - 2201 (EEP 7.1.2) Release Notes on page 6115

[1]Support for this component is subject to your license agreement.

[2]The Spark Notebook UI in Hue is a beta feature.

[3]Support for Sentry is limited to Impala users.

The EEP 7.1.2 repository contains the following ecosystem components that are supported for internal data-fabric monitoring use cases only:

- Collectd 5.10.0.20
- Elasticsearch 6.8.8.320
- Fluentd 1.10.3.220
- Grafana 7.5.2.220
- Kibana 6.8.8.320
- OpenTSDB 2.4.0

Package Names for Ecosystem Packs (EEPs)
This page describes how to view the the package names for each Ecosystem Pack (EEP) release.

To view the package names for an EEP:

1. Use a browser to navigate to https://package.ezmeral.hpe.com/releases/MEP/. A list of EEP links is displayed.
2. Click the link for your EEP. A list of operating system links is displayed.
3. Click the link for your operating system. The list of package names is displayed.

For more information about the supported EEPs, see EEP Components and OS Support on page 5734.

For information about packages and dependencies, see Packages and Dependencies for Data Fabric Software on page 70.

last-updated: Jun 06, 2024

Airflow Release Notes

The release notes for the Airflow component included in the HPE Ezmeral Data Fabric contain notes specific to data-fabric only.

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734 or EEP Support and Lifecycle Status on page 5728. To view release notes for prior data-fabric releases, see Previous Versions on page 6194.

Airflow 2.8.3.0 - 2404 (EEP 9.2.2) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Airflow. You may also be interested in the Apache Airflow home page.

Airflow Version	2.8.3.0
Release Date	April 2024
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/airflow
GitHub Release Tag	2.8.3.0-eep-922
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.
Documentation	• Apache Airflow on page 3894 • Installing Airflow on page 234 • Airflow Providers on page 3899

New in This Release

- This release updates the Airflow component to version 2.8.3.0.
- Introduced 2 new options:
  - `admin_only_cli_access`: A property to limit Airflow CLI access to only the admin cluster user. Set to `true` to limit Airflow CLI only for the admin cluster user. This property disables impersonation functionality.
  - `admin_cli_with_impersonation`: A property to limit Airflow CLI access to only the admin cluster user, except for `airflow tasks` commands. Supports impersonation when the property is set to `true`. This property has lower priority than `admin_only_cli_access`.
- If the `logrotation` tool is installed on the cluster, Airflow copies its own configuration to the `logrotation` conf files. Then the webserver and scheduler log files are rotated daily by default.

Fixes

- Fix incorrect serialization of FixedTimezone (#38139)
- Fix excessive permission changing for log task handler (#38164)
- Fix task instances list link (#38096)

last-updated: Jun 06, 2024

- Fix a bug where scheduler heartrate parameter was not used (#37992)
- Add padding to prevent grid horizontal scroll overlapping tasks (#37942)
- Fix hash caching in ObjectStoragePath (#37769)

Known Issues and Limitations

- The Installer can install Airflow, but cannot set up MySQL as the backend database for Airflow. The default Airflow database is SQLite.
- Apache PySpark has many CVEs and is removed from the default Airflow dependencies. To use the Spark JDBC operator/hook from Apache, install PySpark as follows:
  1. Run `<airflow_home>/build/env/bin/activate`.
  2. Run `pip install pyspark==3.3.2`.
  3. Run `deactivate`.
  4. **NOTE:** This process does not affect the Ezmeral Spark provider.
- If the `repair_pip_depends.sh` script failed with the following error, you must run the script again:

```
subprocess.CalledProcessError: Command 'krb5-config --libs gssapi'
returned non-zero exit      status 127.
 [end of output]
```

Resolved Issues

None.

Airflow 2.7.3.0 - 2401 (EEP 9.2.1) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Airflow. You may also be interested in the Apache Airflow home page.

Airflow Version	2.7.3.0
Release Date	January 2024
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/airflow
GitHub Release Tag	2.7.3.0-eep-921
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.
Documentation	• Apache Airflow on page 3894 • Installing Airflow on page 234 • Airflow Providers on page 3899

New in This Release

- This release updates the Airflow component to version 2.7.3.0.

last-updated: Jun 06, 2024

- The `airflow db migrate` command replaces `db init` and `db upgrade` as the command to create or upgrade the Airflow database.

Fixes

None.

Known Issues and Limitations

- The Installer can install Airflow, but cannot set up MySQL as the backend database for Airflow. The default Airflow database is SQLite.
- Apache PySpark has many CVEs and is removed from the default Airflow dependencies. To use the Spark JDBC operator/hook from Apache, install PySpark as follows:
  1. Run `<airflow_home>/build/env/bin/activate`.
  2. Run `pip install pyspark==3.3.2`.
  3. Run `deactivate`.
  4. **NOTE:** This process does not affect the Ezmeral Spark provider.
- If the `repair_pip_depends.sh` script failed with the following error, you must run the script again:

```
subprocess.CalledProcessError: Command 'krb5-config --libs gssapi'
returned non-zero exit      status 127.
 [end of output]
```

Resolved Issues

- AIRFLOW-164: Airflow fails to start on FIPS-enabled node. Extra steps are needed to install Airflow on a FIPS node. See Installation on a FIPS Node.

Airflow 2.7.1.0 - 2310 (EEP 9.2.0) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Airflow. You may also be interested in the Apache Airflow home page.

Airflow Version	2.7.1.0
Release Date	October 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/airflow
GitHub Release Tag	2.7.1.0-eep-920
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.
Documentation	• Apache Airflow on page 3894 • Installing Airflow on page 234 • Airflow Providers on page 3899

last-updated: Jun 06, 2024

New in This Release

- This release updates the Airflow component to version 2.7.1.0.
- The `airflow db migrate` command replaced `db init` and `db upgrade` as the command to create or upgrade the Airflow database.

Fixes

None.

Known Issues and Limitations

- Airflow is not supported with FIPS-enabled nodes.
- The Installer can install Airflow, but cannot set up MySQL as the backend database for Airflow. The default Airflow database is SQLite.
- Apache PySpark has many CVEs and is removed from the default Airflow dependencies. To use the Spark JDBC operator/hook from Apache, install PySpark as follows:
  1. Run `<airflow_home>/build/env/bin/activate`.
  2. Run `pip install pyspark==3.3.2`.
  3. Run `deactivate`.
  4. **NOTE:** This process does not affect the Ezmeral Spark provider.

Resolved Issues

- None.

Airflow 2.6.1.0 - 2307 (EEP 9.1.2) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Airflow. You may also be interested in the Apache Airflow home page.

Airflow Version	2.6.1.0
Release Date	July 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/airflow
GitHub Release Tag	2.6.1.0-eep-912
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.
Documentation	• Apache Airflow • Installing Airflow • Airflow Providers

New in This Release

- This release updates the Airflow component to version 2.6.1.0.

last-updated: Jun 06, 2024

- Airflow 2.6.1 impersonation requires the same group for Airflow and impersonating users or changes in `airflow.cfg`

```
file_task_handler_new_folder_permissions to 0o777
file_task_handler_new_file_permissions to 0o666
```

- Added `ticket_location` dag parameter for overwrite `MAPR_TICKETFILE_LOCATION`. This allows you to use non-standard ticket locations for impersonation.

Fixes

None.

Known Issues and Limitations

- Airflow is not supported with FIPS-enabled nodes.
- The Installer can install Airflow, but cannot set up MySQL as the backend database for Airflow. The default Airflow database is SQLite.
- Apache PySpark is removed from the default Airflow dependencies. To use the Spark JDBC operator/hook from Apache, install PySpark as follows:
  1. Run `<airflow_home>/build/env/bin/activate`.
  2. Run `pip install pyspark==<spark_version>`.
  3. Run `deactivate`.
  4. **NOTE:** This process does not affect the Ezmeral Spark provider.

Resolved Issues

- None.

Airflow 2.5.1.100 - 2405 (EEP 8.1.2) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Airflow. You may also be interested in the Apache Airflow home page.

Airflow Version	2.5.1.100
Release Date	May 2024
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/airflow
GitHub Release Tag	2.5.1.100-eep-812
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP (MEP) and OS to view the list of package names.
Documentation	• Apache Airflow • Installing Airflow • Airflow Providers

last-updated: Jun 06, 2024

New in This Release

This release updates the Airflow component to version 2.5.1.100.

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
88c0ef18fd	2024-03-19	AIRFLOW-210: Created scheduler log directory for next day to avoid race condition issues
0fd7e86056	2024-02-26	AIRFLOW-205: Added additional log information for case when the recorded pid doesn't equal to task pid
f5eec18873	2023-10-17	AIRFLOW-185: Check and create scheduler log directory before scheduling

Known Issues and Limitations

- Airflow is not supported on FIPS-enabled nodes.
- Starting with EEP 8.1.1, Apache PySpark is removed from the default Airflow dependencies. To use the Spark JDBC operator/hook from Apache, install PySpark as follows:
  1. Run `<airflow_home>/build/env/bin/activate`.
  2. Run `pip install pyspark==<spark_version>`.
  3. Run `deactivate`.
  4. **NOTE:** This process does not affect the Ezmeral Spark provider.

Resolved Issues

- None.

Airflow 2.5.1.0 - 2304 (EEP 9.1.1) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Airflow. You may also be interested in the Apache Airflow home page.

Airflow Version	2.5.1.0
Release Date	April 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/airflow
GitHub Release Tag	2.5.1.0-eep-911
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.
Documentation	• Apache Airflow • Installing Airflow • Airflow Providers

last-updated: Jun 06, 2024

New in This Release

This release updates the Airflow component to version 2.5.1.0.

Fixes

None.

Known Issues and Limitations

- Airflow is not supported with FIPS-enabled nodes.
- The Installer can install Airflow, but cannot set up MySQL as the backend database for Airflow. The default Airflow database is SQLite.
- Starting with EEP 8.1.1, Apache PySpark is removed from the default Airflow dependencies. To use the Spark JDBC operator/hook from Apache, install PySpark as follows:
  1. Run `<airflow_home>/build/env/bin/activate`.
  2. Run `pip install pyspark==<spark_version>`.
  3. Run `deactivate`.
  4. **NOTE:** This process does not affect the Ezmeral Spark provider.

Resolved Issues

- None.

Airflow 2.4.3.0 - 2301 (EEP 9.1.0) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Airflow. You may also be interested in the Apache Airflow home page.

Airflow Version	2.4.3.0
Release Date	January 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/airflow
GitHub Release Tag	2.4.3.0-eep-910
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.
Documentation	• Apache Airflow • Installing Airflow • Airflow Providers

New in This Release

This release updates the Airflow component to version 2.4.3.0.

last-updated: Jun 06, 2024

Fixes

None.

Known Issues and Limitations

- Airflow is not supported with FIPS-enabled nodes.
- The Installer can install Airflow, but cannot set up MySQL as the backend database for Airflow. The default Airflow database is SQLite.
- Airflow Amazon S3 providers might work with the Minio S3 API, but HPE does not guarantee this functionality.

Resolved Issues

- None.

Airflow 2.3.3.0 - 2210 (EEP 9.0.0) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Airflow. You may also be interested in the Apache Airflow home page.

Airflow Version	2.3.3.0
Release Date	October 2022
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/airflow
GitHub Release Tag	2.3.3.0-eep-900
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.
Documentation	• Apache Airflow • Installing Airflow • Airflow Providers

New in This Release

This release updates the Airflow component to version 2.3.3.0. A variety of operators and sensors are provided to integrate Airflow with the HPE Ezmeral Data Fabric Database. In addition, release 7.0.0 includes operators, sensors, and transfers that enable Airflow to create and interact with S3 buckets. For more information, see Airflow Providers.

Fixes

None.

Known Issues and Limitations

- Airflow is not supported with FIPS-enabled nodes.
- The Installer can install Airflow, but cannot set up MySQL as the backend database for Airflow. The default Airflow database is SQLite.

last-updated: Jun 06, 2024

- S3 operators can be used with Airflow in release 7.0.0 but not in release 6.2.0 because native S3 support is not implemented in release 6.2.0.
- Airflow Amazon S3 providers might work with Minio S3 API, but HPE does not guarantee this functionality.

Resolved Issues

- None.

Airflow 2.5.1.0 - 2305 (EEP 8.1.1) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Airflow. You may also be interested in the Apache Airflow home page.

New in This Release

This release updates the Airflow component to version 2.5.1.0.

Fixes

None.

Known Issues and Limitations

- Airflow is not supported on FIPS-enabled nodes.
- The Installer can install Airflow, but cannot set up MySQL as the backend database for Airflow. The default Airflow database is SQLite.
- Starting with EEP 8.1.1, Apache PySpark is removed from the default Airflow dependencies. To use the Spark JDBC operator/hook from Apache, install PySpark as follows:
  1. Run `<airflow_home>/build/env/bin/activate`.
  2. Run `pip install pyspark==<spark_version>`.
  3. Run `deactivate`.
  4. **NOTE:** This process does not affect the Ezmeral Spark provider.

last-updated: Jun 06, 2024

Resolved Issues

- None.

Airflow 2.2.1.0 - 2201 (EEP 8.1.0) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Airflow. You may also be interested in the Apache Airflow home page.

Airflow Version	2.2.1.0
Release Date	January 2022
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/airflow
GitHub Release Tag	2.2.1.0-eep-810
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP (MEP) and OS to view the list of package names.
Documentation	• Apache Airflow • Installing Airflow • Airflow Providers

New in This Release

This is the first release of the Airflow component. Starting from EEP 8.1.0, the HPE Ezmeral Data Fabric supports Apache Airflow in core releases 7.0.0 and 6.2.0. You can use Airflow to:

- Define, schedule, and monitor workflows.
- Orchestrate third-party systems to execute tasks.
- Analyze and manage workflows using the Airflow web interface.

A variety of operators and sensors are provided to integrate Airflow with the HPE Ezmeral Data Fabric Database. In addition, release 7.0.0 includes operators, sensors, and transfers that enable Airflow to create and interact with S3 buckets. For more information, see Airflow Providers.

Fixes

None.

Known Issues and Limitations

- Airflow is not supported on FIPS-enabled nodes.
- The Installer can install Airflow, but cannot set up MySQL as the backend database for Airflow. The default Airflow database is SQLite.
- S3 operators can be used with Airflow in release 7.0.0 but not in release 6.2.0 because native S3 support is not implemented in release 6.2.0.
- Airflow Amazon S3 providers might work with Minio S3 API, but HPE does not guarantee this functionality.

last-updated: Jun 06, 2024

- Airflow requires a patch to operate in a release 6.2.0 cluster with security enabled.

Resolved Issues

- None.

AsyncHBase Release Notes

The release notes for AsyncHBase component contains notes specific to MapR only.

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734. To view release notes for prior MapR releases, see Previous Versions on page 6194.

AsyncHBase 1.8.2-2009 Release Notes

The notes below relate to the HPE Ezmeral Data Fabric. You may also be interested in the AsyncHBase Github page.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	1.8.2
Release Date	September 2020
MapR Version Interoperability	Component Versions for Released EEPs
Source on GitHub	https://github.com/mapr/asynchbase
GitHub Release Tag	v1.8.2-mapr-2009

Resolved Issues

None.

Data Access Gateway Release Notes

This section includes the release notes for the Data Access Gateway.

Data Access Gateway 6.3 Release Notes

These notes describe release 6.3 of the Data Access Gateway.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

last-updated: Jun 06, 2024

Version	6.3.0.0
Release Date	April 2024
Version Interoperability	See Data Access Gateway Support Matrix on page 5801.
Package Name	`mapr-data-access-gateway` To view the full list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP version and OS.
Documentation	Administering the Data Access Gateway on page 1961

New in This Release

Data Access Gateway 6.3 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes:
  - MFS-17129
    - Updated Spring Framework version to 5.3.31 (from 5.3.24)
    - Updated Spring Security version to 5.8.9 (from 5.8.0)
  - MFS-16374
    - Updated jetty version to 9.4.53.v20231009.

Data Access Gateway 6.3 is available for Data Fabric versions 7.2.0 and later.

Known Issues and Limitations

None.

Resolved Issues

None.

Data Access Gateway 6.2 Release Notes

These notes describe release 6.2 of the Data Access Gateway.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	6.2
Release Date	November 2023
Version Interoperability	See Data Access Gateway Support Matrix on page 5801.
Package Name	`mapr-data-access-gateway` To view the full list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP version and OS.
Documentation	Administering the Data Access Gateway on page 1961

New in This Release

Support for Kafka Record Headers is added to the Apache Kafka Wire Protocol Service.

Known Issues and Limitations

None.

Resolved Issues

None.

Data Access Gateway 6.1 Release Notes

These notes describe release 6.1 of the Data Access Gateway.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	6.1
Release Date	July 2023
Version Interoperability	See Data Access Gateway Support Matrix on page 5801.
Package Name	`mapr-data-access-gateway` To view the full list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS.
Documentation	Administering the Data Access Gateway on page 1961

New in This Release

- Data Access Gateway version 6.1 supports fully distributed Kafka Wire Protocol service.

  In previous versions of Data Access Gateway, only the controller is assigned the partition leader of all topic partitions. In Data Access Gateway version 6.1, topic partitions are distributed evenly among all Data Access Gateway nodes, improving overall cluster throughput.

- Added support for Python, Go, Scala, C Kafka, and Node.js clients.

Data Access Gateway 6.1 can be used with core 7.4.0, 7.3.0, and 7.2.0. However, Kafka Wire Service protocol is only available for Data Access Gateway 6.1 on core 7.4.0. When using Data Access Gateway 6.1 with core 7.3.0 or 7.2.0, Kafka Wire Protocol service is disabled. Data Access Gateway 6.1 supports FIPS and non-FIPS installations. See FIPS Support for Ecosystem Components on page 5774.

The HPE Ezmeral Data Fabric Data Access Gateway is included in EEP repositories beginning with EEP 5.0.0. The Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the data-fabric cluster. As of version 6.1, Data Access Gateway supports REST endpoints for HPE Ezmeral Data Fabric Binary and JSON tables (See Administering Tables on page 1344), lightweight Ojai clients for HPE Ezmeral Data Fabric JSON tables (see Using the Python OJAI Client on page 3458 and HPE Ezmeral Data Fabric Database and Apps on page 3232), and Apache Kafka clients for HPE Ezmeral Data Fabric Streams (see Administering Streams on page 1488).

Client	Supported EEPs
MapR Database JSON REST API	EEP 5.0.0 and later
Python OJAI client	EEP 6.0.0 and later
Node.js OJAI client	EEP 6.0.0 and later
C# OJAI client	EEP 6.0.0 and later
Go OJAI client	EEP 6.0.0 and later

last-updated: Jun 06, 2024

Client	Supported EEPs
Java OJAI Thin Client	EEP 6.3.0 and later
Apache Kafka Java Client	EEP 9.0.0 and later
Apache Kafka Python Client	EEP 9.1.2 and later
Apache Kafka C Client	EEP 9.1.2 and later
Apache Kafka Scala Client	EEP 9.1.2 and later
Apache Kafka Go Client	EEP 9.1.2 and later
Apache Kafka Node.js Client	EEP 9.1.2 and later

Fixes

None.

Known Issues and Limitations

None.

Resolved Issues

None.

Data Access Gateway 6.0 Release Notes

These notes describe release 6.0 of the Data Access Gateway.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	6.0
Release Date	April 2023
Version Interoperability	Compatible with release 7.3.0 with EEP 9.1.1 and later
Package Name	`mapr-data-access-gateway` To view the full list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS.
Documentation	Administering the Data Access Gateway on page 1961

New in This Release

Data Access Gateway 6.0 removes support for configuring topic mapping rules. In Data Access Gateway 6.0, the new topic-mapping scheme is one topic per stream and, optionally, in its own volume.

While EEP 9.1.1 can be used with core 7.2.0 or core 7.3.0, Data Access Gateway 6.0 can only be used with core 7.3.0. In addition, only Data Access Gateway 6.0 can be used with release 7.3.0. Data Access Gateway 6.0 supports FIPS and non-FIPS installations. See FIPS Support for Ecosystem Components on page 5774.

The HPE Ezmeral Data Fabric Data Access Gateway is included in EEP repositories beginning with EEP 5.0.0. The Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the data-fabric cluster.

Client	Supported EEPs
MapR Database JSON REST API	EEP 5.0.0 and later
Python OJAI client	EEP 6.0.0 and later
Node.js OJAI client	EEP 6.0.0 and later
C# OJAI client	EEP 6.0.0 and later
Go OJAI client	EEP 6.0.0 and later
Java OJAI Thin Client	EEP 6.3.0 and later

Fixes

None.

Known Issues and Limitations

None.

Resolved Issues

None.

Data Access Gateway 5.1 Release Notes

These notes describe the release 5.1 of the Data Access Gateway.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	5.1
Release Date	January 2023
MapR Version Interoperability	Compatible with release 7.2.0 with EEP 9.1.0 and later*
Package Name	`mapr-data-access-gateway` To view the full list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS.
Documentation	Administering the Data Access Gateway on page 1961

New in This Release

Data Access Gateway 5.1 adds SSL support in the Apache Kafka Wire Protocol Service.

Only Data Access Gateway 5.1 can be used with release 7.2.0. Data Access Gateway 5.1 supports FIPS and non-FIPS installations. See FIPS Support for Ecosystem Components on page 5774.

The HPE Ezmeral Data Fabric Data Access Gateway is included in EEP repositories beginning with EEP 5.0.0. The Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the data-fabric cluster.

Client	Supported EEPs
MapR Database JSON REST API	EEP 5.0.0 and later
Python OJAI client	EEP 6.0.0 and later
Node.js OJAI client	EEP 6.0.0 and later

Client	Supported EEPs
C# OJAI client	EEP 6.0.0 and later
Go OJAI client	EEP 6.0.0 and later
Java OJAI Thin Client	EEP 6.3.0 and later

Fixes

None.

Known Issues and Limitations

None.

Resolved Issues

None.

Data Access Gateway 5.0 Release Notes

These notes describe the release 5.0 of the Data Access Gateway.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	5.0
Release Date	October 2022
MapR Version Interoperability	Compatible with release 7.1.0 with EEP 9.0.0 and later*
Package Name	`mapr-data-access-gateway` To view the full list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS.
Documentation	Administering the Data Access Gateway on page 1961

New in This Release

As its primary feature, Data Access Gateway 5.0 enables support for the Apache Kafka Wire Protocol Service. Apache Kafka Wire Protocol Service makes it possible for Apache Kafka clients written in any programming language to access topics in HPE Ezmeral Data Fabric Streams. For more information about the new service, see Apache Kafka Wire Protocol Service on page 3501.

Only Data Access Gateway 5.0 can be used with release 7.1.0. Data Access Gateway 5.0 supports FIPS and non-FIPS installations. See FIPS Support for Ecosystem Components on page 5774.

The HPE Ezmeral Data Fabric Data Access Gateway is included in EEP repositories beginning with EEP 5.0.0. The Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the data-fabric cluster.

Client	Supported EEPs
MapR Database JSON REST API	EEP 5.0.0 and later
Python OJAI client	EEP 6.0.0 and later
Node.js OJAI client	EEP 6.0.0 and later
C# OJAI client	EEP 6.0.0 and later

Client	Supported EEPs
Go OJAI client	EEP 6.0.0 and later
Java OJAI Thin Client	EEP 6.3.0 and later

Fixes

None.

Known Issues and Limitations

None.

Resolved Issues

- [DAG] Upgrade spring framework to 5.3.20+:
  - Updated Spring version to 5.3.22.
  - Updated Spring Security Version to 5.6.7.
  - Updated Jersey Version to 2.37.

None.

Data Access Gateway 4.0.0.1 Release Notes

These notes describe the 4.0.0.1 release of the Data Access Gateway.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	4.0.0.1
Release Date	May 2024
MapR Version Interoperability	See Data Access Gateway Support Matrix on page 5801.
Package Name	`mapr-data-access-gateway` To view the full list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS.
Documentation	Administering the Data Access Gateway on page 1961

New in This Release

The following third party Java libraries are updated in DAG release 4.0.0.1:

- Google Protobuf updated to version `3.21.12`
- Jackson updated to version `2.13.4`
- Jersey updated to version `2.37`
- Jersey Spring updated to version `2.37`
- Spring updated to version `5.3.22`
- Spring Security updated to version `5.6.7`

Fixes

None.

Known Issues and Limitations

Using Data Access Gateway 4.0.0.1 with EEP 8.1.2 requires core patch 7.0.0.24 or newer.

Resolved Issues

None.

Data Access Gateway 4.0 Release Notes

These notes describe the 4.0 release of the Data Access Gateway.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	4.0
Release Date	January 2022
MapR Version Interoperability	Compatible with release 6.2 with EEP 7.0.0 and later*
Package Name	`mapr-data-access-gateway` To view the full list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS.
Documentation	Administering the Data Access Gateway on page 1961

*The latest core 6.2.0 EBF patch must be applied before you can use Data Access Gateway 4.0 on release 6.2.0.

New in This Release

Only Data Access Gateway 4.0 can be used with release 7.0.0 in FIPS mode. This is the only significant difference between Data Access Gateway 3.0 and 4.0. Both versions 3.0 and 4.0 can be used in non-FIPS mode.

The HPE Ezmeral Data Fabric Data Access Gateway is included in EEP repositories beginning with EEP 5.0.0. The Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the data-fabric cluster.

Client	Supported EEPs
MapR Database JSON REST API	EEP 5.0.0 and later
Python OJAI client	EEP 6.0.0 and later
Node.js OJAI client	EEP 6.0.0 and later
C# OJAI client	EEP 6.0.0 and later
Go OJAI client	EEP 6.0.0 and later
Java OJAI Thin Client	EEP 6.3.0 and later

Configuring the Maximum Message Size for the gRPC Service

EEP 7.1.0 and later support a new configuration option (`grpc.service.max-message-size`) that allows you to change the maximum message size that the gRPC service accepts. For details, see Administering the Data Access Gateway on page 1961.

In EEP 7.1.0 and later, the Java OJAI Thin Client supports an OJAI Connection String option (`maxmsgsize`) to change the maximum message size that the gRPC client accepts. For details, see Using the Java OJAI Thin Client on page 3450.

Fixes

None.

Known Issues and Limitations

None.

Resolved Issues

None.

Data Access Gateway 3.0 Release Notes

These notes describe the 3.0 release of the Data Access Gateway.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	3.0
Release Date	Setember 2020
MapR Version Interoperability	Compatible with release 6.2 with EEP 7.0.0 and later
Package Name	`mapr-data-access-gateway` To view the full list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS.
Documentation	Administering the Data Access Gateway on page 1961

New in This Release

The HPE Ezmeral Data Fabric Data Access Gateway is included in EEP repositories beginning with EEP 5.0.0. The Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the data-fabric cluster.

Client	Supported EEPs
MapR Database JSON REST API	EEP 5.0.0 and later
Python OJAI client	EEP 6.0.0 and later
Node.js OJAI client	EEP 6.0.0 and later
C# OJAI client	EEP 6.0.0 and later
Go OJAI client	EEP 6.0.0 and later
Java OJAI Thin Client	EEP 6.3.0 and later

Configuring the Maximum Message Size for the gRPC Service

last-updated: Jun 06, 2024

EEP 7.1.0 and later support a new configuration option (`grpc.service.max-message-size`) that allows you to change the maximum message size that the gRPC service accepts. For details, see Administering the Data Access Gateway on page 1961.

In EEP 7.1.0 and later, the Java OJAI Thin Client supports an OJAI Connection String option (`maxmsgsize`) to change the maximum message size that the gRPC client accepts. For details, see Using the Java OJAI Thin Client on page 3450.

Fixes

Drill Release Notes

The release notes for Apache Drill contains notes specific to MapR only. Release notes for prior releases are posted on the Apache Drill web site.

Drill 1.20.3.200-2401 (EEP 9.2.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution for Apache Drill. You may also be interested in the Apache Drill homepage and the Apache Drill release notes:

Version	1.20.3.200
Release Date	January 2024
HPE Version Interoperability	See Ecosystem Support Matrix and EEP Components and OS Support on page 5734.
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.

New in This Release

Drill 1.20.3.200 introduces the following enhancements or HPE platform-specific behavior changes:

- **IMPORTANT:** Drill 1.20.3.200 *removes* support for the automated configuration of the Hive plugin with configure.sh on page 2821. For example, in release 7.6.0 and later, the following command is no longer supported by Drill:

  ```
  /opt/mapr/server/configure.sh -EC '-hiveMetastoreHost nodeA'
  ```

- Drill 1.20.3.200 resolves an issue with applying an action to `storage-plugins-override.conf`.
- Drill 1.20.3.200 implements various CVE fixes. For more information, see the fixes listed in the next section.

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
95d7824	2023-12-13	MD-6480: CVE-2023-2976. Remove shaded guava and upgrade guava to 32.1.2-jre version; MD-6485: CVE-2022-1471. Update snakeyaml to 2.0version. Update liquibase to 4.25.0 version; MD-6483: CVE-2023-44487. Update netty to 4.1.101.Finalversion. Update jetty to 2.15.3 version; MD-6478: CVE-2023-39410. Update avro to 1.11.3 version; MD-6486: CVE-2023-3635. Update okhttp to 4.12.0 version; MD-6482: CVE-2023-35116. Update jackson to 2.15.3 version;
a7d1e82	2023-12-27	MD-6491: Drill doesn't follow drill.exec.storage.action_on_plugins_override_file action
7bb7163	2023-11-14	MD-6477: Prevent XXE Attacks in XML Format Plugin.

Known Issues

- None.

Limitations

- The Hive storage plugin in Drill does not support reading the parquet `timestamp` type with the `int64` logical type.

Drill 1.20.3.100-2310 (EEP 9.2.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the Apache Drill homepage and the Apache Drill release notes:

Version	1.20.3.100
Release Date	October 2023
HPE Version Interoperability	See Ecosystem Support Matrix and EEP Components and OS Support on page 5734.
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.

New in This Release

Drill 1.20.3.100 introduces the following enhancements or HPE platform-specific behavior changes:

- Drill version updated to 1.20.3.100
- Protobuf version downgraded to 3.21.12

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
59dcc83f40	2023-09-05	MD-6465: downgrade protobuf to 3.21.12
d73f237f55	2023-08-09	DRILL-8451: options and profile pages have bad order symbols style

last-updated: Jun 06, 2024

5cf156aa76	2023-08-09	DRILL-8449: Typo in FreeMarker templates
455183be57	2023-06-29	MD-6447: log masking based on drill user (#596)
dfa98887a9	2023-04-27	MD-6426: Fix endless retrying zk set data for a large query

Known Issues

- None.

Limitations

- The hive storage plugin in Drill does not support reading the parquet `timestamp` type with the `int64` logical type.

Drill 1.20.3.0-2304 (EEP 9.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the Apache Drill homepage and the Apache Drill release notes:

Version	1.20.3.0
Release Date	April 2023
HPE Version Interoperability	See Component Versions for Released EEPs on page 5750 and EEP Components and OS Support on page 5734.
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Drill 1.20.3.0 introduces the following enhancements or HPE platform-specific behavior changes:

- Drill version updated to 1.20.3.0
- Protobuf version updated to 3.22.2

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
d9d6d06143	2023-03-15	MD-6411: Update protobuf to 3.22.2

Known Issues

- None.

Limitations

- The hive storage plugin in Drill does not support reading the parquet `timestamp` type with the `int64` logical type.

Drill 1.20.2.100-2301 (EEP 9.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the Apache Drill homepage and the Apache Drill release notes:

Version	1.20.2.100

Release Date	January 2023
HPE Version Interoperability	See Component Versions for Released EEPs on page 5750 and EEP Components and OS Support on page 5734.
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Drill 1.20.2.100 introduces the following enhancements or HPE platform-specific behavior changes:

- Drill version updated to 1.20.2.100.

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
f388115d6d	2022-12-16	MD-6393: Protobuf-java CVE-2020-9492

Known Issues

- None.

Limitations

- The hive storage plugin in Drill does not support reading the parquet `timestamp` type with the `int64` logical type.

Drill 1.20.2.0-2210 (EEP 9.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the Apache Drill homepage and the Apache Drill release notes:

Version	1.20.2.0
Release Date	October 2022
HPE Version Interoperability	See Component Versions for Released EEPs on page 5750 and EEP Components and OS Support on page 5734.
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Drill 1.20.2.0-2210 introduces the following enhancements or HPE platform-specific behavior changes:

- Drill version updated to 1.20.2.0.
- Separate storage in HBase for query profiles and storage plugin information. See Configuring HBase Persistent Storage Tables on page 3985.
- Query profile data masking based on user filters. See Mask Sensitive Data in Query Logs and Profiles on page 4097.
- Transport layer security (TLS) default version is now 1.3.

last-updated: Jun 06, 2024

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
db2eea295e	2022-09-28	MD-6376: Change kafka_2.13 dependency scope to test
5d882ba211	2022-09-23	MD-6375: Update commons-text to 1.9
df8692a28e	2022-09-09	MD-6371: Enable mapr maven profile by default **ATTENTION:** If you use Drill as a maven dependency, note that the related dependencies for Drill have changed in this release.
47c25a7766	2022-09-08	MD-6370: Excluded Xalan dependency
286b8db58b	2022-10-03	MD-6306: Remove spring dependencies
48f5927cf9	2022-10-03	MD-6293: Exclude htrace-core, update jackson to 2.13.2
e9561b34e1	2022-10-03	MD-6272: Update Antlr4 to version 4.9.3
c4236e9c09	2022-09-07	MD-6264: Cannot verify certificate when ssl enabled on Drill-on-Yarn
4cb67f7c03	2022-09-07	MD-5516: Drill-on-Yarn client does not handle REST status/ management API over SSL

Known Issues

- Due to Drill version changes (3-digit to 4-digit), you cannot upgrade from Drill in EEP 7.0.0 (Drill 1.16.1) to Drill in EEP 7.0.1 (Drill 1.16.1.5) or later. You must perform a new installation of Drill. Alternatively, if you are running Drill on CentOS or RHEL, you can issue the following command as a workaround to upgrade Drill:

  ```
  rpm -Uv --<old-package> <path/to/packages>/*.rpm
  ```

  See Upgrading Drill on page 367.

Limitations

- The hive storage plugin in Drill does not support reading the parquet `timestamp` type with the `int64` logical type.

Drill 1.16.1.600-2405 (EEP 8.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the Apache Drill homepage and the Apache Drill release notes:

Version	1.16.1.600
Release Date	May 2024
HPE Version Interoperability	See Component Versions for Released EEPs on page 5750 and EEP Components and OS Support on page 5734.
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Drill 1.16.1.600-2405 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes.
- Resolving display issues.

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
7a182bc731	2023-08-09	DRILL-8451: options and profile pages have bad order symbols style
ef6fa69928	2023-08-08	DRILL-8449: Typo in FreeMarker templates
135a852b1d	2022-10-20	DRILL-8338: Upgrade jQuery to 3.6.1 and DataTables to 1.12.1 due to sonatype-2020-0988

Known Issues

None.

Limitations

None.

Drill 1.16.1.500-2305 (EEP 8.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the Apache Drill homepage and the Apache Drill release notes:

Version	1.16.1.500
Release Date	May 2023
HPE Version Interoperability	See Component Versions for Released EEPs on page 5750 and EEP Components and OS Support on page 5734.
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Drill 1.16.1.500-2305 introduces the following enhancements or HPE platform-specific behavior changes:

- Separate storage in HBase for query profiles and storage plugin information. See Configuring HBase Persistent Storage Tables on page 3985.

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
38c9c314a9	2023-05-05	MD-6438: Update version of shaded guava to 31.1-jre
df338e7671	2023-05-03	MD-6439: Update jackson version to 2.12.7 and jackson databind 2.12.7.1
2572e8a8e2	2023-05-03	MD-6437: Update protobuf-java to 3.21.12
33da89f90f	2023-04-28	MD-6426: Fix endless retrying zk set data for a large query
2cfc983fbb	2023-04-20	MD-6435: Update jetty to 9.4.51.v20230217

c7bac76d3f	2023-04-19	MD-6429: remove conjars repo
8a69b8c69b	2023-03-10	MD-6412: Update commons-text to 1.10.0 due to CVE
b1abff4981	2022-09-09	MD-6371: Enable mapr maven profile by default
2531a80da4	2022-09-08	MD-6370: Exclude Xalan dependency
e20c4ca438	2022-05-04	MD-6272: Update Drill to use Antlr4 version 4.9.3
53181b0213	2022-05-02	MD-6312: Hide warning about an illegal reflective access operation while connecting via sqlline
88bfe5171c	2022-04-21	DRILL-8122: Change kafka metadata obtaining due to KAFKA-5697 (#2456)
7f7fe93ce3	2022-04-12	MD-6304: add requested file from DRILL-7204
64b78f7f04	2022-04-12	DRILL-7619: Fixed link to the metrics endpoint
8933f37e56	2022-04-12	DRILL-7582: Moved Drillbits REST API communication to the back end layer
2b4db26be7	2022-04-11	MD-6264: Cannot verify certificate when ssl enabled on DOY (#581)
c9eef515ca	2022-04-11	MD-6271: drill couldn't start when FIPS enabled on Rocky linux (#580)
59c28b849f	2022-04-07	MD-6306: Remove spring transitive dependencies (#583)

Known Issues

- During the Drill-on-YARN installation, the system fails to upload the Drill archive because the `/user/drill` directory does not exist. If you install and try to start Drill-on-YARN (version 1.16.1.400 in EEP-8.1.0 or 1.16.1.500 in EEP-8.1.1 on Core 6.2.0 or 7.0.0) using the `mapr-drill-yarn` package, the system returns the following messages:

```
/opt/mapr/drill/drill-1.16.1/bin/drill-on-yarn.sh start

WARNING: An illegal reflective access operation has occurred
WARNING: Illegal reflective access by
javassist.util.proxy.SecurityActions (file:/opt/mapr/drill/drill-1.16.1/
jars/3rdparty/javassist-3.24.0-GA.jar) to method
java.lang.ClassLoader.defineClass(java.lang.String,byte[],int,int,java.sec
urity.ProtectionDomain)
WARNING: Please consider reporting this to the maintainers of
javassist.util.proxy.SecurityActions
WARNING: Use --illegal-access=warn to enable warnings of further illegal
reflective access operations
WARNING: All illegal access operations will be denied in a future release
Connecting to DFS... Connected.
2023-06-20 02:28:59,1379 ERROR JniCommon fc/jni_MapRClient.cc:816 Thread:
1438881 Mismatch found for java and native libraries java build version
6.2.0.0.20200915234957.GA, native build version 6.2.0.0.20200909000740.GA
java patch version $Id: mapr-version: 6.2.0.0.20200915234957.GA

6.2.0.0.20200909000740.GA a40a31acab7f5e88e1
Uploading /opt/mapr/drill/drill-1.16.1/drill.tar.gz to /user/drill/
drill.tar.gz ... Failed.
Failed to upload Drill archive
  Caused by: Failed to create DFS directory: /user/drill
  Caused by: Could not create FileClient err: 0
  Caused by: Could not create FileClient err: 0
```

To resolve this issue, complete the following steps:

1. Install Drill-on-YARN, as described in Installing Drill to Run Under YARN on page 240, but do not configure or start Drill-on-YARN.

last-updated: Jun 06, 2024

2. Create a file named `recreate_archive.sh` with the following information:

   TIP: You can create and run this file in any location you choose.

```
read -p "This operation will recreate drill.tar.gz in drill home
directory. Continue? " -n 1 -r
echo
if [[ ! $REPLY =~ ^[Yy]$ ]]
then
        exit 1
fi

drillHome="/opt/mapr/drill/drill-$(cat /opt/mapr/drill/drillversion)"
hadoopHome="/opt/mapr/hadoop/hadoop-$(cat /opt/mapr/hadoop/
hadoopversion)"

hbaseJar="$(ls /opt/mapr/lib/mapr-hbase-*-mapr.jar)"
maprWebJar="$(ls /opt/mapr/lib/mapr-security*-mapr.jar)"
maprdbJar="$(ls /opt/mapr/lib/maprdb-[0-9].[0-9].[0-9].[0-9]-mapr.jar)"
mapredJar="$(ls /opt/mapr/lib/maprdb-mapreduce-*-mapr.jar)"
maprfsJar="$(ls /opt/mapr/lib/maprfs-[0-9].[0-9].[0-9].[0-9]-mapr.jar)"
jerseyClientJar="$(ls ${hadoopHome}/share/hadoop/yarn/lib/
jersey-client-*.jar)"
jerseyCoreJar="$(ls ${hadoopHome}/share/hadoop/yarn/lib/
jersey-core-*.jar)"

echo "Drop old mapr jars from ${drillHome}/jars/3rdparty/"
rm -f ${drillHome}/jars/3rdparty/mapr-hbase*
rm -f ${drillHome}/jars/3rdparty/mapr-security-web-*
rm -f ${drillHome}/jars/3rdparty/maprdb-*
rm -f ${drillHome}/jars/3rdparty/maprfs-*

echo "Copy new jars from /opt/mapr/lib/"
cp ${hbaseJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${hbaseJar} has been copied"
cp ${maprWebJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${maprWebJar} has been copied"
cp ${maprdbJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${maprdbJar} has been copied"
cp ${mapredJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${mapredJar} has been copied"
cp ${maprfsJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${maprfsJar} has been copied"

echo "Copy jersey jars from hadoop for timeline client"
cp ${jerseyClientJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${jerseyClientJar} has been copied"
cp ${jerseyCoreJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${jerseyCoreJar} has been copied"

if [ -f ${drillHome}/drill.tar.gz ]; then
    rm -f ${drillHome}/drill.tar.gz
    echo "${drillHome}/drill.tar.gz has been dropped"
fi

tempDir=drill-$(date +%s)

mkdir /tmp/$tempDir
[ $? == 0 ] && echo "Created temporary directory ${tempDir}"

cd /tmp/$tempDir

mkdir drill
```

last-updated: Jun 06, 2024

```
[ $? == 0 ] && echo "Created drill directory"

cp -r ${drillHome}/* ./drill/
echo "${drillHome} copied to drill directory"

tar -czf drill.tar.gz ./drill
echo "Created new drill archive"

cp drill.tar.gz ${drillHome}/
echo "drill.tar.gz copied to ${drillHome}"

rm -rf /tmp/$tempDir
echo -e "\033[0;32mDONE.\033[0m"
```

3. Issue the following command to run the script:

   ```
   sh recreate_archive.sh
   ```

   When the script runs, a prompt appears:

   ```
   This operation will recreate drill.tar.gz in drill home directory.
   Continue?
   ```

   Reply with y to allow the script to update the JAR files in Drill-on-YARN.

   You should see the following output:

   ```
   Drop old mapr jars from /opt/mapr/drill/drill-1.16.1/jars/3rdparty/
   Copy new jars from /opt/mapr/lib/
   /opt/mapr/lib/mapr-hbase-6.2.0.0-mapr.jar has been copied
   /opt/mapr/lib/mapr-security-web-6.2.0.0-mapr.jar has been copied
   /opt/mapr/lib/maprdb-6.2.0.0-mapr.jar has been copied
   /opt/mapr/lib/maprdb-mapreduce-6.2.0.0-mapr.jar has been copied
   /opt/mapr/lib/maprfs-6.2.0.0-mapr.jar has been copied
   Copy jersey jars from hadoop for timeline client
   /opt/mapr/hadoop/hadoop-2.7.6/share/hadoop/yarn/lib/
   jersey-client-1.19.jar has been copied
   /opt/mapr/hadoop/hadoop-2.7.6/share/hadoop/yarn/lib/
   jersey-core-1.19.jar has been copied
   /opt/mapr/drill/drill-1.16.1/drill.tar.gz has been dropped
   Created temporary directory drill-1656424210
   Created drill directory
   /opt/mapr/drill/drill-1.16.1 copied to drill directory
   Created new drill archive
   drill.tar.gz copied to /opt/mapr/drill/drill-1.16.1
   DONE.
   ```

4. Configure Drill to run under YARN and start Drill-on-YARN, as described in Configuring Drill to Run Under YARN.

- Due to Drill version changes (3-digit to 4-digit), you cannot upgrade from Drill in EEP 7.0.0 (Drill 1.16.1) to Drill in EEP 7.0.1 (Drill 1.16.1.5) or later. You must perform a new installation of Drill. Alternatively, if you are running Drill on CentOS or RHEL, you can issue the following command as a workaround to upgrade Drill:

  ```
  rpm -Uv --<old-package> <path/to/packages>/*.rpm
  ```

  See Upgrading Drill on page 367.

Limitations

- Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

Drill 1.16.1.400-2201 (EEP 8.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the Apache Drill homepage and the Apache Drill release notes:

Version	1.16.1.400
Release Date	January 2022
HPE Version Interoperability	See Component Versions for Released EEPs on page 5750 and EEP Components and OS Support on page 5734.
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Drill 1.16.1.400-2201 introduces the following enhancements or HPE platform-specific behavior changes:

- None

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
33a7d24ea2	2022-01-10	MD-6251: Secondary index error when reading from mapr-db json (#575)
8365703194	2021-12-30	MD-5516: Add https support for Drill-on-YARN (#566)
d492882d29	2021-12-30	MD-6191: Allow partition pruning with dynamic CURRENT_DATE operator.
a6ab48aede	2021-12-20	MD-6196: Medial CVE fixes (jquery, bootstrap, data tables)
5ee9b79204	2021-12-20	MD-6196: Medial CVE fixes (junit, bcpkix-jdk15on)
4f92206395	2021-12-08	MD-6202: Excluding transitive netty dependency from zookeeper
aeb91d399c	2021-12-07	MD-6161: fix skipping of types written not in uppercase (#565)
cbbceb728b	2021-11-26	DRILL-8009: DrillConnectionImpl#isValid() doesn't correspond JDBC API
a5b79c9e67	2021-11-21	MD-6196: Fix the CVEs with the high severity
bddeab869d	2021-11-16	DRILL-7586: Fix loading incorrect version of commons-lang3
ec1051c0ec	2021-11-09	MD-6182: Fixed problem with starting drill on the fips cluster (#564)

Known Issues

- During the Drill-on-YARN installation, the system fails to upload the Drill archive because the `/user/drill` directory does not exist. If you install and try to start Drill-on-YARN (version 1.16.1.400 in

EEP-8.1.0 on Core 6.2.0 or 7.0.0) using the `mapr-drill-yarn` package, the system returns the following messages:

```
/opt/mapr/drill/drill-1.16.1/bin/drill-on-yarn.sh start

WARNING: An illegal reflective access operation has occurred

jersey-core-*.jar)"

echo "Drop old mapr jars from ${drillHome}/jars/3rdparty/"
rm -f ${drillHome}/jars/3rdparty/mapr-hbase*
rm -f ${drillHome}/jars/3rdparty/mapr-security-web-*
rm -f ${drillHome}/jars/3rdparty/maprdb-*
rm -f ${drillHome}/jars/3rdparty/maprfs-*

echo "Copy new jars from /opt/mapr/lib/"
cp ${hbaseJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${hbaseJar} has been copied"
cp ${maprWebJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${maprWebJar} has been copied"
cp ${maprdbJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${maprdbJar} has been copied"
cp ${mapredJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${mapredJar} has been copied"
cp ${maprfsJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${maprfsJar} has been copied"

echo "Copy jersey jars from hadoop for timeline client"
cp ${jerseyClientJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${jerseyClientJar} has been copied"
cp ${jerseyCoreJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${jerseyCoreJar} has been copied"

if [ -f ${drillHome}/drill.tar.gz ]; then
    rm -f ${drillHome}/drill.tar.gz
    echo "${drillHome}/drill.tar.gz has been dropped"
fi

tempDir=drill-$(date +%s)

mkdir /tmp/$tempDir
[ $? == 0 ] && echo "Created temporary directory ${tempDir}"

cd /tmp/$tempDir

mkdir drill
```

last-updated: Jun 06, 2024

```
[ $? == 0 ] && echo "Created drill directory"

cp -r ${drillHome}/* ./drill/
echo "${drillHome} copied to drill directory"

tar -czf drill.tar.gz ./drill
echo "Created new drill archive"

cp drill.tar.gz ${drillHome}/
echo "drill.tar.gz copied to ${drillHome}"

rm -rf /tmp/$tempDir
echo -e "\033[0;32mDONE.\033[0m"
```

3. Issue the following command to run the script:

   ```
   sh recreate_archive.sh
   ```

   When the script runs, a prompt appears:

   ```
   This operation will recreate drill.tar.gz in drill home directory.
   Continue?
   ```

   Reply with y to allow the script to update the JAR files in Drill-on-YARN.

   You should see the following output:

   ```
   Drop old mapr jars from /opt/mapr/drill/drill-1.16.1/jars/3rdparty/
   Copy new jars from /opt/mapr/lib/
   /opt/mapr/lib/mapr-hbase-6.2.0.0-mapr.jar has been copied
   /opt/mapr/lib/mapr-security-web-6.2.0.0-mapr.jar has been copied
   /opt/mapr/lib/maprdb-6.2.0.0-mapr.jar has been copied
   /opt/mapr/lib/maprdb-mapreduce-6.2.0.0-mapr.jar has been copied
   /opt/mapr/lib/maprfs-6.2.0.0-mapr.jar has been copied
   Copy jersey jars from hadoop for timeline client
   /opt/mapr/hadoop/hadoop-2.7.6/share/hadoop/yarn/lib/
   jersey-client-1.19.jar has been copied
   /opt/mapr/hadoop/hadoop-2.7.6/share/hadoop/yarn/lib/
   jersey-core-1.19.jar has been copied
   /opt/mapr/drill/drill-1.16.1/drill.tar.gz has been dropped
   Created temporary directory drill-1656424210
   Created drill directory
   /opt/mapr/drill/drill-1.16.1 copied to drill directory
   Created new drill archive
   drill.tar.gz copied to /opt/mapr/drill/drill-1.16.1
   DONE.
   ```

4. Configure Drill to run under YARN and start Drill-on-YARN, as described in Configuring Drill to Run Under YARN.

- Due to Drill version changes (3-digit to 4-digit), you cannot upgrade from Drill in EEP 7.0.0 (Drill 1.16.1) to Drill in EEP 7.0.1 (Drill 1.16.1.5) or later. You must perform a new installation of Drill. Alternatively, if you are running Drill on CentOS or RHEL, you can issue the following command as a workaround to upgrade Drill:

  ```
  rpm -Uv --<old-package> <path/to/packages>/*.rpm
  ```

  See Upgrading Drill on page 367.

Limitations

- Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

Drill 1.16.1.300-2110 (EEP 8.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the Apache Drill homepage and the Apache Drill release notes:

Version	1.16.1.300
Release Date	October 2021
HPE Version Interoperability	See Component Versions for Released EEPs on page 5750 and EEP Components and OS Support on page 5734.
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Drill 1.16.1.300-2110 introduces the following enhancements or HPE platform-specific behavior changes:

- None

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
e1578d9aed	2021-09-06	MD-6167: Update the maven artifact version strings to eep
7dd73ee1a9	2021-08-27	MD-6163: Fixed bug with returning null values when selecting by key without tests
4c322e45ce	2021-08-18	MD-6165: Downgrading jackson libs to be consistent with core (from 2.12.1 to 2.11.1)
67619111f2	2021-08-12	MD-6162: Security vulnerability found in jars used in Drill
1c657eff14	2021-08-12	MD-6153: CVE-2019-10172, CVE-2019-10202 vulnerabilities in jackson-mapper-asl-1.9.13.jar
ffe1f0b175	2021-08-06	DRILL-7934: Fix NullPointerException error when reading parquet files
5c58e3c598	2021-07-28	MD-6144: Jetty security vulnerability
ee6525a53f	2021-07-26	MD-6145: CVE-2020-13956, WS-2017-3734 vulnerabilities in http-client
597c32929e	2021-07-15	MD-6140: mapr-drill failing with java.lang.NoClassDefFoundError: org/apache/zookeeper/Environment
4d04fcdd74	2021-07-07	MD-6143: Commons-codec vulnerability WS-2019-0379
d9c5a9f006	2021-06-03	MD-6130: Different jackson jar versions in 3rdparty libs
4e673662e6	2021-05-27	MD-6126: CVE-2020-13936 velocity-engine-core vulnerability

f80f67df1e	2021-05-19	DRILL-7372: MethodAnalyzer consumes too much memory
c023fa7705	2021-05-19	MD-6022: Column names are not flipped when running a query

Known Issues

- Due to Drill version changes (3-digit to 4-digit), you cannot upgrade from Drill in EEP 7.0.0 (Drill 1.16.1) to Drill in EEP 7.0.1 (Drill 1.16.1.5) or later. You must perform a new installation of Drill. Alternatively, if you are running Drill on CentOS or RHEL, you can issue the following command as a workaround to upgrade Drill:

  ```
  rpm -Uv --<old-package> <path/to/packages>/*.rpm
  ```

  See Upgrading Drill on page 367.

Limitations

- Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

Drill 1.16.1.250-2201 (EEP 7.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Drill. You may also be interested in the Apache Drill homepage and the Apache Drill release notes:

Version	1.16.1.250
Release Date	March 2022
HPE Version Interoperability	See Component Versions for Released MEPs.
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/, and select your MEP and OS to view the list of package names.

New in This Release

Drill 1.16.1.250-2201 introduces the following enhancements or HPE platform-specific behavior changes:

- None

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
33a7d24ea2	2022-01-10	MD-6251: Secondary index error at reading from mapr-db json (#575)
8365703194	2021-12-30	MD-5516: Add https support for drill on yarn (#566)
d492882d29	2021-12-30	MD-6191: Change to allow partition prunning with dynamic CURRENT_DATE operator.
a6ab48aede	2021-12-20	MD-6196: Fix the CVEs with the high severity, Medial CVE fixes (jquery bootstrap datatables junit bcpkix-jdk15on junit bcpkix-jdk15on)
aeb91d399c	2021-12-07	MD-6161: fix skipping of types written not in uppercase (#565)

cbbceb728b	2021-11-26	DRILL-8009: DrillConnectionImpl#isValid() doesn't correspond JDBC API
09267911da	2021-11-16	MD-6197: Update hbase version to 1.4.13.0-eep-810-SNAPSHOT
bddeab869d	2021-11-16	DRILL-7586: Fix loading incorrect version of commons-lang3
ec1051c0ec	2021-11-09	MD-6182: Fixed problem with starting drill on the fips cluster (#564)
42dafe04ac	2021-08-27	MD-6160: Fixed test with not equal predicate (#558)
7dd73ee1a9	2021-08-27	Fixed bug with returning null values when selecting by key without tests (#560)
4c322e45ce	2021-08-18	MD-6165: Downgrading jackson libs to be consistent with core (from 2.12.1 to 2.11.1)
67619111f2	2021-08-12	MD-6162: Security vulnerability found in jars used in Drill
1c657eff14	2021-08-12	MD-6153: CVE-2019-10172 CVE-2019-10202 vulnerabilities in jackson-mapper-asl-1.9.13.jar
ffe1f0b175	2021-08-06	DRILL-7934: Fix NullPointerException error when reading parquet files
5c58e3c598	2021-07-28	MD-6144: Jetty security vulnerability
ee6525a53f	2021-07-26	MD-6145: CVE-2020-13956 WS-2017-3734 vulnerabilities in http-client
597c32929e	2021-07-15	MD-6140: mapr-drill failing with java.lang.NoClassDefFoundError: org/apache/zookeeper/Environment (#555)
4d04fcdd74	2021-07-07	MD-6143: Commons-codec vulnerability WS-2019-0379
d9c5a9f006	2021-06-03	MD-6130: Different jackson jar versions in 3rdparty libs (#554)

Known Issues and Limitations

- Due to Drill version changes (3-digit to 4-digit), you cannot upgrade from Drill in MEP 7.0.0 (Drill 1.16.1) to Drill in MEP 7.0.1 (Drill 1.16.1.5) or later. You must perform a new installation of Drill. Alternatively, if you are running Drill on CentOS or RHEL, you can issue the following command as a workaround to upgrade Drill:

  ```
  rpm -Uv --<old-package> <path/to/packages>/*.rpm
  ```

  See Upgrading Drill on page 367.

- Older versions of Drill, such as Drill 1.10.0, supported the HBase plug-in, but Drill versions 1.11.0 through 1.16.0.x do not support queries on HBase tables.

Flume Release Notes

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

last-updated: Jun 06, 2024

The release notes for Flume contain notes specific to MapR only.

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734. To view release notes for prior MapR releases, see Previous Versions on page 6194.

Flume 1.9.0.0 Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Flume 1.9.0.0.

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

The following release notes for the Flume 1.9.0.0 component are included in the MapR distribution for Apache Hadoop:

Flume 1.9.0.200-2110 (EEP 8.0.0) Release Notes

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Flume. You may also be interested in the Apache Flume 1.9.0 changelog or the Apache Flume homepage.

For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	1.9.0.200
Release Date	October 2021
HPE Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	https://github.com/mapr/flume
GitHub Release Tag	1.9.0.200-eep-800
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names

New in This Release

No new features were introduced in this release.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
cb11414	2021-09-07	MAPR-FLUME-82 Update maven artifact version strings to replace 'mep/mapr' with 'eep'
420b96f	2021-09-03	MAPR-FLUME-81 mapr-security-web jar is taken from the cluster

last-updated: Jun 06, 2024

eb25c7b	2021-09-03	MAPR- FLUME-79 kafka-eventstreams*.jar was added to classpath
d9a47e3	2021-07-23	MAPR- FLUME-71 Kafka version was updated to 2.6.1.0-mapr

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Flume 1.9.0.300-2201 (EEP 7.1.2) Release Notes

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Flume. You may also be interested in the Apache Flume 1.9.0 changelog or the Apache Flume homepage.

Version	1.9.0.300
Release Date	March 2022
HPE Version Interoperability	See MEP Components and OS Support
Source on GitHub	https://github.com/mapr/flume
GitHub Release Tag	1.9.0.300-mapr-712
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for MapR Ecosystem Packs (MEPs).

New in This Release

Flume 1.9.0.300-2201 introduces the following enhancements or HPE platform-specific behavior changes:

- Fixes to address CVEs

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
3b8a033	2022-01-25	MAPR-FLUME-85 log4j v1 was updated to the 1.3.1-mapr
0a3c544	2021-12-16	MAPR-FLUME-84 Log4j version was updated to 1.3.0-mapr
e8219f9	2021-12-08	MAPR-FLUME-83 Fixed WS-2021-0419 and CVE-2020-8908
6aeb64e	2021-12-07	MAPR-FLUME-83 CVE fixes

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Hadoop Release Notes

The release notes for the Hadoop and YARN components included in the HPE Ezmeral Data Fabric contain notes specific to data-fabric only.

Hadoop 3.3.5.300 - 2404 (EEP 9.2.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution of Apache Hadoop. You may also be interested in the Apache Hadoop changelog and the Apache Hadoop home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	3.3.5.300
Release Date	April 2024
Version Interoperability	See EEP Components and OS Support on page 5734.
GitHub Source	https://github.com/mapr/hadoop-common/
GitHub Release Tag	3.3.5.300-eep-922
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names.

Documentation	• Hadoop Overview: Hadoop on page 4124
	• YARN Overview: YARN on page 4720
	• Installation: Installing Hadoop and YARN on page 241
	• Upgrade:
	  • Pre-Upgrade Steps for Hadoop and YARN on page 349
	  • Upgrading Hadoop and YARN on page 368
	  • Post-Upgrade Steps for Hadoop and YARN on page 388
	• Commands: Hadoop Commands on page 5540

New in this Release

Hadoop 3.3.5.300 - 2404 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes

last-updated: Jun 06, 2024

- Bug fixes

Fixes

This HPE release includes the following fixes on the base Apache release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
08d8bba7964	2024-04-02	MAPRYARN-430: Disable ability to execute runC container and remove openssl link from container-executor
ebdbd292de9	2024-03-29	ECO-329: Solr updated to 8.11.3 due CVEs
7e6c2e461e2	2024-03-25	MAPRHADOOP-447: Update to commons-configuration2 2.10.1 due to CVE
aa9d7003d69	2024-03-22	MAPRYARN-428: Added tests for SLS
b19ca5d0253	2024-03-19	MAPRHADOOP-447: Fixed build after update commons-compress
7236bd502bc	2024-03-19	MAPRHADOOP-447: Updated nimbus-jose-jwt to 9.37.2 due CVEs
36c42193028	2024-03-19	MAPRHADOOP-447: Updated commons-compress to 1.26.1 due CVEs
39b48bba5fa	2024-02-22	MAPRHADOOP-447: Updated aws-java-sdk to 1.12.663
7c789b22430	2024-02-22	MAPRHADOOP-447: Updated Jetty to 9.4.54.v20240208
fcb727ed5ff	2024-02-22	MAPRHADOOP-447: Updated Netty to 4.1.107.Final
cb4af2de6a6	2024-02-22	Backport HADOOP-18894: upgrade sshd-core due to CVEs
d8deccf24be	2024-02-20	MAPRYARN-427: Create appSystemDir before generation mapr ticket for application
e9ca56c1c78	2024-02-16	MAPRYARN-426: Add MapReduceDefaultProperties to properties for TestDFSIO initialization
d033827ddca	2024-02-14	MAPRHADOOP-443: Fix for yarn-site backup function during configure.sh execution
35c7910aa8e	2024-02-12	MAPRYARN-425: Add RM volume sharding to FSStateStore for RMAppRoot directory

Known Issues and Limitations

Hadoop 3.3.5.300 - 2404 has the following known issues and limitations:

- Multiple labels are not supported within the same node or queue.

Resolved Issues

None.

Hadoop 3.3.5.200 - 2401 (EEP 9.2.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution of Apache Hadoop. You may also be interested in the Apache Hadoop changelog and the Apache Hadoop home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	3.3.5.200

last-updated: Jun 06, 2024

Release Date	January 2024
Version Interoperability	See EEP Components and OS Support on page 5734.

New in this Release

Hadoop 3.3.5.200 - 2401 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base Apache release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
2bd31cfcf32	2024-01-02	Backport HADOOP-19010 - NullPointerException in Hadoop Credential Check CLI
ce934dc5a8c	2024-01-02	MAPRHADOOP-420: Updated aws-java-sdk to 1.12.625 to update shaded netty to 4.1.100 due CVE
e7de866b731	2024-01-02	Backport YARN-11498. Add exclusion for jettison everywhere jersey-json is loaded
b1107624a2f	2023-12-18	MAPRHADOOP-434: Add missing property to configuration oom_score_adj for YARN containers
8fb43045602	2023-11-29	MAPRHADOOP-430: Fixed duplicate files exception in DistCp
795680a7200	2023-11-27	MAPRHADOOP-429: Added commons-compress symlink to Core classpath
9c62fe3af9b	2023-11-24	MAPRHADOOP-401: Updated Guava to 32.1.3-jre due CVE-2023-2976

last-updated: Jun 06, 2024

c788acce7cc	2023-11-17	MAPRYARN-413: Changed Log level for "maxAMshare reached" message
924b962ebbb	2023-11-06	MAPRHADOOP-420: Updated grpc to 1.57.2 due CVE-2023-33953
8b92d0d57c0	2023-11-06	MAPRHADOOP-420: Excluded kerby from solr test framework
ecfd5dba26f	2023-11-02	MAPRHADOOP-420: Updated avro to 1.11.3 due CVE-2023-39410
d3cbf518d3d	2023-11-02	Backport HADOOP-18655. Upgrade kerby to 2.0.3 due to CVE-2023-25613
da9baf8e37e	2023-11-02	MAPRHADOOP-420: Updated grpc to 1.53.2 due CVE-2023-33953
7ecfed1b1f8	2023-11-02	MAPRHADOOP-420: Updated bcfips to 1.0.2.4 due CVE-2022-45146
a86455c8c37	2023-11-02	MAPRHADOOP-420: updated aws-java-sdk-bundle to 1.12.579 due CVE
eecfa6ad647	2023-10-30	Backport HADOOP-18936. Upgrade to jetty 9.4.53
5eb0c1e65c4	2023-10-26	Backport HADOOP-18933. upgrade to netty 4.1.100 due to CVE
872908c43a4	2023-10-26	MAPRHADOOP-420: Updated AWS v1 to 1.12.565
1a6e2e30926	2023-10-26	Backport HADOOP-18916. Exclude all module-info classes from uber jars
5b48db8c93e	2023-10-26	Backported part of HADOOP-18301 for commons-io update
c4c57c02903	2023-10-26	Backport HADOOP-18917. Addendum: Upgrade to commons-io 2.14.0
ce76c2fcab9	2023-10-26	Backport HADOOP-18917. Upgrade to commons-io 2.14.0
dd2a645b637	2023-10-26	Backport HADOOP-18912. upgrade snappy-java to 1.1.10.4
b5d5206011d	2023-10-26	Backport HADOOP-18890. Remove use of okhttp in runtime code
affa03babec	2023-10-23	Backport HADOOP-15124. Improve FileSystem.Statistics performance
69b8da18f2e	2023-10-11	MAPRMR-26: Job History page redirection is not happening properly in RM UI when there are two interfaces on the node
4ff0087f5cc	2023-10-09	MAPRYARN-413: Add "maxAMshare reached" message to INFO logs
13a4711b119	2023-10-05	MAPRYARN-411: Changed log RM level for finding system and stage directories
70e7de8714a	2023-10-05	MAPRHADOOP-416: Fixed local volume creating for NM

Known Issues and Limitations

Hadoop 3.3.5.200 - 2401 has the following known issues and limitations:

- Multiple labels are not supported within the same node or queue.

Resolved Issues

None.

Hadoop 3.3.5.100 - 2310 (EEP 9.2.0) Release Notes

last-updated: Jun 06, 2024

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution of Apache Hadoop. You may also be interested in the Apache Hadoop changelog and the Apache Hadoop home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	3.3.5.100
Release Date	October 2023
Version Interoperability	See EEP Components and OS Support on page 5734.
GitHub Source	https://github.com/mapr/hadoop-common/
GitHub Release Tag	3.3.5.100-eep-920
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names.

Documentation	• Hadoop Overview: Hadoop on page 4124
	• YARN Overview: YARN on page 4720
	• Installation: Installing Hadoop and YARN on page 241
	• Upgrade:
	  • Pre-Upgrade Steps for Hadoop and YARN on page 349
	  • Upgrading Hadoop and YARN on page 368
	  • Post-Upgrade Steps for Hadoop and YARN on page 388
	• Commands: Hadoop Commands on page 5540

New in this Release

Hadoop 3.3.5.100 - 2310 introduces the following enhancements or HPE platform-specific behavior changes:

- Backported critical bug fixes and improvements from Apache Hadoop 3.3.6 release.
- CVE fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base Apache release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
e20d0d56988	2023-09-22	Backported HADOOP-18895. Upgrade to commons-compress 1.24.0 (#6062)
874f6913f80	2023-09-08	MAPRHADOOP-411: Added check for system FIPS configuration

last-updated: Jun 06, 2024

5975f1ab30f	2023-09-05	MAPRHADOOP-409: Add compute node support to NM volume script
f1f2db6ef60	2023-08-17	Backported HADOOP-18832. Upgrade aws-java-sdk to 1.12.499 (#5908)
b6743e48e90	2023-08-15	Backported HADOOP-18837. Upgrade okio to 3.4.0 due to CVE-2023-3635. (#5914)
2bc84402be3	2023-08-02	MAPRYARN-409: Fixed size parameter for NM container logs request
c6b72fdfc1f	2023-08-01	MAPRYARN-408: Fixed prelaunch output capture
1acc06d10f2	2023-07-31	MAPRYARN-407: Fixed disks usages for case when disks are not configured
93565ed17ee	2023-07-28	MAPRYARN-406: Moved disks as resource configuration to yarn-site.xml
0d590d5904e	2023-07-25	Backported MAPREDUCE-7441. Fix race condition in closing FadvisedFileRegion. Contributed by Benjamin Teke
44aea0b2627	2023-07-25	MAPRYARN-401: NullPointerException in IFile$Reader for Apache's shuffle implementation
dd5145f6feb	2023-07-11	Backported YARN-11528. Lock triple-beam to the version compatible with node.js 12 to avoid compilation error. (#5827). Contributed by Masatake Iwasaki
b473aa28aa4	2023-07-07	Backported HADOOP-18718. Fix several maven build warnings (#5592). Contributed by Dongjoon Hyun.
fa3ea3114dc	2023-07-05	Backported HADOOP-18755. openFile builder new optLong() methods break hbase-filesystem (#5704)
75822a22610	2023-07-05	Backported HADOOP-18652. Path.suffix raises NullPointerException (#5653). Contributed by Patrick Grandjean.
546a6903ef1	2023-07-05	Backported HADOOP-18724. Open file fails with NumberFormatException for S3AFileSystem (#5611)
c63fffc6b19	2023-07-05	Backported YARN-11312: [UI2] Refresh buttons don't work after EmberJS upgrade (#5654)
1c0ae8c3131	2023-07-05	Backported YARN-11482. Fix bug of DRF comparision DominantResourceFairnessComparator2 in fair scheduler. (#5607). Contributed by Xiaoqiao He.
148a9e1b9f7	2023-07-05	Backported MAPREDUCE-7437. MR Fetcher class to use an AtomicInteger to generate IDs. (#5579)
03417633b7c	2023-07-05	Backported HADOOP-18662. ListFiles with recursive fails with FNF. (#5477). Contributed by Ayush Saxena.
639b8170a5d	2023-07-05	Backported YARN-11395. RM UI, RMAttemptBlock can not render FINAL_SAVING. Contributed by Bence Kosztolnik
fc5c195f99a	2023-07-05	Backported HADOOP-18433. Fix main thread name for . (#4838) (#5692)
c4b8a4bbfb3	2023-07-05	Backported YARN-11360: Add number of decommissioning/ shutdown nodes to YARN cluster metrics. (#5060)

Known Issues and Limitations

Hadoop 3.3.5.100 - 2310 has the following known issues and limitations:

- Multiple labels are not supported within the same node or queue.

last-updated: Jun 06, 2024

Resolved Issues

None.

Hadoop 3.3.5.0 - 2307 (EEP 9.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution of Apache Hadoop. You may also be interested in the Apache Hadoop changelog and the Apache Hadoop home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	3.3.5.0
Release Date	July 2023
Version Interoperability	See EEP Components and OS Support on page 5734.
GitHub Source	https://github.com/mapr/hadoop-common/
GitHub Release Tag	3.3.5.0-eep-912
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names.

Documentation	• Hadoop Overview: Hadoop on page 4124
	• YARN Overview: YARN on page 4720
	• Installation: Installing Hadoop and YARN on page 241
	• Upgrade:

	  • Upgrading Hadoop and YARN on page 368
	  • Post-Upgrade Steps for Hadoop and YARN on page 388
	• Commands: Hadoop Commands on page 5540

New in this Release

Hadoop 3.3.5.0 - 2307 introduces the following enhancements or HPE platform-specific behavior changes:

- Backported all commits from Apache Hadoop 3.3.5 release.
- CVE fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base Apache release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
65d4f35d	2023/06/26	MAPRHADOOP-394: Updated Netty to 4.1.94 due to CVE

last-updated: Jun 06, 2024

8eaa42cd	2023/06/26	MAPRHADOOP-393: Updated snappy-java to 1.1.10.1 due CVEs
dfc40913	2023/06/20	MAPRYARN-399: Add implementation [YARN-11178] Avoid CPU busy idling and resource wasting in DelegationTokenRenewerPoolTracker thread
64297123	2023/06/16	Backported HADOOP-18496. Upgrade okhttp3 and dependencies due to kotlin CVEs
1e11a14b	2023/06/16	MAPRHADOOP-391: Updated HBase version for 912 release
2cbb27c5	2023/06/16	MAPRHADOOP-392: Updated shaded jars version for 912 release
e43f66ff	2023/06/14	Backported HADOOP-18711. upgrade nimbus jwt jar due to issues in its embedded shaded json-smart code
03469be0	2023/06/14	Backported HADOOP-18712. Upgrade to jetty 9.4.51 due to CVE
70e4eae7	2023/06/14	Backported HADOOP-18101. Bump aliyun-sdk-oss to 3.13.2 and jdom2 to 2.0.6.1
c181eddd	2023/06/06	MAPRHADOOP-386: Fixed relogin from Kerberos ticket cache
0c3126b0	2023/05/26	MAPRHADOOP-385: Fixed YARN services initialization when hadoop.login property set to kerberos
cd622bb4	2023/05/25	MAPRHADOOP-384: Add login object to UGI to use it for re-login operation with keytab
228ad629	2023/05/24	MAPRHADOOP-383: Updated solr to 8.11.2 due CVE-2021-44548
65c45ffc	2023/05/17	MAPRYARN-397: Proxy should respond to client with a redirect if it gets SSL errors from server
49e4db0c	2023/05/12	MAPRMR-25: Fixed compression files for MR applications
e52717b1	2023/05/08	MAPRHADOOP-379: Removed json-smart symlink after removing this dependency from
81717e97	2023/05/08	Backported HADOOP-18687. hadoop-auth: remove unnecessary dependency on json-smart
1a5301f6	2023/04/19	Backported HADOOP-18602. Remove netty3 dependency
8a39f12e	2023/04/19	Backported MAPREDUCE-7431. ShuffleHandler refactor and fix after Netty4 upgrade
869f28cc	2023/04/19	Backported HADOOP-15327. Upgrade MR ShuffleHandler to use Netty4
42513ff6	2023/04/18	MAPRHADOOP-373: Added retry for get and renew token at ATSv1
5854ad0b	2023/04/11	MAPRHADOOP-372: Added property for disabling Kerberos Auth Handler in MultiMechsAuthenticationHandler
59520a24	2023/04/11	MAPRYARN-396: Job history server failed with MalformedJsonException during startup when Kerberos debug enabled

Known Issues and Limitations

Hadoop 3.3.5.0 - 2307 has the following known issues and limitations:

- Multiple labels are not supported within the same node or queue.

Resolved Issues

None.

Hadoop 3.3.4.200 - 2304 (EEP 9.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution of Apache Hadoop. You may also be interested in the Apache Hadoop changelog and the Apache Hadoop home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	3.3.4.200
Release Date	April 2023
Version Interoperability	See EEP Components and OS Support on page 5734.

New in this Release

Hadoop 3.3.4.200 - 2304 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base Apache release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
cd130515b1d	2023/3/03	MAPRHADOOP-369: Updated jettison to 1.5.4

last-updated: Jun 06, 2024

8069beac7d9	2023/3/29	ECO-277: Update zookeeper-jute for application-catalog-webapp to Hadoop project version
609655d9fac	2023/3/29	Backport HADOOP-17717. Update wildfly openssl to 1.1.3.Final.
86658eea13e	2023/3/28	Backport YARN-11076. Upgrade jQuery version in Yarn UI2. (#4046)
d8594582246	2023/3/21	MAPRHADOOP-366: Updated angular to 1.8.3 version
1df722e2bad	2023/3/14	ECO-268: Overwrite jetty dependency for solr to Hadoop version
1835c9eacb5	2023/3/14	MAPRHADOOP-365: Updated bctls and bcpkix jars
1c561f49896	2023/3/14	ECO-265: Updated aws-java-sdk-bundle to 1.12.425
5bffe418c54	2023/3/14	Backport HADOOP-18658. snakeyaml dependency: upgrade to v2.0
787fb9d799e	2023/3/14	Backport HADOOP-18646. Upgrade Netty to 4.1.89.Final to fix CVE-2022-41881
7b62c3a51b2	2023/3/14	Backport HADOOP-18538. Upgrade kafka to 2.8.2
9cbc34c2e28	2023/3/14	Backport HADOOP-18480. Upgrade aws sdk to 1.12.316
9724672b2d5	2023/3/14	Backport HADOOP-18358. Update commons-math3 from 3.1.1 to 3.6.1.
9158dc525a3	2023/3/14	Backport HADOOP-18360. Update commons-csv from 1.0 to 1.9.0.
33377afbf7f	2023/3/14	Backport HADOOP-18587: upgrade to jettison 1.5.3 due to cve
68c43c19015	2023/3/14	Backport HADOOP-18622. Upgrade ant to 1.10.13
cb38312f603	2023/3/14	Backport HADOOP-18300. Upgrade Gson dependency to version 2.9.0
497e3c9b5da	2023/3/14	Backport HADOOP-18484. Upgrade hsqldb to v2.7.1 to mitigate CVE-2022-41853
7fec17d77d8	2023/3/14	Backport HADOOP-18472. Upgrade to snakeyaml 1.33
c8148ea862b	2023/3/7	MAPRYARN-394: Fixed ACL issue for local logs access
b825ad6ab70	2023/3/6	MFS-15708: Fixed default block size behavior for copy commands
30fad7a3f46	2023/3/3	MAPRYARN-393: Added check that label is exists on the cluster for FairScheduler
2fd3b128ed4	2023/2/28	MAPRHADOOP-363: Updated Jetty version to 9.4.50
ef8da4ba117	2023/2/20	MAPRHADOOP-362: Updated protobuf-java to 3.21.12
f15d03ccb3a	2023/2/15	MAPRYARN-390: RM fails to start with default capacity scheduler config
a29874c670c	2023/2/9	Backport HDFS-16766. XML External Entity (XXE) attacks can occur while processing XML received from an untrusted source
a6120a56071	2023/2/3	MAPRHADOOP-356: Added additional check that file exists before adding to classpath
4753281c816	2023/1/30	MAPRHADOOP-357: Updated Guava to 31.1-jre
2d40a6cc6d8	2023/1/25	MAPRYARN-386: Fixed incorrect value for state and start time field at Fair scheduler app page

2b4d861ef44	2023/1/25	MAPRHADOOP-318: Fixed partitions resources and user metrics at FairScheduler with Label configuration

Known Issues and Limitations

Hadoop 3.3.4.200 - 2304 has the following known issues and limitations:

- Multiple labels are not supported within the same node or queue.

