<policyName,...>
```

To associate a comma-separated list of security policies with a table without replacing existing security policies, run the following command:

```
maprcli table securitypolicy
add -path <tablePath> -securitypolicy
<policyName,...>
```

To replace security policies on a table with a comma-separated list of new security policies, run the following command:

```
maprcli table securitypolicy
set -path <tablePath> -securitypolicy
<policyName,...>
```

To remove one or more security policies from a table, run the following command:

```
maprcli table
securitypolicy remove -path
<tablePath> -securitypolicy
<policyName,...>
```

**REST API**

Send a request of type POST. For example, to associate a comma-separated list of security policies with a table at the time of table creation, send a request similar to the following:

```
https://<hostname>:8443/rest/table/
create?
path=<tablePath>&securitypolicy=<poli
cyName,...>
```

To associate a comma-separated list of security policies with a table without replacing existing security policies, send a request similar to the following:

```
https://<hostname>:8443/rest/table/
securitypolicy/add?
path=<tablePath>&securitypolicy=<poli
cyName,...>
```

To replace security policies on a table with a comma-separated list of new security policies, send a request similar to the following:

```
https://<hostname>:8443/rest/table/
securitypolicy/set?
```

```
path=<tablePath>&securitypolicy=<policyName,...>
```

To remove one or more security policies from a table, run the following command:

```
https://<hostname>:8443/rest/table/securitypolicy/remove?path=<tablePath>&securitypolicy=<policyName,...>
```

## Control System

1. Log in to the Control System and go to the **Create New Table** page or the **Edit Table** page.
2. Select the security policies to associate with the table in the **Security** section.
3. Specify all other required settings and click **Save Changes**.

**TIP:** For more information, see:

- [table create](#) on page 2417
- [table securitypolicy add](#) on page 2524
- [table securitypolicy set](#) on page 2526
- [table securitypolicy remove](#) on page 2525

## Tagging Column Families

### About this task

Associate security policies with JSON table column families.

### CLI

To associate a comma-separated list of security policies with a column family when the column family is created:

```
maprcli table cf
create -path <tablePath> -cfname
<column-family-name> -jsonpath
<family path> -securitypolicy
<policyName,...> -force true
```

To associate a comma-separated list of security policies with a column family without replacing existing security policies, run the following command:

```
maprcli table cf securitypolicy
add -path <tablePath> -cfname
<column-family-name> -securitypolicy
<policyName,...>
```

To replace security policies on a column family with a comma-separated list of new security policies, run the following command:

```
maprcli table cf securitypolicy
set -path <tablePath> -cfname
<column-family-name> -securitypolicy
<policyName,...>
```

To remove one or more security policies from a column family, run the following command:

```
maprcli table cf securitypolicy
remove -path <tablePath> -cfname
<column-family-name> -securitypolicy
<policyName,...>
```

## REST API

Send a request of type POST. For example, to associate a comma-separated list of security policies with a column family at the time of table creation, send a request similar to the following:

```
https://<hostname>:8443/rest/table/cf/
create?
path=<tablePath>&cfname=<column-famil
y-name>&securitypolicy=<policyName,...
>
```

To associate a comma-separated list of security policies with a column family without replacing existing security policies, send a request similar to the following:

```
https://<hostname>:8443/rest/table/cf/
securitypolicy/add?
path=<path>&cfname=<column-family-name
>&securitypolicy=<policyName,...>
```

To replace security policies on a column family with a comma-separated list of new security policies, send a request similar to the following:

```
https://<hostname>:8443/rest/table/cf/
securitypolicy/set?
path=<path>&cfname=<column-family-name
>&securitypolicy=<policyName,...>
```

To remove one or more security policies from a column family, run the following command:

```
https://<hostname>:8443/rest/table/cf/
securitypolicy/remove?
path=<path>&cfname=<column-family-name
>&column=<JSON-table-field>&securitypo
licy=<policyName,...>
```

## Control System

1. Log in to the Control System, and click **Data > Tables**.

2. Locate and select the table that contains the column family you want to secure.
3. On the **Summary** tab, locate the **Security** section.
4. In the **Security** section, click on the table name to expand the list of column families associated with the table.
5. Click the **+** icon in the **Security Policy** column next to the column family you want to secure with a security policy.
6. In the **Tag Security Policy to Column Family:** window, select the security policy you want to apply to the column family.
7. Click **Add**.

**TIP:** For more information, see:

- [table cf create](#) on page 2443
- [table cf securitypolicy add](#) on page 2459
- [table cf securitypolicy set](#) on page 2462
- [table cf securitypolicy remove](#) on page 2460

## Tagging Fields

### About this task

Associate security policies with JSON fields.

#### CLI

To associate a comma-separated list of security policies with a JSON table field, without replacing existing security policies, run the following command:

```
maprcli table cf
column securitypolicy
add -path <tablePath> -cfname
<column-family-name> -column
<column-name> -securitypolicy
<policyName,...>
```

To replace security policies on a JSON table field with a comma-separated list of new security policies, run the following command:

```
maprcli table cf
column securitypolicy
set -path <tablePath> -cfname
<column-family-name> -column
<column-name> -securitypolicy
<policyName,...>
```

To remove one or more security policies from a JSON table field, run the following command:

```
maprcli table cf
column securitypolicy
```

## REST API

```
remove -path <tablePath> -cfname
<column-family-name> -column
<column-name> -securitypolicy
<policyName, ...>
```

Send a request of type POST. For example, to associate a comma-separated list of security policies with a column family at the time of table creation, send a request similar to the following:

```
https://<hostname>:8443/rest/table/
create?
path=<tablePath>&securitypolicy=<poli
cyName, ...>
```

To associate a comma-separated list of security policies with a JSON table field without replacing existing security policies, send a request similar to the following:

```
https://<hostname>:8443/rest/table/cf/
column/securitypolicy/add?
path=<path>&cfname=<col-family-name>&s
ecuritypolicy=<policyName, ...>
```

To replace security policies on a JSON table field, with a comma-separated list of new security policies, send a request similar to the following:

```
https://<hostname>:8443/rest/table/cf/
column/securitypolicy/set?
path=<path>&cfname=<column-family-name
>&securitypolicy=<policyName, ...>
```

To remove one or more security policies from a JSON table field, run the following command:

```
https://<hostname>:8443/rest/table/cf/
column/securitypolicy/remove?
path=<path>&cfname=<column-family-name
>&column=<JSON-table-field>&securitypo
licy=<policyName, ...>
```

## Control System

1. Log in to the Control System, and click **Data > Tables**.
2. Locate and select the table that contains the field you want to secure.
3. On the **Summary** tab, locate the **Security** section.
4. In the **Security** section, click on the table name to expand the list of column families, and then click on the column family that contains the field you want to secure.
5. Click the **+** icon in the **Security Policy** column next to the field you want to secure with a security policy.

6. In the **Tag Security Policy to Column Family** window, select the security policy you want to apply to the column family.
7. Click **Add**.

**TIP:** For more information, see:

- [table of column securitypolicy add](#) on page 2429
- [table of column securitypolicy set](#) on page 2441
- [table of column securitypolicy remove](#) on page 2440

### Related tasks

[Removing Tagged Security Policies from Data Objects](#) on page 1901

You can remove security policies associated with data objects using the Control System, CLI, or REST API.

### Security Policy Java APIs

You can create, retrieve, and remove security policies, and associate security policies with a data object using file system APIs.

The standard Linux extended attributes to tag file system objects are POSIX-compliant. You can use these attributes on any Linux or POSIX-compliant client without installing additional Data Fabric software.

With the extended attribute syntax, applications need to ensure that to combine tags, they first retrieve the old tags and then combine them with the new tags. Otherwise, the new tags replace the old tags. Alternatively, applications can use an API with the following features:

1. Setting tags should be additive: new tags should be added to the existing tags, and not replace the existing tags.
2. Set multiple tags for the same resource in a single API.
3. Set tags for multiple file system resources in a single operation.

The extended `MapRFileSystem` Java class provides such an API for setting policy tags.

The list of `MapRFileSystem` API methods for data tagging is as follows:

```
public class MapRFileSystem extends FileSystem;
```

Method and Description	Modifier and Type
<b>Add a Security Policy Tag</b>	
<code>addSecurityPolicyTag (Path path, String securityPolicyTag) throws IOException;</code> Use this method to add a single security policy tag to the list of existing security policy tags (if any) for the file or directory specified in <i>path</i> . The <i>securityPolicyTag</i> parameter contains a security policy tag.	public int
<code>addSecurityPolicyTag (Path path, List&lt;String&gt;securityPolicyTags) throws IOException;</code> Use this method to add one or more security policies to the list of existing security policies (if any) for the file or directory specified in <i>path</i> . The <i>securityPolicyTags</i> parameter contains a list of one or more security policy tags.	public int
<b>Replace a Security Policy Tag</b>	

Method and Description	Modifier and Type
<p><code>setSecurityPolicyTag (Path path, String securityPolicyTag) throws IOException;</code></p> <p>Use this method to set the security policy tag to the file or directory specified in <i>path</i>, replacing all existing tags. The <i>securityPolicyTag</i> parameter contains a security policy tag.</p>	public int
<p><code>setSecurityPolicyTag (Path path, List&lt;String&gt;securityPolicyTags) throws IOException;</code></p> <p>Use this method to set one or more security policy tags for the file or directory specified in <i>path</i>, replacing any existing security policy tags. The <i>securityPolicyTags</i> parameter contains a list of one or more security policy tags.</p>	public int
<b>Remove a Security Policy Tag</b>	
<p><code>removeSecurityPolicyTag (Path path, String securityPolicyTag) throws IOException;</code></p> <p>Use this method to remove the security policy tag contained in the <i>securityPolicyTag</i> parameter from the list of existing security policy tags (if any) for the file or directory specified in <i>path</i>.</p>	public int
<p><code>removeSecurityPolicyTag (Path path, List&lt;String&gt;securityPolicyTags) throws IOException;</code></p> <p>Use this method to remove one or more security policy tags from the list of existing security policy tags (if any) for the file or directory specified in <i>path</i>. The <i>securityPolicyTags</i> parameter contains a list of one or more security policy tags.</p>	public int
<p><code>removeAllSecurityPolicyTags (Path path) throws IOException;</code></p> <p>Use this method to remove all security policies tagged to the file or directory specified by <i>path</i>.</p>	public int
<b>Retrieve Security Policy Tags</b>	
<p><code>getSecurityPolicyTag (Path path, List&lt;String&gt;securityPolicyTags) throws IOException;</code></p> <p>Use this method to retrieve the security policy tags associated with the file or directory specified in <i>path</i>. The <i>securityPolicyTags</i> parameter contains a list of one or more security policy tags.</p>	public int

The following example illustrates the usage of file system APIs, and the interchangeability of using the file system API with the extended attribute APIs:

1. Set three security policy tags: `general`, `hipaa`, and `pai`, on the file `/mapr/lab/foo.txt`.
2. Retrieve these security policy tags using the extended attribute commands and the `getSecurityPolicyTag` API.
3. Remove the tag `pai`. Two tags remain: `hipaa` and `general`.
4. Add a new tag `topsecret`.

The two existing tags, `general` and `hipaa`, are preserved. Finally, there are three tags: `general`, `hipaa`, and `topsecret`.

### Step 1: Set Security Policy Tags

Use the Java `addSecurityPolicyTag` API to set three security policies, `pai`, `general`, and `hipaa`, for the file `/mapr/lab/foo.txt` as follows.

```
import java.net.*;
import org.apache.hadoop.fs.*;
```

```
import org.apache.hadoop.conf.*;
import com.mapr.fs.MapRFileSystem;
import java.util.List;
import java.util.ArrayList;
...
Configuration conf = new Configuration();
FileSystem fs = FileSystem.get(conf);
Path path = Paths.get("/mapr/lab/foo.txt");
List<String> securityPolicies = new ArrayList<String>();
securityPolicies.add ("pci");
securityPolicies.add ("general");
securityPolicies.add ("hipaa");
((MapRFileSystem fs).addSecurityPolicyTag (path, securityPolicies);
```

## Step 2: Retrieve Security Policy Tags

The `getSecurityPolicyTag` API returns the same set of security policies `general`, `hipaa`, and `pci` in a List of String object, instead of a comma-separated list:

```
List<String> securityPolicies = new ArrayList<String>();
int status = getSecurityPolicyTag (path, securityPolicies);
```

Alternatively, use the `getfattr` extended attribute API, to retrieve the three security policy tags:

```
getfattr -d /mapr/lab/foo.txt
# file: /mapr/lab/foo.txt
security.mapr.policy="general,hipaa,pci"
```

The tags are always returned in alphabetical order regardless of the tags that you set first. All security policies are considered equal in terms of determining access rights.

Use the extended attribute Java API `getXAttr` to obtain the same result: retrieve the three security policy tags. The following segment prints the comma-separated list: `general,hipaa,pci`.

```
import java.net.*;
import org.apache.hadoop.fs.*;
import org.apache.hadoop.conf.*;
...
Configuration conf = new Configuration();
FileSystem fs = FileSystem.get(conf);
Path path = Paths.get("/mapr/lab/foo.txt");
byte[] securityPolicyBytes = fs.getXAttr(path, "security.mapr.policy");
System.out.println ("Security Policies: " + securityPolicyBytes.toString());
```

## Step 3: Remove a Security Policy Tag

At this point, the example has three tags for `/mapr/lab/foo.txt`: `general`, `hipaa`, and `pci`. Now, remove the tag `pci` using the `removeSecurityPolicyTag` API:

```
Configuration conf = new Configuration();
FileSystem fs = FileSystem.get(conf);
Path path = Paths.get("/mapr/lab/foo.txt");
...
((MapRFileSystem fs).removeSecurityPolicyTag (path, "pci");
```

Use any of the methods listed in step 2, to see that the `pci` tag is removed.

**Step 4: Add a Security Policy Tag**

Add a tag `topsecret` using the `addSecurityPolicyTag` API:

```
FileSystem fs = FileSystem.get(conf);
Path path = Paths.get("/mapr/lab/foo.txt");
...
((MapRFileSystem fs).addSecurityPolicyTag (path, "topsecret");
```

Since this API sets the tags in an additive fashion, it preserves the two existing tags `general` and `hipaa`. The final output is three tags: `general`, `hipaa` and `topsecret`.

**Complete Example of Setting and Retrieving Security Policies**

The following sample program uses the tagging APIs on the file `/user/root/disks.txt`.

This program does the following tasks:

1. Tags the file with two tags, namely `general`, and `pci`.
2. Retrieve the tags. The output should display `general`, and `pci`.
3. Remove the tag `pci`.
4. Retrieve the tags. The output should display `general`.
5. Add the tag `hipaa`.
6. Retrieve the tags. The output should display `general`, and `hipaa`.