Resolved Issues

None.

Hadoop 3.3.4.100 - 2301 (EEP 9.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution of Apache Hadoop. You may also be interested in the Apache Hadoop changelog and the Apache Hadoop home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	3.3.4.100
Release Date	January 2023

	  • Upgrading Hadoop and YARN on page 368
	  • Post-Upgrade Steps for Hadoop and YARN on page 388
	• Commands: Hadoop Commands on page 5540

New in this Release

This is an incremental release of Hadoop 3 for the HPE Ezmeral Data Fabric. Starting from EEP 9.0.0, the HPE Ezmeral Data Fabric supports Apache Hadoop 3.3.4 in release 7.1.0. Hadoop 3.3.4.100 - 2301 introduces the following enhancements:

- Enables the YARN user interface version 2 by default
- Adds a package to support the automatic configuration of ATS v1

- JDK 17 runtime support

Fixes

CVE updates.

Known Issues and Limitations

Hadoop 3.3.4.1000 - 2301 has the following known issues and limitations:

- Multiple labels are not supported within the same node.
- The Cluser and User Metrics pages show incorrect counters calculation for Fair Scheduler + LBS configuration.

Resolved Issues

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
650e8a5d	2023-01-07	MAPRHADOOP-341: Additional fix for jettision update to 1.5.2 version.
24599773	2022-12-21	MAPRHADOOP-341: Updated jettison to 1.5.2 due CVE-2022-45685 and CVE-2022-45693
197c8610	2022-12-21	MAPRHADOOP-341: Updated netty to 4.1.86.Final due CVE-2022-41881
5f546373	2022-12-14	MAPRHADOOP-324: Fixed directory creating for distcp file copy
5e40ca69	2022-12-13	MAPRHADOOP-341: Updated commons-net to 3.9.0 due CVE-2021-37533
f4c64ac4	2022-12-13	Backport HADOOP-18512: upgrade woodstox-core to 5.4.0 for security fix.
54f88a64	2022-12-13	Backport HADOOP-18361. Update commons-net from 3.6 to 3.8.0.
01d948b7	2022-12-13	MAPRHADOOP-341: Updated Guava to 30.1.1-jre
1e76be07	2022-12-12	MAPRHADOOP-340: Fixed configuration container executor after update
a6b6b366	2022-12-08	MAPRHADOOP-339: Updated HBase to 1.4.14.300-eep-910 version
60f6576b	2022-12-05	MAPRHADOOP-336: Updated protobuf-java to 3.21.9
da8b0c62	2022-12-01	MAPRYARN-383: JDK17 support for ATS v1.5
b3b46824	2022-11-21	Backport HADOOP-18493: upgrade jackson-databind to 2.12.7.1
4d738e29	2022-11-19	Backport HADOOP-18497. Upgrade commons-text version to 1.10.0 to fix CVE-2022-42889.
ff2f1b53	2022-11-08	MAPRHADOOP-331: Skip mapreduce.shuffle.ssl.enabled changes for customSecure or -R cases
e379fd28	2022-11-07	MAPRHADOOP-328: JDK 17 runtime support
fd029128	2022-11-07	MAPRHADOOP-107: Changed GC to ParallelGC for better perf
299d7553	2022-11-04	MAPRHADOOP-276: Added Hadoop configuration for custom install location

0957286e	2022-10-25	MAPRYARN-379: Added configuration for ATSv1.0
20c7eeb4	2022-10-24	MAPRHADOOP-318: fix Cluster/User Metrics page incorrect counters
7e05db17	2022-10-24	MAPRHADOOP-324: Distcp creates a directory for every file
9bef300b	2022-10-24	MAPRHADOOP-317: fix root.root queue permanent existence
3ed3b114	2022-10-24	MAPRHADOOP-321: Fixed container-executor.cfg configuration
379cdba4	2022-10-24	MAPRYARN-378: Enable Yarn UI v2 by default

Hadoop 3.3.4.0 - 2210 (EEP 9.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution of Apache Hadoop. You may also be interested in the Apache Hadoop changelog and the Apache Hadoop home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	3.3.4.0

New in this Release

This is the first release of Hadoop 3 for the HPE Ezmeral Data Fabric. Starting from EEP 9.0.0, the HPE Ezmeral Data Fabric supports Apache Hadoop 3.3.4 in release 7.1.0. Hadoop 3.3.4.0 - 2210 introduces the following enhancements:

- HTTPFS package is now a part of Hadoop.
- ATS v2 support is added.

Fixes

None.

Known Issues and Limitations

Hadoop 3.3.4.0 - 2210 has the following known issues and limitations:

- Rolling upgrades from Hadoop 2.x to Hadoop 3.x are not supported. Only offline upgrades to Hadoop 3.x are supported.
- The `sync()` method is deprecated in Hadoop 3.3.4.0. As a workaround, use the `hsync()` method instead.
- Tez does not work with TLS v2. To configure the Tez UI, use TLS v1 or 1.5. For more information, see Configuring ATS 1.0 or 1.5 for Hadoop 3.3 on page 4731.
- YARN UI v2 is not supported.
- Multiple labels are not supported within one node.

Resolved Issues

- None.

Hadoop 2.7.6.400 - 2405 (EEP 8.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution of Apache Hadoop. You may also be interested in the Apache Hadoop changelog and the Apache Hadoop home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	2.7.6.400
Release Date	May 2024
Version Interoperability	See EEP Components and OS Support on page 5734.
GitHub Source	https://github.com/mapr/hadoop-common/
GitHub Release Tag	2.7.6.400-eep-812
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names.

Documentation	• Hadoop Overview: Hadoop on page 4124
	• YARN Overview: YARN on page 4720
	• Installation: Installing Hadoop and YARN on page 241
	• Upgrade:
	  • Pre-Upgrade Steps for Hadoop and YARN on page 349
	  • Upgrading Hadoop and YARN on page 368
	  • Post-Upgrade Steps for Hadoop and YARN on page 388
	• Commands: Hadoop Commands on page 5540

New in this Release

Hadoop 2.7.6.400 - 2405 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

Fixes

This HPE release includes the following fixes on the base Apache release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
70cfcd5bb9d	2024-05-01	MAPRHADOOP-460: Added symlinks for zookeeper libraries
2e7d98042a6	2024-04-22	MAPRHADOOP-464: Moved client and core symlinks from package scripts
4a8cfec05d9	2024-04-15	MAPRHADOOP-463: Updated commons-compress to 1.26.1 due CVE-2024-25710, CVE-2024-26308
d2014d8d1e6	2024-04-15	MAPRHADOOP-463: Updated Jetty to 9.4.54.v20240208 due CVE-2023-40167, CVE-2023-36478
ae83d959b22	2024-04-15	MAPRHADOOP-463: Updated Netty to 4.1.108.Final due CVE-2024-29025
5c408984547	2024-04-15	MAPRHADOOP-461: Updated tomcat to 9.0.87
779432c0de2	2024-03-05	MAPRHADOOP-454: Updated aws-java-sdk to 1.12.663 due CVE-2022-42003/CVE-2022-42004
952dc816894	2024-03-04	MAPRHADOOP-453: Removed json-smart symlink for update
a10b0b56eb3	2024-03-04	MAPRHADOOP-449: Excluded Netty from zookeeper transitive dependency
1d6c9c082c3	2024-03-01	MAPRHADOOP-449: Updated Netty to 4.1.100.Final due CVE-2023-44487
ead535aeef9	2024-03-01	MAPRHADOOP-453: Removed json-smart symlink from Hadoop due CVE
760fbb43921	2024-03-01	MAPRHADOOP-451: Updated guava to 32.1.3-jre version due CVE-2023-2976
2172f813aec	2024-01-17	MAPRYARN-418: Check that resourcesUploadPolicies include resource, else don't upload this resource to shared cache

bf1d9b5eac6	2023-10-09	MAPRYARN-413: Add "maxAMshare reached" message to INFO logs

Known Issues and Limitations

None.

Resolved Issues

None.

Hadoop 2.7.6.300 - 2305 (EEP 8.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution of Apache Hadoop. You may also be interested in the Apache Hadoop changelog and the Apache Hadoop home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	2.7.6.300

New in this Release

Hadoop 2.7.6.300 - 2305 introduces the following enhancements or HPE platform-specific behavior changes:

Fixes

This HPE release includes the following fixes on the base Apache release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
f370e4482f6	2023-04-26	MAPRHADOOP-369: Updated jettison to 1.5.4
57e0ea0e4b7	2023-04-26	Backported HADOOP-18484. Upgrade hsqldb to v2.7.1 to mitigate CVE-2022-41853
5745785d03e	2023-04-26	MAPRHADOOP-377: Updated java-xmlbuilder due CVE-2014-125087
88e6fd00472	2023-04-21	MAPRHADOOP-374: Update Jetty to 9.4.51.v20230217
97efb4b6c91	2023-03-13	MAPRYARN-303: Added label check for queues
a4fca4f3053	2023-02-20	MAPRHADOOP-362: Updated protobuf-java to 3.21.12
9863e42daf8	2023-02-14	MAPRHADOOP-272: Fix of not reported failed maps to AppMaster
c7833b0e296	2023-02-14	MAPRYARN-355: Handle cases when HS volume is disabled
289ef245964	2023-02-14	MAPRHADOOP-254: NPE when listing symlink pointing to a non-existent directory
b7803ba03c8	2023-02-14	MAPRYARN-355: Add property to enable new volumes topology for JHS and RM
49c06fd25a0	2023-02-14	Backported HADOOP-12191. Bzip2Factory is not thread safe.
0beda4540f6	2023-02-14	MAPRHADOOP-244: Fixed FileSystem.listFiles method for case with symlink in path
d36f1de2b4c	2023-02-14	Backported HDFS-10239. Fsshell mv fails if port usage doesn't match in src and destination paths.
b8340d7d0e6	2023-02-14	Backported YARN-3241. FairScheduler handles invalid queue names inconsistently.
ffb7f421909	2023-02-06	MAPRHADOOP-356: Added additional check that file exists before adding to classpath
e6203b95746	2023-01-27	MAPRHADOOP-355: Hide Jetty Server version header in HTTP responses
95f21b7f5b4	2023-01-23	MAPRHADOOP-354: Updated guava to 31.1-jre version
93ac43c70f4	2023-01-18	MAPREDUCE-6852. Job#updateStatus() failed with NPE due to race condition.
fa68392e91b	2023-01-12	Backported YARN-10438. Handle null containerId in ClientRMService#getContainerReport()
2b689991b2f	2023-01-03	MAPRHADOOP-341: Updated commons-net to 3.9.0 due CVE-2021-37533
bbb29349a57	2022-12-12	MAPRHADOOP-336: Updated protobuf java to 3.21.9
dd5960f2515	2022-11-28	Backported YARN-6510. Fix profs stat file warning caused by process names that includes parenthesis.
63ad9405be3	2022-11-25	MAPRHADOOP-331: Skip mapreduce.shuffle.ssl.enabled changes for customSecure or -R cases
b6a6dd9847b	2022-10-14	Backported HADOOP-18344. Upgrade AWS SDK to 1.12.262
8898f261475	2022-10-14	MAPRHADOOP-320: Updated distcp command to copy files into existing directory
fa0e428c02a	2022-09-30	MAPRHADOOP-250: Configure.sh -R resets the RM HA configuration in warden.resourcemanager.conf from '1' to 'all'

last-updated: Jun 06, 2024

77c959bd998	2022-08-30	MAPRHADOOP-299: Updated Jackson 2 to 2.12.7 due CVE
bb38f6a66b0	2022-08-23	MAPRHADOOP-294: Updated Jackson to 1.9.14-atlassian-6 due CVE-2019-10172
8ea6600588e	2022-08-09	Backported HADOOP-18155. Refactor tests in TestFileUtil
743984850d2	2022-08-09	Backported HADOOP-18136. Verify FileUtils.unTar() handling of missing .tar files.
411062b1ca2	2022-06-20	Backported YARN-8640. Restore previous state in container-executor after failure.
cf555cfe11a	2022-05-03	Backported YARN-3957. FairScheduler NPE In FairSchedulerQueueInfo causing scheduler page to return 500.

Known Issues and Limitations

None.

Resolved Issues

None.

Hadoop 2.7.6.200 - 2201 (EEP 8.1.0) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of Apache Hadoop.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	2.7.6.200
Release Date	January 2022
Version Interoperability	See EEP Components and OS Support on page 5734.
GitHub Source	https://github.com/mapr/hadoop-common/
GitHub Release Tag	2.7.6.200-eep-810
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names.

Documentation	• Hadoop Overview: Hadoop on page 4124
	• YARN Overview: YARN on page 4720
	• Installation: Installing Hadoop and YARN on page 241
	• Upgrade:
	  • Pre-Upgrade Steps for Hadoop and YARN on page 349
	  • Upgrading Hadoop and YARN on page 368
	  • Post-Upgrade Steps for Hadoop and YARN on page 388
	• Commands: Hadoop Commands on page 5540

New in this Release

Hadoop 2.7.6.100 - 2110 introduces the following enhancements:

- Added FIPS support.
- Added sharding for RM volume across multiple volumes to support stability.

Fixes

This HPE release includes the following fixes on the base Apache release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
974986fae21	2022-01-25	MAPRHADOOP-213: updated log4j to 1.3.1-mapr version
65cf470fefa	2022-01-21	MAPRYARN-349: verify ownership/permissions for cluster directory when RM/HS starts
e587b904ab1	2022-01-13	MAPRHADOOP-211: handle case when volume mapr.resourcemanager.volume is already mounted with incorrect mount point
7ac1f8da988	2021-12-14	MAPRYARN-348: Updated Netty4 to 4.1.71.Final version
41bd3d1a720	2021-12-09	MAPRHADOOP-209: Fixed backward compatibility for client
ce8692d77c4	2021-12-06	MAPRYARN-337 - Create Spark spill local volumes by default
0cc00d6dd33	2021-12-01	MAPRYARN-345: Added FIPS support to AWS client
513f2c49362	2021-11-24	MAPRYARN-312: fix MapRTicketLocalizer to be able to operate with nm-local-dirs as with list of directories
a48cf251a22	2021-11-18	MAPRYARN-342: Removed Netty3 dependency
d25811160d6	2021-11-18	Backport HADOOP-11245. Update NFS gateway to use Netty4
ed9b5fa1f04 2b0e116df0b	2021-11-18	Backport HDFS-5570. Deprecate hftp / hsftp and replace them with webhdfs / swebhdfs. Contributed by Haohui Mai
c6245b1186e	2021-11-18	MAPRYARN-343: updated gson to 2.8.9 version
7c9a5632a37	2021-11-18	MAPRHADOOP-207: Jetty updated to 9.4.44.v20210927 version
330748ae5f0	2021-11-02	Backport YARN-4925. ContainerRequest in AMRMClient, application should be able to specify nodes/racks together with nodeLabelExpression. Contributed by Bibin A Chundatt
ddad84644f1	2021-10-25	MAPRYARN-333: Fixed logging ContainerLocalizer to local file system while yarn.use-central-logging-for-mapreduce-only is enabled
336907aa52c a6d6f29f6c1 0e5d6028056	2021-10-22	MAPRYARN-326: Added SCRAM-SASL to Hadoop
782d4b83149	2021-10-13	MAPRYARN-317: add ability to enable case in-sensitive groups/usernames in fair-scheduler file
59737fbb1dd	2021-10-04	Backport YARN-7157. Add admin configuration to filter per-user's apps in secure cluster. Contributed by Sunil G.
d1c8ea0dd4a	2021-09-03	MAPRYARN-296: YARN RM UI or commands do not show allocated containers for finished applications

last-updated: Jun 06, 2024

1579432cb0d	2021-09-03	Backport YARN-4417. Make RM and Timeline-server REST APIs more consistent. Contributed by Wangda Tan
db2081bd96d	2021-09-03	Backport YARN-5440. Use AHSClient in YarnClient when TimelineServer is running (Xuan Gong via gtcarrera9)
078ab8abb3f	2021-09-03	Backport YARN-5767. Fix the order that resources are cleaned up from the local Public/Private caches. Contributed by Chris Trezzo
085526639b5	2021-08-20	MAPRHADOOP-195: Create symlinks to verify script for Hadoop services
56a48da51ec	2021-08-17	MAPRYARN-274: Shard RM volume across multiple volumes to support scalability
f45e2898856 42a6a35138c	2021-08-12	MAPRHADOOP-187: Add property to preserve link for "hadoop cp" and distCp operations
07887e3f7c5 8c752b00fcc	2021-07-21	MAPRHADOOP-185: Use alternate java.security for yarn scripts

Known Issues and Limitations

- None.

Resolved Issues

- None.

Hadoop 2.7.6.100 - 2110 (EEP 8.0.0) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of Apache Hadoop.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	2.7.6.100
Release Date	October 2021
Version Interoperability	See EEP Components and OS Support on page 5734.
GitHub Source	Not applicable
GitHub Release Tag	2.7.6.100-eep-800
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names.

Documentation	• Hadoop Overview: Hadoop on page 4124
	• YARN Overview: YARN on page 4720
	• Installation: Installing Hadoop and YARN on page 241
	• Upgrade:
	  • Pre-Upgrade Steps for Hadoop and YARN on page 349
	  • Upgrading Hadoop and YARN on page 368
	  • Post-Upgrade Steps for Hadoop and YARN on page 388
	• Commands: Hadoop Commands on page 5540

New in this Release

Hadoop 2.7.6.100 - 2110 introduces the following enhancements or HPE platform-specific behavior changes:

- All fixes from Apache Hadoop 2.7.6 have been backported.
- Support for file exclusion list in DistCp.
- Added a `yarn top` tool.
- Support for BCFKS keystores for Hadoop Credential Provider.

Fixes

This HPE release includes the following fixes on the base Apache release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
4d102084877	2021-09-13	MAPRHADOOP-200: Load ssl configuration after core-site.
48960d6b6e5	2021-09-01	MAPRYARN-323-325: Added BC provider to Hadoop services
b808c225390	2021-09-01	Backport HADOOP-17699. Remove hardcoded SunX509 usage from SSLFactory. (#3016)
ca635e0db98	2021-09-01	MAPRHADOOP-192: Exclude bc-fips jars from Hadoop build
0dc49e773b8	2021-09-01	Backport HADOOP-13011 - Clearly Document the Password Details for Keystore-based Credential Providers
5400bc53028	2021-09-01	Backport HADOOP-17284. Support BCFKS keystores for Hadoop Credential Provider. (#2334)
c4ef4f0f162	2021-09-01	Backport HADOOP-12942. hadoop credential commands non-obviously use password of "none" (Mike Yoder via lmccay)
b93bcdf2592	2021-08-18	MAPRHADOOP-194: Update commons-compress to 1.21
4f1c4ec9828	2021-08-12	MAPRHADOOP-190: update htrace to 4.2.0-mapr-incubating
dc9fce5dd8f	2021-08-04	MAPRMR-21: ControlledJob#toString failed with NPE when job status is not successfully updated
f267f098be2	2021-08-04	Backport MAPREDUCE-6762. ControlledJob#toString failed with NPE when job status is not successfully updated (Weiwei Yang via Varun Saxena)

last-updated: Jun 06, 2024

e0732a00771	2021-07-28	MAPRHADOOP-186: Update Jetty to 9.4.43.v20210629
a30951764be	2021-07-27	MAPRMR-20: add retry support for all Job actions
a42503a9153	2021-07-26	Update gradle-wrapper.properties
1d04de14c09	2021-07-26	Backport MAPRYARN-321: Upgraded Avro version to 1.10.1
2b2518f33a8	2021-07-23	Backport HADOOP-17341. Upgrade commons-codec to 1.15 (#2428)
b6988af1234	2021-07-20	Backport HADOOP-10075. addendum to fix compilation on Windows
7d0183ee3bd	2021-06-21	MAPRYARN-320: Kill child process from container-executor
ad8e8d08c0b	2021-06-18	Backport YARN-10490. yarn top command not quitting completely with ctrl+c. Contributed by Agshin Kazimli
1c737ee2f90	2021-06-18	MAPRYARN-316: Added disks to "yarn top" command
a35adb43f87	2021-06-18	Backport YARN-3348. Add a 'yarn top' tool to help understand cluster usage. Contributed by Varun Vasudev
9f5418a1de5	2021-06-07	Backport HADOOP-17602. Upgrade JUnit to 4.13.1. Contributed by Ahmed Hussein.
f3b647eea98	2021-06-04	Fixed LocatedFileStatusFetcher for work with symlinks
9b16bf0084b	2021-06-03	MAPRHADOOP-177: Fixed mkdir command for non existing parent dir
e96a8d7e003	2021-06-02	MAPRHADOOP-174: Fixed issue with copying multiple files to directory
740035b02f1	2021-05-31	Backport HADOOP-16245. Restrict the effect of LdapGroupsMapping SSL configurations to avoid interfering with other SSL connections. Contributed by Erik Krogen.
27e38cbbb28	2021-05-31	Backport HADOOP-12862. LDAP Group Mapping over SSL can not specify trust store. Contributed by Wei-Chiu Chuang and Konstantin Shvachko.
290a908be21	2021-05-31	Backport HADOOP-15345. Backport HADOOP-12185 to branch-2.7: NetworkTopology is not efficient adding/getting/removing nodes. Contributed by He Xiaoqiao.
532934140ad	2021-05-31	Backport HDFS-13195. DataNode conf page cannot display the current value after reconfig. Contributed by maobaolong.
f9918ab5550	2021-05-31	Backport HDFS-12884. BlockUnderConstructionFeature.truncateBlock should be of type BlockInfo. Contributed by chencan.
1c3f997eb9b	2021-05-31	Backport HADOOP-13105. Support timeouts in LDAP queries in LdapGroupsMapping. Contributed by Mingliang Liu.
209c93fbe66	2021-05-31	Backport HADOOP-12001. Fixed LdapGroupsMapping to include configurable Posix UID and GID attributes during the search. Contributed by Patrick White.
fdb6bf9b675	2021-05-31	Backport HADOOP-15279. increase maven heap size recommendations
444cef90d29	2021-05-31	Backport HADOOP-15283. Upgrade from findbugs 3.0.1 to spotbugs 3.1.2 in branch-2 to fix docker image build.
a156fd13c95	2021-05-31	Backport HDFS-4210. Throw helpful exception when DNS entry for JournalNode cannot be resolved. Contributed by Charles Lamb and John Zhuge.

last-updated: Jun 06, 2024

79158f841e8	2021-05-31	Backport HADOOP-15206. BZip2 drops and duplicates records when input split size is small. Contributed by Aki Tanaka
93547c2cb3b	2021-05-31	Backport HADOOP-12568. Update core-default.xml to describe posixGroups support. Contributed by Wei-Chiu Chuang.
28283d0740c	2021-05-31	Backport HADOOP-12793. Write a new group mapping service guide (Wei-Chiu Chuang via iwasakims)
a6aef9fa3fa	2021-05-31	Backport HADOOP-9477. Add posixGroups support for LDAP groups mapping service. (Dapeng Sun via Yongjun Zhang)
2b0f6773337	2021-05-31	Backport MAPREDUCE-7048. Uber AM can crash due to unknown task in statusUpdate. Contr ibuted by Peter Bacsko
ac06e483c05	2021-05-31	Backport HDFS-10453. ReplicationMonitor thread could stuck for long time due to the race between replication and delete of same file in a large cluster.. Contributed by He Xiaoqiao.
384340b76ed	2021-05-31	Backport HDFS-7959. WebHdfs logging is missing on Datanode (Kihwal Lee via sjlee)
953f75abed0	2021-05-31	Backport HDFS-13120. Snapshot diff could be corrupted after concat. Contributed by Xiaoyu Yao.
8bc1c2ecbaa	2021-05-31	Backport HADOOP-15212. Add independent secret manager method for logging expired tokens. Contributed by Daryn Sharp.
f73da507697	2021-05-31	Backport MAPREDUCE-7020. Task timeout in uber mode can crash AM. Contributed by Peter Bacsko
ef3f06d320b	2021-05-31	Backport HDFS-12371. BlockVerificationFailures and BlocksVerified show up as 0 in Datanode JMX. Contributed by Hanisha Koneru.
7570e0e491d	2021-05-31	Backport HADOOP-13508. FsPermission string constructor does not recognize sticky bit. Contributed by Atul Sikaria.
27e4c5fe92e	2021-05-31	Backport HDFS-11003. Expose XmitsInProgress through DataNodeMXBean. Contributed By Brahma Reddy Battula
a537ad3ea2d	2021-05-31	Backport HADOOP-13263. Reload cached groups in background after expiry. (Contributed bt Stephen O'Donnell)
358d2fd6795	2021-05-31	Backport HADOOP-14246. Authentication Tokens should use SecureRandom instead of Random and 256 bit secrets (Conttributed by Robert Kanter via Daniel Templeton)
fb29d47034b	2021-05-31	Backport HDFS-11384. Balancer disperses getBlocks calls to avoid NameNode's rpc queue saturation. Contributed by Konstantin V Shvachko.
442c573b4e6	2021-05-31	Backport MAPREDUCE-7028. Concurrent task progress updates causing NPE in Application Master. Contributed by Gergo Repas
ead4809bbc1	2021-05-31	Backport HDFS-12881. Output streams closed with IOUtils suppressing write errors. Contributed by Ajay Kumar
f7842437eff	2021-05-31	Backport MAPREDUCE-5124. AM lacks flow control for task events. Contributed by Peter Bacsko
9316e6866df	2021-05-31	Backport YARN-4167. NPE on RMActiveServices#serviceStop when store is null. (Bibin A Chundatt via rohithsharmaks) Backport YARN-6633 by Inigo Goiri.
573618f058e	2021-05-31	Backport YARN-3425. NPE from RMNodeLabelsManager.serviceStop when NodeLabelsManager.serviceInit failed. (Bibin A Chundatt via wangda) Backport YARN-6632 by Inigo Goiri.

last-updated: Jun 06, 2024

38565378f4f	2021-05-31	Backport YARN-7661. NodeManager metrics return wrong value after update node resource. Contributed by Yang Wang
cb027e006c4	2021-05-28	Backport MAPRHADOOP-174: Added wildcard usage for path with symlinks
ffc31a97594	2021-05-26	Backport YARN-4348. ZKRMStateStore.syncInternal shouldn't wait for sync completion for avoiding blocking ZK's event thread. (ozawa)
226dfdeca76	2021-05-26	Backport YARN-3798. ZKRMStateStore shouldn't create new session without occurrance of SESSIONEXPIED. (ozawa and Varun Saxena)
4f4bf8a1446	2021-05-20	MAPRHADOOP-173: Moving cluster from secure to unsecure breaks yarn-site.xml
6a83c9d9918	2021-05-19	COMSECURE-384: Add Bouncy Castle JARs to Hadoop class path - unitTested
fa833c7d5bb	2021-05-17	MAPRHADOOP-171: Distcp to S3A does not work
ff9e411bb5f	2021-05-13	MAPRHADOOP-172: configure ssl-client/server.xml as part of hadoop-util configuration
da5ef438a37	2021-05-11	Backport HADOOP-15970. Upgrade plexus-utils from 2.0.5 to 3.1.0.
4e64e475366	2021-05-06	MAPRYARN-299: change service name identification approach
6d453dc22df	2021-04-28	MAPRHADOOP-169: Updated JQuery to 3.5.1 for SLS
2ac48dc37c5	2021-04-28	Backport HADOOP-17302. Upgrade to jQuery 3.5.1 in hadoop-sls. (#2379)
32e551d6ae2	2021-04-28	Backport HADOOP-14040. Use shaded aws-sdk uber-JAR 1.11.86. Contributed by Steve Loughran and Sean Mackrory
8394c1d02c1	2021-04-28	Backport HADOOP-12537 S3A to support Amazon STS temporary credentials. Contributed by Sean Mackrory.
1c36296b9e8	2021-04-28	Backport HADOOP-12723 S3A: Add ability to plug in any AWSCredentialsProvider. Contributed by Steven Wong.
eed76986ecd	2021-04-26	Backport HADOOP-1540. Support file exclusion list in distcp. Contributed by Rich Haase
912a88cdc84	2021-04-20	MAPRHADOOP-167: jackson-mapper-asl updated to 1.9.13-atlassian-5

Hadoop 2.7.6.0 - 2201 (EEP 7.1.2) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of Apache Hadoop.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	2.7.6.0

Release Date	March 2022
Version Interoperability	See EEP Components and OS Support on page 5734.
GitHub Source	https://github.com/mapr/hadoop-common/
GitHub Release Tag	`2.7.6.0-mapr-712`
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names.

Documentation	• Hadoop Overview: Hadoop on page 4124
	• YARN Overview: YARN on page 4720
	• Installation: Installing Hadoop and YARN on page 241
	• Upgrade:
	  • Pre-Upgrade Steps for Hadoop and YARN on page 349
	  • Upgrading Hadoop and YARN on page 368
	  • Post-Upgrade Steps for Hadoop and YARN on page 388
	• Commands: Hadoop Commands on page 5540

New in this Release

Hadoop 2.7.6.0 is a minor update that includes a backport of all commits from Apache Hadoop 2.7.6 with bug fixes and updated dependencies to address CVEs.

Fixes

This data-fabric release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub.

Commit	Date (YYYY-MM-DD)	Comment
eff76fc8	2022-01-31	Backport HADOOP-11918. Listing an empty s3a root directory throws FileNotFound
b0ad6bf0	2022-01-25	MAPRHADOOP-213: updated log4j to 1.3.1-mapr version
6bdb3818	2021-12-14	MAPRYARN-348: Updated Netty4 to 4.1.71.Final version
e27dbdcc	2021-11-18	MAPRYARN-342: Removed Netty3 dependency
371faa33	2021-11-18	Backport HADOOP-11245. Update NFS gateway to use Netty4
47f8a560 a761d74d	2021-11-18	Backport HDFS-5570. Deprecate hftp / hsftp and replace them with webhdfs / swebhdfs. Contributed by Haohui Mai
b7ee29dd	2021-11-18	MAPRYARN-343: updated gson to 2.8.9 version
f5bee762	2021-11-18	MAPRHADOOP-207: Jetty updated to 9.4.44.v20210927 version
30f10fee	2021-11-02	Backport YARN-4925. ContainerRequest in AMRMClient, application should be able to specify nodes/racks together with nodeLabelExpression. Contributed by Bibin A Chundatt

last-updated: Jun 06, 2024

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

HBase Release Notes

The release notes for HBase component included in the HPE Ezmeral Data Fabric contains notes specific to data-fabric only.

More details are available on the Apache website under the Release Notes for Apache HBase page and the Apache HBase Project page.

HBase 1.4.14.700 - 2404 (EEP 9.2.2) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of HBase.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. You may also be interested in the Ecosystem Component Release Notes on page 5804 and the Apache HBase homepage.

Version	1.4.14.700
Release Date	April 2024
Version Interoperability	See Interoperability Matrix, Ecosystem Support Matrix, and HBase Support Matrix.
Source on GitHub	https://github.com/mapr/hbase
GitHub Release Tag	1.4.14.700-eep-922
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.

New in this Release

HBase 1.4.14.700 - 2404 introduces the following enhancements or HPE platform-specific behavior changes:

- CVEs fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
4daa14f98	2024-04-02	EEP-HBASE-387: Upgrade Jetty to 9.4.54.v20240208
8e2754442	2024-04-02	EEP-HBASE-386: Keep only v1.26.1 for common compress

146ffd027	2024-04-01	EEP-HBASE-373: Prepare HBase for EEP-922 release
9a9339d87	2024-03-25	EEP-HBASE-383: BufferedMutator performance issue: one RPC per operation
3be400dc6	2024-03-04	EEP-HBASE-382: CVE-2017-17790
99681d69e	2024-03-04	EEP-HBASE-378: CVE-2023-1436 reported in Hbase
7aba253d6	2024-03-01	EEP-HBASE-377: netty-codec reported for hbase
b66f27fb3	2024-03-01	EEP-HBASE-374: Customer is reporting the CVE-2023-46589 for hbase package
e7976008b	2024-02-16	EEP-HBASE-372: Permission denied to execute command in the hbase shell as another user

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

None.

Resolved Issues

None.

HBase 1.4.14.600 - 2401 (EEP 9.2.1) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of HBase.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. You may also be interested in the Ecosystem Component Release Notes on page 5804 and the Apache HBase homepage.

Version	1.4.14.600
Release Date	January 2024
Version Interoperability	See Interoperability Matrix, Ecosystem Support Matrix, and HBase Support Matrix.
Source on GitHub	https://github.com/mapr/hbase
GitHub Release Tag	1.4.14.600-eep-921
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.

New in this Release

HBase 1.4.14.600 - 2401 introduces the following enhancements or HPE platform-specific behavior changes:

- CVEs fixes
- Bug fixes

last-updated: Jun 06, 2024

Fixes

This HPE release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
b3e677dbe	2024-01-08	EEP-HBASE-370: Upgrade Avro to 1.11.3
f85f8fd81	2024-01-08	EEP-HBASE-369: Upgrade Jetty to 9.4.53.v20231009
796e9035f	2024-01-08	EEP-HBASE-366: Vulnerabilities in hbase-shaded-htrace in MEP 6.3.6 (jackson-databind)
fa8c828b3	2023-12-12	EEP-HBASE-358: Update Guava to 32.1.3 to address CVE-2023-2976
df66c5683	2023-12-05	EEP-HBASE-365: HBase build fails due to licence issues

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

None.

Resolved Issues

None.

HBase 1.4.14.500 - 2307 (EEP 9.1.2) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of HBase.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. You may also be interested in the Ecosystem Component Release Notes on page 5804 and the Apache HBase homepage.

Version	1.4.14.500
Release Date	July 2023
Version Interoperability	See Interoperability Matrix, Ecosystem Support Matrix, and HBase Support Matrix.
Source on GitHub	https://github.com/mapr/hbase
GitHub Release Tag	1.4.14.500-eep-912
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.

New in this Release

HBase 1.4.14.500 - 2307 introduces the following enhancements or HPE platform-specific behavior changes:

- CVEs fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
e4a77dc67b	2023-07-17	EEP-HBASE-357: Can not start hbase-shell on SLES cluster
e0e94b35ab	2023-06-30	EEP-HBASE-340: MEP 9.1.1: Vulnerable version of avro-1.10.1 bundled as part of the mapr-hbase.
35d070d93	2023-06-14	EEP-HBASE-356: hbase non interactive shell throw ERROR NoMethodError: undefined method 'conf' for IRB:Module
090ca8ba9	2023-06-13	EEP-HBASE-347: Security: Vulnerable version of libthrift 0.13.0, bundled as part of the MEP 9.1.1 HBase.
d2ae3202c	2023-06-13	EEP-HBASE-342: Security:: vulnerable version of jackson-databind bundled as part of the HBase~

New in this Release

HBase 1.4.14.200 - 2210 introduces the following enhancements or HPE platform-specific behavior changes:

- Version update to 1.4.14.200
- CVE fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
f5c74467eb	2022-10-03	EEP-HBASE-300 HBase services fail to start after updating dependencies
23eca0055a	2022-10-03	EEP-HBASE-299 ClassNotFoundException: org.apache.hadoop.hbase.shaded.com.google.common.base.Objects
40664b4cb7	2022-10-03	EEP-HBASE-296 CVE fixes at HBase 1.4.14
e7cc204d70	2022-08-23	EEP-HBASE-294 CVE-2021-29425 - commons-io
a973f4598d	2022-08-23	EEP-HBASE-295 Update hadoop artifacts version to 3.3.4.0-eep-900-SNAPSHOT
8cfdf5c705	2022-08-23	ECO-224 CVE-2018-14721 - jackson databind
3364e656b0	2022-08-23	EEP-HBASE-292 Update HBase to use 'reload4j'
0e58730c4c	2022-08-23	EEP-HBASE-291 HBase mapreduce jobs fail with Error: java.lang.ClassNotFoundException: org.apache.commons.lang.ArrayUtils
f894f94ef2	2022-08-23	EEP-HBASE-278: HBase mapreduce jobs fail on mixed fips cluster configuration
d227f2c9c7	2022-08-03	EEP-HBASE-288 Build HBase 1.4.14 with Hadoop3
219b1d45cd	2022-04-11	EEP-HBASE-284 HBase v1.4.14 porting to EEP. Warden scripts fixed

last-updated: Jun 06, 2024

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

None.

Resolved Issues

For a FIPS-enabled configuration, mixed mode support is not available in this release. For example, a non-FIPS client node cannot communicate with a FIPS server node.

HBase 1.4.14.125 - 2405 (EEP 8.1.2) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of HBase.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. You may also be interested in the Ecosystem Component Release Notes on page 5804 and the Apache HBase homepage.

New in this Release

HBase 1.4.14.125 - 2405 introduces the following enhancements or HPE platform-specific behavior changes:

- CVEs fixes.
- Bug fixes.

Fixes

This HPE release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
d754bcd5d	2024-04-12	EEP-HBASE-387: Upgrade Jetty to 9.4.54.v20240208
dda13ea80	2024-04-12	EEP-HBASE-386: Keep only v1.26.1 for common compress
bda61108a	2024-04-12	EEP-HBASE-303: HBase warden.*.conf is not created after configure.sh
180c3da8d	2024-03-25	EEP-HBASE-383: BufferedMutator performance issue: one RPC per operation

last-updated: Jun 06, 2024

fa19b16bf	2024-03-04	EEP-HBASE-382: CVE-2017-17790
824da8389	2024-03-04	EEP-HBASE-378: CVE-2023-1436 reported in Hbase
b8b2fb715	2024-03-01	EEP-HBASE-370: Upgrade Avro to 1.11.3
c9806e7a9	2024-03-01	EEP-HBASE-372: Permission denied to execute command in the hbase shell as another user
c4be4707b	2024-03-01	EEP-HBASE-358: Update Guava to 32.1.3 to address CVE-2023-2976
a3a69d4da	2024-03-01	EEP-HBASE-377: netty-codec reported for hbase
c4651e692	2024-03-01	EEP-HBASE-376: Address CVE-2014-125087 vulnerability in HBASE

HBase 1.4.14.100 - 2305 (EEP 8.1.1) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of HBase.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. You may also be interested in the Ecosystem Component Release Notes on page 5804 and the Apache HBase homepage.

Version	1.4.14.100
Release Date	May 2023
Version Interoperability	See Interoperability Matrix, Ecosystem Support Matrix, and HBase Support Matrix.
Source on GitHub	https://github.com/mapr/hbase
GitHub Release Tag	1.4.14.100-eep-811
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.

New in this Release

HBase 1.4.14.100 - 2305 introduces the following enhancements or HPE platform-specific behavior changes:

- Upgraded HBase from version 1.14.13 to version 1.14.14.

- Starting with EEP 8.1.1, HBase works on FIPS mixed mode clusters.
- CVEs fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
2d75a4004	2023-05-05	HBASE-20295 fix NullPointException in TableOutputFormat.checkOutputSpecs
ba7988608	2023-05-02	EEP-HBASE-333: Update Guava to 31.1-jre
1c50fabf1a	2023-05-02	EEP-HBASE-332: Update Jetty to 9.4.51.v20230217
62b2797ba6	2023-03-28	EEP-HBASE-318: Use core jars from the cluster whenever it's possible. Jars conflict potential issue.
c61d1f737f	2023-03-27	EEP-317: Update protobuf-java version to 3.21.12
8d08493e0a	2023-03-15	ECO-264: Security: Vulnerable version of gson 2.8.5 binary bundled with mapr-hadoop-core-3.3.4.200.202303070410-1.x86_64.rpm
7ea8152dca	2023-03-14	EEP-HBASE-309: [HBase]Update protobuf-java version to 3.21.9
7f48573924	2023-03-14	ECO-224 CVE-2018-14721 - jackson databind (part2)
95d262818	2023-03-14	EEP-HBASE-317: netty-codec-haproxy vulnerabilities
aacd9e4b0	2023-03-14	EEP-HBASE-315: commons-text vulnerabilities
fd8cf28fa	2023-03-14	EEP-HBASE-316: jackson-databind vulnerabilities
67e5455a1	2023-03-14	EEP-HBASE-314: tomcat-embed-core and tomcat-coyote vulnerabilities
3217048a5	2023-03-14	EEP-HBASE-313: jettison vulnerabilities
79e459715	2023-03-14	HBASE-300 HBase services fail to start after updating dependencies
bc963dd08	2023-03-14	HBASE-299 ClassNotFoundException: org.apache.hadoop.hbase.shaded.com.google.common.base.Objects
a3499e1de	2023-03-14	HBASE-296 CVE fixes at HBase 1.4.14

61475ab5a	2023-03-14	HBASE-294 CVE-2021-29425 - commons-io
4de7a18bd	2023-03-14	EEP-HBASE-324: Backport vulnerability related solutions from EEP-911 to MEP-811
58e447b34	2023-03-13	HBASE-292 Update HBase to use 'reload4j'
044f1aaea	2022-08-18	ECO-224 CVE-2018-14721 - jackson databind
bd88cc453	2022-06-22	EEP-HBASE-278: HBase mapreduce jobs fail on mixed fips cluster configuration
5c2c47999	2022-02-09	EEP-HBASE-280: FIPS mode check needs to be done over ssl-client instead of Zookeeper

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

None.

Resolved Issues

None.

HBase 1.4.14.0 - 2212 (EEP 6.4.0) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of HBase.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. You may also be interested in the Ecosystem Component Release Notes on page 5804 and the Apache HBase homepage.

Version	1.4.14.0
Release Date	December 2022
Version Interoperability	See Interoperability Matrix, Ecosystem Support Matrix, and HBase Support Matrix.
Source on GitHub	https://github.com/mapr/hbase
GitHub Release Tag	1.4.14.0-eep-640
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.

New in this Release

HBase 1.4.14.0 - 2212 introduces the following enhancements or HPE platform-specific behavior changes:

- Version update to 1.4.14.0
- CVE fixes
- Bug fixes

Fixes

This is the first release of the 1.4.x line for EEP 6.x.x. On top of Apache 1.4.14 release, all the previous HPE-specific solutions and the following commits have been applied. For additional information, see the Apache release notes.

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
d8ad7fc	2022-10-26	HBASE-300 HBase services fail to start after updating dependencies
4b513eb	2022-10-26	HBASE-299 ClassNotFoundException: org.apache.hadoop.hbase.shaded.com.google.common.base.Objects
c84eb1e	2022-10-26	HBASE-298 "list" command prints a warning
123e6a9	2022-10-26	HBASE-296 CVE fixes at HBase 1.4.14
fa4bf5a	2022-08-22	HBASE-294 CVE-2021-29425 - commons-io
56565b0	2022-08-22	HBASE-293 Method getScanMetrics() is abstract
3de5002	2022-08-19	ECO-224 CVE-2018-14721 - jackson databind

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

None.

Resolved Issues

None.

HBase 1.4.13.200 - 2201 (EEP 8.1.0) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of HBase.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. You may also be interested in the Ecosystem Component Release Notes on page 5804 and the Apache HBase homepage.

Version	1.4.13.200
Release Date	January 2022
Version Interoperability	See Interoperability Matrix, Ecosystem Support Matrix, and HBase Support Matrix.
Source on GitHub	https://github.com/mapr/hbase
GitHub Release Tag	1.4.13.200-eep-810
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.

New in this Release

HBase 1.4.13.200 - 2201 introduces the following enhancemtns or HPE platform-specific behavior changes:

- Federal Information Processing Standards (FIPS) support
- CVE fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
12c2a75dff9	2022-02-09	EEP-HBASE-280: FIPS mode check needs to be done over ssl-client instead of Zookeeper
af61cf17008	2022-01-25	EEP-HBASE-275: Upgrade Log4J version to '1.3.1-mapr'
ddba4184c7	2022-01-13	EEP-HBASE-274: HBase REST authentication doesn't work for /jmx and /conf
45e13fbfe7	2022-01-05	EEP-HBASE-271: Update log4j v2 to the latest available (to 2.17+)
f33379b62c	2021-12-20	EEP-HBASE-263: Log4j Vulnerabilities: CVE-2019-17571 -- Upgrading to 1.3.0-mapr
04229b0d9b	2021-12-14	EEP-HBASE-263: Log4j Vulnerabilities: CVE-2019-17571
8ce02cfa42	2021-12-14	EEP-HBASE-269: CVE-2021-44228 - Log4j vulnerability in HBase
65769ae7c3	2021-11-25	EEP-HBASE-268: Upgrade Jetty to 9.4.44.v20210927 to sync with Hadoop
c98b48fd3c	2021-11-25	EEP-HBASE-264: Nimbus-jose-jwt Vulnerabilities: CVE-2019-17195, CVE-2017-12974 and CVE-2017-12972
f4c5bc5e5b	2021-11-24	EEP-HBASE-267: Update Spark version to 3.2.0.0-eep-SNAPSHOT
44c6284197	2021-11-23	EEP-HBASE-266: Exclude bcprov-jdk15on from HBase dependencies
cbee9488cf	2021-11-18	EEP-HBASE-260: Netty Vulnerabilities: WS-2020-0408, CVE-2021-37137 and CVE-2021-37136
c030c1b1af	2021-11-15	EEP-HBASE-257: HBase mapreduce jobs failed on cluster with enabled FIPS

51bc6be0cb	2021-11-09	EEP-HBASE-258: Update hadoop version to 2.7.6.200-eep-810-SNAPSHOT
74a9e15252	2021-10-25	MAPR-HBASE-252: [Hbase] CVE-2021-42340 Apache Tomcat DoS
748a79f5ab	2021-10-21	MAPR-HBASE-254: Upgrade slf4j dependencies from 1.7.5 to 1.7.25 to sync with Hadoop
21108dde8d	2021-10-18	MAPR-HBASE-251: HBase services can't start on cluster with enabled FIPS

Known Issues and Limitations

This release contains the following known issues and limitations:

- For a FIPS-enabled configuration, mixed mode support is not available in this release. For example, a non-FIPS client node cannot communicate with a FIPS server node.

HBase 1.4.13.100 - 2110 (EEP 8.0.0) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of HBase.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. You may also be interested in the Ecosystem Component Release Notes on page 5804 and the Apache HBase homepage.

Version	1.4.13.100
Release Date	October 2021
Version Interoperability	See Interoperability Matrix, Ecosystem Support Matrix, and HBase Support Matrix.
Source on GitHub	https://github.com/mapr/hbase
GitHub Release Tag	1.4.13.100-eep-800
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.

New in this Release

HBase 1.4.13.100 - 2110 introduces mainly bug fixes and fixes to common vulnerabilities and exposures (CVEs).

Fixes

This HPE release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
dd0fda2904	2021-09-16	MAPR-HBASE-249: ThriftServer and RESTServer cannot start on core 7.0.0.

last-updated: Jun 06, 2024

36bba5050e	2021-09-06	MAPR-HBASE-247: mapr-security-web jar should be taken from the cluster.
e9c5d738d8 912685bd11	2021-09-03 2021-09-03	MAPR-HBASE-246: Update the maven artifact version strings to eep.
c9e1ff499b	2021-08-11	MAPR-HBASE-245: Update Spark version to 3.1.2.0-mapr-SNAPSHOT.
0195fe8ea1	2021-08-09	MAPR-HBASE-244: Upgrade Avro version to 1.10.1.
447f5b6f36	2021-08-09	MAPR-HBASE-243: Update Hadoop version to 2.7.6.0-mapr-720-SNAPSHOT.
eda8dcfeea ae90385dbe	2021-07-27 2021-08-12	MAPR-HBASE-240: CVE-2012-5783 vulnerability in commons-httpclient. (HBASE-16267 Remove commons-httpclient dependency from hbase-rest module).
9f4c884c4d	2021-07-22	MAPR-HBASE-242: Too large error message/uninformative when running HBase shell from user without ticket.
0e453c03b9	2021-06-19	MAPR-HBASE-239: WS-2019-0379: commons-codec vulnerability.
bb7013e7ab	2021-06-18	MAPR-HBASE-237: Sync Jackson version with hadoop-2.7.5.0.
4924431fad	2021-06-18	MapR [SPARK-889] HBase examples running fails with "org.apache.spark.unsafe.types.UTF8String is not a valid external type for schema of string".
ca6787138f	2021-06-04	MAPR-HBASE-236: CVE-2020-15250 vulnerability in JUnit.
861cf40791	2021-06-04	MAPR-HBASE-208: HBase build should use only internal repositories / mirrors.

Known Issues and Limitations

This release contains the following known issues and limitations:

- None

HBase 1.4.13.50 - 2201 (EEP 7.1.2) Release Notes

The notes below relate to the HPE Ezmeral Data Fabric distribution of HBase.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. You may also be interested in the Ecosystem Component Release Notes on page 5804 and the Apache HBase homepage.

Version	1.4.13.50
Release Date	March 2022
MapR Version Interoperability	See Interoperability Matrix, Ecosystem Support Matrix, and HBase Support Matrix.

Known Issues and Limitations

This release contains the following known issues and limitations:

- None

Hive Release Notes

The release notes for the Hive component included in the HPE Ezmeral Data Fabric contain notes specific to data-fabric only.

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734 or EEP Support and Lifecycle Status on page 5728. To view release notes for prior data-fabric releases, see Previous Versions on page 6194.

last-updated: Jun 06, 2024

Hive 3.1.3 Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Hive 3.1.3.

The following release notes for the Hive 3.1.3 component are included in the HPE Ezmeral Data Fabric distribution for Apache Hadoop:

Hive 3.1.3.550 - 2404 (EEP 9.2.2) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the Apache Hive-3.1.3 Release Notes and the Apache Hive homepage.

Hive Version	3.1.3.550
Release Date	April 2024
HPE Version Interoperability	See Hive and HCatalog Support Matrix and Ecosystem Support Matrix and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/hive
GitHub Release Tag	3.1.3.550-eep-922
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.

ODBC/JDBC Drivers	Hive 3.1.3 works with the following HPE Hive drivers:
	• ODBC Drivers
	  • Mac OS X
	  • Linux
	  • 32-bit
	  • 64-bit
	  • Windows
	  • 32-bit
	  • 64-bit
	For additional driver information, see Connecting to HiveServer2.

Feature support

The following list describes support of various components and functionality with Hive 3.1.3.550 - 2404:

- Supports Hive-3.1.3 on Tez-0.10.2 For more information, see Tez 0.10.2.100 - 2301 (EEP 9.1.0) Release Notes on page 6110.
- Does not support Hive on Spark. You cannot use Spark as a query engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-3.1.3 because Apache Slider is not an HPE supported ecosystem component.
- Starting from Hive 2.1, Hive must run the `schematool` command as an initialization step.

last-updated: Jun 06, 2024

- Starting from EEP 9.1.0, you can enable Hive to work with JDK 17. See Considerations for JDK 17 on page 250.
- Starting from EEP 9.0.0, Data Fabric supports Ranger, which can be integrated with HiveServer2. For more information, see Integrating HiveServer2 with Ranger on page 4596.

New in This Release

Hive 3.1.3.550 - 2404 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Data (YYYY-MM-DD)	HPE Fix Number and Description
64179be3f8	2024-04-01	EEP-HIVE-1489: Backport HIVE-22527
7dcc2e9500	2024-03-26	EEP-HIVE-1491: Update Hive libs to resolve CVEs
b3d5655a2e	2024-03-13	EEP-HIVE-1488: Grouping sets size cannot be greater than 64
930f93fc4c	2024-03-05	EEP-HIVE-1485: fix MIN/MAX UDAF failure for specific cases
2ce7edb9ef	2024-02-22	EEP-HIVE-1476: fix logic for MapJoin to BucketMapJoin conversion
dec91650fb	2024-02-20	EEP-HIVE-1486: expand datatype for PARAM_VALUE column type in PARTITION_PARAMS metastore table

Known Issues and Limitations

See Considerations for Hive on JDK 17 on page 4210.

Hive 3.1.3.500 - 2401 (EEP 9.2.1) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the Apache Hive-3.1.3 Release Notes and the Apache Hive homepage.

Hive Version	3.1.3.500
Release Date	January 2024
HPE Version Interoperability	See Hive and HCatalog Support Matrix and Ecosystem Support Matrix and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/hive
GitHub Release Tag	3.1.3.500-eep-921
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.

last-updated: Jun 06, 2024

ODBC/JDBC Drivers	Hive 3.1.3 works with the following HPE Hive drivers:
	• ODBC Drivers
	  • Mac OS X
	  • Linux
	  • 32-bit
	  • 64-bit
	  • Windows
	  • 32-bit
	  • 64-bit
	For additional driver information, see Connecting to HiveServer2.

Feature support

The following list describes support of various components and functionality with Hive 3.1.3.300 - 2307:

- Supports Hive-3.1.3 on Tez-0.10.2 For more information, see Tez 0.10.2.100 - 2301 (EEP 9.1.0) Release Notes on page 6110.
- Does not support Hive on Spark. You cannot use Spark as a query engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-3.1.3 because Apache Slider is not an HPE supported ecosystem component.
- Starting from Hive 2.1, Hive must run the `schematool` command as an initialization step.
- Starting from EEP 9.1.0, you can enable Hive to work with JDK 17. See Considerations for JDK 17 on page 250.
- Starting from EEP 9.0.0, Data Fabric supports Ranger, which can be integrated with HiveServer2. For more information, see Integrating HiveServer2 with Ranger on page 4596.

New in This Release

Hive 3.1.3.500 - 2401 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Data (YYYY-MM-DD)	HPE Fix Number and Description
9b11a6f146	2023-12-29	EEP-HIVE-1470: CTAS does not allow to create a table with custom location and with SELECT 1 as a data source
72e73d79b6	2023-12-22	EEP-HIVE-1469: hive.metastore.use.SSL property is broken in Hive-3.x

last-updated: Jun 06, 2024

0f1ce9d023	2023-12-21	EEP-HIVE-1471: extract MapRKeystoreReader and related utils to a separate mapr-util module
93861f5d58	2023-12-19	EEP-HIVE-1467: hive.metastore.sasl.enabled property does not work in Hive-3.x
5b8efea891	2023-12-10	EEP-HIVE-1466: Compaction does not work for transactional tables in Hive-3.x.x
83a4aa71c8	2023-12-05	EEP-HIVE-1448: cksum: /opt/mapr/hive/hive-3.1.3/hcatalog/etc/webhcat/webhcat-site.xml: No such file or directory
70daa31ef8	2023-12-04	EEP-HIVE-1459: Update Avro to 1.11.3 due CVE-2023-39410
5dce82ac0c	2023-12-01	EEP-HIVE-1465: upgrade commons-io to 2.14.0
5447a9694a	2023-12-01	EEP-HIVE-1465: upgrade snappy-java to 1.1.10.5
0ec60aa06d	2023-12-01	EEP-HIVE-1465: upgrade ivy to 2.5.2
3c586a8e98	2023-12-01	EEP-HIVE-1465: upgrade netty to 4.1.101.Final
5fbed803f0	2023-12-01	EEP-HIVE-1465: upgrade jetty to 9.4.53.v20231009
d6c76784ee	2023-12-01	EEP-HIVE-1465: upgrade guava to 32.1.3-jre

Known Issues and Limitations

- HIVE-1336: When using Hive configured with Java 17, sometimes Hive gives the following error:

```
Caused by: java.lang.reflect.InaccessibleObjectException: <detailed
description>: module java.base does not "opens <module name>" to unnamed
module
```

Error example:

```
Caused by: java.lang.reflect.InaccessibleObjectException: Unable to make
field private final int java.time.LocalDate.year accessible: module
java.base does not "opens java.time" to unnamed module
```

Workaround:

Add the `--add-opens java.base/<module name>=ALL-UNNAMED` configuration option (for example, `--add-opens java.base/java.time=ALL-UNNAMED`) to the following:

1. `HADOOP_OPTS` variable in the `hive-env.sh` configuration file.
2. `mapreduce.map.java.opts`, `mapreduce.reduce.java.opts`, `yarn.app.mapreduce.am.command-opts` properties of the `hive-site.xml` configuration file.

Hive 3.1.3.400 - 2310 (EEP 9.2.0) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the Apache Hive-3.1.3 Release Notes and the Apache Hive homepage.

Hive Version	3.1.3.400
Release Date	October 2023
HPE Version Interoperability	See Hive and HCatalog Support Matrix and Ecosystem Support Matrix and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/hive
GitHub Release Tag	3.1.3.400-eep-920
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.

ODBC/JDBC Drivers	Hive 3.1.3 works with the following HPE Hive drivers:
	• ODBC Drivers
	  • Mac OS X
	  • Linux
	  • 32-bit
	  • 64-bit
	  • Windows
	  • 32-bit
	  • 64-bit
	For additional driver information, see Connecting to HiveServer2.

Feature support

The following list describes support of various components and functionality with Hive 3.1.3.300 - 2307:

- Supports Hive-3.1.3 on Tez-0.10.2 For more information, see Tez 0.10.2.100 - 2301 (EEP 9.1.0) Release Notes on page 6110.
- Does not support Hive on Spark. You cannot use Spark as a query engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-3.1.3 because Apache Slider is not an HPE supported ecosystem component.
- Starting from Hive 2.1, Hive must run the `schematool` command as an initialization step.
- Starting from EEP 9.1.0, you can enable Hive to work with JDK 17. See Considerations for JDK 17 on page 250.
- Starting from EEP 9.0.0, Data Fabric supports Ranger, which can be integrated with HiveServer2. For more information, see Integrating HiveServer2 with Ranger on page 4596.

New in This Release

Hive 3.1.3.400 - 2310 introduces the following enhancements or HPE platform-specific behavior changes:

last-updated: Jun 06, 2024

- None.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Data (YYYY-MM-DD)	HPE Fix Number and Description
a2b29b0b2f	2023-10-04	EEP-HIVE-1098: HS2 closing session error while closing a session org.bouncycastle.tls.TlsFatalAlert: handshake_failure(40) [FIPS enabled]
e4e631b0de	2023-10-03	EEP-HIVE-1444: Hive CLI or beeline gives access error in MR mode
e5afa85630	2023-09-25	EEP-HIVE-1414: Add Hive automatic configuration for Java 17
c52e1df481	2023-09-06	EEP-HIVE-1441: Backport HIVE-21296 into Hive-3.x
fdcafecc6c	2023-04-12	EEP-HIVE-1442: [Hive-3] Failed to launch Hive WebHCat job. java.io.FileNotFoundException for zookeeper jar.
5eb356aca4	2023-08-31	EEP-HIVE-1439: create empty configuration file stub if doesn't exist
fd032d69a4	2023-08-29	EEP-HIVE-1373: Hive WebHCat started on HTTP for EEP-911 instead of HTTPS (as it was for 810) based on the SBD logic
1437873e64	2023-08-07	EEP-HIVE-1435: backport hive commits needed for RAN-279

Known Issues and Limitations

- HIVE-1336: When using Hive configured with Java 17, sometimes Hive gives the following error:

```
Caused by: java.lang.reflect.InaccessibleObjectException: <detailed
description>: module java.base does not "opens <module name>" to unnamed
module
```

Error example:

```
Caused by: java.lang.reflect.InaccessibleObjectException: Unable to make
field private final int java.time.LocalDate.year accessible: module
java.base does not "opens java.time" to unnamed module
```

Workaround:

Add the `--add-opens java.base/<module name>=ALL-UNNAMED` configuration option (for example, `--add-opens java.base/java.time=ALL-UNNAMED`) to the following:

1. `HADOOP_OPTS` variable in the `hive-env.sh` configuration file.
2. `mapreduce.map.java.opts`, `mapreduce.reduce.java.opts`, `yarn.app.mapreduce.am.command-opts` properties of the `hive-site.xml` configuration file.

Hive 3.1.3.300 - 2307 (EEP 9.1.2) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the Apache Hive-3.1.3 Release Notes and the Apache Hive homepage.

Hive Version	3.1.3.300
Release Date	July 2023
HPE Version Interoperability	See Hive and HCatalog Support Matrix and Ecosystem Support Matrix and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/hive
GitHub Release Tag	3.1.3.300-eep-912
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.

ODBC/JDBC Drivers	Hive 3.1.3 works with the following HPE Hive drivers:
	• ODBC Drivers
	  • Mac OS X
	  • Linux
	  • 32-bit
	  • 64-bit
	  • Windows
	  • 32-bit
	  • 64-bit
	For additional driver information, see Connecting to HiveServer2.

Feature support

The following list describes support of various components and functionality with Hive 3.1.3.300 - 2307:

- Supports Hive-3.1.3 on Tez-0.10.2 For more information, see Tez 0.10.2.100 - 2301 (EEP 9.1.0) Release Notes on page 6110.
- Does not support Hive on Spark. You cannot use Spark as a query engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-3.1.3 because Apache Slider is not an HPE supported ecosystem component.
- Starting from Hive 2.1, Hive must run the `schematool` command as an initialization step.
- Starting from EEP 9.1.0, you can enable Hive to work with JDK 17. See Considerations for JDK 17 on page 250.
- Starting from EEP 9.0.0, Data Fabric supports Ranger, which can be integrated with HiveServer2. For more information, see Integrating HiveServer2 with Ranger on page 4596.

last-updated: Jun 06, 2024

New in This Release

Hive 3.1.3.300 - 2307 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Data (YYYY-MM-DD)	HPE Fix Number and Description
d7214e8461	2023-06-30	EEP-HIVE-1426: upgrade tomcat from 10.0.23 due to CVE-2022-42252
85dfe21337	2023-06-30	EEP-HIVE-1424: upgrade jackson-databind from 2.13.3 due to CVE-2022-42003,CVE-2022-42004
67300a8595	2023-05-02	EEP-HIVE-1388: update guava to 31.1-jre
9f4f1339a6	2023-06-29	EEP-HIVE-1423: jta (1.1) - CVE-2009-1104, CVE-2009-1105, CVE-2009-1107
90251319fd	2023-06-29	EEP-HIVE-1422: transaction-api (1.1) - CVE-2009-1104, CVE-2009-1105, CVE-2009-1107
c79ca5c170	2023-06-29	EEP-HIVE-1421: ant, ant-launcher (1.10.9) - CVE-2021-36373, CVE-2021-36374
86b9a75888	2023-06-29	EEP-HIVE-1420: Update Netty to 4.1.94 due to CVE
81b2e0753a	2023-06-29	EEP-HIVE-1419: Update Jetty to 9.4.51.v20230217 CVE
6f919a98bc	2023-06-26	EEP-HIVE-1415: Hive query fails with the exception: 'Output column number expected to be 0 when isRepeating'
2bbafeb449	2023-06-27	EEP-HIVE-1410: webhcatalog allows TRACE method by default

c95334e432	2023-06-09	EEP-HIVE-1345: CVE-2019-20444 & CVE-2019-20445; netty-3.10.6.Final.jar Vulnerabilities
c529098402	2023-06-09	EEP-HIVE-1384: Hive as non mapr user looking for daemon.conf file on client only nodes
27528543b0	2023-05-01	EEP-HIVE-1383: INSERT query fails with NPE if the table has a complex data type

Known Issues and Limitations

- HIVE-1336: When using Hive configured with Java 17, sometimes Hive gives the following error:

```
Caused by: java.lang.reflect.InaccessibleObjectException: <detailed
description>: module java.base does not "opens <module name>" to unnamed
module
```

Error example:

```
Caused by: java.lang.reflect.InaccessibleObjectException: Unable to make
field private final int java.time.LocalDate.year accessible: module
java.base does not "opens java.time" to unnamed module
```

Workaround:

Add the `--add-opens java.base/<module name>=ALL-UNNAMED` configuration option (for example, `--add-opens java.base/java.time=ALL-UNNAMED`) to the following:

1. `HADOOP_OPTS` variable in the `hive-env.sh` configuration file.
2. `mapreduce.map.java.opts`, `mapreduce.reduce.java.opts`, `yarn.app.mapreduce.am.command-opts` properties of the `hive-site.xml` configuration file.

Hive 3.1.3.200 - 2304 (EEP 9.1.1) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the Apache Hive-3.1.3 Release Notes and the Apache Hive homepage.

Hive Version	3.1.3.200
Release Date	April 2023
HPE Version Interoperability	See Hive and HCatalog Support Matrix and Ecosystem Support Matrix and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/hive
GitHub Release Tag	3.1.3.200-eep-911
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.

ODBC/JDBC Drivers	Hive 3.1.3 works with the following HPE Hive drivers:
	• ODBC Drivers
	  • Mac OS X
	  • Linux
	  • 32-bit
	  • 64-bit
	  • Windows
	  • 32-bit
	  • 64-bit
	For additional driver information, see Connecting to HiveServer2.

last-updated: Jun 06, 2024

Feature support

The following list describes support of various components and functionality with Hive 3.1.3.200 - 2304:

- Supports Hive-3.1.3 on Tez-0.10.2 For more information, see Tez 0.10.2.100 - 2301 (EEP 9.1.0) Release Notes on page 6110.
- Does not support Hive on Spark. You cannot use Spark as a query engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-3.1.3 because Apache Slider is not an HPE supported ecosystem component.
- Starting from Hive 2.1, Hive must run the `schematool` command as an initialization step.
- Starting from EEP 9.1.0, you can enable Hive to work with JDK 17. See Considerations for JDK 17 on page 250.
- Starting from EEP 9.0.0, Data Fabric supports Ranger, which can be integrated with HiveServer2. For more information, see Integrating HiveServer2 with Ranger on page 4596.

New in This Release

Hive 3.1.3.200 - 2304 introduces the following enhancements or HPE platform-specific behavior changes:

- CVEs fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Data (YYYY-MM-DD)	HPE Fix Number and Description
d400b257ed	2023-04-06	EEP-HIVE-1378: Bump jettison to 1.5.4 due CVE-2023-1436
117bc26e78	2023-03-24	EEP-HIVE-1361: Hive Metastore requires hive-service library
f4c6381730	2023-04-06	EEP-ECO-298: CVE: MEP 9.1.1: Security Scan reported vulnerable twill-zookeeper 0.6.0-incubating
429938f62a	2023-04-06	EEP-ECO-283: CVE:: MEP 9.1.1 :: Vulnerable version of Ivy 2.4.0
ae4d8d1724	2023-03-28	EEP-HIVE-1371: EEP-9.1.1 WebHCat seems to be broken
ef0d1a79a7	2023-02-28	EEP-HIVE-1360: Hive 3.1.3 CLI does not start on 9.1.0 cluster
b76e2092c0	2023-02-20	EEP-HIVE-1358: Update protobuf-java version to 3.21.12
476f0232ec	2023-02-14	EEP-HIVE-1355: Hive queries when accessing directories with symlinks
dd8bf4aef1	2023-01-31	EEP-HIVE-967: Replace sudo command with maprexecute In Hive configure.sh

e56d5b67ac	2023-01-26	EEP-HIVE-1347: Hide extra logging during first run of configure.sh
321ced2869	2023-01-25	EEP-HIVE-1159: Hive/Tez configure.sh script must not restart RM or TLS
9b661b1ac2	2023-01-19	EEP-HIVE-151: Fix Regression of MAPR-21055 for Tez engine

Known Issues and Limitations

- HIVE-1336: When using Hive configured with Java 17, sometimes Hive gives the following error:

```
Caused by: java.lang.reflect.InaccessibleObjectException: <detailed
description>: module java.base does not "opens <module name>" to unnamed
module
```

Error example:

```
Caused by: java.lang.reflect.InaccessibleObjectException: Unable to make
field private final int java.time.LocalDate.year accessible: module
java.base does not "opens java.time" to unnamed module
```

Workaround:

Add the `--add-opens java.base/<module name>=ALL-UNNAMED` configuration option (for example, `--add-opens java.base/java.time=ALL-UNNAMED`) to the following:

1. `HADOOP_OPTS` variable in the `hive-env.sh` configuration file.
2. `mapreduce.map.java.opts`, `mapreduce.reduce.java.opts`, `yarn.app.mapreduce.am.command-opts` properties of the `hive-site.xml` configuration file.

Hive 3.1.3.100 - 2301 (EEP 9.1.0) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the Apache Hive-3.1.3 Release Notes and the Apache Hive homepage.

Hive Version	3.1.3.100
Release Date	January 2023
HPE Version Interoperability	See Hive and HCatalog Support Matrix and Ecosystem Support Matrix and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/hive
GitHub Release Tag	3.1.3.100-eep-910
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.

ODBC/JDBC Drivers	Hive 3.1.3 works with the following HPE Hive drivers:
	• ODBC Drivers
	  • Mac OS X
	  • Linux
	  • 32-bit
	  • 64-bit
	  • Windows
	  • 32-bit
	  • 64-bit
	For additional driver information, see Connecting to HiveServer2.

Feature support

The following list describes support of various components and functionality with Hive 3.1.3.100 - 2301:

- Supports Hive-3.1.3 on Tez-0.10.2 For more information, see Tez 0.10.2.100 - 2301 (EEP 9.1.0) Release Notes on page 6110.
- Does not support Hive on Spark. You cannot use Spark as a query engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-3.1.3 because Apache Slider is not an HPE supported ecosystem component.
- Starting from Hive 2.1, Hive must run the `schematool` command as an initialization step.
- Starting from EEP 9.1.0, you can enable Hive to work with JDK 17. See Considerations for JDK 17 on page 250.
- Starting from EEP 9.0.0, Data Fabric supports Ranger, which can be integrated with HiveServer2. For more information, see Integrating HiveServer2 with Ranger on page 4596.

New in This Release

Hive 3.1.3.100 - 2301 introduces the following enhancements or HPE platform-specific behavior changes:

- CVEs fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Data (YYYY-MM-DD)	HPE Fix Number and Description
be3f282f11	2023-01-03	EEP-HIVE-1349: Update Hive in EEP 9.1.0 to Antlr Runtime version 4.9.3
4784937501	2022-12-22	EEP-HIVE-1344: Update Hive OJAI dep to v3.2.0

ec6f0122fc	2022-12-07	EEP-HIVE-1340: Update protobuf-java version to 3.21.9
ab53ad8d96	2022-10-14	EEP-HIVE-1318 : Remove Expiry check on ticket when using MapR-SASL
04c1ec16be	2022-10-09	EEP-HIVE-1327 : CVE-2022-36364 vulnerability in Calcite Avatica

Known Issues and Limitations

- HIVE-1315: Hive 3 on Tez 0.10.x is unable to run jobs by using S3 endpoint in HPE Ezmeral Data Fabric Object Store. There is no workaround for this issue in this release.
- HIVE-19502: Unable to insert values into table stored by JdbcStorageHandler
- HIVE-19286: NPE in MERGE operator on MR mode
- HIVE-1336: When using Hive configured with Java 17, sometimes, Hive gives the following error:

  ```
  Caused by: java.lang.reflect.InaccessibleObjectException: <detailed
  description>: module java.base does not "opens <module name>" to unnamed
  module
  ```

  Error example:

  ```
  Caused by: java.lang.reflect.InaccessibleObjectException: Unable to make
  field private final int java.time.LocalDate.year accessible: module
  java.base does not "opens java.time" to unnamed module
  ```

  Workaround:

  Add the `--add-opens java.base/<module name>=ALL-UNNAMED` configuration option (for example, `--add-opens java.base/java.time=ALL-UNNAMED`) to the following:

  1. `HADOOP_OPTS` variable in the `hive-env.sh` configuration file.
  2. `mapreduce.map.java.opts`, `mapreduce.reduce.java.opts`, `yarn.app.mapreduce.am.command-opts` properties of the `hive-site.xml` configuration file.

Hive 3.1.3.0 - 2210 (EEP 9.0.0) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the

- Apache Hive-3.0.0 Release Notes
- Apache Hive-3.1.0 Release Notes
- Apache Hive-3.1.1 Release Notes
- Apache Hive-3.1.2 Release Notes
- Apache Hive-3.1.3 Release Notes
- Apache Hive homepage.

Hive Version	3.1.3.0
Release Date	October 2022

HPE Version Interoperability	See Hive and HCatalog Support Matrix and Ecosystem Support Matrix and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/hive
GitHub Release Tag	3.1.3.0-eep-900
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.

ODBC/JDBC Drivers	Hive 3.1.3 works with the following HPE Hive drivers:
	• ODBC Drivers
	  • Mac OS X
	  • Linux
	  • 32-bit
	  • 64-bit
	  • Windows
	  • 32-bit
	  • 64-bit
	For additional driver information, see Connecting to HiveServer2.

Feature support

The following list describes support of various components and functionality with Hive 3.1.3 - 2210:

- Supports Hive-3.1.3 on Tez-0.10.2 For more information, see Tez 0.10.2 - 2210 (EEP 9.0.0) Release Notes on page 6111.
- Does not support Hive on Spark. You cannot use Spark as a query engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-3.1.3 because Apache Slider is not an HPE supported ecosystem component.
- Starting from Hive 2.1, Hive must run the `schematool` command as an initialization step.
- Starting from EEP 9.0.0, Data Fabric supports Ranger, which can be integrated with HiveServer2. For more information, see Integrating HiveServer2 with Ranger on page 4596.

New in This Release

Hive 3.1.3.0 - 2210 introduces the following enhancements or HPE platform-specific behavior changes:

- Updated Thrift version to 0.16.0.
- Added support for Ranger. See Ranger 2.3.0.0 - 2210 (EEP 9.0.0) Release Notes on page 6078.

last-updated: Jun 06, 2024

- Added support for Hive Metatsore configuration properties. You can separately add configuration options for Hive Metastore in `hivemetastore-site.xml` file. However, configuration options in `hive-site.xml` file are still valid.
- Removed `hive.warehouse.subdir.inherit.perms` Hive property.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Data (YYYY-MM-DD)	HPE Fix Number and Description
f3fc0ea	2022-09-22	HIVE-21227: HIVE-20776 causes view access regression (Na Li reviewed by Karthik Manamcheri and Peter Vary)
7ee7c44	2022-09-22	HIVE-20776 : Run HMS filterHooks on server-side in addition to client-side (Na Li reviewed by Karthik, Sergio, Morio, Adam and Vihang Karajgaonkar)
09e3658	2022-09-20	HIVE-21844 : HMS schema Upgrade Script is failing with NPE. (Mahesh Kumar Behera reviewed by Sankar Hariappan)
a03408d	2022-09-17	HIVE-22645: Jline can break bash terminal behavior (László Bodor reviewed by Miklos Gergely, Zoltan Haindrich)
3a0ad371	2022-09-15	HIVE-20424: schematool shall not pollute beeline history (Daniel Dai, reviewed by Sankar Hariappan)
fbc8822	2022-09-17	HIVE-23339: SBA does not check permissions for DB location specified in Create database query (Shubham Chaurasia, reviewed by Miklos Gergely) (#1011)
4c762f3	2022-04-16	HIVE-20786 - Maven Build Failed with group id is too big (Szehon, reviewed by Vihang)
03a6478	2022-05-07	HIVE-21685: Wrong simplification in query with multiple IN clauses (Jesus Camacho Rodriguez, reviewed by Zoltan Haindrich)
7769ff0	2022-08-10	HIVE-25631: Initiator speed-up: only read compaction history once per loop (Denys Kuzmenko, reviewed by Karen Coppage)
db5f7a6	2022-08-10	HIVE-24602: Retry compaction after configured time (Peter Varga, reviewed by Karen Coppage)
a756bb1	2022-08-10	HIVE-23683: Add enqueue time to compaction (Peter Vary reviewed by Karen Coppage and Laszlo Pinter)

d315e4e	2022-08-10	HIVE-22729: Provide a failure reason for failed compactions (Laszlo Pinter reviewed by Karen Coppage, Denys Kuzmenko and Peter Vary)
a79531f	2022-08-10	HIVE-22627: Add schema changes introduced in HIVE-21443 to the schema upgrade scripts (Zoltan Chovan via Peter Vary)
f1c85b3	2022-08-10	HIVE-21443: Better usability for SHOW COMPACTIONS (Peter Vary reviewed by Gopal V and Marta Kuczora)
cfc5cb3	2022-08-10	HIVE-20607: TxnHandler should use PreparedStatement to execute direct SQL queries (Sankar Hariappan, reviewed by Daniel Dai)
b87f9bc	2022-08-10	HIVE-20264: Bootstrap repl dump with concurrent write and drop of ACID table makes target inconsistent (Sankar Hariappan, reviewed by Mahesh Kumar Behera, Anishek Agarwal)
498d751	2022-08-02	HIVE-25709: Upgrade netty to 4.1.69 in the hive/pom (Saihemanth via Naveen Gangam)
4760818	2022-08-02	HIVE-25312: Upgrade netty to 4.1.65.Final (Zoltan Haindrich reviewed by Panagiotis Garefalakis)
ac0d202	2022-08-02	HIVE-24138. Llap external client flow is broken due to netty shading. (#1491) (Ayush Saxena reviewed by Laszlo Bodor)
acf3c08	2022-08-02	HIVE-23073 : Shade netty and upgrade to netty 4.1.48.Final (Laszlo Bodor via Ashutosh Chauhan)
b2e55fd	2022-08-02	HIVE-25054: Upgrade `jodd-core` dependency to get rid of CVE-2018-21234 (Abhay Chennagiri, reviewed by Jesus Camacho Rodriguez)
5607fdd	2022-08-02	HIVE-22248 Fix statistics persisting issues (Miklos Gergely reviewed by Jesus Camacho Rodriguez)
fb5d356	2022-08-02	HIVE-19316: StatsTask fails due to ClassCastException (Jaume Marhuenda, reviewed by Jesus Camacho Rodriguez)
c6ff737	2022-08-02	HIVE-25635: Upgrade libthrift to 0.16.0
d8cfea6	2022-08-02	HIVE-25468: Authorization for Create/Drop functions in HMS(Saihemanth Gantasala via Naveen Gangam)

038936e	2022-08-02	HIVE-23786 HMS server side filter with Ranger (Sam An reviewed by Peter Vary)
2b89a55	2022-08-02	HIVE-24026: HMS/Ranger Spark view authorization plan (Sai Hemanth Gantasala reviewed by Vihang Karajgaonkar)
ecf1d55	2022-08-02	HIVE-21920: Extract command authorisation from the Driver (Miklos Gergely, reviewed by Jesus Camacho Rodriguez)
70893f1	2022-08-02	HIVE-21829: HiveMetaStore authorization issue with AlterTable and DropTable events (Ramesh Mani, reviewed by Daniel Dai)

Known Issues and Limitations

- HIVE-1321: Unable to use Data Fabric SASL HiveServer2 authentication for data-fabric client in Hive 3 to connect from client to server. As a workaround, you can use PAM authentication.
- HIVE-1315: Hive 3 on Tez 0.10.x is unable to run jobs by using S3 endpoint in HPE Ezmeral Data Fabric Object Store. There is no workaround for this issue in this release.
- IN-3165: Unable to start Hive Metastore service because schema was not created in database. As a workaround, run the following schematool command as an initialization step:

  ```
  /opt/mapr/hive/hive-<version>/bin/schematool -dbType mysql -initSchema
  ```

  For details, see Configuring MariaDB for the Hive Metastore on page 4166.
- HIVE-19502: Unable to insert values into table stored by JdbcStorageHandler
- HIVE-19286: NPE in MERGE operator on MR mode

- HIVE-760: [Hive-2.3] Could not start hive-metastore on Centos 8 MetaException(message:Version information not found in metastore)

  Starting in EEP 7.0.0, use the MySQL driver with MariaDB.

  ```
  <property>
      <name>javax.jdo.option.ConnectionURL</name>
      <value>jdbc:mysql://localhost:3306/hive?
  createDatabaseIfNotExist=true</value>
   </property>
   <property>
      <name>javax.jdo.option.ConnectionDriverName</name>
      <value>com.mysql.jdbc.Driver</value>
      <description>Driver class name for a JDBC metastore</description>
   </property>
  ```

  Some SELECT queries can be converted to a single FETCH task minimizing latency. Currently, the query should be single sourced and should not have a subquery or any aggregations or distincts (which incurs RS), lateral views and joins:

  ```
  none : disable hive.fetch.task.conversion
  minimal : SELECT star, filter on partition columns, LIMIT only
  more :  SELECT, filter, LIMIT only (support TABLESAMPLE and virtual
  columns)
  ```

- Hive 3.1.3 in EEP 9.0.0 does not support standalone Metastore.

Hive 2.3.9 Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Hive 2.3.9.

The following release notes for the Hive 2.3.9 component are included in the HPE Ezmeral Data Fabric distribution for Apache Hadoop:

Hive 2.3.9.200 - 2405 (EEP 8.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the Apache Hive-2.3.9 Release Notes and the Apache Hive homepage.

Hive Version	2.3.9.200
Release Date	May 2024
HPE Version Interoperability	See Hive and HCatalog Support Matrix and Ecosystem Support Matrix and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/hive
GitHub Release Tag	2.3.9.200-eep-812
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your MEP and OS to view the list of package names.

ODBC/JDBC Drivers	Hive 2.3.9 works with the following HPE Hive drivers:
	• ODBC Drivers
	  • Mac OS X
	  • Linux
	  • 32-bit
	  • 64-bit
	  • Windows
	  • 32-bit
	  • 64-bit
	For additional driver information, see Connecting to HiveServer2.

Feature support

The following list describes support of various components and functionality with Hive 2.3.9.200 - 2405:

- Supports Hive-2.3.9 on Tez-0.9.2 For more information, see Tez 0.9.2.500 - 2305 (EEP 8.1.1) Release Notes on page 6112.
- Does not support Hive on Spark. You cannot use Spark as a query engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-2.3.9 because Apache Slider is not an HPE supported ecosystem component.
- Starting from Hive 2.1, Hive must run the `schematool` command as an initialization step.

Changes in default security configuration

The following list describes changes in default security for Hive 2.3.9.200 - 2405:

- None.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Data (YYYY-MM-DD)	HPE Fix Number and Description
08635d143f	2024-05-04	EEP-HIVE-1497: upgrade libs due to CVE
89dcc0070b	2022-10-31	EEP-HIVE-1331: IllegalAccessError: tried to access method org.apache.orc.impl.SchemaEvolution.getBaseRow
2cac387b9d	2024-01-04	EEP-HIVE-1460: upgrade jettison to 1.5.4
fc3cbaa830	2024-01-04	EEP-HIVE-1460: upgrade jetty to 9.4.53.v20231009
49af22341b	2024-01-04	EEP-HIVE-1460: upgrade velocity to 2.3

last-updated: Jun 06, 2024

2ef2c83317	2024-01-04	EEP-HIVE-1460: upgrade ivy to 2.5.2
27b888c4cc	2023-10-27	EEP-HIVE-1455: snappy-java injects native implementation to Platform Class Loader
d4dc191848	2023-06-22	EEP-HIVE-1413: Address CVE-2022-1471 for hive
d033623b71	2023-06-21	EEP-HIVE-1413: Address CVE-2022-1471 for hive
63a931a7ee	2023-06-21	EEP-HIVE-1412: Address CVE-2022-37865 for hive
6f6876af95	2023-06-09	EEP-HIVE-1345: CVE-2019-20444 & CVE-2019-20445; netty-3.10.6.Final.jar Vulnerabilities

Known Issues and Limitations

- Some parquet files created by Spark are not usable by Hive. For Spark to generate a fully compatible parquet for Hive, you must enable the following compatability option prior to parquet files creation:

  ```
  spark.sql.parquet.writeLegacyFormat
  ```

  See the full option definition in the Spark documentation.

  If you have already created incompatible parquet files, you must regenerate the files after enabling the compatibility option.

Resolved Issues

- None.

Hive 2.3.9.100 - 2305 (EEP 8.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the Apache Hive-2.3.9 Release Notes and the Apache Hive homepage.

Hive Version	2.3.9.100
Release Date	May 2023

bd334abdb6	2022-02-09	HIVE-25631: Initiator speed-up: only read compaction history once per loop (Denys Kuzmenko, reviewed by Karen Coppage)

Known Issues and Limitations

- Some parquet files created by Spark are not usable by Hive. For Spark to generate a fully compatible parquet for Hive, you must enable the following compatability option prior to parquet files creation:

  ```
  spark.sql.parquet.writeLegacyFormat
  ```

  See the full option definition in the Spark documentation.

  If you have already created incompatible parquet files, you must regenerate the files after enabling the compatibility option.

Resolved Issues

- None.

Hive 2.3.9 - 2212 (EEP 6.4.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the Apache Hive-2.3.9 Release Notes and the Apache Hive homepage.

Hive Version	2.3.9
Release Date	December 2022

last-updated: Jun 06, 2024

HPE Version Interoperability	See EEP Components and OS Support.
Source on GitHub	https://github.com/mapr/hive
GitHub Release Tag	2.3.9-mapr-2212
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your MEP and OS to view the list of package names.

ODBC/JDBC Drivers	Hive 2.3.9 works with the following HPE Hive drivers:
	• ODBC Drivers
	  • Mac OS X
	  • Linux
	  • 32-bit
	  • 64-bit HIVE-20204
	  • Windows
	  • 32-bit
	  • 64-bit
	For additional driver information, see Connecting to HiveServer2.

Feature support

The following list describes support of various components and functionality with Hive 2.3.9 - 2212:

- Does not support Hive on Spark, so you cannot use Spark as an execution engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-2.3.9.
- Starting from Hive 2.1, Hive must run the `schematool` command as an initialization step.

Changes in default security configuration

The following list describes changes in default security for Hive 2.3.9 - 2212:

- None.

Fixes

This HPE release includes the following fixes on the base release:

Hive 2.3.9.0 - 2201 (EEP 8.1.0) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the Apache Hive-2.3.9 Release Notes and the Apache Hive homepage.

Hive Version	2.3.9.0
Release Date	January 2022
HPE Version Interoperability	See Hive and HCatalog Support Matrix and Ecosystem Support Matrix and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/hive
GitHub Release Tag	2.3.9.0-eep-810
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.

ODBC/JDBC Drivers	Hive 2.3.9 works with the following HPE Hive drivers:
	• ODBC Drivers
	  • Mac OS X
	  • Linux
	  • 32-bit
	  • 64-bit
	  • Windows
	  • 32-bit
	  • 64-bit
	For additional driver information, see Connecting to HiveServer2.

Feature support

The following list describes support of various components and functionality with Hive 2.3.9 - 2201:

- Supports Hive-2.3.9 on Tez-0.9.2 For more information, see Tez 0.9.2 - 2201 (EEP 8.1.0) Release Notes on page 6113.
- Does not support Hive on Spark. You cannot use Spark as a query engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-2.3.9 because Apache Slider is not an HPE supported ecosystem component.
- Starting from Hive 2.1, Hive must run the `schematool` command as an initialization step.

Changes in default security configuration

The following list describes changes in default security for Hive 2.3.9 - 2201:

- Starting from EEP-8.1.0, Hive supports SCRAM token and SCRAM-SHA-256 authentication in HPE Ezmeral Data Fabric.

Table

#	Property	Data Type	Default value	Description
1	hive.delegation.token.authentication	String	DIGEST	Delegation token authentication method. Possible values are DIGEST, SCRAM

To configure SCRAM token and SCRAM-SHA-256 authentication, set the following property on `HIVE_HOME/conf/hive-site.xml` file:

```
<property>
    <name>hive.delegation.token.authentication</name>
    <value>SCRAM</value>
</property>
```

last-updated: Jun 06, 2024

Execute `MAPR_HOME/server/configure.sh -R` script on a newly installed and Data-Fabric SASL or KERBEROS secured cluster to automatically configure the following authentications:

1. For a FIPS enabled cluster, Hive configures `hive.delegation.token.authentication=SCRAM` authentication.
2. For a non-FIPS cluster if you configure Hadoop with `hadoop.security.token.authentication.method=SCRAM` authentication, Hive configures the SCRAM authentication.
3. For other clusters, Hive configures `hive.delegation.token.authentication=DIGEST` authentication.

For non-secure clusters, Hive configures `hive.delegation.token.authentication=DIGEST` authentication.

When you upgrade Hive, the upgrade does not update the value of the set `hive.delegation.token.authentication` property.

Manually set the value of `hive.delegation.token.authentication` property when you change the cluster settings from FIPS to non-FIPS or from non-FIPS to FIPS.

New in This Release

Hive 2.3.9.0 - 2201 introduces the following enhancements or HPE platform-specific behavior changes:

- Starting from EEP-8.1.0, Hive supports FIPS and SCRAM SASL.
- Beginning with EEP 8.1.0, JAR artifacts for Hive use four digits instead of three digits. For example:

```
hive-service-rpc-2.3.9.0-mapr-SNAPSHOT.jar
hive-llap-ext-client-2.3.9.0-mapr-SNAPSHOT.jar
hive-exec-2.3.9.0-mapr-SNAPSHOT.jar
hive-beeline-2.3.9.0-mapr-SNAPSHOT.jar
```

If your application includes a Hive dependency in the `pom.xml` file, you must update the JAR artifact before using Hive 2.3.9 - 2201.

The Hive package name on package.ezmeral.hpe.com continues to use two digits, and the Hive root folder continues to use three digits.

- Improved `Describe table` operator in terms of fetching statistics of partitions. Starting from EEP 8.0.0, you can fetch the partition information using the `describe` command with `formatted` or `extended` statements.

  Configure the `hive.describe.partitionedtable.ignore.stats` property to change the behaviour of fetching statistics of partitions. It is set to the default value of `false`.

```
<property>
    <name>hive.describe.partitionedtable.ignore.stats</name>
    <value>false</value>
    <description>Enables partitioned table stats collection for 'DESCRIBE
FORMATTED' or 'DESCRIBE EXTENDED' commands</description>
</property>
```

```
<property>
    <name>hive.describe.partitionedtable.ignore.stats</name>
    <value>true</value>
    <description>Disables partitioned table stats collection for
'DESCRIBE FORMATTED' or 'DESCRIBE EXTENDED' commands</description>
 </property
```

- Hive supports symbolic links on file system. See Hive Features in HPE Ezmeral Data Fabric on page 4297.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Data (YYYY-MM-DD)	HPE Fix Number and Description

This release from HPE also includes the following back-ported issues. For complete details, refer to the commit log for this project in GitHub.

GitHub Commit Number	Data (YYYY-MM-DD)	HPE Fix Number and Description
95ae2bebc9	2021-12-21	HIVE-17774: compaction may start with 0 splits and fail
ed4b16c0fa	2021-10-08	HIVE-16820 : TezTask may not shut down correctly before submit (Sergey Shelukhin, reviewed by Siddharth Seth)
794c971152	2021-10-28	HIVE-20072 : Write access being requested when performing select on a table

Known Issues and Limitations

- HIVE-1089: Hive on MapReduce engine does not support data insertion into Versioned buckets.You must use Unversioned buckets on MaprReduce engine in S3 file system.

  Hewlett Packard Enterprise recommends using Hive on Tez engine for full S3 file system support.

- HIVE-19502: Unable to insert values into table stored by JdbcStorageHandler
- HIVE-19286: NPE in MERGE operator on MR mode

- HIVE-760: [Hive-2.3] Could not start hive-metastore on Centos 8 MetaException(message:Version information not found in metastore)

  Starting in EEP 7.0.0, use the MySQL driver with MariaDB.

```
<property>
    <name>javax.jdo.option.ConnectionURL</name>
    <value>jdbc:mysql://localhost:3306/hive?
createDatabaseIfNotExist=true</value>
 </property>
 <property>
    <name>javax.jdo.option.ConnectionDriverName</name>
    <value>com.mysql.jdbc.Driver</value>
    <description>Driver class name for a JDBC metastore</description>
 </property>
```

  Some SELECT queries can be converted to a single FETCH task minimizing latency. Currently, the query should be single sourced and should not have a subquery or any aggregations or distincts (which incurs RS), lateral views and joins:

```
none : disable hive.fetch.task.conversion
minimal : SELECT star, filter on partition columns, LIMIT only
more :  SELECT, filter, LIMIT only (support TABLESAMPLE and virtual
columns)
```

Resolved Issues

- MAPR-TEZ-172 fixes a HIVE-789 known issue from Hive 2.3.8 - 2104 in this release.

Hive 2.3.9 - 2110 (EEP 8.0.0) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the Apache Hive-2.3.9 Release Notes and the Apache Hive homepage.

Hive Version	2.3.9
Release Date	October 2021
HPE Version Interoperability	See Hive and HCatalog Support Matrix and Ecosystem Support Matrix and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/hive
GitHub Release Tag	2.3.9-eep-2110
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.

ODBC/JDBC Drivers	Hive 2.3.9 works with the following HPE Hive drivers:
	• ODBC Drivers
	  • Mac OS X
	  • Linux
	  • 32-bit
	  • 64-bit
	  • Windows
	  • 32-bit
	  • 64-bit
	For additional driver information, see Connecting to HiveServer2.

Feature support

The following list describes support of various components and functionality with Hive 2.3.9 - 2110:

- Supports Hive-2.3.9 on Tez-0.9.2 For more information, see Tez 0.9.2 - 2110 (EEP 8.0.0) Release Notes on page 6114.
- Does not support Hive on Spark. You cannot use Spark as a query engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-2.3.9 because Apache Slider is not an HPE supported ecosystem component.
- Starting from Hive 2.1, Hive must run the `schematool` command as an initialization step.

Changes in default security configuration

The following list describes changes in default security for Hive 2.3.9 - 2110:

- None.

New in This Release

Hive 2.3.9 - 2110 introduces the following enhancements or HPE platform-specific behavior changes:

last-updated: Jun 06, 2024

- Improved `Describe table` operator in terms of fetching statistics of partitions. Starting from EEP 8.0.0, you can fetch the partition information using the `describe` command with `formatted` or `extended` statements.

  Configure the `hive.describe.partitionedtable.ignore.stats` property to change the behaviour of fetching statistics of partitions. It is set to the default value of `false`.

```
<property>
    <name>hive.describe.partitionedtable.ignore.stats</name>
    <value>false</value>
    <description>Enables partitioned table stats collection for 'DESCRIBE
FORMATTED' or 'DESCRIBE EXTENDED' commands</description>
</property>
```

```
<property>
    <name>hive.describe.partitionedtable.ignore.stats</name>
    <value>true</value>
    <description>Disables partitioned table stats collection for
'DESCRIBE FORMATTED' or 'DESCRIBE EXTENDED' commands</description>
 </property
```

- Hive supports symbolic links on file system. See Hive Features in HPE Ezmeral Data Fabric on page 4297.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Data (YYYY-MM-DD)	HPE Fix Number and Description

e5ed2cb9ed	2021-05-22	HIVE-18069: MetaStoreDirectSql to get tables has misplaced comma (Jesus Camacho Rodriguez, reviewed by Aihua Xu)
9b506546a4	2021-05-22	HIVE-15436: Enhancing metastore APIs to retrieve only materialized views (Jesus Camacho Rodriguez, reviewed by Ashutosh Chauhan)
051002d23a	2021-05-22	HIVE-6990 : Direct SQL fails when the explicit schema setting is different from the default on (Bing Li, Sergey Shelukhin via Ashutosh Chauhan)

Known Issues and Limitations

- HIVE-19502 Unable to insert values into table stored by JdbcStorageHandler
- HIVE-19286 NPE in MERGE operator on MR mode
- HIVE-760 [Hive-2.3] Could not start hive-metastore on Centos 8 MetaException(message:Version information not found in metastore)

  Starting in MEP 7.0.0, use the MySQL driver with MariaDB.

```
<property>
    <name>javax.jdo.option.ConnectionURL</name>
    <value>jdbc:mysql://localhost:3306/hive?
createDatabaseIfNotExist=true</value>
  </property>
 <property>
    <name>javax.jdo.option.ConnectionDriverName</name>
    <value>com.mysql.jdbc.Driver</value>
    <description>Driver class name for a JDBC metastore</description>
 </property>
```

  Some SELECT queries can be converted to a single FETCH task minimizing latency. Currently, the query should be single sourced and should not have a subquery or any aggregations or distincts (which incurs RS), lateral views and joins:

```
none : disable hive.fetch.task.conversion
minimal : SELECT star, filter on partition columns, LIMIT only
more :  SELECT, filter, LIMIT only (support TABLESAMPLE and virtual
columns)
```

Resolved Issues

- MAPR-TEZ-172 fixes a HIVE-789 known issue from Hive 2.3.8 - 2104 in this release.

Hive 2.3.8 Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Hive 2.3.8.

The following release notes for the Hive 2.3.8 component are included in the HPE Ezmeral Data Fabric distribution for Apache Hadoop:

Hive 2.3.8 - 2201 (EEP 7.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hive. You may also be interested in the Apache Hive-2.3.8 Release Notes and the Apache Hive homepage.

Hive Version	2.3.8
Release Date	March 2022
HPE Version Interoperability	See Hive and HCatalog Support Matrix andEcosystem Support Matrix and MEP Components and OS Support.
Source on GitHub	https://github.com/mapr/hive
GitHub Release Tag	2.3.8-mapr-2201
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate tohttp://package.ezmeral.hpe.com/releases/MEP/, and select your EEP and OS to view the list of package names.

ODBC/JDBC Drivers	Hive 2.3.8 works with the following HPE Hive drivers:
	• ODBC Drivers
	  • Mac OS X
	  • Linux
	  • 32-bit
	  • 64-bit
	  • Windows
	  • 32-bit
	  • 64-bit
	For additional driver information, see Connecting to HiveServer2.

Feature support

The following list describes support of various components and functionality with Hive 2.3.8 - 2201:

- Supports Hive-2.3.8 on Tez-0.9.2 For more information, see Tez 0.9.2 - 2201 (EEP 7.1.2) Release Notes on page 6115.
- Does not support Hive on Spark. You cannot use Spark as an query engine for Hive. However, you can run Hive and Spark on the same cluster. You can also use Spark SQL and Drill to query Hive tables.
- Does not support HDFS encryption in Hive tables.
- Does not support LLAP with Hive-2.3.8 because Apache Slider is not a HPE supported ecosystem component.

last-updated: Jun 06, 2024

- Starting from Hive 2.1, Hive needs to run the `schematool` command as an initialization step.

Changes in default security configuration

The following list describes changes in default security for Hive 2.3.8 - 2201:

- None.

New in This Release

Hive 2.3.8 - 2201 introduces the following enhancements or HPE platform-specific behavior changes:

- Added configuration to view audit logs for connected, disconnected, and total connected users in HiveServer2.
- Added Service verifier.

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
3a48a4b629	2022-01-12	MAPR-HIVE-1071 : Fix SslDefaultTest

1fc7585a2e	2021-06-08	ORC-437: Make acid schema checks case insensitive

Known Issues and Limitations

- HIVE-19502 Unable to insert values into table stored by JdbcStorageHandler
- HIVE-19286 NPE in MERGE operator on MR mode
- HIVE-789 [Hive-Hbase integration] Unable to run queries against hive-hbase tables. ClassNotFoundException: HiveHBaseTableInputFormat [MEP-7.0.0]

If you run an HBase + Hive + Tez integration in MEP 7.1.0, you may encounter the following exception:

```
Caused by: java.lang.ClassNotFoundException:
org.apache.hadoop.hbase.client.mapr.BaseTableMappingRules
    at java.base/
jdk.internal.loader.BuiltinClassLoader.loadClass(BuiltinClassLoader.java:581
)
    at java.base/
jdk.internal.loader.ClassLoaders$AppClassLoader.loadClass(ClassLoaders.java:
178)
    at java.base/java.lang.ClassLoader.loadClass(ClassLoader.java:522)
    ... 39 more
```

This exception can occur due to the new Tez classloader implemented in the Tez project. To resolve this issue, put the following additional JAR files in the `/apps/tez/tez-0.9` folder.

Issue the following commands before you run HBase + Hive + Tez integration in MEP 7.1.0:

```
hadoop fs -mkdir /apps/tez/tez-0.9/hbase
hadoop fs -put /opt/mapr/hbase/hbase-1.4.12/lib/* /apps/tez/tez-0.9/hbase/
```

Add the following property to `/opt/mapr/tez/tez-0.9/conf/tez-site.xml`:

```
<property>
<name>tez.lib.uris</name>
<value>${fs.defaultFS}/apps/tez/tez-0.9,${fs.defaultFS}/apps/tez/tez-0.9/
```

```
lib,${fs.defaultFS}/apps/tez/tez-0.9/hbase/</value>
 </property>
```

It is assumed that the Hive version is 2.3, Hbase version is 1.4.12, Tez version is 0.9, Hadoop version is 2.7.4, Zookeeper version is 3.5.6.0, and ecosystem release is 2009.

HIVE-760 [Hive-2.3] Could not start hive-metastore on Centos 8 MetaException(message:Version information not found in metastore)

Starting in MEP 7.0.0, use the MySQL driver with MariaDB.

```
<property>
    <name>javax.jdo.option.ConnectionURL</name>
    <value>jdbc:mysql://localhost:3306/hive?createDatabaseIfNotExist=true</
value>
  </property>
 <property>
    <name>javax.jdo.option.ConnectionDriverName</name>
    <value>com.mysql.jdbc.Driver</value>
    <description>Driver class name for a JDBC metastore</description>
 </property>
```

Some SELECT queries can be converted to a single FETCH task minimizing latency. Currently, the query should be single sourced and should not have a subquery or any aggregations or distincts (which incurs RS), lateral views and joins:

```
none : disable hive.fetch.task.conversion
minimal : SELECT star, filter on partition columns, LIMIT only
more :  SELECT, filter, LIMIT only (support TABLESAMPLE and virtual columns)
```

Resolved Issues

- None.

HttpFS Release Notes

The release notes for HttpFS included in the MapR Converged Data Platform contains notes specific to MapR only.

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734. To view release notes for prior MapR releases, see Previous Versions on page 6194.

HttpFS 1.1.0.400 - 2405 (EEP 8.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	1.1.0.400
Release Date	May 2024
Version Compatibility	See EEP Components and OS Support on page 5734
GitHub Source	https://github.com/mapr/httpfs/
GitHub Release Tag	1.1.0.400-eep-812
Maven Artifacts	http://repository.mapr.com/maven/

Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your MEP (EEP) and OS to view the list of package names

New in This Release

HttpFS 1.1.0.400-eep-812 - 2405 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
3b71d464c3	2024/04/26	HTTPFS-118: Updated Jetty dependency to 9.4.54.v20240208
6787661e65	2024/04/26	HTTPFS-118: Updated Hadoop dependency for 8.1.2 release

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

None.

Resolved Issues

None.

HttpFS 1.1.0.300 - 2305 (EEP 8.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	1.1.0.300
Release Date	May 2023
Version Compatibility	See EEP Components and OS Support on page 5734
GitHub Source	https://github.com/mapr/httpfs/
GitHub Release Tag	1.1.0.300-eep-811
Maven Artifacts	http://repository.mapr.com/maven/
Package Names	Navigate tohttps://package.ezmeral.hpe.com/releases/MEP/ and select your MEP (EEP) and OS to view the list of package names

New in This Release

HttpFS 1.1.0.300-eep-811 - 2305 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

last-updated: Jun 06, 2024

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
625cf57	2023/04/24	HTTPFS-114: Updated Jetty to 9.4.51 version
b686ada	2023/04/24	HTTPFS-113: Added maxThread property to fix "Insufficient configured threads"
2d8b0c7	2023/02/16	HTTPFS-110: Fixed warnings for configuration step
852b35a	2023/02/14	HTTPFS-111: Added ipaddress to httpfs-audit log file

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

None.

Resolved Issues

None.

HttpFS 1.1.0.200 - 2201 (EEP 8.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	1.1.0.200
Release Date	January 2022
Version Compatibility	See EEP Components and OS Support on page 5734
GitHub Source	https://github.com/mapr/httpfs/
GitHub Release Tag	1.1.0.200-eep-810
Maven Artifacts	http://repository.mapr.com/maven/
Package Names	Navigate tohttps://package.ezmeral.hpe.com/releases/MEP/ and select your MEP (EEP) and OS to view the list of package names

New in This Release

HttpFS 1.1.0.200-eep-810 - 2201 introduces the following enhancements or HPE platform-specific behavior changes:

- Adds FIPS support.
- Upgrades commons-io.

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
e7946c91	2021-12-15	HTTPFS-96: log4j updated to 1.3.0-mapr due vulnerability CVE-2019-17571, CVE-2021-4104
34c838ff	2021-12-01	HTTPFS-94: Updated jdom-1.1.jar due vulnerability CVE-2021-33813
34312110	2021-11-25	Added execute permission to configuration script
4234dba2	2021-11-19	HTTPFS-93: commons-io-2.4.jar vulnerability CVE-2021-29425
e009fb22	2021-11-18	HTTPFS-92: Updated Hadoop and Jetty version to the latest
02824dda	2021-10-06	HTTPFS-87 - Fix unit tests
36235297	2021-09-13	HTTPFS-82: HttpFS can't load SSL config and start with NPE
13709650	2021-09-09	Httpfs 73: Add FIPS support

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

None

Resolved Issues

None

HttpFS 1.1.0.100 - 2110 (EEP 8.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	1.1.0.100
Release Date	October 2021
Version Compatibility	See EEP Components and OS Support on page 5734
GitHub Source	https://github.com/mapr/httpfs/
GitHub Release Tag	1.1.0.100-eep-800
Maven Artifacts	http://repository.mapr.com/maven/
Package Names	Navigate tohttps://package.ezmeral.hpe.com/releases/MEP/ and select your MEP (EEP) and OS to view the list of package names

New in This Release

HttpFS 1.1.0.100-eep-800 - 2110 introduces the following enhancements or HPE platform-specific behavior changes:

- Adds XAttrs support (for details, see https://hadoop.apache.org/docs/current/hadoop-project-dist/hadoop-hdfs/WebHDFS.html#Extended_Attributes.28XAttrs.29_Operations)

last-updated: Jun 06, 2024

- Updates Jetty to 9.4.43.v20210629
- Updates Jackson v1 and v2 depenencies

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
49f1d8ab	2021-04-19	HTTPFS-68 - Fixed problem with starting httpfs on SLES
83f9eb5f	2021-04-29	Backport HDFS-6430 HTTPFS - Implement XAttr support (Yi Liu via tucu)
e371c077	2021-05-20	HTTPFS-69 fix bug with incremental install
eef38d0d	2021-07-12	Httpfs 70: Fixed unit tests
9e3db8fb	2021-07-28	HTTPFS-75: Update Jetty to 9.4.43.v20210629
e0dd2c6e	2021-08-03	HTTPFS-76: Remove sudo usage in HttpFS
e920552c	2021-08-17	HTTPFS-78: Update Jackson v1 and v2 depenencies
c1e7bcda	2021-09-02	HTTPFS-79: HttpFS can't find credential.provider.path and read encrypted password

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

None

Resolved Issues

None

HttpFS 1.1.0.50 (EEP 7.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	1.1.0.50
Release Date	March 2022
HPE Version Compatibility	See EEP Components and OS Support on page 5734
GitHub Source	https://github.com/mapr/httpfs/
GitHub Release Tag	1.1.0.50-mapr-712
Maven Artifacts	http://repository.mapr.com/maven/

Package Names	Navigate tohttps://package.ezmeral.hpe.com/releases/MEP/ and select your MEP and OS to view the list of package names

New in This Release

HttpFS 1.1.0.50-mapr-712 is a defect-repair release.

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
a52a14d2	2022-01-25	HTTPFS-97: Updated log4j v1 to the 1.3.1-mapr
20c083d7	2021-12-15	HTTPFS-96: log4j updated to 1.3.0-mapr due vulnerability CVE-2019-17571, CVE-2021-4104
a6d7766a	2021-12-01	HTTPFS-94: Updated jdom-1.1.jar due vulnerability CVE-2021-33813
8da91d17	2021-11-25	Added execute permission to configuration script
3eb470a1	2021-11-19	HTTPFS-93: commons-io-2.4.jar vulnerability CVE-2021-29425
2ba6ea9b	2021-11-18	HTTPFS-92: Updated Hadoop and Jetty version to the latest
9edac004	2021-10-07	HTTPFS-82: HttpFS can't load SSL config and start with NPE
acc2f3ca	2021-10-27	HTTPFS-79: HttpFS can't find credential.provider.path and read encrypted password

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

None.

Resolved Issues

None.

Hue Release Notes

The release notes for Hue component included in the MapR Converged Data Platform contains notes specific to MapR only.

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734. To view release notes for prior MapR releases, see Previous Versions on page 6194.

Hue 4.11.0.100 - 2404 (EEP 9.2.2) Release Notes
This section provides reference information, including new features, fixes, known issues, and limitations for Hue 4.11.0.0-2310.

last-updated: Jun 06, 2024

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop. You can find additional information in the following change logs or the Hue homepage:

- Changelog for Hue 4.11
- Changelog for Hue 4.10
- Changelog for Hue 4.9
- Changelog for Hue 4.8
- Changelog for Hue 4.7

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	4.11.0.100
Release Date	April 2024
MapR Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	https://github.com/mapr/hue/tree/4.11.0.0-eep-920
GitHub Release Tag	4.11.0.100-eep-922
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names

New in This Release

EEP 9.2.2 introduces RHEL v9.x support.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Data (YYYY-MM-DD)	HPE Fix Number and Description
a3cabd9	2024-03-21	MHUE-593 Update Python 3.8 used in Hue to the latest version
a60a879	2024-03-29	MHUE-588 Hue hangs after a file download - [download] Check for binary empty chunk string correctly (#3277) (#443)
c6f8810, 0179125, b15cda7	2024-04-04	Provide RHEL 9 compatibility

Resolved Issues

None.

Known Issues and Limitations

- Integration with MySQL data sources is now not supported through the RDBMS application. Instead, use SQLAlchemy interpreters.
- Hue 4.11 is not compatible with a FIPS-enabled setup.
- HPE Ezmeral Data Fabric does not support the integration between Hue and the following components:

last-updated: Jun 06, 2024

  - Impala
  - Oozie
  - Pig
  - Sentry
  - Solr Search
  - Sqoop
  - Sqoop2
  - ZooKeeper
- MHUE-209 Hue cannot create a table from a `*.csv` file via importer from ADLS.
- When the `[notebook]` section of the `hue.ini` contains a Drill entry that precedes the Hive entry, the Table Browser uses the Drill back end. This can be turned off by changing the `force_hs2_metadata=true` setting in the `[metastore]` section of the `hue.ini` file.

Hue 4.11.0.0 - 2310 (EEP 9.2.0) Release Notes
This section provides reference information, including new features, fixes, known issues, and limitations for Hue 4.11.0.0-2310.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop. You can find additional information in the following change logs or the Hue homepage:

- Changelog for Hue 4.11
- Changelog for Hue 4.10
- Changelog for Hue 4.9
- Changelog for Hue 4.8
- Changelog for Hue 4.7

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	4.11.0.0
Release Date	October 2023
MapR Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	https://github.com/mapr/hue/tree/4.11.0.0-eep-920
GitHub Release Tag	4.11.0.0-eep-920
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names

New in This Release

EEP 9.2.0 updates the Hue version to 4.11. In addition, Python is updated to version 3 in the Hue EEP package.

Fixes

Not applicable. All commits supported porting to the new version of Hue.

Resolved Issues

None.

Known Issues and Limitations

- Integration with MySQL data sources is now not supported through the RDBMS application. Instead, use SQLAlchemy interpreters.
- Hue 4.11 is not compatible with a FIPS-enabled setup.
- HPE Ezmeral Data Fabric does not support the integration between Hue and the following components:
  - Impala
  - Oozie
  - Pig
  - Sentry
  - Solr Search
  - Sqoop
  - Sqoop2
  - ZooKeeper
- MHUE-209 Hue cannot create a table from a `*.csv` file via importer from ADLS.
- When the `[notebook]` section of the `hue.ini` contains a Drill entry that precedes the Hive entry, the Table Browser uses the Drill back end. This can be turned off by changing the `force_hs2_metadata=true` setting in the `[metastore]` section of the `hue.ini` file.

Hue 4.6.0.650 - 2307 (EEP 9.1.2) Release Notes
This section provides reference information, including new features, fixes, known issues, and limitations for Hue 4.6.0.650-2307.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop. You can find additional information in the following change logs or the Hue homepage:

- Changelog for Hue 4.6
- Changelog for Hue 4.5
- Changelog for Hue 4.4

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	4.6.0.650
Release Date	July 2023
MapR Version Interoperability	See EEP Components and OS Support on page 5734

Source on GitHub	https://github.com/mapr/hue/tree/branch-4.6.0
GitHub Release Tag	4.6.0.650-eep-912
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names

New in This Release

None.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
43ac306	2023-06-09	I1116 [notebook] Fix not rendering Markdown in notebook's snippet (Issue #1116) (#1117)
63dbcf6	2023-06-09	HUE-9240 [hive] Do no skip first table column on LLAP upstream
1d0e3ea	2023-06-09	MHUE-538 kt_renewer service does not work with RHEL 8
ccf613e	2023-06-14	MHUE-539 "Change Permissions" shows incorrect permissions
4166fa1	2023-06-22	HUE-9153 [core] Avoid logging failure when data contains non unicode in REST resource lib
cabcdec	2023-06-22	HUE-8888 [core] Avoid AttributeError when logging REST call
9810c89	2023-06-22	Backport fix for openeing files with non-English names
27c9a43	2023-06-26	MHUE-542 Fix upload of files with non-English characters in names

For complete details, refer to the commit log for this project in GitHub.

Resolved Issues

None.

Known Issues and Limitations

- Hue 4.6 is not compatible with FIPS-enabled setup.
- HPE Ezmeral Data Fabric does not support the integration between Hue 4.6.0 and the following components:
  - Solr Search
  - ZooKeeper
- MHUE-209 Hue cannot create a table from a `*.csv` file via importer from ADLS.
- When the `[notebook]` section of the `hue.ini` contains a Drill entry that precedes the Hive entry, the Table Browser uses the Drill back end. This can be turned off by changing the `force_hs2_metadata=true` setting in the `[metastore]` section of the `hue.ini` file.

NOTE: In Hue 4.3.0-1912, support for the integration of Drill with the Table Browser in Hue was added as an experimental feature.

last-updated: Jun 06, 2024

Hue 4.6.0.600 - 2301 (EEP 9.1.0) Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Hue 4.6.0.600-2301.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop. You can find additional information in the following change logs or the Hue homepage:

- Changelog for Hue 4.6
- Changelog for Hue 4.5
- Changelog for Hue 4.4

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	4.6.0.600
Release Date	January 2023
MapR Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	`https://github.com/mapr/hue/tree/4.6.0.600-eep-910`
GitHub Release Tag	4.6.0.600-eep-910
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names

New in This Release

None.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
f59548f, 84fc207	2011-11-15	MHUE-525 Hiveserver2 HA Connection Issue

For complete details, refer to the commit log for this project in GitHub.

Resolved Issues

- MHUE-525 - The fix, which implements HiveServer 2 HA connection failover, was backported from the upstream.

Known Issues and Limitations

- Hue 4.6 is not compatible with FIPS-enabled setup.
- HPE Ezmeral Data Fabric does not support the integration between Hue 4.6.0 and the following components:
  - Solr Search
  - ZooKeeper

- MHUE-209 Hue cannot create a table from a `*.csv` file via importer from ADLS.
- Hue uses python parquet lib to read parquet files. This library does not support all possible parquet formats.
- When the `[notebook]` section of the `hue.ini` contains a Drill entry that precedes the Hive entry, the Table Browser uses the Drill back end. This can be turned off by changing the `force_hs2_metadata=true` setting in the `[metastore]` section of the `hue.ini` file.

NOTE: In Hue 4.3.0-1912, support for the integration of Drill with the Table Browser in Hue was added as an experimental feature.

Hue 4.6.0.500 - 2210 (EEP 9.0.0) Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Hue 4.6.0.500-2210.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop. You can find additional information in the following change logs or the Hue homepage:

- Changelog for Hue 4.6
- Changelog for Hue 4.5
- Changelog for Hue 4.4

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	4.6.0.500
Release Date	October 2022
MapR Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	`https://github.com/mapr/hue/tree/4.6.0.500-eep-900`
GitHub Release Tag	4.6.0.500-eep-900
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names

New in This Release

The following features are new in this release:

- The Oozie application and workflow are deprecated. See Discontinued Ecosystem Components on page 5748.
- This release supports Hue integration with HTTPFS 3.3.4. Note that in EEP 9.0.0, the HTTPFS package is part of Hadoop.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description

last-updated: Jun 06, 2024

a1519e7, 07ff637, 2579148, 58d03eb, c38355c	2022-05-25	MHUE-502 Provide an ability to configure MAPR-SECURITY for ZooKeeper client
f477631, ef945c9	2022-09-02	MHUE-513 Move Oozie to blacklist
a4a1678	2022-09-02	MHUE-518 Change HBase version for hbase_conf_dir variable in hue.ini
d637639	2022-09-15	MHUE-516 Set default version of Hive Thrift protocol to 11

For complete details, refer to the commit log for this project in GitHub.

Resolved Issues

- MHUE-502 - Integration with HiveServer2 HA now works with MapR-Secured ZooKeeper

Known Issues and Limitations

- Hue 4.6 is not compatible with FIPS-enabled setup.
- HPE Ezmeral Data Fabric does not support the integration between Hue 4.6.0 and the following components:
  - Solr Search
  - ZooKeeper
- MHUE-209 Hue cannot create a table from a `*.csv` file via importer from ADLS.
- Hue uses python parquet lib to read parquet files. This library does not support all possible parquet formats.
- When the `[notebook]` section of the `hue.ini` contains a Drill entry that precedes the Hive entry, the Table Browser uses the Drill back end. This can be turned off by changing the `force_hs2_metadata=true` setting in the `[metastore]` section of the `hue.ini` file.

NOTE: In Hue 4.3.0-1912, support for the integration of Drill with the Table Browser in Hue was added as an experimental feature.

Hue 4.6.0.310 - 2305 (EEP 8.1.1) Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Hue 4.6.0.310-2305.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop. You can find additional information in the following change logs or the Hue homepage:

- Changelog for Hue 4.6
- Changelog for Hue 4.5
- Changelog for Hue 4.4

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	4.6.0.310
Release Date	May 2023

MapR Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	`https://github.com/mapr/hue/tree/4.6.0.310-eep-811`
GitHub Release Tag	4.6.0.310-eep-811
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names

New in This Release

- MHUE-502 – With HS2 High Availability support enabled, Hue can now connect to MapR-Secured Zookeeper to get an active HiveServer2.
- MHUE-525 – With HiveServer2 High Availability support enabled, Hue can now reconnect to HS2 when connection to an active HS2 is lost.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
1879133	2022-05-25	Remove old kazoo library that does not have support of sasl
3ed7087	2022-05-25	Add kazoo-2.7.0 which has support of SASL
d5607b4	2022-05-25	Add pure-sasl dependency
92cdb7e	2022-05-25	Add MapRSASL mechanism implementation for puresasl
8eb1da5	2022-05-25	MHUE-502 Provide an ability to configure MAPR-SECURITY for ZooKeeper client
15966f0	2022-12-23	HUE-9358 [hive] Proper message with LLAP HA discovery when all servers down
ff394ec	2022-12-23	MHUE-525 - Performed a complete manual test by stopping and starting Hive server multiple times and one at a time to ensure that the Hue code can replace the Old active HS2 with the new Active HS2. (CDPD-10924)
bcf3f8b	2022-12-26	Fix indentation after backporting fix for MHUE-525 to Hue 4.6

For complete details, refer to the commit log for this project in GitHub.

Resolved Issues

None.

Known Issues and Limitations

- Hue 4.6 is not compatible with FIPS-enabled setup.
- HPE Ezmeral Data Fabric does not support the integration between Hue 4.6.0 and the following components:
  - Solr Search
  - ZooKeeper
- MHUE-209 Hue cannot create a table from a `*.csv` file via importer from ADLS.

last-updated: Jun 06, 2024

- Hue uses python parquet lib to read parquet files. This library does not support all possible parquet formats.
- When the `[notebook]` section of the `hue.ini` contains a Drill entry that precedes the Hive entry, the Table Browser uses the Drill back end. This can be turned off by changing the `force_hs2_metadata=true` setting in the `[metastore]` section of the `hue.ini` file.

NOTE: In Hue 4.3.0-1912, support for the integration of Drill with the Table Browser in Hue was added as an experimental feature.

Hue 4.6.0.300 - 2201 (EEP 8.1.0) Release Notes
This section provides reference information, including new features, fixes, known issues, and limitations for Hue 4.6.0.300-2201.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop. You can find additional information in the following change logs or the Hue homepage:

- Changelog for Hue 4.6
- Changelog for Hue 4.5
- Changelog for Hue 4.4

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	4.6.0.300
Release Date	January 2022
MapR Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	https://github.com/mapr/hue/tree/4.6.0.300-eep-810

Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names

New in This Release

This Hue release:

- Provides the ability to configure a custom port fo the S3-fs endpoint.
- Disables Impala, Pig, and Sqoop1 applications by default.
- Updates the list of dependencies in Hue to resolve CVE vulnerabilities.
- Allows connection to an S3 server that uses self-signed certificates.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
6b36590	2021-10-28	MHUE-480 [drill] Backport Drill JDBC client refactoring from Hue 4.3

119d3ae	2021-11-03	MHUE-484 Fix ssl_password_script.sh to resolve issue on Core 7/ Ubuntu 18
2c3191d	2021-11-11	MHUE-238 Provide an ability to configure custom port for S3-fs endpoint
b3bee61	2021-11-18	PR1123 [aws] s3datetime_to_timestamp parse timestamp with Z(minio.io)
0fa24ae	2021-11-19	MHUE-477 [build-boxes] Fix Hue installation on Ubuntu Focal
422b8a4	2021-12-01	fix(boto): S3 region parser references unassigned variable when S3 is colocated
4472b8e	2021-12-01	HUE-9435 [aws] Fix issue with aws behind proxy and make S3_USE_SIGV4 default when region is set
7d3c9d6	2021-12-22	MHUE-491 Disable Sentry, Impala and Pig apps
862faa9	2021-12-24	MHUE-491 Disable Pig in interpreter list
007af8a	2021-12-28	MHUE-491 Disable Sqoop1 in interpreter list
2f5828c	2022-01-07	MHUE-487 Backport fix for CVE-2021-3177
65f6d2a	2022-01-09	MHUE-487 Hue CVE fixes for Jan 2022 release
37dfea4	2022-01-09	HUE-5095 [backend] Python requests library should put port information in log message
c8ee955	2022-01-10	MHUE-487 Revert upgrade of cryptography because it breaks build
7a8c4b6	2022-02-03	MHUE-500 Allow to connect to S3 server that uses self-signed certificates

For complete details, refer to the commit log for this project in GitHub.

Resolved Issues

This release resolves the following issues:

- MHUE-480 - Configured to use Zookeeper connection type does not work for Drill
- MHUE-484 - Fix ssl_password_script.sh which breaks Hue on Ubuntu 18.04
- MHUE-477 - Fix Hue compatibility with Ubuntu 20.04

Known Issues and Limitations

- Hue 4.6 is not compatible with FIPS-enabled setup.
- HPE Ezmeral Data Fabric does not support the integration between Hue 4.6.0 and the following components:
  - Solr Search
  - ZooKeeper
- MHUE-209 Hue cannot create a table from a `*.csv` file via importer from ADLS.
- Hue uses python parquet lib to read parquet files. This library does not support all possible parquet formats.
- When the `[notebook]` section of the `hue.ini` contains a Drill entry that precedes the Hive entry, the Table Browser uses the Drill back end. This can be turned off by changing the `force_hs2_metadata=true` setting in the `[metastore]` section of the `hue.ini` file.

last-updated: Jun 06, 2024

NOTE: In Hue 4.3.0-1912, support for the integration of Drill with the Table Browser in Hue was added as an experimental feature.

Hue 4.6.0.200 - 2110 (EEP 8.0.0) Release Notes
This section provides reference information, including new features, fixes, known issues, and limitations for Hue 4.6.0.200-2110.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop. You can find additional information in the following change logs or the Hue homepage:

- changelog for Hue 4.6
- changelog for Hue 4.5
- changelog for Hue 4.4

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	4.6.0.200
Release Date	October 2021

Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names

New in This Release

No new features were introduced in this release.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
64a5614	2021-05-21	MHUE-470 Hue not starts because of wrong permissions of metrics file
5dc5f7b	2021-09-21	MHUE-476 SSL key and certificate could not be found or have a problem
b4ebcb1	2021-09-21	MHUE-474 Remove usage of sudo in Hue

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- HPE Ezmeral Data Fabric does not support the integration between Hue 4.6.0 and the following components:
  - Solr Search
  - ZooKeeper

- MHUE-209 Hue cannot create a table from a `*.csv` file via importer from ADLS.
- Hue uses python parquet lib to read parquet files. This library does not support all possible parquet formats.
- When the `[notebook]` section of the `hue.ini` contains a Drill entry that precedes the Hive entry, the Table Browser uses the Drill back end. This can be turned off by changing the `force_hs2_metadata=true` setting in the `[metastore]` section of the `hue.ini` file.

NOTE: In Hue 4.3.0-1912, support for the integration of Drill with the Table Browser in Hue was added as an experimental feature.

Hue 4.6.0.150 (EEP 7.1.2) Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for Hue 4.6.0.150.

The notes below relate specifically to the data-fabric Distribution for Apache Hadoop. You can find additional information in the following change logs or the Hue homepage:

- changelog for Hue 4.4
- changelog for Hue 4.5
- changelog for Hue 4.6

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	4.6.0.250
Release Date	March 2022
MapR Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	https://github.com/mapr/hue/tree/4.6.0.150-mapr-712
GitHub Release Tag	4.6.0.150-mapr-712
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names

New in This Release

Hue 4.6.0.150 introduces the following enhancements or HPE platform-specific behavior changes:

- MHUE-238: Enables configuring a custom port for the S3-fs end point.
- MHUE-487: Updates the list of Hue dependencies to resolve CVE vulnerabilities.

Fixes

This data-fabric release includes the following fixes on the base release:

GitHubCommitNumber	Date (YYYY-MM-DD)	MapR Fix Number and Description
64a5614	2021-05-21	MHUE-470 Hue not starts because of wrong permissions of metrics file
bb8980b	2021-08-26	MHUE-470 Fix metrics file location defining

last-updated: Jun 06, 2024

5dc5f7b	2021-09-21	MHUE-476 SSL key and certificate could not be found or have a problem
b4ebcb1	2021-09-21	MHUE-474 Remove sudo usage in Hue
6b36590	2021-10-28	MHUE-480 [drill] Backport Drill JDBC client refactoring from Hue 4.3
119d3ae	2021-11-03	MHUE-484 Fix ssl_password_script.sh to resolve issue on Ubuntu 18
2c3191d	2021-11-11	MHUE-238 Provide an ability to configure custom port for S3-fs endpoint
b3bee61	2021-11-18	PR1123 [aws] s3datetime_to_timestamp parse timestamp with Z(minio.io)
0fa24ae	2021-11-19	MHUE-477 [build-boxes] Fix Hue installation on Ubuntu Focal
422b8a4	2021-12-01	fix(boto): S3 region parser references unassigned variable when S3 is colocated

b6ba643	2021-12-22	MHUE-477 Polish Hue compatibility libs setup
f8c0e2a	2022-01-21	MHUE-487 Backport fix for CVE-2021-3177
94d559e	2022-01-21	MHUE-487 Hue CVE fixes for Jan 2022 release
44ef53d	2022-01-21	HUE-5095 [backend] Python requests library should put port information in log message
4519d2e	2022-01-21	MHUE-487 Revert upgrade of cryptography because it breaks build

For complete details, refer to the commit log for this project in GitHub.

Resolved Issues

- MHUE-470: Hue does not start because of wrong permissions in the metrics file.
- MHUE-480: ZooKeeper connection type does not work for Drill.
- MHUE-484: The ssl_password_script.sh which breaks Hue on Ubuntu 18.04.

Known Issues and Limitations

- HPE does not support the integration between Hue 4.6.0 and the following components:
  - Solr Search
  - ZooKeeper
- Integration between Hue 4.6.0 and Sentry 1.7 is supported on secure clusters that use Kerberos authentication, but it is not supported on secure clusters that use MapR-SASL authentication.
- MHUE-209 Hue cannot create a table from *.csv file via importer from ADLS.
- Hue uses python parquet lib to read parquet files. This library does not support all possible parquet formats.
- When the `[notebook]` section of the `hue.ini` contains a Drill entry that precedes the Hive entry, the Table Browser uses the Drill back end. This can be turned off by changing the `force_hs2_metadata=true` setting in the `[metastore]` section of the `hue.ini` file.

NOTE: In Hue 4.3.0-1912, support for the integration of Drill with the Table Browser in Hue was added as an experimental feature.

Livy Release Notes

The release notes for Livy component included in the HPE Ezmeral Data Fabric contain notes specific to HPE Ezmeral Data Fabric only.

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734. To view release notes for prior HPE Ezmeral Data Fabric releases, see Previous Versions on page 6194.

Livy 0.8.0.0 - 2401 (EEP 9.2.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop. You can find additional information on the Livy release notes page or Livy homepage.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	0.8.0.0
Release Date	January 2024
HPE Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	https://github.com/mapr/livy/tree/0.8.0.0-eep-921
GitHub Release Tag	0.8.0.0-eep-921
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP(MEP) and OS to view the list of package names.

New in This Release

- Livy Server is updated to version 0.8.

Fixes

This HPE release includes the following fixes on the base release:

- None.

Resolved issues

None.

Known Issues and Limitations

- When you enable the SSL in a mixed (FIPS and non-FIPS) configuration, Spark application run fails. To run Spark applications, set `spark.ssl.ui.enabled` option to `false` in `spark-defaults.conf` configuration file.
- Hive-compatible JDBC / ODBC server introduced in Livy 0.7 is not available in HPE distribution.

Livy 0.7.0.400 - 2310 (EEP 9.2.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop. You can find additional information on the Livy release notes page or Livy homepage.

last-updated: Jun 06, 2024

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	0.7.0.400
Release Date	October 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	https://github.com/mapr/livy/tree/0.7.0.400-eep-920
GitHub Release Tag	0.7.0.400-eep-920
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP(MEP) and OS to view the list of package names.

New in This Release

The current release adds support for the Java 17 runtime environment.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
d9f3942	2022-11-07	EZAF-182 Provide an option to enable or disable SSL (#93)
34febfc	2023-08-25	Update Kryo to provide Java 17 compatibility
bc2a4a1	2023-09-06	Open access to packages that have become non-public in Java 17

For complete details, refer to the commit log for this project in GitHub.

Resolved issues

None.

Known Issues and Limitations

- Livy in EEP 9.2.0 does not support FIPS enabled environment.
- When you enable the SSL in a mixed (FIPS and non-FIPS) configuration, Spark application run fails. To run Spark applications, set `spark.ssl.ui.enabled` option to `false` in `spark-defaults.conf` configuration file.
- Hive-compatible JDBC / ODBC server introduced in Livy 0.7 is not available in HPE distribution.

Livy 0.7.0.300 - 2210 (EEP 9.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop. You can find additional information on the Livy release notes page or Livy homepage.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	0.7.0.300
Release Date	October 2022

HPE Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	https://github.com/mapr/livy/tree/0.7.0.300-eep-900
GitHub Release Tag	0.7.0.300-eep-900
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP(MEP) and OS to view the list of package names.

New in This Release

Hadoop and Spark versions were updated to be compatible with EEP 9.0.0. .

Fixes

This HPE release includes the following fixes on the base release:

- None.

For complete details, refer to the commit log for this project in GitHub.

Resolved issues

None.

Known Issues and Limitations

- Livy in EEP 9.0.0 does not support FIPS enabled environment..
- When you enable the SSL in a mixed (FIPS and non-FIPS) configuration, Spark application run fails. To run Spark applications, set `spark.ssl.ui.enabled` option to `false` in `spark-defaults.conf` configuration file.
- Hive-compatible JDBC / ODBC server introduced in Livy 0.7 is not available in HPE distribution.

Livy 0.7.0.200 - 2201 (EEP 8.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop. You can find additional information on the Livy release notes page or Livy homepage.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	0.7.0.200
Release Date	January 2022
HPE Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	https://github.com/mapr/livy/tree/0.7.0.200-eep-810
GitHub Release Tag	0.7.0.200-eep-810
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP(MEP) and OS to view the list of package names.

New in This Release

- MLIVY-96: Updated dependencies in Livy to be compatible with Spark 3.2 .

- MLIVY-98: Fixed incompatibility of Livy Python modules with Python 3.8.
- MLIVY-97, MLIVY-99: Ensured Livy worked on FIPS-enabled cluster. Added support of SCRAM-SHA-256 SASL mechanism for communication between Livy server and Livy session Spark Applications.
- MLIVY-92: Updated dependencies in Livy to resolve CVE vulnerabilities.
- MLIVY-100: Updated `log4j 1.2.17` to `log4j 1.3.1-mapr` to resolve vulnerabilities.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
1daea08	2021-12-09	MLIVY-96 Update dependencies to be compatible with Spark 3.2
96d6457	2021-12-24	Mock ast.Module to work with Python 3.8
78fc627	2022-01-04	MLIVY-70 Switch to log4j 1.3.0-mapr
7b018f7	2022-01-21	MLIVY-97 Fix Livy on FIPS-enabled cluster
f28d269	2022-01-24	MLIVY-99 Fix Livy for older cores
80417bf	2022-01-24	MLIVY-92 CVE fixes
4922f62	2022-01-25	MLIVY-92 Fix Livy after last round of CVE fixing
5c2abf2	2022-01-25	MLIVY-92 Resolve dependencies issues
ad6697d	2022-01-25	MLIVY-100 Update log4j v1 to the 1.3.1-mapr
700c1bb	2022-01-27	MLIVY-97 Change the way of enabling SCRAM-SHA-256 on FIPS setup
70263f8	2022-02-02	MLIVY-101 Build Livy ECO EEP 8.1.0 components with DF v 6.2.0

For complete details, refer to the commit log for this project in GitHub.

Resolved issues

- MLIVY-98: Fixed incompatibility of Livy Python modules with Python 3.8.

Known Issues and Limitations

- When you enable the SSL in a mixed (FIPS and non-FIPS) configuration, Spark application run fails. To run Spark applications, set `spark.ssl.ui.enabled` option to `false` in `spark-defaults.conf` configuration file.
- Hive-compatible JDBC / ODBC server introduced in Livy 0.7 is not available in HPE distribution.

Livy 0.7.0.100 - 2110 (EEP 8.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop. You can find additional information on the Livy release notes page or Livy homepage.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	0.7.0.100
Release Date	October 2021
MapR Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	https://github.com/mapr/livy/tree/0.7.0.100-eep-800
GitHub Release Tag	0.7.0.100-eep-800
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP(MEP) and OS to view the list of package names.

New in This Release

- Support for Spark 3.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
4068bf1	2021-09-14	SPARK-884 Update Kryo version
9e57289	2021-09-14	SPARK-884 Backport changes for org.apache.livy.rsc.driver.SparkEntries from upstream
6677a0e	2021-09-15	MLIVY-90 No result after executing the script for SparkR
713c93a	2021-09-21	MLIVY-88 Remove usage of sudo in Livy

Known Issues and Limitations

- Hive-compatible JDBC / ODBC server introduced in Livy 0.7 is not available in HPE distribution.

Livy 0.7.0.050 - 2202 (EEP 7.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop. You can find additional information on the Livy release notes page or Livy homepage.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	0.7.0.050
Release Date	March 2022
MapR Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	https://github.com/mapr/livy/tree/0.7.0.050-mapr-712
GitHub Release Tag	0.7.0.050-mapr-712

last-updated: Jun 06, 2024

Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names

New in This Release

- MLIVY-92: Updated dependencies in Livy to resolve CVE vulnerabilities.
- MLIVY-100: Updated `log4j 1.2.17` to `log4j 1.3.1-mapr` to resolve vulnerabilities.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
4068bf1	2021-09-14	SPARK-884 Update Kryo version
9e57289	2021-09-14	SPARK-884 Backport changes for org.apache.livy.rsc.driver.SparkEntries from upstream
6677a0e	2021-09-15	MLIVY-90 No result after executing the script for sparkR (for MEP-7.1)
713c93a	2021-09-21	MLIVY-88 Remove sudo usage in Livy
1daea08	2021-12-09	MLIVY-96 Update dependencies to be compatible with Spark 3.2
96d6457	2021-12-24	Mock ast.Module to work with Python 3.8
78fc627	2022-01-04	MLIVY-70 Switch to log4j 1.3.0-mapr
7b018f7	2022-01-21	MLIVY-97 Fix Livy on FIPS-enabled cluster
f28d269	2022-01-24	MLIVY-99 Fix Livy for older cores
80417bf	2022-01-24	MLIVY-92 CVE fixes
4922f62	2022-01-25	MLIVY-92 Fix Livy after last round of CVE fixing
5c2abf2	2022-01-25	MLIVY-92 Resolve dependencies issues
ad6697d	2022-01-25	MLIVY-100 Update log4j v1 to the 1.3.1-mapr
700c1bb	2022-01-27	MLIVY-97 Change the way of enabling SCRAM-SHA-256 on FIPS setup
70263f8	2022-02-02	MLIVY-101 Build Livy ECO EEP 8.1.0 components with DF v 6.2.0
2431e84	2022-02-07	Use EEP-7.1 artifacts

For complete details, refer to the commit log for this project in GitHub.

Resolved issues

- MLIVY-90: Executing SparkR script doesn't provide any result.

- MLIVY-98: Fixed incompatibility of Livy Python modules with Python 3.8.

Known Issues and Limitations

- Hive-compatible JDBC / ODBC server introduced in Livy 0.7 is not available in HPE distribution.

HPE Ezmeral Data Fabric Streams Client Release Notes

The release notes for HPE Ezmeral Data Fabric Streams clients included in the MapR Converged Data Platform.

HPE Ezmeral Data Fabric Streams C Client 0.11.3 - 1803 Release Notes

Release notes for the HPE Ezmeral Data Fabric Streams C client included in the MapR Converged Data Platform. The notes below relate specifically to the MapR Converged Data Platform.

Version	0.11.3
Release Date	March 2018
MapR Version Interoperability	See EEP Components and OS Support on page 5734
Package Names	Package Names for Ecosystem Packs (EEPs) on page 5828

New in This Release

This is a release of the HPE Ezmeral Data Fabric Streams C Client for EEP 5.0 (and above) that suppported by MapR cluster version 6.0.1 (and above). This C Client is is a binding for librdkafka 0.11.3.

Fixes

- N/A

Known Issues and Limitations

none

Resolved Issues

None.

HPE Ezmeral Data Fabric Streams Python Client 0.11.3 - 1803 Release Notes

This section provides reference information, including new features, fixes, known issues, and limitations for HPE Ezmeral Data Fabric Streams Python Client as of EEP 5.0 or above.

Release notes for the HPE Ezmeral Data Fabric Streams Python client included in the MapR Converged Data Platform. The notes below relate specifically to the MapR Converged Data Platform. You can use HPE Ezmeral Data Fabric Streams Python Client EEP 5.0 (and above) on MapR cluster version 6.0.1 (and above).

Version	0.11.3
Release Date	March 2018
Source on GitHub	
MapR Version Interoperability	See EEP Components and OS Support on page 5734
Package Names	Package Names for Ecosystem Packs (EEPs) on page 5828

last-updated: Jun 06, 2024

New in This Release

This is a release of the HPE Ezmeral Data Fabric Streams Python Client for EEP 5.0 (and above) that suppported by MapR cluster version 6.0.1 (and above). This Python Client is is a binding for librdkafka 0.11.3.

Fixes

- N/A

Known Issues and Limitations

- You cannot use the MapR Installer to install the HPE Ezmeral Data Fabric Streams Python Client. To install the HPE Ezmeral Data Fabric Streams Python Client, use pip to manually install the package. See Installing HPE Ezmeral Data Fabric Streams Python Client on page 256 for more information.

HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3 - 1803 Release Notes
This section provides reference information, including new features, fixes, known issues, and limitations for HPE Ezmeral Data Fabric Streams C#/.NET Client as of EEP 5.0 or above.

Release notes for the HPE Ezmeral Data Fabric Streams C#/.NET client included in the MapR Converged Data Platform. The notes below relate specifically to the MapR Converged Data Platform. You can use HPE Ezmeral Data Fabric Streams Python Client EEP 5.0 (and above) on MapR cluster version 6.0.1 (and above).

Version	0.11.3
Release Date	March 2018
Source on GitHub	
MapR Version Interoperability	See EEP Components and OS Support on page 5734
Package Names	Package Names for Ecosystem Packs (EEPs) on page 5828

New in This Release

This is a new release of the HPE Ezmeral Data Fabric Streams C#/.NET Client for EEP 5.0 (and above) that suppported by MapR cluster version 6.0.1 (and above). This C#/.NET Client is a binding for librdkafka 0.11.3.

Fixes

- N/A

Known Issues and Limitations

- You cannot use the MapR Installer to install the HPE Ezmeral Data Fabric Streams C#/.NET Client. See Installing HPE Ezmeral Data Fabric Streams C#/.NET Client on page 258 for more information.

HPE Ezmeral Data Fabric Streams Tools Release Notes

The release notes for HPE Ezmeral Data Fabric Streams tools included in the MapR Converged Data Platform.

Kafka Streams Release Notes

The release notes for the Kafka Streams component included in the MapR Converged Data Platform contains notes specific to MapR only.

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734. To view release notes for prior MapR releases, see Previous Versions on page 6194.

Kafka Streams 2.6.1.750 - 2404 (EEP 9.2.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. See Apache Kafka 2.6.1 release notes and Apache Kafka Streams homepage for more information.

Version	2.6.1.750
Release Date	April 2024
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka
GitHub Release Tag	2.6.1.750-eep-922
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Streams 2.6.1.750 - 2404 introduces the following enhancements or HPE platform-specific behavior changes:

- Bug fixes
- CVE fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
955e886714	2024-04-01	ECO-351 Security:: Vulnerable versions of “snappy-java” OSS versions 1.1.10.1reported as part of the mapr-kafka-connect-hdfs-10.0.0.501.202312220447-1.noarch.rpm
ca4059c27e	2024-04-01	KAFKA-1034 Update Jetty to 9.4.54.v20240208
b873a64a7a	2024-04-01	ECO-344 Security:: Vulnerable versions of “jackson-databind” OSS versions mapr-kafka-connect-*.noarch.rpm
114f3fa536	2024-04-01	ECO-341 Security: Vulnerable versions of “guava” OSS versions reported as part of the mapr-kafka-*.rpm
fe013278a7	2024-03-14	KAFKA-10792: Prevent source task shutdown from blocking herder thread (#9669)
3c6ef14d2b	2024-02-16	KAFKA-1001 Update scala version to resolve CVE-2022-36944

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- Transactions are not supported.
- Pattern subscription is not supported.
- The application reset tool hangs if it runs when the Kafka Streams application is running.

last-updated: Jun 06, 2024

- The application reset tool may throw a Null Pointer Exception when the date or duration parameter is used.
- The application reset tool does not reset to intermediate offset if the topic has multiple partitions.
- MAPR-KAFKA-581: Stream hangs in rebalancing state. The workaround is to set a larger timeout. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- [MS-1386, KAFKA-983]: Consumer client events related to consumer rebalance (assignment change, `ConsumerRebalanceListener` callbacks, invocation, etc.) now happen only inside the `consumer.poll()` method in the user thread, according to the Apache defined behavior.
- [KAFKA-1031]: In Kafka REST, this means that subscribing a consumer by sending a `POST` request to a `/subscription` endpoint will not cause partitions to be assigned to it. Partitions will be assigned only on the next poll call (`GET /records`).

Kafka Streams 2.6.1.700 - 2401 (EEP 9.2.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. See Apache Kafka 2.6.1 release notes and Apache Kafka Streams homepage for more information.

Version	2.6.1.700
Release Date	January 2024
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka
GitHub Release Tag	2.6.1.700-eep-921
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Streams 2.6.1.700 - 2401 introduces the following enhancements or HPE platform-specific behavior changes:

- Bug fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
708ea12c65	2023-11-07	KAFKA-973 Kafka Connect not responding after restart due to lots of status messages

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- Transactions are not supported.
- Pattern subscription is not supported.
- The application reset tool hangs if it runs when the Kafka Streams application is running.

- The application reset tool may throw a Null Pointer Exception when the date or duration parameter is used.
- The application reset tool does not reset to intermediate offset if the topic has multiple partitions.
- MAPR-KAFKA-581: Stream hangs in rebalancing state. The workaround is to set a larger timeout. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- None.

Kafka Streams 2.6.1.600 - 2307 (EEP 9.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. See Apache Kafka 2.6.1 release notes and Apache Kafka Streams homepage for more information.

Version	2.6.1.600
Release Date	July 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka
GitHub Release Tag	2.6.1.600-eep-912
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Streams 2.6.1.600 - 2307 introduces the following enhancements or HPE platform-specific behavior changes:

- Bug fixes
- CVEs fixes
- KAFKA-936: Starting from EEP 9.1.2, the `kafka-eventstreams` artifact is moved to the Kafka project as a sub-module.
  - Previous maven coordinates for `kafka-eventstreams` library:

```
<dependency>
    <groupId>com.mapr.kafka</groupId>
    <artifactId>kafka-eventstreams</artifactId>
    <version><eventstreams_version></version>
</dependency>
```

    For old maven coordinates, such as for `0.2.0.*`, use `<eventstreams_version>`. For example, for EEP 9.1.1, `<eventstreams_version>` is `0.2.0.200-eep-911`.

last-updated: Jun 06, 2024

- New maven coordinates for `kafka-eventstreams` library:

  ```
  <dependency>
      <groupId>org.apache.kafka</groupId>
      <artifactId>kafka-eventstreams</artifactId>
      <version><kafka_version></version>
  </dependency>
  ```

  For new maven coordinates, such as for `2.6.1.*`, use `<kafka_version>`. For example, for EEP 9.1.2, `kafka_version` is `2.6.1.600-eep-912`.

If you do not use `kafka-eventstreams` as a dependency (in gradle/maven), then this change does not affect you in any way, as there are no changes in the `.jar` itself that break backward compatibility.

If you do use `kafka-eventstreams` as a dependency in your project, then for EEP 9.1.2 and later you must use the same `groupID` and `version` as for all other `kafka*` artifacts. For example, for EEP 9.1.2, this would be as follows:

```
org.apache.kafka:kafka-eventstreams:2.6.1.600-eep-912
```

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
58ce24041a	2023-06-23	KAFKA-964 Duplicates of jetty-security jar in the kafka lib directory
333cfad146	2023-06-15	KAFKA-959 maprfs jar is bundled in kafka package
143ec75029	2023-06-01	KAFKA-936 Exclude com.sun.jersey:jersey-server from hadoop-common (for eventstreams)
4454d9ad74	2023-05-16	KAFKA-936 Move "kafka-eventstreams" as a Sub-module of "mapr-kafka" Repository

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- Transactions are not supported.
- Pattern subscription is not supported.
- The application reset tool hangs if it runs when the Kafka Streams application is running.
- The application reset tool may throw a Null Pointer Exception when the date or duration parameter is used.
- The application reset tool does not reset to intermediate offset if the topic has multiple partitions.
- MAPR-KAFKA-581: Stream hangs in rebalancing state. The workaround is to set a larger timeout. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- None.

Kafka Streams 2.6.1.500 - 2304 (EEP 9.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. See Apache Kafka 2.6.1 release notes and Apache Kafka Streams homepage for more information.

Version	2.6.1.500
Release Date	April 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka
GitHub Release Tag	2.6.1.500-eep-911
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Streams 2.6.1.500 - 2304 introduces the following enhancements or HPE platform-specific behavior changes:

- Bug fixes
- CVEs fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
71263ef2e0	2023-04-03	ECO-284 Security:: CVE:: Vulnerable version of jackson-databind bundled as part of MEP 9.1.1 -> Kafka binaries.
9893d858b5	2021-05-21	KAFKA-12820: Upgrade maven-artifact dependency to resolve CVE-2021-26291
8022fd4bf5	2020-12-10	MINOR: remove duplicate code from resetByDuration (#9699)
1a860761c3	2021-04-12	KAFKA-9527: fix NPE when using time-based argument for Stream Resetter Tool (#10042)
fb86d71eb6	2023-03-17	KAFKA-932 Update kafka-evenstream for EEP 9.1.1 release

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- Transactions are not supported.
- Pattern subscription is not supported.
- The application reset tool hangs if it runs when the Kafka Streams application is running.
- The application reset tool may throw a Null Pointer Exception when the date or duration parameter is used.
- The application reset tool does not reset to intermediate offset if the topic has multiple partitions.
- MAPR-KAFKA-581: Stream hangs in rebalancing state. The workaround is to set a larger timeout. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- None.

Kafka Streams 2.6.1.400 - 2301 (EEP 9.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. See Apache Kafka 2.6.1 release notes and Apache Kafka Streams homepage for more information.

Version	2.6.1.400
Release Date	January 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka
GitHub Release Tag	2.6.1.400-eep-910
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Streams 2.6.1.400 - 2301 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

Fixes

This HPE release includes the following fixes on the base release:

- None.

Known Issues and Limitations

- Transactions are not supported.
- Pattern subscription is not supported.
- The application reset tool hangs if it runs when the Kafka Streams application is running.
- The application reset tool may throw a Null Pointer Exception when the date or duration parameter is used.
- The application reset tool does not reset to intermediate offset if the topic has multiple partitions.
- MAPR-KAFKA-581: Stream hangs in rebalancing state. The workaround is to set a larger timeout. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- None.

Kafka Streams 2.6.1.300 - 2210 (EEP 9.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. See Apache Kafka 2.6.1 release notes or the Apache Kafka Streams homepage for more information.

Version	2.6.1.300
Release Date	October 2022

HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka
GitHub Release Tag	2.6.1.300-eep-900
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Streams 2.6.1.300 - 2210 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
8997fdad16	2022-09-13	KAFKA-908 Vulnerable bc-fips-1.0.2.1.jar
e2d8a728bb	2022-08-29	KAFKA-902 Fix CVE's in Kafka
f43e238b49	2022-08-25	KAFKA-898 Unable to JDBC connector in standalone mode by non-mapr user
264debc72e	2022-08-19	KAFKA-900 Update hadoop artifacts version to 3.3.4.0-eep-900-SNAPSHOT
a41c08b138	2022-08-19	KAFKA-899 CVE-2021-29425 - commons-io
e912cf0c74	2022-08-09	KAFKA-895 NPE after creating few hdfs connectors
80b20a3b7f	2022-07-27	KAFKA-893 Fail to get Group Metadata from Consumer
bf663562a6	2022-07-14	KAFKA-891 Publish Kafka_2.12 maven artifacts for Kafka version 2.6.1
c7dbe0c7d2	2022-07-11	MS-1085 Make AlterConsumerGroupOffsetsResult constructor accessible from outside the package.
a249b7c2f3	2022-06-27	MS-1082 Make ListConsumerGroupOffsetsResult constructor accessible from outside the package.
4f04a30312	2022-06-22	KAFKA-888 Kafka dependency updates to work with Hadoop3 libs
b5c744d860	2021-06-18	KAFKA-885 Fix CVE-2021-38153

39bcd77be7	2022-06-15	KAFKA-856 Remove unitTest from jenkins build
42a8dada83	2022-06-14	KAFKA-887 Rename GRADLE_OPTS to KAFKA_GRADLE_OPTS
c22c070d72	2022-06-14	KAKFA-887 Parametrize gradle tasks and options in private-pkg
f5e8b68065	2022-06-10	KAFKA-883 Update hadoop, hbase, hive dependencies for all kafka eco
c87092a4a4	2022-06-09	KAFKA-875 Adapt unit tests to mapr default value of group.id
5aac0f87cf	2022-06-07	KAFKA-881 Update Kafka to use 'reload4j'
d719ccbbbc	2022-06-02	KAFKA-880 Kafka broker cannot authenticate to ZK node with core7.0
5895a146c7	2022-05-27	KAFKA-865 Add mapr-specific javadoc to Admin#listOffsets
b3370d944d	2022-05-25	DFDEVOPS-1820 Remove hosts from container
3a1821912c	2022-05-25	KAFKA-856 Run Kafka Client unit tests as a part or releaseTarGz goal (adapt tests)
49a16477f0	2022-05-25	KAFKA-849 kafka client crashes with NPE while trying to use SSL (defaults defined 2)
b0f288d5ff	2022-05-24	KAFKA-878 Add required apache initialization in KafkaProducer
f18dd54378	2022-05-24	KAFKA-877 Restore change from KAFKA-6180
0d9c3487ca	2022-05-24	KAFKA-876 Get rid of deprecated ExtendedSerializer and ExtendedDeserializer
57f3262af5	2022-05-23	KAFKA-874 Add groupId validation and NPE protection to commitAsync()
f8a2387b2c	2022-05-23	KAFKA-873 Remove useless validation in apache mode initialization
cff0f2e87f	2022-05-23	KAFKA-872 Remove KAFKA-392 changes from apache code
80dc911b1c	2022-05-23	KAFKA-871 Subscribe and assign to empty list should be treated as unsubscribe()
e20485d2e8	2022-05-23	KAFKA-870 Some close() methods are not actually executed when closing consumer/producer in apache kafka mode
794d984917	2021-07-20	MINOR: Fix `testResolveDnsLookup` by using a mocked dns resolver
e381e1e607	2021-02-05	KAFKA-12193: Re-resolve IPs after a client disconnects

last-updated: Jun 06, 2024

a791e49df2	2021-06-28	KAFKA-12790: Remove SslTransportLayerTest.testUnsupportedTlsVersion
5d2a6b1755	2021-07-20	MINOR: Fix testTlsDefaults failure due to TLS 1.0/1.1 being disabled
7240c17852	2022-05-18	KAFKA-866 KafkaMaprStreams#getShortTopicNameFromFullTopicName should do nothing if topic name is already short
fd63dc5f6a	2022-05-13	KAFKA-863 Remove rest-utils dependency from connect:runtime
4d124e8461	2022-05-13	KAFKA-864 Impersonation in Worker should be optional
e3b634d7fd	2022-05-10	KAFKA-843 Add logging when generating challenge string
23f7419598	2022-04-20	KAFKA-843 Add authorization header if authorization is enabled
9287e2c952	2022-04-11	KAFKA-854 Add metrics support
dfc1956b7c	2022-03-29	KAFKA-855 could not get TopicInfo, err 13

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- Transactions are not supported.
- Pattern subscription is not supported.
- The application reset tool hangs if it runs when the Kafka Streams application is running.
- The application reset tool may throw a Null Pointer Exception when the date or duration parameter is used.
- The application reset tool does not reset to intermediate offset if the topic has multiple partitions.
- MAPR-KAFKA-581: Stream hangs in rebalancing state. The workaround is to set a larger timeout. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- None.