```
package com.mapr.fs;
import java.net.*;
import org.apache.hadoop.fs.*;
import org.apache.hadoop.conf.*;
import java.io.*;
import com.mapr.fs.MapRFileSystem;
import java.util.List;
import java.util.ArrayList;

class SecurityPolicyTest
{
    public static void main (String [] args) throws IOException
    {
        Configuration conf = new Configuration();
        if (args.length != 1) {
            System.out.println ("Usage: com.mapr.fs.SecurityPolicyTest <path>");
            System.exit(-1);
        }
        String pathName = args[0];
        System.out.println ("Path name: " + pathName);
        FileSystem fs = FileSystem.get(conf);
        Path path = new Path (pathName);
        List<String> securityPolicies = new ArrayList<String>();
        System.out.println ("Adding general,pci");
        securityPolicies.clear();
        securityPolicies.add ("general");
        securityPolicies.add ("pci");
        ((MapRFileSystem)fs).setSecurityPolicyTag(path, securityPolicies);
        List<String> tags = new ArrayList<String>();
        int status = ((MapRFileSystem)fs).getSecurityPolicyTag(path, tags);
        if (status == 0) {
            System.out.println ("Tags:");
```

```

        for (int i=0; i<tags.size(); i++) {
            System.out.println (tags.get(i));
        }
    }
    System.out.println ("Removing pci");
    ((MapRFileSystem)fs).removeSecurityPolicyTag (path,"pci");
    tags.clear();
    status = ((MapRFileSystem)fs).getSecurityPolicyTag(path, tags);
    if (status == 0) {
        System.out.println ("Tags:");
        for (int i=0; i<tags.size(); i++) {
            System.out.println (tags.get(i));
        }
    }
    System.out.println ("Add hipaa");
    ((MapRFileSystem)fs).addSecurityPolicyTag(path, "hipaa");
    tags.clear();
    status = ((MapRFileSystem)fs).getSecurityPolicyTag(path,
tags);
    if (status == 0) {
        System.out.println ("Tags:");
        for (int i=0; i<tags.size(); i++) {
            System.out.println (tags.get(i));
        }
    }
    }
}
}

```

## Output

```

# sh RUN
# export CLASSPATH=`mapr classpath`
# java -cp $CLASSPATH com.mapr.fs.SecurityPolicyTest /user/root/disks.txt
Path name: /user/root/disks.txt
Adding general,pci
Tags:
    general,pci
Removing pci
Tags:
    general
Add hipaa
Tags:
    general,hipaa

```

## Enforcing Security Policies at the Volume-Level

Describes how to set enforcement modes for security policies at the volume-level.

### About this task

The system enforces data access controls during data operations. Data access controls are the ACEs defined in security policies and ACEs and POSIX mode bits directly defined on data objects. The enforcement mode tells the system which of these data access controls to evaluate and enforce during data operations.

You can set the enforcement mode to one of the following values from the Control System, CLI, or REST API:

Enforcement Mode	Enforce Security Policies	Enforce Data ACEs and POSIX Mode Bits
PolicyAceAndDataAce (Default)	Yes	Yes
PolicyAceOnly	Yes	No

Enforcement Mode	Enforce Security Policies	Enforce Data ACEs and POSIX Mode Bits
DataAceOnly	No	Yes
PolicyAceAuditAndDataAce (Permissive mode)	Performs checks but does not fail; audits instead	Yes

For detailed information about the enforcement mode options, see [Volume-Level Security Policy Enforcement Mode](#) on page 853.

*Set the Enforcement Mode from the Control System*

### Procedure

1. Log in to the Control System, and go to the [volume information page](#).
2. In the **Security** pane, click  associated with **Enforcement Mode** to display the **Change Enforcement Mode** window.
3. Select the enforcement mode to apply to the volume.
4. Click **Save Changes** for the changes to take effect.

*Set the Enforcement Mode from the CLI or REST API*

### About this task

#### CLI

Set the enforcement mode when you create a volume:

```
/opt/mapr/bin/maprcli volume
create -name <volName> -path
<mountPath> -securitypolicy
<policyName> -enforcementmode
PolicyAceAndDataAce|PolicyAceOnly|
DataAceOnly
```

Set the enforcement mode when you modify a volume:

```
/opt/mapr/bin/maprcli
volume modify -name
<volName> -enforcementmode
PolicyAceAndDataAce|PolicyAceOnly|
DataAceOnly
```

#### REST

Send a POST request to set the enforcement mode when you create a volume:

```
curl -k -X POST 'https://
<hostname>:8443/rest/volume/create?
name=<volName>&path=<mountPath>&securi
typolicy=<policyName>&enforcementmode=
PolicyAceAndDataAce|PolicyAceOnly|
DataAceOnly' --user <username>:<pwd>
```

Send a request of type POST to set enforcement mode when you edit a volume:

```
curl -X POST 'https://<hostname>:8443/
rest/volume/modify?
```

```
name=<volName>&enforcementmode=PolicyA
ceAndDataAce|PolicyAceOnly|
DataAceOnly' --user <username>:<pwd>
```

For more information, see [volume create](#) on page 2592 and [volume modify](#) on page 2681.

### Troubleshooting Security Policies

This topic describes problems that you may encounter when creating and using security policies. It includes recommendations on how to troubleshoot and resolve problems.

#### Cannot Create a Security Policy

You encounter the following error when attempting to create a security policy:

```
ERROR (1) - Security policy create of XXX failed: Security policy creation
failed: No privileges to create a security policy
```

You must have cluster-level create/delete security policy (cp) permission to create a security policy.

To check your cluster-level permissions, assuming you have cluster-level login permission, run the following command:

```
maprcli acl show -type cluster
```

The following shows sample output for a user with the necessary cp permission:

Allowed actions	Principal
[login, cp]	User PolicyAdmin

#### Cannot view a Security Policy

If you receive an error when running the `maprcli security policy info` command, the root cause depends on the error you encounter:

##### No Data Fabric Ticket

```
ERROR (22) - You do not
have a ticket to communicate
with 10.10.20.40:7222. Retry after
obtaining a new ticket using maprlogin
```

This indicates that you do not have a Data Fabric ticket to access the secure Data Fabric cluster.

Create a Data Fabric ticket by running [maprlogin password](#).

##### No Policy-Level Permission

```
ERROR (2) - Security policy lookup
of XXX failed, Operation not permitted
```

The possible reasons for this error are as follows:

Possible Cause	Troubleshooting Steps
Either you or the group that you belong to does not have the policy-level read permission.	<ol style="list-style-type: none"> <li>1. Ask the user who granted you access to confirm your policy-level permission by running: <pre>maprcli security policy info \   -name XXX \   -columns acl -json</pre> </li> <li>2. Request access if you do not have the read permission.</li> </ol>
You are not a member of a group that has policy-level permission.	<ol style="list-style-type: none"> <li>1. Run the <code>id</code> command to verify your group membership.</li> <li>2. If you are not a member of the group, request an administrator to add you.</li> <li>3. If you are using Data Fabric tickets, recreate your ticket after updating your group membership.</li> </ol>
Your Data Fabric ticket does not reflect your updated group membership because you created the ticket before changing your group membership.	<ol style="list-style-type: none"> <li>1. Verify your Data Fabric ticket by examining the output from <code>maprlogin print</code>.</li> <li>2. If the ticket does not include the group that has policy-level permission, then recreate your Data Fabric ticket.</li> </ol>

### Cannot Modify a Security Policy

Depending on the property you are trying to modify, you must have certain policy-level permissions:

#### Update Non-Permission Properties of a Policy

If you encounter the following error:

```
ERROR (1) - Security policy
update of XXX failed: Insufficient
```

```
privileges to update general section
for security policy XXX
```

You must have one of the following cluster-level or policy-level permissions:

- Cluster-level `cp`, `a`, or `fc` permission
- Policy-level `a` or `fc` permission

### Update Permission Properties of a Policy

If you encounter the following error:

```
ERROR (1) - Security policy
update of XXX failed: Insufficient
privileges to update ACL for security
policy XXX
```

You must have one of the following cluster-level or policy-level permissions:

- Cluster-level `cp` or `admin` permission
- Policy-level `admin` permission

### Cannot tag a security policy to a data object

If you cannot tag a policy to a data object or the volume page search in the Control System is not displaying a security policy, verify that `allowtagging` is set to `true`, as described in [Changing the State of a Security Policy](#) on page 1904.

### Policies not visible after the CLDB starts

After the CLDB master starts, it can take a couple of minutes for the `policyserver` to come up. Currently, only the policy server on the cluster designated as the global policy master serves operations. Member clusters standby and do not serve operations. Wait for the `policyserver` to come up.

### Mirroring/Restore fails due to no policies

If mirroring or restore fails due to no policies, import the policies from the global policy master or a member cluster that has the policies, as described in [Security Policy Domain and Policy Management](#) on page 849.

### Access check on mirror source and destination clusters differ

The policies may have been modified on the global policy master and not propagated to either of them. Get the latest policies, as described in [Security Policy Domain and Policy Management](#) on page 849.

### Access checks fail

View the file system audit logs on the master node.

### Where are the logs?

The following table lists the log locations for components related to security policies:

Component	Location
PolicyServer	<code>cldb.log</code>
Access Check	MFS
Audit Logs	NC master node FS Audit Logs
Client (For tagging)	Regular Client logs ( <code>ffs.log</code> or enable Hadoop debug then <code>stdout</code> )

**Related concepts**

[Granting Security Policy Permissions](#) on page 1883

Permissions define which administrative users can create, view, and modify security policies.

Administrators set the permissions on security policies through cluster-level and security policy-level ACLs.

**Policy-Based Security Quick Reference**

This quick reference provides tips and `maprcli` commands for the most common tasks related to Policy-Based Security.

Task	Commands
<b>Enable PBS</b> (Required for upgrades from pre-6.2.0 versions of data-fabric)	If upgrading from a data-fabric version that does not support extended attributes, enable the feature: <pre>/opt/mapr/bin/maprcli cluster feature enable -name mfs.feature</pre> Enable PBS: <pre>/opt/mapr/bin/maprcli cluster feature enable -name mfs.feature</pre> Related documentation: <ul style="list-style-type: none"> <li>• <a href="#">Upgrade Workflows (Releases 6.x or 7.x to 7.8.0)</a> on page 293</li> <li>• <a href="#">Installer</a> on page 5610</li> </ul>
<b>Designate a master security policy cluster</b> (Required to create and modify security policies)	You must designate a master security policy cluster to set the security policy global master for member clusters. Master and member security policies form a security policy domain. <pre>maprcli config save -values '{"cldb.pbs.global.master":"1"}'</pre> #1 = master security policy cluster #0 = member of the security policy cluster           To identify which cluster is master, run: <pre>maprcli dashboard info -json   grep -i global "globalPolicyMaster"</pre> Related Documentation: <ul style="list-style-type: none"> <li>• <a href="#">Configuring the Global Policy Master</a> on page 852</li> <li>• <a href="#">Security Policy Domain and Policy Management</a> on page 849</li> <li>• <a href="#">Setting Global Configuration Options for Policy-Based Security</a> on page 1880</li> </ul>
<b>Grant an admin cp permission</b> (Required to create security policies)	Admins with cluster-level <code>a</code> (admin) permission can assign <code>cp</code> (create security policy) permission to users. <pre>/opt/mapr/bin/maprcli acl edit -type cluster -name &lt;cluster-name&gt; -user &lt;user&gt;:&lt;action&gt;[,&lt;action&gt;...][&lt;user&gt;:&lt;action&gt;[,&lt;action&gt;...]]</pre> <b>#Example: Grant jsmith cp cluster-level permission</b> <pre>#!/opt/mapr/bin/maprcli acl edit -type cluster -name myCluster -user jsmith:cp</pre> Related documentation: <ul style="list-style-type: none"> <li>• <a href="#">acl edit</a> on page 1994</li> <li>• <a href="#">Example Using Security Policies</a> on page 865</li> </ul>

Task	Commands
<b>Grant admins access to a security policy</b>	<p>Admins with cluster-level <code>cp</code> permission can set permissions on a security policy during policy-level permissions through policy-level ACLs. Regardless of how or when the a user or group has on a security policy. Note that the commands shown do not include</p> <pre>#Grant user permission to a security policy during policy create /opt/mapr/bin/maprcli security policy create -name &lt;security-policy-name&gt;  #Modify a security policy and grant user permission to the policy /opt/mapr/bin/maprcli security policy modify -name &lt;security-policy-name&gt;  #Overwrite the existing permissions on a security policy /opt/mapr/bin/maprcli acl set -cluster &lt;cluster name&gt; -name &lt;security-policy-name&gt;  #Adds or modifies the existing permissions on a security policy /opt/mapr/bin/maprcli acl edit -cluster &lt;cluster name&gt; -name &lt;security-policy-name&gt;</pre> <p>Related documentation:</p> <ul style="list-style-type: none"> <li>• <a href="#">Granting Security Policy Permissions</a> on page 1883</li> <li>• <a href="#">policy create</a> on page 2322</li> <li>• <a href="#">policy modify</a> on page 2352</li> <li>• <a href="#">acl set</a> on page 1995</li> <li>• <a href="#">acl edit</a> on page 1994</li> </ul>

### Customizing Security in HPE Ezmeral Data Fabric

Describes the `.customSecure` file and how HPE Ezmeral Data Fabric 6.x handles custom security settings.

This topic contains the following subsections:

- [What is Custom Security?](#) on page 1934
- [Identifying the Current Security State of the Cluster](#) on page 1934
- [About the .customSecure File](#) on page 1935
- [Custom Security and the HPE Ezmeral Data Fabric Installer](#) on page 1935
- [Adding a Node to a Cluster with Custom Security](#) on page 1935
- [Adding a Service to a Cluster with Custom Security](#) on page 1935

**NOTE:** Implementing custom security is not recommended unless your installation demands it. Using the custom security option means that HPE Ezmeral Data Fabric software does not ensure that your system is secure by default, and that you need to manually perform all security configuration.

In HPE Ezmeral Data Fabric 6.x, the `configure.sh` script detects that a cluster is in one of three security states:

Secure	The cluster is configured with the default HPE Ezmeral Data Fabric security settings.
Custom secure	The cluster has a mixture of HPE Ezmeral Data Fabric security settings and custom settings.

Understanding how `configure.sh` handles custom security settings is important when you upgrade a cluster, add services, add nodes, or change security settings.

### What is Custom Security?

Any change to the default HPE Ezmeral Data Fabric configuration for authentication, authorization, or encryption represents a "custom security" change. Users who make such changes are encouraged to create a `.customSecure` file to ensure that `configure.sh` does not remove these changes. Custom security changes include any change to the keystore or truststore passwords or the number of keys in those files or the names of the keys.

Other examples of custom security changes include:

- Implementing Kerberos security
- Changing the Hive authorization model
- Changing the Oozie authorization model

### Identifying the Current Security State of the Cluster

If the current security state of the cluster (secure or custom secure) is unknown, you can use one of these checks to identify which state the cluster is in:

- Check the security value in the `/opt/mapr/conf/mapr-clusters.conf` file. For example:

```
<clusternam1> secure=true <CLDB> <CLDB> ... <CLDB>
```

For more information, see [mapr-clusters.conf](#) on page 2988.

- Check for the presence of the `.customSecure` file:

```
/opt/mapr/conf/.customSecure
```

If the file is present, `configure.sh` treats the cluster as custom secure.

### About the `.customSecure` File

If you customized the security settings for cluster and you want to ensure that `configure.sh` does not change any of the settings, create a `.customSecure` file. Create the file in the following location on every node:

```
/opt/mapr/conf/.customSecure
```

The `.customSecure` file does not contain any information. The presence of the file tells `configure.sh` that the cluster has security settings that must not be changed by `configure.sh`.

Typically, you create the `.customSecure` file manually. However, in some cases, `configure.sh` creates or removes the `.customSecure` file for you. For example, if `configure.sh` detects that it is being run after an upgrade from a MapR 5.x secure cluster, it creates the `.customSecure` file automatically. If you use the `-forceSecurityDefaults` option and `-secure` with `configure.sh`, the script removes the `.customSecure` file because you are forcing the removal of custom security settings.

### Forcing a Change to the Security Configuration

If your HPE Ezmeral Data Fabric 6.x cluster has custom security settings (the `.customSecure` file is present), and you want to change to the default HPE Ezmeral Data Fabric secure or non-secure settings, use the `-forceSecurityDefaults` option of `configure.sh` to make the change. Note these considerations:

- Using the `-forceSecurityDefaults` option removes the `.customSecure` file. You must specify the `-secure` option with `-forceSecurityDefaults`. Otherwise, the command will have no effect.
- The `-forceSecurityDefaults` option might not remove all custom settings. Some manual editing might be necessary to return the cluster to a usable state.
- If you are forcing a custom-secured cluster to be HPE Ezmeral Data Fabric secure, you still must include other `configure.sh` options that are required for security. You must perform any steps required to add security. For example, see [Enabling Wire-level Security](#) on page 1791.

### Custom Security and the HPE Ezmeral Data Fabric Installer

Using the HPE Ezmeral Data Fabric Installer or HPE Ezmeral Data Fabric Installer Stanzas is not supported on clusters with custom security or customized configurations.

### Adding a Node to a Cluster with Custom Security

Adding a node to a cluster with custom security is similar to adding a node to a cluster with HPE Ezmeral Data Fabric security, but there are some additional steps:

1. Add the node with default HPE Ezmeral Data Fabric security as described in [Adding Nodes to a Cluster](#) on page 1106.
2. To support your custom security mode, copy any custom resources or settings as needed from existing nodes to the added node.
3. Create the `/opt/mapr/conf/.customSecure` file on the added node:

```
/usr/bin/touch /opt/mapr/conf/.customSecure
```

### Adding a Service to a Cluster with Custom Security

If you add a new service (ecosystem component) to a secure or custom-secure cluster, `configure.sh` configures the service for HPE Ezmeral Data Fabric security automatically. If the cluster is custom secure,

you need to change the security settings for the service to be compatible with the current cluster settings and restart the service. Any subsequent use of `configure.sh -R` will leave the customization in place.

## Managing Impersonation

Provides instructions for enabling and using Data Fabric impersonation features.

Impersonation, also known as identity assertion, is one user accessing data and submitting jobs on behalf of another user. Impersonation in Data Fabric allows centralized control of access to resources in the file system and HPE Ezmeral Data Fabric Database.

### Example: Access Control and Impersonation

As an example of impersonation, consider user Bob and a generic Service X:

1. Bob launches a client for the service and may or may not provide credentials.
2. Service X authenticates Bob and establishes a connection for him to use.
3. Bob issues a command to the service that will produce a query.
4. The service uses any user's `servicewithimpersonation` ticket to authenticate with the datastore - file system/HPE Ezmeral Data Fabric Database.
5. The datastore authenticates the user with the impersonation ticket. The service can now proceed.
6. The service sends the datastore a query, as user Bob.
7. The datastore checks permissions for Bob on the assets that the query will access.
8. If Bob has permissions, the datastore returns the query results to the service, which relays the results to the client, and the query succeeds.
9. If Bob does not have permissions, the datastore sends an access error to the service, which relays the error to the client, and the query fails.

When you use impersonation in Data Fabric:

- The datastore permissions are authoritative.
- The process has end-to-end security.
- Users can do nothing more and nothing less than what they are authorized to do.
- This control is independent of remote authentication and security mechanisms that control user access to application features.
- Any permissions set up within applications, or within the UNIX filesystem permissions on servers where Data Fabric components reside, have no effect on user access to Data Fabric resources.
- The `mapr` superuser is allowed to impersonate any Data Fabric user in any group, connecting from any host. Other users with impersonation capability can impersonate any Data Fabric user in any group, except the `mapr` superuser and the `root` user.

### Using Impersonation without Security

Although it is possible to enable impersonation in a non-secure Data Fabric installation, HPE strongly recommends against doing this. The implementation rules are different. Setting up the Data Fabric environment with impersonation operating under those rules makes it very difficult to enable security later. Disabling security in a secure Data Fabric installation is easy, if the need arises.

If you choose to implement impersonation in a non-secure Data Fabric cluster, see [Configuring Impersonation when Cluster Security is not Enabled](#).

## Using Impersonation with Security

In general, this documentation assumes that security is enabled in your Data Fabric installation. See [Enabling Wire-level Security](#) on page 1791 and [Enabling Encryption of Data at Rest](#) on page 1793.

You can use the `maprlogin` utility to generate a **servicewithimpersonation** ticket that can be used to access a secure cluster impersonating another user. That is, the **servicewithimpersonation** ticket provides the user the ability to impersonate other users (except the `mapr` user) in addition to the ability to access a secure cluster. The **servicewithimpersonation** ticket generated with the list of `impersonatedgids` and `impersonateduids` cannot be used to impersonate user `root` or user `mapr`. If the user is other than `root` or `mapr`, CLDB resolves the username to UID locally. It then checks if the resolved UID can be impersonated (that is, if it is a part of the ticket's `impersonateduids`) or at least one of the GIDs of the resolved UID can be impersonated (i.e., if at least one of the GIDs should be part of the ticket's `impersonatedgids`). The **servicewithimpersonation** ticket can only be generated by a user with full control on a cluster's ACL.

If you are setting up user impersonation in a secure cluster, you need to generate an impersonation ticket. See the *Generating and Printing Service with Impersonation Ticket* section in the [maprlogin Command Examples](#) on page 2922 topic and [Generating a Service with Impersonation Ticket](#) on page 1827 for information.

After generating the ticket:

1. Ensure that user1 has read permissions on the ticket.
2. If you moved the ticketfile to a different location, set the `$MAPR_TICKETFILE_LOCATION` environment variable.

## How Impersonation Works

Introduces impersonation functionality, limitations, and core requirements.

If a user attempts to impersonate another user to the file system or HPE Ezmeral Data Fabric Database systems and the configuration parameters for resolving the UID and GIDs on the server (see [Resolving Username with UID and GIDs During Impersonation](#)) are disabled:

1. The Data Fabric client looks for that user name in the local operating system registry.
2. If the user name is:
  - Found, Data Fabric sends the user's UID and GID to the server for impersonation.
  - Not found in the local operating system registry, the user action is not processed.

If a user attempts to impersonate another user to the file system or HPE Ezmeral Data Fabric Database systems and if the configuration parameters for resolving the UID and GIDs on the server (see [Resolving Username with UID and GIDs During Impersonation](#)) are enabled:

1. The Data Fabric client asks CLDB to look for that user name and resolve the UID and GIDs for that user on the server.
2. If the user name is:
  - Found on the server, the server allows the user to proceed with the impersonation.
  - Not found, the user action is not processed.

**NOTE:** If the configuration property for resolving the username is set on the client, and the configuration property for resolving the username is not set on CLDB, the operation fails with an error.

### Limitations on Impersonation

Service with impersonation tickets cannot be used to impersonate the `mapr` or `root` users. A scoped service with impersonation ticket cannot contain the UID of the `root` or `mapr` user (in the impersonated UIDs) and the GID of the `root` or `mapr` user (in the impersonated GIDs). The `mapr` user can impersonate any user, including `root`.

### Core Requirements for Impersonation

The `mapr` superuser is allowed to access to the file system and HPE Ezmeral Data Fabric Database systems. The following conditions must be met for the `mapr` superuser to be able to impersonate another Data Fabric user:

1. The `hadoop.proxyuser.mapr.groups` and `hadoop.proxyuser.mapr.hosts` parameters must be set correctly in the `core-site.xml` file.

See [Enabling Impersonation for the mapr Superuser](#).

These settings are not always required. The `hadoop proxy user` functionality is only applicable to ecosystem components included in the Data Fabric distribution for Apache Hadoop. If the Data Fabric client accesses an ecosystem component, such as `HiveServer2`, these settings may be required. These settings are never needed if the Data Fabric client accesses the file system or HPE Ezmeral Data Fabric Database directly. Enabling impersonation here ensures that the correct settings are in place if they are needed.

2. The name of the Data Fabric user that you want the `mapr` superuser to be able to impersonate must appear in the local operating system registry where the Data Fabric client is running if server-side [resolution of UID and GIDs](#) is not enabled.
3. The UID and GUID of the user name under which the Data Fabric client is running must match exactly the UID and GUID for that user name on the server.

**NOTE:** The `mapr` user can impersonate any user, including user `root`.

For all other users with access to the file system and HPE Ezmeral Data Fabric Database systems, the following conditions must be met for the user to impersonate another user.

1. A valid `servicewithimpersonation` ticket must be present for the user who intends to impersonate on the system.
2. The name of the user to impersonate must appear in the local operating system registry where the Data Fabric client is running if the server-side [resolution of UID and GIDs](#) is not enabled.
3. The UID and GUID of the user name under which the Data Fabric client is running must match exactly the UID and GUID for that user name on the server.

**NOTE:** If a user is not authorized to impersonate, then the operations proceeds as the user, not the target user. Some operations succeed and some do not, even if the user has all the permissions for these operations. Also, if a user with full access and impersonating capability tries to impersonate another user, the operations succeeds only if the target user has permissions on the directory.

### Component Requirements for Impersonation

Some Data Fabric ecosystem components have additional requirements to enable impersonation.

The following components must have settings that support impersonation in the configuration files indicated, on each node where the component resides:

- **Drill:** Edit the `drill-env.sh` file. See [Configuring User Impersonation](#) in the Apache Drill documentation.
- **HBase:** Edit the `hbase-site.xml` file. See [Impersonation through the HBase REST Gateway](#).
- **HiveServer2:** Edit the `hive-site.xml` file. See [Hive User Impersonation](#).
- **Hue:** Edit the `hue.ini` file.
- **Spark:** No special settings are required for Spark in MapReduce 2 (YARN) mode since Spark automatically inherits the correct behavior from YARN. If running standalone, Spark cannot perform impersonation and should not be used if security is important.

### Application Development Requirements

You can set up impersonation in an application programmatically.

- **C/C++:** Use `hb_connection_create_as_user()`. See [Creating C Apps - Binary Tables](#) on page 3242 and [Impersonation Example](#) on page 3245 for more information.
- **Java:** Use `UserGroupInformation.doAs()`. See [Class UserGroupInformation](#) in the Hadoop documentation for more information.

### Enabling Impersonation for the HPE Ezmeral Data Fabric Superuser

Provides a procedure necessary to implement superuser impersonation.

#### About this task

To enable impersonation in your HPE Ezmeral Data Fabric installation:

#### Procedure

1. Open the following file in a text editor:

```
/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/core-site.xml
```

2. Add the following `hadoop.proxyuser` properties:

```
<property>
  <name>hadoop.proxyuser.mapr.hosts</name>
  <value>*</value>
</property><property>
  <name>hadoop.proxyuser.mapr.groups</name>
  <value>*</value>
</property>
```

The `hosts` setting (\*) allows the `mapr` superuser to connect from any host to impersonate a user.

The `groups` setting (\*) allows the `mapr` superuser to impersonate any user in any group.

**NOTE:** Do not use anything other than a single asterisk here. Other parts of HPE Ezmeral Data Fabric ignore the values here and treat them as if each is set to a single asterisk.

3. Close the file, saving any changes that you made.

## Enabling Impersonation for any User

Provides the procedure necessary to implement impersonation for any data-fabric user.

### About this task

To enable impersonation for any data-fabric user:

### Procedure

1. Log in to the system as root, mapr user, or any user with full control.
2. Generate a servicewithimpersonation ticket for the data-fabric user.

For example:

```
$ maprlogin generateticket -type servicewithimpersonation -user
mapruser1 -out /var/tmp/sample_ticket
```

**WARNING:** The `mapr` user ticket can be used to impersonate any user, including user root.

You can generate a scoped `servicewithimpersonation` ticket for the user. Scoped impersonation tickets allow the user using the ticket to impersonate only the UIDs and or GIDs specified in the ticket. For example:

```
$ maprlogin generateticket -type servicewithimpersonation -user
mapruser1 -impersonateduids 550 -impersonatedgids 500 -out /var/tmp/
sample_ticket
```

**NOTE:** If you generate a scoped impersonation ticket, the impersonated UIDs cannot contain the UID of user `root` or user `mapr`, and the impersonated GIDs cannot contain the GID of user `root` or user `mapr`.

For more information, see [maprlogin](#) on page 2918.

3. Move the ticket to a secure location, and share the ticket with the user (for whom this ticket is generated).
4. (Optional) Copy the file to a permanent directory.

## Configuring Impersonation without Cluster Security

Describes how to use impersonation on a non-secure cluster.

### About this task

To configure impersonation without enabling cluster security, perform the following steps on the client.

### Procedure

1. Enable impersonation for each ecosystem component you will use that supports impersonation. See *Component Requirements for Impersonation* in [How Impersonation Works](#).
2. Enable impersonation for the data-fabric core components. See [Enabling Impersonation for the mapr Superuser](#).
3. On each client system from which you want to use impersonation:
  - a) Set a `MAPR_IMPERSONATION_ENABLED` environment variable with the value `true`. This value must be set in the environment of any process you start that does impersonation.

- b) Create a file in `/opt/mapr/conf/proxy/` that has the name of the data-fabric superuser or any other user. For the data-fabric superuser, the default file name would be `mapr`. For all other users, use their username for the proxy file.

If the data-fabric superuser has a different name in your cluster, use that name for the proxy file. To verify the data-fabric superuser name, check the `mapr.daemon.user=` line in the `/opt/mapr/conf/daemon.conf` file on a data-fabric cluster server.

### Resolving Username with UID and GIDs During Impersonation

Lists parameters for configuring impersonation.

To resolve username with UID and GIDs on the server (and not the local operating system registry) during impersonation, set the following configuration parameters on the client and CLDB:

Parameter	Description
<code>fs.mapr.server.resolve.user</code>	<p>Must be set in <code>core-site.xml</code> file on the client machine. Value can be one of the following:</p> <ul style="list-style-type: none"> <li><code>true</code> - enable</li> <li><code>false</code> - disable</li> </ul> <p>By default, this parameter is disabled. If enabled, the client requests the CLDB to resolve the user with UID/GIDs. For example, to enable this property, your entry in the <code>core-site.xml</code> file should be as shown below:</p> <pre>&lt;configuration&gt;   &lt;property&gt;     &lt;name&gt;fs.mapr.server.resolve.user&lt;/name&gt;     &lt;value&gt;true&lt;/value&gt;   &lt;/property&gt; &lt;/configuration&gt;</pre>
<code>cldb.security.resolve.user</code>	<p>Must be set using the <code>config</code> command. Value can be one of the following:</p> <ul style="list-style-type: none"> <li><code>0</code> - disable</li> <li><code>1</code> - enable</li> </ul> <p>By default, this is disabled. If enabled, CLDB resolve the user with UID/GIDs for all incoming client requests. For example, to enable this property, run the following command:</p> <pre>maprcli config save -values {cldb.security.resolve.user:1}</pre>

**NOTE:** Both configuration parameters must be set to enable support for UID/GID resolution on the server. If the configuration parameter is set on the client to resolve on the server and if the configuration parameter is not set on CLDB, the operation fails with an error.

## Managing Secure Clusters

Provides procedures that will enable you to use Data Fabric clusters securely.

Administrative topics such as configuring cross-cluster security, managing mirror volumes in secure clusters, running commands on remote secure clusters are discussed. In addition, access scenarios for secure and non-secure Data Fabric clusters and HDFS clusters are described.

## Setting Up Cross-Cluster Security

Provides an overview of the `configure-crosscluster.sh` utility that is used to set up security between two clusters.

### About this task

When all local and remote CLDB nodes are reachable from the local node, you can run the `configure-crosscluster.sh` on page 2841 utility on any CLDB node to automatically set up a trust relationship between clusters.

For two or more HPE Ezmeral Data Fabric clusters to communicate with one another, a secure trust relationship must exist between the clusters. A secure trust relationship between clusters is required for running commands remotely, creating remote replicas and mirror copies of volumes, and accessing data using NFS on the other cluster. The following sections describe the [quick](#) way to configure both the clusters for mirroring, replication, and remote access, and the [advanced manual](#) way to configure the clusters for mirroring, replication, remote access, and/or NFS server access.

### Quick Configuration

#### About this task

You can run the `configure-crosscluster.sh` on page 2841 utility on any CLDB node in a cluster to automatically set up a trust relationship between the cluster and another cluster. To automatically configure two clusters for remote access, mirroring, and replication in both directions:

#### Procedure

1. Log in to the CLDB node on a cluster.
2. Run the `configure-crosscluster.sh` on page 2841 utility with the `all` parameter.

For example:

```
# /opt/mapr/server/configure-crosscluster.sh create all -remoteip
<remote_node_IP>
```

When the utility runs, it performs the following actions on all the clusters:

- a. Updates the `/opt/mapr/conf/mapr-clusters.conf` file to include the first entry from the `/opt/mapr/conf/mapr-clusters.conf` file on the other cluster.
- b. Imports the certificate of the other cluster in the `/opt/mapr/conf/ssl_truststore` file, and copies the updated `/opt/mapr/conf/ssl_truststore` file to all the other nodes on the cluster.
- c. Generates a cross-cluster ticket for the other cluster, copies the ticket to the CLDB node on the other cluster, merges the ticket with the `/opt/mapr/conf/maprserverticket` file on the node in the other cluster, and copies the updated `/opt/mapr/conf/maprserverticket` file to all other CLDB nodes on the other cluster.

For more information on the arguments, syntax, and options, see the `configure-crosscluster.sh` on page 2841 utility.

3. Verify access to the remote cluster by:

- Running remote commands on a node in either cluster.
- Creating mirror volumes on any node in the destination cluster.
- Setting up table and stream replication on tables and streams in the source cluster.

To configure access over NFS, see [Configuring Secure Clusters for Cross-Cluster NFS Access](#) on page 1951.

## Advanced Configuration

### About this task

Using the [configure-crosscluster.sh](#) on page 2841 utility with the default configuration works only when all local and remote CLDB nodes are reachable from the local node. It does not work, for example, if you set up multi-homed clusters as documented in the MAPR\_SUBNETS section in [Designating NICs for HPE Ezmeral Data Fabric](#) on page 1148, because the [configure-crosscluster.sh](#) on page 2841 utility cannot traverse between local and remote IPs (for example, from the external IP 23.21.203.95 to internal IP 10.10.100.100). In such environments, run the [configure-crosscluster.sh](#) on page 2841 utility with the `-remotehosts` parameter.

You can configure the clusters manually for unidirectional or bidirectional remote access, mirroring, or replication only. The following sections describe the manual steps for:

### Configuring Secure Clusters for Running Commands Remotely

Describes how to configure secure clusters to access them all from a single cluster and run commands remotely on them.

### About this task

You can configure a number of secure clusters to access them all from one cluster. You need not log into each secure cluster separately and run `maprccli` commands locally on them.

For example, suppose you need to manage two secure clusters, clusterA and clusterB. One method is to log into each cluster separately and run commands locally on each. However, it is possible to log into clusterA only and manage both clusters from clusterA, running commands locally for clusterA and remotely for clusterB. When you type the `maprccli` commands, you must use the `-cluster` parameter in those commands to specify the cluster on which you want the commands to run.

You can configure the secure clusters for remote access manually (as described in the following section) or automatically by running the `configure-crosscluster.sh` utility. If you run the `configure-crosscluster.sh` utility, the utility configures the clusters for running commands remotely in both directions. See [configure-crosscluster.sh](#) on page 2841 for more information.

### Prerequisite

### About this task

Ensure that you have the [relevant ports open](#) for secure cluster communication.

### Setting Up Secure Clusters Manually for Cross-Cluster Access

### About this task

To manually configure two secure clusters for remote access:

**Procedure**

1. Log in to the secure cluster from which you want to run commands.  
In the rest of this procedure, this cluster is referred to as clusterA and the remote cluster is referred to as clusterB.
2. Configure clusterA for communicating with the other clusters by editing `mapr-clusters.conf` file on each node clusterA to specify the hostname or IP address of the CLDB nodes on the other clusters.

For example, suppose:

- clusterA's `/opt/mapr/conf/mapr-clusters.conf` file contains the following:

```
clusterA.cluster.com secure=true perfnode50.lab:7222
```

- clusterB's `/opt/mapr/conf/mapr-clusters.conf` file contains the following:

```
clusterB.cluster.com secure=true perfnode100.lab:7222
```

Perform the following steps to configure the nodes on the clusters:

- a) On any node in clusterA, append the first entry from clusterB's `mapr-clusters.conf` file, entry which is prefixed with the cluster name, to the end of clusterA's `mapr-clusters.conf` file.

Note that clusterA's entry must be the first line of the `mapr-clusters.conf` file:

```
clusterA.cluster.com secure=true perfnode50.lab:7222
clusterB.cluster.com secure=true perfnode100.lab:7222
```

The clusterA's `mapr-clusters.conf` file now contains two entries.

- b) Copy the updated `/opt/mapr/conf/mapr-clusters.conf` file to all the other nodes in clusterA.
- c) On any node in clusterB, append the first entry from clusterA's `mapr-clusters.conf` file, entry which is prefixed with the cluster name, to the end of the remote cluster's `mapr-clusters.conf` file.

Note that clusterB's entry must be the first line of `mapr-clusters.conf` file:

```
clusterB.cluster.com secure=true perfnode100.lab:7222
clusterA.cluster.com secure=true perfnode50.lab:7222
```

The clusterB's `mapr-clusters.conf` file now contains two entries.

- d) Copy the updated `/opt/mapr/conf/mapr-clusters.conf` file to all the nodes in clusterB.

See [mapr-clusters.conf](#) on page 2988.

3. Perform the following steps on clusterA to ensure that the `ssl_truststore` file has signers for all the clusters:

- a) Copy the `ssl_truststore` from the `/opt/mapr/conf` directory of clusterB into a temporary directory on clusterA.

For example:

```
# scp mapr@<remote-ip>:/opt/mapr/conf/ssl_truststore /tmp/
clusterB_ssl_truststore
```

- b) Merge the `ssl_truststore` of clusterB with the `ssl_truststore` of clusterA using the `/opt/mapr/server/manageSSLKeys.sh` utility.

For example, if you copied the `ssl_truststore` file of clusterB as `/tmp/clusterB_ssl_truststore`, run the following command to merge the files:

```
/opt/mapr/server/manageSSLKeys.sh merge /tmp/
clusterB_ssl_truststore /opt/mapr/conf/ssl_truststore
```

- c) Copy the merged `ssl_truststore` file to every node on clusterA.

4. Perform the following steps on clusterB *only* if you want to set up access to clusterA from clusterB:

- a) Copy the `ssl_truststore` from the `/opt/mapr/conf` directory of clusterA into a temporary directory on clusterB.

For example:

```
# scp mapr@<remote-ip>:/opt/mapr/conf/ssl_truststore /tmp/
clusterA_ssl_truststore
```

- b) Merge the `ssl_truststore` of clusterB with the `ssl_truststore` of clusterA using the `/opt/mapr/server/manageSSLKeys.sh` utility.

For example, if you copied the `ssl_truststore` file of clusterA as `/tmp/clusterA_ssl_truststore`, run the following command to merge the files:

```
/opt/mapr/server/manageSSLKeys.sh merge /tmp/
clusterA_ssl_truststore /opt/mapr/conf/ssl_truststore
```

- c) Copy the merged `ssl_truststore` file to every node on clusterB.

5. For crossclusters to work using the Control System, place the `mapruserticket` of the remote cluster into the local cluster.

- a) Generate a `mapruserticket` for the remote cluster as `mapr` user:

```
maprlogin password -cluster demo
[Password for user 'mapr' at cluster 'demo': ]
MapR credentials of user 'mapr' for cluster 'demo' are written to
'/tmp/maprticket_5000'
```

- b) Merge the generated `maprticket`:

```
cat /tmp/maprticket_5000 >>/opt/mapr/conf/
mapruserticket
```

6. Verify access by running remote commands on clusterA.

See [Verifying Access to run Remote Commands](#) on page 1946.

## Verifying Access to run Remote Commands

### Procedure

1. Log in to any node on clusterA and run the [maprlogin](#) on page 2918 utility from clusterA to obtain user ticket for accessing the remote cluster.

For example, to obtain tickets for managing the remote cluster from clusterA, run the following command::

```
# /opt/mapr/bin/maprlogin password -cluster clusterB.cluster.com
```

2. Verify access by running remote commands on clusterA.

For example, the following command, executed from a node in clusterA, lists the volumes on clusterB:

```
# /opt/mapr/bin/maprcli volume list -cluster clusterB.cluster.com
```

## Configuring Secure Clusters for Cross-Cluster Mirroring and Replication

Describes configuring clusters for cross-cluster operations such as mirroring and replication.

### About this task

Cross-cluster tickets are required on secure clusters that need to pull data from another secure cluster and on secure clusters that need to push data to another secure cluster. For example:

- Volume mirroring is a pull operation. The destination cluster pulls the volume data from the source cluster. Since the destination cluster performs the operation, the destination cluster receives a ticket that is generated on the source cluster.
- Table and streams replication is a push operation. The source cluster pushes table or stream data to the destination cluster. Since the source cluster performs the operation, the source cluster receives a ticket that is generated on the destination cluster.

You can configure secure clusters for cross-cluster mirroring and replication manually (as described in [Manually Setting up Secure Clusters for Cross-Cluster Mirroring](#) on page 1946 and [Manually Setting up Secure Clusters for Cross-Cluster Replication](#) on page 1950). You can configure secure clusters automatically, by running the `configure-crosscluster.sh` utility. This utility configures the clusters for both mirroring and replication in both directions. For more information, see [configure-crosscluster.sh](#) on page 2841.

## Manually Setting up Secure Clusters for Cross-Cluster Mirroring

### About this task

To set up secure clusters for cross-cluster mirroring:

### Procedure

1. Verify that the user for whom you are configuring access, exists in the registry on both the clusters and has the following permissions:
  - Permissions to create volumes on the source cluster.
  - Permissions to mirror volumes on the destination cluster.

You can set up access for the `mapr` user, who already has permissions to create volumes and mirror volumes.

2. Configure source cluster (clusterA) to communicate with the other clusters by editing the `mapr-clusters.conf` file on each node of clusterA to specify the hostname or IP address of the CLDB nodes on the other clusters.

For example, suppose:

- The `/opt/mapr/conf/mapr-clusters.conf` file on the source cluster (clusterA) contains the following:

```
clusterA.cluster.com secure=true perfnode50.lab:7222
```

- The `/opt/mapr/conf/mapr-clusters.conf` file on the destination cluster (clusterB) contains the following:

```
clusterB.cluster.com secure=true perfnode100.lab:7222
```

Perform the following steps to configure the nodes on the clusters:

- a) On any node in clusterA, append the first entry from clusterB's `mapr-clusters.conf` file, the entry which is prefixed with the cluster name, to the end of clusterA's `mapr-clusters.conf` file. Note that clusterA's entry must be the first line of the `mapr-clusters.conf` file:

```
clusterA.cluster.com secure=true perfnode50.lab:7222
clusterB.cluster.com secure=true perfnode100.lab:7222
```

The `mapr-clusters.conf` file for clusterA now contains two entries.

- b) Copy the updated `/opt/mapr/conf/mapr-clusters.conf` file to all the other nodes in clusterA.
- c) On any node in the destination cluster (clusterB), append the first entry from clusterA's `mapr-clusters.conf` file, entry which is prefixed with the cluster name, to the end of the remote cluster's `mapr-clusters.conf` file.

Note that clusterB's entry must be the first line of the `mapr-clusters.conf` file:

```
clusterB.cluster.com secure=true perfnode100.lab:7222
clusterA.cluster.com secure=true perfnode50.lab:7222
```

The `mapr-clusters.conf` file for clusterB now contains two entries.

- d) Copy the updated `/opt/mapr/conf/mapr-clusters.conf` file to all the nodes in clusterB.

See [mapr-clusters.conf](#) on page 2988.

3. Log in to any node on the source cluster (ClusterA) and perform the following steps:

- a) Generate a cross-cluster ticket for the destination cluster (clusterB) for the mapr user.

For example, to generate a cross-cluster for the destination cluster (clusterB), run the following command on the source cluster (clusterA):

```
/opt/mapr/bin/maprlogin generateticket -type crosscluster -out /tmp/crossclusterticket -user destinationclusteruser
```

- b) Copy the cross-cluster ticket file to any node on the destination cluster (clusterB).

For example:

```
scp /tmp/crossclusterticket mapr@<dest-ip>:/tmp/  
sourceClusterTicketFile
```

4. Log in to the node on the destination cluster (clusterB) where the cross-cluster ticket was copied, and perform the following steps:

- a) Merge the cross-cluster ticket file with the `/opt/mapr/conf/maprserverticket` file on the node.

For example, to merge, run the following command:

```
cat /tmp/sourceClusterTicketFile >> /opt/mapr/conf/maprserverticket
```

- b) Copy the `/opt/mapr/conf/maprserverticket` file to all the CLDB nodes on the destination cluster.

5. Merge the `ssl_truststore` files by using the `/opt/mapr/server/manageSSLKeys.sh` tool.

In this step, you use the `copytruststore` option of `manageSSLKeys.sh` on page 2903 to create a copy of the truststore. Then you copy it to the destination node using SCP, and finally run `merge` without any additional options. For example:

- a. On clusterA, create a new `ssl_truststore` by using the `copytruststore` option:

```
/opt/mapr/server/manageSSLKeys.sh copytruststore /tmp/  
clusterA_ssl_truststore <ssl.server.truststore.password>  
<ssl.server.truststore.password>
```

You can obtain the `ssl.server.truststore.password` password from the `/opt/mapr/conf/store-passwords.txt` file for the key `ssl.server.truststore.password` on the CLDB master node for clusterA.

- b. Copy the `ssl_truststore` from clusterA to clusterB:

```
scp mapr@<remote-ip>:/opt/mapr/conf/clusterA_ssl_truststore /tmp/  
clusterA_ssl_truststore
```

- c. Merge the `ssl_truststore` on clusterB:

```
/opt/mapr/server/manageSSLKeys.sh merge /tmp/  
clusterA_ssl_truststore /opt/mapr/conf/ssl_truststore  
<ssl.server.truststore.password on ClusterA>  
<ssl.server.truststore.password on clusterB>
```

You can obtain the password for `ssl.server.truststore.password` from the `/opt/mapr/conf/store-passwords.txt` file for the key `ssl.server.truststore.password` on the CLDB master node for clusterA.

You can obtain the password for `ssl.server.truststore.password` from the `/opt/mapr/conf/store-passwords.txt` file for the key `ssl.server.truststore.password` on the CLDB master node for clusterB.

6. Copy the merged `ssl_truststore` file to every node on clusterB.

7. Generate ticket for `root` user to clusterA from clusterB by using the following command:

```
maprlogin password -cluster clusterA
```

8. **Optional:** If your clusters are secure, configure your source cluster so that you can use the Control System to set up and administer table replication from the source to the destination cluster.

These steps make it convenient to use the Control System for setting up and managing replication involving two secure clusters. However, before following them, perform these prerequisite tasks.

**NOTE:**

- Ensure that both clusters are managed by the same team or group. The UIDs and GIDs of the users that are able to log in to the Control System on the source cluster must exactly match their UIDs and GIDs on the destination cluster. This restriction applies only to access to both clusters through the Control System, and does not apply to access to both clusters through the `maprccli`. If the clusters are managed by different teams or groups, use the `maprccli` instead of the Control System to set up and manage table replication involving two secure clusters.
  - Ensure that the proper file-system and table permissions are in place on both clusters. Otherwise, any user who can log into the Control System and has the same UID or GID on the destination cluster will be able to set up replication either from the source cluster to the destination cluster or vice versa. A user could create one or more tables on the destination cluster, enable replication to them from the source cluster, load the new tables with data from the source cluster, and start replication. A user could also create tables on the source cluster, enable replication to them from tables in the destination cluster, load the new tables with data from the destination cluster, and start replication.
- a. On the source cluster (clusterA), generate a service ticket by using the `maprlogin` command:

```
maprlogin generateticket -type service -cluster <destination cluster>
-user mapr -duration <duration> -out <output folder>
```

Where `-duration` is the length of time before the ticket expires. You can specify the value in either of these formats:

- `[Days:]Hours:Minutes`
  - `Seconds`
- b. To every node of the destination cluster (clusterB), add the service ticket to the file `/opt/mapr/conf/maprusersticket` file:

```
cat <path and filename of the service ticket> >> /opt/mapr/conf/
maprusersticket
```

- c. Restart the web server by running the `maprccli node services` command. For the syntax of this command, see [node services](#) on page 2298.

9. Perform the steps to [verify configuration for mirroring](#).

### Results

You can now create mirror volumes on the destination cluster and set up a schedule to pull data from the volumes on the source cluster. However, you cannot create volumes on the source cluster that pull data from volumes in the destination cluster, because the setup described above is unidirectional. To configure

the clusters for bidirectional mirroring, repeat the steps above, by switching the source and destination clusters.

For example, suppose there are two clusters, clusterA and clusterB, and you performed the steps above for clusterA as the source cluster and clusterB as the destination cluster. After you complete the steps above, your destination cluster, clusterB can pull data from volumes on clusterA. For clusterA to mirror data on clusterB, perform the steps above with clusterB as the source cluster and clusterA as the destination cluster.

## Manually Setting up Secure Clusters for Cross-Cluster Replication

### About this task

To set up secure clusters for cross-cluster replication:

### Procedure

1. Verify that the user, for whom you are configuring access, exists in the registry on the destination cluster.
2. Log in to any node on the destination cluster and perform the following steps:
  - a) Generate a cross-cluster ticket for the source cluster.  
For example, to generate a cross-cluster for the source cluster, run the following command on the destination cluster:

```
/opt/mapr/bin/maprlogin generateticket -type crosscluster -out /tmp/crossclusterticket -user destinationclusteruser
```

- b) Copy the cross-cluster ticket file to any node on the source cluster.

For example:

```
scp /tmp/crossclusterticket mapr@<source-ip>:/tmp/sourceClusterTicketFile
```

3. Log in to the node in the source cluster where the cross-cluster ticket was copied, and perform the following steps:
  - a) Merge the cross-cluster ticket file with the `/opt/mapr/conf/maprserverticket` file on the node.

For example, to merge, run the following command:

```
cat /tmp/destinationClusterTicketFile >> /opt/mapr/conf/maprserverticket
```

- b) Copy the `/opt/mapr/conf/maprserverticket` file to all the nodes on the source cluster.
4. Configure the Gateway for table and streams replication.  
See [Configuring Gateways for Table and Stream Replication](#) on page 1521 for more information.
5. Perform the steps to [verify configuration for replication](#).

### Results

You can now set up volumes on the source cluster to push data to replicas on the destination cluster. However, you cannot create replicas on the source cluster that get data from volumes in the destination cluster because the setup described above is unidirectional. To configure the clusters for bidirectional replication, repeat the steps above by switching the source and destination clusters.

For example, suppose there are two clusters, clusterA and clusterB, and you performed the steps above for clusterA as the source cluster and clusterB as the destination cluster. After you complete the steps above, your source cluster, clusterA can push data to replicas on clusterB. For clusterB to replicate data on clusterA, perform the steps above with clusterB as the source cluster, and clusterA as the destination cluster.

## Verifying Cross-Cluster Configuration for Mirroring and Replication

### About this task

You can verify the cross-cluster configuration for:

### Procedure

1. Mirroring by logging in to a node on the destination cluster as the user for whom access was configured, and creating a mirror volume on the destination cluster for a volume on the source cluster. You can create mirror volumes using [the Control System](#) and/or the [CLI](#).
2. Replication by logging in to a node on the source cluster as the user for whom access was configured and creating a replica in the destination cluster for a volume, table, and stream on the source cluster. You can create replicas using the Control System and the CLI. To set up replication on secure clusters for:
  - Tables, refer to the documentation for [the Control System](#) and/or the [CLI](#).
  - Streams, refer to the documentation for [the Control System](#) and/or the [CLI](#).

## Configuring Secure Clusters for Cross-Cluster NFS Access

Describes how to manually set up cross-cluster NFS access.

### About this task

HPE Ezmeral Data Fabric-NFS offers many usability and interoperability advantages to the customer, and makes big data radically easier and less expensive to use. In a secure environment, however, you must configure NFS carefully because the NFS protocol is inherently insecure. Running the NFS server on any cluster node might expose the file system to be world readable and writeable to any machine that knows the IP address of the cluster node running the NFS server and has access to the network, regardless of the permissions, passwords and other security mechanisms. At the minimum, you should configure iptables firewall rules for all the cluster nodes where the NFS server is running, to restrict incoming NFS traffic to authorized client IP addresses.

Configuring cross-cluster NFS access might expose the entire file system of the other cluster to be world readable and writeable as well. Therefore, automated configuration for cross-cluster NFS access is not available with the [configure-crosscluster.sh](#) on page 2841 utility. You should manually configure cross-cluster NFS access only if you are fully aware of the security risks, and taken appropriate steps to mitigate the risks by securing both your NFS gateway, and incoming client traffic.

This section describes the manual configuration process on a secure cluster for accessing another secure cluster using NFS. There are two methods by which an NFS client can access file systems from multiple clusters:

1. Run the NFS server on one cluster.

For this method, configure cross-cluster NFS security for the NFS gateway on one cluster, so that the NFS client can mount the file system once from the NFS gateway, and then access the file systems for both clusters.

## 2. Run the NFS server on both clusters.

For this method, cross-cluster NFS configuration is not needed. The NFS client can mount the HPE Ezmeral Data Fabric file system individually for each cluster. This method requires that the NFS gateway to be run on each cluster, and the client performs one NFS mount for each NFS file system to be accessed.

The following procedure describes how to setup NFS for the first method:

### Procedure

1. Log in to any node on the secure cluster where the NFS server is running.  
In the rest of this procedure, this cluster is referred to as `clusterA.cluster.com` and the remote cluster is referred to as `clusterB.cluster.com`.
2. Set up the `/opt/mapr/conf/maprserverticket` file on `clusterA.cluster.com` to include the server ticket from `clusterB.cluster.com`. To set up:
  - a) Copy the `/opt/mapr/conf/maprserverticket` file from any node on `clusterB.cluster.com` to any directory on the node you are logged into on `clusterA.cluster.com`.
  - b) Append `maprserverticket` entry in the `maprserverticket` file from `clusterB.cluster.com` to the `/opt/mapr/conf/maprserverticket` file on the node you are logged into on `clusterA.cluster.com`.

**NOTE:** If you configured cross-cluster security either automatically using the [configure-crosscluster.sh](#) on page 2841 utility or manually before, there can be multiple entries in the `maprserverticket` file; copy the first entry with the alias matching the remote cluster name.

For example, to add `maprserverticket` of `clusterB.cluster.com` into the `/opt/mapr/conf/maprserverticket` file of `clusterA.cluster.com`, run the following command:

```
cat /tmp/remoteclusterticketfile | grep B.cluster.com |
head --lines=+1 >> /opt/mapr/conf/maprserverticket
```

- c) Copy the `/opt/mapr/conf/maprserverticket` file (on the node you are logged into in `clusterA.cluster.com`) to all the other nodes running NFS server on `clusterA.cluster.com`.
3. Verify data access on both clusters using NFS.

Users with access to the NFS servers must be able to access data in both clusters by providing the correct path. For example, users with NFS server access can verify access by running commands similar to the following:

```
# ls /mapr
clusterA.cluster.com clusterB.cluster.com
# ls /mapr/clusterB.cluster.com/
apps file CLUSTERB hbase opt tmp user var
```

### Configuring Cross-Cluster Security for a Mixed (FIPS and Non-FIPS) Configuration

Describes how to configure cross-cluster security when the clusters include FIPS and non-FIPS-enabled nodes.

The `configure-crosscluster.sh` script does not support mixed configurations consisting of FIPS and non-FIPS-enabled nodes. However, you can use manual steps to enable cross-cluster security in this scenario.

The following is an example for configuring mixed clusters consisting of a combination of FIPS-enabled and secure non-FIPS-enabled nodes. Suppose you have a five-node local cluster, and three of the nodes are FIPS-enabled nodes:

- AF1.example.com (CLDB)
- AF2.example.com (CLDB)
- AF3.example.com (CLDB)

Suppose the other two nodes are secure non-FIPS nodes:

- AS4.example.com
- AS5.example.com

In addition, suppose the remote cluster is a five-node cluster, and three of the nodes are FIPS-enabled nodes:

- BF1.example.com (CLDB)
- BF2.example.com (CLDB)
- BF3.example.com (CLDB)

Suppose the other two nodes in the remote cluster are secure non-FIPS nodes:

- BS4.example.com
- BS5.example.com

You can use the following steps to configure cross-cluster security:

1. Run the `configure-crosscluster.sh` script on the FIPS-enabled CLDB nodes:

```
$ cat localhostfile
AF1.example.com
AF2.example.com
AF3.example.com
$ cat remotehostsfile
BF1.example.com
BF2.example.com
BF3.example.com
$ /opt/mapr/server/configure-crosscluster.sh create all \
  -localtruststorepassword localtrustpass \
  -remotetruststorepassword remotetrustpass \
  -localhosts localhostfile \
  -remotehosts remotehostsfile
```

2. Copy the `/opt/mapr/conf/ssl_truststore.bcfks` to a temporary location of the first non-FIPS node in the local cluster (AF4.example.com in the example). Then use the `manageSSLKeys.sh` `convert` utility to convert the updated local trust store from BCFKS to JKS format. After confirming that the conversion is successful, copy the trust store to `/opt/mapr/conf`. For example:

```
$ /opt/mapr/server/manageSSLKeys.sh convert \
  -p localtrustpass -srcType bcfks -dstType JKS \
  /opt/mapr/conf/ssl_truststore.bcfks /tmp/ssl_truststore
$ cp /tmp/ssl_truststore /opt/mapr/conf/.
```

- Copy the `mapr-clusters.conf` and `maprserverticket` (for all or server mode) from the local FIPS node (`AF1.example.com`) to the secure non-FIPS node of the local cluster (`AF4.example.com`). For example, on `AF1.example.com`:

```
$ cd /opt/mapr/conf
$ scp mapr-clusters.conf \
    mapr@AS4.example.com:/opt/mapr/conf/mapr-clusters.conf
$ scp maprserverticket \
    mapr@AS4.example.com:/opt/mapr/conf/maprserverticket
```

- Use `pscp` to copy the `ssl_truststore`, `mapr-clusters.conf`, and `maprserverticket` to all the other secure non-FIPS nodes in the cluster.
- Repeat steps 2 and 3 for the non-FIPS hosts in the remote cluster, starting with the first non-FIPS remote node (`BF4.example.com`):
  - On `BF4.example.com`, use the `manageSSLKeys.sh` `convert` utility to convert the updated remote trust store from BCFKS to JKs format, and copy it to `/opt/mapr/conf`.
  - Copy the `mapr-cluster.conf` and `maprticket` files from the remote FIPS node (`BF1.example.com`) to all the non-FIPS nodes in the remote cluster (`BF4.example.com` and `BF5.example.com`).

#### Related reference

[configure-crosscluster.sh](#) on page 2841

Use the `configure-crosscluster.sh` utility to set up cross-cluster security between two clusters.

## Accessing External HDFS Clusters

Outlines how to use protocols to connect to other clusters.

HPE Ezmeral Data Fabric clusters can access an external HDFS cluster with the `webhdfs://` protocols.

### Prerequisites

Before you begin, verify the following:

- The HPE Ezmeral Data Fabric node accessing the HDFS cluster must have the `mapr-core` or `mapr-client` package installed.
- The HDFS cluster is installed and configured according to the vendor's specifications.
- To use the `hdfs://` protocol, edit the `fs.hdfs.impl` property in the `$HADOOP_HOME/conf/core-site.xml` file to include the value `org.apache.hadoop.hdfs.DistributedFileSystem`.

The following cases provide information about HPE Ezmeral Data Fabric and accessing HDFS clusters.

### Configuring Access Between Non-Secure Data Fabric and HDFS Clusters

If the Data Fabric and HDFS clusters are both non-secure, verify that the `fs.hdfs.impl` property in the `$HADOOP_HOME/conf/core-site.xml` file has the following value:

```
org.apache.hadoop.hdfs.DistributedFileSystem
```

No additional configuration is required.

### Verifying access to HDFS cluster

Use the following commands to verify access to the remote HDFS cluster from the Data Fabric cluster.

**CDH3 Only**

```
hadoop fs -ls hdfs://<namenode_host:port>/
```

**Other HDFS Versions**

```
hadoop fs -ls webhdfs://<namenode_host_running_webhdfs_service>/
```

**Using Java Applications with Secure Clusters**

Describes ramifications associated with using Java applications in a Data Fabric secure environment.

A secure computing environment places additional requirements on the Java Virtual Machine (JVM) properties of Java clients. The JVMs launched by Data Fabric with scripts, such as those used by the `maprcli`, `hadoop`, or `hbase` commands, have those properties automatically set by Data Fabric. Data Fabric attempts to set useful values for these properties.

When a JVM is used or launched directly, such as when you write a stand-alone Java program, any Java code that sets values for the following properties may cause issues on your cluster.

Property	Default Value	Description
<code>java.security.auth.login.config</code>	<code>/opt/mapr/conf/mapr.login.conf</code>	Path to the file that specifies JAAS configurations used by Data Fabric.
<code>javax.net.ssl.trustStore</code>	<code>/opt/mapr/conf/ssl_truststore</code>	Controls the truststore used by Data Fabric clients for HTTPS connections.
<code>http.auth.preference</code>	<code>basic</code>	The default setting disables JVM's default handling of SPNEGO, enabling Data Fabric's Hadoop code to handle SPNEGO authentication.
<code>zookeeper.saslprovider</code>	<code>com.mapr.security.maprsasl.MaprSaslProvider</code>	Enables ZooKeeper security.
<code>hadoop.login</code>	<code>hadoop_default</code>	Controls the JAAS configuration used by Data Fabric security.

**Administering the Data Access Gateway**

The HPE Ezmeral Data Fabric Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the HPE Ezmeral Data Fabric cluster. This section describes considerations when upgrading the service, how to modify configuration settings, and how to administer and manage the service.

**Installing the Data Access Gateway Service**

The HPE Ezmeral Data Fabric Data Access Gateway is installed when you install the HPE Ezmeral Data Fabric Database using the HPE Ezmeral Data Fabric Installer. To manually install the service, see [Installing Data Access Gateway](#) on page 254. For conceptual information, see [Understanding the HPE Ezmeral Data Fabric Data Access Gateway](#) on page 1016.

**Shutting Down and Upgrading the Data Access Gateway Service**

When the Data Access Gateway receives a shutdown request, it stops accepting new requests and returns an error to the client. Any in-progress requests are allowed to complete before shutting down the service. This allows you to perform rolling upgrades.

## Modifying Configuration Settings for the Data Access Gateway Service

### Logging Properties

The HPE Ezmeral Data Fabric Data Access Gateway uses standard Log4J configuration to control its logging. The log4j properties are in the `/opt/mapr/data-access-gateway/conf/log4j2.xml` file on nodes where you have installed the service. After modifying any properties on a node, restart the service. For details, see [Administering the Data Access Gateway Service](#) on page 1957.

Log data is stored in the `/opt/mapr/data-access-gateway/logs/data-access-gateway.log` file.

### Application Properties

To configure HPE Ezmeral Data Fabric Data Access Gateway properties, modify `/opt/mapr/data-access-gateway/conf/properties.cfg` on nodes where you have installed the service.

The following table lists the properties you can configure:

<b>auth.token.expiration</b>	<p><i>Default:</i> 1800 seconds</p> <p><i>Description:</i> Expiration time (in seconds) for the authentication token.</p>
<b>grpc.service.max-message-size</b>	<p><i>Default:</i> 32MB</p> <p><i>Description:</i> The maximum message size that the gRPC service accepts. The default is set to 32MB, as this is the default maximum document size for HPE Ezmeral Data Fabric Database JSON tables. This property is available in Data Access Gateway 2.0.202104302209 and later or 3.0.0.0.202104302219 and later.</p>
<b>grpc.service.ojai.query.result-limit</b>	<p><i>Default:</i> 5000</p> <p><i>Description:</i> Limit on the number of documents returned in retrieval requests using the Node.js and Python OJAI clients.</p>
<b>grpc.service.port</b>	<p><i>Default:</i> 5678</p> <p><i>Description:</i> Port number gRPC clients use to connect to the Data Access Gateway. The Node.js and Python OJAI clients are gRPC clients.</p>
<b>grpc.service.ssl.enabled</b>	<p><i>Default:</i> cluster</p> <p><i>Description:</i> Controls whether TLS is enabled for the gRPC Service.</p> <p>Values: cluster true false</p> <p>If set to cluster:</p> <ul style="list-style-type: none"> <li>• TLS is enabled if your HPE Ezmeral Data Fabric cluster is secure.</li> <li>• TLS is disabled if your HPE Ezmeral Data Fabric cluster is not secure.</li> </ul>
<b>rest.https.port</b>	<p><i>Default:</i> 8243</p> <p><i>Description:</i> Port number used to connect to the Data Access Gateway using HTTPS.</p>
<b>rest.result.limit</b>	<p><i>Default:</i> 5000</p> <p><i>Description:</i> Limit the number of documents returned in retrieval requests using the HPE Ezmeral Data Fabric Database JSON REST API.</p>

There is also a configuration file `/opt/mapr/data-access-gateway/conf/ojai-config.json` for parameters used by Data Access Gateway clients:

- HPE Ezmeral Data Fabric Database JSON REST API
- Node.js OJAI
- Python OJAI
- C# OJAI
- Go OJAI
- Java OJAI Thin Client

A parameter you can modify is the client sort limit:

```
{
  "ojai": {
    "mapr": {
      "query": {
        "max-client-sort-limit": 6000
      }
    }
  }
}
```

To understand why you might want to modify this parameter, see [Comparisons and Sorts in OJAI Queries](#) on page 3370.

After modifying any parameters on a node, restart the service as described in [Administering the Data Access Gateway Service](#) on page 1957.

### Warden Configuration

The Warden configuration for the HPE Ezmeral Data Fabric Data Access Gateway is in the `/opt/mapr/data-access-gateway/conf/warden.data-access-gateway.conf` file on nodes where you have installed the Data Access Gateway. To control the amount of memory allocated to the service, modify the following settings:

<b>service.heapsize.max</b>	<i>Default:</i> 3000 <i>Description:</i> Defines the maximum heap size (in MB) for the service.
<b>service.heapsize.min</b>	<i>Default:</i> 3000 <i>Description:</i> Defines the minimum heap size (in MB) for the service.

After modifying the warden configuration file on a node, run `configure.sh -R`, and restart the service:

```
/opt/mapr/server/configure.sh -R
maprcli node services -nodes <node name> -name data-access-gateway -action
restart
```

**NOTE:** Starting from version 5.0, DAG includes Apache Kafka Wire Protocol Service. See [Configuring Apache Kafka Wire Protocol Service](#) on page 3511 for configuration details.

### Administering the Data Access Gateway Service

The HPE Ezmeral Data Fabric Data Access Gateway is a service that you administer in the same manner as other HPE Ezmeral Data Fabric services. The name of the service is `data-access-gateway`.

To restart the service through the CLI, run the following command:

```
maprcli node services -nodes <node name> -name data-access-gateway -action
restart
```

For details about other operations you can perform on the service, see [Managing Services](#) on page 1129.

### Related concepts

[Understanding the HPE Ezmeral Data Fabric Data Access Gateway](#) on page 1016

The HPE Ezmeral Data Fabric Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the HPE Ezmeral Data Fabric cluster.

[Using the HPE Ezmeral Data Fabric Database JSON REST API](#) on page 3482

Starting in the EEP 5.0 release, you can use a REST API to access HPE Ezmeral Data Fabric Database JSON tables. The REST API allows you to use HTTP calls to perform basic operations on HPE Ezmeral Data Fabric Database JSON tables.

[Using the Node.js OJAI Client](#) on page 3457

Starting with EEP 6.0, you can use the Node.js OJAI client to write HPE Ezmeral Data Fabric Database JSON applications. The client provides you with a lightweight library that supports the OJAI API. You can connect to HPE Ezmeral Data Fabric Database JSON from middleware components, and add, update, and query documents in a HPE Ezmeral Data Fabric Database JSON table.

[Using the Python OJAI Client](#) on page 3462

Starting with EEP 6.0, you can use the Python OJAI client to write HPE Ezmeral Data Fabric Database JSON applications. The client provides you with a lightweight library that supports the OJAI API. You can connect to HPE Ezmeral Data Fabric Database JSON, and add, update, and query documents in a HPE Ezmeral Data Fabric Database JSON table.

[Using the C# OJAI Client](#) on page 3472

Starting with EEP 6.1.0, you can use the C# OJAI client to write HPE Ezmeral Data Fabric Database JSON applications. The client provides you with a lightweight library that supports the OJAI API. You can connect to HPE Ezmeral Data Fabric Database JSON, and add, update, and query documents in a HPE Ezmeral Data Fabric Database JSON table.

[Using the Go OJAI Client](#) on page 3477

Starting with EEP 6.0.0, you can use the Go OJAI client to write HPE Ezmeral Data Fabric Database JSON applications. The client provides you with a lightweight library that supports the OJAI API. You can connect to HPE Ezmeral Data Fabric Database JSON, and add, update, and query documents in a HPE Ezmeral Data Fabric Database JSON table.

[Using the Java OJAI Thin Client](#) on page 3454

Starting with EEP 6.3.0, you can use the Java OJAI Thin Client to write HPE Ezmeral Data Fabric Database JSON applications. The Java OJAI Thin Client provides a lightweight library that supports the OJAI API. You can connect to HPE Ezmeral Data Fabric Database JSON, and add, update, and query documents in a HPE Ezmeral Data Fabric Database JSON table.

## L3/L4 Load Balancing with the Data Fabric Data Access Gateway

You can use `haproxy` for L3/L4 load balancing of clients that use the Data Fabric Data Access Gateway. This topic describes how to install, configure, and run `haproxy`, and how to set your client connection string to connect to the load balancing service.

### Prerequisites

Determine the server where you want to run the load balancing service. The server must be reachable by the clients using the Data Access Gateway. It also must be able to connect to the Data Access Gateway.

### Procedure

1. Install the `haproxy` service on the server you have identified:

**CentOS**

```
sudo yum install haproxy
```

**Ubuntu**

```
sudo add-apt-repository ppa:vbernat/
haproxy-1.7
sudo apt update
sudo apt install haproxy
```

**SLES**