Kafka Streams 2.6.1.120 - 2405 (EEP 8.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. See Apache Kafka 2.6.1 release notes or the Apache Kafka Streams homepage for more information.

Version	2.6.1.120
Release Date	May 2024
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka
GitHub Release Tag	2.6.1.120-eep-812

last-updated: Jun 06, 2024

Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Streams 2.6.1.120 - 2405 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes.
- Bug fixes.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
4bd1c7cc25	2024-05-09	KAFKA-1048 ERROR 500 for any kafka-connect request on cluster without mapr-patch
7ca17192e3	2024-04-18	KAFKA-1040 CVE fixes for EEP-8.1.2 release
3ee70efde5	2022-07-27	KAFKA-893 Fail to get Group Metadata from Consumer

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- KAFKA-848: If used with Core 6.2, Kafka services will not start because of:

```
java.lang.ClassNotFoundException:
org.bouncycastle.jsse.provider.BouncyCastleJsseProvider
```

  To work around this exception, copy the `bc-fips` and `bctls-fips` jars from Hadoop to Kafka manually:

```
cp /opt/mapr/hadoop/hadoop-2.7.6/share/hadoop/common/lib/
bctls-fips-1.0.11.4.jar /opt/mapr/kafka/kafka-2.6.1/libs/
```

```
cp /opt/mapr/hadoop/hadoop-2.7.6/share/hadoop/common/lib/
bc-fips-1.0.2.1.jar /opt/mapr/kafka/kafka-2.6.1/libs/
```

- Transactions are not supported.
- Pattern subscription is not supported.
- The application reset tool hangs if it runs when the Kafka Streams application is running.
- The application reset tool may throw a Null Pointer Exception when the date or duration parameter is used.
- The application reset tool does not reset to intermediate offset if the topic has multiple partitions.

- MAPR-KAFKA-581: Stream hangs in rebalancing state. The workaround is to set a larger timeout. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- None.

Kafka Streams 2.6.1.110 - 2305 (EEP 8.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. See Apache Kafka 2.6.1 release notes or the Apache Kafka Streams homepage for more information.

Version	2.6.1.110
Release Date	May 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.

80dc911b1c	2022-05-23	KAFKA-871 Subscribe and assign to empty list should be treated as unsubscribe() (#245)
e20485d2e8	2022-05-23	KAFKA-870 Some close() methods are not actually executed when closing consumer/producer in apache kafka mode (#244)

794d984917	2021-07-20	MINOR: Fix `testResolveDnsLookup` by using a mocked dns resolver (#11091)
e381e1e607	2021-02-05	KAFKA-12193: Re-resolve IPs after a client disconnects (#9902) (#10061)
a791e49df2	2021-06-28	KAFKA-12790: Remove SslTransportLayerTest.testUnsupportedTlsVersion (#10922)
5d2a6b1755	2021-07-20	MINOR: Fix testTlsDefaults failure due to TLS 1.0/1.1 being disabled (#11092)
7240c17852	2022-05-18	KAFKA-866 KafkaMaprStreams#getShortTopicNameFromFullTopicName should do nothing if topic name is already short (#242)
9287e2c952	2022-04-11	KAFKA-854 Add metrics support (#237)
3b507fab20	2022-03-25	EEP-KAFKA-849 kafka client crashes with NPE while trying to use SSL
097ec06c3c	2022-02-15	KAFKA-848 Missing dependencies were added

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- Transactions are not supported.
- Pattern subscription is not supported.
- The application reset tool hangs if it runs when the Kafka Streams application is running.
- The application reset tool may throw a Null Pointer Exception when the date or duration parameter is used.
- The application reset tool does not reset to intermediate offset if the topic has multiple partitions.
- MAPR-KAFKA-581: Stream hangs in rebalancing state. The workaround is to set a larger timeout. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- None.

Kafka Streams 2.6.1.100 - 2201 (EEP 8.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. See Apache Kafka 2.6.1 release notes or the Apache Kafka Streams homepage for more information.

Version	2.6.1.100
Release Date	January 2022
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka
GitHub Release Tag	2.6.1.100-eep-810

last-updated: Jun 06, 2024

Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Streams 2.6.1.100 - 2201 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
0d14450	2022-01-25	MAPR-KAFKA-839 Updated log4j version to 1.3.1-mapr
20b0965	2022-01-12	MAPR-KAFKA-771 Make ListConsumerGroupsResult constructor accessible from outside the package.
cabe9f4	2021-12-16	MAPR-KAFKA-826 Added force override of log4j version
6b76e00	2021-12-15	MAPR-KAFKA-826 Updated log4j version
f59ab85	2021-11-19	MAPR-KAFKA-800 Skip already existing stream creation
17e8dbe	2021-11-19	MAPR-KAFKA-804 Netty CVE for kafka components
022472e	2021-11-16	MAPR-KAFKA-786 Added publishing of kafka-streams-test-utils
7a256fd	2021-11-15	MAPR-KAFKA-799 Backport KAFKA-12211 NoSuchFileException will be thrown if hasPersistentStores is false when creating stateDir
8e73665	2021-11-11	MAPR-KAFKA-796 Update dependencies versions for MEP-8.1
6f93f7e	2021-11-09	MAPR-KAFKA-793 KafkaProducer throws NPE to spring-kafka (additional commit)
44b509a	2021-11-08	MAPR-KAFKA-793 KafkaProducer throws NPE to spring-kafka

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- Transactions are not supported.

- Pattern subscription is not supported.
- The application reset tool hangs if it runs when the Kafka Streams application is running.
- The application reset tool may throw a Null Pointer Exception when the date or duration parameter is used.
- The application reset tool does not reset to intermediate offset if the topic has multiple partitions.
- MAPR-KAFKA-581: Stream hangs in rebalancing state. The workaround is to set a larger timeout. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- None.

Kafka Streams 2.6.1.0 - 2110 (EEP 8.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. See Apache Kafka 2.6.1 release notes or the Apache Kafka Streams homepage for more information.

Version	2.6.1.0
Release Date	October 2021
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka
GitHub Release Tag	2.6.1.0-eep-800
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Streams 2.6.1.0 - 2110 introduces the following enhancements or HPE platform-specific behavior changes:

- Kafka-664: When a Consumer application (in HPE Ezmeral Data Fabric Event Data Streams) calls `consumer.poll()`, the Consumer does not read any data from the topic if the timeout (`request.timeout.ms`) is set to 0. In previous releases, Consumers read one message.

If you plan to upgrade from Kafka 2.1.1 to 2.6.1, you may want to review Changes in Kafka 2.6.1 on page 4463.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
`360bf7ab, b0507115`	2021-10-11	KAFKA-783 Add log4j properties for MM2.
`c9a89245`	2021-10-06	KAFKA-781 Avoid overwriting task user name.
`e3f52c9394`	2021-09-25	KAFKA-770 Configuration topic which stores offsets should store the topics' names without Mapr Stream name.

69565a337e	2021-09-23	KAFKA-761 Seek to beginning of Mapr partitions before reading logs from configuration's topics.
343c082fbc	2021-09-16	KAFKA-762 NPE while starting kafka-connect service on core 7.0.0
ba61df9ded	2021-07-17	KAFKA-654 Make MirrorMaker 2 fully functional with Mapr Streams
bd0c93efd2	2021-09-08	KAFKA-757 mapr-security-web jar should be taken from the cluster
6ad6204cdf	2021-09-05	KAFKA-758 Update the maven artifact version strings to eep
20f177c8fb	2021-09-01	KAFKA-752 KafkaConsumer.pause() throws NoSuchElementException
cc0c8eaf13	2021-08-25	KAFKA-751 Protobuf and JsonSchema formats were added to Schema Registry 6.0.0
290bf71f61	2021-08-19	KAFKA-746 Remove workaround implemented due to the difference in work of poll(0) between Mapr and Apache Kafka.
32cfddfd2a	2021-08-18	KAFKA-725 Update hadoop dependency
9910062bb7	2021-08-17	KAFKA-745 Update Jackson dependencies
61e6625b43	2021-08-13	KAFKA-686 Service verifier was added to Kafka Connect
ecc67384f7	2021-08-10	KAFKA-680 Jetty CVE for kafka components
8fb65fa77b	2021-07-08	KAFKA-724 Avoid appearing NPE when using MirrorMaker
ca2adcf2d9	2021-07-02	KAFKA-654 The value of property AUTO_COMMIT_INTERVAL_MS_CONFIG has Long type
e326b73eb2	2021-05-25	KAFKA-714 mapr-streams dependency was replaced with kafka-eventstreams
29e9fe9f14	2021-05-24	KAFKA-715 Hadoop dependency was updated to 2.7.5.100-mapr-720-SNAPSHOT
e6a7e80417	2021-03-03	KAFKA-681 Avoid appearing NPE when using MirrorMaker
00b0b4b438	2021-02-24	KAFKA-679 Hadoop version was changed to 2.7.4.0-mapr-710
b02d49328f	2021-02-23	KAFKA-676 Workaround for not implemented method MarlinAdminClientImpl.describeConfigs
939b524487	2021-02-19	KAFKA-650 Kafka connect JDBC code base was upgraded to version 10.0.1

last-updated: Jun 06, 2024

6dff118ef9	2021-02-15	KAFKA-649 Kafka connect code base was upgraded to version 10.0.0
18c41383c0	2021-02-11	KAFKA-670 Avoid potential use of Apache methods in Mapr Kafka 2.6
210c161329	2021-01-14	KAFKA-660 TaskManager should be inited before adding records to tasks.
c2898ea40c	2021-01-21	KAFKA-666 Synchronized blocks with monitor object 'taskmanager' were removed.
0882ab8b3a	2021-01-12	KAFKA-662 InternalStreamCompacted attribute was removed from StoreChangelogReader
5bd960288c	2021-01-05	KAFKA-659 Avoid appearing NullPointerException

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- Transactions are not supported.
- Pattern subscription is not supported.
- The application reset tool hangs if it runs when the Kafka Streams application is running.
- The application reset tool may throw a Null Pointer Exception when the date or duration parameter is used.
- The application reset tool does not reset to intermediate offset if the topic has multiple partitions.
- MAPR-KAFKA-581: Stream hangs in rebalancing state. The workaround is to set a larger timeout. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- None.

Kafka Streams 2.1.1.300 - 2201 (EEP 7.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. See Apache Kafka 2.1.1 Release Notes or the Apache Kafka Streams homepage for more information.

Version	2.1.1
Release Date	March 2022
HPE Version Interoperability	See MEP Components and OS Support
Source on GitHub	https://github.com/mapr/kafka
GitHub Release Tag	2.1.1.300-mapr-712
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for MapR Ecosystem Packs (MEPs).

New in This Release

Kafka Streams 2.1.1.300 - 2201 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
60e9aa8	2022-01-25	MAPR-KAFKA-839 Updated log4j version to 1.3.1-mapr
cd21153	2022-01-10	MAPR-KAFKA-835 Updated log4jv2 version
fa557de	2021-12-29	MAPR-KAFKA-774 Kafka-connect service does not restart after running configure.sh script
21bc64e	2021-12-17	MAPR-KAFKA-826 Updated log4j version
7f1ec00	2021-12-15	MAPR-KAFKA-827 Updated hadoop version
c69400d	2021-12-08	MAPR-KAFKA-814 CVE for kafka
8c115b0	2021-10-21	MAPR-KAFKA-779 Kafka-connect service starts with encrypted ssl passwords

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- Pattern subscription is not supported.
- The application reset tool hangs if it runs when the Kafka Streams application is running.
- The application reset tool may throw a Null Pointer Exception when the date or duration parameter is used.
- The application reset tool does not reset to intermediate offset if the topic has multiple partitions.
- MAPR-KAFKA-581: Stream hangs in rebalancing state. The workaround is to set a larger timeout. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- None.

KSQL Release Notes

The release notes for the KSQL component included in the MapR Converged Data Platform contains notes specific to MapR only.

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734. To view release notes for prior MapR releases, see Previous Versions on page 6194.

KSQL 6.0.0.400 - 2304 (EEP 9.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	6.0.0.400
Release Date	April 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/ksql
GitHub Release Tag	6.0.0.400-eep-911
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

KSQL 6.0.0.400 - 2304 introduces the following enhancements or HPE platform-specific behavior changes:

- Bug fixes
- CVE fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
e9e452efa5	2023-04-04	ECO-284 Security:: CVE:: Vulnerable version of jackson-databind bundled as part of MEP 9.1.1 -> Kafka binaries.
9d2727bfd8	2023-03-31	KAFKA-935 Update protobuf-java to 3.21.12
86f83d8303	2023-03-30	KAFKA-934 KSQL 6.0.0 Impersonation does not work
797596b13f	2023-03-28	KAFKA-933 KSQL 6.0.0 BASIC authentication does not work
395966737e	2023-02-22	KAFKA-669 Extra hadoop jars in Kafka Components lib directory

For complete details, refer to the commit log for this project in Github.

Known Issues and Limitations

- You cannot upgrade KSQL from 4.x to 5.x/6.x versions; you must uninstall KSQL 4.x and then install the newer version.
- Concurrent queries on a table can result in a null pointer exception.
- The SHOW TOPICS command does not print information about active consumers and consumer groups.

last-updated: Jun 06, 2024

- MAPR-KAFKA-437: Dropping streams/tables may take up to five minutes. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”
- MAPR-KAFKA-427: KSQL server periodically responds with a 403 code only. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- None.

KSQL 6.0.0.300 - 2301 (EEP 9.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	6.0.0.300
Release Date	January 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/ksql
GitHub Release Tag	6.0.0.300-eep-910
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

KSQL 6.0.0.300 - 2301 introduces the following enhancements or HPE platform-specific behavior changes:

- Updated protobuf-java to 3.21.9
- Updated ANTL4 to 4.9.3
- Bug fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
900b807f64	2023-01-18	KAFKA-929 Update ANTL4 to antlr4-runtime-4.9.3
63361baf4d	2022-12-27	KAFKA-919 Upgrade protobuf version to 3.21.9
db057a4fc3	2022-09-15	chore: upgrade garbage collector to g1 (#9556)

For complete details, refer to the commit log for this project in Github.

Known Issues and Limitations

- You cannot upgrade KSQL from 4.x to 5.x/6.x versions; you must uninstall KSQL 4.x and then install the newer version.
- Concurrent queries on a table can result in a null pointer exception.
- The SHOW TOPICS command does not print information about active consumers and consumer groups.

- MAPR-KAFKA-437: Dropping streams/tables may take up to five minutes. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”
- MAPR-KAFKA-427: KSQL server periodically responds with a 403 code only. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- None.

KSQL 6.0.0.200 - 2210 (EEP 9.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	6.0.0.200
Release Date	October 2022
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/ksql
GitHub Release Tag	6.0.0.200-eep-900
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

KSQL 6.0.0.200 - 2210 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes.
- Bug fixes.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
818a4f3354	2022-10-14	KAFKA-902 Fix CVE's in Kafka (part2)
5db458bc8f	2022-08-30	KAFKA-902 Fix CVE's in Kafka
60a502e018	2022-08-22	KAFKA-901 KSQL not started because of Exception java.lang.NoClassDefFoundError: io/confluent/rest/RestConfig
db8f4f5b21	2022-08-19	KAFKA-900 Update hadoop artifacts version to 3.3.4.0-eep-900-SNAPSHOT
fa91685985	2022-08-12	KAFKA-881 Update Kafka to use 'reload4j'
92b603b567	2022-07-08	KAFKA-888 Kafka dependency updates to work with Hadoop3 libs
48d5226878	2022-06-13	KAFKA-882 Ksql client does not handle cross-cluster auth feature

9fd32a457e	2022-06-10	KAFKA-883 Update hadoop, hbase, hive dependencies for all kafka eco
e789ddd8a1	2022-06-01	KAFKA-863 Add explicit restutils dependency to ksql

For complete details, refer to the commit log for this project in Github.

Known Issues and Limitations

- You cannot upgrade KSQL from 4.x to 5.x/6.x versions; you must uninstall KSQL 4.x and then install the newer version.
- Concurrent queries on a table can result in a null pointer exception.
- The SHOW TOPICS command does not print information about active consumers and consumer groups.
- MAPR-KAFKA-437: Dropping streams/tables may take up to five minutes. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”
- MAPR-KAFKA-427: KSQL server periodically responds with a 403 code only. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- None.

KSQL 6.0.0.110 - 2305 (EEP 8.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	6.0.0.110
Release Date	May 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/ksql
GitHub Release Tag	6.0.0.110-eep-811
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

KSQL 6.0.0.110 - 2305 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes.
- Bug fixes.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
93226737a6	2023-05-04	KAFKA-939 Update Guava to 31.1-jre

328a881e46	2023-05-03	KAFKA-937 Update Jetty to 9.4.51.v20230217
c0411c1d25	2023-04-12	ECO-284 Security:: CVE:: Vulnerable version of jackson-databind bundled as part of MEP 9.1.1 -> Kafka binaries.
18f4eb0b36	2023-03-31	KAFKA-935 Update protobuf-java to 3.21.12
4c69397c3f	2023-03-30	KAFKA-934 KSQL 6.0.0 Impersonation does not work
e1fc162ee5	2023-03-28	KAFKA-933 KSQL 6.0.0 BASIC authentication does not work
96f220d987	2023-02-22	KAFKA-669 Extra hadoop jars in Kafka Components lib directory
48d5226878	2022-06-13	KAFKA-882 Ksql client does not handle cross-cluster auth feature
e789ddd8a1	2022-06-01	KAFKA-863 Add explicit restutils dependency to ksql

For complete details, refer to the commit log for this project in Github.

Known Issues and Limitations

- You cannot upgrade KSQL from 4.x to 5.x/6.x versions; you must uninstall KSQL 4.x and then install the newer version.
- Concurrent queries on a table can result in a null pointer exception.
- The SHOW TOPICS command does not print information about active consumers and consumer groups.
- MAPR-KAFKA-437: Dropping streams/tables may take up to five minutes. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”
- MAPR-KAFKA-427: KSQL server periodically responds with a 403 code only. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- None.

KSQL 6.0.0.100 - 2201 (EEP 8.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	6.0.0.100
Release Date	January 2022
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/ksql
GitHub Release Tag	6.0.0.100-eep-810
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

KSQL 6.0.0.100 - 2201 introduces the following enhancements or HPE platform-specific behavior changes:

- Federal Information Processing Standards (FIPS) support (valid for core 7.0.0 and later). See FIPS Compliance for HPE Ezmeral Data Fabric on page 878.
- CVE fixes.
- Bug fixes.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
59d3a86	2022-01-26	MAPR-KAFKA-839 Updated log4j version to 1.3.1-mapr
8ed2a69	2022-01-25	MAPR-KAFKA-837 Avoid IndexOutOfBounds error
e475458	2022-01-25	MAPR-KAFKA-837 Update vert.x version to the one which is works with netty 4.1.69.Final
3036b52	2022-01-19	MAPR-KAFKA-836 Add providers before vert.x starts to read security properties
a69ebf6	2021-12-21	MAPR-KAFKA-792 FIPS support was added with changes in vertx-core
7f7bce7	2021-12-17	MAPR-KAFKA-803 Changed kafka-streams-test-utils version to eep snapshot
a1edebe	2021-12-01	MAPR-KAFKA-808 Kafka-ksql CVE fixes (additional fix)
2f50a62	2021-11-25	MAPR-KAFKA-808 Kafka-ksql CVE fixes
0446c5e	2021-11-24	MAPR-KAFKA-800 Skip already existing stream creation by KSQL
19ffc24	2021-11-15	MAPR-KAFKA-798 KSQL cli logs contain errors about metrics submission
ea4cd7a	2021-11-11	MAPR-KAFKA-796 Update dependencies versions
82d7c5f	2021-10-27	MAPR-KAFKA-784 Add security java options if FIPS mode is enabled
cf49faf	2021-10-15	MAPR-KAFKA-782 All eep jars that can be taken from /opt/mapr/kafka was excluded

For complete details, refer to the commit log for this project in Github.

Known Issues and Limitations

- You cannot upgrade KSQL from 4.x to 5.x/6.x versions; you must uninstall KSQL 4.x and then install the newer version.
- Concurrent queries on a table can result in a null pointer exception.
- The SHOW TOPICS command does not print information about active consumers and consumer groups.
- MAPR-KAFKA-437: Dropping streams/tables may take up to five minutes. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”
- MAPR-KAFKA-427: KSQL server periodically responds with a 403 code only. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- None.

KSQL 6.0.0.0 - 2110 (EEP 8.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	6.0.0.0
Release Date	October 2021
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/ksql
GitHub Release Tag	6.0.0.0-eep-800
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

KSQL 6.0.0.0 - 2110 introduces the following enhancements or HPE platform-specific behavior changes:

- None

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
ae254aca1c	2021-09-08	MAPR-KAFKA-757 mapr-security-web and maprdb jars should be taken from the cluster
5da53e1e6b	2021-09-05	MAPR-KAFKA-758 Update the maven artifact version strings to eep
1f57181607	2021-08-31	MAPR-KAFKA-749 Incorrect access mode for scripts in bin directory
51fd694f20	2021-08-31	MAPR-KAFKA-737 Implement authentication.cookie.expiration property support

3d16826412	2021-08-26	MAPR-KAFKA-750 Cannot create table because producer is clossed
6228621cf4	2021-08-19	MAPR-KAFKA-741 Make verify_service executable
608c4ec5e5	2021-08-18	MAPR-KAFKA-745 Update Jackson dependencies
95381a5e8b	2021-08-17	MAPR-KAFKA-725 Update hadoop dependency version
c99c6f314e	2021-08-16	MAPR-KAFKA-744 Vulnerabilities in http-client
4cdd4d68c0	2021-08-13	MAPR-KAFKA-741 Add service verifier to Kafka KSQL
428cba4c9f	2021-08-11	MAPR-KAFKA-680 Jetty CVE for kafka components
553dba7156	2021-08-03	MAPR-KAFKA-736 KSQL start fails in non-interactive mode
a244d69947	2021-08-02	MAPR-KAFKA-735 KSQL server crashes if truststore is in not default location

For complete details, refer to the commit log for this project in Github.

Known Issues and Limitations

- You cannot upgrade KSQL from 4.x to 5.x/6.x versions; you must uninstall KSQL 4.x and then install the newer version.
- Concurrent queries on a table can result in a null pointer exception.
- The SHOW TOPICS command does not print information about active consumers and consumer groups.
- MAPR-KAFKA-437: Dropping streams/tables may take up to five minutes. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”
- MAPR-KAFKA-427: KSQL server periodically responds with a 403 code only. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- None.

KSQL 5.1.2.300 - 2201 (EEP 7.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	5.1.2
Release Date	March 2022
HPE Version Interoperability	See MEP Components and OS Support
Source on GitHub	https://github.com/mapr/ksql
GitHub Release Tag	5.1.2.300-mapr-712
Maven Artifacts	https://repository.mapr.com/maven/

Package Names	See Package Names for MapR Ecosystem Packs (MEPs).

New in This Release

KSQL 5.1.2.300 - 2201 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
709e387	2022-01-26	MAPR-KAFKA-839 Updated log4j version to 1.3.1-mapr
444227c	2021-12-17	MAPR-KAFKA-826 Updated log4j version
1a5787e	2021-12-17	MAPR-KAFKA-818 Jackson-databind CVE for kafka components
c2dcfb3	2021-12-17	MAPR-KAFKA-818 Gson CVE for kafka components
f798c47	2021-12-16	MAPR-KAFKA-827 Updated hadoop version

For complete details, refer to the commit log for this project in Github.

Known Issues and Limitations

- The SHOW TOPICS command does not print information about active consumers and consumer groups.
- MAPR-KAFKA-437: Dropping streams/tables may take up to five minutes. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”
- MAPR-KAFKA-427: KSQL server periodically responds with a 403 code only. This issue is caused by MS-915: “MapR Stream application hangs inside cycle”

Resolved Issues

- None.

Kafka Connect Release Notes

The release notes for the Kafka Connect component included in the MapR Converged Data Platform contains notes specific to MapR only.

NOTE: To identify the EEP to which a specific release note belongs, seeEEP Release Notes on page 5804 . To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734. To view release notes for prior MapR releases, see Previous Versions on page 6194.

Kafka Connect HDFS 10.0.0.500 - 2307 (EEP 9.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

last-updated: Jun 06, 2024

Version	10.0.0.500
Release Date	July 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka-connect-hdfs
GitHub Release Tag	10.0.0.500-eep-912
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Connect HDFS 10.0.0.400 - 2304 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
af215a5	2023-06-26	ECO-278 Downgrade avro version to 1.10.1
aa5fc1d	2023-06-16	KAFKA-961 netty-codec-haproxy (4.1.79.Final) - CVE-2022-41881 - mapr-kafka-connect-hdfs
11b3af9	2023-06-14	KAFKA-954 libthrift (0.13.0) - CVE-2020-13949 - mapr-kafka-connect-hdfs
5c3a98c	2023-06-14	KAFKA-949 Exclude avro-ipc-jetty dependency to fix jetty CVE
c6529a7	2023-04-18	ECO-278 CVE: MEP 9.1.1 :: mapr-kafka-connect-hdfs-10.0.0.300.202301091304-1.noarch.rpm, is bundled with vulnerable avro-* packages

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Connect HDFS 10.0.0.400 - 2304 (EEP 9.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	10.0.0.400
Release Date	April 2023

HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka-connect-hdfs
GitHub Release Tag	10.0.0.400-eep-911
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Connect HDFS 10.0.0.400 - 2304 introduces the following enhancements or HPE platform-specific behavior changes:

- CVEs fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
145358a	2023-04-03	ECO-292 CVE:: MEP 9.1.1 : Vulnerable version of parquet-hadoop1.11.0 bundled as part of the MEP 9.1.1 Kafka binaries.
560f603	2023-04-03	ECO-284 Security:: CVE:: Vulnerable version of jackson-databind bundled as part of MEP 9.1.1 -> Kafka binaries.

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Connect HDFS 10.0.0.300 - 2301 (EEP 9.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	10.0.0.300
Release Date	January 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka-connect-hdfs
GitHub Release Tag	10.0.0.300-eep-910
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Connect HDFS 10.0.0.300 - 2301 introduces the following enhancements or HPE platform-specific behavior changes:

- Protocol buffer updated to protobuf-java 3.21.9.

Fixes

This HPE release includes the following fixes on the base release:

- None.

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Connect HDFS 10.0.0.200 - 2210 (EEP 9.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	10.0.0.200
Release Date	October 2022
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka-connect-hdfs
GitHub Release Tag	10.0.0.200-eep-900
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Connect HDFS 10.0.0.200 - 2210 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
d5ac2b0	2022-10-14	KAFKA-902 Fix CVE's in Kafka (part 2)
3cf9a59	2022-09-27	KAFKA-903 hdfs sink hive connector creates directories in mfs with incorrect ownership
921451e	2022-08-30	KAFKA-902 Fix CVE's in Kafka

6f0cee0	2022-08-19	KAFKA-900 Update hadoop artifacts version to 3.3.4.0-eep-900-SNAPSHOT
6be8477	2022-08-12	KAFKA-881 Update Kafka to use 'reload4j'
eb25625	2021-04-23	KAFKA-895 NPE after creating few hdfs connectors
2180b7f	2022-07-11	KAFKA-888 Kafka dependency updates to work with Hadoop3 libs
cef0fe0	2022-06-10	KAFKA-883 Update hadoop, hbase, hive dependencies for all kafka eco

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Connect HDFS 10.0.0.110 - 2305 (EEP 8.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	10.0.0.110
Release Date	May 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka-connect-hdfs
GitHub Release Tag	10.0.0.110-eep-811
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Connect HDFS 10.0.0.110 - 2305 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes.
- Bug fixes.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
af8899e	2023-05-05	KAFKA-939, KAFKA-940 Exclude guava from jackson-datatype-guava
9c67fe4	2023-05-04	KAFKA-940 Update Jackson1 to 1.9.14-atlassian-6 to and Jackson2 to 2.13.3

last-updated: Jun 06, 2024

a6ff4a0	2023-04-03	ECO-292 CVE:: MEP 9.1.1 : Vulnerable version of parquet-hadoop1.11.0 bundled as part of the MEP 9.1.1 Kafka binaries.
58eafb8	2023-04-12	ECO-284 Security:: CVE:: Vulnerable version of jackson-databind bundled as part of MEP 9.1.1 -> Kafka binaries.
99ff9bb	2021-04-23	KAFKA-895 NPE after creating few hdfs connectors

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Connect HDFS 10.0.0.100 - 2201 (EEP 8.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	10.0.0.100
Release Date	January 2022
HPE Version Interoperability	See EEP Components and OS Support on page 5734.

- None.

Kafka Connect HDFS 10.0.0.0 - 2110 (EEP 8.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	10.0.0.0
Release Date	October 2021
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka-connect-hdfs
GitHub Release Tag	10.0.0.0-eep-800
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Connect HDFS 6.0.0.0 - 2110 introduces the following enhancements or HPE platform-specific behavior changes:

- None

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
df8d31b	2021-09-09	MAPR-KAFKA-704 Kafka Connect lib dir contains Kafka client jar
d0eb929	2021-09-07	MAPR-KAFKA-757 mapr-security-web and maprdb jars should be taken from the cluster
041943d	2021-09-05	MAPR-KAFKA-758 Update the maven artifact version strings to eep
cb558bd	2021-08-26	MAPR-KAFKA-751 Protobuf and Json Schema connect converters were added.
5ac9da4	2021-08-18	MAPR-KAFKA-745 Update Jackson v1 and v2 dependencies
28ab440	2021-08-16	MAPR-KAFKA-744 Vulnerabilities in http-client

f36b2e4	2021-08-11	MAPR-KAFKA-725 Update hadoop, hive, hbase dependencies
1fbf6c5	2021-05-25	MAPR-KAFKA-715 Hadoop dependency was updated to 2.7.5.100-mapr-720-SNAPSHOT
5472301	2021-02-25	MAPR-KAFKA-675 Skip checking the creation of mapr hadoop directory.
4afca95	2021-02-24	MAPR-KAFKA-678 hadoop-client and hadoop-yarn-client version should be 2.7.4.0-mapr

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Connect HDFS 5.1.2.300 - 2201 (EEP 7.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	5.1.2
Release Date	March 2022
HPE Version Interoperability	See MEP Components and OS Support
Source on GitHub	https://github.com/mapr/kafka-connect-hdfs
GitHub Release Tag	5.1.2.300-mapr-712
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for MapR Ecosystem Packs (MEPs).

New in This Release

Kafka Connect HDFS 5.1.2.300 - 2201 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
5d304a3	2021-12-15	MAPR-KAFKA-827 Updated hadoop version
80aa646	2021-12-10	MAPR-KAFKA-815 Groovy CVE for kafka components
7e8a349	2021-12-10	MAPR-KAFKA-815 Gson CVE for kafka components

668d5f6	2021-12-10	MAPR-KAFKA-815 Jackson-databind CVE for kafka components
b7c4b42	2021-12-10	MAPR-KAFKA-815 Compress-commons CVE for kafka components
ad32ceb	2021-12-10	MAPR-KAFKA-815 Netty CVE for kafka components

For complete details, refer to the commit log for this project in GitHub.

Kafka Connect JDBC 10.0.1.200 - 2210 (EEP 9.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop.

Version	10.0.1.200
Release Date	October 2022
MapR Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka-connect-jdbc
GitHub Release Tag	10.0.1.200-eep-900
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

- CVE fixes

Fixes

This release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
c5dce0cd	2022-08-30	KAFKA-902 Fix CVE's in Kafka
78374fac	2022-08-12	KAFKA-881 Update Kafka to use 'reload4j'
f6c9f43e	2022-07-11	KAFKA-888 Kafka dependency updates to work with Hadoop3 libs
588e8740	2022-06-10	KAFKA-883 Update hadoop, hbase, hive dependencies for all kafka eco

Known Issues and Limitations

- None

Resolved Issues

- None

Kafka Connect JDBC 10.0.1.110 - 2305 (EEP 8.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop.

Version	10.0.1.110
Release Date	May 2023
MapR Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka-connect-jdbc
GitHub Release Tag	10.0.1.110-eep-811
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

- CVE fixes.

Fixes

This release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
5a85785c	2023-05-04	KAFKA-940 Update Jackson1 to 1.9.14-atlassian-6 to and Jackson2 to 2.13.3
082e3b2c	2023-05-04	KAFKA-939 Update Guava to 31.1-jre
1c40a50b	2023-04-12	ECO-295 CVE:: Vulnerable version of sqlite-jdbc 3.25.2 bundled as part of the mapr-kafka-connect-jdbc-10.0.1.300.202301171533-1.noarch.rpm
6b103253	2023-04-12	ECO-284 Security:: CVE:: Vulnerable version of jackson-databind bundled as part of MEP 9.1.1 -> Kafka binaries.

For complete details, refer to the commit log for this project in GitHub.

Kafka Connect JDBC 5.1.2.100 - 2201 (EEP 7.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	5.1.2
Release Date	March 2022
MapR Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	https://github.com/mapr/kafka-connect-jdbc
GitHub Release Tag	5.1.2.100-mapr-712
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names

New in This Release

- CVE fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
ca93b71	2022-01-25	MAPR-KAFKA-839 Updated log4j version to 1.3.1-mapr
dbd7f1b	2021-12-17	MAPR-KAFKA-826 Updated log4j version

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
e83832b	2021-12-13	MAPR-KAFKA-816 Netty CVE for kafka components
eb97326	2021-12-13	MAPR-KAFKA-816 PostgreSQL CVE for kafka components
bede6f3	2021-12-13	MAPR-KAFKA-816 Commons compress CVE for kafka components
7398651	2021-12-13	MAPR-KAFKA-816 Gson CVE for kafka components
7a991e1	2020-08-20	MAPR-KAFKA-632 Required field 'db_name' is set. 'db_name' is not mentioned in columns' names while processing select query.
7f97732	2020-08-06	MAPR-KAFKA-627 Schema name of Hive tables should be null to avoid building wrong queries and because of unsupported features of HiveResultSetMetaData.
8efd842	2020-07-21	MAPR-KAFKA-243 Illegal character was excluded from Hive query
c9949f0	2020-07-13	MAPR-KAFKA-612 Revert previous fix & add property for MySqlDatabaseDialect
62231de	2020-07-06	MAPR-KAFKA-553 HiveDatabaseDialect was added
9d6ecc2	2020-07-02	MAPR-KAFKA-612 Retrive DB name from JDBC URL if catalog.pattern is null

Kafka Connect 10.0.0.500 - 2307 (EEP 9.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. See Apache Kafka 2.6.1 release notesor the Apache Kafka Streams homepagefor more information.

Version	10.0.0.500
Release Date	July 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Connect 10.0.0.500 - 2307 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
0ace797050	2023-06-26	KAFKA-963 hdfs sink connector failed to create table in hive (java17)
f6587a677d	2023-05-16	ECO-294 Use whitelist for deserialization instead of blacklist

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Connect 10.0.0.400 - 2304 (EEP 9.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. See Apache Kafka 2.6.1 release notesor the Apache Kafka Streams homepagefor more information.

Version	10.0.0.400
Release Date	April 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Connect 10.0.0.400 - 2304 introduces the following enhancements or HPE platform-specific behavior changes:

- Bug fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
eb25430ffc	2023-02-14	KAFKA-924 ssl.cipher.suites.exclude doesn't disable SSL cipher suites

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Connect 10.0.0.300 - 2301 (EEP 9.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. See Apache Kafka 2.6.1 release notesor the Apache Kafka Streams homepagefor more information.

Version	10.0.0.300
Release Date	January 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Connect 10.0.0.300 - 2301 introduces the following enhancements or HPE platform-specific behavior changes:

- Protocol buffer updated to protobuf-java 3.21.9.

Fixes

This HPE release includes the following fixes on the base release:

- None.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Connect 10.0.0.200 - 2210 (EEP 9.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. See Apache Kafka 2.6.1 release notesor the Apache Kafka Streams homepagefor more information.

Version	10.0.0.200
Release Date	October 2022
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Connect 10.0.0.200 - 2210 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
f43e238	2022-08-25	KAFKA-898 Unable to JDBC connector in standalone mode by non-mapr user
e912cf0	2022-08-15	KAFKA-895 NPE after creating few hdfs connectors
e3b634d	2022-05-10	KAFKA-843 Add logging when generating challenge string
23f7419	2022-04-20	KAFKA-843 Add authorization header if authorization is enabled
dfc1956	2022-03-29	KAFKA-855 could not get TopicInfo, err 13

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Connect 10.0.0.110 - 2305 (EEP 8.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. See Apache Kafka 2.6.1 release notesor the Apache Kafka Streams homepagefor more information.

Version	10.0.0.110
Release Date	May 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Connect 10.0.0.110-2305 introduces the following enhancements or HPE platform-specific behavior changes:

- Bug fixes.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
fa75de0fc7	2022-08-09	KAFKA-895 NPE after creating few hdfs connectors

81b240d8ca	2023-02-14	KAFKA-924 ssl.cipher.suites.exclude doesn't disable SSL cipher suites
fd63dc5f6a	2022-05-13	KAFKA-863 Remove rest-utils dependency from connect:runtime (#240)
4d124e8461	2022-05-13	KAFKA-864 Impersonation in Worker should be optional (#241)
e3b634d7fd	2022-05-10	KAFKA-843 Add logging when generating challenge string (#239)
23f7419598	2022-04-20	KAFKA-843 Add authorization header if authorization is enabled (#234)
dfc1956b7c	2022-03-29	KAFKA-855 could not get TopicInfo, err 13 (#236)

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Connect 10.0.0.100 - 2201 (EEP 8.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. See Apache Kafka 2.6.1 release notesor the Apache Kafka Streams homepagefor more information.

Version	10.0.0.100
Release Date	January 2022
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Connect 10.0.0.100-2201 introduces the following enhancements or HPE platform-specific behavior changes:

- Federal Information Processing Standards (FIPS) support (valid for core 7.0.0 and later). See FIPS Compliance for HPE Ezmeral Data Fabric on page 878.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
5ac2089	2022-02-01	MAPR-KAFKA-842 Change default value for "listeners" property for kafka-connect
7c5c9cc	2021-12-22	MAPR-KAFKA-774 Kafka-connect service does not restart after running configure.sh script

078d514	2021-11-16	MAPR-KAFKA-794 Kafka Connect doesn't use field which is not present in core 6.2
53e77e1	2021-11-12	MAPR-KAFKA-785 Fix Kafka Connect work with enabled FIPS
e76de0a	2021-10-25	MAPR-KAFKA-785 Kafka Connect works with enabled FIPS

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Connect 5.1.2.300 - 2201 (EEP 7.1.2)

The notes below relate specifically to the HPE Distribution for Apache Hadoop.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	5.1.2
Release Date	March 2022
MapR Version Interoperability	See EEP Components and OS Support on page 5734
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names

New in This Release

- None.

Fixes

Changes have been made to the mapr-kafka package and to the packaging process.

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
fa557de	2021-12-29	MAPR-KAFKA-774 Kafka-connect service does not restart after running configure.sh script
8c115b0	2021-10-21	MAPR-KAFKA-779 Kafka-connect service starts with encrypted ssl passwords

Known Issues and Limitations

- None

Resolved Issues

- None

Kafka REST Release Notes

The release notes for the Kafka REST component included in the MapR Converged Data Platform contains notes specific to MapR only.

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734. To view release notes for prior MapR releases, see Previous Versions on page 6194.

Kafka REST Proxy 6.0.0.400 - 2304 (EEP 9.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. You may also be interested in the Apache Kafka REST Proxy 6.0.0.0 changelog or the Apache Kafka REST Proxy project homepage.

Version	6.0.0.400
Release Date	April 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka-rest
GitHub Release Tag	6.0.0.400-eep-911
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka REST Proxy 6.0.0.400 - 2304 introduces the following enhancements or HPE platform-specific behavior changes:

- CVEs fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
9745e7883	2023-04-04	ECO-284 Security:: CVE:: Vulnerable version of jackson-databind bundled as part of MEP 9.1.1 -> Kafka binaries.

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

None.

Resolved Issues

None.

Kafka REST Proxy 6.0.0.300 - 2301 (EEP 9.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. You may also be interested in the Apache Kafka REST Proxy 6.0.0.0 changelog or the Apache Kafka REST Proxy project homepage.

Version	6.0.0.300
Release Date	January 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka-rest
GitHub Release Tag	6.0.0.300-eep-910
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka REST Proxy 6.0.0.300 - 2301 introduces the following enhancements or HPE platform-specific behavior changes:

- Updated protobuf-java to 3.21.9

Fixes

None.

Known Issues and Limitations

None.

Resolved Issues

None.

Kafka REST Proxy 6.0.0.200 - 2210 (EEP 9.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. You may also be interested in the Apache Kafka REST Proxy 6.0.0.0 changelog or the Apache Kafka REST Proxy project homepage.

Version	6.0.0.200
Release Date	October 2022
MapR Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka-rest
GitHub Release Tag	6.0.0.200-eep-900
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka REST Proxy 6.0.0.200 - 2210 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes.

Fixes

This release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
57cfa145	2022-08-30	KAFKA-902 Fix CVE's in Kafka
be6ad140	2022-08-12	KAFKA-881 Update Kafka to use 'reload4j'
12250fe4	2022-07-08	KAFKA-888 Kafka dependency updates to work with Hadoop3 libs
acd81167	2022-06-10	KAFKA-883 Update hadoop, hbase, hive dependencies for all kafka eco
8a950a47	2022-05-17	KAFKA-865 GET /offsets for partitions return incorrect value of beginning_offset
0d941328	2022-04-29	KAFKA-861 "api.v3.enable" default value description doesn't match actual
1162cf08	2022-03-29	KAFKA-852 [kafka-rest] Enable TLSv1.3 by default
c8b56abd	2021-11-26	KAFKA-809 Gson CVE for kafka components

For complete details, refer to the commit log for this project in Github.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka REST Proxy 6.0.0.110 - 2305 (EEP 8.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. You may also be interested in the Apache Kafka REST Proxy 6.0.0.0 changelog or the Apache Kafka REST Proxy project homepage.

Version	6.0.0.110
Release Date	May 2023
MapR Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka-rest
GitHub Release Tag	6.0.0.110-eep-811
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka REST Proxy 6.0.0.110 - 2305 introduces the following enhancements or HPE platform-specific behavior changes:

- Bug fixes.
- CVE fixes.

Fixes

This release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	
ac08b3dbf	2023-05-04	KAFKA-939 Update Guava to 31.1-jre
b628e1405	2023-05-03	ECO-284 Security:: CVE:: Vulnerable version of jackson-databind bundled as part of MEP 9.1.1 -> Kafka binaries.
8a950a477	2022-05-17	KAFKA-865 GET /offsets for partitions return incorrect value of beginning_offset
0d941328d	2022-04-29	KAFKA-861 "api.v3.enable" default value description doesn't match actual
1162cf082	2022-03-29	EEP-KAFKA-852 [kafka-rest] Enable TLSv1.3 by default

For complete details, refer to the commit log for this project in Github.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka REST Proxy 6.0.0.100 - 2201 (EEP 8.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. You may also be interested in the Apache Kafka REST Proxy 6.0.0.0 changelog or the Apache Kafka REST Proxy project homepage.

Version	6.0.0.100
Release Date	January 2022
MapR Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka-rest
GitHub Release Tag	6.0.0.100-eep-810
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka REST Proxy 6.0.0.100 - 2201 introduces the following enhancements or HPE platform-specific behavior changes:

- Federal Information Processing Standards (FIPS) support (valid for core 7.0.0 and later). See FIPS Compliance for HPE Ezmeral Data Fabric on page 878.
- CVE fixes.

Fixes

This release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
c8b56ab	2021-11-26	MAPR-KAFKA-809 Gson CVE for kafka components
8f413c0	2021-11-11	MAPR-KAFKA-796 Update dependencies versions
b4d85bc	2021-11-04	MAPR-KAFKA-787 Change error message for not supporting API
8d06f39	2021-10-27	MAPR-KAFKA-784 Add security java options if FIPS mode is enabled

For complete details, refer to the commit log for this project in Github.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka REST Proxy 6.0.0.0 - 2110 (EEP 8.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. You may also be interested in the Apache Kafka REST Proxy 6.0.0.0 changelog or the Apache Kafka REST Proxy project homepage.

Version	6.0.0.0
Release Date	October 2021
MapR Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/kafka-rest
GitHub Release Tag	6.0.0.0-eep-800
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka REST Proxy 6.0.0.0 - 2110 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

Fixes

This release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
f4361740	2021-09-27	MAPR-KAFKA-729 Replace sudo command with maprexecute in Kafka REST Server
98f4487f	2021-09-21	MAPR-KAFKA-753 Incorrect pid in the /opt/mapr/pid/kafka-rest.pid after fresh install kafka-rest
245062f3	2021-09-14	MAPR-KAFKA-756 onsumer doesn't read data from topic
99280f05	2021-09-08	MAPR-KAFKA-757 mapr-security-web jars should be taken from the cluster
851ea5d3	2021-09-05	MAPR-KAFKA-758 Update the maven artifact version strings to eep
e9a8c7ed	2021-08-18	MAPR-KAFKA-745 Update Jackson dependency version
4e56e605	2021-08-13	MAPR-KAFKA-689 Service verifier was added to Kafka Rest
9d91ef73	2021-08-09	MAPR-KAFKA-725 Update hadoop, hive, hbase dependencies for kafka
f62d66e3	2021-05-27	MAPR-KAFKA-714 mapr-streams dependency was replaced with kafka-eventstreams
89b52ebb	2021-05-25	MAPR-KAFKA-715 Hadoop dependency was updated to 2.7.5.100-mapr-720-SNAPSHOT
f9b4747a	2021-03-02	MAPR-KAFKA-677 Responses for API v3 negative cases are produced correctly
de7d0181	2021-02-26	MAPR-KAFKA-680 Jetty version differ from the default ones was excluded from project.
2dcc3cc8	2021-02-24	MAPR-KAFKA-679 Hadoop version was changed to 2.7.4.0-mapr-710
d0fb611e	2021-02-10	MAPR-KAFKA-673 AdminClient instance should be created for certain user

Kafka REST Proxy 5.1.2.300 - 2201 (EEP 7.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka. You may also be interested in the Apache Kafka REST Proxy 5.1.2 changelog or the Apache Kafka REST Proxy project homepage.

Version	5.1.2
Release Date	March 2022
MapR Version Interoperability	See MEP Components and OS Support
Source on GitHub	https://github.com/mapr/kafka-rest
GitHub Release Tag	5.1.2.300-mapr-712
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for MapR Ecosystem Packs (MEPs).

New in This Release

Kafka REST Proxy 5.1.2.300 - 2201 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
85eaf8b	2021-12-30	MAPR-KAFKA-833 Updated log4jv2 version
411270e	2021-12-16	MAPR-KAFKA-827 Updated hadoop version
f5d1070	2021-12-14	MAPR-KAFKA-825 CVE-2021-44228 - Log4j vulnerability in Kafka REST

For complete details, refer to the commit log for this project in Github.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Schema Registry Release Notes

The release notes for the Kafka Schema Registry component included in the MapR Converged Data Platform contains notes specific to MapR only.

last-updated: Jun 06, 2024

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734. To view release notes for prior MapR releases, see Previous Versions on page 6194.

Kafka Schema Registry 6.0.0.500 - 2401 (EEP 9.2.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	6.0.0.500
Release Date	January 2024
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/schema-registry
GitHub Release Tag	6.0.0.500-eep-921
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Schema Registry 6.0.0.500 - 2401 introduces the following enhancements or HPE platform-specific behavior changes:

- Bug fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
270f08288f	2023-11-15	KAFKA-976 Schema Registry server hangs after a few 404 requests
f5277fdb1a	2023-09-22	KAFKA-968 Schema Registry authentication failed periodically

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Schema Registry 6.0.0.400 - 2304 (EEP 9.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	6.0.0.400
Release Date	April 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/schema-registry

GitHub Release Tag	6.0.0.400-eep-911
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Schema Registry 6.0.0.400 - 2304 introduces the following enhancements or HPE platform-specific behavior changes:

- Bug fixes
- CVEs fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
dfa072a6fe	2023-04-03	ECO-284 Security:: CVE:: Vulnerable version of jackson-databind bundled as part of MEP 9.1.1 -> Kafka binaries.
74fefc198a	2023-03-31	KAFKA-935 Update protobuf-java to 3.21.12

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Schema Registry 6.0.0.300 - 2301 (EEP 9.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	6.0.0.300
Release Date	January 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/schema-registry
GitHub Release Tag	6.0.0.300-eep-910
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Schema Registry 6.0.0.300 - 2301 introduces the following enhancements or HPE platform-specific behavior changes:

- Updated protobuf-java to 3.21.9

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
4db098d763	2022-12-27	KAFKA-919 Upgrade protobuf version to 3.21.9

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Schema Registry 6.0.0.200 - 2210 (EEP 9.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	6.0.0.200
Release Date	October 2022
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/schema-registry
GitHub Release Tag	6.0.0.200-eep-900
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Schema Registry 6.0.0.200 - 2210 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
dedb519c0	2022-08-30	KAFKA-902 Fix CVE's in Kafka
fb720b4d7	2022-08-19	KAFKA-900 Update hadoop artifacts version to 3.3.4.0-eep-900-SNAPSHOT
6321fc122	2022-08-12	KAFKA-881 Update Kafka to use 'reload4j'
6e6961f27	2022-07-08	KAFKA-888 Kafka dependency updates to work with Hadoop3 libs
25b8a9de6	2022-06-10	KAFKA-883 Update hadoop, hbase, hive dependencies for all kafka eco

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Schema Registry 6.0.0.110 - 2305 (EEP 8.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	6.0.0.110
Release Date	May 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/schema-registry
GitHub Release Tag	6.0.0.110-eep-811
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Schema Registry 6.0.0.110 - 2305 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
622a52459e	2023-05-04	KAFKA-939 Update Guava to 31.1-jre
5e21bdbff8	2023-04-10	ECO-284 Security:: CVE:: Vulnerable version of jackson-databind bundled as part of MEP 9.1.1 -> Kafka binaries.
bd59ae4cc4	2023-03-31	KAFKA-935 Update protobuf-java to 3.21.12

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Schema Registry 6.0.0.100 - 2201 (EEP 8.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	6.0.0.100

Release Date	January 2201
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/schema-registry
GitHub Release Tag	6.0.0.100-eep-810
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Schema Registry 6.0.0.100 - 2201 introduces the following enhancements or HPE platform-specific behavior changes:

- Federal Information Processing Standards (FIPS) support (valid for core 7.0.0 and later). See FIPS Compliance for HPE Ezmeral Data Fabric on page 878.
- CVE fixes.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
5e9ecf0	2021-11-30	MAPR-KAFKA-810 Gson CVE for kafka components
1a10948	2021-11-30	MAPR-KAFKA-810 Commons compress CVE for kafka components
51edd36	2021-11-17	MAPR-KAFKA-802 Schema Registry starts on the cluster with FIPS disabled
19eca68	2021-11-11	MAPR-KAFKA-796 Update dependencies versions
0639c9b	2021-11-04	MAPR-KAFKA-788 Removed old Kafka licenses and notices
70314bd	2021-10-27	MAPR-KAFKA-784 Add security java options if FIPS mode is enabled

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Schema Registry 6.0.0.0 - 2110 (EEP 8.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

Version	6.0.0.0
Release Date	October 2021
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/schema-registry

GitHub Release Tag	6.0.0.0-eep-800
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs) on page 5828.

New in This Release

Kafka Schema Registry 6.0.0.0 - 2110 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
90a62fe2c	2021-09-09	MAPR-KAFKA-757 mapr-security-web jar should be taken from the cluster
895247849	2021-09-05	MAPR-KAFKA-758 Update the maven artifact version strings to eep
3ae046f00	2021-08-25	MAPR-KAFKA-751 Protobuf and Json Schema jars is present in Schema Registry package as Avro jars.
6d241d46d	2021-08-19	MAPR-KAFKA-741 Make verify_service executable
20e5affeb	2021-08-18	MAPR-KAFKA-745 Update Jackson dependencies
28e444832	2021-08-03	MAPR-KAFKA-717 kafka-eventstreams.jar was added to classpath
bbed535c7	2021-05-29	MAPR-KAFKA-715 Hadoop jars should be taken from cluster
189220edd	2021-05-27	MAPR-KAFKA-714 mapr-streams dependency was replaced with kafka-eventstreams
e995cab97	2021-05-25	MAPR-KAFKA-715 Hadoop dependency was updated to 2.7.5.100-mapr-720-SNAPSHOT
0cdde9a77	2021-02-24	MAPR-KAFKA-679 Hadoop version was changed to 2.7.4.0-mapr-710
869273aa6	2021-02-03	MAPR-KAFKA-671 Kafka version was changed from 2.6.0 to 2.6.1
94c2442c6	2021-01-25	MAPR-KAFKA-667 The usage of option BOOTSTRAP_SERVERS was removed.

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Kafka Schema Registry 5.1.2.300 - 2201 (EEP 7.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Kafka.

last-updated: Jun 06, 2024

Version	5.1.2
Release Date	March 2022
HPE Version Interoperability	See MEP Components and OS Support
Source on GitHub	https://github.com/mapr/schema-registry
GitHub Release Tag	5.1.2.300-mapr-712
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for MapR Ecosystem Packs (MEPs).

New in This Release

Kafka Schema Registry 5.1.2.300 - 2201 introduces the following enhancements or HPE platform-specific behavior changes:

- CVE fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	MapR Fix Number and Description
6e39949	2022-01-25	MAPR-KAFKA-839 Updated log4j version to 1.3.1-mapr
fc6295c	2021-12-17	MAPR-KAFKA-826 Updated log4j version
4009691	2021-12-16	MAPR-KAFKA-827 Updated hadoop version
7828427	2021-12-09	MAPR-KAFKA-820 CVE in Kafka component

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Monitoring Release Notes

The release notes for Monitoring components included in the Converged Data Platform contains notes specific to Data Fabric only.

Monitoring Components - EEP 9.2.2 Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

last-updated: Jun 06, 2024

Version	The EEP 9.2.2 release contains the following monitoring-component versions: • Collectd 5.12.0.650 • Elasticsearch 6.8.8.750 • Fluentd 1.10.3.650 • Grafana 7.5.10.550 • Kibana 6.8.8.600 • Opentsdb 2.4.1.600
Release Date	April 30, 2024
Version Interoperability	Component Versions for Released EEPs
Package Names	Package Names for Ecosystem Packs (EEPs) on page 5828

New in This Release

- Using the monitoring components with JRE 17 or JDK 17 is now supported on EEP 9.2.0 and later.
- To compare Monitoring component versions, see Component Versions for Released EEPs on page 5750.

Fixes

None.

Known Issues and Limitations

Log monitoring is not supported in installations with FIPS-enabled nodes in EEP 8.1.0 and later.

Resolved Issues

None.

Monitoring Components - EEP 9.2.0 Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	The EEP 9.2.0 release contains the following monitoring-component versions: • Collectd 5.12.0.600 • Elasticsearch 6.8.8.600 • Fluentd 1.10.3.500 • Grafana 7.5.10.500 • Kibana 6.8.8.600 • Opentsdb 2.4.1.510

last-updated: Jun 06, 2024

Release Date	October 31, 2023
Version Interoperability	Component Versions for Released EEPs
Package Names	Package Names for Ecosystem Packs (EEPs) on page 5828

New in This Release

- Using the monitoring components with JRE 17 or JDK 17 is now supported on EEP 9.2.0.
- The Collectd component underwent a minor version update for EEP 9.2.0. Other monitoring components are unchanged for EEP 9.2.0.

  To compare Monitoring component versions, see Component Versions for Released EEPs on page 5750.

Fixes

None.

Known Issues and Limitations

Log monitoring is not supported in installations with FIPS-enabled nodes in EEP 8.1.0 and later.

Resolved Issues

None.

Monitoring Components - EEP 9.1.2 Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	The EEP 9.1.2 release contains the following monitoring-component versions: • Collectd 5.12.0.500 • Elasticsearch 6.8.8.600 • Fluentd 1.10.3.500 • Grafana 7.5.10.500 • Kibana 6.8.8.600 • Opentsdb 2.4.1.510
Release Date	July 2023
Version Interoperability	Component Versions for Released EEPs
Package Names	Package Names for Ecosystem Packs (EEPs) on page 5828

New in This Release

- The monitoring components are unchanged for EEP 9.1.2. However, using the monitoring components with JRE 17 or JDK 17 is not supported. For more information, see this knowledge article.

  To compare Monitoring component versions, see Component Versions for Released EEPs on page 5750.

Fixes

None.

Known Issues and Limitations

Log monitoring is not supported in installations with FIPS-enabled nodes in EEP 8.1.0 and later.

Resolved Issues

None.

Monitoring Components - EEP 9.1.1 Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	The EEP 9.1.1 release contains the following monitoring-component versions: • Collectd 5.12.0.500 • Elasticsearch 6.8.8.600 • Fluentd 1.10.3.500 • Grafana 7.5.10.500 • Kibana 6.8.8.600 • Opentsdb 2.4.1.510
Release Date	April 2023
Version Interoperability	Component Versions for Released EEPs
Package Names	Package Names for Ecosystem Packs (EEPs) on page 5828

New in This Release

- The monitoring components are unchanged for EEP 9.1.1.

  To compare Monitoring component versions, see Component Versions for Released EEPs on page 5750.

Fixes

None.

Known Issues and Limitations

The monitoring components are not supported on JRE 17 or JDK 17.

Log monitoring is not supported in installations with FIPS-enabled nodes in EEP 8.1.0 and later.

Resolved Issues

None.

Monitoring Components - EEP 9.1.0 Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	The EEP 9.1.0 release contains the following monitoring-component versions: • Collectd 5.12.0.500 • Elasticsearch 6.8.8.600 • Fluentd 1.10.3.500 • Grafana 7.5.10.500 • Kibana 6.8.8.600 • Opentsdb 2.4.1.510
Release Date	January 2023
Version Interoperability	Component Versions for Released EEPs
Package Names	Package Names for Ecosystem Packs (EEPs) on page 5828

New in This Release

- EEP 9.1.0 includes updates to all the monitoring components.

  To compare Monitoring component versions, see Component Versions for Released EEPs on page 5750.

Fixes

OTSDB-148: OpenTSDB, tsdb_cluster_mgmt.sh tool during purge process is filling the disk space on the following location `/opt/mapr/opentsdb/opentsdb-2.4.1/var/log/opentsdb`.

Known Issues and Limitations

The monitoring components are not supported on JRE 17 or JDK 17.

Log monitoring is not supported in installations with FIPS-enabled nodes in EEP 8.1.0 and later.

Resolved Issues

None.

Monitoring Components - EEP 9.0.0 Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	The EEP 9.0.0 release contains the following monitoring-component versions: • Collectd 5.12.0.500 • Fluentd 1.10.3.500 • Opentsdb 2.4.1.500 • Elasticsearch 6.8.8.600 • Grafana 7.5.10.500 • Kibana 6.8.8.600
Release Date	October 2022
Version Interoperability	Component Versions for Released EEPs
Package Names	Package Names for Ecosystem Packs (EEPs) on page 5828

New in This Release

- EEP 9.0.0 includes updates to all the monitoring components.

  To compare Monitoring component versions, see Component Versions for Released EEPs on page 5750.

Fixes

None.

Known Issues and Limitations

Log monitoring is not supported in installations with FIPS-enabled nodes in EEP 8.1.0 and later.

Resolved Issues

None.

Monitoring Components - EEP 8.1.0 Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

last-updated: Jun 06, 2024

Version	The EEP 8.1.0 release contains the following monitoring-component versions: • Collectd 5.12.0.310 • Fluentd 1.10.3.300 • Opentsdb 2.4.1.300 • Elasticsearch 6.8.8.410 • Grafana 7.5.10.310 • Kibana 6.8.8.400
Release Date	January 2022
Version Interoperability	Component Versions for Released EEPs
Package Names	Package Names for Ecosystem Packs (EEPs) on page 5828

New in This Release

- EEP 8.1.0 includes updates to Collectd, Elasticsearch, and Grafana.

  To compare Monitoring component versions, see Component Versions for Released EEPs on page 5750.

Fixes

Principal fixes in this release include:

- COLD-218 - nfs3 errors in collectd_daemon.log
- COLD-219 - Need to add configurable filter for jmx to specify process names we want to attach to for jmx collection
- ES-88 - Fix vulnerabilities including CVE-2021-44228

Known Issues and Limitations

Log monitoring is not supported in installations with FIPS-enabled nodes in EEP 8.1.0.

Resolved Issues

None.

Monitoring Components - EEP 8.0.0 Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

last-updated: Jun 06, 2024

Version	The EEP 8.0.0 release contains the following monitoring-component versions: • Collectd 5.12.0.300 • Fluentd 1.10.3.300 • Opentsdb 2.4.1.300 • Elasticsearch 6.8.8.400 • Grafana 7.5.10.300 • Kibana 6.8.8.400
Release Date	October 2021
Version Interoperability	Component Versions for Released EEPs
Package Names	Package Names for Ecosystem Packs (EEPs) on page 5828

New in This Release

- EEP 8.0.0 includes updates to all of the monitoring components. In particular, the Collectd, Grafana, and Open TSDB versions changed significantly. Open TSDB now uses a four-digit version. See About the Patch Version on page 5717.

  To compare Monitoring component versions, see Component Versions for Released EEPs on page 5750.

- In Grafana 7.5.x, the steps to display sample dashboards are different from the steps used in previous versions of Grafana. For more information, see Sample Dashboards in Grafana on page 1754.

Fixes

Principal fixes in this release include:

- COLD-206: Activate Java logging in collectd
- COLD-213: need to update types.db with new metrics
- KIB-55: configure.sh fails to extract certs when clustername is not all lowercase
- OTSDB-121: CVE-2018-10237,CVE-2020-8908 vulnerabilities in Guava
- OTSDB-130: ot_purgeData.log log rotation fails when selinux is enabled and enforcing

Known Issues and Limitations

None.

Resolved Issues

None.

Monitoring Components - EEP 7.1.2 Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric.

These release notes contain only data-fabric-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

last-updated: Jun 06, 2024

Version	The EEP 7.1.2 release contains the following monitoring-component versions: • Collectd 5.10.0.20 • Fluentd 1.10.3.220 • Opentsdb 2.4.0 • Elasticsearch 6.8.8.320 • Grafana 7.5.2.220 • Kibana 6.8.8.320
Release Date	March 2022
Version Interoperability	Component Versions for Released EEPs
Package Names	Package Names for Ecosystem Packs (EEPs) on page 5828

New in This Release

- EEP 7.1.2 includes updates to these monitoring components:
  - Collectd
  - Fluentd
  - Elasticsearch
  - Grafana
  - Kibana

  To compare Monitoring component versions, see Component Versions for Released EEPs on page 5750.

Fixes

Principal fixes in this release include:

- COLD-218: nfs3 errors in collectd_daemon.log
- COLD-219: need to add configurable filter for jmx to specify process names we want to attach to for jmx collection
- ES-86: fix startup in unsecure mode
- ES-87: configure.sh fails if clustername is not lowercase
- ES-88: Fix vulnerabilities including CVE-2021-44228
- ES-94: mep-712 elasticsearch - searchguard.ssl.transport.keystore_filepath or searchguard.ssl.transport.pemkey_filepath must be set if transport ssl is reqested
- FLUD-60: do not do chmod on files if directory does not exist
- FLUD-61: MEP-712 - private-pkg fix
- KIB-57: MEP-7.1.2 extract_cluster_certs missing in build config in private_pkg

Known Issues and Limitations

Log monitoring is not supported in installations with FIPS-enabled nodes in EEP 7.1.2.

Resolved Issues

None.

S3 Gateway Release Notes

The S3 Gateway was formerly known as the *Object Store with S3-Compatible API*. The release notes for the S3 Gateway component included in the HPE Ezmeral Data Fabric contain notes specific to data-fabric only.

NOTICE: The S3 gateway is included in EEP 6.0.0 - EEP 8.0.0 repositories. S3 gateway is not supported in HPE Ezmeral Data Fabric 7.0.0 onward. HPE Ezmeral Data Fabric 7.0.0 introduces a native object storage solution. For more information, see HPE Ezmeral Data Fabric Object Store on page 541.

To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734. To view release notes for prior releases, see Previous Versions on page 6194.

S3 Gateway 2.2.0.0 - 2110 (EEP 8.0.0) Release Notes

This section provides reference information, including new features, patches, and known issues for the 2.2.0.0 release of the S3 Gateway.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

S3 Gateway Version	2.2.0.0
Release Date	October 2021
Version Interoperability	See EEP Components and OS Support on page 5734.
Maven Artifacts	https://repository.mapr.com/maven/
Source on GitHub	https://github.com/mapr/minio/
GitHub Release Tag	2.2.0.0-eep-800
Package Names	• mapr-objectstore-client-2.2.0.0 • mapr-objectstore-gateway-2.2.0.0 To view the list of package names, navigate to Package Names for Ecosystem Packs (EEPs) on page 5828, and select your EEP and OS.

New in This Release

S3 Gateway 2.2.0.0 - 2110 introduces the following enhancements or HPE platform-specific behavior changes:

- Objectstore with S3-Compatible API is now called S3 Gateway in HPE Ezmeral Data Fabric product documentation.
- FS mode added for LDAP integration.
- MinIO updated to RELEASE.2021-04-22T15-44-28Z.

- MC (MinIO Client) updated to RELEASE.2021-04-22T17-40-00Z.

Fixes

This data-fabric release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
5b18bbda	2021-04-29	S3-247: Added LDAP integration support for FS mode
6e50767b	2021-08-25	S3-268: Changed log rotation

For complete details, refer to the commit log for this project in GitHub.

Known Issues

- S3-261: The MinIO password is stored in cleartext.

Resolved Issues

- S3-268: Fixed an issue in logrotate that caused the S3 gateway to stop running in the cluster.

S3 Gateway 2.1.0.0 - 2104 (EEP 7.1.0) Release Notes

This section provides reference information, including new features, patches, and known issues for the 2.1.0.0 release of the S3 Gateway.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

S3 Gateway Version	2.1.0.0
Release Date	April 2021
Version Interoperability	See EEP Components and OS Support on page 5734.
Maven Artifacts	https://repository.mapr.com/maven/
Source on GitHub	https://github.com/mapr/minio/
GitHub Release Tag	2.1.0.0-mapr-710
Package Names	• mapr-objectstore-client-2.1.0.0 • mapr-objectstore-gateway-2.1.0.0 To view the list of package names, navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS.

New in This Release

S3 Gateway 2.1.0.0 - 2104 introduces the following enhancements or HPE platform-specific behavior changes:

- Multi-volume support
- Distributed mode support
- Service verifier
- Minio updated to RELEASE.2021-03-17T02-33-02Z
- MC updated to RELEASE.2021-03-23T05-46-11Z

Fixes

This data-fabric release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
69ef372e	2021-03-24	[S3-244] Added new ldap configuration and config migrations
a693008f	2021-03-15	[S3-240] Added service verifier
96c85fbf	2021-03-03	[S3-236] Added support of multi volumes
07af4968	2021-02-26	[S3-167] Added implementation of distributed mode for MapR FS
d6d2bf0d	2021-01-25	[S3-233] Added skip of Streams config during migration
d71a60f9	2021-01-25	[S3-234] Fixed clean start in FS mode

For complete details, refer to the commit log for this project in GitHub.

Known Issues

- None.

Resolved Issues

- S3-234: The objectstore no longer fails to start the first time in FS mode.
- S3-241: The old folder is no longer present after upgrade to new minor version.
- S3-244: CVE-2021-21362 MinIO vulnerability resolved.

NiFi Release Notes

The release notes for the NiFi component included in the HPE Ezmeral Data Fabric contain notes specific to data-fabric only.

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734 or EEP Support and Lifecycle Status on page 5728. To view release notes for prior data-fabric releases, see Previous Versions on page 6194.

NiFi 1.19.1.100 - 2404 (EEP 9.2.2) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric distribution for Apache NiFi. You may also be interested in theApache NiFi changelog and theApache NiFi home page.

NiFi Version	1.19.1.100
Release Date	April 2024
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/nifi
GitHub Release Tag	1.19.1.100-eep-922
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.

last-updated: Jun 06, 2024

Documentation	• NiFi on page 4573 • Installing NiFi on page 263

New in This Release

None.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	Fix Number and Description
7e3d17866a	2024-03-21	ENIFI-138: add more slf4j-reload4j exclusions
1043bf1159	2024-02-15	ENIFI-243: fix handling for not-used libs
398757c6f8	2024-01-05	EZNIFI-233: fix IS_SECURED init expr for configure.sh run
a01f91659c	2024-01-15	Correct mischanged jersey-client version
41c90bad19	2024-01-11	EZNIFI-238: NoClassDefFoundError org/apache/hive/common/util/MapRKeystoreReader
367778019f	2024-01-10	EZNIFI-185: include nifi-hive-services-api-nar to build
c924621372	2023-07-31	EZNIFI-199: stop interrupting FileSystem statistic data cleaner thread
12060aa924	2023-09-28	EZNIFI-219: copy warden.nifi.conf file with preserved user and group owner, permissions
ec4e0f6440	2023-06-06	NIFI-11653: Added Connection URL Validation for Database Services
36d6cb20bc	2023-02-08	NIFI-11151: Improving code reusability of DBCP services
b76ed0524b	2023-02-16	NIFI-11191: Refactored HikariCPConnectionPoolTest with Mock Driver (#6966)
eb49f830f2	2023-05-30	NIFI-11614: Improved Validation for JndiJmsConnectionFactoryProvider

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- All processors launch under NiFi user. This user is a cluster admin (mapr).
- Processors and services related to HBase and Hive are available only if each node in the NiFi cluster has installed the `mapr-hive` and `mapr-hbase` packages, respectively.
- NiFi does not support the following:
  - Spark
  - HPE Ezmeral Data Fabric Database DB JSON
  - Installation on edge nodes
  - Data Fabric SASL for UI

Resolved Issues

- None.

NiFi 1.19.1.0 - 2301 (EEP 9.1.0) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric distribution for Apache NiFi. You may also be interested in theApache NiFi changelog and theApache NiFi home page.

NiFi Version	1.19.1.0
Release Date	January 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/nifi
GitHub Release Tag	1.19.1.0-eep-910
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.
Documentation	• NiFi on page 4573 • Installing NiFi on page 263

New in This Release

- Code base updated to version 1.19.1.
- Added integration with Livy.

Fixes

None.

Known Issues and Limitations

- All processors launch under NiFi user. This user is a cluster admin (mapr).
- NiFi doesn't support the following:
  - Spark
  - HPE Ezmeral Data Fabric Database DB JSON
  - Installation on edge nodes
  - Data Fabric SASL for UI

Resolved Issues

- None.

NiFi 1.16.3.0 - 2210 (EEP 9.0.0) Release Notes

The following notes relate specifically to the HPE Ezmeral Data Fabric distribution for Apache NiFi. You may also be interested in theApache NiFi changelog and theApache NiFi home page.

NiFi Version	1.16.3.0

Release Date	October 2022
HPE Version Interoperability	See EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/nifi
GitHub Release Tag	1.16.3.0-eep-900
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP(MEP) and OS to view the list of package names.
Documentation	• NiFi on page 4573 • Installing NiFi on page 263

New in This Release

This is the first release of the NiFi component. Starting from EEP 9.0.0, the HPE Ezmeral Data Fabric supports Apache NiFi in core releases 7.1.0. The key features of NiFi are:

- Flow Management
- Ease of Use
- Security
- Extensible Architecture
- Flexible Scaling Model

You can use NiFi on FIPS enabled nodes with the following:

- HiveServer2
- Hive Metastore
- HDFS
- Kafka
- HBase
- HPE Ezmeral Data Fabric Database Binary

Fixes

None.

Known Issues and Limitations

- All processors launch under NiFi user. This user is a cluster admin (mapr user).
- NiFi doesn't support the following:
  - Livy
  - Spark
  - HPE Ezmeral Data Fabric Database DB JSON

- Installation on edge nodes
- Data Fabric SASL for UI

Resolved Issues

- None.

OTel Release Notes

This section includes the release notes for OpenTelemetry (OTel).

OTel 0.80.0.39 Release Notes

These notes describe release 0.80.0.39 of OpenTelemetry (OTel).

OpenTelemetry (OTel) is an observability framework that allows you to instrument, generate, collect, and export telemetry data. For more information about OTel, see the official OpenTelemetry documentation.

Version	0.80.0.39
Release Date	October 2023

New in This Release

Both the HPE Ezmeral Data Fabric and HPE Ezmeral Data Fabric – Customer Managed platforms provide support for OTel starting from release 7.5.0. You can use OTel to:

- Centralize monitoring of Data Fabric deployments.
- Generate telemetry data, such as metrics and logs, for fabrics.
- View telemetry data generated on fabrics quickly and easily with EZ Central.
- Dynamically update OTel endpoints via `maprcli` commands or HPE Ezmeral Data Fabric UI, preventing the need for manual updates. This feature is available for both secure and non-secure endpoints.
- Choose the telemetry data you want your OTel endpoint to generate. When configuring an OTel endpoint, you can enable or diable the generation of logs and metrics.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Oozie Release Notes

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

The release notes for Oozie component included in the MapR Converged Data Platform contains notes specific to MapR only. More details are available on the Apache Oozie project website.

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734. To view release notes for prior MapR releases, see Previous Versions on page 6194.

Oozie 5.2.1.0 Release Notes

The following Oozie 5.2.1.0 component release notes are included in the HPE Ezmeral Data Fabric.

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

Oozie 5.2.1.400 - 2405 (EEP 8.1.2) Release Notes

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Oozie. You may also be interested in the Apache Oozie 5.2.1 changelog or the Apache Oozie project homepage.

Version	5.2.1.400
Release Date	May 2024
HPE Version Interoperability	See the Interoperability Matrix, Ecosystem Support Matrix, and Oozie Support Matrix
Source on GitHub	https://github.com/mapr/oozie
GitHub Release Tag	5.2.1.400-eep-812
Maven Artifacts	http://repository.mapr.com/maven/.
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names

New in This Release

Oozie 5.2.1.400 - 2405 introduces the following new features:

- Bug fixes.
- Dependency updates due to CVEs.

Fixes

This release by HPE includes the following patches on the base Apache release. For complete details, refer to the commit log for this project in GitHub.

Commit	Date (YYYY-MM-DD)	Comment
1096d7049	2024-04-24	Backported OOZIE-3718: Improve Oozie Web UI filtering

last-updated: Jun 06, 2024

17e0aa360	2024-04-24	Backported OOZIE-3717: When fork actions parallel submit, becasue ForkedActionStartXCommand and ActionStartXCommand has the same name, so ForkedActionStartXCommand would be lost, and cause deadlock
e1d624c27	2024-04-24	Backported OOZIE-3715: Fix fork out more than one transitions submit, one transition submit fail can't execute KillXCommand
499362324	2024-04-24	Backported OOZIE-3716: Invocation of Main class completed Message is skipped when LauncherSecurityManager calls system exit
8a87d2765	2024-04-24	OOZ-388: Updated Guava to 32.1.3-jre
48f18573b	2024-04-24	OOZ-385: Updated Jettison to 1.5.4 due CVEs
c671ba2ef	2024-04-24	OOZ-385: Updated jython-standalone to 2.7.3.Final due CVE
f3b955a8e	2024-04-24	OOZ-388: Updated Netty to 4.1.108.Final
76ef03903	2024-04-24	OOZ-388: Updated Jetty to 9.4.54.v20240208
25266e3c6	2024-04-24	OOZ-385: Updated xercesImpl to 2.12.2 due CVE-2022-23437
0f622f08a	2024-02-15	SQOOP-131: Downgrade commons-io to prevent permission access exception for Sqoop action

Known Issues and Limitations

- None.

Resolved Issues

- None.

Oozie 5.2.1.300 - 2305 (EEP 8.1.1) Release Notes

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

7da9077b8	2023-02-13	Backported OOZIE-3649 Upgrade transitive log4j2 version to 2.17.1
be18cdc68	2023-01-30	Backported OOZIE-3673 Add possibility to configure custom SSL/TLS protocols when executing an email action
09b2cdc3b	2023-01-03	OOZ-370: Oozie should clean tmp location only during start
e72eb3a35	2022-09-05	OOZ-358/360: Added property for disabling cleanup Oozie tmp directory Added logs for sharelib copying during Oozie start
89d92158b	2022-05-04	OOZ-348: configure.sh script adds "oozie.services.ext" property into oozie-site.xml even if this property already exists.

last-updated: Jun 06, 2024

6697819d3	2022-05-04	OOZ-337: Updated Jetty version
ea6148432	2022-05-04	OOZ-340: Changed directory for temporary files
411641ea2	2022-05-04	OOZ-349: Added oozie.yarn.app.container.log.filesize to default property
5c7e35fb7	2022-05-04	OOZ-349: Oozie launcher container syslogs are empty due to the non-zero yarn.app.container.log.filesize
bb6fa09ea	2022-05-03	OOZ-348: Update hadoop-common from hadoop_home/share/hadoop/common dir
2e6bad8f2	2022-05-03	OOZ-347: Added container directory to HADOOP_CLASSPATH for Hive action

Known Issues and Limitations

- None.

Resolved Issues

- None.

Oozie 5.2.1.200 - 2201 (EEP 8.1.0) Release Notes

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Oozie. You may also be interested in the Apache Oozie 5.2.1 changelog or the Apache Oozie project homepage.

Version	5.2.1.200
Release Date	January 2022
HPE Version Interoperability	See the Interoperability Matrix, Ecosystem Support Matrix, and Oozie Support Matrix
Source on GitHub	https://github.com/mapr/oozie
GitHub Release Tag	5.2.1.200-eep-810
Maven Artifacts	http://repository.mapr.com/maven/.
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names

New in This Release

Oozie 5.2.1.200 - 2201 introduces the following new feature:

- Starting from EEP-8.1.0, Oozie supports FIPS.
- Updated the following:
  - Netty

- Derby
- Jython Standalone
- JUnit
- Log4j
- Jetty
- Gson
- Graphviz
- Commons Collections
- XML Graphics Commons
- Commons Compress
- Netty4
- Spark to version 3.2.0.0

- Starting from EEP-8.1.0, Oozie does not support Pig and Sqoop.

Fixes

This release by HPE includes the following patches on the base Apache release. For complete details, refer to the commit log for this project in GitHub.

Commit	Date (YYYY-MM-DD)	Comment
0035192a	2022-02-04	OOZ-331: JMX SSL options always false for MEP7+ releases
a6be3d7d	2022-01-26	OOZ-328: Added mapr-security-web jar to Jetty for JMX
5ca08852	2022-01-25	OOZ-327: Updated log4j v1 to the 1.3.1-mapr
15eb8fc6	2022-01-14	OOZ-326: Fixed error during initial configuration

Oozie 5.2.1.100 - 2110 (EEP 8.0.0) Release Notes

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Oozie. You may also be interested in the Apache Oozie 5.2.1 changelog or the Apache Oozie project homepage.

Version	5.2.1.100
Release Date	October 2021
HPE Version Interoperability	See the Interoperability Matrix, Ecosystem Support Matrix, and Oozie Support Matrix
Source on GitHub	https://github.com/mapr/oozie
GitHub Release Tag	5.2.1.100-eep-800
Maven Artifacts	http://repository.mapr.com/maven/.
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names

New in This Release

Oozie 5.2.1.100 - 2110 introduces the following new feature:

- Updated Hive libraries to version 2.3.9.
- Updated Jetty to version 9.4.43.v20210629 .
- Updated Spark to version 3.1.2.0.

Fixes

This release by HPE includes the following patches on the base Apache release. For complete details, refer to the commit log for this project in GitHub.

Commit	Date (YYYY-MM-DD)	Comment

bd629f49	2021-05-27	OOZ-252: Oozie status server failed with Error message: Insufficient configured threads
51eefe7d	2021-07-05	OOZ-235 - upgrade spark up to 3.1.1
dfe42c6c	2021-07-05	OOZ-255: Update Hive libs to v2.3.9
1b2d0e77	2021-07-12	OOZ-258: update hadoop up to 2.7.6.0-mapr-720 version
c532ee4c	2021-07-19	OOZ-259: Updated jetty to the 9.4.41.v20210516
e7c22985	2021-07-28	OOZ-261: Update Jetty to 9.4.43.v20210629
3bfb1df0	2021-08-10	OOZ-262: Update Jackson v1 and v2 depenencies
99f50b41	2021-08-12	OOZ-263 Update Spark version to 3.1.2.0
9673c8d2	2021-08-16	OOZ-264: Removed avatica from common sharelib to avoid jackson versions conflict
0c9967ed	2021-08-17	OOZ-266: Drop Hive v1.2 from Spark dependencies
c845882c	2021-08-17	OOZ-265: force update dependencies
5f8b87ad	2021-08-17	Updated Hive SNAPSHOTS to correct version
e5aec661	2021-08-18	OOZ-267/OOZ-266: Removed log4jv2 from spark action and added missing libraries

Known Issues and Limitations

- None.

Resolved Issues

- None.

Oozie 5.2.1.50 - 2201 (EEP 7.1.2) Release Notes

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Oozie. You may also be interested in the Apache Oozie 5.2.1 changelog or the Apache Oozie project homepage.

Pig Release Notes

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

The release notes for Pig component, included in the MapR Converged Data Platform, contains notes specific to MapR only. More details are available on the Apache Pig website.

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734. To view release notes for prior MapR releases, see Previous Versions on page 6194.

Pig 0.17.0.0 Release Notes

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

The following Pig 0.17.0.0 component release notes are included in the MapR distribution for Apache Hadoop.

Pig 0.17.0.100 - (EEP 8.0.0) 2110 Release Notes

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Pig. You may also be interested in the Apache Pig 0.17.0 changelog or the Apache Pig homepage.

Pig Version	0.17.0.100
Release Date	October 2021
Source on GitHub	https://github.com/mapr/pig/
GitHub Release Tag	0.17.0.100-eep-800
Version Compatibility	See EEP Components and OS Support on page 5734
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	See Package Names for Ecosystem Packs (EEPs)

New in This Release

- None.

Fixes

This release by HPE includes the following fixes on the base Apache release. For complete details, refer to the commit log for this project in GitHub.

Commit	Date (YYYY-MM-DD)	Comment
226ae101a	2021-09-14	MAPR-PIG-61 : Error messages during starting Pig with using Hcatalog option
7e29a0fdf	2021-09-10	MAPR-PIG-60 : Unable to enter pig shell after updating jars to eep suffix
1dfec233f	2021-09-03	MAPR-PIG-59 : Update the maven artifact version strings to eep

Known Issues and Limitations

- None.

Resolved Issues

- None.

Pig 0.17.0.0 - (EEP 7.0.0) 2009 Release Notes

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

The notes below relate specifically to the HPE Ezmeral Distribution for Apache Pig. You may also be interested in the Apache Pig 0.17.0 changelog or the Apache Pig homepage.

Ranger Release Notes

Apache Ranger is supported on release 7.1.0 and later. The release notes for the Ranger component included in the HPE Ezmeral Data Fabric contain notes specific to Data Fabric only.

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734. To view release notes for prior Data Fabric releases, see Previous Versions on page 6194.

Ranger 2.4.0.0 - 2310 (EEP 9.2.0) Release Notes

Apache Ranger is a tool to help you monitor and manage security for the Hadoop components that are included in the HPE Ezmeral Ecosystem Pack. For more information about the Data Fabric implementation of Ranger, see Ranger on page 4583.

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution of Apache Ranger. You may also be interested in the Apache Ranger home page and the Apache Ranger changelog.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	2.4.0.0
Release Date	October 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	https://github.com/mapr/ranger
GitHub Release Tag	2.4.0.0-eep-920
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP (MEP) and OS to view the list of package names.

New in this Release

EEP 9.2.0 updates the Ranger version to 2.4.0.

Installation

You can install Ranger by using manual steps or by using the Installer. See these topics:

- Installing Ranger (manual steps)

- Installing Ranger Using the Installer

Fixes

This HPE release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
5842bd28f	2023-09-27	RAN-302 Package uninstall throws ps errors
c24bd54ab	2023-09-27	RAN-301 Warden fails to start Ranger services on Compute node because of wrong permissions of warden.ranger-*.conf files set after configure.sh run
d2563521d	2023-09-21	RAN-289 db_override_connection_string doesn't work
26cca4e74	2023-09-15	(RAN-299) RAN-102 FIPS mode: keystore types (JCEKS -> BCFKS) (Part 2) (yarn)
90d69fc98	2023-09-14	RAN-294 Upgrade artifact naming to EEP v9.2.0
c786b23d1	2023-09-14	RAN-298 setup.sh run fails on cluster with enabled FIPS mode
bde16d562	2023-09-04	RAN-291 Usersync: take jetty-util jar from hadoop-common

Known Issues and Limitations

Ranger and Mixed FIPS Configurations

The Ranger component in EEP 9.2.0 cannot be used in a mixed FIPS configuration (a cluster consisting of FIPS and non-FIPS nodes).

RAN-279

If you are upgrading to EEP 9.2.0 or later, you must upgrade both Ranger and Hive packages together if the Hive plugin is used. If you upgraded only Ranger, you might encounter the following error:

```
Error: Error running query:
java.lang.NoSuchMethodError:
'java.lang.String
org.apache.hadoop.hive.ql.security.aut
horization.plugin.HivePrivilegeObject.
getOwnerName()' (state=,code=0)
```

Upgrading Hive should fix the problem.

RAN-292

After upgrading Ranger, the old 3-digit directory might remain. For example, after upgrading from Ranger version 2.3.0 to version 2.4.0, you might see the following:

```
[mapr@node2 ~]$ ls -l /opt/mapr/
ranger/
total 16
drwxr-xr-x 3 mapr mapr 4096 Sep 20
10:25 ranger-2.3.0
drwxr-xr-x 3 mapr mapr 4096 Sep 20
10:23 ranger-2.3.0.300.202307050726
drwxr-xr-x 8 mapr mapr 4096 Sep 20
10:23 ranger-2.4.0
-rw-r--r-- 1 mapr mapr    6 Sep 20
10:24 rangerversion
```

last-updated: Jun 06, 2024

	The `ranger-2.3.0` is the old directory that was not removed on upgrade. This does not affect anything, and it is safe to remove the directory manually.
RAN-292	On Debian-based distributions, upgrading Ranger might throw the following warning: `dpkg: warning: unable to delete old directory '<directory>': Directory not empty` This issue does affect anything and can safely be ignored.

Resolved Issues

HMS functionalities are supported in a preview state.

Ranger 2.3.0.300 - 2307 (EEP 9.1.2) Release Notes

Apache Ranger is a tool to help you monitor and manage security for the Hadoop components that are included in the HPE Ezmeral Ecosystem Pack. For more information about the Data Fabric implementation of Ranger, see Ranger on page 4583.

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution of Apache Ranger. You may also be interested in the Apache Ranger home page and the Apache Ranger changelog.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	2.3.0.300
Release Date	April 2023
HPE Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	https://github.com/mapr/ranger
GitHub Release Tag	2.3.0.300-eep-912
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP (MEP) and OS to view the list of package names.

New in this Release

This release of Ranger includes:

- Bug fixes

Installation

You can install Ranger by using manual steps or by using the Installer. See these topics:

- Installing Ranger (manual steps)
- Installing Ranger Using the Installer

Fixes

This HPE release includes the following fixes on the base Apache release. For details, refer to the commit log for this project in GitHub:

last-updated: Jun 06, 2024

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
2ab612e52	2023-06-19	EEP-RAN-277 Upgrade internal dependencies and update artifact name for EEP-912
8bfa40cdb	2023-06-02	EEP-RAN-275: solr error messages in Audit tab in Ranger
e84c9cc36	2023-04-14	RAN-274 Ranger runitme directory should be owned by unix_user

Known Issues and Limitations

Ranger and Mixed FIPS Configurations	The Ranger component in EEP 9.1.2 cannot be used in a mixed FIPS configuration (a cluster consisting of FIPS and non-FIPS nodes).

Resolved Issues

HMS functionalities are supported in a preview state.

Ranger 2.3.0.200 - 2304 (EEP 9.1.1) Release Notes

Apache Ranger is a tool to help you monitor and manage security for the Hadoop components that are included in the HPE Ezmeral Ecosystem Pack. For more information about the Data Fabric implementation of Ranger, see Ranger on page 4583.

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution of Apache Ranger. You may also be interested in the Apache Ranger home page and the Apache Ranger changelog.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP (MEP) and OS to view the list of package names.

New in this Release

This release of Ranger includes:

- Yarn plugin:
- Bug fixes
- CVE fixes

Installation

You can install Ranger by using manual steps or by using the Installer. See these topics:

- Installing Ranger (manual steps)

- Installing Ranger Using the Installer

Fixes

This HPE release includes the following fixes on the base apache release. For details, refer to the commit long for this project in GitHub:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
ad636fd10	2023-03-28	EEP-RAN-271: Upgrade internal EEP dependencies (Hadoop, Hive)
d0f262020	2023-03-27	EEP-RAN-268: Update protobuf-java version to 3.21.12
829515b75	2023-03-01	RAN-158 setup.sh output notifies about errors in "setup.sh: line 429" in Ubuntu OS
d835bf0ef	2023-02-01	EEP-RAN-264: Yarn service is not available by default on Ranger Admin UI after packages installation
cf176ac16	2023-02-01	EEP-RAN-263: sed error when rangerUsersync_password contains character
cecba7bb9	2023-01-25	EEP-RAN-262: Upgrade Ranger snapshot version to 2.3.0.200-eep-911-SNAPSHOT

Known Issues and Limitations

Ranger and Mixed FIPS Configurations	The Ranger component in EEP 9.1.1 cannot be used in a mixed FIPS configuration (a cluster consisting of FIPS and non-FIPS nodes).

Resolved Issues

HMS functionalities are supported in a preview state.

Ranger 2.3.0.100 - 2301 (EEP 9.1.0) Release Notes

Apache Ranger is a tool to help you monitor and manage security for the Hadoop components that are included in the HPE Ezmeral Ecosystem Pack. For more information about the Data Fabric implementation of Ranger, see Ranger on page 4583.

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution of Apache Ranger. You may also be interested in the Apache Ranger home page and the Apache Ranger changelog.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	2.3.0.100
Release Date	January 2023
HPE Version Interoperability	See EEP 9.1.0 Components and OS Support on page 5740
Source on GitHub	https://github.com/mapr/ranger
GitHub Release Tag	2.3.0.100-eep-910
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP (MEP) and OS to view the list of package names.

last-updated: Jun 06, 2024

New in this Release

This release of Ranger includes:

- PrestoDB plugin for Kubernetes
- New configuration properties:
  - RAN-223: `ranger.security.type` (security_type)
  - RAN-216: `ranger.usersync.service.retryinmillis` (RETRY_INTERVAL)
- RAN-192: New package `mapr-ranger-usersync` to decouple services
- CVE fixes
- Bug fixes
- Added a new property `ranger.usersync.service.retryinmillis`.

  When UserSync fails to communicate with Admin, UserGroup initialization fails. Starting from EEP 9.1.0, you can use the `ranger.usersync.service.retryinmillis` property to specify the retry interval for the service start process upon failure. The default value is `15000 milliseconds` and the minimum value is `10000 milliseconds`.

Installation

You can install Ranger by using manual steps or by using the Installer. See these topics:

- Installing Ranger (manual steps)
- Installing Ranger Using the Installer

Fixes

This HPE release includes the following fixes on the base apache release. For details, refer to the commit long for this project in GitHub:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
500752ad	2023-01-05	EEP-RAN-257: Error appears during configure.sh run if user-sync is installed on a separate node
59d3bbfa6	2022-12-29	EEP-RAN-256: Remove yarn service from Ranger Admin UI home screen
3d0abff6d	2022-12-23	EEP-RAN-254: [PrestoDB] Adding row level filtering support with test cases
3621ab7b5	2022-12-23	EEP-RAN-254: [PrestoDB] Adding hadoop-shaded-guava into runtime library
2fb70b4c0	2022-12-23	EEP-RAN-254: [PrestoDB] Using HPE specific presto-*.jar
d29289998	2022-12-21	EEP-RAN-255: netty-codec-haproxy vulnerabilities
70527c5a7	2022-12-21	EEP-RAN-253: kafka-clients vulnerabilities
3d213c4dc	2022-12-21	EEP-RAN-251: commons-text vulnerabilities
e3256ea64	2022-12-21	RANGER-3960: Upgrade spring-security version to 5.7.5
659bed2db	2022-12-21	EEP-RAN-248: snakeyaml vulnerabilities
ca033e018	2022-12-21	EEP-RAN-246: woodstox-core vulnerabilities

ec4435f19	2022-10-11	RAN-203 authorizer.RangerHiveAuthorizer: failed to get database object from Hive metastore

last-updated: Jun 06, 2024

eaed5948c	2022-10-11	RAN-201 Add properties to ranger-ugsync-site.xml to be able to enable deletion of synced unix users/groups which were removed
4f6f3db8b	2022-10-11	RAN-200 DF cluster admin should be Ranger admin as well
959781089	2022-09-28	RAN-202 Could not initiate at timedTask

Known Issues and Limitations

Ranger and Mixed FIPS Configurations

The Ranger component in EEP 9.1.0 cannot be used in a mixed FIPS configuration (a cluster consisting of FIPS and non-FIPS nodes).

RAN-260

Because of conflicts between the Ranger debian packages in EEP 9.1.0, installing or upgrading multiple Ranger packages to EEP 9.1.0 on the same node causes the following installation error:

```
trying to overwrite '/opt/mapr/ranger/
rangerversion', which is also in
package <package_name>
```

Workaround: To avoid this issue, pass the `--force-overwrite` option to `dpkg` when installing the packages. You can accomplish this through `apt` by using the `-o DPkg::options::="--force-overwrite"` option.

For example, the following command installs the `mapr-ranger` and `mapr-ranger-userysnc` packages by passing the `--force-overwrite` option to `dpkg` through `apt`:

```
sudo apt install
mapr-ranger mapr-ranger-usersync -o
DPkg::options::="--force-overwrite"
```

Resolved Issues

HMS-related known issues are removed from the Known Issues section.

Ranger 2.3.0.0 - 2210 (EEP 9.0.0) Release Notes

Apache Ranger is a tool to help you monitor and manage security for the Hadoop components that are included in the HPE Ezmeral Ecosystem Pack. For more information about the Data Fabric implementation of Ranger, see Ranger on page 4583.

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution of Apache Ranger. You may also be interested in the Apache Ranger home page and the Apache Ranger 2.3.0 changelog.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	2.3.0.0
Release Date	October 2022
HPE Version Interoperability	See EEP 9.0.0 Components and OS Support on page 5741.
Source on GitHub	https://github.com/mapr/ranger

GitHub Release Tag	2.3.0.0-eep-900
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to http://package.ezmeral.hpe.com/releases/MEP/, and select your EEP (MEP) and OS to view the list of package names.

New in this Release

This is the first release of the Ranger component. Starting from EEP 9.0.0, the HPE Ezmeral Data Fabric supports Apache Ranger in core release 7.1.0. Ranger is supported for FIPS-enabled nodes. You can use Ranger to create policies that restrict access to Hive Metastore and HiveServer2.

Installation

You can install Ranger by using manual steps or by using the Installer. See these topics:

- Installing Ranger (manual steps)
- Installing Ranger Using the Installer

Fixes

None. This is the first release of the Data Fabric Ranger product.

Known Issues and Limitations

The following table summarizes the known issues:

Issue(s)	Description	Workaround or Notes
N/A	The Ranger component in EEP 9.0.0 cannot be used in a mixed FIPS configuration (a cluster consisting of FIPS and non-FIPS nodes).	None.
RAN-161, RAN-169, RAN-177	Applying HiveCLI Policies	Issues with HiveCLI and Ranger integration require the user to perform the following steps to get Ranger policies applied in HiveCLI: **1.** Create or update the policy. **2.** Start the HiveCLI session as the cluster admin user, and run some simple queries. **3.** Reconnect from a common user if it was connected during the policy update. Auditing with Solr and tag-based policies are not supported.
RAN-166	Hive Metastore Auth Enabling/Disabling Automation	See "HMS auth enabling" and "disabling" in the documentation. Currently, this function must be performed manually by the user.
RAN-181	Column-Level Access in Hive Metastore	Currently in Ranger, you cannot restrict access on the column level in the Hive Metastore.

last-updated: Jun 06, 2024

Issue(s)	Description	Workaround or Notes
RAN-171	Column-Level Policies Break the Connection to the Hive Metastore	If you have policies that are applied for concrete columns (and not for a wildcard (*)), you might encounter a problem where you cannot connect to the Hive Metastore from any client. To fix this issue, provide access to the corresponding database and table. For example: **1.** Create a policy for `db.NONE`. **2.** Create a policy for `db.table.NONE`.
RAN-175	The Ranger Hive service can fail to connect to the Hive Thrift Server on a Kerberos cluster. This happens because Kerberos implements a user format that is different from the format used by non-Kerberos clusters. The difference in user formats causes authentication to fail.	Use either of the following workarounds: • Map Kerberos principals to short names. You can do this by using the `hadoop.security.auth_to_local` property in `core-site.xml`. For more information, see Mapping Kerberos principals to OS user accounts in the Hadoop documentation. • Use LDAP/AD user synchronization instead of the default UNIX user format. For more information, see Configuring LDAP/AD for Ranger on page 4590.
RAN-179	Row-Level Filtering and Column Masking in Hive Metastore	These features are not supported in Hive Metastore.
RAN-182	Spark Needs Access to the Default Database	If you want to connect to your custom database from Spark, you first need to provide access to the default database.
RAN-183	SHOW DATABASES will not be restricted in spark and drill. SHOW TABLES will not be restricted in Drill.	
RAN-184, RAN-187, RAN-188	To execute an INSERT if you are integrating with Hive Metastore, you must provide SELECT, UPDATE, and ALTER permissions on the table level.	Provide all three permissions. If you provide the SELECT and UPDATE permissions but do not provide the ALTER permission, you will be able to insert a record to a table, but an error message will be generated for the missing ALTER permission.

Resolved Issues

None.

Spark Release Notes

The release notes for Spark component (included in the HPE Ezmeral Data Fabric) contains notes specific to MapR only.

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734. To view release notes for prior MapR releases, see Previous Versions on page 6194.

Spark 3.3.3.0 (EEP 9.2.1) Release Notes

This section provides reference information, including new features, patches, and known issues for Spark 3.3.3.0.

The notes below relate specifically to the Hewlett Packard Enterprise Distribution for Apache Hadoop. For more information, you may also want to consult the open-source Spark 3.3.3 Release Notes.

These release notes contain only Hewlett Packard Enterprise specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Spark Version	3.3.3.0
Release Date	January 2024
HPE Version Interoperability	See Component Versions for Released EEPs on page 5750 and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/spark
GitHub Release Tag	3.3.3.0-eep-921
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names.

Hive Support

- Starting from Spark 3.1.2, Spark supports Hive 2.3.

Delta Lake Support

Spark 3.2.0 and later provides Delta Lake support on HPE Ezmeral Data Fabric. See Apache Spark Feature Support on page 4607.

New in This Release

- For a complete list of new features, see the open-source Spark 3.3.3 Release Notes.
  - Bug fixes.
  - CVE fixes.

Fixes

This HPE release includes the following new fixes since the latest Spark release. For details, refer to the commit log for this project in GitHub.

GitHub Commit	Date (YYYY-MM-DD)	Comment
fa4a702	28/12/2023	[SPARK-1246] Spark read from parquet is failing
652ee53	19/12/2023	[SPARK-1226] Run, analyze and fix CVE issues based on scan of Spark package
86ffc3f	14/12/2023	[SPARK-1241] Update Guava version to the latest to fix the CVEs
c44454e	13/12/2023	[SPARK-1243] Prepare Spark 3.3.3 to weekly release
1e11cc2	21/11/2023	[SPARK-1225] Move dist dir to devops/dist
d9cf0bb	21/11/2023	[SPARK-1237] "No such file or directory" when installing Spark 3.3.3 packages
6c09a9c	14/11/2023	[SPARK-1225] Invoke deploy during first build

8973558	14/11/2023	[DFDEVOPS-3051] Update scala-maven-plugin to prevent StackOverflow failures during build
372f649	14/11/2023	[DFDEVOPS-3022] Add an option to easily modify build images per component
903a3d9	14/11/2023	[SPARK-1225] Final improvements for build scripts and add some documentation of build workflow
3f44c4f	14/11/2023	[EZAF-1127] Fix name of Spark Classpath Filter package
af1f597	08/11/2023	[SPARK-1228] "Warning: Ignoring non-Spark config property: maprfs" message appears when spark session is starting
53ce510	06/11/2023	[SPARK-1227] Backport Spark-3.3.3 to EEP
7e1d633	02/11/2023	[EZAF-3538] EEP Spark logging is different from Apache
310ca51	01/11/2023	MapR [SPARK-1220] Reported vulnerabilities in MEP 6.3.0 in mapr-spark-2.4.4
438d76f	26/10/2023	[SPARK-1165] Handling of MapR-ES re-subscription in Spark job
5e327d3	25/10/2023	[SPARK-1029] Symlinks are not working with Parquet files
8b9f639	25/10/2023	[SPARK-1140] Spark job fails on standalone cluster mode
f71f47f	09/10/2023	[SPARK-1216] java.net.URISyntaxException: Relative path in absolute URI: ${system:user.name%7D
9b4c72b	09/10/2023	[SPARK-1121] Incorrect value INSTALL_DIR=/home//__spark-internal__/security_keys
f77b049	09/10/2023	[SPARK-1144] Spark job fails on FIPS cluster

Known Issues and Limitations

- FIPS in mixed mode not supported with enabled SSL for WebUI.
- SPARK-1099: Non-mapr user is unable to insert values into Hive table by using Spark Thrift Server

Resolved Issues

- None.

Spark 3.3.2.200 (EEP 9.2.0) Release Notes

This section provides reference information, including new features, patches, and known issues for Spark 3.3.2.200.

The notes below relate specifically to the Hewlett Packard Enterprise Distribution for Apache Hadoop. For more information, you may also want to consult the open-source Spark 3.3.2 Release Notes.

These release notes contain only Hewlett Packard Enterprise specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Spark Version	3.3.2.200
Release Date	October 2023
HPE Version Interoperability	See Component Versions for Released EEPs on page 5750 and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/spark
GitHub Release Tag	3.3.2.200-eep-920

Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names.

Hive Support

- Starting from Spark 3.1.2, Spark supports Hive 2.3.

Delta Lake Support

Spark 3.2.0 and later provides Delta Lake support on HPE Ezmeral Data Fabric. See Apache Spark Feature Support on page 4607.

New in This Release

- For a complete list of new features, see the open-source Spark 3.3.2 Release Notes.
  - Bug fixes.

Fixes

This HPE release includes the following new fixes since the latest Spark release. For details, refer to the commit log for this project in GitHub.

GitHub Commit	Date (YYYY-MM-DD)	Comment
9e174df	20/09/2023	MapR [SPARK-1212] Update list of libs to fix CVEs that are present in our current versions
32e27ba	29/08/2023	MapR [SPARK-1206] Runing Spark from client node throws errors

Known Issues and Limitations

- FIPS in mixed mode not supported with enabled SSL for WebUI. ·
- SPARK-1099: Non-mapr user is unable to insert values into Hive table by using Spark Thrift Server

Resolved Issues

- None.

Spark 3.3.2.100 - 2307 (EEP 9.1.2) Release Notes

This section provides reference information, including new features, patches, and known issues for Spark 3.3.2.100.

last-updated: Jun 06, 2024

The notes below relate specifically to the Hewlett Packard Enterprise Distribution for Apache Hadoop. For more information, you may also want to consult the open-source Spark 3.3.2 Release Notes.

These release notes contain only Hewlett Packard Enterprise specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Spark Version	3.3.2.100
Release Date	July 2023
HPE Version Interoperability	See Component Versions for Released EEPs on page 5750 and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/spark
GitHub Release Tag	3.3.2.100-eep-2307

Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names.

Hive Support

- Starting from Spark 3.1.2, Spark supports Hive 2.3.

Delta Lake Support

Spark 3.2.0 and later provides Delta Lake support on HPE Ezmeral Data Fabric. See Apache Spark Feature Support on page 4607.

New in This Release

- For a complete list of new features, see the open-source Spark 3.3.2 Release Notes.
  - Bug fixes.

Fixes

This HPE release includes the following new fixes since the latest Spark release. For details, refer to the commit log for this project in GitHub.

GitHub Commit	Date (YYYY-MM-DD)	Comment
41a0e26	05/06/2023	MapR [SPARK-1185] Update Spark dep on EEP 9.1.2 components artifacts
1988b41	06/06/2023	MapR [SPARK-1188] [Java 17] Need to open java.lang module for Spark HS, Spark Master and Spark Workers
28948bd	19/06/2023	MapR [SPARK-1190] Address CVE-2022-37865
fef9cec	21/06/2023	MapR [SPARK-1195] Fix Spark scripts as htrace-core*.jar was removed from HBase
7a5cfdf	08/07/2023	[MAPRYARN-397] Proxy should respond to client with a redirect if it gets SSL errors from server

cf50fbd	11/07/2023	MapR [SPARK-1196] MaprDB spark connector - Cannot convert true to a MapRDB predicate
ca1ae41	12/07/2023	MapR [SPARK-1202] Configure.sh overwrites the hive-site.xml

Known Issues and Limitations

- When you enable the SSL in a mixed (FIPS and non-FIPS) configuration, Spark application run fails. To run Spark applications, set `spark.ssl.ui.enabled` option to `false` in `spark-defaults.conf` configuration file.
- SPARK-1099: Non-mapr user is unable to insert values into Hive table by using Spark Thrift Server

Symptoms:

Navigate to Spark Beeline as a non-mapr user and connect to Spark Thrift Server.

```
!connect jdbc:hive2://
<node1.cluster.com>:2304/
default;ssl=true;auth=maprsasl
```

Create a table:

```
CREATE TABLE nonmaprctastest2 (key
int);
insert into table nonmaprctastest2
values 1, 2, 3;
```

The following error occurs:

```
Caused by:
java.lang.RuntimeException: Cannot
create staging directory: 'maprfs:/
user/hive/warehouse/
nonmaprctastest2/.hive-staging_hive_2
022-08-23_11-38-31_177_32171751135127
58641-4': User mapruser1(user id
5001) has been denied access to
create .hive-staging_hive_2022-08-23_
11-38-31_177_3217175113512758641-4
```

Cause:

In Hive 2.x, permissions for all the tables in `maprfs:///user/hive/warehouse/` directory are set to `777`. However, in Hive 3.x, permissions for table directories are set to `755`. In EEP, Spark Thrift Server creates the table as a user who started the Spark Thrift Server. When Hive 3.x changes the user to the user who did not start he Spark Thrift Server, the user can no longer make write operation with tables.

Workaround:

You can choose one of the following workarounds:

- After creating the Hive table, set permissions to `777` in `maprfs:///user/hive/warehouse` directory.
- After creating the Hive table, set owner to the user who created the Hive table.

last-updated: Jun 06, 2024

- Use HiveServer2 instead of Spark Thrift Server which uses impersonation.

Resolved Issues

- None.

Spark 3.3.2.0 - 2304 (EEP 9.1.1) Release Notes

This section provides reference information, including new features, patches, and known issues for Spark 3.3.2.0.

The notes below relate specifically to the Hewlett Packard Enterprise Distribution for Apache Hadoop. For more information, you may also want to consult the open-source Spark 3.3.2 Release Notes.

These release notes contain only Hewlett Packard Enterprise specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Spark Version	3.3.2.0
Release Date	April 2023
HPE Version Interoperability	See Component Versions for Released EEPs on page 5750 and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/spark
GitHub Release Tag	3.3.2.0-eep-2304
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names.

Hive Support

- Starting from Spark 3.1.2, Spark supports Hive 2.3.

Delta Lake Support

Spark 3.2.0 and later provides Delta Lake support on HPE Ezmeral Data Fabric. See Apache Spark Feature Support on page 4607.

New in This Release

- For a complete list of new features, see the open-source Spark 3.3.2 Release Notes.
  - Updated the Spark version to 3.3.2.
  - Bug fixes.

Fixes

This HPE release includes the following new fixes since the latest Spark release. For details, refer to the commit log for this project in GitHub.

GitHub Commit	Date (YYYY-MM-DD)	Comment
cb9a81a	28/02/2023	[SPARK-41944][CONNECT] Pass configurations when local remote mode is on

f23f39a	31/03/2023	MapR [SPARK-1158] Spark unable to launch jobs after upgrading hadoop patches
210daaa	31/03/2023	MapR [SPARK-1163] Create Spark build with the permanent fix of MAPR-SPARK-947 instead of a workaround.
cc419cab	06/04/2023	MapR [SPARK-1167] Script configure.sh resets hive-site.xml

Known Issues and Limitations

- When you enable the SSL in a mixed (FIPS and non-FIPS) configuration, Spark application run fails. To run Spark applications, set `spark.ssl.ui.enabled` option to `false` in `spark-defaults.conf` configuration file.
- SPARK-1099: Non-mapr user is unable to insert values into Hive table by using Spark Thrift Server

Symptoms:

Navigate to Spark Beeline as a non-mapr user and connect to Spark Thrift Server.

```
!connect jdbc:hive2://
<node1.cluster.com>:2304/
default;ssl=true;auth=maprsasl
```

Create a table:

```
CREATE TABLE nonmaprctastest2 (key
int);
insert into table nonmaprctastest2
values 1, 2, 3;
```

The following error occurs:

```
Caused by:
java.lang.RuntimeException: Cannot
create staging directory: 'maprfs:/
user/hive/warehouse/
nonmaprctastest2/.hive-staging_hive_2
022-08-23_11-38-31_177_32171751135127
58641-4': User mapruser1(user id
5001) has been denied access to
create .hive-staging_hive_2022-08-23_
11-38-31_177_3217175113512758641-4
```

Cause:

In Hive 2.x, permissions for all the tables in `maprfs:///user/hive/warehouse/` directory are set to `777`. However, in Hive 3.x, permissions for table directories are set to `755`. In EEP, Spark Thrift Server creates the table as a user who started the Spark Thrift Server. When Hive 3.x changes the user to the user who did not start he Spark Thrift Server, the user can no longer make write operation with tables.

Workaround:

You can choose one of the following workarounds:

- After creating the Hive table, set permissions to `777` in `maprfs:///user/hive/warehouse` directory.

last-updated: Jun 06, 2024

- After creating the Hive table, set owner to the user who created the Hive table.
- Use HiveServer2 instead of Spark Thrift Server which uses impersonation.

Resolved Issues

- None.

Spark 3.3.1.0 - 2301 (EEP 9.1.0) Release Notes

This section provides reference information, including new features, patches, and known issues for Spark 3.3.1.0.

The notes below relate specifically to the Hewlett Packard Enterprise Distribution for Apache Hadoop. For more information, you may also want to consult the open-source Spark 3.3.1 Release Notes.

These release notes contain only Hewlett Packard Enterprise specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Spark Version	3.3.1.0
Release Date	January 2023
HPE Version Interoperability	See Component Versions for Released EEPs on page 5750 and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/spark
GitHub Release Tag	3.3.1.0-eep-2301
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names.

Hive Support

- Starting from Spark 3.1.2, Spark supports Hive 2.3.

Delta Lake Support

Spark 3.2.0 and later provides Delta Lake support on HPE Ezmeral Data Fabric. See Apache Spark Feature Support on page 4607.

New in This Release

- For a complete list of new features, see the open-source Spark 3.3.1 Release Notes.
  - Updated Spark to version 3.3.1.0.
  - CVE fixes.
  - Bug fixes.

Fixes

This HPE release includes the following new fixes since the latest Spark release. For details, refer to the commit log for this project in GitHub.

GitHub Commit	Date (YYYY-MM-DD)	Comment

adf391c	2023/01/04	MapR [SPARK-1139] Update Spark in EEP 9.1.0 to Antlr Runtime version 4.9.3

Known Issues and Limitations

- When you enable the SSL in a mixed (FIPS and non-FIPS) configuration, Spark application run fails. To run Spark applications, set `spark.ssl.ui.enabled` option to `false` in `spark-defaults.conf` configuration file.
- If you are using Spark SQL with Derby database without Hive or Hive Metastore installation, you will see the Java Runtime Exception. See Apache Spark Feature Support on page 4607 for workaround. Spark does not support `log4j1.2` logging on HPE Ezmeral Data Fabric.
- SPARK-1099: Non-mapr user is unable to insert values into Hive table by using Spark Thrift Server

Symptoms:

Navigate to Spark Beeline as a non-mapr user and connect to Spark Thrift Server.

```
!connect jdbc:hive2://
<node1.cluster.com>:2304/
default;ssl=true;auth=maprsasl
```

Create a table:

```
CREATE TABLE nonmaprctastest2 (key
int);
insert into table nonmaprctastest2
values 1, 2, 3;
```

The following error occurs:

```
Caused by:
java.lang.RuntimeException: Cannot
create staging directory: 'maprfs:/
user/hive/warehouse/
nonmaprctastest2/.hive-staging_hive_2
022-08-23_11-38-31_177_32171751135127
58641-4': User mapruser1(user id
5001) has been denied access to
create .hive-staging_hive_2022-08-23_
11-38-31_177_3217175113512758641-4
```

Cause:

In Hive 2.x, permissions for all the tables in `maprfs:///user/hive/warehouse/` directory are set to `777`. However, in Hive 3.x, permissions for table directories are set to `755`. In EEP, Spark Thrift Server creates the table as a user who started the Spark Thrift Server. When Hive 3.x changes the user to the user who did not start he Spark Thrift Server, the user can no longer make write operation with tables.

Workaround:

You can choose one of the following workarounds:

- After creating the Hive table, set permissions to `777` in `maprfs:///user/hive/warehouse` directory.
- After creating the Hive table, set owner to the user who created the Hive table.
- Use HiveServer2 instead of Spark Thrift Server which uses impersonation.

Resolved Issues

- None.

Spark 3.3.0.0 - 2210 (EEP 9.0.0) Release Notes

This section provides reference information, including new features, patches, and known issues for Spark 3.3.0.0.

The notes below relate specifically to the Hewlett Packard Enterprise Distribution for Apache Hadoop. For more information, you may also want to consult the open-source Spark 3.3.0 Release Notes

These release notes contain only Hewlett Packard Enterprise specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Spark Version	3.3.0.0
Release Date	October 2022
HPE Version Interoperability	See Component Versions for Released EEPs on page 5750 and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/spark
GitHub Release Tag	3.3.0.0-eep-2210
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names.

Hive Support

- Starting from Spark 3.1.2, Spark supports Hive 2.3.

Delta Lake Support

Spark 3.2.0 and later provides Delta Lake support on HPE Ezmeral Data Fabric. See Apache Spark Feature Support on page 4607.

New in This Release

- For a complete list of new features, see the open-source Spark 3.3.0 Release Notes.
  - Updated Spark to version 3.3.0.0.
  - Updated Log4j to version 2.x.
  - Updated Hadoop to version 3.x.
  - CVE fixes.
  - Bug fixes.

Fixes

This HPE release includes the following new fixes since the latest Spark release. For details, refer to the commit log for this project in GitHub.

```

Cause:

In Hive 2.x, permissions for all the tables in `maprfs:///user/hive/warehouse/` directory are set to `777`. However, in Hive 3.x, permissions for table directories are set to `755`. In EEP, Spark Thrift Server creates the table as a user who started the

	Spark Thrift Server. When Hive 3.x changes the user to the user who did not start he Spark Thrift Server, the user can no longer make write operation with tables.
Workaround:	You can choose one of the following workarounds: • After creating the Hive table, set permissions to 777 in `maprfs:///user/hive/warehouse` directory. • After creating the Hive table, set owner to the user who created the Hive table. • Use HiveServer2 instead of Spark Thrift Server which uses impersonation.

Resolved Issues

- None.

Spark 3.2.0.200 - 2405 (EEP 8.1.2) Release Notes

This section provides reference information, including new features, patches, and known issues for Spark 3.2.0.200.

The notes below relate specifically to the Hewlett Packard Enterprise Distribution for Apache Hadoop. For more information, you may also want to consult the open-source Spark 3.2.0 Release Notes.

These release notes contain only Hewlett Packard Enterprise specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Spark Version	3.2.0.200
Release Date	May 2024
HPE Version Interoperability	See Component Versions for Released EEPs on page 5750 and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/spark
GitHub Release Tag	3.2.0.200-eep-812
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names.

IMPORTANT:

- Beginning with EEP 6.0.0, the KeyStore and TrustStore password can be removed from `spark-defaults.conf` and set in `/opt/mapr/conf/ssl-client.xml`.
- Beginning with Core 6.2 and EEP 7.0, Spark supports SSL for WebUI.

Hive Support

- Starting from Spark 3.1.2, Spark supports Hive 2.3.

New in This Release

For a complete list of new features, see the open-source Spark 3.2.0 Release Notes.

- Bug fixes.

Fixes

This HPE release includes the following new fixes since the latest Spark release. For details, refer to the commit log for this project in GitHub.

GitHub Commit	Date (YYYY-MM-DD)	Comment

12aa8af	15/05/2023	MapR [SPARK-1181] View creation fail with "Caused by: java.lang.NumberFormatException: For input string: "${pom"""

Known Issues and Limitations

- When you enable the SSL in a mixed (FIPS and non-FIPS) configuration, Spark application run fails. To run Spark applications, set `spark.ssl.ui.enabled` option to `false` in `spark-defaults.conf` configuration file.
- If you are using Spark SQL with Derby database without Hive or Hive Metastore installation, you will see the Java Runtime Exception. See Apache Spark Feature Support on page 4607 for workaround. Spark 3.1.2 does not support `log4j1.2` logging on HPE Ezmeral Data Fabric.

last-updated: Jun 06, 2024

Resolved Issues

- None.

Spark 3.2.0.0 - 2201 (EEP 8.1.0) Release Notes

This section provides reference information, including new features, patches, and known issues for Spark 3.2.0.0.

The notes below relate specifically to the Hewlett Packard Enterprise Distribution for Apache Hadoop. For more information, you may also want to consult the open-source Spark 3.2.0 Release Notes.

These release notes contain only Hewlett Packard Enterprise specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

NOTE: Spark 3.2.0 runs on Java 11, Scala 2.12, Python 3.6+ and SparkR 3.5+.

Spark Version	3.2.0.0
Release Date	January 2022
HPE Version Interoperability	See Component Versions for Released EEPs on page 5750 and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/spark
GitHub Release Tag	3.2.0.0-eep-810
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names.

IMPORTANT:

- Beginning with EEP 6.0.0, the KeyStore and TrustStore password can be removed from `spark-defaults.conf` and set in `/opt/mapr/conf/ssl-client.xml`.
- Beginning with EEP 6.0.0, after an upgrade, the previous version's configuration files are saved in the `/opt/mapr/spark` directory.
- MapR 6.1.0 with EEP 6.0.0 and later support simplified security. If you enable security on your data-fabric cluster, HPE scripts automatically configure Spark security features.
- Beginning with Core 6.2 and EEP 7.0, Spark supports SSL for WebUI.

Hive Support

- Starting from Spark 3.1.2, Spark supports Hive 2.3.

Delta Lake Support

Spark 3.2.0 provides Delta Lake support on HPE Ezmeral Data Fabric. See Apache Spark Feature Support on page 4607.

New in This Release

- For a complete list of new features, see the open-source Spark 3.2.0 Release Notes.

last-updated: Jun 06, 2024

Fixes

This HPE release includes the following new fixes since the latest Spark release. For details, refer to the commit log for this project in GitHub.

f951c10	2021/12/28	MapR [SPARK-975] Spark CVE fixes for Jan 2022 release
0c07103	2021/12/30	MapR [SPARK-921] Replace sudo command with maprexecute in Spark
6a38156	2021/12/30	MapR [SPARK-984] Select from temp view which was created under orc df fails
279f325	2022/01/11	MapR [SPARK-965] Spark Structured Streaming application fails when need to recovery from checkpoint
6060b6c	2022/01/14	MapR [SPARK-994] Update jackson-mapper-asl v1.9.13 to 1.9.13-atlassian-5

last-updated: Jun 06, 2024

1636a6e	2022/01/17	MapR [SPARK-992] STS doesn't work on cluster with enabled FIPS
1661404	2022/01/18	MapR [SPARK-995] Write to parquet fails.
5b4c35f	2022/01/25	MapR [SPARK-1001] Update log4j v1 to the 1.3.1-mapr
a919353	2022/01/25	MapR [SPARK-1002] Spark WebUI not work on FIPS cluster
5fa1feb	2022/01/28	MapR [SPARK-1000] Spark's -Djava.library.path misses hadoop native libs

Known Issues and Limitations

- The JDBC driver for Microsoft SQL Server does not support WITH CTE query on Spark.
- When you enable the SSL in a mixed (FIPS and non-FIPS) configuration, Spark application run fails. To run Spark applications, set `spark.ssl.ui.enabled` option to `false` in `spark-defaults.conf` configuration file.
- If you are using Spark SQL with Derby database without Hive or Hive Metastore installation, you will see the Java Runtime Exception. See Apache Spark Feature Support on page 4607 for workaround. Spark 3.2.0 does not support `log4j1.2` logging on HPE Ezmeral Data Fabric.
- HPE Ezmeral Data Fabric does not support GPU aware scheduling feature on Spark 3.2.0. See Apache Spark Feature Support on page 4607.

Resolved Issues

- None.

Spark 3.1.2.0 - 2110 (EEP 8.0.0) Release Notes

This section provides reference information, including new features, patches, and known issues for Spark 3.1.2.0.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop. For more information, you may also want to consult the open-source Spark 3.1.2 Release Notes.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Spark Version	3.1.2.0
Release Date	October 2021
MapR Version Interoperability	See Component Versions for Released EEPs on page 5750 and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/spark
GitHub Release Tag	3.1.2.0-eep-800
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names.

last-updated: Jun 06, 2024

IMPORTANT:

- Beginning with EEP 6.0.0, the KeyStore and TrustStore password can be removed from `spark-defaults.conf` and set in `/opt/mapr/conf/ssl-client.xml`.
- Beginning with EEP 6.0.0, after an upgrade, the previous version's configuration files are saved in the `/opt/mapr/spark` directory.
- MapR 6.1.0 with EEP 6.0.0 and later support simplified security. If you enable security on your data-fabric cluster, HPE scripts automatically configure Spark security features.
- Beginning with Core 6.2 and EEP 7.0, Spark supports SSL for WebUI.

Hive Support

- Starting from Spark 3.1.2, Spark supports Hive 2.3.

Delta Lake Support

Starting from EEP 8.0.0, Delta Lake support is available for Apache Spark 3.1.2 on HPE Ezmeral Data Fabric. See Apache Spark Feature Support on page 4607.

New in This Release

- For a complete list of new features, see the open-source Spark 3.1.2 Release Notes.

Fixes

This HPE release includes the following new fixes since the latest Spark release. For details, refer to the commit log for this project in GitHub.

GitHub Commit Number	Date (YYYY/MM/DD)	HPE Fix Number and Description
22b57ce	2021/07/29	MapR [SPARK-811] Updating to Spark 3.x
bfd5a1a	2021/07/29	MapR [SPARK-839] Unstable problem with security keys for job on yarn-cluster mode
9045b8f	2021/07/29	[SPARK-32723][WEBUI] Upgrade to jQuery 3.5.1
c4c0808	2021/07/29	MapR [SPARK-843] Improve logging for SSL certs generation
3cf3522	2021/07/29	MapR [SPARK-847] Spark can't read data from symlink
2f6cbe1	2021/07/29	MapR [SPARK-846] Add service verifier to Spark package
f11cc5a	2021/07/29	MapR [SPARK-861] Error logs in spark-historyserver
711eb00	2021/07/29	MapR [SPARK-863] Interaction with HBase via hbase spark connector fails
bd65fe6	2021/07/29	MapR [SPARK-841] Backport SPARK-32723

ac7871c	2021/09/10	MapR [SPARK-934] Spark and Livy jobs fail on core 7.0.0 with encrypted ssl password
a6b59d0	2021/09/20	MapR [SPARK-943] Spark 3 and S3 integration fails
4a04f88	2021/09/20	MapR [SPARK-945] Components can't read keyPassword
a5cb0b8	2021/09/21	MapR [SPARK-894] Hadoop artifacts should be taken from the cluster
e8c8667	2021/09/22	MapR [SPARK-946] Excessive warning messages in spark-shell
715edb7	2021/09/22	MapR [SPARK-947] Error when using Spark SQL with derby db

Known Issues

- If you are using Spark SQL with Derby database without Hive or Hive Metastore installation, you will see the Java Runtime Exception. See Apache Spark Feature Support on page 4607 for workaround. Spark 3.1.2 does not support `log4j1.2` logging on HPE Ezmeral Data Fabric.
- HPE Ezmeral Data Fabric does not support GPU aware scheduling feature on Spark 3.1.2. See Apache Spark Feature Support on page 4607.

Resolved Issues

- None.

Spark 2.4.7.200 - 2201 (EEP 7.1.2) Release Notes

This section provides reference information, including new features, patches, and known issues for Spark 2.4.7.100.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Hadoop. For more information, you may also wish to consult the open-source Spark 2.4.7 Release Notes.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Spark Version	2.4.7.200
Release Date	March 2022
MapR Version Interoperability	See Component Versions for Released EEPs on page 5750 and EEP Components and OS Support on page 5734.
Source on GitHub	https://github.com/mapr/spark
GitHub Release Tag	2.4.7.200-mapr-712
Maven Artifacts	https://repository.mapr.com/maven/

Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP and OS to view the list of package names.

IMPORTANT:

- Beginning with EEP 6.0.0, the keyStore and trustStore password can be removed from `spark-defaults.conf` and set in `/opt/mapr/conf/ssl-client.xml`.
- Beginning with EEP 6.0.0, after an upgrade, the previous version's configuration files are saved in the `/opt/mapr/spark` directory.
- MapR 6.1.0 with EEP 6.0.0 and later support simplified security. If you enable security on your data-fabric cluster, HPE scripts automatically configure Spark security features.
- Beginning with Core 6.2 and EEP 7.0, Spark supports SSL for WebUI.

Hive Support

This version of Spark supports integration with Hive, but has the following exceptions:

- Hive-on-Spark is not supported.
- Spark-SQL is supported, but is not fully compatible with Hive. See the Apache Spark documentation and the Spark documentation for details.

New in This Release

- For a complete list of new features, see the open-source Spark 2.4.7 Release Notes.
- Service verifier

Fixes

This HPE release includes the following new fixes since the latest data-fabric Spark release. For details, refer to the commit log for this project in GitHub.

GitHub Commit Number	Date (YYYY/MM/DD)	HPE Fix Number and Description
54fc6c7	29/12/2021	MapR [SPARK-975] Spark CVE fixes for Jan 2022 release
cd2d2c0	06/01/2022	MapR [SPARK-986] log4j-1.2.17.jar vulnerability:CVE-2019-17571
4ab6ab0	14/01/2022	MapR [SPARK-994] Update jackson-mapper-asl v1.9.13 to 1.9.13-atlassian-5
0e59d27	25/01/2022	MapR [SPARK-1001] Update log4j v1 to the 1.3.1-mapr

Known Issues

- If you are using Spark SQL with Derby database without Hive or Hive Metastore installation, you will see the Java Runtime Exception. See Apache Spark Feature Support on page 4607 for workaround. Spark does not support `log4j1.2` logging on HPE Ezmeral Data Fabric.
- SPARK-865: If you run a `configure.sh` command to configure HBase after Spark configuration, then you must manually copy the `hbase-site.xml` configuration file from the HBase configuration directory to the Spark configuration directory.

Resolved Issues

- None.

Sqoop Release Notes

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

The release notes for the Sqoop component (included in the MapR Converged Data Platform) contain notes specific to MapR only. More details are available on the Apache Sqoop Project page.

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734. To view release notes for prior MapR releases, see Previous Versions on page 6194.

Sqoop 1.4.7 - 2110 (EEP 8.0.0) Release Notes

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Sqoop. You may also be interested in the Apache Sqoop changelog and the Apache Sqoop home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes.

Version	1.4.7
Release Date	October 2021
HPE Version Interoperability	See EEP Components and OS Support
Source on GitHub	https://github.com/mapr/sqoop
GitHub Release Tag	1.4.7.100-eep-800
Maven Artifacts	http://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.

New in This Release

Sqoop 1.4.7 - 2110 introduces the following enhancements or HPE platform-specific behavior changes:

- None.

Fixes

This HPE release includes the following fixes on the base release:

Commit	Date (YYYY-MM-DD)	Comment
e226e3a	2021-05-27	SQOOP-105: Fix FileSystemCounters counter variable in the ImportJobBase class

last-updated: Jun 06, 2024

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

.

Sqoop 1.4.7 - 2201 (EEP 7.1.2) Release Notes

IMPORTANT: This component is deprecated. Hewlett Packard Enterprise recommends using an alternate product. Deprecated components are either in maintenance or have reached the end of their maintenance lifecycle. For more information, see Discontinued Ecosystem Components on page 5748.

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Sqoop. You may also be interested in the Apache Sqoop 1.4.7 changelog or the Apache Sqoop project homepage.

Version	1.4.7
Release Date	March 2022
HPE Version Interoperability	See MEP Components and OS Support
Source on GitHub	https://github.com/mapr/sqoop
GitHub Release Tag	1.4.7.50-mapr-712
Maven Artifacts	http://repository.mapr.com/maven/
Package Names	SeePackage Names for MapR Ecosystem Packs (EEPs)

New in This Release

Sqoop 1.4.7 - 2201 introduces the following enhancements or HPE platform-specific behavior changes:

- Bug fixes and updates but no significant new features.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
361bfc15	2022-01-25	SQOOP-122: Updated log4j v1 to the 1.3.1-mapr
5de95389	2022-01-20	SQOOP-121: Updated Log4j due CVE-2019-17571
ee9d6d56	2021-11-24	SQOOP-111: Excluded unused dependencies with vulnerabilities
f698c49e	2021-11-24	SQOOP-115: Updated jackson2 dependencies to 2.11.1 version
05323b1f	2021-11-24	SQOOP-114: Updated postgresql to 42.2.13 version
783521bf	2021-11-24	SQOOP-113: Updated accumulo-master to 2.0.1 version

last-updated: Jun 06, 2024

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
35c0accd	2021-11-24	SQOOP-112: Updated commons-compress to 1.21 version

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

- None.

Resolved Issues

- None.

Tez Release Notes

The release notes for the Tez component contain notes specific to MapR software only.

NOTE: To identify the EEP to which a specific release note belongs, see EEP Release Notes on page 5804. To see which operating systems support the ecosystem components in a specific EEP, see EEP Components and OS Support on page 5734. To view release notes for prior MapR releases, see Previous Versions on page 6194.

Tez 0.10.2.400 - 2401 (EEP 9.2.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Tez. You may also be interested in the Apache Tez changelog and the Apache Tez home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	0.10.2.400
Release Date	January 2024
Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	Not applicable
GitHub Release Tag	0.10.2.400-eep-921
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.

New in This Release

Tez 0.10.2.400 - 2401 is a defect-repair release. This release provides:

- CVE fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description

8f435751f	2023-12-07	EEP-TEZ-289: Update Guava to 32.1.3 to address CVE-2023-2976
890dd410e	2023-10-27	EEP-TEZ-293: Prepare Tez for EEP-921 development
9e33a5df8	2023-10-20	EEP-TEZ-279: Throw WARN instead of just failing in Tez configure.sh if user under-configured Tez on the Installation & configuration stage.
c384013dc	2023-09-14	EEP-TEZ-291: TEZ builds fail as 'StateMachineTez is not abstract and does not override abstract method getPreviousState()'

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

Tez does not work with TLS version 2. To enable the Tez UI, follow the steps in Configuring ATS 1.0 or 1.5 for Hadoop 3.3 on page 4731.

Resolved Issues

None.

Tez 0.10.2.300 - 2307 (EEP 9.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Tez. You may also be interested in the Apache Tez changelog and the Apache Tez home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	0.10.2.300
Release Date	July 2023
Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	Not applicable
GitHub Release Tag	0.10.2.300-eep-912
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.

New in This Release

Tez 0.10.2.300 - 2307 is a defect-repair release. This release provides:

- CVE fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description

e9e61abba	2023-06-26	EEP-TEZ-287: Vulnerability - CVE-2023-24998
8747c96da	2023-06-26	EEP-TEZ-286: Upgrade internal dependencies and update artifact name for EEP-912
c57c9bf69	2023-05-23	EEP-TEZ-179: The Catalina server contains duplicate libs and classes
60fa01a06	2023-05-04	EEP-TEZ-283: Update jackson to 1.9.14-atlassian-6
1bb3056cd	2023-05-02	EEP-TEZ-282: Update Bower Registry to a different mirror

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

Tez does not work with TLS version 2. To enable the Tez UI, follow the steps in Configuring ATS 1.0 or 1.5 for Hadoop 3.3 on page 4731.

Resolved Issues

None.

Tez 0.10.2.200 - 2304 (EEP 9.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Tez. You may also be interested in the Apache Tez changelog and the Apache Tez home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	0.10.2.200
Release Date	April 2023
Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	Not applicable
GitHub Release Tag	0.10.2.200-eep-911
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.

New in This Release

Tez 0.10.2.200 - 2304 is a defect-repair release. This release provides:

- CVE fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description

27ce18f95	2023-03-29	Change protocol in Tomcat installation URL
d86f9177f	2023-03-27	EEP-TEZ-276: Update protobuf-java version to 3.21.12
0c11404ac	2023-02-20	EEP-TEZ-274: Wrong version of apache-tomcat specified in warden.tezui.conf.template
865cba1c3	2023-02-20	EEP-TEZ-275: Upgrade project version to 0.10.2.200-eep-911 and use EEP-911 versions for internal components

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

Tez does not work with TLS version 2. To enable the Tez UI, follow the steps in Configuring ATS 1.0 or 1.5 for Hadoop 3.3 on page 4731.

Resolved Issues

None.

Tez 0.10.2.100 - 2301 (EEP 9.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Tez. You may also be interested in the Apache Tez changelog and the Apache Tez home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	0.10.2.100
Release Date	January 2023
Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	Not applicable
GitHub Release Tag	0.10.2.100-eep-910
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.

New in This Release

Tez 0.10.2.100 - 2301 is a defect-repair release. This release provides:

- CVE fixes
- Bug fixes

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description

43e2a0bc9	2023-01-03	MAPR-TEZ-142: Changed value of Content-Security-Policy header for fixing TezUI.
1d58b7dfd	2022-12-29	EEP-TEZ-269: Unable to start apache-tomcat-9.0.70: NoClassDefFoundError: javax/ws/rs/core/Application
fb5ea3add	2022-12-21	EEP-TEZ-268: netty-codec-haproxy vulnerabilities
86f9ee4de	2022-12-19	EEP-TEZ-264: jettison vulnerabilities
3a8d46f9b	2022-12-19	EEP-TEZ-266: tomcat-coyote vulnerabilities
8308dc318	2022-12-19	EEP-TEZ-265: commons-text vulnerabilities
115ca2623	2022-12-19	TEZ-4449: Upgrade jettison to 1.5.1 to fix CVE-2022-40149. (#242) (fanshilun reviewed by Laszlo Bodor)
4c6f119c4	2022-12-07	EEP-TEZ-259: [Tez]Update protobuf-java version to 3.21.9

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

Tez does not work with TLS version 2. To enable the Tez UI, follow the steps in Configuring ATS 1.0 or 1.5 for Hadoop 3.3 on page 4731.

Resolved Issues

None.

Tez 0.10.2 - 2210 (EEP 9.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Tez. You may also be interested in the Apache Tez changelog and the Apache Tez home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	0.10.2
Release Date	October 2022
Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	Not applicable
GitHub Release Tag	0.10.2.0-eep-900
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.

New in This Release

Tez 0.10.2 - 2210 is a defect-repair release.

last-updated: Jun 06, 2024

Fixes

None. This is the first release of the 0.10.x line. All previous solutions from 0.9.x have been backported to the current release. For additional information, see the Apache release note.

Known Issues and Limitations

Tez does not work with TLS version 2. To enable the Tez UI, follow the steps in Configuring ATS 1.0 or 1.5 for Hadoop 3.3 on page 4731.

Resolved Issues

None.

Tez 0.9.2.500 - 2305 (EEP 8.1.1) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Tez. You may also be interested in the Apache Tez changelog and the Apache Tez home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	0.9.2.500
Release Date	May 2023
Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	Not applicable
GitHub Release Tag	0.9.2.500-eep-811

Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.

New in This Release

Tez 0.9.2.500 - 2305 is a defect-repair release. This release provides:

- Bug fixes.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
94bf9449fa	2023-05-10	EEP-TEZ-284: Vulnerability (CVE-2022-42252) for tomcat in core 6.2
438b1dc34	2023-05-04	EEP-TEZ-283: Update jackson to 1.9.14-atlassian-6
172e2bcaf	2023-05-02	EEP-TEZ-282: Update Bower Registry to a different mirror
c8f641bb2	2023-05-02	EEP-TEZ-280: Update Jetty to 9.4.51.v20230217
c553a9ad4	2023-05-02	EEP-TEZ-281: Update Guava to 31.1-jre

ed694080a	2023-03-29	Change protocol in Tomcat installation URL
edb087d05	2023-03-27	EEP-TEZ-276: Update protobuf-java version to 3.21.12
1d4353517	2022-12-02	TEZ-4411: Update FileSaver dependency (#206) (Nikhil Gupta reviewed by Laszlo Bodor, Deependra Patel)
66fe997d6	2022-04-16	EEP-TEZ-221: inconsistent result of running /bin/monitor.sh to get the current state of Tez UI process
6eb908e37	2022-04-05	EEP-TEZ-220: [00107023] Tez-UI does not start using warden script template
8a2c3af8c	2022-03-14	EEP-TEZ-218: Update vulnerable jars based on CVEs Inquiry from customer

For complete details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

None.

Resolved Issues

None.

Tez 0.9.2 - 2201 (EEP 8.1.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Tez. You may also be interested in the Apache Tez changelog and the Apache Tez home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	0.9.2
Release Date	January 2022
Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	Not applicable
GitHub Release Tag	0.9.2.400-eep-810
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.

New in This Release

Tez 0.9.2 - 2201 is a defect-repair release.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Data (YYYY-MM-DD)	HPE Fix Number and Description
f5c03c004	2022-01-25	EEP-TEZ-215: Upgrade Log4J version to '1.3.1-mapr'
32dfb6f5a	2021-12-23	EEP-TEZ-208: CVE-2019-10744, CVE-2020-8203, CVE-2021-23337 : lodash-*.js
1cadfeed3	2021-12-23	EEP-TEZ-210: CVE-2021-25329: tomcat-catalina-9.0.36.jar & CVE-2020-13934, CVE-2020-17527, CVE-2021-25122, CVE-2021-41079: tomcat-coyote-9.0.36.jar
24fe8da63	2021-12-23	EEP-TEZ-213: log4j-1.2.17.jar vulnerability: CVE-2019-17571
6f5bfee01	2021-12-17	EEP-TEZ-209: High: WS-2020-0408 ; 3 Medium: CVE-2021-21290: netty*.jar
e0f57eec9	2021-12-10	EEP-TEZ-207: CVE-2019-10172, CVE-2019-10202: jackson-mapper-asl-1.9.13.jar
56d130d53	2021-12-06	EEP-TEZ-212: Upgrade Jetty to 9.4.44.v20210927 to sync with Hadoop
21d777f71	2021-11-23	EEP-TEZ-211: Hive on Tez job failed for core 7 with FIPS enabled. Can't find HmacSHA1 algorithm.
97da9f716	2021-11-23	EEP-TEZ-205: Update hadoop version to 2.7.6.200-eep-810-SNAPSHOT
27b2b96f3	2021-10-08	MAPR-TEZ-203: Backport Apache Jira TEZ-3951 and add timeout logic for cancellation

For details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

None.

Resolved Issues

None.

Tez 0.9.2 - 2110 (EEP 8.0.0) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Tez. You may also be interested in the Apache Tez changelog and the Apache Tez home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	0.9.2
Release Date	October 2021
Version Interoperability	See EEP Components and OS Support on page 5734

Source on GitHub	https://github.com/mapr/tez
GitHub Release Tag	0.9.2.300-eep-800
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.

New in This Release

Tez 0.9.2 - 2110 introduces the following enhancements or HPE platform-specific behavior changes:

None.

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Data (YYYY-MM-DD)	HPE Fix Number and Description
c4e33daed	2021-09-03	MAPR-TEZ-201: Update the maven artifact version strings to eep.
c98eef1fd	2021-08-17	MAPR-TEZ-200: Change project version from 0.9.2-mapr-SNAPSHOT to 0.9.2.0-mapr-SNAPSHOT for development artifacts.
c2264efc9	2021-08-09	MAPR-TEZ-199: Update Hadoop version to 2.7.6.0-mapr-720-SNAPSHOT.
93a750b7e	2021-07-26	MAPR-TEZ-172: Add Hbase jars to maprfs:/apps/tez/tez-0.9/hbase during Tez configuration via configure.sh.

For details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

None.

NOTE: In the previous release note (Tez 0.9.2), MAPR-TEZ-172 was part of the known issues. In this release, MAPR-TEZ-172 has been fixed, and the commit reference is 93a750b7e.

Resolved Issues

None.

Tez 0.9.2 - 2201 (EEP 7.1.2) Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Distribution for Apache Tez. You may also be interested in the Apache Tez changelog and the Apache Tez home page.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

27b2b96f3	2021-10-08	MAPR-TEZ-203: Backport Apache Jira TEZ-3951 and add timeout logic for cancellation
c4e33daed	2021-09-03	MAPR-TEZ-201: Update the maven artifact version strings to eep.

c98eef1fd	2021-08-17	MAPR-TEZ-200: Change project version from 0.9.2-mapr-SNAPSHOT to 0.9.2.0-mapr-SNAPSHOT for development artifacts.
c2264efc9	2021-08-09	MAPR-TEZ-199: Update Hadoop version to 2.7.6.0-mapr-720-SNAPSHOT.
93a750b7e	2021-07-26	MAPR-TEZ-172: Add Hbase jars to maprfs:/apps/tez/tez-0.9/hbase during Tez configuration via configure.sh. **NOTE:** In Tez 0.9.2 - 2201 (EEP 8.1.0) Release Notes on page 6113, MAPR-TEZ-172 was included in the known issues. In this release, the issue has been fixed, and the commit reference is 93a750b7e.

Known Issues and Limitations

None.

Resolved Issues

None.

Zeppelin Release Notes (Package-Based)

The release notes for the Zeppelin component contain notes specific to the Data Fabric product release of Zeppelin. These release notes support the package-based Zeppelin component and specifically Zeppelin 0.9 and later.

Zeppelin 0.10.1.100 - 2307 Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution of Apache Zeppelin. You may also be interested in the Apache Zeppelin project homepage and the following Apache Zeppelin changelog.

Version	0.10.1.100
Release Date	July 2023
Version Interoperability	See EEP Components and OS Support on page 5734
Source on GitHub	Zeppelin: https://github.com/mapr/zeppelin
GitHub Release Tag	Zeppelin: 0.10.1.100-eep-912
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.
Documentation	See Zeppelin on page 4736.

New in this Release

None.

last-updated: Jun 06, 2024

Fixes

This HPE release includes the following fixes on the base release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
a5d47cc	2023-06-22	MZEP-280 Fix issues with folder renaming, removing and restoring
70a39af	2023-06-30	MZEP-282 Update Simaba Drill JDBC Drivers in Zeppelin to the latest available
48d7363	2023-06-30	MZEP-281 Initial fix to run Zeppelin on Java 17

Known Issues and Limitations

- You cannot install the package-based Zeppelin by using the Installer. You must install Zeppelin using the manual steps.

Zeppelin 0.10.1.0 - 2210 Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution of Apache Zeppelin. You may also be interested in the Apache Zeppelin project homepage and the following Apache Zeppelin changelog.

Version	0.10.1.0
Release Date	October 2022
Version Interoperability	See EEP 9.0.0 Components and OS Support on page 5741
Source on GitHub	Zeppelin: https://github.com/mapr/zeppelin
GitHub Release Tag	Zeppelin: 0.10.1.0-eep-900
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/ and select your EEP (MEP) and OS to view the list of package names.
Documentation	See Zeppelin on page 4736.

New in this Release

Zeppelin is distributed as an RPM or DEB package and is included in the EEP 9.0.0 release. This is the first release of the Zeppelin component as a package within the HPE Ezmeral Ecosystem Pack. Zeppelin 0.10.1.0:

- Adds support for Spark 3.3.0.
- Adds HBase support.

Fixes

- None.

New Features and Enhancements

The following describes enhancements and new features included with this release.

- Package-based installation.
- Support for Apache Zeppelin 0.10.1 features
- Built with support for Java 11 and Hadoop 3
- Improved support of Kerberos security
- Pig interpreter is removed from the EEP distribution
- Helium plugins browser is now configured to use the upstream Helium plugins repository rather than using a snapshot of that repository

Known Issues and Limitations

- You cannot install the package-based Zeppelin by using the Installer. You must install Zeppelin using the manual steps.

Zeppelin 0.9.0.100 - 2212 Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric distribution of Apache Zeppelin. You may also be interested in the Apache Zeppelin project homepage and the Apache Zeppelin changelog.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes.

Version	0.9.0.100
Release Date	December 2022
HPE Version Interoperability	See EEP Components and OS Support
Source on GitHub	Zeppelin: https://github.com/mapr/zeppelin
GitHub Release Tag	0.9.0.100-mapr-640
Maven Artifacts	https://repository.mapr.com/maven/
Package Names	Navigate to https://package.ezmeral.hpe.com/releases/MEP/, and select the appropriate EEP (MEP) and OS to view the list of package names.

Zeppelin is distributed as a Linux package and is included in the EEP 6.4.0 release.

New in this Release

This is the first release of the Zeppelin component as a package that is included in the HPE Ezmeral ecosystem pack.

Zeppelin is now compatible with Spark 2.4.8.

Fixes

This HPE release includes the following fixes on the base Apache release:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
4cfc997	2022-10-14	MZEP-271: Improve Kerberos support

For complete details, refer to the commit log for this project in GitHub.

last-updated: Jun 06, 2024

Known Issues and Limitations

You cannot install the package-based Zeppelin by using the Installer. You must install Zeppelin using the manual steps.

Ecosystem Pack (EEP) Reference

This section contains links to information that is specific to a given EEP.

Note that the *MapR Ecosystem Pack (MEP)* has been renamed as the *Ezmeral Ecosystem Pack (EEP)*. For more information about HPE Ezmeral Data Fabric terminology, see Documentation Enhancements in What's New in Release 7.7 on page 30.

EEP 9.2.2 Reference Information

This section contains links to release notes and other reference information for EEP 9.2.2.

What's New in EEP 9.2.2

Summarizes the new features and product updates in Ecosystem Pack (EEP) 9.2.2.

EEP 9.2.2 can be used with releases:

- 7.7.0
- 7.6.1
- 7.5.0
- 7.4.0
- 7.3.0 (requires a patch)
- 7.2.0 (requires a patch)

For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

last-updated: Jun 06, 2024

EEP 9.2.2 Version Updates

EEP 9.2.2 provided significant updates to some components. Other components received minor updates. The following table summarizes the significant version updates for EEP 9.2.2:

Component	EEP 9.2.1 Version	EEP 9.2.2 Version
Airflow	2.7.3.0	2.8.3.0
Collectd	5.12.0.600	5.12.0.650
DAG	6.2.0.0	6.3.0.0
Elasticsearch	6.8.8.700	6.8.8.750
Fluentd	1.10.3.600	1.10.3.650
Grafana	7.5.10.500	7.5.10.550
Hadoop	3.3.5.200	3.3.5.300
HBase	1.4.14.600	1.4.14.700
Hive	3.1.3.500	3.1.3.550
Hue	4.11.0.0	4.11.0.100
NiFi	1.19.1.0	1.19.1.100
Kafka Streams	2.6.1.700	2.6.1.750
Kafka Connect JDBC	10.0.1.400	10.0.1.500
OpenTSDB	2.4.1.510	2.4.1.600

To compare the versions of various components in different EEPs, see Component Versions for Released EEPs on page 5750.

The following components are unchanged for EEP 9.2.2:

- AsyncHBase 1.8.2
- Ezotelcol 0.80.0.39
- Monitoring components:
  - Kibana 6.8.8.600
- Ranger 2.4.0.0
- Streams clients:
  - HPE Ezmeral Data Fabric Streams C Client 0.11.3
  - HPE Ezmeral Data Fabric Streams Python Client 0.11.3
  - HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3
- KSQL 6.0.0.400
- Kafka Connect HDFS 10.0.0.500
- Kafka Connect 10.0.0.500
- Kafka REST Proxy 6.0.0.400
- Zeppelin 0.10.1.100

last-updated: Jun 06, 2024

Airflow 2.8.3.0

EEP 9.2.2 updated Airflow to version 2.8.3.0 and introduced two new options:

- `admin_only_cli_access` – Disables impersonation functionality.
- `admin_cli_with_impersonation` – Limits Airflow CLI access to only the admin cluster user.

See Airflow 2.8.3.0 - 2404 (EEP 9.2.2) Release Notes on page 5829.

Collectd 5.12.0.650

EEP 9.2.2 updated Collectd to version 5.12.0.650. See What's New in EEP 9.2.2 on page 6120.

DAG 6.3.0.0

EEP 9.2.2 updated Data Access Gateway to version 6.3.0.0, incorporating several CVE fixes. See Data Access Gateway 6.3 Release Notes on page 5839.

Elasticsearch 6.8.8.750

EEP 9.2.2 updated Elasticsearch to version 6.8.8.750. See What's New in EEP 9.2.2 on page 6120.

Fluentd 1.10.3.650

EEP 9.2.2 updated Fluentd to version 1.10.3.650. See What's New in EEP 9.2.2 on page 6120.

Grafana 7.5.10.550

EEP 9.2.2 updated Grafana to version 7.5.10.550. See What's New in EEP 9.2.2 on page 6120.

Hadoop 3.3.5.300

EEP 9.2.2 updated Hadoop to version 3.3.5.300, providing numerous CVE and bug fixes. See Hadoop 3.3.5.300 - 2404 (EEP 9.2.2) Release Notes on page 5867.

HBase 1.4.14.700

EEP 9.2.2 updated HBase to version 1.4.14.700, providing numerous CVE and bug fixes.. See HBase 1.4.14.700 - 2404 (EEP 9.2.2) Release Notes on page 5892.

Hive 3.1.3.550

EEP 9.2.2 updated Hive to version 3.1.3.550. See Hive 3.1.3.550 - 2404 (EEP 9.2.2) Release Notes on page 5911.

Hue 4.11.0.100

EEP 9.2.2 updated Hue to version 4.11.0.100. See Hue 4.11.0.100 - 2404 (EEP 9.2.2) Release Notes on page 5961.

NiFi 1.19.1.100

EEP 9.2.2 updated NiFi to version 1.19.1.100 and provided numerous bug fixes. See NiFi 1.19.1.100 - 2404 (EEP 9.2.2) Release Notes on page 6053.

Kafka Streams 2.6.1.750

EEP 9.2.2 updated Kafka Streams to version 2.6.1.750. See Kafka Streams 2.6.1.750 - 2404 (EEP 9.2.2) Release Notes on page 5983.

Kafka Connect JDBC 10.0.1.500

EEP 9.2.2 updated Kafka Connect JDBC to version 10.0.1.500. See Kafka Connect JDBC 10.0.1.500 - 2404 (EEP 9.2.2) Release Notes on page 6017.

OpenTSDB 2.4.1.600

EEP 9.2.2 updated OpenTSDB to version 2.4.1.600. See What's New in EEP 9.2.2 on page 6120.

Support for RHEL 9 and Ubuntu 22.04

EEP 9.2.2 added support for RHEL 9 and Ubuntu 22.04 for all components. For OS version support, see Operating System Support Matrix on page 5719.

Support for JDK 11 and JDK 17

EEP 9.2.2 and core 7.7.0 can be used with JDK 11 or JDK 17. However, Installer 1.18.0.6 is not supported on JDK 17. Therefore, installations of or upgrades to EEP 9.2.2 and core 7.7.0 must be performed manually. See Java Support Matrix on page 5764 and Installer Updates on page 5674.

Using the monitoring components with JRE or JDK 17 is supported in EEP 9.2.0 or later.

Discontinued Components

The following components are present in earlier ecosystem packs but are not included in EEP 9.2.2:

- Flume
- Oozie
- Pig
- S3 Gateway
- Sqoop

For more information, see Discontinued Ecosystem Components on page 5748.

Installer Support for EEP 9.2.2

Installer 1.18.0.6 supports EEP 9.2.2 and previously released EEPs. For a list of the EEPs that are supported by different versions of the Installer, see Installer EEP Support on page 5773.

Installer 1.18.0.6 is not supported for use with JDK 17. In addition, Installer 1.18.0.x cannot be used with older versions of Ubuntu. For more information, see Selecting an Installer Version to Use on page 5587.

EEP Upgrades

If your cluster is running EEP 8.0.0 or 8.1.0, you can upgrade to Ecosystem Pack 9.x.x.

For information about upgrading EEPs, see:

- Checking the EEP Version on page 5598
- EEP Support and Lifecycle Status on page 5728
- Upgrading Ecosystem Packs on page 346
- Applying a Patch for an Ecosystem Component on page 481

For information about upgrading to core 7.7.0 and EEP 9.2.2, see:

- Installation Notes (Release 7.7) on page 34

- Upgrade Notes (Release 7.7) on page 37

EEP 9.2.2 Ecosystem Components and Release Notes

For a list of the EEP 9.2.2 components and their release notes, see Ecosystem Pack 9.2.2 Release Notes on page 5804.

EEP 9.2.2 Ecosystem JDK / JRE Support

Summarizes JDK and JRE build and run information for EEP 9.2.2 Data Fabric ecosystem components.

The "Different from Open-Source Equivalent" column highlights that while some open-source components are built with JDK 8, the Data Fabric component is built with JDK 11 and will only run on JRE 11 or JRE 17.

Ecosystem Components	Built Using JDK Version	Runs on JRE or JDK Version	Different from Open-Source Equivalent?
Airflow 2.7.3.0	Not a Java component		
AsyncHBase 1.8.2.0	8	8-11 and 17	Yes (OSS version compiles with Java 6)
Data Access Gateway 6.2.0.0	11	11 and 17	N/A
Drill 1.20.3.200	11	11 and 17	Yes
Hadoop 3.3.5.200	11	11 and 17	Yes
HBase 1.4.14.600	11	11 and 17	Yes
Hive 3.1.3.500	11	11 and 17	Yes
HttpFS 3.3.5.200	11	11 and 17	Yes
Hue 4.11.0.0	Not a Java component		
Kafka Client 2.6.1.600	11	11 and 17	Yes
Kafka Rest 6.0.0.400	11	11 and 17	Yes
Kafka Schema Registry 6.0.0.400	11	11 and 17	Yes
Kafka Connect HDFS 10.0.0.500	11	11 and 17	Yes
Kafka Connect JDBC 10.0.1.400	11	11 and 17	Yes
KSQL 6.0.0.400	11	11 and 17	Yes
Livy 0.8.0.0	11	11 and 17	Yes
NiFi 1.19.1.0	11	11 and 17	Yes
OTel	11	11 and 17	Yes
Ranger 2.4.0.0	11	11 and 17	Yes
Spark 3.3.3.0	11	11 and 17	Yes
Tez 0.10.2.300	11	11 and 17	Yes
Zeppelin 0.10.1.100	11	11 and 17	Yes
Monitoring Components			

last-updated: Jun 06, 2024

Ecosystem Components	Built Using JDK Version	Runs on JRE or JDK Version	Different from Open-Source Equivalent?
Collectd 5.12.0.600	11	11 and 17	Yes
Elasticsearch 6.8.8.600	12	11 and 17	No
Fluentd 1.10.3.500	N/A	N/A	N/A
Grafana 7.5.10.500	N/A	N/A	N/A
Kibana 6.8.8.600	N/A	N/A	N/A
OpenTSDB 2.4.1.510	11	11 and 17	Yes

Release History for EEPs on page 5788
This section shows the original release dates for all Ecosystem Packs (EEPs).

What's New in EEP 9.2.1

Summarizes the new features and product updates in Ecosystem Pack (EEP) 9.2.1.

EEP 9.2.1 can be used with releases:

- 7.6.1
- 7.5.0
- 7.4.0
- 7.3.0 (requires a patch)
- 7.2.0 (requires a patch)

For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

EEP 9.2.1 Versions and Features

EEP 9.2.1 provided significant updates to some components. Other components received minor updates. The following table summarizes the significant version updates for EEP 9.2.1:

last-updated: Jun 06, 2024

Component	EEP 9.2.0 Version	EEP 9.2.1 Version
Airflow	2.7.1.0	2.7.3.0
Drill	1.20.3.100	1.20.3.200
Hadoop	3.3.5.100	3.3.5.200
HBase	1.4.14.500	1.4.14.600
Hive	3.1.3.400	3.1.3.500
Livy	0.7.0.400	0.8.0.0
Spark	3.3.2.200	3.3.3.0
Kafka Streams	2.6.1.600	2.6.1.700
Kafka Schema Registry	6.0.0.400	6.0.0.500
Tez	0.10.2.300	0.10.2.400

To compare the versions of various components in different EEPs, see Component Versions for Released EEPs on page 5750.

The following components are unchanged for EEP 9.2.1:

- AsyncHBase 1.8.2
- Data Access Gateway 6.2.0.0
- Hue 4.11.0.0
- Monitoring components:
  - Collectd 5.12.0.600
  - Elasticsearch 6.8.8.600
  - Fluentd 1.10.3.500
  - Grafana 7.5.10.500
  - Kibana 6.8.8.600
  - OpenTSDB 2.4.1.510
- NiFi 1.19.1.0
- OTel 0.80.0.39
- Ranger 2.4.0.0
- Streams clients:
  - HPE Ezmeral Data Fabric Streams C Client 0.11.3
  - HPE Ezmeral Data Fabric Streams Python Client 0.11.3
  - HPE Ezmeral Data Fabric Streams C#/.NET 0.11.3
- KSQL 6.0.0.400
- Kafka Connect HDFS 10.0.0.500

last-updated: Jun 06, 2024

- Kafka Connect JDBC 10.0.1.400
- Kafka Connect 10.0.0.500
- Kafka REST Proxy 6.0.0.400
- Zeppelin 0.10.1.100

Airflow 2.7.3.0

EEP 9.2.1 updated Airflow to version 2.7.3.0. See Airflow 2.7.3.0 - 2401 (EEP 9.2.1) Release Notes on page 5830. EEP 9.2.1 also introduced support for connections to Hive with High Availability (HA) enabled. See Configuring Hook Connections for Hive High Availability on page 3904.

Drill 1.20.3.200

EEP 9.2.1 updated Drill to version 1.20.3.200. See Drill 1.20.3.200-2401 (EEP 9.2.1) Release Notes on page 5848.

Hadoop 3.3.5.200

EEP 9.2.1 updated Hadoop to version 3.3.5.200. See Hadoop 3.3.5.200 - 2401 (EEP 9.2.1) Release Notes on page 5868.

HBase 1.4.14.600

EEP 9.2.1 updated HBase to version 1.4.14.600. See HBase 1.4.14.600 - 2401 (EEP 9.2.1) Release Notes on page 5893.

Hive 3.1.3.500

EEP 9.2.1 updated Hive to version 3.1.3.500. For more information, see Hive 3.1.3.500 - 2401 (EEP 9.2.1) Release Notes on page 5912.

Livy 0.8.0.0

EEP 9.2.1 updated Livy to version 0.8.0.0. For more information, see Livy 0.8.0.0 - 2401 (EEP 9.2.1) Release Notes on page 5975.

Spark 3.3.3.0

EEP 9.2.1 updated Spark to version 3.3.3.0. For more information, see the Spark 3.3.3.0 (EEP 9.2.1) Release Notes on page 6080.

Kafka Streams 2.6.1.700

EEP 9.2.1 updated Kafka Streams to version 2.6.1.700. For more information, see the Kafka Streams 2.6.1.700 - 2401 (EEP 9.2.1) Release Notes on page 5984.

Kafka Schema Registry 6.0.0.500

EEP 9.2.1 updated Kafka Schema Registry to version 6.0.0.500. For more information, see the Kafka Schema Registry 6.0.0.500 - 2401 (EEP 9.2.1) Release Notes on page 6036.

Tez 0.10.2.400

EEP 9.2.1 updated Tez to version 0.10.2.400. For more information, see the Tez 0.10.2.400 - 2401 (EEP 9.2.1) Release Notes on page 6107.

Support for JDK 11 and JDK 17

EEP 9.2.1 and core 7.6.1 can be used with JDK 11 or JDK 17. However, Installer 1.18.0.5 is not supported on JDK 17. Therefore, installations of or upgrades to EEP 9.2.1 and core 7.6.1 must be performed manually. See Java Support Matrix on page 5764 and Installer Updates on page 5674.

Using the monitoring components with JRE or JDK 17 is now supported in EEP 9.2.0 or later.

Discontinued Components

The following components are present in earlier ecosystem packs but are not included in EEP 9.2.1:

- Flume
- Oozie
- Pig
- S3 Gateway
- Sqoop

For more information, see Discontinued Ecosystem Components on page 5748.

Installer Support for EEP 9.2.1

Installer 1.18.0.5 supports EEP 9.2.1 and previously released EEPs. For a list of the EEPs that are supported by different versions of the Installer, see Installer EEP Support on page 5773.

Installer 1.18.0.5 is not supported for use with JDK 17. In addition, Installer 1.18.0.x cannot be used with older versions of Ubuntu. For more information, see Selecting an Installer Version to Use on page 5587.

EEP Upgrades

If your cluster is running EEP 8.0.0 or 8.1.0, you can upgrade to Ecosystem Pack 9.x.x.

For information about upgrading EEPs, see:

- Checking the EEP Version on page 5598
- EEP Support and Lifecycle Status on page 5728
- Upgrading Ecosystem Packs on page 346
- Applying a Patch for an Ecosystem Component on page 481

For information about upgrading to core 7.6.1 and EEP 9.2.1, see:

- Installation Notes (Release 7.7) on page 34
- Upgrade Notes (Release 7.7) on page 37

EEP 9.2.1 Ecosystem Components and Release Notes

For a list of the EEP 9.2.1 components and their release notes, see Ecosystem Pack 9.2.1 Release Notes on page 5806.

EEP 9.2.1 Ecosystem JDK / JRE Support
Summarizes JDK and JRE build and run information for EEP 9.2.1 Data Fabric ecosystem components.

The "Different from Open-Source Equivalent" column highlights that while some open-source components are built with JDK 8, the Data Fabric component is built with JDK 11 and will only run on JRE 11 or JRE 17.

Ecosystem Components	Built Using JDK Version	Runs on JRE or JDK Version	Different from Open-Source Equivalent?
Airflow 2.7.3.0	Not a Java component		
AsyncHBase 1.8.2.0	8	8-11 and 17	Yes (OSS version compiles with Java 6)
Data Access Gateway 6.2.0.0	11	11 and 17	N/A
Drill 1.20.3.200	11	11 and 17	Yes
Hadoop 3.3.5.200	11	11 and 17	Yes
HBase 1.4.14.600	11	11 and 17	Yes
Hive 3.1.3.500	11	11 and 17	Yes
HttpFS 3.3.5.200	11	11 and 17	Yes
Hue 4.11.0.0	Not a Java component		
Kafka Client 2.6.1.600	11	11 and 17	Yes
Kafka Rest 6.0.0.400	11	11 and 17	Yes
Kafka Schema Registry 6.0.0.400	11	11 and 17	Yes
Kafka Connect HDFS 10.0.0.500	11	11 and 17	Yes
Kafka Connect JDBC 10.0.1.400	11	11 and 17	Yes
KSQL 6.0.0.400	11	11 and 17	Yes
Livy 0.8.0.0	11	11 and 17	Yes
NiFi 1.19.1.0	11	11 and 17	Yes
OTel	11	11 and 17	Yes

What's New in EEP 9.2.0

Summarizes the new features and product updates in Ecosystem Pack (EEP) 9.2.0.

EEP 9.2.0 can be used with releases:

- 7.5.0
- 7.4.0
- 7.3.0 (requires a patch)
- 7.2.0 (requires a patch)

For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

EEP 9.2.0 Versions and Features

EEP 9.2.0 introduced a new ecosystem component: `mapr-ezotelcol-0.80.0.39`. For more information about OTel, see the notes later on this page.

EEP 9.2.0 provided significant updates to many components. Other components received minor updates. The following table summarizes the significant version updates for EEP 9.2.0:

Component	EEP 9.1.2 Version	EEP 9.2.0 Version
Airflow	2.6.1.0	2.7.1.0
Data Access Gateway	6.1.0.0	6.2.0.0
Hue	4.6.0.650	4.11.0.0.0
OTel	(Not present)	0.80.0.39
Ranger	2.3.0.300	2.4.0.0

To compare the versions of various components in different EEPs, see Component Versions for Released EEPs on page 5750.

last-updated: Jun 06, 2024

Airflow 2.7.1.0 Support

EEP 9.2.0 updates Airflow to version 2.7.1.0. See Airflow 2.7.1.0 - 2310 (EEP 9.2.0) Release Notes on page 5831.

Data Access Gateway 6.2 Support

Data Access Gateway 6.2 provides:

- Full support for distributed Kafka Wire Protocol service.
- Support for Python, Go, Scala, C Kafka, and Node.js clients.
- Improved overall cluster throughput by distributing topic partitions evenly among all Data Access Gateway nodes.

Data Access Gateway 6.2 can be used with core 7.5.0, 7.4.0, 7.3.0, and 7.2.0. However, Kafka Wire Service protocol is only available for Data Access Gateway 6.2 running with core 7.4.0 and 7.5.0. When using Data Access Gateway 6.2 with core 7.3.0 or 7.2.0, Kafka Wire Protocol service is disabled. See the Data Access Gateway 6.2 Release Notes on page 5840.

Hue 4.11.0.0

EEP 9.2.0 updates Hue to version 4.11.0.0. For more information, see Hue 4.11.0.0 - 2310 (EEP 9.2.0) Release Notes on page 5963.

OTel 0.80.0.39

The new `mapr-ezotelcol` package enables the OpenTelemetry (OTel) service. OTel is supported on both the as-a-service offering and the HPE Ezmeral Data Fabric – Customer Managed platform. For more information, see the OTel 0.80.0.39 Release Notes on page 6057.

Ranger 2.4.0.0

EEP 9.2.0 updates Ranger to version 2.4.0.0. For more information, see the Ranger 2.4.0.0 - 2310 (EEP 9.2.0) Release Notes on page 6071.

Support for JDK 11 and JDK 17

EEP 9.2.0 and core 7.5.0 can be used with JDK 11 or JDK 17. However, Installer 1.18.0.4 is not supported on JDK 17. Therefore, installations of or upgrades to EEP 9.2.0 and core 7.5.0 must be performed manually. See Java Support Matrix on page 5764 and Installer Updates on page 5674.

Using the monitoring components with JRE or JDK 17 is now supported in EEP 9.2.0 or later.

Discontinued Components

The following components are present in earlier ecosystem packs but are not included in EEP 9.2.0:

- Flume
- Oozie
- Pig
- S3 Gateway
- Sqoop

For more information, see Discontinued Ecosystem Components on page 5748.

last-updated: Jun 06, 2024

Installer Support for EEP 9.2.0

Installer 1.18.0.4 supports EEP 9.2.0 and previously released EEPs. For a list of the EEPs that are supported by different versions of the Installer, see Installer EEP Support on page 5773.

Installer 1.18.0.4 is not supported for use with JDK 17. In addition, Installer 1.18.0.x cannot be used with older versions of Ubuntu. For more information, see Selecting an Installer Version to Use on page 5587.

EEP Upgrades

If your cluster is running EEP 8.0.0 or 8.1.0, you can upgrade to Ecosystem Pack 9.x.x.

For information about upgrading EEPs, see:

- Checking the EEP Version on page 5598
- EEP Support and Lifecycle Status on page 5728
- Upgrading Ecosystem Packs on page 346
- Applying a Patch for an Ecosystem Component on page 481

For information about upgrading to core 7.5.0 and EEP 9.2.0, see:

- Installation Notes (Release 7.7) on page 34
- Upgrade Notes (Release 7.7) on page 37

EEP 9.2.0 Ecosystem Components and Release Notes

EEP 9.2.0 Ecosystem JDK / JRE Support

Summarizes JDK and JRE build and run information for EEP 9.2.0 data-fabric ecosystem components.

The "Different from Open-Source Equivalent" column highlights that while some open-source components are built with JDK 8, the data-fabric component is built with JDK 11 and will only run on JRE 11 or JRE 17.

Ecosystem Components	Built Using JDK Version	Runs on JRE or JDK Version	Different from Open-Source Equivalent?
Airflow 2.7.1.0	Not a Java component		
AsyncHBase 1.8.2.0	8	8-11 and 17	Yes (OSS version compiles with Java 6)
Data Access Gateway 6.2.0.0	11	11 and 17	N/A
Drill 1.20.3.100	11	11 and 17	Yes
Hadoop 3.3.5.100	11	11 and 17	Yes

This topic contains information about the components included in Ecosystem Pack 9.1.2.

Component Versions for Released EEPs on page 5750
The published Ecosystem Packs (EEPs) contain different component versions with different features. Comparing the component versions can help you make decisions about installing or upgrading data-fabric software.

EEP 9.1.2 Components and OS Support on page 5738

This topic lists the ecosystem and monitoring components that are included in EEP 9.1.2 and shows the operating system support for each component.

Release History for EEPs on page 5788
This section shows the original release dates for all Ecosystem Packs (EEPs).

What's New in EEP 9.1.2
Summarizes the new features and product updates in Ecosystem Pack (EEP) 9.1.2.

EEP 9.1.2 can be used with core 7.4.0 or 7.3.0 (requires core patch 7.3.0.1 or newer) or 7.2.0 (requires core patch 7.2.0.4 or newer). For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

EEP 9.1.2 Versions and Features

EEP 9.1.2 introduced no new components. EEP 9.1.2 provided significant updates to several components. Other components received minor updates. The following table summarizes the significant version updates in EEP 9.1.2:

Component	EEP 9.1.1 Version	EEP 9.1.2 Version
Airflow	2.5.1.0	2.6.1.0
Data Access Gateway	6.0.0.0	6.1.0.0
Spark	3.3.2.0	3.3.2.100

To compare the versions of various components in different EEPs, see Component Versions for Released EEPs on page 5750.

Airflow 2.6.1.0 Support

EEP 9.1.2 updates Airflow to version 2.6.1.0 and provides several updates to user impersonation functionality. See Airflow 2.6.1.0 - 2307 (EEP 9.1.2) Release Notes on page 5832.

Data Access Gateway 6.1.0.0 Support

Data Access Gateway 6.1 adds the following:

- Full support for distributed Kafka Wire Protocol service.
- Support for Python, Go, Scala, C Kafka, and Node.js clients.
- Improved overall cluster throughput by distributing topic partitions evenly among all Data Access Gateway nodes.

Data Access Gateway 6.1 can be used with core 7.4.0, 7.3.0, and 7.2.0. However, Kafka Wire Service protocol is only available for Data Access Gateway 6.1 on core 7.4.0. When using Data Access Gateway 6.1 with core 7.3.0 or 7.2.0, Kafka Wire Protocol service is disabled. See Data Access Gateway 6.1 Release Notes on page 5841.

Hadoop 3.3.5.0 Support

EEP 9.1.2 updates Hadoop to version 3.3.5.0, backporting all commits from the 3.3.5.0 release and providing several defect fixes and CVE fixes. See Hadoop 3.3.5.0 - 2307 (EEP 9.1.2) Release Notes on page 5873.

last-updated: Jun 06, 2024

Support for JDK 11 and JDK 17

EEP 9.1.2 and core 7.4.0 can be used with JDK 11 or JDK 17. However, Installer 1.18.0.3 is not supported on JDK 17. Therefore, installations of or upgrades to EEP 9.1.2 and core 7.4.0 must be performed manually. See Java Support Matrix on page 5764 and Installer Updates on page 5674.

Monitoring components currently are not compatible with JRE or JDK 17 in EEP 9.1.2. For more information, see this knowledge article.

Discontinued Components

The following components are present in earlier ecosystem packs but are not included in EEP 9.1.2:

- Flume
- Oozie
- Pig
- S3 Gateway
- Sqoop

For more information, see Discontinued Ecosystem Components on page 5748.

Enabling Hive With JDK 17

EEP 9.1.2 can be used with JDK 17. Some additional configuration steps are required to enable Hive 3.1.3.300 for use in a JDK 17 installation. See Considerations for JDK 17 on page 250.

Installer Support for EEP 9.1.2

Installer 1.18.0.3 supports EEP 9.1.2 and previously released EEPs. For a list of the EEPs that are supported by different versions of the Installer, see Installer EEP Support on page 5773.

Installer 1.18.0.3 is not supported for use with JDK 17. In addition, Installer 1.18.0.x cannot be used with older versions of Ubuntu. For more information, see Selecting an Installer Version to Use on page 5587.

EEP Upgrades

If your cluster is running EEP 8.0.0 or 8.1.0, you can upgrade to Ecosystem Pack 9.x.x.

For information about upgrading EEPs, see:

- Checking the EEP Version on page 5598
- EEP Support and Lifecycle Status on page 5728
- Upgrading Ecosystem Packs on page 346

For information about upgrading to core 7.4.0 and EEP 9.1.2, see:

- Installation Notes (Release 7.7) on page 34
- Upgrade Notes (Release 7.7) on page 37

EEP 9.1.2 Ecosystem Components and Release Notes

For a list of the EEP 9.1.2 components and their release notes, see Ecosystem Pack 9.1.2 Release Notes on page 5810.

EEP 9.1.2 Ecosystem JDK / JRE Support
Summarizes JDK and JRE build and run information for EEP 9.1.2 data-fabric ecosystem components.

The "Different from Open-Source Equivalent" column highlights that while some open-source components are built with JDK 8, the data-fabric component is built with JDK 11 and will only run on JRE 11 or JRE 17.

Ecosystem Components	Built Using JDK Version	Runs on JRE or JDK Version	Different from Open-Source Equivalent?
Airflow 2.6.1.0	Not a Java component		
AsyncHBase 1.8.2.0	8	8-11 and 17	Yes (OSS version compiles with Java 6)
Data Access Gateway 6.1.0.0	11	11 and 17	N/A
Drill 1.20.3.0	11	11 and 17	Yes
Hadoop 3.3.5.0	11	11 and 17	Yes
HBase 1.4.14.500	11	11 and 17	Yes
Hive 3.1.3.300	11	11 and 17	Yes
HttpFS 3.3.5.0	11	11 and 17	Yes
Hue 4.6.0.650	Not a Java component		
Kafka Client 2.6.1.600	11	11 and 17	Yes
Kafka Rest 6.0.0.400	11	11 and 17	Yes
Kafka Schema Registry 6.0.0.400	11	11 and 17	Yes
Kafka Connect HDFS 10.0.0.500	11	11 and 17	Yes
Kafka Connect JDBC 10.0.1.400	11	11 and 17	Yes
KSQL 6.0.0.400	11	11 and 17	Yes
Livy 0.7.0.300	11	11 and 17**	Yes
NiFi 1.19.1.0	11	11 and 17	Yes
Ranger 2.3.0.300	11	11 and 17	Yes
Spark 3.3.2.0	11	11 and 17	Yes
Tez 0.10.2.300	11	11 and 17	Yes
Zeppelin 0.10.1.100	11	11 and 17	Yes
Monitoring Components*			
Collectd 5.12.0.500*	11	11	Yes
Elasticsearch 6.8.8.600*	12	11	No
Fluentd 1.10.3.500*	N/A	N/A	N/A
Grafana 7.5.10.500*	N/A	N/A	N/A

This topic lists the ecosystem and monitoring components that are included in EEP 9.1.1 and shows the operating system support for each component.

Release History for EEPs on page 5788
This section shows the original release dates for all Ecosystem Packs (EEPs).

What's New in EEP 9.1.1

Summarizes the new features and product updates in Ecosystem Pack (EEP) 9.1.1.

EEP 9.1.1 can be used with core 7.2.0 or core 7.3.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

EEP 9.1.1 Versions and Features

EEP 9.1.1 introduced no new components. EEP 9.1.1 provided significant updates to several components. Other components received minor updates. The following table summarizes the significant version updates in EEP 9.1.1:

Component	EEP 9.1.0 Version	EEP 9.1.1 Version
Airflow	2.4.3.0	2.5.1.0
Data Access Gateway	5.1.0.0	6.0.0.0
Drill	1.20.2.100	1.20.3.0
Spark	3.3.1.0	3.3.2.0

To compare the versions of various components in different EEPs, see Component Versions for Released EEPs on page 5750.

Airflow 2.5.1.0 Support

EEP 9.1.1 updates Airflow to version 2.5.1.0 and provides several defect fixes. See Airflow 2.5.1.0 - 2304 (EEP 9.1.1) Release Notes on page 5834.

last-updated: Jun 06, 2024

Data Access Gateway 6.0.0.0 Support

Data Access Gateway 6.0 removes support for configuring topic mapping rules. In Data Access Gateway 6.0, the new topic-mapping scheme is one topic per stream per volume.

CAUTION: Streams users who upgrade from release 7.1.0 (DAG 5.0) or release 7.2.0 (DAG 5.1) to release 7.3.0 (DAG 6.0) will not be able to access topics configured using the pre-DAG 6.0 mapping rules.

While EEP 9.1.1 can be used with core 7.2.0 or core 7.3.0, Data Access Gateway 6.0 can only be used with core 7.3.0. See Data Access Gateway 6.0 Release Notes on page 5842.

To use EEP 9.1.1 with core 7.2.0, you must install Data Access Gateway 5.1.0 (and not Data Access Gateway 6.0.0), and you must perform the installation or upgrade using manual steps. The Installer does not support installing or upgrading to EEP 9.1.1 with core 7.2.0.

Drill 1.20.3.0 Support

EEP 9.1.1 updates Drill to version 1.20.3.0, and provides Protobuf version 3.22.2. See Drill 1.20.3.0-2304 (EEP 9.1.1) Release Notes on page 5850.

Spark 3.3.2.0 Support

EEP 9.1.1 updates Spark to version 3.3.2.0, providing several defect fixes and CVE fixes.

For more information, see Apache Spark Feature Support on page 4607, the RAPIDS Accelerator Overview, and the Spark Release Notes on page 6080.

Support for JDK 11 and JDK 17

EEP 9.1.1 and core 7.3.0 can be used with JDK 11 or JDK 17. However, Installer 1.18.0.2 is not supported on JDK 17. Therefore, installations of or upgrades to EEP 9.1.1 and core 7.3.0 must be performed manually. See Java Support Matrix on page 5764 and Installer Updates on page 5674.

Discontinued Components

The following components are present in earlier ecosystem packs but are not included in EEP 9.1.1:

- Flume
- Oozie
- Pig
- S3 Gateway
- Sqoop

For more information, see Discontinued Ecosystem Components on page 5748.

Enabling Hive With JDK 17

EEP 9.1.1 can be used with JDK 17. Some additional configuration steps are required to enable Hive 3.1.3.200 for use in a JDK 17 installation. See Considerations for JDK 17 on page 250.

Installer Support for EEP 9.1.1

Installer 1.18.0.2 supports EEP 9.1.1 and previously released EEPs. For a list of the EEPs that are supported by different versions of the Installer, see Installer EEP Support on page 5773.

last-updated: Jun 06, 2024

Installer 1.18.0.2 is not supported for use with JDK 17. In addition, Installer 1.18.0.x cannot be used with older versions of Ubuntu. For more information, see Selecting an Installer Version to Use on page 5587.

EEP Upgrades

If your cluster is running EEP 8.0.0 or 8.1.0, you can upgrade to Ecosystem Pack 9.x.x.

For information about upgrading EEPs, see:

- Checking the EEP Version on page 5598
- EEP Support and Lifecycle Status on page 5728
- Upgrading Ecosystem Packs on page 346

For information about upgrading to core 7.3.0 and EEP 9.1.1, see:

- Installation Notes (Release 7.7) on page 34
- Upgrade Notes (Release 7.7) on page 37

EEP 9.1.1 Ecosystem Components and Release Notes

For a list of the EEP 9.1.1 components and their release notes, see Ecosystem Pack 9.1.1 Release Notes on page 5812.

last-updated: Jun 06, 2024

What's New in EEP 9.1.0

Summarizes the new features and product updates in Ecosystem Pack (EEP) 9.1.0.

EEP 9.1.0 can be used only with core 7.2.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

EEP 9.1.0 Versions and Features

EEP 9.1.0 introduced no new components. EEP 9.1.0 provided significant updates to many components. Other components received minor updates. The following table summarizes the significant version updates in EEP 9.1.0:

Component	EEP 9.0.0 Version	EEP 9.1.0 Version
Airflow	2.3.3.0	2.4.3.0
Data Access Gateway	5.0.0.0	5.1.0.0
NiFi	1.16.3.0	1.19.1.0
Spark	3.3.0.0	3.3.1.0

To compare the versions of various components in different EEPs, see Component Versions for Released EEPs on page 5750.

Airflow 2.4.3.0 Support

EEP 9.1.0 updates Airflow to version 2.4.3.0. For more information, see Airflow 2.4.3.0 - 2301 (EEP 9.1.0) Release Notes on page 5835.

Data Access Gateway 5.1.0.0 Support

Data Access Gateway 5.1.0.0 adds SSL support in the Kafka Wire Protocol Service.

NiFi 1.19.1.0 Support

EEP 9.1.0 updates NiFi to version 1.19.1.0 and adds integration with Livy. Upgrade steps for NiFi are provided in Upgrading Ecosystem Packs on page 346.

Ranger 2.3.0.100 Support

In EEP 9.0.0, the `mapr-ranger` provides both Admin and UserSync services. Beginning with EEP 9.1.0, `mapr-ranger` provides only the Admin service, and there is a new package for the UserSync service: `mapr-ranger-usersync`. For more information, see Upgrading Ranger on page 384 and Post-Upgrade Steps for Ranger on page 396.

Spark 3.3.1.0 Support

EEP 9.1.0 updates Spark to version 3.3.1.0, providing defect and CVE fixes.

EEP 9.0.0 included Spark 3.3, which supports GPU-aware scheduling. Spark 3.3 enables use of the RAPIDS Accelerator by Nvidia to accelerate Spark processing. For more information, see Apache Spark Feature Support on page 4607, the RAPIDS Accelerator Overview, and the Spark Release Notes on page 6080.

Support for JDK 11 and JDK 17

EEP 9.1.0 and core 7.2.0 can be used in JDK 11 or in JDK 17 installations. However, JDK 17 installations and upgrades must be performed manually. Installer 1.18.0.1 is not supported on JDK 17.

last-updated: Jun 06, 2024

Discontinued Components

The following components are present in earlier ecosystem packs but are not included in EEP 9.1.0:

- Flume
- Oozie
- Pig
- S3 Gateway
- Sqoop

For more information, see Discontinued Ecosystem Components on page 5748.

Enabling Hive With JDK 17

EEP 9.1.0 can be used with JDK 17. Some additional configuration steps are required to enable Hive 3.1.3.100 for use in a JDK 17 installation. See Considerations for JDK 17 on page 250.

Installer Support for EEP 9.1.0

Installer 1.18.0.1 supports EEP 9.1.0 and previously released EEPs. For a list of the EEPs that are supported by different versions of the Installer, see Installer EEP Support on page 5773.

Installer 1.18.0.1 is not supported for use with JDK 17. In addition, Installer 1.18.0.x cannot be used with older versions of Ubuntu. For more information, see Selecting an Installer Version to Use on page 5587.

EEP Upgrades

IMPORTANT: Installer 1.18.0.2 supports core upgrades only from release 7.2.0 to 7.3.0. All EEP upgrades are supported. To upgrade core or EEP manually, see these topics:

- Upgrading Core Without the Installer on page 322
- Upgrading the Ecosystem Pack Without the Installer on page 366

If your cluster is running EEP 8.0.0 or 8.1.0, you can upgrade to Ecosystem Pack 9.x.x.

For information about upgrading EEPs, see:

- Checking the EEP Version on page 5598
- EEP Support and Lifecycle Status on page 5728
- Upgrading Ecosystem Packs on page 346

For information about upgrading to core 7.1.0 and EEP 8.1.0, see:

- Installation Notes (Release 7.7) on page 34
- Upgrade Notes (Release 7.7) on page 37

EEP 9.1.0 Ecosystem Components and Release Notes

For a list of the EEP 9.1.0 components and their release notes, see Ecosystem Pack 9.1.0 Release Notes on page 5814.

Component Versions for Released EEPs on page 5750
The published Ecosystem Packs (EEPs) contain different component versions with different features. Comparing the component versions can help you make decisions about installing or upgrading data-fabric software.

EEP 9.0.0 Components and OS Support on page 5741
This topic lists the ecosystem and monitoring components that are included in EEP 9.0.0 and shows the operating system support for each component.

Release History for EEPs on page 5788
This section shows the original release dates for all Ecosystem Packs (EEPs).

What's New in EEP 9.0.0

Summarizes the new features and product updates in Ecosystem Pack (EEP) 9.0.0.

EEP 9.0.0 can be used with core 7.1.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

EEP 9.0.0 Versions and Features

EEP 9.0.0 introduced three new components:

- NiFi
- Ranger
- Zeppelin

EEP 9.0.0 also provided significant updates to many components. Other components received minor updates. The following table summarizes the significant version updates in EEP 9.0.0:

Component	EEP 8.1.0 Version	EEP 9.0.0 Version
Data Access Gateway	4.0.0.0	5.0.0.0
Drill	1.16.1	1.20.2
Hadoop	2.7.6.200	3.3.4.0
Hive	2.3	3.1.3.0
NiFi	Not present	1.16.3.0
Ranger	Not present	2.3.0.0
Spark	3.2.0.0	3.3.0.0

last-updated: Jun 06, 2024

Component	EEP 8.1.0 Version	EEP 9.0.0 Version
Zeppelin	Not present	0.10.1.0

To compare the versions of various components in different EEPs, see Component Versions for Released EEPs on page 5750.

Drill 1.20.2 Support

In EEP 9.0.0, Drill is upgraded from version 1.16.1 to 1.20.2. Drill 1.20.2 provides some fixes and new features, including a TLS update to version 1.3, persistent HBase storage for query profiles, and query-profile data masking based on user filters. For additional information, see Drill 1.20.2.0-2210 (EEP 9.0.0) Release Notes on page 5851.

Hadoop 3.3.4 Support

EEP 9.0.0 includes Hadoop 3.3.4.0. This Hadoop version adds ATS v2 support and enables GPU support for Spark. In addition, HTTPFS is a part of Hadoop 3. See Hadoop 3.3.4.0 - 2210 (EEP 9.0.0) Release Notes on page 5879.

Hive 3.1.3 Support

EEP 9.0.0 includes Hive 3.1.3. Hive 3.1.3 includes support for Ranger and new Hive Metastore configuration properties, and also API changes.

For more information, see Hive 3.1.3 API Changes on page 4299 and the Hive 3.1.3.0 - 2210 (EEP 9.0.0) Release Notes on page 5923.

NiFi 1.16.3.0 Support

EEP 9.0.0 includes NiFi 1.16.3.0. For more information, see NiFi 1.16.3.0 - 2210 (EEP 9.0.0) Release Notes on page 6055.

Ranger 2.3 Support

EEP 9.0.0 includes Ranger 2.3.0.0. Apache Ranger provides centralized security administration and fine-grain access control for user access within Apache Hadoop, Apache Hive, Apache HBase and other Apache components. For more information, see Ranger on page 4583.

Spark 3.3 Support

EEP 9.0.0 includes Spark 3.3, which supports GPU-aware scheduling. Spark 3.3 enables use of the RAPIDS Accelerator by Nvidia to accelerate Spark processing. For more information, see Apache Spark Feature Support on page 4607, the RAPIDS Accelerator Overview, and the Spark Release Notes on page 6080.

Zeppelin 0.10.1 Support

EEP 9.0.0 includes Zeppelin 0.10.1.0, which is now offered as an RPM or DEB package in the ecosystem pack. Previous releases of Zeppelin consisted of a Docker container, which was offered as part of the Data Science Refinery (DSR) product in releases 6.0.0 and later. As indicated in Discontinued Ecosystem Components on page 5748, support for DSR is discontinued. Note that upgrades from the Docker-image based Zeppelin product to the package-based Zeppelin product are not supported.

For more information about Zeppelin 0.10.1.0, see Zeppelin on page 4736 and the Zeppelin 0.10.1.0 - 2210 Release Notes on page 6118.

last-updated: Jun 06, 2024

Discontinued Components

The following components are present in earlier ecosystem packs but are not included in EEP 9.0.0:

- Flume
- Oozie
- Pig
- S3 Gateway
- Sqoop

For more information, see Discontinued Ecosystem Components on page 5748.

Installer Support for EEP 9.0.0

Installer 1.18.0.0 supports EEP 9.0.0 and previously released EEPs. For a list of the EEPs that are supported by different versions of the Installer, see Installer EEP Support on page 5773.

Installer 1.18.0.x cannot be used with older versions of Ubuntu. For more information, see Selecting an Installer Version to Use on page 5587.

EEP Upgrades

IMPORTANT: Installer 1.18.0.2 supports core upgrades only from release 7.2.0 to 7.3.0. All EEP upgrades are supported. To upgrade core or EEP manually, see these topics:

- Upgrading Core Without the Installer on page 322
- Upgrading the Ecosystem Pack Without the Installer on page 366

If your cluster is currently running EEP 5.x or 6.x, you can upgrade to Ecosystem Pack 6.4.0. If your cluster is running EEP 8.0.0 or 8.1.0, you can upgrade to Ecosystem Pack 9.x.x.

For information about upgrading EEPs, see:

- Checking the EEP Version on page 5598
- EEP Support and Lifecycle Status on page 5728
- Upgrading Ecosystem Packs on page 346

For information about upgrading to core 7.1.0 and EEP 8.1.0, see:

- Installation Notes (Release 7.7) on page 34
- Upgrade Notes (Release 7.7) on page 37

EEP 9.0.0 Ecosystem Components and Release Notes

For a list of the EEP 9.0.0 components and their release notes, see Ecosystem Pack 9.0.0 Release Notes on page 5816.

This section shows the original release dates for all Ecosystem Packs (EEPs).

What's New in EEP 8.1.2

Summarizes the new features and product updates in Ecosystem Pack (EEP) 8.1.2.

EEP 8.1.2 can be used with core 7.0.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

EEP 8.1.2 Versions and Features

EEP 8.1.2 provides minor updates to various components.

To compare the versions of various components in different EEPs, see Component Versions for Released EEPs on page 5750.

FIPS Support

When used with release 7.0.0, most EEP 8.1.2 components support the Federal Information Processing Standard (FIPS) 140-2 Level 1. See FIPS Support for Ecosystem Components on page 5774.

Discontinued Components

For an up-to-date list of discontinued components, see Discontinued Ecosystem Components on page 5748.

Terminology Changes

Beginning with EEP 8.0.0, the HPE Ezmeral Data Fabric product documentation includes the following terminology changes:

Old Name	New Name
Ecosystem Pack (MEP)[1]	Ezmeral Ecosystem Pack (EEP)
HPE Ezmeral Data Fabric XD Distributed File and Object Store	HPE Ezmeral Data Fabric File Store
Object Store with S3-Compatible API	S3 Gateway

[1]In some areas, *MEP* continues to be used instead of EEP. To minimize issues for longtime MEP users, the package repository for released EEPs continues to use the *MEP* abbreviation in the directory names. See

https://package.ezmeral.hpe.com/releases/MEP/. In addition, *MEP* remains in some documentation URLs to ensure that bookmarks and links to the URLs continue to work.

For more information about data-fabric terminology, see Documentation Enhancements in What's New in Release 7.7 on page 30.

Installer Support for EEP 8.1.2

The latest version of Installer 1.18.0.6 supports EEP 8.1.2. For a list of the EEPs that are supported by different versions of the Installer, see Installer EEP Support on page 5773.

Patch Requirements for EEP 8.1.2

If you are using Data Access Gateway 4.0.0.1 or the monitoring components with core 7.0.0, you must install the latest core 7.0.0 patch.

All EEP 8.1.2 components other than Data Access Gateway 4.0.0.1 and the monitoring components can be used with core 7.0.0 without a patch.

EEP Upgrades

If your cluster is running EEP 7.0.x or 7.1.x, you can upgrade to Ecosystem Pack 7.1.2 or 8.x.x.

For information about upgrading EEPs, see:

- Checking the EEP Version on page 5598
- EEP Support and Lifecycle Status on page 5728
- Upgrading Ecosystem Packs on page 346

For information about upgrading to core 7.0.0 and EEP 8.1.2, see:

- Installation Notes (Release 7.0.0)
- Upgrade Notes (Release 7.0.0)

EEP 8.1.2 Ecosystem Components and Release Notes

For a list of the EEP 8.1.2 components and their release notes, see Ecosystem Pack 8.1.2 Release Notes on page 5818.

Version Change for Hive JAR Artifacts

Beginning with EEP 8.1.0, JAR artifacts for Hive use four digits instead of three digits. For more information, see Hive 2.3.9.0 - 2201 (EEP 8.1.0) Release Notes on page 5936.

What's New in EEP 8.1.1

Summarizes the new features and product updates in Ecosystem Pack (EEP) 8.1.1.

EEP 8.1.1 can be used with core 6.2.0 and core 7.0.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

EEP 8.1.1 Versions and Features

EEP 8.1.1 provides significant updates to Airflow and HBase. Other components received minor updates. The following table summarizes the significant version updates in EEP 8.1.1:

Component	EEP 8.1.0 Version	EEP 8.1.1 Version	Release Note
Airflow	2.2.1.0	2.5.1.0	Airflow 2.5.1.0 - 2305 (EEP 8.1.1) Release Notes on page 5837
HBase	1.4.13.200	1.4.14.100	HBase 1.4.14.100 - 2305 (EEP 8.1.1) Release Notes on page 5902

To compare the versions of various components in different EEPs, see Component Versions for Released EEPs on page 5750.

FIPS Support

When used with release 7.0.0, most EEP 8.1.1 components support the Federal Information Processing Standard (FIPS) 140-2 Level 1. See FIPS Support for Ecosystem Components on page 5774.

Discontinued Components

For an up-to-date list of discontinued components, see Discontinued Ecosystem Components on page 5748.

Terminology Changes

Beginning with EEP 8.0.0, the HPE Ezmeral Data Fabric product documentation includes the following terminology changes:

Old Name	New Name
Ecosystem Pack (MEP)[1]	Ezmeral Ecosystem Pack (EEP)

last-updated: Jun 06, 2024

Old Name	New Name
HPE Ezmeral Data Fabric XD Distributed File and Object Store	HPE Ezmeral Data Fabric File Store
Object Store with S3-Compatible API	S3 Gateway

[1]In some areas, *MEP* continues to be used instead of EEP. To minimize issues for longtime MEP users, the package repository for released EEPs continues to use the *MEP* abbreviation in the directory names. See https://package.ezmeral.hpe.com/releases/MEP/. In addition, *MEP* remains in some documentation URLs to ensure that bookmarks and links to the URLs continue to work.

For more information about data-fabric terminology, see Documentation Enhancements in What's New in Release 7.7 on page 30.

Installer Support for EEP 8.1.1

No version of the Installer currently supports EEP 8.1.1. Check this page again soon to see if a new Installer version becomes available to support EEP 8.1.1. For a list of the EEPs that are supported by different versions of the Installer, see Installer EEP Support on page 5773.

EEP Upgrades

If your cluster is running EEP 7.0.x or 7.1.x, you can upgrade to Ecosystem Pack 7.1.2 or 8.x.x.

For information about upgrading EEPs, see:

- Checking the EEP Version on page 5598
- EEP Support and Lifecycle Status on page 5728
- Upgrading Ecosystem Packs on page 346

For information about upgrading to core 7.0.0 and EEP 8.1.1, see:

This topic contains information about the components included in Ecosystem Pack 8.1.0.

Component Versions for Released EEPs on page 5750
The published Ecosystem Packs (EEPs) contain different component versions with different features. Comparing the component versions can help you make decisions about installing or upgrading data-fabric software.

EEP 8.1.0 Components and OS Support on page 5745
This topic lists the ecosystem and monitoring components that are included in EEP 8.1.0 and shows the operating system support for each component.

Release History for EEPs on page 5788
This section shows the original release dates for all Ecosystem Packs (EEPs).

What's New in EEP 8.1.0

Summarizes the new features and product updates in Ecosystem Pack (EEP) 8.1.0.

EEP 8.1.0 can be used with core 6.2.0 and core 7.0.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

EEP 8.1.0 Versions and Features

EEP 8.1.0 introduces a new component, Airflow, to the HPE Ezmeral Ecosystem Pack and provides significant updates to Spark. Other components received minor updates. The following table summarizes the significant version updates in EEP 8.1.0:

Component	EEP 8.0.0 Version	EEP 8.1.0 Version
Airflow	N/A	2.2.1.0
Data Access Gateway	3.0.0.0	4.0.0.0
Spark	3.1.2	3.2.0

To compare the versions of various components in different EEPs, see Component Versions for Released EEPs on page 5750.

FIPS Support

When used with release 7.0.0, most EEP 8.1.0 components support the Federal Information Processing Standard (FIPS) 140-2 Level 1. The following table summarizes EEP 8.1.0 component support for FIPS:

EEP 8.1.0 Component	FIPS Support
Airflow	No
Data Access Gateway	Yes
Drill	Yes
HBase	Yes*
Hive	Yes
HTTPFS	Yes
Hue	No

last-updated: Jun 06, 2024

EEP 8.1.0 Component	FIPS Support
Kafka REST	Yes
Kafka Schema Registry	Yes
Kafka Connect HDFS	Yes
Kafka Connect JDBC	Yes
KSQL	Yes
Kafka Streams	Yes
Livy	Yes**
Oozie	Yes
Spark	Yes**
Tez	Yes
YARN	Yes

*HBase cannot be used in a mixed (FIPS and non-FIPS) configuration. For example, a non-FIPS client node cannot communicate with a FIPS server node.

**In a mixed (FIPS and non-FIPS) configuration, there is a known issue related to Spark and Livy applications when the Spark UI is enabled. See the Spark and Livy release notes.

For more information about FIPS, see FIPS Compliance for HPE Ezmeral Data Fabric on page 878. For release note information, see the Ecosystem Pack 8.1.0 Release Notes on page 5822.

Discontinued Components

S3 Gateway, Oozie, and Data Science Refinery (DSR) were added to the list of discontinued components. For more information, see Discontinued Ecosystem Components on page 5748.

Terminology Changes

Beginning with EEP 8.0.0, the HPE Ezmeral Data Fabric product documentation includes the following terminology changes:

Old Name	New Name
Ecosystem Pack (MEP)[1]	Ezmeral Ecosystem Pack (EEP)
HPE Ezmeral Data Fabric XD Distributed File and Object Store	HPE Ezmeral Data Fabric File Store
Object Store with S3-Compatible API	S3 Gateway

[1]In some areas, *MEP* continues to be used instead of EEP. To minimize issues for longtime MEP users, the package repository for released EEPs continues to use the *MEP* abbreviation in the directory names. See https://package.ezmeral.hpe.com/releases/MEP/. In addition, *MEP* remains in some documentation URLs to ensure that bookmarks and links to the URLs continue to work.

For more information about data-fabric terminology, see Documentation Enhancements in What's New in Release 7.7 on page 30.

Support for Ubuntu 18.04 and 20.04 (But Not Ubuntu 16.04)

EEP 8.1.0 can be used with core 6.2.0 on Ubuntu 18.04 and 20.04 but is not supported with core 6.2.0 on Ubuntu 16.04. For a list of the operating systems that each EEP can support, see EEP Components and

OS Support on page 5734. For a list of the operating systems that different versions of core can support, see Operating System Support Matrix on page 5719.

Installer Support for EEP 8.1.0

Installer 1.17.0.3 and later support EEP 8.1.0 and previously released EEPs. Installer 1.17.0.3 can be used on core 6.2.0 and core 7.0.0. For a list of the EEPs that are supported by different versions of the Installer, see Installer EEP Support on page 5773.

Installer 1.17.0.x cannot be used with older versions of Ubuntu. For more information, see Selecting an Installer Version to Use on page 5587.

EEP Upgrades

If your cluster is currently running EEP 5.x or 6.x, you can upgrade to Ecosystem Pack 6.3.5. If your cluster is running EEP 7.0.x or 7.1.x, you can upgrade to Ecosystem Pack 7.1.2 or 8.x.x.

For information about upgrading EEPs, see:

- Checking the EEP Version on page 5598
- EEP Support and Lifecycle Status on page 5728
- Upgrading Ecosystem Packs on page 346

For information about upgrading to core 7.0.0 and EEP 8.1.0, see:

- Installation Notes (Release 7.0.0)
- Upgrade Notes (Release 7.0.0)

EEP 8.1.0 Ecosystem Components and Release Notes

For a list of the EEP 8.1.0 components and their release notes, see Ecosystem Pack 8.1.0 Release Notes on page 5822.

Version Change for Hive JAR Artifacts

Beginning with EEP 8.1.0, JAR artifacts for Hive use four digits instead of three digits. For more information, see Hive 2.3.9.0 - 2201 (EEP 8.1.0) Release Notes on page 5936.

Availability of EEP 6.3.6

EEP 6.3.6 was released at the same time as EEP 8.1.0 to provide defect repair for EEP 6.3.x users.

API Server and Web Server Packages for EEP 8.1.0

EEP 8.1.0 can be used with release 7.0.0 and with release 6.2.0. However, the API server (`mapr-apiserver`) and web server (`mapr-webserver`) packages that you must apply are different depending on the core release version. And the packages for release 7.0.0 and release 6.2.0 reside in different locations. Use the following table to determine which packages to use:

For release	Use the API server and web server packages in the . . .
7.0.0	Releases repository for core 7.0.0: `http://package.ezmeral.hpe.com/releases/v7.0.0/`
6.2.0	EEP repository for EEP 8.1.0: `http://package.ezmeral.hpe.com/releases/MEP/MEP-8.1.0/`

For more information about the API server and web server packages, see Setting Up the Control System on page 454.

EEP 8.x.y Ecosystem JDK / JRE Support
Summarizes JDK and JRE build and run information for EEP 8.x.y data-fabric ecosystem components.

The "Different from Open-Source Equivalent" column highlights that while some open-source components are built with JDK 8, the data-fabric component is built with JDK 11 and will only run on JRE 11.

Ecosystem Components	Built Using JDK Version	Runs on JRE or JDK Version	Different from Open-Source Equivalent?
AsyncHBase 1.8.2.0	8	8-11	Yes (OSS version compiles with Java 6)
Data Access Gateway 3.0.0.0	11	11	N/A
Drill 1.16.1.300	11	11	Yes
Flume 1.9.0.200	11	11	Yes
Hadoop 2.7.6.100	11	11	Yes
HBase 1.4.13.100	11	11	Yes
Hive 2.3.9	11	11	Yes
HttpFS 1.1.0.100	11	11	Yes
Hue 4.6.0.200	Not a Java component		
Kafka Rest 6.0.0.0	11	11	Yes
Kafka Schema Registry 6.0.0.0	11	11	Yes
Kafka Connect HDFS 10.0.0.0	11	11	Yes
Kafka Connect JDBC 10.0.1.0	11	11	Yes
KSQL 6.0.0.0	11	11	Yes
Livy 0.7.0.100	11	11	Yes
Oozie 5.2.1.100	11	11	No
Pig 0.17.0.100	11	11	Yes
S3 Gateway 2.2.0.0	Not a Java component		
Spark 3.1.2.0	11	11	Yes
Sqoop 1.4.7	11	11	No
Tez 0.9.2	11	11	Yes
MapR Monitoring Components			
Collectd 5.12.0.300	11	11	Yes
Elasticsearch 6.8.8.400	12	11	No

last-updated: Jun 06, 2024

Ecosystem Components	Built Using JDK Version	Runs on JRE or JDK Version	Different from Open-Source Equivalent?
Fluentd 1.10.3.300	N/A	N/A	N/A
Grafana 7.5.10.300	N/A	N/A	N/A
Kibana 6.8.8.400	N/A	N/A	N/A
OpenTSDB 2.4.1.300	11	11	Yes

EEP 8.0.0 Reference Information

This section contains links to release notes and other reference information for EEP 8.0.0.

NOTICE: Hewlett Packard Enterprise recommends using EEP 8.1.0 instead of EEP 8.0.0. For more information about EEP 8.1.0, see EEP 8.1.0 Reference Information on page 6152.

Component Versions for Released EEPs on page 5750
The published Ecosystem Packs (EEPs) contain different component versions with different features. Comparing the component versions can help you make decisions about installing or upgrading data-fabric software.

EEP 8.0.0 Components and OS Support on page 5746
This topic lists the ecosystem and monitoring components that are included in EEP 8.0.0 and shows the operating system support for each component.

Release History for EEPs on page 5788
This section shows the original release dates for all Ecosystem Packs (EEPs).

What's New in EEP 8.0.0

Summarizes the new features and product updates in Ecosystem Pack (EEP) 8.0.0.

NOTICE: Hewlett Packard Enterprise recommends using EEP 8.1.0 instead of EEP 8.0.0. For more information about EEP 8.1.0, see EEP 8.1.0 Reference Information on page 6152.

EEP 8.0.0 can be used only with core 6.2.0. For more information about EEP and core version support, see EEP Support and Lifecycle Status on page 5728.

EEP 8.0.0 Versions and Features

The following component versions changed significantly for EEP 8.0.0:

Component Group	Component	EEP 7.1.0 Version	EEP 8.0.0 Version
Hadoop	Hadoop	2.7.5.0	2.7.6.100

last-updated: Jun 06, 2024

Component Group	Component	EEP 7.1.0 Version	EEP 8.0.0 Version
Kafka	Kafka Connect	5.1.2.200	10.0.0.0
	Kafka REST	5.1.2.200	6.0.0.0
	Kafka Schema Registry	5.1.2.200	6.0.0.0
	Kafka Streams	2.1.1.200	2.6.1.0
Monitoring	Collectd	5.10.0.0	5.12.0.300
	Grafana	7.5.2.200	7.5.10.300
	Open TSDB	2.4.0	2.4.1.300
S3 Gateway	S3 Gateway	2.1.0.0	2.2.0.0
Spark	Spark	2.4.7.100	3.1.2.0

To compare the versions of various components in different EEPs, see Component Versions for Released EEPs on page 5750.

Hadoop Updates

Hadoop 2.7.6.100 includes numerous fixes and enhancements contained in the Apache Hadoop base release. For more information, see Hadoop 2.7.6.100 - 2110 (EEP 8.0.0) Release Notes on page 5886.

Kafka and Streams Updates

EEP 8.0.0 delivers the following Kafka and Streams improvements:

- Kafka and Streams
  - MirrorMaker 2 support. For more information, see Mirroring Topics with HPE Ezmeral Data Fabric MirrorMaker 2 on page 1522.
  - Consumers no longer read any topic data when the Consumer application calls `consumer.poll` and the timeout (`request.timeout.ms`) is set to 0. Previously, Consumers read one message.
- Kafka Schema Registry
  - Support for JSON Schema and Protobuf formats in addition to Avro.
- Kafka REST Proxy
  - REST Proxy API v3 HTTP Methods and URIs support. For more information, see API v3 HTTP Methods and URIs on page 4492. Note that REST Proxy API v1 HTTP Methods and URIs are no longer supported in Kafka Rest 6.0.0.

For more information, see the Kafka release notes in Ecosystem Pack 8.0.0 Release Notes on page 5824.

Monitoring (Collectd, Grafana, Open TSDB) Updates

Monitoring updates for EEP 8.0.0 keep the components up to date with recent open-source releases. Open TSDB added a fourth digit to its version to be consistent with other data-fabric component versions. For more information, see Monitoring Components - EEP 8.0.0 Release Notes on page 6048.

S3 Gateway

The S3 Gateway, formerly called the *Object Store with S3-Compatible API*, includes various MinIO and LDAP updates. For more information, see S3 Gateway 2.2.0.0 - 2110 (EEP 8.0.0) Release Notes on page 6051.

Spark Updates

last-updated: Jun 06, 2024

- EEP 8.0.0 updates the Spark version to 3.x. For more information see Spark 3.1.2.0 - 2110 (EEP 8.0.0) Release Notes on page 6099 and Spark 3.1.2 Release Notes.
- Delta Lake support is available for Spark 3.1.2 on HPE Ezmeral Data Fabric. See Apache Spark Feature Support on page 4607.
- For information about upgrading to Spark 3.x, see this page.

Terminology Changes

Beginning with EEP 8.0.0, the HPE Ezmeral Data Fabric product documentation includes the following terminology changes:

Old Name	New Name
Ecosystem Pack (MEP)[1]	Ezmeral Ecosystem Pack (EEP)
HPE Ezmeral Data Fabric XD Distributed File and Object Store	HPE Ezmeral Data Fabric File Store
Object Store with S3-Compatible API	S3 Gateway

[1]In some areas, *MEP* continues to be used instead of EEP. To minimize issues for longtime MEP users, the package repository for released EEPs continues to use the *MEP* abbreviation in the directory names. See https://package.ezmeral.hpe.com/releases/MEP/. In addition, *MEP* remains in some documentation URLs to ensure that bookmarks and links to the URLs continue to work.

For more information about data-fabric terminology, see Documentation Enhancements in What's New in Release 7.7 on page 30.

In Maintenance and End of Maintenance Ecosystem Components

Pig, Flume, and Sqoop are now *In Maintenance*, meaning that these components will be updated only for critical security flaws and will be discontinued within six months.

Impala and Sentry have transitioned to *End of Maintenance*, meaning that they are removed from EEP 8.0.0 and later for core 6.2.0. No maintenance is provided for End of Maintenance components.

For more information, see Discontinued Ecosystem Components on page 5748 and Understand the EEP Lifecycle on page 5724.

Maven Artifact Version String

Beginning with EEP 8.0.0, *eep* replaces *mapr* in the Maven artifact version string. For example:

Old Version String

```
<groupId>org.apache.hive</groupId>
<artifactId>hive</artifactId>
<version>2.3.8-mapr-2104</version>
```

New Version String

```
<groupId>org.apache.hive</groupId>
<artifactId>hive</artifactId>
<version>2.3.9-eep-2110</version>
```

This change applies to EEP 8.0.0 and later EEPs and does not apply to previously published Maven artifacts.

Support for Ubuntu 18.04 (But Not Ubuntu 16.04)

EEP 8.0.0 can be used with core 6.2.0 on Ubuntu 18.04 but is not supported with core 6.2.0 on Ubuntu 16.04. For a list of the operating systems that each EEP can support, see EEP Components and OS Support on page 5734. For a list of the operating systems that different versions of core can support, see Operating System Support Matrix on page 5719.

Maintenance EEPs

At the release of EEP 8.0.0, EEPs 7.1.1 and 6.3.5 were released as maintenance EEPs. Maintenance EEPs provide defect repair and an upgrade path for previously released EEPs.

EEP 7.1.1 is identical to EEP 7.1.0 except for changes to the monitoring (Spyglass) components. For a list of monitoring fixes , see Monitoring Release Notes on page 6042. To compare ecosystem component versions, see Component Versions for Released EEPs on page 5750. For reference information about specific EEPs, see Ecosystem Pack (EEP) Reference on page 6120.

Installer Support for EEP 8.0.0

Installer 1.17.0.0 supports EEP 8.0.0 and maintenance EEPs 7.1.1 and 6.3.5, as well as previously released EEPs. For a list of the EEPs that are supported by different versions of the Installer, see Installer EEP Support on page 5773.

Installer 1.17.0.0 cannot be used with older versions of Ubuntu. For more information, see Selecting an Installer Version to Use on page 5587.

EEP Upgrades

The EEP 8.0.0 release includes EEP 8.0.0, EEP 7.1.1, and EEP 6.3.5, but no other EEP revisions. If your cluster is currently running EEP 5.x or 6.x, you can upgrade to Ecosystem Pack 6.3.5. If your cluster is running EEP 7.0.x or 7.1.x, you can upgrade to Ecosystem Pack 7.1.1 or 8.0.0.

For more information about upgrading EEPs, see:

- Checking the EEP Version on page 5598
- EEP Support and Lifecycle Status on page 5728
- Upgrading Ecosystem Packs on page 346

For information about upgrading to core 6.2.0 and EEP 8.0.0, see Installation Notes (Release 7.7) on page 34.

EEP 8.0.0 Ecosystem Components and Release Notes

For a list of the EEP 8.0.0 components and their release notes, see Ecosystem Pack 8.0.0 Release Notes on page 5824.

This section contains links to release notes and other reference information for EEP 8.0.0.

EEP 7.1.2 Reference Information

This section contains links to release notes and other reference information for EEP 7.1.2.

EEP 7.1.2 provides Log4j fixes and other defect repair. Before using EEP 7.1.2, review the following considerations. EEP 7.1.2:

- Can be used with release 6.2.0 and with release 7.0.0. See EEP Support and Lifecycle Status on page 5728. For operating system support, see EEP 7.1.2 Components and OS Support on page 5747.

last-updated: Jun 06, 2024

- Does NOT include FIPS support.
- Requires Hadoop version 2.7.6.0.
- Supports Spark 2.x on release 7.0.0. If your environment requires Spark 3.x on release 7.0.0, you must upgrade to EEP 8.1.0.

Control System Release Notes

This section contains release notes for the HPE Ezmeral Data Fabric Control System.

Control System release notes are provided for version 7.1.0 and later. Release notes for earlier Control System versions are not available.

Control System 7.5.0.0 Release Notes

Release Notes for Control System 7.5.0.0

The notes below relate specifically to the HPE Ezmeral Data Fabric Control System.

These release notes contain only control system information and are not necessarily cumulative in nature.

Version	7.5.0.0
Release Date	November 2023
Package Versions	The CORE 7.5.0 release contains the following control system packages: • `mapr-apiserver-7.5.0.0` • `mapr-webserver-7.5.0.0`
Version Interoperability	core 7.5
Documentation	• HPE Ezmeral Data Fabric Control System on page 539 • Setting Up the Control System on page 454

New in This Release

None

Known Issues and Limitations

None

Resolved Issues

- DFUI-521 - Volumes not getting displayed in the Control System for SSO user.
- DFUI-523 - User properties tab not getting displayed in the Control System when SSO user log ins and navigates to user properties table.
- DFUI-570 - Add virtual IP button missing on NFS page,S3 server page when SSO user login to the Control System.
- DFUI-524 - License page broken in the Control System when SSO user log into the Control System and navigates to license page.

Control System 7.3.0.0 Release Notes

Release notes for Control System 7.3.0.0

The notes below relate specifically to the HPE Ezmeral Data Fabric Control System.

These release notes contain only control system information and are not necessarily cumulative in nature.

Version	7.3.0.0
Release Date	May 2023
Package Versions	The CORE 7.3.0 release contains the following control system packages: • `mapr-apiserver-7.3.0.0` • `mapr-webserver-7.3.0.0`
Version Interoperability	core 7.3
Documentation	• HPE Ezmeral Data Fabric Control System on page 539 • Setting Up the Control System on page 454

New in This Release

HPE Ezmeral Data Fabric Control System 7.3.0.0 includes the following updates and new features:

- Support for single sign-on (SSO) with Keycloak identity and access management.

Fixes

None

Known Issues and Limitations

Known issues in this release include:

- DFUI-521 - Volumes not getting displayed in the Control System for SSO user.

- DFUI-523 - User properties tab not getting displayed in the Control System when SSO user log ins and navigates to user properties table.
- DFUI-570 - Add virtual IP button missing on NFS page,S3 server page when SSO user login to the Control System.
- DFUI-524 - License page broken in the Control System when SSO user log into the Control System and navigates to license page.
- DFUI-639 - Non-LDAP SSO user authenticating to Keycloak is unable to create volume, stream, or table via the Control System.

Resolved Issues

None.

Control System - 7.2.0.0 Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Control System.

These release notes contain only control system information and are not necessarily cumulative in nature.

Version	7.2.0.0
Release Date	January 2023
Package Versions	The EEP 9.1.0 release contains the following control system packages: • `mapr-apiserver-7.2.0.0` • `mapr-webserver-7.2.0.0`
Version Interoperability	core 7.2
Documentation	• HPE Ezmeral Data Fabric Control System on page 539 • Setting Up the Control System on page 454

New in This Release

HPE Ezmeral Data Fabric Control System 7.2.0.0 includes the following updates and new features:

- The maprcli command, `tier move`, to move tier to different database topology via the CLI and/or REST API call.

Fixes

None

Known Issues and Limitations

None

Resolved Issues

Resolved issues in this release include:

- MON-8121 - Check for valid Erasure Coding schemes
- MON-8245 - 0 is displayed on Query with S3 Select page for empty object

- MON-7885 - When chart header text on dash board page, query gets displayed
- MON-8218 - Unable to get volume details in Data Fabric

Control System - 7.1.0.0 Release Notes

The notes below relate specifically to the HPE Ezmeral Data Fabric Control System.

These release notes contain only control system information and are not necessarily cumulative in nature.

Version	7.1.0.0
Release Date	October 2022
Package Versions	The EEP 9.0.0 release contains the following control system packages: • `mapr-apiserver-7.1.0.0` • `mapr-webserver-7.1.0.0`
Version Interoperability	core 7.1
Documentation	• HPE Ezmeral Data Fabric Control System on page 539 • Setting Up the Control System on page 454

New in This Release

HPE Ezmeral Data Fabric Control System 7.1.0.0 includes the following updates and new features:

- The maprcli command, `tier move`, to move tier to different database topology via the CLI and/or REST API call.

Fixes

None

Known Issues and Limitations

Known issues in this release include:

- MON-8215 - Upgrade from 6.2.0+Release EBF to 7.1.0. MCS is not coming up. Refer to Configuring ATS 1.0 or 1.5 for Hadoop 3.3 on page 4731 for the workaround related to the issue.

Resolved Issues

Resolved issues in this release include:

- MON-8106 - Apiserver should log an error when user is unauthorized
- MON-8082 - Storage Utilization Pane on Volumes page is incorrect and misleading
- MON-8217 - Register Now button continues to be present after adding valid license
- MON-8218 - Customer not able to get volume details in MCS and keeps on spinning
- MON-7497 - Cannot remove multiple nodes from a MapR cluster in a single remove operation via MCS

Kubernetes Interfaces for Data Fabric Release Notes

This section contains release notes for the Kubernetes Interfaces for Data Fabric.

These interfaces expose the non-containerized HPE Ezmeral Data Fabric to workloads on container-orchestration systems and enable persistent storage for Kubernetes objects in the non-containerized file system. For information about running containerized data-fabric services on Kubernetes, see About HPE Ezmeral Data Fabric.

CSI Storage Plugin Release Notes

This section contains release notes for the Container Storage Interface (CSI) Storage Plugin.

Container Storage Interface (CSI) Storage Plugin Release 1.2.x (FUSE POSIX)

These notes describe release 1.2.x of the Container Storage Interface (CSI) Storage Plugin for FUSE POSIX.

You may also be interested in the Kubernetes Release Notes. For the latest 1.2.x version, see the `mapr-csi` github repository.

Version	1.2.x
Release Date	November 2020
MapR Version Interoperability	Compatible with release 6.1.0 and later.
Kubernetes Compatibility	Kubernetes 1.17.0 and later.*
OpenShift Compatibility	4.4 and later.
CSI Driver Downloads	See Downloads (CSI) on page 275 for more information.
Documentation	• Overview: Container Storage Interface (CSI) Storage Plugin Overview on page 805 • Installation: Installing, Uninstalling, and Upgrading the Container Storage Interface (CSI) Storage Plugin on page 279 • Supported Versions: CSI Version Compatibility on page 5763
Related Resources	https://www.hpe.com/us/en/resource-library.html

***** Kubernetes alpha features are not supported.

New in this Release

This release of the Container Storage Interface (CSI) Storage Plugin increments the version of the `csi-kdfplugin` to 1.2.x. Release 1.2.x includes support for:

- Volume cloning for dynamic provisioning. For more information, see CSI Volume Cloning.
- Snapshot restore for dynamic provisioning. For more information, see Snapshot & Restore Feature.
- Dynamic and static provisioning of raw block volumes. For more information, see Raw Block Volumes on page 808.

You can access the `csi-kdfplugin` by installing the custom resource definition (CRD) using the `csi-maprkdf-v<version>.yaml` file. Or you can build your own container and point to the plugin on the Docker hub at `maprtech/csi-kdfplugin:<version>`. For installation information, see Installing, Uninstalling, and Upgrading the Container Storage Interface (CSI) Storage Plugin on page 279.

last-updated: Jun 06, 2024

Patches

None.

Limitations

Note the following limitations:

- CSI Driver version 1.2.x does not support coexistence with the FlexVolume Driver on the same Kubernetes cluster.
- All nodes in the Kubernetes cluster must use the same Linux OS. Configuration files are available to support the following Linux distributions:
  - CentOS
  - RHEL (use CentOS configuration file)
  - Ubuntu
- The Container POSIX client package is included by default when you install the Container Storage Interface (CSI) Storage Plugin. The Basic, Container, or Platinum POSIX client can be enabled by specifying a parameter in the pod spec.
- The CSI Driver does not include support for inline volumes in pods. It supports only PersistentVolumes.

Known Issues

Note the following known issues:

- Snapshot restore fails if the snapshot contains symlinks to other files in the directory.

Resolved Issues

Issue	Description
CSI-30	Enable memory profiling for fuse process w/ trackMemory : true option
CSI-241	Support volume clone for dynamic provisioning
CSI-242	Support snapshot restore for dynamic provisioning
CSI-243	Support for OpenShift 4.4, 4.5, 4.6+ & Kubernetes 1.17, 1.18, 1.19+
CSI-248	Retain fuse logs after pod delete w/ retainLogs: true option
REL-301	Update kdfplugin image w/ 6.2 release bits on centos8
CSI-254	Option 'numrpcthreads' added to configure Number of Client RPC threads (default:1, max:4).
CSI-258	DF client fixes & updates
CSI-259	Reduce verbose logging on CSI logfiles
CSI-262	[BETA] Support ticket-based authentication to apiserver. You can use MAPR_CLUSTER_TICKET instead of MAPR_CLUSTER_USER and MAPR_CLUSTER_PASSWORD. See REST Secrets on page 3887.
BDP-2631	Update to livenessprobe v2.2.0 image to remove level5 messages
CSI-282	Refresh CSI driver to package latest DFv7.6.1 binaries
CSI-275	'numrpcthreads' is ignored for statically provisioned volumes
CSI-273	Make wait time after starting DF processes configurable - 'startDelay' (default 5 secs)

Container Storage Interface (CSI) Storage Plugin Release 1.0 (Loopback NFS)
These notes describe release 1.0.x of the Container Storage Interface (CSI) Storage Plugin for Loopback NFS.

You may also be interested in the Kubernetes Release Notes. For the latest 1.0.x version, see the `mapr-csi` github repository.

Version	1.0.x
Release Date	November 2020
MapR Version Interoperability	Compatible with release 6.1.0 and later.
Kubernetes Compatibility	Kubernetes 1.17.0 and later.*
OpenShift Compatibility	4.4 and later.
CSI Driver Downloads	See Downloads (CSI) on page 275 for more information.
Documentation	• Overview: Container Storage Interface (CSI) Storage Plugin Overview on page 805 • Installation: Installing, Uninstalling, and Upgrading the Container Storage Interface (CSI) Storage Plugin on page 279 • Supported Versions: CSI Version Compatibility on page 5763
Related Resources	https://www.hpe.com/us/en/resource-library.html

***** Kubernetes alpha features are not supported.

New in this Release

This first release of the Container Storage Interface (CSI) Storage Plugin for NFS includes `.yaml` configuration files that can be installed onto a Kubernetes cluster. Once installed, these containers provide an NFS-based CSI Driver for the file-system volume plug-in and a Kubernetes Dynamic Volume Provisioner that permit static and dynamic provisioning of data-fabric storage from Kubernetes.

You can access the `csi-nfsplugin` by installing the custom resource definition (CRD) using the `csi-maprnfskdf-v<version>.yaml` file. Or you can build your own container and point to the plugin on the Docker hub at `maprtech/csi-nfsplugin:<version>`. For installation information, see Installing, Uninstalling, and Upgrading the Container Storage Interface (CSI) Storage Plugin on page 279.

Release 1.0.x also includes support for dynamic and static provisioning of raw block volumes. For more information, see Raw Block Volumes on page 808.

Patches

None.

Limitations

Note the following limitations:

- CSI Driver version 1.0.x does not support coexistence with the FlexVolume Driver on the same Kubernetes cluster.
- All nodes in the Kubernetes cluster must use the same Linux OS. Configuration files are available to support the following Linux distributions:
  - CentOS

last-updated: Jun 06, 2024

  - RHEL (use CentOS configuration file)
  - Ubuntu
- The CSI Driver does not include support for inline volumes in pods. It supports only PersistentVolumes.

Known Issues

Note the following known issues:

- Snapshot restore fails if the snapshot contains symlinks to other files in the directory.

Resolved Issues

Issue	Description
CSI-30	Enable memory profiling for fuse process w/ trackMemory : true option
CSI-241	Support volume clone for dynamic provisioning
CSI-242	Support snapshot restore for dynamic provisioning
CSI-243	Support for OpenShift 4.4, 4.5, 4.6+ & Kubernetes 1.17, 1.18, 1.19+
CSI-248	Retain fuse logs after pod delete w/ retainLogs: true option
REL-301	Update kdfplugin image w/ 6.2 release bits on centos8
CSI-254	Option 'numrpcthreads' added to configure Number of Client RPC threads (default:1, max:4).
CSI-258	DF client fixes & updates
CSI-259	Reduce verbose logging on CSI logfiles
CSI-262	[BETA] Support ticket-based authentication to apiserver. You can use MAPR_CLUSTER_TICKET instead of MAPR_CLUSTER_USER and MAPR_CLUSTER_PASSWORD. See REST Secrets on page 3887.
BDP-2631	Update to livenessprobe v2.2.0 image to remove level5 messages
CSI-282	Refresh CSI driver to package latest DFv7.6.1 binaries
CSI-275	'numrpcthreads' is ignored for statically provisioned volumes
CSI-273	Make wait time after starting DF processes configurable - 'startDelay' (default 5 secs)

Container Storage Interface (CSI) Storage Plugin Release 1.1.0

These notes describe Release 1.1.0 of the Container Storage Interface (CSI) Storage Plugin.

You may also be interested in the Kubernetes Release Notes.

Version	1.1.0
Release Date	August 2020
MapR Version Interoperability	Compatible with MapR 6.1.0 and later.
Kubernetes Compatibility	Kubernetes 1.16.0 and later.*
OpenShift Compatibility	4.2 and 4.3.
CSI Driver Downloads	See Downloads (CSI) on page 275 for more information.

Documentation	• Overview: Container Storage Interface (CSI) Storage Plugin Overview on page 805 • Installation: Installing, Uninstalling, and Upgrading the Container Storage Interface (CSI) Storage Plugin on page 279 • Supported Versions: CSI Version Compatibility on page 5763
Related Resources	https://www.hpe.com/us/en/resource-library.html

***** Kubernetes alpha features are not supported.

New in this Release

This release of the Container Storage Interface (CSI) Storage Plugin increments the version of the `csi-kdfplugin` to 1.1.0. Release 1.1.0 includes support for all three MapR POSIX licenses (Basic, Container, and Platinum) and allows users to pass custom startup parameters to the FUSE process.

Release 1.1.0 also includes support for volume expansion for dynamic provisioning. For more information, see Example: Volume Expansion for Dynamic Provisioning Using Container Storage Interface (CSI) Storage Plugin on page 3845.

You can access the new `csi-kdfplugin` by installing the custom resource definition using the `csi-maprkdf-v1.1.0.yaml` file. Or you can build your own container and point to the plugin on the Docker hub at `maprtech/csi-kdfplugin:1.1.0`. For installation information, see Installing, Uninstalling, and Upgrading the Container Storage Interface (CSI) Storage Plugin on page 279.

Patches

None.

Limitations

Note the following limitations:

- CSI Driver version 1.1.0 does not support coexistence with the FlexVolume Driver on the same Kubernetes cluster.
- All nodes in the Kubernetes cluster must use the same Linux OS. Configuration files are available to support the following Linux distributions:
  - CentOS
  - Red Hat (use CentOS configuration file)
  - Ubuntu
- The Container POSIX client package is included by default when you install the Container Storage Interface (CSI) Storage Plugin. The Basic, Container, or Platinum POSIX client can be enabled by specifying a parameter in the pod spec. Only the FUSE-based POSIX client is supported. NFSv3 and NFSv4 are not supported.
- The CSI Driver does not include support for inline volumes in pods. It supports only PersistentVolumes.

Known Issues

Note the following known issues:

- On nodeplugin pod restart or upgrade scenario, the existing POSIX client(s) running in the CSI Driver container are killed. The workaround is to move/stop the container workload using MapR CSI Storage Plugin, restart/update the MapR CSI Storage Plugin and start using the MapR CSI Storage Plugin again.
- On Provisioner restart, Provisioner loses the information about the REST server where volume or snapshot should be deleted for existing volume and snapshots provisioned. The administrator must manually remove the volume and/or snapshot for provisioned volumes from the HPE Ezmeral Data Fabric.
- Provisioned snapshot information is written to the provisioner log, but not available in the Kubernetes objects such as volumeSnapshots, VolumesnapshotContents etc.
- If you want read-only behavior, specify `readOnly` in the `volumeAttributes`. For example, the following is supported:

```
csi:
    nodePublishSecretRef:
      name: "mapr-ticket-secret"
      namespace: "test-csi"
    driver: com.mapr.csi-kdf
    volumeHandle: pv-securepv-test-read-only-id
    volumeAttributes:
      volumePath: "/user/root"
      cluster: "clusterA"
      cldbHosts: "10.10.10.210"
      securityType: "secure"
      readOnly: "true"
```

The following is not supported:

```
csi:
    nodePublishSecretRef:
      name: "mapr-ticket-secret"
      namespace: "test-csi"
    driver: com.mapr.csi-kdf
    volumeHandle: pv-securepv-test-read-only-id
    readOnly: true
    volumeAttributes:
      volumePath: "/user/root"
      cluster: "clusterA"
      cldbHosts: "10.10.10.210"
      securityType: "secure"
```

Resolved Issues

Issue	Description
K8S-844	[csi-driver] mapr k8s log rotation policy and clearing of unused mounts (more fixes)
K8S-1199	Ship debugging tools with POSIX client in K8S world
K8S-1405	Support CSI driver for OpenShift 4.3
K8S-1694	[csi-driver] Implemement CSI Spec v1.3 for CSI Driver
K8S-1695	[csi-driver] Implement VolumeExpansion RPC
K8S-1696	[csi-driver] Update all side container images (support k8s 1.15+)

Container Storage Interface (CSI) Storage Plugin Release 1.0.2
These notes describe Release 1.0.2 of the Container Storage Interface (CSI) Storage Plugin.

***** Kubernetes alpha features are not supported.

New in this Release

This release of the Container Storage Interface (CSI) Storage Plugin increments the version of the `csi-kdfplugin` to 1.0.2. Release 1.0.2 adds support for all three MapR POSIX licenses (Basic, Container, and Platinum) and allows users to pass custom startup parameters to the FUSE process.

For new-feature information, see Example: Mounting a PersistentVolume for Static Provisioning on page 3831.

You can access the new `csi-kdfplugin` by installing the custom resource definition using the `csi-maprkdf-v1.0.2.yaml` file. Or you can build your own container and point to the plugin on the Docker hub at `maprtech/csi-kdfplugin:1.0.2`. For installation information, see Installing, Uninstalling, and Upgrading the Container Storage Interface (CSI) Storage Plugin on page 279.

Patches

None.

Limitations

Note the following limitations:

- CSI Driver version 1.0 does not support coexistence with the FlexVolume Driver on the same Kubernetes cluster.
- All nodes in the Kubernetes cluster must use the same Linux OS. Configuration files are available to support the following Linux distributions:
  - CentOS
  - Red Hat (use CentOS configuration file)
  - Ubuntu
- The Container POSIX client package is included by default when you install the Container Storage Interface (CSI) Storage Plugin. The Basic or Platinum POSIX client can be enabled by specifying a parameter in the Pod spec. Only the FUSE-based POSIX client is supported. NFSv3 and NFSv4 are not supported.
- The CSI Driver does not include support for inline volumes in pods. It supports only PersistentVolumes.

last-updated: Jun 06, 2024

Known Issues

Note the following known issues:

- On nodeplugin Pod restart or upgrade scenario, the existing POSIX client(s) running in the CSI Driver container are killed. The workaround is to move/stop the container workload using MapR CSI Storage Plugin, restart/update the MapR CSI Storage Plugin and start using the MapR CSI Storage Plugin again.
- On Provisioner restart, Provisioner loses the information about the REST server where volume or snapshot should be deleted for existing volume and snapshots provisioned. The administrator must manually remove the volume and/or snapshot for provisioned volumes from the HPE Ezmeral Data Fabric.
- Provisioned snapshot information is written to the provisioner log, but not available in the Kubernetes objects such as volumeSnapshots, VolumesnapshotContents etc.
- If you want read-only behavior, specify `readOnly` in the `volumeAttributes`. For example, the following is supported:

```
csi:
    nodePublishSecretRef:
      name: "mapr-ticket-secret"
      namespace: "test-csi"
    driver: com.mapr.csi-kdf
    volumeHandle: pv-securepv-test-read-only-id
    volumeAttributes:
      volumePath: "/user/root"
      cluster: "clusterA"
      cldbHosts: "10.10.10.210"
      securityType: "secure"
      readOnly: "true"
```

The following is not supported:

```
csi:
    nodePublishSecretRef:
      name: "mapr-ticket-secret"
      namespace: "test-csi"
    driver: com.mapr.csi-kdf
    volumeHandle: pv-securepv-test-read-only-id
    readOnly: true
    volumeAttributes:
      volumePath: "/user/root"
      cluster: "clusterA"
      cldbHosts: "10.10.10.210"
      securityType: "secure"
```

Resolved Issues

Issue	Description
K8S-844	MapR K8S log rotation policy and clearing of unused mounts
K8S-1068	Ability to modify the fuse.conf per container basis.
K8S-1208	PODs fail to mount MapR with /opt/mapr/k8s/hostname empty file error.

Container Storage Interface (CSI) Storage Plugin Release 1.0
These notes describe the first release of the Container Storage Interface (CSI) Storage Plugin.

You may also be interested in the Kubernetes Release Notes.

Version	1.0
Release Date	February 2019
MapR Version Interoperability	Compatible with MapR 6.1.0 or later.
Kubernetes Compatibility	Kubernetes 1.13.0 and later.*
OpenShift Compatibility	4.1 and 4.2
CSI Driver Downloads	See Downloads (CSI) on page 275 for more information.
Documentation	Container Storage Interface (CSI) Storage Plugin Overview on page 805
Related Resources	https://www.hpe.com/us/en/resource-library.html

***** Kubernetes alpha features are not supported.

New in this Release

This first release of the Container Storage Interface (CSI) Storage Plugin includes `.yaml` configuration files that can be installed onto a Kubernetes cluster. Once installed, these containers provide a CSI Driver for the file system volume plug-in and a Kubernetes Dynamic Volume Provisioner that permit static and dynamic provisioning of MapR storage from Kubernetes.

Fixes

None.

Limitations

Note the following limitations:

- CSI Driver version 1.0 does not support coexistence with the FlexVolume Driver on the same Kubernetes cluster.
- All nodes in the Kubernetes cluster must use the same Linux OS. Configuration files are available to support the following Linux distributions:
  - CentOS
  - Red Hat (use CentOS configuration file)
  - Ubuntu
- The Basic POSIX client package is included by default when you install the Container Storage Interface (CSI) Storage Plugin. The Platinum POSIX client can be enabled by specifying a parameter in the Pod spec. Only the FUSE-based POSIX client is supported. NFSv3 and NFSv4 are not supported.
- The CSI Driver does not include support for inline volumes in pods. It only supports PersistentVolumes.

Known Issues

Note the following known issues:

- On nodeplugin Pod restart or upgrade scenario, the existing POSIX client(s) running in the CSI Driver container are killed. The workaround is to move/stop the container workload using MapR CSI Storage Plugin, restart/update the MapR CSI Storage Plugin and start using the MapR CSI Storage Plugin again.

last-updated: Jun 06, 2024

- On Provisioner restart, Provisioner loses the information about the REST server where volume or snapshot should be deleted for existing volume and snapshots provisioned. The administrator must manually remove the volume and/or snapshot for provisioned volumes from the HPE Ezmeral Data Fabric.
- Provisioned snapshot information is written to the provisioner log, but not available in the Kubernetes objects such as volumeSnapshots, VolumesnapshotContents etc.
- If you want read-only behavior, specify `readOnly` in the `volumeAttributes`. For example, the following is supported:

```
csi:
    nodePublishSecretRef:
      name: "mapr-ticket-secret"
      namespace: "test-csi"
    driver: com.mapr.csi-kdf
    volumeHandle: pv-securepv-test-read-only-id
    volumeAttributes:
      volumePath: "/user/root"
      cluster: "clusterA"
      cldbHosts: "10.10.10.210"
      securityType: "secure"
      readOnly: "true"
```

The following is not supported:

```
csi:
    nodePublishSecretRef:
      name: "mapr-ticket-secret"
      namespace: "test-csi"
    driver: com.mapr.csi-kdf
    volumeHandle: pv-securepv-test-read-only-id
    readOnly: true
    volumeAttributes:
      volumePath: "/user/root"
      cluster: "clusterA"
      cldbHosts: "10.10.10.210"
      securityType: "secure"
```

Resolved Issues

None.

MapR Data Fabric for Kubernetes FlexVolume Driver Release Notes

This section contains release notes for the MapR Data Fabric for Kubernetes FlexVolume Driver.

MapR Data Fabric for Kubernetes Release 1.1.0

These notes describe version 1.1.0 of the MapR Data Fabric for Kubernetes.

You may also be interested in the Kubernetes documentation.

Version	1.1.0
Release Date	December 2018

last-updated: Jun 06, 2024

MapR Version Interoperability	Compatible with MapR 5.2.2 or later.  **NOTE:** If your installation requires MapR and Kubernetes software to coexist on the same nodes, you must use one of these versions: • Version 1.0.1 with MapR 6.0.1 or later • Version 1.1.0 with MapR 6.1.0 or later
OS Compatibility	The operating system (OS) on a node where the volume plug-in is installed must be a supported OS for the MapR version. For a list of supported OS versions, see Operating System Support Matrix on page 5719.
Kubernetes Compatibility	Kubernetes 1.9 or later.  **NOTE:** Kubernetes alpha features are not supported.
MapR Software Downloads	MapR installation (`.yaml`) files are located here: https://package.ezmeral.hpe.com/tools/KubernetesDataFabric
Source on GitHub	This repository contains Docker images, installation files, and examples: https://github.com/mapr/KubernetesDataFabric
Docker Hub	Docker containers for the MapR installation files are located here: • https://hub.docker.com/r/maprtech/kdf-provisioner/ • https://hub.docker.com/r/maprtech/kdf-plugin/
Documentation	Kubernetes Interfaces for Data Fabric FlexVolume Driver Overview on page 809
Related Resources	https://mapr.com/solutions/data-fabric/kubernetes/

New in This Release

Version 1.1.0 of the MapR Data Fabric for Kubernetes includes a new plug-in and provisioner and uses the updated version of the FUSE POSIX client included in MapR 6.1.0. Version 1.1.0 can be used on cluster nodes that:

- Are installed with MapR software only (MapR 5.2.2 or later)
- Have both MapR software (MapR 6.1.0 or later) and Kubernetes software

This release of the MapR Data Fabric for Kubernetes includes a set of Docker containers and their respective `.yaml` configuration files that can be installed onto a Kubernetes cluster. Once installed, these containers provide a Kubernetes FlexVolume Driver for file system and a Kubernetes Dynamic Volume Provisioner that permit static and dynamic provisioning of MapR storage from Kubernetes.

To upgrade a previously installed version of the plug-in and provisioner to version 1.1.0, see Upgrading the MapR Data Fabric for Kubernetes on page 299.

Fixes

None.

last-updated: Jun 06, 2024

Known Issues and Limitations

Note these limitations:

- Installations that require MapR and Kubernetes software to coexist on the same nodes must use one of the following:
  - Version 1.0.1 with MapR 6.0.1 or later
  - Version 1.1.0 with MapR 6.1.0 or later
- All nodes in the Kubernetes cluster must use the same Linux OS. Configuration files are available to support these Linux distributions:
  - CentOS
  - RedHat (use CentOS configuration file)
  - SSE (use CentOS configuration file)
  - Ubuntu
- Docker for Mac with Kubernetes is not supported as a development platform for containers used with the MapR Data Fabric for Kubernetes.
- Volume plug-in files are supported for:
  - CentOS
  - Ubuntu
  - Microsoft Azure AKS
  - Red Hat OpenShift**
  - Google Kubernetes Engine (GKE)
- Amazon EKS is not supported.
- The Basic POSIX client package is included by default when you install the MapR Data Fabric for Kubernetes. The Platinum POSIX client can be enabled by specifying a parameter in the Pod spec. Only the POSIX client is supported. NFSv3 is not supported.

**OpenShift Origin is supported because it supports Kubernetes 1.9. The OpenShift Container Platform (formerly known as OpenShift Enterprise) can be used only if it supports Kubernetes 1.9 or later.

Resolved Issues

Issue	Description
K8S-310	Node restart causes the KDF driver to not update the volume mount.
K8S-315	Version 1.1.0 uses the FUSE POSIX client included in MapR 6.1.0.
K8S-332	On an upgrade from a previous version of the volume plug-in, POSIX can fail with the following error in the POSIX log file: `Create/Attach to stats shared memory failed.`
K8S-353	Kubelet restart causes the existing volume mount to fail.
K8S-362	Version 1.1.0 provides compatibility with MapR 6.1.0 or earlier volume attributes, as provided in the storage class.
K8S-399	Version 1.1.0 provides ReadWriteMany support with the KDF volume driver.

MapR Data Fabric for Kubernetes Release 1.0.2

These notes describe version 1.0.2 of the MapR Data Fabric for Kubernetes.

You may also be interested in the Kubernetes documentation.

Version	1.0.2
Release Date	July 2018
MapR Version Interoperability	Compatible with MapR 5.2.2 or later. **NOTE:** Version 1.0.2 does *not* support the coexistence of MapR and Kubernetes software on the same nodes. If your installation requires MapR and Kubernetes software to coexist on the same nodes, see the MapR Data Fabric for Kubernetes release notes to identify the latest version that supports coexistence.
OS Compatibility	The operating system (OS) on a node where the volume plug-in is installed must be a supported OS for the MapR version. For a list of supported OS versions, see Operating System Support Matrix on page 5719.
Kubernetes Compatibility	Kubernetes 1.9 or later. **NOTE:** Kubernetes alpha features are not supported.
MapR Software Downloads	MapR installation (`.yaml`) files are located here: https://package.ezmeral.hpe.com/tools/KubernetesDataFabric
Source on GitHub	This repository contains Docker images, installation files, and examples: https://github.com/mapr/KubernetesDataFabric
Docker Hub	Docker containers for the MapR installation files are located here: • https://hub.docker.com/r/maprtech/kdf-provisioner/ • https://hub.docker.com/r/maprtech/kdf-plugin/
Documentation	Kubernetes Interfaces for Data Fabric FlexVolume Driver Overview on page 809
Related Resources	https://mapr.com/solutions/data-fabric/kubernetes/

New in This Release

Version 1.0.2 of the MapR Data Fabric for Kubernetes can only be used on cluster nodes that are installed with MapR software (MapR 5.2.2 or later). Version 1.0.2 cannot be used on cluster nodes having both MapR and Kubernetes software.

This release of the MapR Data Fabric for Kubernetes includes a set of Docker containers and their respective `.yaml` configuration files that can be installed onto a Kubernetes cluster. Once installed, these containers provide a Kubernetes FlexVolume Driver for file system and a Kubernetes Dynamic Volume Provisioner that permit static and dynamic provisioning of MapR storage from Kubernetes.

Fixes

None.

last-updated: Jun 06, 2024

Known Issues and Limitations

Note these limitations:

- Version 1.0.2 does *not* support the coexistence of MapR and Kubernetes software on the same nodes. If your installation requires MapR and Kubernetes software to coexist on the same nodes, see the MapR Data Fabric for Kubernetes release notes to identify the latest version that supports coexistence.
- All nodes in the Kubernetes cluster must use the same Linux OS. Configuration files are available to support these Linux distributions:
  - CentOS
  - RedHat (use CentOS configuration file)
  - SSE (use CentOS configuration file)
  - Ubuntu
- Docker for Mac with Kubernetes is not supported as a development platform for containers used with the MapR Data Fabric for Kubernetes.
- Volume plug-in files are supported for:
  - CentOS
  - Ubuntu
  - Microsoft Azure AKS
  - Red Hat OpenShift**
  - Google Kubernetes Engine (GKE)
- Amazon EKS is not supported.
- The Basic POSIX client package is included by default when you install the MapR Data Fabric for Kubernetes. The Platinum POSIX client can be enabled by specifying a parameter in the Pod spec. Only the POSIX client is supported. NFSv3 is not supported.

**OpenShift Origin is supported because it supports Kubernetes 1.9. The OpenShift Container Platform (formerly known as OpenShift Enterprise) can be used only if it supports Kubernetes 1.9.

Resolved Issues

Issue	Description
K8S-139	Version 1.0.2 includes a fix for UID/GID handling in secure, non-impersonated environments. Before Version 1.0.2, if the UID/GID of the ticket was different from the UID/GID of the container, write operations could fail. With this fix, if the UID/GID of the ticket is different from the UID/GID of the container, all operations are performed using the UID/GID of the ticket.
K8S-164	In version 1.0.1, SELinux relabeling on the pod-container volume mounts caused an issue with the flexvolume-mounted filesystem. (SELinux relabeling is enabled by default for the volume plug-in in version 1.0.1.) In version 1.0.2, the volume plug-in resolves the issue by opting out of SELinux relabeling, reporting `selinux Relabel:false` in its `init` call.

MapR Data Fabric for Kubernetes Release 1.0.1

These notes describe version 1.0.1 of the MapR Data Fabric for Kubernetes.

You may also be interested in the Kubernetes documentation.

last-updated: Jun 06, 2024

Version	1.0.1
Release Date	May 2018
MapR Version Interoperability	Compatible with MapR 5.2.2 or later.  **NOTE:** Version 1.0.1 supports installing MapR and Kubernetes software on the same nodes. However, not all versions of the MapR Data Fabric for Kubernetes support this feature. To identify other versions that support this feature, see the MapR Data Fabric for Kubernetes release notes.
OS Compatibility	The operating system (OS) on a node where the volume plug-in is installed must be a supported OS for the MapR version. For a list of supported OS versions, see Operating System Support Matrix on page 5719.
Kubernetes Compatibility	Kubernetes 1.9 or later.  **NOTE:** Kubernetes alpha features are not supported.
MapR Software Downloads	MapR installation (`.yaml`) files are located here: https://package.ezmeral.hpe.com/tools/KubernetesDataFabric
Source on GitHub	This repository contains Docker images, installation files, and examples: https://github.com/mapr/KubernetesDataFabric
Docker Hub	Docker containers for the MapR installation files are located here: • https://hub.docker.com/r/maprtech/kdf-provisioner/ • https://hub.docker.com/r/maprtech/kdf-plugin/
Documentation	Kubernetes Interfaces for Data Fabric FlexVolume Driver Overview on page 809
Related Resources	https://mapr.com/solutions/data-fabric/kubernetes/

New in This Release

Version 1.0.1 of the MapR Data Fabric for Kubernetes can be used:

- On cluster nodes that are installed with MapR software only (MapR 5.2.2 or later)
- On cluster nodes having both MapR software (MapR 6.0.1 or later) and Kubernetes software

This release of the MapR Data Fabric for Kubernetes includes a set of Docker containers and their respective `.yaml` configuration files that can be installed onto a Kubernetes cluster. Once installed, these containers provide a Kubernetes FlexVolume Driver for file system and a Kubernetes Dynamic Volume Provisioner that permit static and dynamic provisioning of MapR storage from Kubernetes.

Fixes

None.

Known Issues and Limitations

Note these limitations:

last-updated: Jun 06, 2024

- Version 1.0.1 supports installing MapR 6.0.1 or later and Kubernetes software on the same nodes. However, not all versions of the MapR Data Fabric for Kubernetes support this feature. To identify other versions that support coexistence, see the MapR Data Fabric for Kubernetes release notes.
- All nodes in the Kubernetes cluster must use the same Linux OS. Configuration files are available to support these Linux distributions:
  - CentOS
  - RedHat (use CentOS configuration file)
  - SSE (use CentOS configuration file)
  - Ubuntu
- Docker for Mac with Kubernetes is not supported as a development platform for containers used with the MapR Data Fabric for Kubernetes.
- Volume plug-in files are supported for:
  - CentOS
  - Ubuntu
  - Microsoft Azure AKS
  - Red Hat OpenShift**
  - Google Kubernetes Engine (GKE)
- Amazon EKS is not supported.
- The Basic POSIX client package is included by default when you install the MapR Data Fabric for Kubernetes. The Platinum POSIX client can be enabled by specifying a parameter in the Pod spec. Only the POSIX client is supported. NFSv3 is not supported.

**OpenShift Origin is supported because it supports Kubernetes 1.9. The OpenShift Container Platform (formerly known as OpenShift Enterprise) can be used only if it supports Kubernetes 1.9.

Resolved Issues

None

Thin Client Release Notes

This section contains release notes for the lightweight client applications that use the Data Access Gateway to send requests to the HPE Ezmeral Data Fabric.

These client applications, which include Java, C#, Go, Python, and Node.js, provide lightweight libraries that support the OJAI API and function as an alternative to the Java OJAI client.

Go OJAI Thin Client 1.0.1 Release Notes

Describes updates to the Go OJAI Thin Client for version 1.0.1.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	1.0.1
Release Date	May 2022
Source on GitHub	https://github.com/mapr/maprdb-go-client/tags
GitHub Release Tag	https://github.com/mapr/maprdb-go-client/releases/tag/1.0.1
Maven Artifacts	https://repository.mapr.com/maven/
Documentation	Using the Go OJAI Client on page 3473

New in This Release

The Go OJAI Thin Client version 1.0.1 introduces the following enhancements or HPE platform-specific behavior changes:

- Go OJAI Thin Client version 1.0.1 is updated to support GoLang 1.15 and later.
- A new `sslValidate` property has been added. For more information, see Getting Started with the Go OJAI Client on page 3473.
- Go OJAI Thin Client version 1.0.1 adds support for an escape character with the `$like` operator.
- The `checkAndReplace` call has been fixed for use with thin clients. Previously, `checkAndReplace` worked properly for the Java client but returned the wrong response when used with thin clients.

Fixes

This thin client version includes the following fixes:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description

b81baf9a	2020-10-07	MAPRDB-2311 - (Update Go Client) Support Special Characters in OJAI Connection String
136f406c	2021-12-23	MAPRDB-2302 Fixed connecting for go 1.16+
1feb94ed	2021-01-26	MAPRDB-2367 [maprdb ojai golang client] Expected response on checkAndReplace changed
67831873	2021-10-28	MAPRDB-2478 added support of Escape Character with $like operator

For details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

None.

Resolved Issues

Fixed an issue in which the thin client did not work with GoLang 1.16+.

Python OJAI Thin Client 1.1.6 Release Notes

Describes updates to the Python OJAI Thin Client for version 1.1.6.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	1.1.6
Release Date	May 2022
pypi.org Repository	https://pypi.org/project/maprdb_python_client/1.1.6/
Source on GitHub	https://github.com/mapr/maprdb-python-client/tags
Documentation	Using the Python OJAI Client on page 3458

New in This Release

The Python OJAI Thin Client version 1.1.6 introduces the following enhancements or HPE platform-specific behavior changes:

- Python OJAI Thin Client version 1.1.6 adds support for an escape character with the `$like` operator.

Fixes

This thin client version includes the following fixes:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
b42410b3	2022-04-05	MAPRDB-2548 Added support for 'Access denied' exception, on client-side
91c65ff9	2022-03-30	MAPRDB-2545 fixed connection string parser for newer versions of python
a61b6d2a	2022-04-08	MAPRDB-2479 added support of Escape Character with $like operator

last-updated: Jun 06, 2024

For details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

None.

Resolved Issues

Fixed an issue in which the thin client did not work with the latest Python versions.

Java OJAI Thin Client 1.0.3 Release Notes

Describes updates to the Java OJAI Thin Client for version 1.0.3.

These release notes contain only HPE-specific information and are not necessarily cumulative in nature. For information about how to use the release notes, see Ecosystem Component Release Notes on page 5804.

Version	1.0.3
Release Date	May 2022
Maven Artifacts	https://repository.mapr.com/nexus/content/repositories/releases/com/mapr/ojai/mapr-ojai-driver-thin/1.0.3-mapr/
Documentation	Using the Java OJAI Thin Client on page 3450

New in This Release

The Java OJAI Thin Client version 1.0.3 introduces the following enhancements or HPE platform-specific behavior changes:

- Java OJAI Thin Client version 1.0.3 adds support for an escape character with the `$like` operator.

Fixes

This thin client version includes the following fixes:

GitHub Commit Number	Date (YYYY-MM-DD)	HPE Fix Number and Description
dea3757a	2022-04-19	MAPRDB-2480 added support of Escape Character with $like operator

For details, refer to the commit log for this project in GitHub.

Known Issues and Limitations

None.

Resolved Issues

None.

Security Vulnerabilities

This section describes how to find information about potential security vulnerabilities in HPE Ezmeral Data Fabric software.

When HPE identifies a potential security vulnerability in the Data Fabric software, a notice is written and posted to the HPE Support Center. Support notices often tell you how to resolve, work around, or mitigate

the vulnerability. Following are some recent notices (a Support Center login might be required to view the notices):

- Impact of CVE-2022-22965, CVE-2022-22963, CVE-2022-22950 affecting Ezmeral Data Fabric components using Spring libraries
- CVE-2021-44228 and CVE-2021-45046 Apache Log4j2 security vulnerabilities
- Mitigating log4j 1.x vulnerabilities CVE-2022-23302, CVE-2022-23305 and CVE-2022-23307
- CVE-2019-17638, CVE-2020-27218: Vulnerabilities in jetty-server

More notices are available on the HPE Support Center. To search for them, see Support Articles in the HPE Support Center on page 6197. See also the HPE Security Bulletin Library.

To sign up for support alerts, see Get connected with updates from HPE.

Container Image Vulnerabilities and CVE Reports

Describes how HPE Ezmeral Engineering provides software updates to address container image vulnerabilities.

HPE Ezmeral Engineering takes security very seriously and makes every effort to ensure that the container images for HPE Ezmeral software products are free of known vulnerabilities at the time of release. However, because new vulnerabilities are always being discovered and reported, it is likely that scanning product images with tools such as Trivy will show lists of CVEs that affect packages inside the images.

The HPE Ezmeral Engineering team also regularly scans product images to identify new vulnerabilities and creates action plans to modify the product images. Please note that most vulnerabilities are present in open-source software leveraged by HPE Ezmeral Engineering. Therefore, HPE Ezmeral Engineering determines when it is best to update products with updated open-source content.

HPE Ezmeral Engineering typically updates vulnerable packages from one minor software product version to the next (for example, from 1.3 to 1.4). For critical vulnerabilities, HPE may provide security-patched container images outside of the established software release cycle, in accordance with the following table.

To keep your platform as secure as possible, please ensure that you upgrade or patch your HPE Ezmeral Software to the latest available software.

Severity (CVSS Base Score Range)	SLA of Response
Critical (9.0 – 10.0)	HPE Ezmeral Engineering will prioritize and begin working on a fix. The team will make the fix available as soon as possible. This might take the form of a special maintenance release of an HPE Ezmeral software product for the sole purpose of making the fix available. If it is possible to deploy the fix as a patch more quickly or conveniently, the patch will also be made available. In the meantime, the support team will work with the community to mitigate the issue.
High (7.0 – 8.9)	HPE Ezmeral Engineering will include a fix in the next planned release (major or minor) of the HPE Ezmeral software product. HPE Ezmeral software releases typically happen on a quarterly basis. The fix will be made available in patch form for customers who want to deploy it sooner, and the support team will assist with applying the patch.
Medium (4.0 – 6.9)	HPE Ezmeral Engineering will include a fix in the next planned release (major or minor) of the HPE Ezmeral product.
Low (0.1 – 3.9)	HPE Ezmeral Engineering will include a fix in the next major release of the HPE Ezmeral product, or the team will provide detailed steps that can be taken to mitigate the issue.

Web Browser Security Issues

This section describes security issues with web browsers.

last-updated: Jun 06, 2024

Web browsers and web servers often need to update their security requirements and configurations to ensure secure communication. Sometimes when web browser security requirements change, the browser is no longer able to connect to the Control System or other web interfaces.

The following fixes are available to resolve browser connection issues caused by changes in browser security requirements, or by an organization's need to maintain legacy (insecure) protocols:

Issue	Affects MapR Version
Weak Ephemeral Diffie-Hellman Key	3.x, 4.x, and 5.0
Unable to Establish a Secure Connection	3.1.x, 4.0.x
Requirement to Enable Insecure Protocols (Not Recommended)	5.1

NOTE: Based on your MapR version, you may need to apply the fix for more than one issue.

Unable to Establish a Secure Connection
This section describes secure connection issues.

Recent versions of Safari and Chrome web browsers have removed support for older certificate cipher algorithms, including those used by some versions of MapR. Because of this, users of these new browser versions may lose the ability to log into the Control System.

A fix for this issue is available in MapR Versions 4.0.2 and later. Existing clusters can be patched to workaround this issue. Information and installation instructions for this patch are found later in this document. For additional fixes that you may also want to apply at this time, see Web Browser Security Issues.

Affected Versions

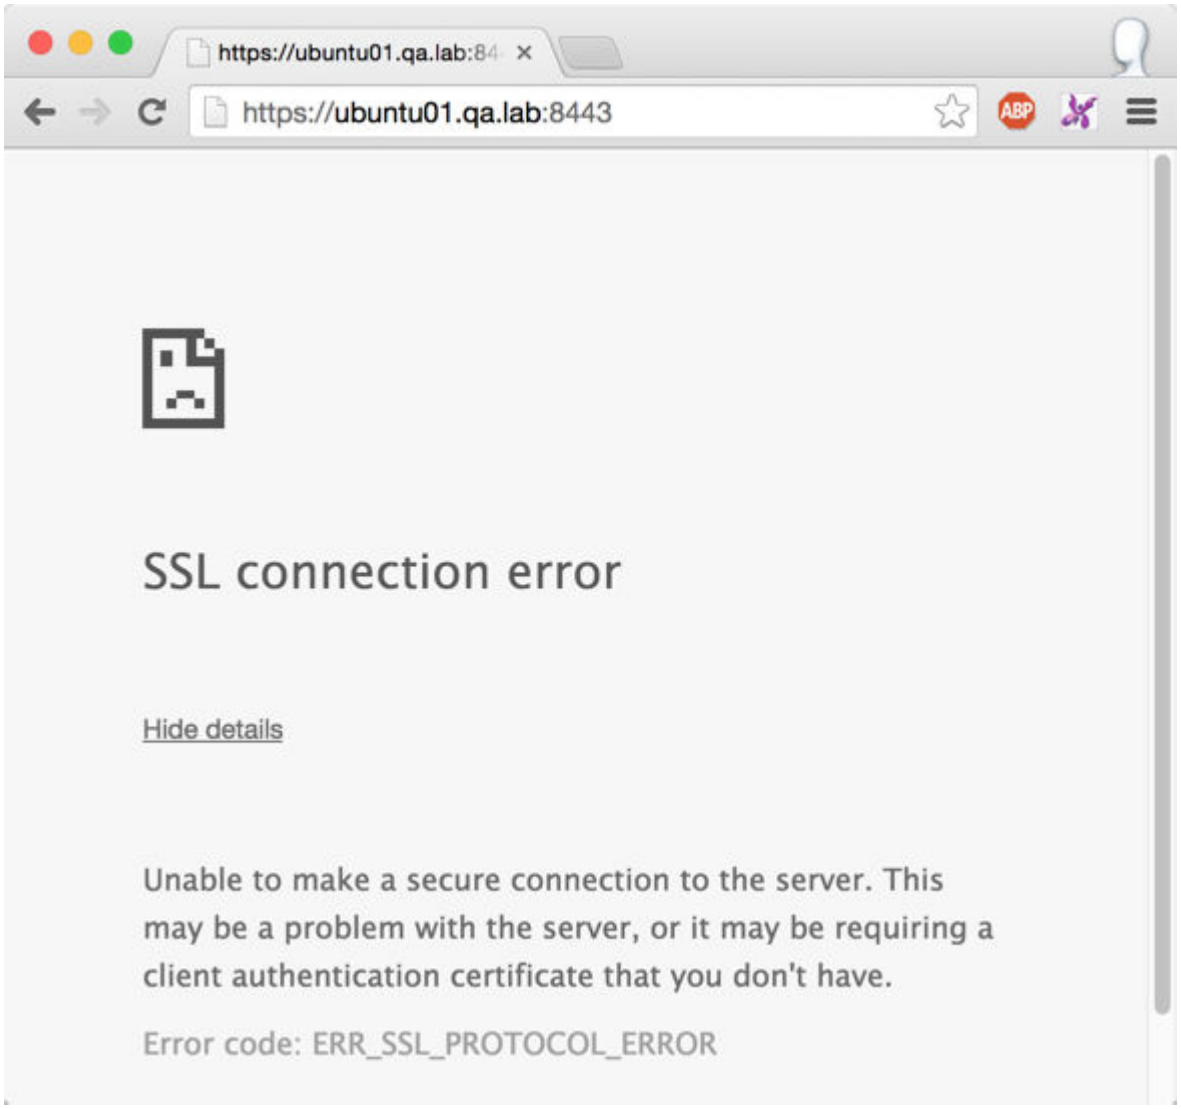
To determine whether you will be affected, your MapR version must be in the range listed in the MapR section below, and you must be accessing the Control System using a browser version listed in either the Safari or Chrome sections.

- MapR - Versions 3.1, 3.1.1, 4.0.0, and 4.0.1
- Safari - Versions 7.0 and higher.
- Chrome - Versions 39.0 and higher.

Symptoms

Error message for Chrome:

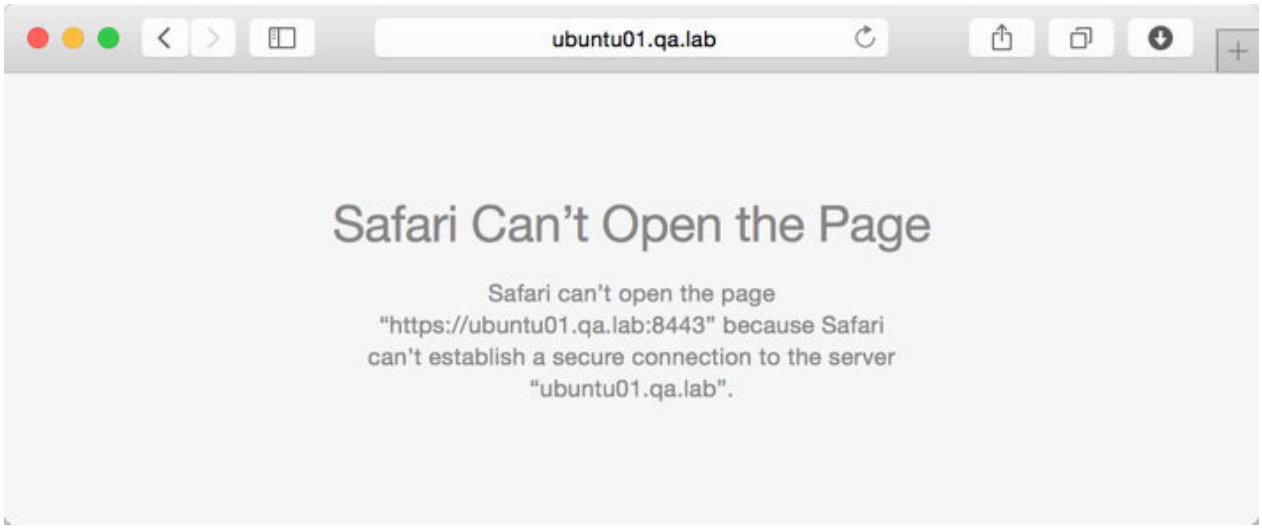
```
          SSL connection error. Unable to make a secure connection to the
server.
          This maybe a problem with the server,
          or it may be requiring a client authentication certificate that
you don't have.
          Error code: ERR_SSL_PROTOCOL_ERROR
```



Error message for Safari

```
          Safari can't open the page <URL>
          because Safari can't establish a secure connection to the server
<server name>.
```

last-updated: Jun 06, 2024



Patching your Cluster

The steps to implement the fix for a secure cluster (cluster with wire-level security) differ from the steps to implement the fix on a non-secure cluster. However, in both cases, you will use the fixssl script to generate new versions of the ssl_keystore and ssl_truststore.

While you are implementing the fix on a non-secure cluster, the webserver will experience a brief downtime. The impact on a secure cluster will be greater, as more services will need to be restarted for the patch to take effect. You have a secure cluster if you use wire-level security to encrypt data transmission between the nodes in your cluster.

Patching a Secure Cluster
Explains how to patch a secure cluster when you are unable to establish a secure connection.

About this task
Once the fix is complete, no further action is required except to access the Control System and other web interfaces, such as the JobTracker UI and the ResourceManager UI.

Procedure

1. Perform the following steps on any cluster node:
   a) Download the script from the following location: https://package.ezmeral.hpe.com/scripts/mcs/ For example:

      ```
      wget https://package.ezmeral.hpe.com/scripts/mcs/fixssl
      ```

   b) Run the following command to update the permissions on the file:

      ```
      chmod 755 fixssl
      ```

last-updated: Jun 06, 2024

c) Run the following command to run the script:

```
sudo ./fixssl
```

Once you run the script, the following is displayed

```
Creating 10 year self signed certificate with
subjectDN='CN=*.us-west-2.compute.internal'
Certificate stored in file </tmp/tmpfile-mapcert.3743>
Certificate was added to keystore

**********************************************************************
******************
* In order for your cluster to work, please copy the following files
in /opt/mapr/conf  *
* to all the nodes in the cluster, to the same directory:
ssl_keystore ssl_truststore   *
* After copying the files to the other nodes, please restart CLDB,
Webserver, and any   *
* other service that utilizes https (Jobtracker,
tasktracker)                          *
* (See doc for more details if you do not wish to have downtime in
your cluster)       *
**********************************************************************
******************
```

2. On each node in the cluster, back up existing certificates and copy the certificates to all other nodes in the cluster. For example:

```
$ maprcli node list -columns ip
 hostname ip
 ip-172-31-18-196.us-west-2.compute.internal 172.31.18.196
 ip-172-31-18-197.us-west-2.compute.internal 172.31.18.197
 ip-172-31-18-198.us-west-2.compute.internal 172.31.18.198
 ip-172-31-18-199.us-west-2.compute.internal 172.31.18.199
 ip-172-31-18-200.us-west-2.compute.internal 172.31.18.200

$ ssh 172.31.18.200 "mv /opt/mapr/conf/ssl_keystore /opt/mapr/conf/
ssl_keystoreold"

$ ssh 172.31.18.200 "mv /opt/mapr/conf/ssl_truststore /opt/mapr/conf/
ssl_truststoreeold"

 $ scp /opt/mapr/conf/ssl_keystore /opt/mapr/conf/ssl_truststore
mapr@172.31.18.200:/opt/mapr/conf
```

last-updated: Jun 06, 2024

3. Restart the CLDB secondary services. To do this, first you determine which cluster nodes are running the CLDB service and then determine which node is running the primary CLDB. The secondary instances are the non-primary CLDB nodes. For example:

```
$ maprcli node list -columns configuredservice -filter
'[configuredservice==cldb]'
 hostname
configuredservice                                  ip
 ip-172-31-18-198.us-west-2.compute.internal
webserver,cldb,fileserver,nfs,hoststats,jobtracker  172.31.18.198
 ip-172-31-18-199.us-west-2.compute.internal
webserver,cldb,fileserver,nfs,hoststats,jobtracker  172.31.18.199
 ip-172-31-18-200.us-west-2.compute.internal
webserver,cldb,fileserver,nfs,hoststats,jobtracker  172.31.18.200

 $ maprcli node cldbmaster

cldbmaster

 ServerID: 8868598593037642491 HostName:
ip-172-31-18-199.us-west-2.compute.internal

 $maprcli node services -cldb restart -nodes 172.31.18.198
172.31.18.200
```

4. Restart half of the TaskTracker and Nodemanager services.
   a) List all TaskTracker or NodeManager Hosts. For example:

```
 $ maprcli node list -columns configuredservice -filter
'[configuredservice==tasktracker]or[configuredservice==nodemanager]'
 hostname
configuredservice                     ip
 ip-172-31-18-196.us-west-2.compute.internal
fileserver,tasktracker,nfs,hoststats  172.31.18.196
 ip-172-31-18-197.us-west-2.compute.internal
fileserver,tasktracker,nfs,hoststats  172.31.18.197
```

   b) Restart TaskTracker and NodeManager services on half of the nodes that run those services. For example, the following command will restart both TaskTracker and NodeManager services on all nodes specified. If either service is not configured on that node, it will ignore it.

```
 $ maprcli node services -multi '[{ "name": "tasktracker", "action":
"restart"}, { "name": "nodemanager", "action": "restart"}]' -nodes
172.31.18.196
 ERROR (10002) -  Service: nodemanager is not configured on node:
ip-172-31-18-196.us-west-2.compute.internal
```

5. Restart JobTracker and ResourceManager services.

last-updated: Jun 06, 2024

a) List all nodes running JobTracker or ResourceManager. For example:

```
$ maprcli node list -columns configuredservice -filter
'[configuredservice==jobtracker]or[configuredservice==resourcemanager]
'
hostname
configuredservice                                      ip
ip-172-31-18-198.us-west-2.compute.internal
webserver,cldb,fileserver,nfs,hoststats,jobtracker  172.31.18.198
ip-172-31-18-199.us-west-2.compute.internal
webserver,cldb,fileserver,nfs,hoststats,jobtracker  172.31.18.199
ip-172-31-18-200.us-west-2.compute.internal
webserver,cldb,fileserver,nfs,hoststats,jobtracker  172.31.18.200
```

b) Restart JobTracker and ResourceManager services. For example, the following command will restart both JobTracker and ResourceManager services on the specified nodes. If either service is not configured on that node, it will ignore it.

```
$ maprcli node services -multi '[{ "name": "jobtracker",
"action": "restart"}, { "name": "resourcemanager", "action":
"restart"}]' -nodes 172.31.18.198 172.31.18.199 172.31.18.200
ERROR (10002) -  Service: resourcemanager is not configured on node:
ip-172-31-18-199.us-west-2.compute.internal
ERROR (10002) -  Service: resourcemanager is not configured on node:
ip-172-31-18-200.us-west-2.compute.internal
ERROR (10002) -  Service: resourcemanager is not configured on node:
ip-172-31-18-198.us-west-2.compute.internal
```

6. Restart remaining TaskTracker and NodeManager services. For example, the following command will restart both TaskTracker and NodeManager services on the specified nodes. If either service is not configured on that node, it will ignore it.

```
$ maprcli node services
-multi '[{ "name": "tasktracker", "action": "restart"}, { "name":
"nodemanager", "action": "restart"}]'
-nodes 172.31.18.197 ERROR (10002) -  Service: nodemanager is not
configured on node: ip-172-31-18-197.us-west-2.compute.internal
```

7. Restart additional secure services (Oozie, HistoryServer, Webserver, HiveServer2, Hue). For example, the following command can be run with the IPs or hostnames of all nodes in the cluster, as it will only restart the services that it finds:

```
$ maprcli node services
                    -multi '[{ "name": "hue", "action": "restart"},
                        { "name": "historyserver", "action": "restart"},
                        { "name": "webserver", "action": "restart"},
                        { "name": "oozie", "action": "restart"},
                        { "name": "hs2", "action": "restart"}]'
                    -nodes 172.31.18.198 172.31.18.199 172.31.18.200
172.31.18.196 172.31.18.197
```

last-updated: Jun 06, 2024

8. Restart CLDB primary service. For example:

```
$ maprcli node cldbmaster
cldbmaster

ServerID: 8868598593037642491 HostName:
ip-172-31-18-199.us-west-2.compute.internal

$ maprcli node services -cldb restart -nodes 172.31.18.199
```

Results

The fixssl script performs the following steps on a node in a secure cluster:

1. Updates manageSSLKeys.sh to use the new certificate cipher algorithm.
2. Backs up the existing certificates so that new versions can be generated with the new cipher algorithm:
   - `/opt/mapr/conf/ssl_keystore` is renamed to `/opt/mapr/conf/ssl_keystore_old`
   - `/opt/mapr/comf/ssl_truststore` is renamed to `/opt/mapr/comf/ssl_truststore_old`
3. Runs the following command to generate new versions of the keystore and truststore files:

```
/opt/mapr/manageSSLKey.sh  create -N <clustername> -ug
<maprusername>:<maprgroup>
```

   - The cluster name is retrieved from `/opt/mapr/conf/mapr-clusters.conf`.
   - The `mapr` user and `mapr` group is retrieved from `/opt/mapr/conf/daemon.conf`.

Weak Ephemeral Diffie-Hellman Key

Recently, some web browsers have updated their list of supported cipher algorithms which are used to ensure secure communication between the browser and web server. Due to this update, new browser versions may lose the ability to login to the Control System and other web interfaces since the ciphers supported by the web browser do not match the ciphers supported by the web servers.

Affected Versions

- MapR - Versions 3.x, 4.x, and 5.0
- Browsers - Latest versions such as Chrome 45 and Firefox 39

Symptoms

Users might see the following error messages if they encounter the issue:

Table

Browser	Error Message
Firefox	`An error occurred during a connection to <ip>:<port>. SSL received a weak ephemeral Diffie-Hellman key in Server Key Exchange handshake message. (Error code: ssl_error_weak_server_ephemeral_dh_key)`
Chrome	`Server has a weak ephemeral Dillie-Heffman public key` or `ERR_SSL_WEAK_EPHEMERAL_DH_KEY`

How to Fix the Issue

Based on the Cluster version that you have, perform one of the following options to fix the issue:

Table

Version	Option(s)
4.x and 5.0	Apply the latest patch on every node in the cluster. -or- Edit the core-site.xml file on each node with a service that runs a web server.
3.x	Edit the core-site.xml file on each node with a service that runs a web server.

Editing core-site.xml

About this task

With this option, you update the core-site.xml on each node with a service that runs a web server such as WebServer (Control System), ResourceManager, and HistoryServer nodes. Then, restart the services associated with the web servers. For example, you would need to restart the webserver service on the node that runs the Control System.

Procedure

1. Add the following configuration to the core-site.xml on each node with a service that runs a web server:

```
<property>
  <name>hadoop.ssl.exclude.cipher.suites</name>
  <value>
SSL_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA,SSL_RSA_EXPORT_WITH_DES40_CBC_SHA,S
SL_RSA_EXPORT_WITH_RC4_40_MD5,TLS_DHE_RSA_WITH_AES_128_CBC_SHA,TLS_DHE_RS
A_WITH_AES_256_CBC_SHA,TLS_DHE_RSA_WITH_AES_256_CBC_SHA256,TLS_DHE_DSS_WI
TH_AES_256_CBC_SHA256,TLS_DHE_DSS_WITH_AES_256_CBC_SHA,TLS_DHE_RSA_WITH_A
ES_128_CBC_SHA256,TLS_DHE_DSS_WITH_AES_128_CBC_SHA256,TLS_DHE_DSS_WITH_AE
S_128_CBC_SHA
 </value>
</property>
```

   - For MapR 3.x clusters, the core-site.xml file is in the following location: /opt/mapr/hadoop/hadoop-0.20.2/conf/
   - For MapR 4.x and 5.x clusters, the core-site.xml file is in the following location: /opt/mapr/hadoop/hadoop-2.x.x/etc/hadoop/

2. Restart services associated with web servers.

   For example:

   - To restart the Control System webserver: `maprcli node services -webserver restart -nodes <webserver nodes>`
   - To restart the ResourceManager service(s): `maprcli node services -name resourcemanager -action restart -nodes <space delimited list of resourcemanager nodes>`

Requirement to Enable Insecure Protocols

HPE Ezmeral Data Fabric disables insecure protocols by default. For example, TLSv1 and SSLv3 are disabled by default due to their associated security risks. In the event that your client environment or crypto libraries cannot be upgraded, you can decide to enable insecure protocols.

last-updated: Jun 06, 2024

NOTE: Enabling insecure protocols is not recommended as the security of communications between the browser and web server is put at risk.

To enable insecure protocols:

1. Based on your requirements, add one of the following configurations to the core-site.xml file on each node with a service that runs a web server:
   - To enable SSLv3:

     ```
     <property>
      <name>hadoop.ssl.exclude.insecure.protocols</name>
      <value>SSLV3</value>
     </property>
     ```

   - To enable TLSv1:

     ```
     <property>
      <name>hadoop.ssl.exclude.insecure.protocols</name>
      <value>TLSV1</value>
     </property>
     ```

   - To enable all insecure protocols that HPE Ezmeral Data Fabric disables by default:

     ```
     <property>
      <name>hadoop.ssl.exclude.insecure.protocols</name>
      <value></value>
     </property
     ```

   The core-site.xml is in the following location: `/opt/mapr/hadoop/hadoop-2.x.x/etc/hadoop/`
2. Restart services associated with web servers.

   Examples:
   - To restart the Control System webserver:

     ```
     maprcli node services -webserver restart -nodes <webserver nodes>
     ```

   - To restart the ResourceManager service(s):

     ```
     maprcli node services -name resourcemanager -action restart -nodes
     <space delimited list of resourcemanager nodes>
     ```

Previous Versions

This page contains links to the documentation for releases that are currently supported or have recently reached end-of-life.

- Data Fabric 7.2
- Data Fabric 7.1
- Data Fabric 7.0
- Data Fabric 6.2

last-updated: Jun 06, 2024

- Data Fabric 6.1

The "Other Docs" section contains release 7.x documentation and documentation that applies to multiple releases, such as:

- Interoperability matrix
- Release notes for ecosystem components
- Installer documentation
- Security vulnerability information

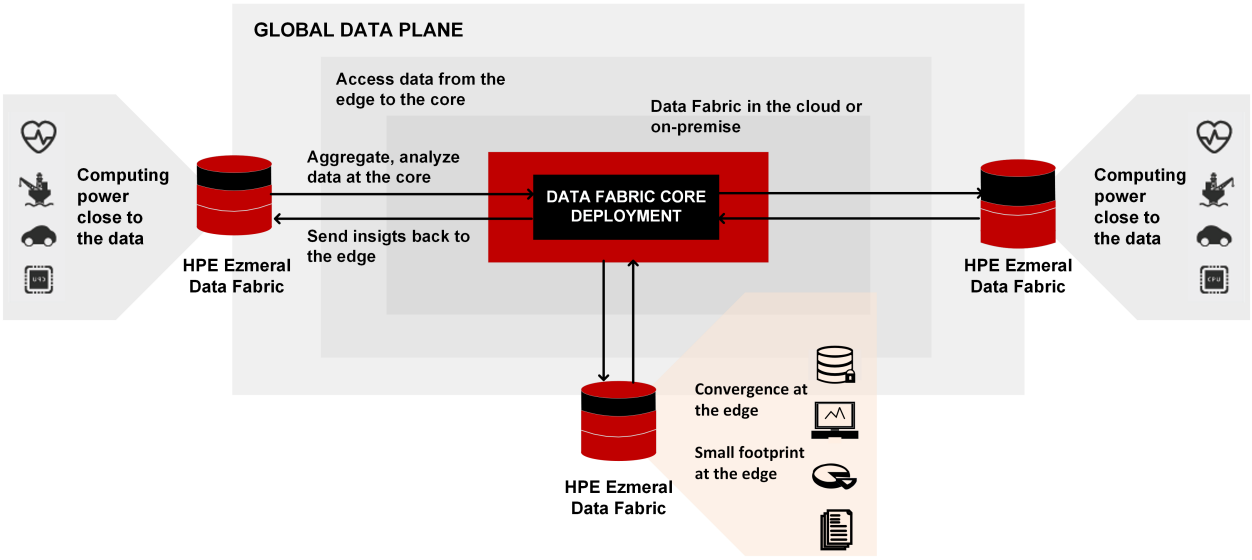
HPE Ezmeral Data Fabric Edge

This section contains information about HPE Ezmeral Data Fabric Edge, which is a small footprint edition of the HPE Ezmeral Data Fabric. HPE Ezmeral Data Fabric Edge is designed to capture, process, and analyze IoT data close to the source.

HPE Ezmeral Data Fabric Edge is a small footprint edition of the HPE Ezmeral Data Fabric and you can use it to capture, process, and analyze IoT data close to the source.

HPE Ezmeral Data Fabric Edge is a fully-functional Data Fabric cluster that can be run on small form-factor commodity hardware, such as Intel NUCs. HPE Ezmeral Data Fabric Edge clusters are supported in three- to five-node configurations. Each cluster supports the full capabilities of the Data Fabric, including the capacity for files, tables, and streams, along with related data management and protection capabilities such as security, snapshots, mirroring, replication, and compression.

HPE Ezmeral Data Fabric Internet of Things



Installation, Configuration, and Management

Install, configure, and manage HPE Ezmeral Data Fabric Edge clusters and nodes the same way you handle traditional Data Fabric clusters and nodes. Each cluster is managed and monitored independently.

If you are installing an HPE Ezmeral Data Fabric Edge cluster, you must ensure to configure the nodes according to the guidelines in the table below (HPE Ezmeral Data Fabric Edge Supported Cluster Configuration). Pay special attention to node hardware minimums and maximums, the number of supported storage pools, and caveats around upgrades and failure tolerances for different cluster sizes.

last-updated: Jun 06, 2024

All HPE Ezmeral Data Fabric Edge clusters must be deployed in conjunction with a core HPE Ezmeral Data Fabric Edge cluster. You must use one or more of the Data Fabric data-replication features to synchronize data from Edge-to-Core, such as Data Fabric mirroring, HPE Ezmeral Data Fabric Database table replication, or HPE Ezmeral Data Fabric Streams replication.

HPE Ezmeral Data Fabric Edge Supported Cluster Configuration

Before you architect your system to use HPE Ezmeral Data Fabric Edge, consider the following supported-configuration specifications:

Specification	Value		
Number of Nodes[1] Per Cluster	Three[2]	Four[2]	Five
Max No of Data Drives Per Node	Up to 4		
Storage Capacity (Usable)[3]	Min : 64GB Max : 10TB		
Replication Factor	Up to 3X		
No. of Storage Pools (per Node)	1		
Cluster Failure Tolerance [4]	1 node		2 nodes
Node Config Types	Homogeneous[5]		
Boot Disk Per Node	1 (Min 20GB)		
Processing Services	Spark, Drill		
Included Software	file system, HPE Ezmeral Data Fabric Database, HPE Ezmeral Data Fabric Streams		
Node Hardware Specs	CPU-Type : x86(64Bit), Cores: 2 - 4, RAM: 16 - 32 GB, Disk-Type : SATA,SAS,SSD, vDisk Speed: 1Gb minimum, 10Gb		
Online Software Upgrade and Patching	Offline Upgrade or Rolling Upgrade		
Supported Core Software Version	Release 5.2 and later		
Supported Deployments	Bare Metal or Virtual Instances		

[1] Node is defined as “data node” or a node running a FileServer process. The node is responsible for storing data on behalf of the entire cluster. Nodes deployed with control-only services like CLDB and ZooKeeper do not count towards minimum node count as they do not contribute to overall availability of data

[2] Clusters with less than 5 nodes may exhibit variable performance, especially during times of failure recovery when node resources are consumed with re-replication of data.

[3] Usable storage defined by total disk size divided by replication factor.

[4] This defines how many failures a cluster can sustain and still keep the cluster accessible to its clients/apps. Definition of failure includes anything that makes a node become unavailable, including hardware failure, software failure, disk failure, network failure, or power failure. HPE cannot assure data integrity for any additional failures beyond this count.

[5] All nodes must be exactly same in terms of capacity, including number of drives, amount of memory, type of cpu, and so forth.

last-updated: Jun 06, 2024

Additional Design Considerations for Edge Clusters

The table above lists several unique considerations for clusters of less than 5 nodes. Carefully design your deployment to achieve a particular RPO/RTO, taking these considerations into account. Some strategies for increasing availability and RPO/RTO in case of smaller clusters include:

- Continuously moving critical data from the edge cluster to a core cluster using Data Fabric replication features like mirroring, HPE Ezmeral Data Fabric Database table replication, and streams replication. This strategy minimizes RPO/RTO in case of multi-failure scenarios.
- Limiting reliance on any single point of failure infrastructure, such as chassis, power source, disk, or network device. Power and network redundancy are strongly recommended. This decreases the likelihood of a multiple failure scenario.

Edge Cluster Use Cases

Collecting Data from Remote Sites

You can manage data collection requirements for remote sites using HPE Ezmeral Data Fabric Edge.

Example

An oil company might have a central cluster in Houston and multiple remote sites, including oil drills in cities, such as Galveston, San Antonio, Dallas, and so forth. Information, such as the temperature, revolutions per minute (RPM), gallons of oil pumped/minute, and so forth are remotely processed by a local cluster from the pumps. On an as-needed basis, a subset of extract, transform, and load (ETL) data can be collected, acquired, and then mirrored to the central cluster in Houston using HPE Ezmeral Data Fabric Edge.

Managing Data Requirements for Analytics in the Cloud or on Containers

You might have scalable or burst compute needs for which cloud service providers, such as AWS, Azure, or Google Cloud Platform are used. You can manage these types of requirements with HPE Ezmeral Data Fabric Edge.

Example

To manage data requirements for analytics in the cloud or on containers with HPE Ezmeral Data Fabric Edge:

1. Create an Edge cluster on the cloud.
2. Mirror the data, as needed, for the compute or analytics job.
3. Remove the cluster.

Support Articles in the HPE Support Center

Data Fabric support articles moved to the HPE Support Center in 2022, changing the way you find and access the support articles.

Creating an HPE Passport Account

To access the HPE Support Center, you need an HPE Passport account. See Obtaining an HPE Passport Account on page 103.

Searching for Data Fabric Support Articles

The HPE Support Center contains support content for all HPE products, which can make it difficult to find Data Fabric content. To search for Data Fabric support articles:

1. Navigate to the HPE Support Center home page.

2. Sign in using your HPE Passport account.
3. Navigate to the HPE Ezmeral Data Fabric home page in the Support Center.
4. To view:
   - CVE advisories:
     a. Click the **Alerts** tab.
     b. Click the **Advisory** button.
   - Support articles:
     a. Click the **Manuals and Guides** tab.
     b. Click the **Troubleshooting** button.
     c. Search on a keyword, or if you know the article number, type in the number.

Sign up for Support Alerts

To sign up for support alerts, see Get connected with updates from HPE.

Linking Your Support Agreement to a Passport Account

If you have a Data Fabric cluster, but the cluster is not linked to your HPE Passport account, use the following steps to link your support agreement to the account:

1. Link your support agreement (SAID/SAR) to your Passport account:
   a. If you have the SAID/SAR for your support agreement, go to the next step. If you don't know your SAID/SAR, open a case below to inform HPE Support).
   b. Click here to access the support home page.
   c. Select **Link Support Agreements**, then register your SAID/SAR (be sure to select the ownership type as **Multiple**).
2. Click here, and use the following steps to open a case with the Ezmeral support team:
   a. Expand the **linked support agreements** section.
   b. Expand the **Support Account Reference** section.
   c. Select **Submit a case for the corresponding serial number** (cluster ID/Platform ID).
   d. Complete all required fields, and click **Submit**.
3. With your cluster linked to your Passport account, you can use the HPE support case manager home page to navigate the support site.

For more information about linking contracts and warranties, see this support article.

More information

Contact HPE

HPE Ezmeral Data Fabric

Doc Site Available as a PDF

Provides a link to the downloadable PDF file containing all the information for the current release.

last-updated: Jun 06, 2024

For a given release, you can access HPE Ezmeral Data Fabric documentation as a single, downloadable PDF file. A PDF file of each release is compiled several weeks after the release becomes public and is available for download from the HPE Support Center.

Here is the PDF location for the current release:

You can also download the PDF from the HPE Support Center:

1. Navigate to the Support Center home page for a Data Fabric release:
   - HPE Ezmeral Data Fabric – Customer-Managed 7.6.1 Documentation
   - HPE Ezmeral Data Fabric – Customer-Managed 7.5.0 Documentation
   - HPE Ezmeral Data Fabric – Customer-Managed 7.4.0 Documentation
   - HPE Ezmeral Data Fabric – Customer-Managed 7.3.0 Documentation
   - HPE Ezmeral Data Fabric – Customer-Managed 7.2.0 Documentation
   - HPE Ezmeral Data Fabric – Customer-Managed 7.1.0 Documentation
   - HPE Ezmeral Data Fabric – Customer-Managed 7.0.0 Documentation
2. Above the right-navigation pane, click the **PDF** button, and select **Export all content**. A PDF file is downloaded to your workstation.

IMPORTANT: PDF files are updated infrequently. They are a snapshot of the available information at the time the PDF was created. For the most current technical information, HPE recommends that you refer to the HTML pages at this location. The HTML pages:

- Are updated continuously.
- Provide a **Feedback** button that enables you to submit comments or corrections.
- Can make it easier to access multimedia resources, such as product videos.

Product Licensing

Provides information related to product licensing.

HPE EZMERAL DATA FABRIC SOFTWARE LICENSING

Contains HPE Ezmeral Data Fabric software licensing information.

Your order includes both a license agreement and a quote. Detailed instructions for obtaining a software license key are available in the HPE support policy. Through the order package, HPE grants the licensee a nonexclusive license to use HPE Ezmeral Data Fabric software when the licensee lawfully obtains it, up to the level of authorized use specified in the customer contract.

SOFTWARE LICENSE KEYS

For each HPE Ezmeral Data Fabric installation, a software license key is created. This applies to both new and upgraded software. This license key is generated based on a cluster ID. The cluster ID is generated once the software is installed on a cluster.

last-updated: Jun 06, 2024

HPE EZMERAL DATA FABRIC PRODUCT LICENSING

HPE licenses its software as a term-subscription for a fixed period of time that is outlined in the customer quote. Other terms that might be specific to your agreement will also be outlined in your quote. An HPE term-subscription typically authorizes the licensee to use the most current commercially available version, release, or update of HPE Ezmeral Data Fabric products.

HPE Data Fabric products are sometimes sold based on capacity under management, which can be measured by terabyte or compute unit. The minimum for HPE Data Fabric File and Object Store is 250 terabytes of HDD or 100 terabytes of SSD, when purchased without other products. HPE Data Fabric requires a minimum of 5 compute units (or nodes) per cluster.

At the end of each fixed term [most commonly 36 months] the customer may choose to renew the licenses for an additional 36 months [at the prevailing price]. If the term-subscription is not renewed, the licensee will no longer have the rights to use the software, will no longer be entitled to the benefits of support, and must destroy all copies of the software.

DEFINITIONS

HDD Capacity Under Management Total hard disk capacity allocated to and managed by HPE Ezmeral Data Fabric products. Capacity Under Management is measured in terabytes 1TB.

SSD Capacity Under Management Total SSD capacity allocated to and managed by HPE Ezmeral Data Fabric products. Capacity Under Management is measured in TB. SSD is based on SATA and SAS interconnects and does not include PCIe-based NVME drives.

Client

A piece of computer software that embeds HPE Ezmeral Data Fabric software to access a service made available by an HPE Ezmeral Data Fabric server.

User

User means an individual authorized by the customer to use the software, regardless of whether the individual is actively using the programs at any given time.

Compute Unit

A compute unit is a server or virtual machine that does not exceed 1 motherboard, 4 CPU sockets, 32 total cores [including virtual cores) and 256GB of RAM.
If a server or virtual machine exceeds any of these parameters, it will be counted as two or more compute units, depending on the factor by which the respective parameter[s) are exceeded.

Attribute	Quantity/Size
Motherboard	1
CPU Sockets	4
Cores	32
Main memory	256GB

Motherboard

The motherboard is the main circuit board of your computer and is also known as the mainboard or logic board.

CPU Socket

The CPU socket is the connector on the motherboard that houses a CPU and forms the electrical interface and contact with the CPU.

CPU Core

Each physical processor contains smaller processing units called physical CPU cores. Some processors have two cores, some four, some six or eight, and so on.

last-updated: Jun 06, 2024

Virtual Core	The unit of processing power in a virtual hardware system. A virtual core is the virtual representation of one or more hardware threads. The virtual Operating Systems Environments use one or more virtual cores. Note: for the purposes of licensing, 1 virtual cores will be counted as one physical core.
Main Memory	The main memory is the area in a computer in which data is stored for quick access by the computer's processor. The term random access memory [RAM] often refers to this primary or main storage.
Node	A node is a server or virtual machine that does not exceed (a) one motherboard; (b) 4 CPU sockets; (c) 32 total cores; (d) 24 hard drives with up to 50 TB total hard drive capacity or 12 TB total flash or SSD capacity; (e) 2x10 GigE capacity; or (f) 256 GB of RAM. If a server or virtual machine exceeds any of these parameters, it will be counted as two or more nodes.
Per core licensing of HPE Ezmeral Data Fabric Platform Bundle	Each license allows the customer to deploy HPE Ezmeral Data Fabric for Al and Analytics on one Core and 2 terabytes of Storage Capacity. The customer must purchase more licenses if they exceed the allowable amount of Cores or Storage Capacity. Core means a part of a CPU that executes a single stream of compiled instruction code. Single-core processors can only process one instruction at a time. Multiple-core processors (CPUs) imply a processing system composed of two or more independent cores. Processing cores can be physical or virtual depending on whether the processor holding the cores is embedded in a physical machine or a virtual machine. For purposes of licensing, two virtual cores is equal to one physical core. Storage Capacity means the total storage capacity (HDD & SSD) allocated to and managed by HPE Products, measured in Terabytes (TB) of raw capacity. Includes space for data, data replication, erasure coding, snapshots, metadata, logs and other data that is stored in HPE Data Fabric.

HPE EZMERAL DATA FABRIC ADDITIONAL LICENSE AUTHORIZATION

Contains HPE Ezmeral Data Fabric additional licensing authorization information.

Last updated: January 17, 2020

THIS HPE EZMERAL DATA FABRIC ADDITIONAL LICENSE AUTHORIZATION ("ALA") IS BY AND BETWEEN HEWLETT PACKARD ENTERPRISE COMPANY ("HPE") AND ITS SUBSIDIARIES AND THE INDIVIDUAL OR LEGAL ENTITY USING THE APPLICABLE SOFTWARE MADE AVAILABLE BY HPE ("CUSTOMER") (WHETHER BY HPE OR AN AUTHORIZED HPE/MAPR PARTNER) AND GOVERNS ALL USE BY CUSTOMER OF THE HPE EZMERAL DATA FABRIC. IF LICENSED THROUGH AN AUTHORIZED HPE/MAPR PARTNER THIS ALA IS IN ADDITION TO AND SUPPLEMENTS THE HPE STANDARD EULA LOCATED AT https://www.hpe.com/us/en/software/licensing.html. THIS ALA (AND THE HPE STANDARD EULA IF LICENSED THROUGH AN AUTHORIZED HPE/MAPR PARTNER) ALSO SUPERSEDES ANY CLICKTHROUGH EULA EMBEDDED IN THE HPE EZMERAL DATA FABRIC. THIS ALA ALSO GOVERNS ALL USE BY CUSTOMER OF FREE SOFTWARE (AS DEFINED BELOW) PROVIDED BY HPE TO CUSTOMER. BY CLICKING ON THE "ACCEPT" BUTTON BELOW AND/OR A BUTTON OR CHECKBOX WITH SIMILAR DESIGNATION THAT DEMONSTRATES ACCEPTANCE OF THIS ALA (AND THE HPE STANDARD EULA IF LICENSED THROUGH AN AUTHORIZED HPE/MAPR PARTNER), OR BY DOWNLOADING, COPYING OR USING THE COMMERCIAL SOFTWARE OR FREE SOFTWARE, CUSTOMER EXPRESSLY ACCEPTS AND AGREES TO THE TERMS OF THIS ALA (AND THE HPE STANDARD EULA IF LICENSED THROUGH AN AUTHORIZED HPE/MAPR PARTNER),

AND CONSENTS TO THE COLLECTION, USE AND TRANSFER OF DATA AS OUTLINED IN THE HPE PRIVACY STATEMENT (https://www.hpe.com/us/en/legal/privacy.html). CERTAIN PROVISIONS OF THIS ALA APPLY ONLY TO EITHER THE COMMERCIAL SOFTWARE OR THE FREE SOFTWARE, AS MORE PARTICULARLY SPECIFIED BELOW. BY WAY OF EXAMPLE, CUSTOMER MAY PURCHASE A COMMERCIAL SOFTWARE LICENSE KEY FROM HPE OR AN AUTHORIZED HPE/MAPR PARTNER AT ANY TIME AND CONVERT CUSTOMER'S COPY OF FREE SOFTWARE TO THE COMMERCIAL SOFTWARE, IN WHICH CASE THE PROVISIONS APPLICABLE TO COMMERCIAL SOFTWARE WILL APPLY FROM THE TIME OF SUCH CONVERSION.

1. Definitions. The following capitalized terms shall have the meanings set forth below:

1.1. "Commercial Software" means the software identified in an order (either by HPE or an authorized HPE/MapR partner) and licensed for a fee, e.g., MapR Enterprise Edition or MapR Enterprise Database Edition software products when licensed for a fee. HPE may allow Customer to convert a copy of Free Software into Commercial Software by entering or installing a license Key for the Commercial Software purchased by Customer.

1.2. "Documentation" means the documentation and guides related to the Licensed Products freely available at https://docs.datafabric.hpe.com/home/.

1.3. "Feedback" means any comments or other feedback Customer may provide to HPE concerning the functionality and performance of the Licensed Products, including identification of potential errors and improvements.

1.4. "Free Software" means a software product that is provided by HPE to Customer free of charge for Customer's internal use for trial, evaluation, testing or similar non-production purposes, and is expressly identified by HPE as free, as evaluation software, as Not For Resale or NFR software, or any similar designation. For the purposes of this ALA, Free Software includes the MapR Community Edition software product or other MapR products made available by HPE on limited-time free, trial or Not For Resale basis.

1.5. "Free Software Term" means a thirty-day period of time that commences when Customer receives the applicable Free Software.

1.6. "Key" means the license key or similar control mechanism to help ensure compliance with the use and time limitations with respect to Licensed Products.

1.7. "Licensed Products" means the Commercial Software and Free Software.

1.8. License Metric: means the specific manner in which the applicable product(s), as defined in the MapR Licensing Data Sheet located at https://mapr.com/products/whats-included/assets/mapr-customerlicensing-01152020.pdf, are licensed.

1.9. "Open Source Software" means any third party software that is distributed as "free software", "open source software" or under a similar licensing or distribution model. Without limiting the generality of the foregoing, Apache Hadoop, Apache Solr and Apache Lucene are Open Source Software.

2. Standard Version. This Section 2 applies solely with respect to the Commercial Software, and not to Free Software:

2.1. License. Subject to the terms and conditions of this ALA, HPE hereby grants Customer a limited, non-exclusive, non-transferable, non-sublicensable license to install, copy and use the Commercial Software internally in the quantities set forth in the applicable License Metric quantity specified in the applicable order, during the applicable license term indicated in the order. For the avoidance of doubt, Customer may not install or use the Commercial Software on hardware which exceeds any License Metric quantities of the product component elements. For the further avoidance of doubt, Customer may not grant access to or transfer the use of the Commercial Software to any third party, whether on a standalone basis or as integrated into any other product, except with respect to third party consultants and service providers providing services to Customer.

2.2. Record Keeping. Customer shall establish and maintain complete and accurate records related to the location, access and use of the Commercial Software by Customer, its employees or its agents, and any such other information as reasonably necessary for HPE to verify compliance with the terms of this ALA. Such records shall be kept for at least 3 years following the end of the quarter to which they pertain.

3. Free Software.

3. This Section 3 applies solely with respect to Free Software, and not to the Commercial Software:

3.1. License. Subject to the terms and conditions of this ALA, HPE hereby grants Customer a limited, non-exclusive, non-transferable, non-sublicensable license to install, copy and use the Free Software internally for trial, evaluation, testing or similar non-production purposes during the Free Software Term, subject to the use and time limitations specified by HPE, whether expressly or through the configuration of a Key. Customer may not grant access to or transfer the use of the Free Software to any third party, whether on a stand-alone basis or as integrated into any other product. If Customer decides to use the Free Software after the Free Software Term, Customer must obtain a license for the equivalent Commercial Software. If Customer decides not to obtain a license for the equivalent Commercial Software after the Free Software Term, Customer will cease using and will delete any such Free Software from its computer systems.

3.2. Termination of License. Either party may terminate the license granted in Section 3.1 for convenience upon 5 days notice.

3.3. No Support. Customer acknowledges that HPE is not obligated to provide any support, maintenance, updates or upgrades for and in connection with the Free Software.

3.4. Disclaimer. FREE SOFTWARE IS PROVIDED "AS-IS" AND WITHOUT ANY WARRANTY. CUSTOMER ACKNOWLEDGES AND AGREES THAT FREE SOFTWARE IS NOT SUITABLE FOR ANY PURPOSE OTHER THAN LIMITED INTERNAL TRIAL AND EVALUATION. HPE AND ITS LICENSORS AND SUPPLIERS SPECIFICALLY DISCLAIM ALL WARRANTIES, WHETHER IMPLIED, STATUTORY OR OTHERWISE, INCLUDING THE WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, TITLE, FITNESS FOR A PARTICULAR PURPOSE OR SATISFACTORY QUALITY, AND ANY AND ALL WARRANTIES ARISING FROM COURSE OF DEALING OR USAGE IN TRADE. NO ADVICE OR INFORMATION, WHETHER ORAL OR WRITTEN, OBTAINED FROM HPE OR ELSEWHERE SHALL CREATE ANY WARRANTY NOT EXPRESSLY STATED IN THIS ALA. HPE AND ITS LICENSORS AND SUPPLIERS DO NOT WARRANT THAT THE FREE SOFTWARE WILL OPERATE WITHOUT ERROR OR INTERRUPTION. CUSTOMER ASSUMES ALL RESPONSIBILITY FOR THE SELECTION OF THE FREE SOFTWARE OR A SPECIFIC VERSION THEREOF TO ACHIEVE CUSTOMER'S INTENDED RESULTS, AND FOR THE OPERATION, USE AND RESULTS OF THE FREE SOFTWARE. THE FREE SOFTWARE IS NOT DESIGNED, INTENDED OR WARRANTED FOR USE IN HAZARDOUS ENVIRONMENTS REQUIRING FAIL-SAFE CONTROLS, INCLUDING WITHOUT LIMITATION, OPERATION OF NUCLEAR FACILITIES, AIRCRAFT NAVIGATION OR COMMUNICATION SYSTEMS, AIR TRAFFIC CONTROL, AND LIFE SUPPORT OR WEAPONS SYSTEMS.

The following provisions of this ALA shall apply to all Licensed Products:

4. Keys, Other Restrictions and Data Collection Notice.

4.1. License Keys. Customer shall not destroy, disable or circumvent, or attempt to destroy, disable or circumvent in any way the Key and/or the use and time limitations set by the Key or any Licensed Products. Customer acknowledges and agrees that any attempt to exceed the use of the Licensed Products beyond the limits configured into the Key will automatically and immediately terminate the licenses granted under this ALA.

4.2 Information Collection. The Licensed Products may contain functionality that automatically collect information concerning the use and configuration of the HPE Ezmeral Data Fabric and overall capacity of your cluster and transmit that information to HPE. The Licensed Products will not access, collect, store or transmit any personally identifiable information or business data files residing in your computer environment as part of this functionality. The Licensed Products only initiate outbound communications to HPE and do not listen for inbound communications. The Licensed Products collect and transmit the information above by default. Unless otherwise provided in the applicable order, Customer has the ability to configure the Licensed Products to turn off the transmission of such information to HPE. HPE may use the information transmitted by the Licensed Products for activities such as determining usage for billing and license compliance and helping improve upon and market its product and service offerings. HPE may retain this information in perpetuity.

last-updated: Jun 06, 2024

5. Open Source Software. The Licensed Products may incorporate or be provided together with Open Source Software. Copyrights and other proprietary rights to the Open Source Software are held by the copyright holders identified in the applicable distribution or the applicable help, notices, about or source files. All Open Source Software is distributed to Customer under the terms of the applicable open source license agreements referenced in the applicable distribution or the applicable help, notices, about or source files.

6. Feedback. Customer hereby assigns to HPE all right, title, and interest in and to the Feedback, if any.

7. Open Source Components. To the extent the Licensed Products includes open source licenses, such licenses shall control over this ALA with respect to the particular open source component. To the extent Licensed Products includes the GNU General Public License or the GNU Lesser General Public License: (a) the software includes a copy of the source code; or (b) if you downloaded the software from a website, a copy of the source code is available on the same website; or (c) if you send HPE written notice, HPE will send you a copy of the source code for a reasonable fee.

8. Australian Consumers. If you acquired the software as a consumer within the meaning of the 'Australian Consumer Law' under the Australian Competition and Consumer Act 2010 then despite any other provision of this ALA, the terms at this URL apply: http://www.hpe.com/software/SWLicensing.

9. Russian Consumers. If you are based in the Russian Federation and the rights to use the software are provided to you under a separate license and/or sublicense agreement concluded between you and a duly authorized HPE partner, then this ALA shall not be applicable.

HPE CUSTOMER PASS THROUGH TERMS FOR MAPR SOFTWARE AND SERVICES

Contains HPE customer pass through terms for MapR software and services information.

HPE's obligations with respect to products or services supplied by HPE and procured by an end-user customer (hereinafter “Customer”) from authorized HPE/MapR Business Partners are limited to the terms and conditions in these HPE CUSTOMER PASS THROUGH TERMS (“Terms”) and the specific Supporting Material included with the HPE supplied products and services. HPE is not responsible for the acts or omissions of HPE Business Partners, for any obligations undertaken by them or representations that they may make, or for any other products or services that they supply to Customer.

1. **Orders.** “Order” means the accepted order including any HPE/MapR-branded supporting material which is identified as incorporated either by attachment or reference (“Supporting Material”). Supporting Material may include (as examples) product lists, hardware or software specifications, end user license agreements, service descriptions, data sheets and their supplements and statements of work (SOWs), HPE Packaged Support Service Agreement, published warranties and service level agreements, and may be available to Customer in hard copy or by accessing a designated HPE/MapR website.

2. **Support Services.** HPE’s support services will be described in the applicable Supporting Material, which will cover the description of HPE’s offering, eligibility requirements, service limitations and Customer responsibilities, as well as the Customer systems supported.

3. **Professional Services.** HPE will deliver any ordered IT consulting, training, or other services as described in the applicable Supporting Material.

4. **Professional Services Acceptance.** The acceptance process (if any) will be described in the applicable Supporting Material, will apply only to the deliverables specified, and shall not apply to other products or services to be provided by HPE.

5. **Eligibility.** HPE’s service, support and warranty commitments do not cover claims resulting from:

    - 1. improper use, site preparation, or site or environmental conditions or other non-compliance with applicable Supporting Material;

    - 2. modifications or improper system maintenance or calibration not performed by HPE or authorized by HPE;

last-updated: Jun 06, 2024

- 3. failure or functional limitations of any non-HPE software or product impacting systems receiving HPE support or service;
- 4. malware (e.g. virus, worm, etc.) not introduced by HPE; or
- 5. abuse, negligence, accident, fire or water damage, electrical disturbances, transportation by Customer, or other causes beyond HPE's control.

6. **Dependencies.** HPE's ability to deliver services will depend on Customer's reasonable and timely cooperation and the accuracy and completeness of any information from Customer needed to deliver the services.

7. **Services Performance.** Services are performed using generally recognized commercial practices and standards. Customer agrees to provide prompt notice of any such service concerns and HPE will re-perform any services that fail to meet this standard.

8. **Services with Deliverables.** If Supporting Material for services defines specific deliverables, HPE warrants those deliverables will conform materially to their written specifications for 30 days following delivery. If Customer notifies HPE of such non-conformity during the 30 day period, HPE will promptly remedy the impacted deliverables and Customer will return those deliverables to HPE.

9. **Remedies.** These Terms state all remedies for warranty claims. To the extent permitted by law, HPE disclaims all other warranties.

10. **Confidentiality.** Information exchanged under these Terms will be treated as confidential if identified as such at disclosure or if the circumstances of disclosure would reasonably indicate such treatment. Confidential information may only be used for the purpose of fulfilling obligations or exercising rights under these Terms, and shared with employees, agents or contractors with a need to know such information to support that purpose. Confidential information will be protected using a reasonable degree of care to prevent unauthorized use or disclosure for 3 years from the date of receipt or (if longer) for such period as the information remains confidential. These obligations do not cover information that: i) was known or becomes known to the receiving party without obligation of confidentiality; ii) is independently developed by the receiving party; or iii) where disclosure is required by law or a governmental agency.

11. **Limitation of Liability.** HPE's liability to Customer under these Terms is limited to $1,000,000. Neither Customer nor HPE will be liable for lost revenues or profits, downtime costs, loss or damage to data or indirect, special or consequential costs or damages. This provision does not limit either party's liability for: unauthorized use of intellectual property, death or bodily injury caused by their negligence; acts of fraud; willful repudiation of these Terms; nor any liability which may not be excluded or limited by applicable law.

12. **Force Majeure.** Neither party will be liable for performance delays nor for non-performance due to causes beyond its reasonable control.

13. **General.** These Terms represent our entire understanding with respect to its subject matter and supersede any previous communication or agreements that may exist. To the extent there is any conflict between these Terms and any Supporting Material, these Terms should apply. Modifications to these Terms will be made only through a written amendment signed by HPE and Customer. These Terms will be governed by the laws of the country of the HPE affiliate delivering services to the Customer the courts of that locale will have jurisdiction. Customer and HPE agree that the United Nations Convention on Contracts for the International Sale of Goods will not apply. Claims arising or raised in the United States will be governed by the laws of the state of California, excluding rules as to choice and conflict of law.

last-updated: Jun 06, 2024

14. **Data Protection.** Each party shall comply with their respective obligations under applicable data protection legislation. To the extent HPE processes personal data on your behalf in the course of providing the services, the HPE Support Services – Data Privacy and Security Agreement found at www.hpe.com/info/customerprivacy.html shall apply.

15. **Media Sanitization.** You are responsible for properly sanitizing or removing data from products that may be replaced or returned to HPE as part of the repair process to ensure the safeguarding of your data. For more information on your responsibilities, go to https://www.hpe.com/us/en/about/support-drivers/privacydataprotection.html.

Open-Source Software Acknowledgements (Release 7.7.x)

Provides licensing information and acknowledges the use of open-source projects with HPE software.

About the NOTICE.txt File

The `NOTICE.txt` file provides licensing information and software acknowledgements for open-source software used by the HPE Ezmeral Data Fabric. On a release 7.7.x Data Fabric node, you can find the file in the `/opt/mapr` directory. The release 7.7.x file contains the following information:

Open Source Notice

```
The Hewlett Packard Enterprise ("HPE") software accompanied by this notice
is provided along with certain
third party software licensed under various open source software licenses
("Open Source Components").  The
below list of Open Source Components includes, as applicable, copyright
notices, original source code URLs and
license URLs, and indicates whether HPE has modified the original source
code of the Open Source Components.
With respect to licenses that require a particular language to be provided
(such as the complete terms of the
license itself), that language is included below under the first Open
Source Component that is subject to such
license.

With respect to Open Source Components licensed under the AGPL, CPL, GPL or
LGPL, HPE hereby offers to provide
upon request the source code thereof, including the HPE modifications, if
any.  Such modifications are
documented by way of comments included in the source code files.

In addition to the warranty disclaimers contained in the open source

```

Apache License

```
                      Apache License
                  Version 2.0, January 2004
               http://www.apache.org/licenses/

   TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

   1. Definitions.

      "License" shall mean the terms and conditions for use, reproduction,
      and distribution as defined by Sections 1 through 9 of this document.

      "Licensor" shall mean the copyright owner or entity authorized by
```

```
      the copyright owner that is granting the License.

      "Legal Entity" shall mean the union of the acting entity and all
      other entities that control, are controlled by, or are under common
      control with that entity. For the purposes of this definition,
      "control" means (i) the power, direct or indirect, to cause the
      direction or management of such entity, whether by contract or
      otherwise, or (ii) ownership of fifty percent (50%) or more of the
      outstanding shares, or (iii) beneficial ownership of such entity.

      "You" (or "Your") shall mean an individual or Legal Entity
      exercising permissions granted by this License.

      "Source" form shall mean the preferred form for making modifications,
      including but not limited to software source code, documentation
      source, and configuration files.

      "Object" form shall mean any form resulting from mechanical
      transformation or translation of a Source form, including but
      not limited to compiled object code, generated documentation,
      and conversions to other media types.

      "Work" shall mean the work of authorship, whether in Source or
      Object form, made available under the License, as indicated by a
      copyright notice that is included in or attached to the work
      (an example is provided in the Appendix below).

      "Derivative Works" shall mean any work, whether in Source or Object
      form, that is based on (or derived from) the Work and for which the
      editorial revisions, annotations, elaborations, or other modifications
      represent, as a whole, an original work of authorship. For the
purposes
      of this License, Derivative Works shall not include works that remain
      separable from, or merely link (or bind by name) to the interfaces of,
      the Work and Derivative Works thereof.

      "Contribution" shall mean any work of authorship, including
      the original version of the Work and any modifications or additions
      to that Work or Derivative Works thereof, that is intentionally
      submitted to Licensor for inclusion in the Work by the copyright owner
      or by an individual or Legal Entity authorized to submit on behalf of
      the copyright owner. For the purposes of this definition, "submitted"
      means any form of electronic, verbal, or written communication sent
      to the Licensor or its representatives, including but not limited to
      communication on electronic mailing lists, source code control
systems,
      and issue tracking systems that are managed by, or on behalf of, the
      Licensor for the purpose of discussing and improving the Work, but
      excluding communication that is conspicuously marked or otherwise
      designated in writing by the copyright owner as "Not a Contribution."

      "Contributor" shall mean Licensor and any individual or Legal Entity
      on behalf of whom a Contribution has been received by Licensor and
      subsequently incorporated within the Work.
```

last-updated: Jun 06, 2024

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

   (b) You must cause any modified files to carry prominent notices stating that You changed the files; and

   (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

   (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

last-updated: Jun 06, 2024

```
      To apply the Apache License to your work, attach the following
      boilerplate notice, with the fields enclosed by brackets "[]"
      replaced with your own identifying information. (Don't include
      the brackets!)  The text should be enclosed in the appropriate
      comment syntax for the file format. We also recommend that a
      file or class name and description of purpose be included on the
      same "printed page" as the copyright notice for easier
      identification within third-party archives.

   Copyright [yyyy] [name of copyright owner]

   Licensed under the Apache License, Version 2.0 (the "License");
   you may not use this file except in compliance with the License.
   You may obtain a copy of the License at

       http://www.apache.org/licenses/LICENSE-2.0

   Unless required by applicable law or agreed to in writing, software
   distributed under the License is distributed on an "AS IS" BASIS,
   WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
   See the License for the specific language governing permissions and
   limitations under the License.

   products derived from this software without specific prior
   written permission.

THIS SOFTWARE IS PROVIDED ``AS IS'' AND ANY EXPRESS OR IMPLIED
WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES
OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, ALL OF
WHICH ARE HEREBY DISCLAIMED.  IN NO EVENT SHALL THE AUTHOR BE
LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR
CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT
OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR
BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF
LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT
(INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE
USE OF THIS SOFTWARE, EVEN IF NOT ADVISED OF THE POSSIBILITY OF SUCH
DAMAGE.
```

License for JavaMail

```
License for JavaMail:

Oracle Corporation ("ORACLE") ENTITLEMENT for SOFTWARE

Licensee/Company: Entity receiving Software.

Effective Date: Date of delivery of the Software to You.

Software: JavaMail 1.4.4

License Term:  Perpetual (subject to termination under the SLA).

Licensed Unit: Software Copy.

Licensed unit Count: Unlimited.

Permitted Uses:

1. You may reproduce and use the Software for Your own Individual,
```

```
Commercial and Research and Instructional Use only for the purposes of
designing, developing, testing, and running Your applets and
applications ("Programs").

2. Subject to the terms and conditions of this Agreement and
restrictions and exceptions set forth in the Software's documentation,
You may reproduce and distribute portions of Software identified as a
redistributable in the documentation (each a "Redistributable"),
provided that You comply with the following (note that You may be
entitled to reproduce and distribute other portions of the Software not
defined in the documentation as a Redistributable under certain other
licenses as described in the THIRDPARTYLICENSEREADME, if applicable):

(a) You distribute Redistributable complete and unmodified and only
bundled as part of Your Programs,

(b) Your Programs add significant and primary functionality to the
Redistributable,

(c) You distribute Redistributable for the sole purpose of running Your
Programs,

(d) You do not distribute additional software intended to replace any
component(s) of the Redistributable,

(e) You do not remove or alter any proprietary legends or notices
contained in or on the Redistributable.

(f) You only distribute the Redistributable subject to a license
agreement that protects Oracle's interests consistent with the terms
contained in this Agreement, and

(g) You agree to defend and indemnify Oracle and its licensors from and
against any damages, costs, liabilities, settlement amounts and/or
expenses  (including attorneys' fees) incurred in connection with any
claim, lawsuit or action by any third party that arises or results from
the use or distribution of any and all Programs and/or
Redistributable.

3. Java Technology Restrictions.  You may not create, modify, or change
the behavior of, or authorize Your licensees to create, modify, or
change the behavior of, classes, interfaces, or subpackages that are in
any way identified as "java", "javax", "sun" or similar convention as
specified by Oracle in any naming convention designation.

4. No Diagnostic, Maintenance, Repair or Technical Support Services.
The scope of Your license does not include any right, express or
implied, (i) to access, copy, distribute, display or use the Software
to provide diagnostic, maintenance, repair or technical support
services for Oracle software or Oracle hardware on behalf of any third party
for Your direct or indirect commercial gain or advantage, without Oracle's
prior written authorization, or (ii) for any third party to access,
copy, distribute, display or use the Software to provide diagnostic,
maintenance, repair or technical support services for Oracle software or
```

last-updated: Jun 06, 2024

Oracle hardware on Your behalf for such party's direct or indirect commercial gain or advantage, without Oracle's prior written authorization. The limitations set forth in this paragraph apply to any and all error corrections, patches, updates, and upgrades to the Software You may receive, access, download or otherwise obtain from Oracle.

5. Records and Documentation. During the term of the SLA and Entitlement, and for a period of three (3) years thereafter, You agree to keep proper records and documentation of Your compliance with the SLA and Entitlement. Upon Oracle's reasonable request, You will provide copies of such records and documentation to Oracle for the purpose of confirming Your compliance with the terms and conditions of the SLA and Entitlement. This section will survive any termination of the SLA and Entitlement. You may terminate this SLA and Entitlement at any time by destroying all copies of the Software in which case the obligations set forth in Section 7 of the SLA shall apply.

Oracle Corporation ("ORACLE")
SOFTWARE LICENSE AGREEMENT

READ THE TERMS OF THIS AGREEMENT ("AGREEMENT") CAREFULLY BEFORE OPENING SOFTWARE MEDIA PACKAGE. BY OPENING SOFTWARE MEDIA PACKAGE, YOU AGREE TO THE TERMS OF THIS AGREEMENT. IF YOU ARE ACCESSING SOFTWARE ELECTRONICALLY, INDICATE YOUR ACCEPTANCE OF THESE TERMS BY SELECTING THE "ACCEPT" BUTTON AT THE END OF THIS AGREEMENT. IF YOU DO NOT AGREE TO ALL OF THE TERMS, PROMPTLY RETURN THE UNUSED SOFTWARE TO YOUR PLACE OF PURCHASE FOR A REFUND OR, IF SOFTWARE IS ACCESSED ELECTRONICALLY, SELECT THE "DECLINE" (OR "EXIT") BUTTON AT THE END OF THIS AGREEMENT. IF YOU HAVE SEPARATELY AGREED TO LICENSE TERMS ("MASTER TERMS") FOR YOUR LICENSE TO THIS SOFTWARE, THEN SECTIONS 1-6 OF THIS AGREEMENT ("SUPPLEMENTAL LICENSE TERMS") SHALL SUPPLEMENT AND SUPERSEDE THE MASTER TERMS IN RELATION TO THIS SOFTWARE.

1. Definitions.

(a) "Entitlement" means the collective set of applicable documents authorized by Oracle evidencing your obligation to pay associated fees (if any) for the license, associated Services, and the authorized scope of use of Software under this Agreement.

(b) "Licensed Unit" means the unit of measure by which your use of Software and/or Service is licensed, as described in your Entitlement.

(c) "Permitted Use" means the licensed Software use(s) authorized in this Agreement as specified in your Entitlement. The Permitted Use for any bundled Oracle software not specified in your Entitlement will be evaluation use as provided in Section 3.

(d) "Service" means the service(s) that Oracle or its delegate will provide, if any, as selected in your Entitlement and as further described in the applicable service listings at www.sun.com/service/servicelist.

(e) "Software" means the Oracle software described in your Entitlement. Also, certain software may be included for evaluation use under Section 3.

(f) "You" and "Your" means the individual or legal entity specified in the Entitlement, or for evaluation purposes, the entity performing the evaluation.

2. License Grant and Entitlement.

Subject to the terms of your Entitlement, Oracle grants you a nonexclusive, nontransferable limited license to use Software for its Permitted Use for the license term. Your Entitlement will specify (a) Software licensed, (b) the Permitted Use, (c) the license term, and (d) the Licensed Units.

Additionally, if your Entitlement includes Services, then it will also specify the (e) Service and (f) service term.

If your rights to Software or Services are limited in duration and the date such rights begin is other than the purchase date, your Entitlement will provide that beginning date(s).

The Entitlement may be delivered to you in various ways depending on the manner in which you obtain Software and Services, for example, the Entitlement may be provided in your receipt, invoice or your contract with Oracle or authorized Oracle reseller. It may also be in electronic format if you download Software.

3. Permitted Use.

As selected in your Entitlement, one or more of the following Permitted Uses will apply to your use of Software. Unless you have an Entitlement that expressly permits it, you may not use Software for any of the other Permitted Uses. If you don't have an Entitlement, or if your Entitlement doesn't cover additional software delivered to you, then such software is for your Evaluation Use.

(a) Evaluation Use. You may evaluate Software internally for a period of 90 days from your first use.

(b) Research and Instructional Use. You may use Software internally to design, develop and test, and also to provide instruction on such uses.

(c) Individual Use. You may use Software internally for personal, individual use.

(d) Commercial Use. You may use Software internally for your own commercial purposes.

last-updated: Jun 06, 2024

(e) Service Provider Use. You may make Software functionality accessible (but not by providing Software itself or through outsourcing services) to your end users in an extranet deployment, but not to your affiliated companies or to government agencies.

4. Licensed Units.

Your Permitted Use is limited to the number of Licensed Units stated in your Entitlement. If you require additional Licensed Units, you will need additional Entitlement(s).

5. Restrictions.

(a) The copies of Software provided to you under this Agreement are licensed, not sold, to you by Oracle. Oracle reserves all rights not expressly granted. (b) You may make a single archival copy of Software, but otherwise may not copy, modify, or distribute Software. However if the Oracle documentation accompanying Software lists specific portions of Software, such as header files, class libraries, reference source code, and/or redistributable files, that may be handled differently, you may do so only as provided in the Oracle documentation. (c) You may not rent, lease, lend or encumber Software. (d) Unless enforcement is prohibited by applicable law, you may not decompile, or reverse engineer Software. (e) The terms and conditions of this Agreement will apply to any Software updates, provided to you at Oracle's discretion, that replace and/or supplement the original Software, unless such update contains a separate license. (f) You may not publish or provide the results of any benchmark or comparison tests run on Software to any third party without the prior written consent of Oracle. (g) Software is confidential and copyrighted. (h) Unless otherwise specified, if Software is delivered with embedded or bundled software that enables functionality of Software, you may not use such software on a stand-alone basis or use any portion of such software to interoperate with any program(s) other than Software. (i) Software may contain programs that perform automated collection of system data and/or automated software updating services. System data collected through such programs may be used by Oracle, its subcontractors, and its service delivery partners for the purpose of providing you with remote system services and/or improving Oracle's software and systems. (j) Software is not designed, licensed or intended for use in the design, construction, operation or maintenance of any nuclear facility and Oracle and its licensors disclaim any express or implied warranty of fitness for such uses. (k) No right, title or interest in or to any trademark, service mark, logo or trade name of Oracle or its licensors is granted under this Agreement.

6. Java Compatibility and Open Source.

Software may contain Java technology. You may not create additional classes to, or modifications of, the Java technology, except under compatibility requirements available under a separate agreement available at www.java.net.

Oracle supports and benefits from the global community of open source developers, and thanks the community for its important contributions and open standards-based technology, which Oracle has adopted into many of its products.

last-updated: Jun 06, 2024

Please note that portions of Software may be provided with notices and open source licenses from such communities and third parties that govern the use of those portions, and any licenses granted hereunder do not alter any rights and obligations you may have under such open source licenses, however, the disclaimer of warranty and limitation of liability provisions in this Agreement will apply to all Software in this distribution.

7. Term and Termination.

The license and service term are set forth in your Entitlement(s). Your rights under this Agreement will terminate immediately without notice from Oracle if you materially breach it or take any action in derogation of Oracle's and/or its licensors' rights to Software. Oracle may terminate this Agreement should any Software become, or in Oracle's reasonable opinion likely to become, the subject of a claim of intellectual property infringement or trade secret misappropriation. Upon termination, you will cease use of, and destroy, Software and confirm compliance in writing to Oracle. Sections 1, 5, 6, 7, and 9-15 will survive termination of the Agreement.

8. Limited Warranty.

Oracle warrants to you that for a period of 90 days from the date of purchase, as evidenced by a copy of the receipt, the media on which Software is furnished (if any) will be free of defects in materials and workmanship under normal use. Except for the foregoing, Software is provided "AS IS". Your exclusive remedy and Oracle's entire liability under this limited warranty will be at Oracle's option to replace Software media or refund the fee paid for Software. Some states do not allow limitations on certain implied warranties, so the above may not apply to you. This limited warranty gives you specific legal rights. You may have others, which vary from state to state.

9. Disclaimer of Warranty.

UNLESS SPECIFIED IN THIS AGREEMENT, ALL EXPRESS OR IMPLIED CONDITIONS, REPRESENTATIONS AND WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT ARE DISCLAIMED, EXCEPT TO THE EXTENT THAT THESE DISCLAIMERS ARE HELD TO BE LEGALLY INVALID.

10. Limitation of Liability.

TO THE EXTENT NOT PROHIBITED BY LAW, IN NO EVENT WILL ORACLE OR ITS LICENSORS BE LIABLE FOR ANY LOST REVENUE, PROFIT OR DATA, OR FOR SPECIAL, INDIRECT, CONSEQUENTIAL, INCIDENTAL OR PUNITIVE DAMAGES, HOWEVER CAUSED REGARDLESS OF THE THEORY OF LIABILITY, ARISING OUT OF OR RELATED TO THE USE OF OR INABILITY TO USE SOFTWARE, EVEN IF ORACLE HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. In no event will Oracle's liability to you, whether in contract, tort (including negligence), or otherwise, exceed the amount paid by you for Software under this Agreement. The foregoing limitations will apply even if the above stated warranty fails of its essential purpose. Some states do not

last-updated: Jun 06, 2024

allow the exclusion of incidental or consequential damages, so some of the terms above may not be applicable to you.

11. Export Regulations.

All Software, documents, technical data, and any other materials delivered under this Agreement are subject to U.S. export control laws and may be subject to export or import regulations in other countries. You agree to comply strictly with these laws and regulations and acknowledge that you have the responsibility to obtain any licenses to export, re-export, or import as may be required after delivery to you.

12. U.S. Government Restricted Rights.

If Software is being acquired by or on behalf of the U.S. Government or by a U.S. Government prime contractor or subcontractor (at any tier), then the Government's rights in Software and accompanying documentation will be only as set forth in this Agreement; this is in accordance with 48 CFR 227.7201 through 227.7202-4 (for Department of Defense (DOD) acquisitions) and with 48 CFR 2.101 and 12.212 (for non-DOD acquisitions).

13. Governing Law.

Any action related to this Agreement will be governed by California law and controlling U.S. federal law. No choice of law rules of any jurisdiction will apply.

14. Severability.

If any provision of this Agreement is held to be unenforceable, this Agreement will remain in effect with the provision omitted, unless omission would frustrate the intent of the parties, in which case this Agreement will immediately terminate.

15. Integration.

This Agreement, including any terms contained in your Entitlement, is the entire agreement between you and Oracle relating to its subject matter. It supersedes all prior or contemporaneous oral or written communications, proposals, representations and warranties and prevails over any conflicting or additional terms of any quote, order, acknowledgment, or other communication between the parties relating to its subject matter during the term of this Agreement. No modification of this Agreement will be binding, unless in writing and signed by an authorized representative of each party.

For inquiries please contact: Oracle Corporation, 500 Oracle Parkway, Redwood Shores, California 94065, USA.

Lesser GNU Public License (LGPL)

```
GNU LESSER GENERAL PUBLIC LICENSE
                       Version 3, 29 June 2007

 Copyright (C) 2007 Free Software Foundation, Inc. <http://fsf.org/>
 Everyone is permitted to copy and distribute verbatim copies
 of this license document, but changing it is not allowed.

  This version of the GNU Lesser General Public License incorporates
the terms and conditions of version 3 of the GNU General Public
License, supplemented by the additional permissions listed below.

  0. Additional Definitions.

  As used herein, "this License" refers to version 3 of the GNU Lesser
General Public License, and the "GNU GPL" refers to version 3 of the GNU
General Public License.

  "The Library" refers to a covered work governed by this License,
other than an Application or a Combined Work as defined below.

  An "Application" is any work that makes use of an interface provided
by the Library, but which is not otherwise based on the Library.
Defining a subclass of a class defined by the Library is deemed a mode
of using an interface provided by the Library.

  A "Combined Work" is a work produced by combining or linking an
Application with the Library.  The particular version of the Library
with which the Combined Work was made is also called the "Linked
Version".

  The "Minimal Corresponding Source" for a Combined Work means the
Corresponding Source for the Combined Work, excluding any source code
for portions of the Combined Work that, considered in isolation, are
based on the Application, and not on the Linked Version.

  The "Corresponding Application Code" for a Combined Work means the
```

```
object code and/or source code for the Application, including any data
and utility programs needed for reproducing the Combined Work from the
Application, but excluding the System Libraries of the Combined Work.

  1. Exception to Section 3 of the GNU GPL.

  You may convey a covered work under sections 3 and 4 of this License
without being bound by section 3 of the GNU GPL.

  2. Conveying Modified Versions.

  If you modify a copy of the Library, and, in your modifications, a
facility refers to a function or data to be supplied by an Application
that uses the facility (other than as an argument passed when the
facility is invoked), then you may convey a copy of the modified
version:

   a) under this License, provided that you make a good faith effort to
   ensure that, in the event an Application does not supply the
   function or data, the facility still operates, and performs
   whatever part of its purpose remains meaningful, or

   b) under the GNU GPL, with none of the additional permissions of
   this License applicable to that copy.

  3. Object Code Incorporating Material from Library Header Files.

  The object code form of an Application may incorporate material from
a header file that is part of the Library.  You may convey such object
code under terms of your choice, provided that, if the incorporated
material is not limited to numerical parameters, data structure
layouts and accessors, or small macros, inline functions and templates
(ten or fewer lines in length), you do both of the following:

   a) Give prominent notice with each copy of the object code that the
   Library is used in it and that the Library and its use are
   covered by this License.

   b) Accompany the object code with a copy of the GNU GPL and this license
   document.

  4. Combined Works.

  You may convey a Combined Work under terms of your choice that,
taken together, effectively do not restrict modification of the
portions of the Library contained in the Combined Work and reverse
engineering for debugging such modifications, if you also do each of
the following:

   a) Give prominent notice with each copy of the Combined Work that
   the Library is used in it and that the Library and its use are
```

last-updated: Jun 06, 2024

```
   covered by this License.

   b) Accompany the Combined Work with a copy of the GNU GPL and this
license
   document.

   c) For a Combined Work that displays copyright notices during
   execution, include the copyright notice for the Library among
   these notices, as well as a reference directing the user to the
   copies of the GNU GPL and this license document.

   d) Do one of the following:

       0) Convey the Minimal Corresponding Source under the terms of this
       License, and the Corresponding Application Code in a form
       suitable for, and under terms that permit, the user to
       recombine or relink the Application with a modified version of
       the Linked Version to produce a modified Combined Work, in the
       manner specified by section 6 of the GNU GPL for conveying
       Corresponding Source.

       1) Use a suitable shared library mechanism for linking with the
       Library.  A suitable mechanism is one that (a) uses at run time
       a copy of the Library already present on the user's computer
       system, and (b) will operate properly with a modified version
       of the Library that is interface-compatible with the Linked
       Version.

   e) Provide Installation Information, but only if you would otherwise
   be required to provide such information under section 6 of the
   GNU GPL, and only to the extent that such information is
   necessary to install and execute a modified version of the
   Combined Work produced by recombining or relinking the
   Application with a modified version of the Linked Version. (If
   you use option 4d0, the Installation Information must accompany
   the Minimal Corresponding Source and Corresponding Application
   Code. If you use option 4d1, you must provide the Installation
   Information in the manner specified by section 6 of the GNU GPL
   for conveying Corresponding Source.)

  5. Combined Libraries.

  You may place library facilities that are a work based on the
Library side by side in a single library together with other library
facilities that are not Applications and are not covered by this
License, and convey such a combined library under terms of your
choice, if you do both of the following:

   a) Accompany the combined library with a copy of the same work based
   on the Library, uncombined with any other library facilities,
   conveyed under the terms of this License.

   b) Give prominent notice with the combined library that part of it
   is a work based on the Library, and explaining where to find the
```

```
   accompanying uncombined form of the same work.

  6. Revised Versions of the GNU Lesser General Public License.

  The Free Software Foundation may publish revised and/or new versions
of the GNU Lesser General Public License from time to time. Such new
versions will be similar in spirit to the present version, but may
differ in detail to address new problems or concerns.

  Each version is given a distinguishing version number. If the
Library as you received it specifies that a certain numbered version
of the GNU Lesser General Public License "or any later version"
applies to it, you have the option of following the terms and
conditions either of that published version or of any later version
published by the Free Software Foundation. If the Library as you
received it does not specify a version number of the GNU Lesser
General Public License, you may choose any version of the GNU Lesser
General Public License ever published by the Free Software Foundation.

  If the Library as you received it specifies that a proxy can decide
whether future versions of the GNU Lesser General Public License shall
apply, that proxy's public statement of acceptance of any version is
permanent authorization for you to choose that version for the
Library.
```

Lesser GNU Public License (LGPL) v2.1

```
Lesser GNU Public License (LGPL) v2.1

                  GNU LESSER GENERAL PUBLIC LICENSE
                       Version 2.1, February 1999

 Copyright (C) 1991, 1999 Free Software Foundation, Inc.
 51 Franklin Street, Fifth Floor, Boston, MA  02110-1301  USA
 Everyone is permitted to copy and distribute verbatim copies
 of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL.  It also counts
 as the successor of the GNU Library Public License, version 2, hence
 the version number 2.1.]

                            Preamble

  The licenses for most software are designed to take away your
freedom to share and change it.  By contrast, the GNU General Public
Licenses are intended to guarantee your freedom to share and change
free software--to make sure the software is free for all its users.

  This license, the Lesser General Public License, applies to some
specially designated software packages--typically libraries--of the
Free Software Foundation and other authors who decide to use it.  You
can use it too, but we suggest you first think carefully about whether
```

```
this license or the ordinary General Public License is the better
strategy to use in any particular case, based on the explanations below.

  When we speak of free software, we are referring to freedom of use,
not price.  Our General Public Licenses are designed to make sure that
you have the freedom to distribute copies of free software (and charge
for this service if you wish); that you receive source code or can get
it if you want it; that you can change the software and use pieces of
it in new free programs; and that you are informed that you can do
these things.

  To protect your rights, we need to make restrictions that forbid
distributors to deny you these rights or to ask you to surrender these
rights.  These restrictions translate to certain responsibilities for
you if you distribute copies of the library or if you modify it.

  For example, if you distribute copies of the library, whether gratis
or for a fee, you must give the recipients all the rights that we gave
you.  You must make sure that they, too, receive or can get the source
code.  If you link other code with the library, you must provide
complete object files to the recipients, so that they can relink them
with the library after making changes to the library and recompiling
it.  And you must show them these terms so they know their rights.

  We protect your rights with a two-step method: (1) we copyright the
library, and (2) we offer you this license, which gives you legal
permission to copy, distribute and/or modify the library.

  To protect each distributor, we want to make it very clear that
there is no warranty for the free library.  Also, if the library is
modified by someone else and passed on, the recipients should know
that what they have is not the original version, so that the original
author's reputation will not be affected by problems that might be
introduced by others.

  Finally, software patents pose a constant threat to the existence of
any free program.  We wish to make sure that a company cannot
effectively restrict the users of a free program by obtaining a
restrictive license from a patent holder.  Therefore, we insist that
any patent license obtained for a version of the library must be
consistent with the full freedom of use specified in this license.

  Most GNU software, including some libraries, is covered by the
ordinary GNU General Public License.  This license, the GNU Lesser
General Public License, applies to certain designated libraries, and
is quite different from the ordinary General Public License.  We use
this license for certain libraries in order to permit linking those
libraries into non-free programs.

  When a program is linked with a library, whether statically or using
a shared library, the combination of the two is legally speaking a
combined work, a derivative of the original library.  The ordinary
General Public License therefore permits such linking only if the
entire combination fits its criteria of freedom.  The Lesser General
Public License permits more lax criteria for linking other code with
the library.
```

last-updated: Jun 06, 2024

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

GNU LESSER GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) The modified work must itself be a software library.

b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

  3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

  Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

  This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

  4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

  If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

  5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and

```
therefore falls outside the scope of this License.

  However, linking a "work that uses the Library" with the Library
creates an executable that is a derivative of the Library (because it
contains portions of the Library), rather than a "work that uses the
library".  The executable is therefore covered by this License.
Section 6 states terms for distribution of such executables.

  When a "work that uses the Library" uses material from a header file
that is part of the Library, the object code for the work may be a
derivative work of the Library even though the source code is not.
Whether this is true is especially significant if the work can be
linked without the Library, or if the work is itself a library.  The
threshold for this to be true is not precisely defined by law.

  If such an object file uses only numerical parameters, data
structure layouts and accessors, and small macros and small inline
functions (ten lines or less in length), then the use of the object
file is unrestricted, regardless of whether it is legally a derivative
work.  (Executables containing this object code plus portions of the
Library will still fall under Section 6.)

  Otherwise, if the work is a derivative of the Library, you may
distribute the object code for the work under the terms of Section 6.
Any executables containing that work also fall under Section 6,
whether or not they are linked directly with the Library itself.

  6. As an exception to the Sections above, you may also combine or
link a "work that uses the Library" with the Library to produce a
work containing portions of the Library, and distribute that work
under terms of your choice, provided that the terms permit
modification of the work for the customer's own use and reverse
engineering for debugging such modifications.

  You must give prominent notice with each copy of the work that the
Library is used in it and that the Library and its use are covered by
this License.  You must supply a copy of this License.  If the work
during execution displays copyright notices, you must include the
copyright notice for the Library among them, as well as a reference
directing the user to the copy of this License.  Also, you must do one
of these things:

    a) Accompany the work with the complete corresponding
    machine-readable source code for the Library including whatever
    changes were used in the work (which must be distributed under
    Sections 1 and 2 above); and, if the work is an executable linked
    with the Library, with the complete machine-readable "work that
    uses the Library", as object code and/or source code, so that the
    user can modify the Library and then relink to produce a modified
    executable containing the modified Library.  (It is understood
    that the user who changes the contents of definitions files in the
    Library will not necessarily be able to recompile the application
    to use the modified definitions.)

    b) Use a suitable shared library mechanism for linking with the
    Library.  A suitable mechanism is one that (1) uses at run time a
```

```
    copy of the library already present on the user's computer system,
    rather than copying library functions into the executable, and (2)
    will operate properly with a modified version of the library, if
    the user installs one, as long as the modified version is
    interface-compatible with the version that the work was made with.

    c) Accompany the work with a written offer, valid for at
    least three years, to give the same user the materials
    specified in Subsection 6a, above, for a charge no more
    than the cost of performing this distribution.

    d) If distribution of the work is made by offering access to copy
    from a designated place, offer equivalent access to copy the above
    specified materials from the same place.

    e) Verify that the user has already received a copy of these
    materials or that you have already sent this user a copy.

  For an executable, the required form of the "work that uses the
Library" must include any data and utility programs needed for
reproducing the executable from it.  However, as a special exception,
the materials to be distributed need not include anything that is
normally distributed (in either source or binary form) with the major
components (compiler, kernel, and so on) of the operating system on
which the executable runs, unless that component itself accompanies
the executable.

  It may happen that this requirement contradicts the license
restrictions of other proprietary libraries that do not normally
accompany the operating system.  Such a contradiction means you cannot
use both them and the Library together in an executable that you
distribute.

  7. You may place library facilities that are a work based on the
Library side-by-side in a single library together with other library
facilities not covered by this License, and distribute such a combined
library, provided that the separate distribution of the work based on
the Library and of the other library facilities is otherwise
permitted, and provided that you do these two things:

    a) Accompany the combined library with a copy of the same work
    based on the Library, uncombined with any other library
    facilities.  This must be distributed under the terms of the
    Sections above.

    b) Give prominent notice with the combined library of the fact
    that part of it is a work based on the Library, and explaining
    where to find the accompanying uncombined form of the same work.

  8. You may not copy, modify, sublicense, link with, or distribute
the Library except as expressly provided under this License.  Any
attempt otherwise to copy, modify, sublicense, link with, or
distribute the Library is void, and will automatically terminate your
rights under this License.  However, parties who have received copies,
or rights, from you under this License will not have their licenses
```

terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

last-updated: Jun 06, 2024

13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

last-updated: Jun 06, 2024

```
  To apply these terms, attach the following notices to the library.  It is
safest to attach them to the start of each source file to most effectively
convey the exclusion of warranty; and each file should have at least the
"copyright" line and a pointer to where the full notice is found.

    <one line to give the library's name and a brief idea of what it does.>
    Copyright (C) <year>  <name of author>

    This library is free software; you can redistribute it and/or
    modify it under the terms of the GNU Lesser General Public
    License as published by the Free Software Foundation; either
    version 2.1 of the License, or (at your option) any later version.

    This library is distributed in the hope that it will be useful,
    but WITHOUT ANY WARRANTY; without even the implied warranty of
    MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE.  See the GNU
    Lesser General Public License for more details.

    You should have received a copy of the GNU Lesser General Public
    License along with this library; if not, write to the Free Software
    Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA
02110-1301  USA

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your
school, if any, to sign a "copyright disclaimer" for the library, if
necessary.  Here is a sample; alter the names:

  Yoyodyne, Inc., hereby disclaims all copyright interest in the
  library `Frob' (a library for tweaking knobs) written by James Random
Hacker.

  <signature of Ty Coon>, 1 April 1990
  Ty Coon, President of Vice

That's all there is to it!

GNU GENERAL PUBLIC LICENSE Version 3, 29 June 2007

```
                GNU GENERAL PUBLIC LICENSE
                   Version 3, 29 June 2007

 Copyright (C) 2007 Free Software Foundation, Inc. <http://fsf.org/>
 Everyone is permitted to copy and distribute verbatim copies
 of this license document, but changing it is not allowed.

                            Preamble

  The GNU General Public License is a free, copyleft license for
software and other kinds of works.

  The licenses for most software and other practical works are designed
to take away your freedom to share and change the works.  By contrast,
the GNU General Public License is intended to guarantee your freedom to
share and change all versions of a program--to make sure it remains free
software for all its users.  We, the Free Software Foundation, use the
GNU General Public License for most of our software; it applies also to
any other work released this way by its authors.  You can apply it to
your programs, too.

  When we speak of free software, we are referring to freedom, not
price.  Our General Public Licenses are designed to make sure that you
have the freedom to distribute copies of free software (and charge for
them if you wish), that you receive source code or can get it if you
want it, that you can change the software or use pieces of it in new
free programs, and that you know you can do these things.

  To protect your rights, we need to prevent others from denying you
these rights or asking you to surrender the rights.  Therefore, you have
certain responsibilities if you distribute copies of the software, or if
you modify it: responsibilities to respect the freedom of others.

  For example, if you distribute copies of such a program, whether
gratis or for a fee, you must pass on to the recipients the same
freedoms that you received.  You must make sure that they, too, receive
or can get the source code.  And you must show them these terms so they
```

know their rights.

  Developers that use the GNU GPL protect your rights with two steps: (1) assert copyright on the software, and (2) offer you this License giving you legal permission to copy, distribute and/or modify it.

  For the developers' and authors' protection, the GPL clearly explains that there is no warranty for this free software. For both users' and authors' sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

  Some devices are designed to deny users access to install or run modified versions of the software inside them, although the manufacturer can do so. This is fundamentally incompatible with the aim of protecting users' freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains in future versions of the GPL, as needed to protect the freedom of users.

  Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

  The precise terms and conditions for copying, distribution and modification follow.

                       TERMS AND CONDITIONS

  0. Definitions.

  "This License" refers to version 3 of the GNU General Public License.

  "Copyright" also means copyright-like laws that apply to other kinds of works, such as semiconductor masks.

  "The Program" refers to any copyrightable work licensed under this License. Each licensee is addressed as "you". "Licensees" and "recipients" may be individuals or organizations.

  To "modify" a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a "modified version" of the earlier work or a work "based on" the earlier work.

  A "covered work" means either the unmodified Program or a work based

```
on the Program.

  To "propagate" a work means to do anything with it that, without
permission, would make you directly or secondarily liable for
infringement under applicable copyright law, except executing it on a
computer or modifying a private copy.  Propagation includes copying,
distribution (with or without modification), making available to the
public, and in some countries other activities as well.

  To "convey" a work means any kind of propagation that enables other
parties to make or receive copies.  Mere interaction with a user through
a computer network, with no transfer of a copy, is not conveying.

  An interactive user interface displays "Appropriate Legal Notices"
to the extent that it includes a convenient and prominently visible
feature that (1) displays an appropriate copyright notice, and (2)
tells the user that there is no warranty for the work (except to the
extent that warranties are provided), that licensees may convey the
work under this License, and how to view a copy of this License.  If
the interface presents a list of user commands or options, such as a
menu, a prominent item in the list meets this criterion.

  1. Source Code.

  The "source code" for a work means the preferred form of the work
for making modifications to it.  "Object code" means any non-source
form of a work.

  A "Standard Interface" means an interface that either is an official
standard defined by a recognized standards body, or, in the case of
interfaces specified for a particular programming language, one that
is widely used among developers working in that language.

  The "System Libraries" of an executable work include anything, other
than the work as a whole, that (a) is included in the normal form of
packaging a Major Component, but which is not part of that Major
Component, and (b) serves only to enable use of the work with that
Major Component, or to implement a Standard Interface for which an
implementation is available to the public in source code form.  A
"Major Component", in this context, means a major essential component
(kernel, window system, and so on) of the specific operating system
(if any) on which the executable work runs, or a compiler used to
produce the work, or an object code interpreter used to run it.

  The "Corresponding Source" for a work in object code form means all
the source code needed to generate, install, and (for an executable
work) run the object code and to modify the work, including scripts to
control those activities.  However, it does not include the work's
System Libraries, or general-purpose tools or generally available free
programs which are used unmodified in performing those activities but
which are not part of the work.  For example, Corresponding Source
includes interface definition files associated with source files for
the work, and the source code for shared libraries and dynamically
linked subprograms that the work is specifically designed to require,
such as by intimate data communication or control flow between those
subprograms and other parts of the work.
```

last-updated: Jun 06, 2024

```
  The Corresponding Source need not include anything that users
can regenerate automatically from other parts of the Corresponding
Source.

  The Corresponding Source for a work in source code form is that
same work.

  2. Basic Permissions.

  All rights granted under this License are granted for the term of
copyright on the Program, and are irrevocable provided the stated
conditions are met.  This License explicitly affirms your unlimited
permission to run the unmodified Program.  The output from running a
covered work is covered by this License only if the output, given its
content, constitutes a covered work.  This License acknowledges your
rights of fair use or other equivalent, as provided by copyright law.

  You may make, run and propagate covered works that you do not
convey, without conditions so long as your license otherwise remains
in force.  You may convey covered works to others for the sole purpose
of having them make modifications exclusively for you, or provide you
with facilities for running those works, provided that you comply with
the terms of this License in conveying all material for which you do
not control copyright.  Those thus making or running the covered works
for you must do so exclusively on your behalf, under your direction
and control, on terms that prohibit them from making any copies of
your copyrighted material outside their relationship with you.

  Conveying under any other circumstances is permitted solely under
the conditions stated below.  Sublicensing is not allowed; section 10
makes it unnecessary.

  3. Protecting Users' Legal Rights From Anti-Circumvention Law.

  No covered work shall be deemed part of an effective technological
measure under any applicable law fulfilling obligations under article
11 of the WIPO copyright treaty adopted on 20 December 1996, or
similar laws prohibiting or restricting circumvention of such
measures.

  When you convey a covered work, you waive any legal power to forbid
circumvention of technological measures to the extent such circumvention
is effected by exercising rights under this License with respect to
the covered work, and you disclaim any intention to limit operation or
modification of the work as a means of enforcing, against the work's
users, your or third parties' legal rights to forbid circumvention of
technological measures.

  4. Conveying Verbatim Copies.

  You may convey verbatim copies of the Program's source code as you
receive it, in any medium, provided that you conspicuously and
```

```
appropriately publish on each copy an appropriate copyright notice;
keep intact all notices stating that this License and any
non-permissive terms added in accord with section 7 apply to the code;
keep intact all notices of the absence of any warranty; and give all
recipients a copy of this License along with the Program.

  You may charge any price or no price for each copy that you convey,
and you may offer support or warranty protection for a fee.

  5. Conveying Modified Source Versions.

  You may convey a work based on the Program, or the modifications to
produce it from the Program, in the form of source code under the
terms of section 4, provided that you also meet all of these conditions:

    a) The work must carry prominent notices stating that you modified
    it, and giving a relevant date.

    b) The work must carry prominent notices stating that it is
    released under this License and any conditions added under section
    7.  This requirement modifies the requirement in section 4 to
    "keep intact all notices".

    c) You must license the entire work, as a whole, under this
    License to anyone who comes into possession of a copy.  This
    License will therefore apply, along with any applicable section 7
    additional terms, to the whole of the work, and all its parts,
    regardless of how they are packaged.  This License gives no
    permission to license the work in any other way, but it does not
    invalidate such permission if you have separately received it.

    d) If the work has interactive user interfaces, each must display
    Appropriate Legal Notices; however, if the Program has interactive
    interfaces that do not display Appropriate Legal Notices, your
    work need not make them do so.

  A compilation of a covered work with other separate and independent
works, which are not by their nature extensions of the covered work,
and which are not combined with it such as to form a larger program,
in or on a volume of a storage or distribution medium, is called an
"aggregate" if the compilation and its resulting copyright are not
used to limit the access or legal rights of the compilation's users
beyond what the individual works permit.  Inclusion of a covered work
in an aggregate does not cause this License to apply to the other
parts of the aggregate.

  6. Conveying Non-Source Forms.

  You may convey a covered work in object code form under the terms
of sections 4 and 5, provided that you also convey the
machine-readable Corresponding Source under the terms of this License,
in one of these ways:
```

```
    a) Convey the object code in, or embodied in, a physical product
    (including a physical distribution medium), accompanied by the
    Corresponding Source fixed on a durable physical medium
    customarily used for software interchange.

    b) Convey the object code in, or embodied in, a physical product
    (including a physical distribution medium), accompanied by a
    written offer, valid for at least three years and valid for as
    long as you offer spare parts or customer support for that product
    model, to give anyone who possesses the object code either (1) a
    copy of the Corresponding Source for all the software in the
    product that is covered by this License, on a durable physical
    medium customarily used for software interchange, for a price no
    more than your reasonable cost of physically performing this
    conveying of source, or (2) access to copy the
    Corresponding Source from a network server at no charge.

    c) Convey individual copies of the object code with a copy of the
    written offer to provide the Corresponding Source.  This
    alternative is allowed only occasionally and noncommercially, and
    only if you received the object code with such an offer, in accord
    with subsection 6b.

    d) Convey the object code by offering access from a designated
    place (gratis or for a charge), and offer equivalent access to the
    Corresponding Source in the same way through the same place at no
    further charge.  You need not require recipients to copy the
    Corresponding Source along with the object code.  If the place to
    copy the object code is a network server, the Corresponding Source
    may be on a different server (operated by you or a third party)
    that supports equivalent copying facilities, provided you maintain
    clear directions next to the object code saying where to find the
    Corresponding Source.  Regardless of what server hosts the
    Corresponding Source, you remain obligated to ensure that it is
    available for as long as needed to satisfy these requirements.

    e) Convey the object code using peer-to-peer transmission, provided
    you inform other peers where the object code and Corresponding
    Source of the work are being offered to the general public at no
    charge under subsection 6d.

  A separable portion of the object code, whose source code is excluded
from the Corresponding Source as a System Library, need not be
included in conveying the object code work.

  A "User Product" is either (1) a "consumer product", which means any
tangible personal property which is normally used for personal, family,
or household purposes, or (2) anything designed or sold for incorporation
into a dwelling.  In determining whether a product is a consumer product,
doubtful cases shall be resolved in favor of coverage.  For a particular
product received by a particular user, "normally used" refers to a
typical or common use of that class of product, regardless of the status
of the particular user or of the way in which the particular user
actually uses, or expects or is expected to use, the product.  A product
is a consumer product regardless of whether the product has substantial
commercial, industrial or non-consumer uses, unless such uses represent
the only significant mode of use of the product.
```

"Installation Information" for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User Product from a modified version of its Corresponding Source. The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

7. Additional Terms.

"Additional permissions" are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

```
    a) Disclaiming warranty or limiting liability differently from the
    terms of sections 15 and 16 of this License; or

    b) Requiring preservation of specified reasonable legal notices or
    author attributions in that material or in the Appropriate Legal
    Notices displayed by works containing it; or

    c) Prohibiting misrepresentation of the origin of that material, or
    requiring that modified versions of such material be marked in
    reasonable ways as different from the original version; or

    d) Limiting the use for publicity purposes of names of licensors or
    authors of the material; or

    e) Declining to grant rights under trademark law for use of some
    trade names, trademarks, or service marks; or

    f) Requiring indemnification of licensors and authors of that
    material by anyone who conveys the material (or modified versions of
    it) with contractual assumptions of liability to the recipient, for
    any liability that these contractual assumptions directly impose on
    those licensors and authors.

  All other non-permissive additional terms are considered "further
restrictions" within the meaning of section 10.  If the Program as you
received it, or any part of it, contains a notice stating that it is
governed by this License along with a term that is a further
restriction, you may remove that term.  If a license document contains
a further restriction but permits relicensing or conveying under this
License, you may add to a covered work material governed by the terms
of that license document, provided that the further restriction does
not survive such relicensing or conveying.

  If you add terms to a covered work in accord with this section, you
must place, in the relevant source files, a statement of the
additional terms that apply to those files, or a notice indicating
where to find the applicable terms.

  Additional terms, permissive or non-permissive, may be stated in the
form of a separately written license, or stated as exceptions;
the above requirements apply either way.

  8. Termination.

  You may not propagate or modify a covered work except as expressly
provided under this License.  Any attempt otherwise to propagate or
modify it is void, and will automatically terminate your rights under
this License (including any patent licenses granted under the third
paragraph of section 11).

  However, if you cease all violation of this License, then your
license from a particular copyright holder is reinstated (a)
provisionally, unless and until the copyright holder explicitly and
```

finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

9. Acceptance Not Required for Having Copies.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance. However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

10. Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An "entity transaction" is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party's predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

11. Patents.

```
  A "contributor" is a copyright holder who authorizes use under this
License of the Program or a work on which the Program is based.  The
work thus licensed is called the contributor's "contributor version".

  A contributor's "essential patent claims" are all patent claims
owned or controlled by the contributor, whether already acquired or
hereafter acquired, that would be infringed by some manner, permitted
by this License, of making, using, or selling its contributor version,
but do not include claims that would be infringed only as a
consequence of further modification of the contributor version.  For
purposes of this definition, "control" includes the right to grant
patent sublicenses in a manner consistent with the requirements of
this License.

  Each contributor grants you a non-exclusive, worldwide, royalty-free
patent license under the contributor's essential patent claims, to
make, use, sell, offer for sale, import and otherwise run, modify and
propagate the contents of its contributor version.

  In the following three paragraphs, a "patent license" is any express
agreement or commitment, however denominated, not to enforce a patent
(such as an express permission to practice a patent or covenant not to
sue for patent infringement).  To "grant" such a patent license to a
party means to make such an agreement or commitment not to enforce a
patent against the party.

  If you convey a covered work, knowingly relying on a patent license,
and the Corresponding Source of the work is not available for anyone
to copy, free of charge and under the terms of this License, through a
publicly available network server or other readily accessible means,
then you must either (1) cause the Corresponding Source to be so
available, or (2) arrange to deprive yourself of the benefit of the
patent license for this particular work, or (3) arrange, in a manner
consistent with the requirements of this License, to extend the patent
license to downstream recipients.  "Knowingly relying" means you have
actual knowledge that, but for the patent license, your conveying the
covered work in a country, or your recipient's use of the covered work
in a country, would infringe one or more identifiable patents in that
country that you have reason to believe are valid.

  If, pursuant to or in connection with a single transaction or
arrangement, you convey, or propagate by procuring conveyance of, a
covered work, and grant a patent license to some of the parties
receiving the covered work authorizing them to use, propagate, modify
or convey a specific copy of the covered work, then the patent license
you grant is automatically extended to all recipients of the covered
work and works based on it.

  A patent license is "discriminatory" if it does not include within
the scope of its coverage, prohibits the exercise of, or is
conditioned on the non-exercise of one or more of the rights that are
specifically granted under this License.  You may not convey a covered
work if you are a party to an arrangement with a third party that is
in the business of distributing software, under which you make payment
to the third party based on the extent of your activity of conveying
the work, and under which the third party grants, to any of the
parties who would receive the covered work from you, a discriminatory
```

last-updated: Jun 06, 2024

patent license (a) in connection with copies of the covered work conveyed by you (or copies made from those copies), or (b) primarily for and in connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or that patent license was granted, prior to 28 March 2007.

Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement that may otherwise be available to you under applicable patent law.

12. No Surrender of Others' Freedom.

If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely from conveying the Program.

13. Use with the GNU Affero General Public License.

Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work licensed under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting work. The terms of this License will continue to apply to the part which is the covered work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as such.

14. Revised Versions of this License.

The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License "or any later version" applies to it, you have the option of following the terms and conditions either of that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the GNU General Public License, you may choose any version ever published by the Free Software Foundation.

If the Program specifies that a proxy can decide which future versions of the GNU General Public License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Program.

last-updated: Jun 06, 2024

```
  Later license versions may give you additional or different
permissions.  However, no additional obligations are imposed on any
author or copyright holder as a result of your choosing to follow a
later version.

  15. Disclaimer of Warranty.

  THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY
APPLICABLE LAW.  EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT
HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY
OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO,
THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR
PURPOSE.  THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM
IS WITH YOU.  SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF
ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

  16. Limitation of Liability.

  IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING
WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS
THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY
GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE
USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF
DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD
PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS),
EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF
SUCH DAMAGES.

  17. Interpretation of Sections 15 and 16.

  If the disclaimer of warranty and limitation of liability provided
above cannot be given local legal effect according to their terms,
reviewing courts shall apply local law that most closely approximates
an absolute waiver of all civil liability in connection with the
Program, unless a warranty or assumption of liability accompanies a
copy of the Program in return for a fee.

                     END OF TERMS AND CONDITIONS

            How to Apply These Terms to Your New Programs

  If you develop a new program, and you want it to be of the greatest
possible use to the public, the best way to achieve this is to make it
free software which everyone can redistribute and change under these terms.

  To do so, attach the following notices to the program.  It is safest
to attach them to the start of each source file to most effectively
state the exclusion of warranty; and each file should have at least
the "copyright" line and a pointer to where the full notice is found.

    <one line to give the program's name and a brief idea of what it does.>
    Copyright (C) <year>  <name of author>
```

last-updated: Jun 06, 2024

```
    This program is free software: you can redistribute it and/or modify
    it under the terms of the GNU General Public License as published by
    the Free Software Foundation, either version 3 of the License, or
    (at your option) any later version.

    This program is distributed in the hope that it will be useful,
    but WITHOUT ANY WARRANTY; without even the implied warranty of
    MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE.  See the
    GNU General Public License for more details.

    You should have received a copy of the GNU General Public License
    along with this program.  If not, see <http://www.gnu.org/licenses/>.

Also add information on how to contact you by electronic and paper mail.

  If the program does terminal interaction, make it output a short
notice like this when it starts in an interactive mode:

    <program>  Copyright (C) <year>  <name of author>
    This program comes with ABSOLUTELY NO WARRANTY; for details type `show
w'.
    This is free software, and you are welcome to redistribute it
    under certain conditions; type `show c' for details.

The hypothetical commands `show w' and `show c' should show the appropriate
parts of the General Public License.  Of course, your program's commands
might be different; for a GUI interface, you would use an "about box".

  You should also get your employer (if you work as a programmer) or school,
if any, to sign a "copyright disclaimer" for the program, if necessary.
For more information on this, and how to apply and follow the GNU GPL, see
<http://www.gnu.org/licenses/>.

  The GNU General Public License does not permit incorporating your program
into proprietary programs.  If your program is a subroutine library, you
may consider it more useful to permit linking proprietary applications with
the library.  If this is what you want to do, use the GNU Lesser General
Public License instead of this License.  But first, please read
<http://www.gnu.org/philosophy/why-not-lgpl.html>.

Glossary

List of terms (with description) used in HPE Ezmeral Data Fabric documentation.

.dfs_attributes

A special file in every directory, for controlling the compression and chunk size used for the directory and its subdirectories.

.rw

A special mount point in the root-level volume (or read-only mirror) that points to the writable original copy of the volume.

.snapshot

A special directory in the top level of each volume, containing all the snapshots for that volume.

access control expression (ACE)

A Boolean expression that defines a combination of users, groups, or roles that have access to an object stored natively such as a directory, file, or HPE Ezmeral Data Fabric Database table.

Access Control Expression (ACE)

NOTE: An ACE (up to 64KB in length) is a combination of users, groups, and/or roles for whom access (to volume data) is defined using boolean expressions and sub expressions within single quotes. When you pass in an access type that has already been set, the new value replaces the existing value for that access type. There is no change to access types that are not passed in with the command, whether or not they were set. For more information, see Managing Access Control Expressions on page 1855.

ACE

last-updated: Jun 06, 2024

access control list (ACL)

A list of permissions attached to an object. An ACL specifies users or system processes that can perform specific actions on an object.

Access Control List (ACL)

NOTE: An Access Control List (ACL) is a list of users or groups. Each user or group in the list is paired with a defined set of permissions that limit the actions that the user or group can perform on the object secured by the ACL. In the HPE Ezmeral Data Fabric, the objects secured by ACLs are the job queue, volumes, and the cluster itself.

ACL

access policy

An ACL or policy in JSON format that describes user access. Grants accounts and IAM users permissions to perform resource operations, such as putting objects in a bucket. You associate access policies with accounts, users, buckets, and objects.

account

Relates to Object Store. An account is a unique administrative unit that owns buckets, policies, and users. A default account exists automatically upon installation of Object Store. You cannot create IAM users in the default account and applications cannot access buckets in the default account. An administrator can create accounts and then create IAM users and buckets in those accounts. Applications can then access buckets as the IAM users in those accounts.

accountable entity (AE)

In the Control System, a user or group whose use of a volume can be subject to quotas. Using the Control System, you can set or modify quotas that limit the space used by all the volumes owned by an accountable entity.

More information

accounting entity (AE) on page 6284

quota on page 6294

accounting entity (AE)

In the CLI, a user or group whose use of a volume can be subject to quotas. Using the CLI, you can set or modify quotas that limit the space used by all the volumes owned by the accounting entity.

More information

accountable entity (AE) on page 6284

quota on page 6294

administrator

A user or users with special privileges to administer the cluster or cluster resources. Administrative functions can include managing hardware resources, users, data, services, security, and availability.

last-updated: Jun 06, 2024

For more information, see 7.7.0 Administration on page 1026. See also Data Fabric user on page 6288.

advisory quota

An advisory disk capacity limit that can be set for a volume, user, or group. When disk usage exceeds the advisory quota, an alert is sent.

air gap

Physical isolation between a computer system and unsecured networks. To enhance security, air-gapped computer systems are disconnected from other systems and networks.

application containers

Lightweight, stand-alone executables that include verything needed to run an application. Application containers are typically available for Linux and Windows applications.

binary table

Key-value and columnar database with HBase API. Supports Apache HBase tables and databases and also provides a native implementation of the HBase API for optimized performance on the Data Fabric platform.

bitmask

A binary number in which each bit controls a single toggle.

bucket

Container for objects. Access policies control user and application access to buckets.

chunk

Files in the file system are split into chunks (similar to Hadoop blocks) that are normally 256 MB by default. Any multiple of 65,536 bytes is a valid chunk size, but tuning the size correctly is important. Files inherit the chunk size settings of the directory that contains them, as do subdirectories on which chunk size has not been explicitly set. Any files written by a Hadoop application, whether via the file APIs or over NFS, use chunk size specified by the settings for the directory where the file is written.

client node

A node that runs the `mapr-client` that can access every cluster node and is used to access the cluster. Also referred to as an "edge node." Client nodes and edge nodes are NOT part of a data-fabric cluster.

See also *node* and *edge node*.

last-updated: Jun 06, 2024

cluster admin

The data-fabric user.

For more information, see Data Fabric user on page 6288.

cluster node

A node that is part of a data-fabric cluster. Cluster nodes can be used for data, compute, or both data and compute.

See also *node*, *data node*, *compute node*, and *gateway node*.

Contrast with *client node* and *edge node*.

coalesce

The interval of time during which READ, WRITE, or GETATTR operations on one file from one IP address or UID are logged only once for a particular operation, if auditing is enabled.
For example, suppose that a client application reads a single file three times in 6 minutes, so that there is one read at 0 minutes, another at 3 minutes, and a final read at 6 minutes. If the coalesce interval is at least 6 minutes, then only the first read operation is logged. However, if the interval is between 4 and 6 minutes, then only the first and third read operations are logged. If the interval is 2 minutes, all three read operations are logged.

Now however, if the client was also writing to the file, irrespective of the coalesce interval for the read operation in the example stated previously, the write operation is logged, as it is a different operation from reading.

composite ID

A unique, internal integer that maps to a security policy or set of security policies. A composite ID is stored with a resource instead of a security policy to optimize storage space.
Related concepts
Security Policy Domain and Policy Management on page 857
Describes how to create the security-policy domain, propagate security policies to all the clusters within the domain, and some considerations for moving data.

compute node

A compute node is used to process data using a compute engine (for example, YARN, Hive, Spark, or Drill). A compute node is by definition a data-fabric cluster node.

See also *node*.

Compare with *data node*.

container

The unit of shared storage in a data-fabric cluster. Every container is either a name container or a data container.
More information
application containers on page 6285

Docker containers on page 6289
YARN resource containers on page 6298

container location database (CLDB)

A service, running on one or more data-fabric nodes, that maintains the locations of services, containers, and other cluster information.

NOTE:

The Container Location Database (CLDB) service tracks the following information about every container in the file system:

- The node where the container is located
- Size of the container
- The volume to which the container belongs
- The policies, quotas, and usage for that volume

core

The minimum complement of software packages required to construct a data-fabric cluster. These packages include `mapr-core`, `mapr-core-internal`, `mapr-cldb`, `mapr-apiserver`, `mapr-fileserver`, `mapr-zookeeper`, and others. Note that ecosystem components are not part of core.

To view the "core" packages on a data-fabric cluster, you can use the `yum list installed` command, as shown in Checking the Core Version on page 5600.

custom resource (CR)

In Kubernetes, the plan or blueprint for building and maintaining an application. Custom resources are specified as `.yaml` files.

A custom resource is a valid instance of a *custom resource definition (CRD)*. Along with controllers, custom resources form a Kubernetes *operator*.

custom resource definition (CRD)

In Kubernetes, a list of valid fields that defines the shape of a custom resource (CR).

CRDs enforce validation of a *custom resource (CR)* and should not be modified. CRDs are specified as `.yaml` files.

data-access gateway

A service that acts as a proxy and gateway for translating requests between lightweight client applications and the data-fabric cluster.

For more information, see Administering the Data Access Gateway on page 1961.

data compaction

A process that enables users to remove empty or deleted space in the database and to compact the database to occupy contiguous space.

More information

log compaction on page 6292

data container

One of the two types of containers in a data-fabric cluster. Data containers typically have a cascaded configuration (master replicates to replica1, replica1 replicates to replica2, and so on). Every data container is either a master container, an intermediate container, or a tail container depending on its replication role.

Data Fabric

A collection of nodes that work together under a unified architecture, along with the services or technologies running on that architecture. A fabric is similar to a Linux cluster. Fabrics help you manage your data, making it possible to access, integrate, model, analyze, and provision your data seamlessly.

Data Fabric administrator

The "Data Fabric user." The user that cluster services run as (typically named `mapr` or `hadoop`) on each node.

See Data Fabric user on page 6288.

Data Fabric gateway

A gateway that supports table and stream replication. The Data Fabric gateway mediates one-way communication between a source Data Fabric cluster and a destination cluster. The Data Fabric gateway also applies updates from JSON tables to their secondary indexes and propagates Change Data Capture (CDC) logs.

For more information, see Administering Data Fabric Gateways on page 1526.

Data Fabric user

The user that cluster services run as (typically named `mapr` or `hadoop`) on each node. The Data Fabric user, also known as the "Data Fabric admin," has full privileges to administer the cluster. The administrative privilege, with varying levels of control, can be assigned to other users as well.

For more information, see Managing Users and Groups on page 1026.

data node

A data node has the function of storing data and always runs FileServer. A data node is by definition a data-fabric cluster node.

See also *node*.

Compare with *compute node*.

desired replication factor

The number of copies of a volume that should be maintained by the data-fabric cluster for normal operation.

When the number of copies falls below the desired replication factor, but remains equal to or above the *minimum replication factor*, re-replication occurs after the timeout specified in the `cldb.fs.mark.rereplicate.sec` parameter.

developer preview

A label for a feature or collection of features that have usage restrictions. Developer previews are not tested for production environments, and should be used with caution.

disk space balancer

The disk space balancer is a tool that balances disk space usage on a cluster by moving containers between storage pools. Whenever a storage pool is over 70% full (or a threshold defined by the `cldb.balancer.disk.threshold.percentage` parameter), the disk space balancer distributes containers to other storage pools that have lower utilization than the average for that cluster. The disk space balancer aims to ensure that the percentage of space used on all of the disks in the node is similar.

disktab

A file on each node, containing a list of the node's disks that have been configured for use by the file system.

Docker containers

The application containers used by Docker software. Docker is a leading proponent of OS virtualization using application containers ("containerization").

Domain

Relates to Object Store. A domain is a management entity for accounts and users. The number of users, the amount of disk space, number of buckets in each of the accounts, total number of accounts, and the number of disabled accounts are all tracked within a domain. Currently, Object Store only supports the primary domain; you cannot create additional domains. Administrators can create multiple accounts in the primary domain.

domain user

Relates to Object Store. A domain user is a cluster security principal authenticated through AD/LDAP. Domain users only exist in the default account. Domain users can log in to the Object Store UI with their domain username and password.

last-updated: Jun 06, 2024

dump file

A file containing data from a volume for distribution or restoration. There are two types of dump files: *full* dump files containing all data in a volume, and *incremental* dump files that contain changes to a volume between two points in time.

full dump file

Ecosystem Pack (EEP)

A selected set of stable, interoperable, and widely used components from the Hadoop Ecosystem that are fully supported on the data-fabric platform. EEPs can include connectors and developer APIs that provide common Hadoop Ecosystem interfaces to data-fabric components (for example, Kafka Connect).

edge cluster

A small-footprint edition of the HPE Ezmeral Data Fabric designed to capture, process, and analyze IoT data close to the source of the data.

"Edge cluster" is the short form of *HPE Ezmeral Data Fabric Edge*.

edge node

A node that runs the `mapr-client` that can access every cluster node and is used to access the cluster. Also referred to as a "client node." Client nodes and edge nodes are NOT part of a data-fabric cluster.

See also *node* and *client node*.

entity

A user or group. Users and groups can represent accounting or accountable entities.
More information
accounting entity (AE) on page 6284
accountable entity (AE) on page 6284

epoch

A sequence number that identifies all copies that have the latest updates for a container. The larger the number, the most up-to-date the copy of the container. The CLDB uses the epoch to ensure that an out-of-date copy cannot become the master for the container.

filelet

A filelet, also called an fid, is a 256MB shard of a file. A 1 GB file for instance is comprised of the following filelets: 64K (primary fid)+(256MB-64KB)+256MB+256MB+256MB.

file system

The NFS-mountable, distributed, high-performance HPE Ezmeral Data Fabric data-storage system.

Related concepts

File System on page 490
Discusses the features of the Data Fabric distributed file system and compares it to the Hadoop Distributed File System (HDFS).

full dump file

More information

dump file on page 6290

gateway node

A node on which a `mapr-gateway` is installed. A gateway node is by definition a data-fabric cluster node.

See also *node* and *cluster node*.

global namespace (GNS)

The data plane that connects HPE Ezmeral Data Fabric deployments. The global namespace is a mechanism that aggregates disparate and remote data sources and provides a namespace that encompasses all of your infrastructure and deployments. Global namespace technology lets you manage globally deployed data as a single resource. Because of the global namespace, you can view and run multiple fabrics as a single, logical, and local fabric. The global namespace is designed to span multiple edge nodes, on-prem data centers, and clouds.

HBase

A distributed storage system, designed to scale to a very large size, for managing massive amounts of structured data.

HPE Ezmeral Data Fabric

A software-as-a-service (SaaS) platform for the hybrid enterprise with data distributed from edge to core to cloud. The federated global namespace integrates files, objects, tables, and streaming data and offers consumption-based pricing. Far-flung deployments run in a single, logical view no matter where the data is located.

Contrast with *HPE Ezmeral Data Fabric – Customer Managed*.

HPE Ezmeral Data Fabric – Customer Managed

A platform for data-driven analytics, ML, and AI workloads that also serves as a secure data store and provides file storage, NoSQL databases, object storage, and event streams. The patented file-system architecture was designed and built for performance, reliability, and scalability.

Contrast with *HPE Ezmeral Data Fabric*.

last-updated: Jun 06, 2024

HPE Ezmeral Data Fabric Edge

A small-footprint edition of the HPE Ezmeral Data Fabric designed to capture, process, and analyze IoT data close to the source of the data. Also referred to as an "edge cluster."

See also *edge cluster*.

heartbeat

A signal sent by each FileServer and NFS node every second to provide information to the CLDB about the node's health and resource usage.

IAM users

Relates to Object Store. An IAM (Identity and Access Management) user represents an actual user or an application. An administrator creates IAM users in an Object Store account and assigns access policies to them to control user and application access to resources in the account.

incremental dump file

More information

dump file on page 6290

Installer

A program that simplifies installation of the HPE Ezmeral Data Fabric. The Installer guides you through the process of installing a cluster with data-fabric services and ecosystem components. You can also use the Installer to update a previously installed cluster with additional nodes, services, and ecosystem components. And you can use the Installer to upgrade a cluster to a newer core version if the cluster was installed using the Installer or an Installer Stanza.

Installer node

The node on which you run the Installer program. The Installer node can be a node in the cluster that you plan to install; or, it can be a node that is not part of the cluster. But certain prerequisites must be met if the Installer node is not one of the nodes in the cluster to be installed.

Kubernetes Interfaces for Data Fabric

A set of Docker containers that provide persistent storage for Kubernetes objects through the file system. Once the Docker containers are installed, both a Kubernetes FlexVolume Driver and a Kubernetes Dynamic Volume Provisioner are available for static and dynamic provisioning of data-fabric storage.

log compaction

A process that purges messages previously published to a topic partition, retaining the latest version.

More information

data compaction on page 6288

last-updated: Jun 06, 2024

MAST Gateway

A gateway that serves as a centralized entry point for all the operations that need to be performed on tiered storage.

For more information, see Overview of MAST Gateway on page 510.

minimum replication factor

The minimum number of copies of a volume that should be maintained by the data-fabric cluster for normal operation. When the replication factor falls below this minimum, re-replication occurs as aggressively as possible to restore the replication level. If any containers in the CLDB volume fall below the minimum replication factor, writes are disabled until aggressive re-replication restores the minimum level of replication.

mirror

A read-only physical copy of a volume.

MOSS

MOSS is the acronym for Multithreaded Object Store Server.

name container

A container in a data-fabric cluster that holds a volume's namespace information and file chunk locations, and the first 64 KB of each file in the volume.

Network File System (NFS)

A protocol that allows a user on a client computer to access files over a network as though they were stored locally.

node

An individual physical or virtual machine in a cluster.

See also *cluster node*.

NodeManager (NM)

A data service that works with the ResourceManager to host the YARN resource containers that run on each data node.

object

File and metadata that describes the file. You upload an object into a bucket. You can then download, open, move, or delete the object.

last-updated: Jun 06, 2024

Object Store

Object and metadata storage solution built into the HPE Ezmeral Data Fabric. Object Store efficiently stores data for fast access and leverages the capabilities of the patented HPE Ezmeral Data Fabric file system for performance, reliability, and scalability.

operator

In Kubernetes, a way to install and manage an application. Kubernetes operators handle not just application installation, but also the entire application lifecycle, including complex upgrades. An operator consists of a combination of two real Kubernetes objects: a controller and a custom resource.

Persistent Application Client Container (PACC)

A Docker-based application container image that includes a container-optimized data-fabric client. The PACC provides seamless access to cluster services, including the file system, HPE Ezmeral Data Fabric Database, and HPE Ezmeral Data Fabric Streams. The PACC makes it fast and easy to run containerized applications that access data in cluster.

policy server

The service that manages security policies and composite IDs.

Related concepts

Security Policy Domain and Policy Management on page 857

Describes how to create the security-policy domain, propagate security policies to all the clusters within the domain, and some considerations for moving data.

quota

A disk capacity limit that can be set for a volume, user, or group. When disk usage exceeds the quota, no more data can be written.

recovery point objective (RPO)

The maximum allowable data loss as a point in time. If the recovery point objective is two hours, then the maximum allowable amount of data loss that is acceptable is two hours of work.

recovery time objective (RTO)

The maximum allowable time to recovery after data loss. If the recovery time objective is five hours, then it must be possible to restore data up to the recovery point objective within five hours.

More information

recovery point objective (RPO) on page 6294

replication factor

The number of copies of a volume.

last-updated: Jun 06, 2024

replication role

The replication role of a container determines how that container is replicated to other storage pools in the cluster.

A *name container* may have one of two replication roles: master or replica. A *data container* may have one of three replication roles: master, intermediate, or tail.

replication role balancer

The replication role balancer is a tool that switches the replication roles of containers to ensure that every node has an equal share of of master and replica containers (for name containers) and an equal share of master, intermediate, and tail containers (for data containers).

re-replication

Re-replication occurs whenever the number of available replica containers drops below the number prescribed by that volume's replication factor. Re-replication may occur for a variety of reasons including replica container corruption, node unavailability, hard disk failure, or an increase in replication factor.

ResourceManager (RM)

A YARN service that manages cluster resources and schedules applications.

role

The service that the node runs in a cluster. You can use a node for one, or a combination of the following roles: CLDB, JobTracker, WebServer, ResourceManager, Zookeeper, FileServer, TaskTracker, NFS, and HBase.

secret

A Kubernetes object that holds sensitive information, such as passwords, tokens, and keys. Pods that require this sensitive information reference the secret in their pod definition. Secrets are the method Kubernetes uses to move sensitive data into pods.

secure by default

The HPE Ezmeral Data Fabric platform and supported ecosystem components are designed to implement security unless the user takes specific steps to turn off security options.

Related concepts

Security for Ecosystem Components on page 986

Whether you install Data Fabric software by using the Installer or by using manual steps, the platform and its ecosystem components are installed with security ON by default.

last-updated: Jun 06, 2024

security policy

A classification that encapsulates security controls on your data. Controls include which users have authorization to access and modify the data, whether to audit data operations, and whether to protect data in motion with wire-level encryption.

Related concepts

Policy-Based Security on page 854

Starting in core version 6.2.0 (EEP 7.0.0), HPE Ezmeral Data Fabric supports Policy-Based Security, a feature that administrators can use to classify security controls into a manageable number of security policies.

schedule

A group of rules that specify recurring points in time at which certain actions are determined to occur.

snapshot

A read-only logical image of a volume at a specific point in time.

storage pool

A unit of storage made up of one or more disks. By default, data-fabric storage pools contain two or three disks. For high-volume reads and writes, you can create larger storage pools when initially formatting storage during cluster creation.

NOTE: Storage pool refers to the combined storage capacity that is obtained by combining one or more storage devices. Storage devices can be anything from a very small disk drive to large arrays of disk drives (each containing 20-30 drives).

A storage pool is created to get a very large capacity of GBs/TBs/PBs available, from which users are provided needed amounts of storage

For example, one can combine 10 hard disk drives of 4TB each, totaling to 40TBs. Now, one can either directly use the 40TB as a single device or partition the space out to many smaller storage capacities such as 100GB, 1TB and so on from this 40TB and provide that access to different users.

stripe width

The number of disks in a storage pool. See *storage pool*.

super group

The group that has administrative access to the data-fabric cluster.

super user

The user that has administrative access to the data-fabric cluster.

last-updated: Jun 06, 2024

tagging

Operation of applying a security policy to a resource.

Related concepts

Policy-Based Security on page 854
Starting in core version 6.2.0 (EEP 7.0.0), HPE Ezmeral Data Fabric supports Policy-Based Security, a feature that administrators can use to classify security controls into a manageable number of security policies.

Related tasks

Tagging Volumes, Directories, and Files with Security Policies on page 1914
Associate security policies with data objects in the file system, including volumes, directories, and files. Associate up to sixteen security policies with a data object in the file system.

Tagging JSON Tables, Column Families, and Fields with Security Policies on page 1919
Associate security policies with HPE Ezmeral Data Fabric Database JSON tables, column families, and fields.

ticket

In the data-fabric platform, a file that contains keys used to authenticate users and cluster servers. Tickets are created using the `maprlogin` or `configure.sh` utilities and are encrypted to protect their contents. Different types of tickets are provided for users and services. For example, every user who wants to access a cluster must have a user ticket, and every node in a cluster must have a server ticket.

ticket secret

A Kubernetes secret that contains a ticket.

See also *secret* and *ticket*.

volume

A tree of files and directories grouped for the purpose of applying a policy or set of policies to all of them at once.

Warden

A data-fabric process that coordinates the starting and stopping of configured services on a node.

For more information, see Warden on page 815.

WORM

Write Once Read Many

Storage device that allows for only one-time write operation and multiple read operations. It can be used to prevent accidental deletion or modification of critical data, or to disallow tampering of such data by virus or malware.

YARN resource containers

A unit of memory allocated for use by YARN to process each map or reduce task.

ZooKeeper

ZooKeeper is a coordination service for distributed applications. It provides a shared hierarchical namespace that is organized like a standard file system.

For more information, see ZooKeeper on page 813.