```
sudo zypper install haproxy
```

2. Configure the `haproxy` service by setting the following parameters in the configuration file at `/etc/haproxy/haproxy.cfg`:

- a) Create a `frontend` section with the following parameters:

```
frontend <section_name>
  mode tcp
  bind *:<port_to_use_in_the_client_connection_string>
  default_backend <backend_section_name>
```

- b) Create a `backend` section with one `server` entry for each Data Access Gateway server:

```
backend <backend_section_name>
  mode tcp
  server <DAG_server_name1> <DAG_server_host1>:<DAG_server_port1>
  server <DAG_server_name2> <DAG_server_host2>:<DAG_server_port2>
  ...
  server <DAG_server_nameN> <DAG_server_hostN>:<DAG_server_portN>
```

The `<backend_section_name>` is the parameter you specified in Step 2a.

3. Restart the `haproxy` service:

```
sudo service haproxy restart
```

**What to do next****Setting Your Client Connection String**

Assume you have the following `haproxy` configuration settings and you have installed `haproxy` on `node1.cluster.com`:

```
frontend connection_input
  mode tcp
  bind *:8553
  default_backend maprdb_servers

backend maprdb_servers
  mode tcp
  server srv01 node1.cluster.com:5678
  server srv02 node2.cluster.com:5678
```

You can use the following client connection string with this sample configuration:

**DAG with HTTPS | TLS**

```
node1.cluster.com:8553?
auth=basic;user=mapr;password=mapr;ssl
=true;sslCA=/opt/mapr/conf/
ssl_truststore.pem;sslTargetNameOverri
de=node1.cluster.com
```

**DAG with HTTP**

```
node1.cluster.com:8553?
auth=basic;user=mapr;password=mapr;ssl
=false
```

**L7 Load Balancing with the Data Access Gateway**

You can use `nginx` for L7 load balancing of clients that use the Data Access Gateway. This topic describes how to install, configure, and run `nginx`, and how to set your client connection string to connect to the load balancing service.

**Prerequisites**

Determine the server where you want to run the load balancing service. The server must be reachable by the clients using the Data Access Gateway. It also must be able to connect to the Data Access Gateway.

**Procedure**

1. Install the `nginx` service on the server you have identified:

**CentOS**

```
sudo yum install nginx
```

**Ubuntu**

```
sudo apt install nginx
```

**SLES**

```
sudo zypper install nginx
```

2. Configure the `nginx` service by setting the following parameters in the configuration file at `/etc/nginx/nginx.conf`:

- a) In the `http` section, create an `upstream` block with one `server` entry for each Data Access Gateway server:

```
upstream <upstream_name> {
    server <DAG_server_host1>:<DAG_server_port1>;
    server <DAG_server_host2>:<DAG_server_port2>;
    ...
    server <DAG_server_hostN>:<DAG_server_portN>
}
```

- b) Create (or modify) the `server` block:

**Secure Cluster**

For a secure cluster, you must specify the following SSL parameters:

- Listen port and protocol
- Path to the SSL certificate

- Path to the SSL key
- Path to the file containing the SSL password

```
server {
    listen 80 ssl http2;
    listen [::]:80;

    ssl_certificate
    <path_to_certificate>;
    ssl_certificate_key
    <path_to_key>;
    ssl_password_file
    <path_to_password_file>;

    access_log logs/access.log
    main;

    location / {
        grpc_pass grpcs://
    <upstream_name>;
    }
}
```

The `<upstream_name>` is the parameter you specified in Step 2a.

### 3. Restart the nginx service:

```
sudo service nginx restart
```

## What to do next

### Setting Your Client Connection String

Assume you have the following `nginx` configuration settings and you have installed `nginx` on `node1.cluster.com`:

#### Secure Cluster

```
user mapr;
worker_processes 1;
error_log /var/log/nginx/error.log
warn;
pid /var/run/nginx.pid;
events {
    worker_connections 1024;
}
http {
    log_format main '$remote_addr -
    $remote_user [$time_local] "$request"
    ' $status
    $body_bytes_sent "$http_referer"
    "' $http_user_agent";
    upstream servers {
        server node1.cluster.com:5678;
        server node2.cluster.com:5678;
    }
    server {
        listen 80 ssl http2;
        listen [::]:80;
```

```

        ssl_certificate /opt/mapr/
conf/ssl_keystore.pem;
        ssl_certificate_key /opt/mapr/
conf/ssl_keystore.pem;
        ssl_password_file /root/
passwd;

        access_log logs/access.log
main;

        location / {
            grpc_pass grpcs://servers;
        }
    }
}

```

You can use the following client connection string with this sample configuration:

```

node1.cluster.com:80?
auth=basic;user=mapr;password=mapr;ssl
=true;sslCA=/opt/mapr/conf/
ssl_truststore.pem;sslTargetNameOverri
de=node1.cluster.com

```

## Planning for High Availability

Configuring a cluster for HA (High Availability) involves running redundant instances of specific services, and configuring NFS properly. When properly licensed and configured for HA, the Data Fabric cluster provides *automatic failover* for continuity throughout the stack.

The following table provides the minimum number of instances of each core service required for HA:

Service	Minimum Number of Instances	Comments
CLDB	2	
ZooKeeper	3	At least 3 are needed to maintain a quorum in case one instance fails.
NFS	2	NFS can be configured for HA using virtual IP addresses (VIPs).
ResourceManager	2	

In HA clusters, it is appropriate to run more than one instance of the WebServer with a load balancer to provide failover. NFS can be configured for HA using VIPs.

The following sections provide information about HA planning:

### CLDB Failover

Explains the concept of CLDB failover, and its advantages.

The CLDB service automatically replicates its data to other nodes in the cluster, preserving at least two (and generally three) copies of the CLDB data. If the CLDB process dies, it is automatically restarted on the node. All jobs and processes wait for the CLDB to return, and resume from where they left off, with no data or job loss.

If the node itself fails, the CLDB data is still safe, and the cluster can continue normally as soon as the CLDB is started on another node. In an Enterprise Edition-licensed cluster, a failed CLDB node automatically fails over to another CLDB node without user intervention, and without data loss. It is possible to recover from a failed CLDB node on a Community Edition cluster, but the procedure is different.

Complete the following steps to recover from a failed CLDB node on a community edition cluster:

### 1. Restore ZooKeeper

If the CLDB node that failed was also running ZooKeeper, install ZooKeeper on another node to maintain the minimum required number of ZooKeeper nodes. Before installing ZooKeeper on another node, ensure that the ZooKeeper role is deleted on the failed node. See [Removing ZooKeeper Role](#) for more information.

### 2. Locate the CLDB Data

#### About this task

After restoring the ZooKeeper service on the HPE Ezmeral Data Fabric cluster, use the `maprcli dump zkinfo` command to identify the latest epoch of the CLDB, identify the nodes where replicates of the CLDB are stored, and select one of those nodes to serve the new CLDB node.

Secure cluster must first be converted to non-secure cluster before running the `maprcli dump zkinfo` command. Perform the following steps as root or use sudo:

**NOTE:** For non-secure clusters, skip to step 4.

#### Procedure

1. On the ZooKeeper nodes, stop Warden and ZooKeeper by running the following commands:

```
service mapr-warden stop
service mapr-zookeeper stop
```

2. Convert the secure cluster to non-secure cluster by running the following command on the ZooKeeper nodes:

**NOTE:** The script `configure.sh` takes comma-separated lists of cluster names and ZooKeeper host names (and optionally ports) or IP addresses.

```
/opt/mapr/server/configure.sh -C <host>[:<port>][,<host>:
[<port>]...]|<IP>[,<IP>...] -Z <host>[:<port>][,<host>[:<port>]...]|
<IP>[,<IP>...] -unsecure -R
```

3. Restart ZooKeeper:

```
service mapr-zookeeper restart
```

- Issue the `maprcli dump zkinfo -zkconnect localhost:5181 -json | grep -i "Container ID"` command using the `-json` flag.

```
maprcli dump zkinfo -zkconnect localhost:5181 -json | grep -i "Container ID"
```

The output displays the ZooKeeper znodes. For example:

```
maprcli dump zkinfo -zkconnect localhost:5181 -json |grep -i "Container ID" | more
"/datacenter/controlnodes/cldb/epoch/1/KvStoreContainerInfo": "
Container ID:1
  VolumeId:1 Master:10.10.104.34:5660-10.10.105.34:5660--9-VALID
Servers:
  10.10.104.34:5660-10.10.105.34:5660--9-VALID
  10.10.104.33:5660-10.10.105.33:5660--9-VALID
  10.10.104.32:5660-10.10.105.32:5660--9-VALID
Inactive Servers:  Unused Servers:  Latest epoch:9"
```

In the above example output, the latest epoch is 9.

- In the `/datacenter/controlnodes/cldb/epoch/1` directory, locate the CLDB with the latest epoch.  
The Latest Epoch field identifies the current epoch of the CLDB data.
- Select a CLDB from among the copies at the latest epoch. For example, `10.10.105.32:5660--9-VALID` indicates that the node has a copy at epoch 9 (the latest epoch).

## Results

You can now install a new CLDB on the selected node.

## What to do next

To convert the non-secure cluster to a secure cluster, run the the following command:

**NOTE:** The script `configure.sh` takes comma-separated lists of cluster names and ZooKeeper host names (and optionally ports) or IP addresses.

```
/opt/mapr/server/configure.sh -C <host>[:<port>][, <host>:
[:<port>]...] | <IP>[, <IP>...] -Z <host>[:<port>][, <host>:[:<port>]...] |
<IP>[, <IP>...] -secure -R
```

## 3. Stop the Selected Node

### About this task

Perform the following steps on the node you have selected for installation of the CLDB:

### Procedure

- Change to the root user (or use `sudo` for the following commands).
- Stop the Warden:

```
service mapr-warden stop
```

## 4. Remove the CLDB Role on the Failed Node

## About this task

To remove the CLDB role on the failed node, perform the following steps:

### Procedure

1. Stop Warden on the node.

```
service mapr-warden stop
```

2. Purge the CLDB package `mapr-cldb` with the `apt-get`, `yum`, or `zypper` commands, depending on your operating system.

## 5. Install the CLDB on the Selected Node

### About this task

Perform the following steps on the node you have selected for installation of the CLDB:

### Procedure

1. Login as `root` or use `sudo` for the following commands.

2. Install the CLDB service on the node:

- RHEL/CentOS: `yum install mapr-cldb`
- Ubuntu: `apt-get install mapr-cldb`

## 6. Configure the Selected Node

The script `configure.sh` configures a node to be part of a HPE Ezmeral Data Fabric cluster, or modifies services running on an existing node in the cluster. The script creates (or updates) configuration files related to the cluster and the services running on the node.

Before you run `configure.sh`, make sure you have a list of the hostname of the ZooKeeper nodes. You can optionally specify the ports for the CLDB and ZooKeeper nodes as well. The default ports are:

Service	Default Port #
CLDB	7222
ZooKeeper	5181

The script `configure.sh` takes an optional cluster name and log file, the CLDB hostname, and comma-separated list of ZooKeeper host names or IP addresses (and optionally ports), using the following syntax:

```
/opt/mapr/server/configure.sh -C <host>[:<port>] -Z <host>[:<port>]
[,<host>[:<port>]...] \
[-L <logfile>][-N <cluster name>]
```

**NOTE:** Each time you specify the `-Z <host>[:<port>]` option, you must use the *same order* for the ZooKeeper node list. If you change the order for any node, the ZooKeeper leader election process will fail.

### Example

```
/opt/mapr/server/configure.sh -C rln1.sj.us:7222 \
-Z
```

```
r1n1.sj.us:5181,r2n1.sj.us:5181,r3n1.sj.us:5181,r4n1.sj.us:5181,r5n1.sj.us:5181 -N MyCluster
```

## 7. Start the Nodes

### About this task

Perform the following steps on the node you have selected for installation of the CLDB:

### Procedure

Start the Warden:

```
service mapr-warden start
```

### Results

After the CLDB restarts, there is a 15-minute delay before replication resumes, in order to allow all nodes to register and heartbeat. This delay can be configured using the `config save` command to set the `cldb.replication.manager.start.mins` parameter.

## 8. Restart All Nodes

To restart all nodes in the cluster, stop each node, configure the node with the new CLDB and ZooKeeper addresses, and start the node.

Complete the following steps on each node in the cluster:

1. Stop the node.
  - a. Change to the root user (or use sudo for the following commands).
  - b. Stop the Warden:

```
service mapr-warden stop
```

2. Configure all the nodes with the new CLDB and ZooKeeper addresses.

The script `configure.sh` configures a node to be part of a HPE Ezmeral Data Fabric cluster, or modifies services running on an existing node in the cluster. You must run this script to configure a node. The script creates (or updates) configuration files related to the cluster and the services running on the node.

Before you run `configure.sh`, make sure you have the hostname of the CLDB node and the hostnames of the ZooKeeper nodes. You can, optionally, specify the ports for the CLDB and ZooKeeper nodes as well. The default ports are:

Service	Default Port #
CLDB	7222
ZooKeeper	5181

The script `configure.sh` takes an optional cluster name and log file, the CLDB hostname, and comma-separated list of ZooKeeper host names or IP addresses (and optionally ports), using the following syntax:

```
/opt/mapr/server/configure.sh -C <host>[:<port>] -Z <host>[:<port>] [,<host>[:<port>]...] [-L <logfile>][-N <cluster name>]
```

**NOTE:** Each time you specify the `-Z <host>[:<port>]` option, you must use the same order for the ZooKeeper node list. If you change the order for any node, the ZooKeeper leader election process will fail.

**Example:**

```
/opt/mapr/server/configure.sh -C r1n1.sj.us:7222 -Z
r1n1.sj.us:5181,r2n1.sj.us:5181,r3n1.sj.us:5181,r4n1.sj.us:5181,r5n1.sj.us:5181 -N MyCluster
```

**3. Start Warden.**

```
service mapr-warden start
```

## Best Practices for Running a Highly Available Cluster

Lists high availability cluster replication types, and the best practices for running such a cluster.

Data Fabric runs a wide variety of concurrent applications in a highly available fashion. Node failures do not have cluster-wide impact, and activities on other nodes in the cluster can continue normally. In parallel, data-fabric components detect failures and automatically recover from them. During the recovery process, clients may experience latency, the duration of which depends on the nature of the failure.

### Node Shutdown Instances

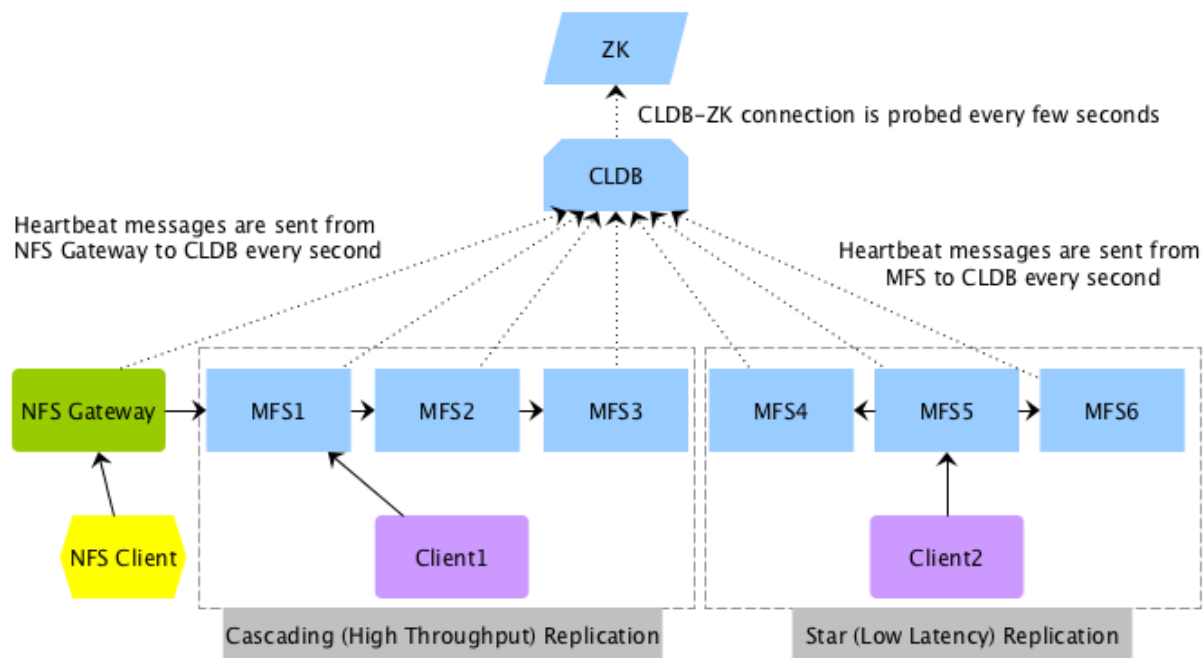

The cause of a service failure can be one of the following:

Planned shutdown	A planned/controlled failure. In this case, data-fabric is informed that a file server will be stopped. Data Fabric services use this information to improve recovery behavior.
Unexpected shutdown	Data Fabric services (file system, NFS server etc.) are stopped. However, the host operating system continues to run and failure detection is fast.
Hard unplanned shutdown	A power off, network down, or some other kind of unplanned stop. A node is stopped in a way that it is no longer reachable. Packets sent to this node do not get an error response and failure is detected through network layer's timeout mechanism. This results in longer failure detection times.

In all of these instances, the recovery process typically involves detecting that a node is unreachable, and contacting another available node for the same piece of information (either for reads, writes, or administrative operations).

### How file system and Associated Services Work

Let's review how file system and associated services typically work, using the following illustration.

**High-throughput or Cascading Replication Type:** As shown in the illustration, the client, Client1, writes to a data-fabric filesystem, MFS1, which in turn talks to MFS2, which in turn talks to MFS3 for cascading (high throughput) replication. The replication is inline and synchronous, which means MFS1 replies to the client only after it receives a response from MFS2. MFS2, in turn, only responds to MFS1 after MFS3 has replied to it. Client1 can read from any MFS, but write only to MFS1.

**Low-latency or Star Replication Type:** As shown in the illustration, the client, Client2, writes to MFS5. This illustration shows an example of star (low latency) replication where MFS5 replicates to both MFS4 and MFS6 in parallel. Again, the replication is inline and synchronous, which means that MFS5 responds to Client2 only after it has received responses from both MFS4 and MFS6.

### Recommended Settings for Running a Cluster with Low Latency and Fast Failover Characteristics

A well designed cluster provides automatic failover for continuity throughout the stack. For an example of a large, high-availability Enterprise Edition cluster, see [Example Cluster Designs](#) on page 82. On a large cluster designed for high availability, services should be assigned according to the service layout guidelines. For more information, see [Service Layout Guidelines for Large Clusters](#) on page 79. In general, services, specifically CLDB and ZooKeeper, should be installed on separate nodes to prevent the failure of multiple services at the same time and to enable the cluster to recover quickly.

### Recommended Settings to Recover from Unplanned Shutdown

Latencies as a result of unplanned or unexpected failures/shutdowns can be improved by performing the following:

#### Enabling Fast Failover of Services

Describes the Fast Failover feature that allows a cluster to rapidly detect and recover from network failures.

For running a cluster with Fast Failover characteristics, enable the Fast Failover feature:

```
/opt/mapr/bin/maprcli config save -values {mfs.feature.fastfailover:1}
```

If you have enabled the fast failover feature, when the file system detects a failed node, it very quickly declares the node as being down. Clients experience a short latency period while the failure is being detected. Once Data Fabric detects the failure, Data Fabric redirects clients of the failed node to an

alternate location (a replica container) for the data. If you have not enabled the fast failover feature, the file system repeatedly contacts the failed node.

This feature is enabled on all new installations. For upgrade installations, this feature is not enabled by default. You need to evaluate whether this feature works well with your existing infrastructure, before enabling it. You cannot turn this feature off after turning it on.

### Tuning the TCP for Fast Failure Detection

Describes how to tune the TCP stack to detect node or network failures rapidly.

An unplanned failure chiefly takes the form of a node failure or a network failure. In both instances, the network layer retries to connect to the failed node. The number of retry attempts is dictated by the TCP parameter `/proc/sys/net/ipv4/tcp_syn_retries`. The default value of that parameter is 5 (in Linux), resulting in a latency of more than a minute to detect the node failure. The problem is compounded when the same failed node is contacted repeatedly in the context of a long operation, such as when a client accesses multiple data objects present on that node.

The data-fabric stack solves the problem by remembering (caching) the information about a node's failure, and by not contacting that node for subsequent operations on data objects present on that node. Since all form of data is replicated, data-fabric services find alternative locations for a data object. This feature is in-built into the current software and does not have to be enabled explicitly. Hence, the communication between a client and a recently failed node incurs a one-time long-duration latency. As mentioned before, that latency is governed by the number of retries at the TCP level. Hence, to further improve the one-time longer latency of an operation between a pair of nodes, it is recommended that the number of TCP retries be decreased from 5 to 4, resulting in a latency of about 30 seconds.

### Setting the Timeout for TCP Connections

To set the TCP retry count, set the value of `tcp_syn_retries` to 4 in the `/proc/sys/net/ipv4/` directory (for IPv4 connections). For example:

```
echo 4 > /proc/sys/net/ipv4/tcp_syn_retries
```

Similarly for IPv6 connections, set:

```
echo 4 > /proc/sys/net/ipv6/tcp_syn_retries
```

This TCP setting of 4 ensures that the TCP stack takes about 30 seconds to detect failure of a remote node. To ensure that this setting is persistent across system reboots, set this value in the `/etc/sysctl.conf` file.

 **WARNING:** This setting impacts all TCP connections to and from a node. Hence, caution must be exercised when lowering this further. Also, in some instances, reducing this further may result in a node being incorrectly flagged as unavailable.

### Reducing Failure Detection Time for File Clients

Describes how to set the time for Hadoop and POSIX clients to detect node failures.

To reduce the amount of time it takes (Hadoop and FUSE-based POSIX) clients to detect (CLDB and data node) failure, define the property, `fs.mapr.connect.timeout`, in the `core-site.xml` file. The value for this property can be set in 100 milliseconds and will be rounded up to the nearest 100 milliseconds. The minimum value for this property is 100 milliseconds, which can be incremented only by units of 100 milliseconds. Suppose a value of 260 milliseconds is specified, by default, the value will automatically be rounded up to 300 milliseconds. The default value for this property is 0, which means that the Linux TCP timeout setting will be used for connections if this property is not set.

Your entry in `core-site.xml` file should look similar to the following:

```
<property>
  <name>fs.mapr.connect.timeout</name>
```

```
<value>200</value>
<description>file client wait time of 200 milliseconds</description>
</property>
```

This setting (for hadoop and FUSE-based POSIX clients) ensures that the clients wait only for the specified amount of time to establish a connection. That is, it is used only for the first request sent to CLDB or a data node before or after a failure. For subsequent requests, the default system connection timeout value is used. In the event of a failure after a connection has been established, the client will wait for the connection to timeout (based on the system timeout value) before it contacts the next (CLDB or data) node to process the request.

For example, suppose the value for this parameter is 100 milliseconds and the Linux TCP connection timeout value is 30 seconds. When a hadoop or FUSE-based POSIX client contacts CLDB or a data node for the first time to establish a connection, the client will wait for 100 milliseconds before trying the next CLDB or data node. After a connection is established, for subsequent requests, the client will wait for 30 seconds for a response. If the node goes down after a connection has been established, the client will wait for 30 seconds before trying the next node. If the client contacts a recovered node for the first time, it will wait for 100 milliseconds to establish the connection.

**NOTE:** HPE Ezmeral Data Fabric filesystem does not use this property internally; it is used by Hadoop and FUSE-based POSIX clients only. This setting is not applicable to NFS gateway and loopbacknfs POSIX clients.

### Detecting CLDB failures

When a connection with CLDB is established, CLDB returns the list of reachable and unreachable CLDB nodes on the cluster.

#### Populating the cache

The client stores information about the unreachable CLDB nodes in `/tmp/cldbinfo/unreachableCldbs` file on the client host. The format of this file is the same as the `mapr-clusters.conf` file (i.e., "clustername ip:port"). For example:

```
cat /tmp/cldbinfo/unreachableCldbs
object_pools 10.10.104.33:7222
10.10.104.34:7222
```

The client reads the `mapr-clusters.conf` file and the `unreachableCldbs` file to determine the CLDB to connect to. It then tries to reach the available CLDB nodes first; it tries the unreachable CLDB nodes only if the available CLDB is unable to service its request.

#### Invalidating the cache

If the available CLDB is unable to service the client request, the client tries the unreachable CLDB. If an unreachable CLDB becomes reachable again, it is removed from the `/tmp/cldbinfo/unreachableCldbs` file, making it reachable for all subsequent IOs and if a reachable CLDB becomes unreachable, it is added to the `/tmp/cldbinfo/unreachableCldbs` file.

### Recommended Settings for Planned Shutdown

Explains the modalities of a planned shutdown.

The HPE Ezmeral Data Fabric stack improves the latencies for planned shutdowns by implementing a fast failover mechanism where different services respond to the intimation of a failure.

## Notifying CLDB to Allow Fast Failover

When planning to shutdown a node, notifying CLDB of an impending shutdown allows CLDB to update the replication chain such that primary and intermediate containers, if any, are not on the node and re-assign VIPs on the node when the node actually goes down. This, in turn, allows clients to continue activities on available nodes.

MapR (v5.1) includes an argument, `node failover`, to the `maprcli` command that notifies CLDB of impending node shutdown so that CLDB can ensure that the specified node does not have any primary containers and intermediate containers (in a cascaded chain), and VIPs are re-assigned.

## Shutting Down a Node

To notify CLDB of a planned shutdown of a node:

1. Enable the fast failover behavior.  
Refer to [Enabling Fast Failover](#) for more information.
2. Reset the value of `tcp_syn_retries` parameter.  
Refer to [Tuning TCP](#) for more information.
3. (Optional) Get the hostname of the node to put in maintenance mode by running the following command:

```
/opt/mapr/bin/maprcli node list -columns hostname
```

4. Run the `failover` command for that node.

For example:

```
/opt/mapr/bin/maprcli node failover -nodes <node-hostname>
```

Wait for few minutes (to allow containers to failover) before proceeding to the next step.

5. Stop warden on that node by running the following command:

```
service mapr-warden stop
```

6. Notify HPE Ezmeral Data Fabric that the node is in maintenance mode and when the maintenance task is complete, remove the node from maintenance mode.

See [Performing Maintenance on a Node](#) for the commands to run to `put` and `take` a node out of maintenance mode.

 **WARNING:** Shut down only one node at a time. Do not take down multiple nodes for maintenance at the same time.

## ResourceManager High Availability

Provides an overview of how high availability for Resource Manager works.

The ResourceManager service tracks a cluster's resources and schedules YARN applications.

Configure high availability for the ResourceManager so that the failure of the ResourceManager service is not a single point of failure for the cluster. The high availability of ResourceManager is based on the cluster configuration for restart, recovery, and failover.

## Restart

The restart settings are configured on the [warden.conf](#) file.

By default, the Warden attempts to restart a failed service three times. You can configure the frequency that Warden attempts to restart failed services before initializing failover in the [warden.conf](#) file.

## Recovery

By default, ResourceManager recovery is enabled and it uses the `FileSystemRMStateStore` implementation to store the ResourceManager state in the file system.

When a ResourceManager restarts or fails over, the active ResourceManager can recover the state of the previously running ResourceManager. You can configure the ResourceManager to have no recovery. You can also configure the state store implementation that you want to use. For more information, see [Recovery for the ResourceManager](#).

## Failover

To configure failover, the cluster must have one or more nodes with the ResourceManager role.

You can select one of the following failover implementations when you use the [configure.sh](#) utility to configure each node:

- **Zero Configuration Failover** - In this failover mechanism, Warden manages the ResourceManager failover. When the active ResourceManager fails, one of the standby ResourceManager nodes automatically loads the working state from the state store and continues providing services to the cluster. It can be configured with a fresh [configure.sh](#) without **-RM** property in command.

Zero configuration failover is the default and recommended setting for the following reasons:

- **Only one ResourceManager process consumes cluster resources.** With the manual or automatic failover option, the active and standby ResourceManagers consume cluster resources.
- **Warden initiates failover automatically.** With the manual failover, you need to manually run the [yarn rmdadmin](#) command for failover to occur.
- **Simplified clients connectivity.** Clients identify the active ResourceManager with a single request to the Zookeeper. With the manual or automatic failover option, ResourceManager clients connect to each ResourceManager in a round-robin fashion until they locate the active ResourceManager; this results in delays when launching or querying jobs.
- **Consistent Configuration.** All cluster nodes and clients can use the same `yarn-site.xml` configuration file. With manual or automatic failover, you must maintain a customized [yarn-site.xml](#) file for each node that runs the ResourceManager.

For information, see [Zero Configuration Failover for the ResourceManager](#). For information on enabling zero configuration failover, see [Enabling Zero Configuration Failover for the ResourceManager](#) on page 1977

- **Manual or Automatic Failover** - For information on the manual or automatic failover, see [Manual or Automatic Failover for the ResourceManager](#).

For information on changing to manual failover from automatic failover, see [Manual Failover Administration](#) on page 1976.

For information on configuration of automatic failover, see [Configuring Automatic Failover for the ResourceManager](#).

**IMPORTANT:** The [ResourceManager configuration properties](#) can be set in `yarn-site.xml` if you wish to override any of the default values. See [ResourceManager Failover Properties](#) and [ResourceManager Recovery Properties](#) for property details.

## Manual or Automatic Failover for the ResourceManager

With the manual or automatic failover mechanism, an active ResourceManager and one or more standby ResourceManager processes run in the cluster. The standby ResourceManager nodes run the ResourceManager process without loading the working state. When the active ResourceManager fails, one of the standby ResourceManager nodes can load the working state from the ZooKeeper and continue providing services to the cluster.

ResourceManager clients (HPE Ezmeral Data Fabric client nodes, ApplicationMaster processes, and NodeManager nodes) attempt connections to the ResourceManager nodes in a round-robin fashion until they hit an active ResourceManager node. If the active ResourceManager node is down, ResourceManager clients resume round-robin polling until an active ResourceManager node is detected.

For web requests, including REST API requests, standby ResourceManager nodes automatically redirect web requests to the active ResourceManager node.

## Difference between Manual Failover and Automatic Failover

The difference between manual failover and automatic failover is how the transition from standby to active occurs for the ResourceManager process.

- With manual failover, you manually invoke the transition of the ResourceManager from standby to active with the `yarn rmdadmin` command.
- With automatic failover, the ResourceManager processes have an embedded ZooKeeper-based ActiveStandbyElector, which chooses the active ResourceManager. This ActiveStandbyElector detects failures in the currently active ResourceManager and automatically transitions one of the standby ResourceManagers to an active state.

If you specify multiple ResourceManagers when you run `configure.sh`, automatic failover is configured. However, you can edit the `yarn-site.xml` file to enable manual failover instead.

## Automatic Failover Administration

The Zookeeper-based ActiveStandbyElector on each ResourceManager node detects failures in the currently active ResourceManager and automatically transitions one of the standby ResourceManagers to an active state. Therefore, `rmdadmin -transitionToStandby` and `-transitionToActive` are disabled.

## Configuring Automatic Failover for the ResourceManager

To use automatic failover, specify multiple ResourceManagers when you run `configure.sh` on each node in the cluster.

The following `configure.sh` script syntax configures three ResourceManager nodes (one active and two standby) and one HistoryServer node:

```
/opt/mapr/server/configure.sh -C <CLDB node list> -Z <ZK node list> -RM
<hostname1,hostname2,hostname3> -HS <hostname1> [additional parameters]
```

**NOTE:** After you run `configure.sh`, each ResourceManager node contains a different value for the `yarn.resourcemanager.ha.id` property in the `yarn-site.xml`.

**Example yarn-site.xml file**

The following configure.sh syntax specifies three ResourceManager nodes (nodeA, nodeB, and nodeC) and a HistoryServer node (nodeA):

```
/opt/mapr/server/configure.sh -C node1,node2,node3 -Z node1,node2,node3 -RM
nodeA,nodeB,nodeC -HS nodeA [additional parameters]
```

## Manual Failover Administration

Configure manual failover for the ResourceManager if you want to manually transition the state of ResourceManagers in the cluster. In the event of a ResourceManager failure, you use `rmadmin` commands to check the status of each ResourceManager and then transition a standby ResourceManager to the active state.

### *Configuring Manual Failover for the ResourceManager*

#### About this task

To configure manual failover, specify multiple ResourceManagers when you run `configure.sh` on each node in the cluster and then edit `yarn-site.xml` to disable automatic failover.

#### Procedure

1. Specify multiple ResourceManagers when you run `configure.sh` on each cluster and client node. The following the `configure.sh` script syntax configures three ResourceManager nodes (one active and two standby):

```

/opt/mapr/server/configure.sh -C <CLDB node list> -Z <ZK node list> -RM
<hostname1,hostname2,hostname3> -HS <hostname1> [additional parameters]

```

**NOTE:** After you run `configure.sh`, each ResourceManager node contains a different value for the `yarn.resourcemanager.ha.id` property in the `yarn-site.xml`.

2. Disable the following automatic failover properties in the `yarn-site.xml` on each node with the ResourceManager role:
  - `yarn.resourcemanager.ha.automatic-failover.enabled`
  - `yarn.resourcemanager.ha.automatic-failover.embedded`
3. Restart the ResourceManager service. For more information, see [Restarting the Services](#) on page 1134.

### *Transitioning a Standby ResourceManager to Active*

#### About this task

The `yarn rmadmin` command includes options to manage high availability for the ResourceManager, including transitioning a ResourceManager node between active and standby modes. These commands take the ResourceManager service ID as an argument and can be run on any node in the cluster. The `serviceID` of a ResourceManager is set in the `yarn.resourcemanager.ha.rm-ids` property of the `yarn-site.xml` file.

Transition a standby ResourceManager to the active state when the active ResourceManager process has failed or the node that runs the process is no longer accessible.

## Procedure

1. Determine if an active ResourceManager is running in the cluster. See [Checking the ResourceManager State](#).
2. Run the following command to set the current active ResourceManager to standby:

```
yarn radmin -transitionToStandby <serviceID>
```

3. Run the following command to transition the standby ResourceManager to the active state:

```
yarn radmin -transitionToActive <serviceID>
```

## Checking the ResourceManager State

### About this task

When you configure manual or automatic failover, the ResourceManager is either in active or standby state. Each ResourceManager has a serviceID that identifies the service.

### Procedure

- To check the state of a ResourceManager, run the following command with the serviceID:

```
yarn radmin -getServiceState <serviceID>
```

The command returns `active` or `standby` based on the state of the ResourceManager associated with the serviceID that you provide.

**NOTE:** Tip To determine the serviceIDs associated with the ResourceManagers in the cluster, run `hadoop conf | grep yarn.resourcemanager.ha.rm-ids`

## Zero Configuration Failover for the ResourceManager

As of MapR 4.0.2, you can use zero configuration failover. With zero configuration failover, the ResourceManager role is installed on two or more nodes but the ResourceManager process only runs on one node in the cluster.

If the node running the ResourceManager process fails and the Warden on that node is unable to restart it, the Warden on each node and Zookeeper work together to start a ResourceManager process on the cluster. ResourceManager clients connect to the Zookeeper to determine which ResourceManager node is active. Therefore, when failover occurs, the Resource Manager clients are not affected as they automatically connect to the active ResourceManager.

**NOTE:** When you run `maprcli service list` command, the state of the active ResourceManager process displays as 2 (running) but the other ResourceManagers displays as 5 (stand by).

## Enabling Zero Configuration Failover for the ResourceManager

To enable zero configuration failover, do not specify the `-RM` parameter when you run `configure.sh` on each node in the cluster. However, for failover to occur, at least two nodes in the cluster must have the ResourceManager role.

For example, if the cluster includes multiple nodes with the ResourceManager role, you can run the following `configure.sh` command on each cluster node and no further configuration is required:

```
/opt/mapr/server/configure.sh -N mycluster -C centos21 -Z centos21 -HS centos22 -F /tmp/disks.txt -disk-opts F
```

configure.sh automatically populates yarn-site.xml with the following configuration:

```
<configuration>
<!-- Resource Manager MapR HA Configs -->
<property>
  <name>yarn.resourcemanager.ha.custom-ha-enabled</name>
  <value>>true</value>
  <description>MapR Zookeeper based RM Reconnect Enabled.
If this is true, set the failover proxy to be the class
MapRZKBasedRMFailoverProxyProvider</description>
</property>
<property>
  <name>yarn.client.failover-proxy-provider</name>

<value>org.apache.hadoop.yarn.client.MapRZKBasedRMFailoverProxyProvider</
value>
  <description>Zookeeper based reconnect proxy provider. Should
be set if and only if mapr-ha-enabled property is true.</description>
</property>
<property>
  <name>yarn.resourcemanager.recovery.enabled</name>
  <value>>true</value>
  <description>RM Recovery Enabled</description>
</property>
<!-- :::CAUTION::: DO NOT EDIT ANYTHING ON OR ABOVE THIS LINE -->
</configuration>
```

For more information about the ResourceManager properties in yarn-site.xml, see [ResourceManager Configuration Properties](#).

## Updating ResourceManager Ports

### About this task

To simplify the failover configurations in the *yarn-site.xml* file, Warden maintains the list of ResourceManager ports in the *warden.resourcemanager.conf* file. For a list of the default port numbers, see [Ports Used by HPE Ezmeral Data Fabric Software](#) on page 3084. If you want to edit the default ResourceManager ports, edit the *warden.resourcemanager.conf* file and the *yarn-site.xml* file on each ResourceManager node.

**NOTE:** If each node requires different ResourceManager ports, you must maintain a separate *yarn-site.xml* file for each node. Therefore, to you use Central Configuration, you must create a customized configuration file for each ResourceManager node in the cluster.

To update the port numbers, edit the values in the *warden.resourcemanager.conf* file and add the values in the *yarn-site.xml* file.

### Procedure

1. Open the *warden.resourcemanager.conf* file (`/opt/mapr/conf/conf.d/warden.resourcemanager.conf`).

- Edit the port numbers, which are listed using the following format: `service.extinfo.<port>=<port number>`

Port Name	Property Name in <code>warden.resourcemanager.conf</code>
ResourceManager Scheduler RPC (for ApplicationMasters)	<code>service.extinfo.SCHEDULER_PORT</code>
ResourceManager Resource Tracker RPC (for NodeManagers)	<code>service.extinfo.RESOURCETRACKER_PORT</code>
ResourceManager Client RPC	<code>service.port</code>
ResourceManager Admin RPC	<code>service.extinfo.ADMIN_PORT</code>
ResourceManager Web UI (HTTP)	<code>service.extinfo.WEBAPP_PORT</code>
ResourceManager Web UI (HTTPS)	<code>service.extinfo.WEBAPP_HTTPS_PORT</code>

- Open the `yarn-site.xml` file (`/opt/mapr/hadoop/hadoop-2.x.x/etc/hadoop/yarn-site.xml`).
- For each port that you edited, add the associated property to the `yarn-site.xml` file:

Port Name	Property Name in <code>yarn-site.xml</code>
ResourceManager Scheduler RPC (for ApplicationMasters)	<code>yarn.resourcemanager.scheduler.address</code>
ResourceManager Resource Tracker RPC (for NodeManagers)	<code>yarn.resourcemanager.resource-tracker.address</code>
ResourceManager Client RPC	<code>yarn.resourcemanager.address</code>
ResourceManager Admin RPC	<code>yarn.resourcemanager.admin.address</code>
ResourceManager Web UI (HTTP)	<code>yarn.resourcemanager.webapp.address</code>
ResourceManager Web UI (HTTPS)	<code>yarn.resourcemanager.webapp.https.address</code>

For example, to update the port number for the ADMIN\_PORT to 9000 on each node, enter the following in the `yarn-site.xml` file on each node:

```
<property>
  <name>yarn.resourcemanager.adminaddress</name>
  <value>10.10.30.140:9000</value>
</property>
```

- Restart the Warden and the ResourceManager services.

### Switching from Zero Configuration to Manual or Automatic Failover

You can change your ResourceManager failover implementation from zero configuration to manual or automatic failover by re-configuring all the cluster and client nodes.

For more information, see [Configuring Manual Failover for the Resource Manager](#) or [Configuring Automatic Failover for the Resource Manager](#).

### Recovery for the ResourceManager

After a restart or failover, the active ResourceManager recovers the ResourceManager state based on the checkpoints provided in the ResourceManager state store. During recovery, the ResourceManager resumes applications and tasks that were running prior to the failover but were not completed.

Two implementations of the ResourceManager state store are available:

- **FileSystemRMStateStore.** Enables implicit write access to a single ResourceManager node. file system provides fencing implicitly and its state store implementation provides better scalability and failover performance than the ZKRMStateStore. The state store is also naturally protected by file system replication. By default, FileSystemRMStateStore is the state store implementation for the ResourceManager and the ResourceManager state store is maintained in the following MapR filesystem volume: `/var/mapr/cluster/yarn/rm/system`.
- **ZKRMStateStore.** Enables implicit write access to a single ResourceManager node. This is usually recommended for HA implementations where YARN is running on HDFS. However, FileSystemRMStateStore is recommended in a MapR cluster.

**NOTE:** For recovery to occur, all ResourceManager nodes must have access to the ResourceManager state store.

### ResourceManager Recovery Administration

To change the default behavior, update the ResourceManager configuration in the `yarn-site.xml` files and restart the ResourceManager(s). The `yarn-site.xml` is located in the following directory: `/opt/mapr/hadoop/hadoop-3.x.x/etc/hadoop/`

#### *Disabling the restart of applications after failover*

You can configure the ResourceManager to not recover its state after a restart or failover occurs.

- Set the value of `yarn.resourcemanager.recovery.enabled` to `false` in `yarn-site.xml` on each ResourceManager node.

#### *Configuring Maximum Attempts for Applications*

Describes how to set the maximum number of restart attempts for all applications run by the data-fabric ResourceManager and the ApplicationMaster.

### About this task

When an ApplicationMaster fails, the ResourceManager restarts the ApplicationMaster as long as the number of restart attempts does not exceed the `max-attempt` values set at the ResourceManager and ApplicationMaster level. By default, the maximum attempt value is set to 2.

### Procedure

- To configure the maximum number of ApplicationMaster attempt retries for all applications run by the ResourceManager:  
Set the value of `yarn.resourcemanager.am.max-attempts` in the `yarn-site.xml` file. The value defaults to 2.
- To configure the number of ApplicationMaster attempts allowed for the MapReduce ApplicationMaster:  
Set the value of `mapreduce.am.max-attempts` in the `mapred-site.xml` file. The value defaults to 2.

#### *Configuring the file system State Store*

Describes the configuration of the data-fabric state store.

### About this task

By default, the Resource Manager stores its state in the data-fabric filesystem. However, you can change the values for the following properties related to the data-fabric filesystem state store:

**Procedure**

- To configure the URI to the state store location:  
Set the value of `yarn.resourcemanager.fs.state-store.uri` in the `yarn-site.xml` file. The value defaults to the ResourceManager volume (`/var/mapr/cluster/yarn/rm/system`).
- To configure the retry policy used by the state store client to connect with data-fabric file system:  
Set the value of `yarn.resourcemanager.fs.state-store.retry-policy-spec` in the `yarn-site.xml` file. The value defaults to (2000,500).
- To configure the number of completed applications retained by the state store:  
Set the value of `yarn.resourcemanager.state-store.max-completed-applications` in the `yarn-site.xml` file. The value defaults to 10000.

*Enabling ZooKeeper Based State Store***About this task**

By default, the Resource Manager stores its state in the file system. However, you can use the Zookeeper based state store instead. To configure the ResourceManager to use the Zookeeper state store:

**Procedure**

- Set the value of `yarn.resourcemanager.store.class` to `org.apache.hadoop.yarn.server.resourcemanager.recovery.ZKRMStateStore` in the `yarn-site.xml`.
- Set the value of `yarn.resourcemanager.zk-address` to a comma-separated list of host:port pairs for each ZooKeeper server used by the ResourceManager. This property needs to be set in `yarn-site.xml`.

**ResourceManager Configuration Properties**

You can configure the failover and recovery properties for the ResourceManager. The default values for the failover and recovery properties are defined in the `yarn-default.xml` or by Data Fabric. You can configure overrides to the default by adding to or editing the properties in `yarn-site.xml`.

**ResourceManager Failover Properties**

The following table describes the configuration properties for ResourceManager failover:

Property	Description
<code>yarn.resourcemanager.ha.custom-ha-enabled</code>	When <code>yarn.client.failover-proxy-provider</code> is set to <code>org.apache.hadoop.yarn.client.MapRZKBasedRMFailoverProxyProvider</code> , this property must be <code>true</code> . The default, set by <code>configure.sh</code> in <code>yarn-site.xml</code> when the cluster uses zero configuration failover for the ResourceManager, is <code>true</code> .
<code>yarn.resourcemanager.ha.enabled</code>	Enables high availability for the ResourceManager. The default, set by Data Fabric in the <code>yarn-site.xml</code> , is <code>true</code> . This property must be set to <code>true</code> for failover to occur.
<code>yarn.resourcemanager.ha.automatic-failover.enabled</code>	When <code>yarn.resourcemanager.ha.enabled</code> is <code>true</code> , this property enables the ResourceManager to automatically failover. The default, set in <code>yarn-default.xml</code> , is <code>true</code> .

Property	Description
yarn.resourcemanager.ha.automatic-failover.embedded	<p>When yarn.resourcemanager.ha.enabled is true, this property enables the ResourceManager to use the embedded automatic failover.</p> <p>The default, set in yarn-default.xml, is <code>true</code>.</p>
yarn.resourcemanager.cluster-id	<p>Specifies the cluster that the ResourceManager belongs to.</p> <p>This value is originally set by <code>configure.sh</code> in the <code>yarn-site.xml</code> and the value is required for failover to occur.</p>
yarn.resourcemanager.ha.rm-ids	<p>The ResourceManager service ID. <code>Configure.sh</code> adds this property to each node with the ResourceManager role.</p>
yarn.resourcemanager.ha.id	<p>Specifies the serviceID of the ResourceManager on the current node.</p>
yarn.resourcemanager.zk-address	<p>Specifies the zookeeper quorum that the ResourceManager belongs to.</p> <p>This value is originally set by <code>configure.sh</code> in the <code>yarn-site.xml</code> when you configure failover.</p>
yarn.client.failover-proxy-provider	<p>Specifies the ResourceManager failover implementation used by clients, ApplicationMasters, and NodeManagers.</p> <p><code>configure.sh</code> sets this value based on the type of failover that you configure.</p> <ul style="list-style-type: none"> <li>For automatic or manual failover, <code>configure.sh</code> sets this value to <code>org.apache.hadoop.yarn.client.ConfiguredRMFailoverProxyProvider</code></li> <li>For zero configuration failover, <code>configure.sh</code> sets this value to <code>org.apache.hadoop.yarn.client.MapRZKBasedRMFailoverProxyProvider</code></li> </ul> <p>This value is set by <code>configure.sh</code> in <code>yarn-site.xml</code> when you configure failover. Otherwise, the default, set in <code>yarn-default.xml</code> is <code>org.apache.hadoop.yarn.client.DefaultFailoverProxyProvider</code>.</p>
yarn.resourcemanager.scheduler.address[.<serviceID>]	<p>The address of the scheduler interface</p> <p>This value, including the serviceID, is set by <code>configure.sh</code> in <code>yarn-site.xml</code> when you configure manual or automatic failover.</p> <p>For zero configuration failover, this property is not needed unless you have configured custom port values. When you specify the custom port number, the serviceID is not required.</p>

Property	Description
yarn.resourcemanager.resource-tracker.address[.<serviceID>]	<p>The address of the resource tracker interface. ResourceManager listens for container requests and heartbeats from the NodeManagers on this port.</p> <p>This value, including the serviceID, is set by configure.sh in yarn-site.xml when you configure manual or automatic failover.</p> <p>For zero configuration failover, this property is not needed unless you have configured custom port values. When you specify the custom port number, the serviceID is not required.</p>
yarn.resourcemanager.address[.<serviceID>]	<p>The address of the client interface. The ResourceManager listens for client requests on this port.</p> <p>This value, including the serviceID, is set by configure.sh in yarn-site.xml when you configure manual or automatic failover.</p> <p>For zero configuration failover, this property is not needed unless you have configured custom port values. When you specify the custom port number, the serviceID is not required.</p>
yarn.resourcemanager.admin.address[.<serviceID>]	<p>The address of the administrative interface. ResourceManager listens for administrative requests from the yarn radmin command on this port.</p> <p>This value, including the serviceID, is set by configure.sh in yarn-site.xml when you configure manual or automatic failover.</p> <p>For zero configuration failover, this property is not needed unless you have configured custom port values. When you specify the custom port number, the serviceID is not required.</p>
yarn.resourcemanager.webapp.address[.<serviceID>]	<p>The address of the ResourceManager web UI.</p> <p>This value, including the serviceID, is set by configure.sh in yarn-site.xml when you configure manual or automatic failover.</p> <p>For zero configuration failover, this property is not needed unless you have configured custom port values. When you specify the custom port number, the serviceID is not required.</p>
yarn.resourcemanager.webapp.https.address[.<serviceID>]	<p>The address of the secure ResourceManager web UI.</p> <p>This value, including the serviceID, is set by configure.sh in yarn-site.xml when you configure manual or automatic failover.</p> <p>For zero configuration failover, this property is not needed unless you have configured custom port values. When you specify the custom port number, the serviceID is not required.</p>
yarn.client.failover-max-attempts	<p>The max number of times FailoverProxyProvider should attempt failover.</p> <p>The default is -1.</p>

Property	Description
yarn.client.failover-sleep-base-ms	The sleep base (in milliseconds) to be used for calculating the exponential delay between failovers. The value defaults to the value set by <code>yarn.resourcemanager.connect.retry-interval.ms</code> , which is 30000 ms.
yarn.client.failover-sleep-max-ms	The maximum sleep time (in milliseconds) between failovers. The value defaults to the value set by <code>yarn.resourcemanager.connect.retry-interval.ms</code> , which is 30000 ms.
yarn.client.failover-retries	The number of times a client attempts to reconnect to a ResourceManager. The default, set in <code>yarn-default.xml</code> , is 0 (infinite).
yarn.client.failover-retries-on-socket-timeouts	The number of times a client attempts to reconnect to a ResourceManager on socket timeouts. The default, set in <code>yarn-default.xml</code> , is 0 (infinite).

### ResourceManager Recovery Properties

The following table describes the configuration properties for ResourceManager recovery:

Property	Description
yarn.resourcemanager.recovery.enabled	Enables the ResourceManager to recovery based on the information in the ResourceManager state store. The default, set by <code>configure.sh</code> , is <code>true</code> .
yarn.resourcemanager.am.max-attempts	The maximum number of application attempts. This is a global setting for all ApplicationMaster nodes. You can configure an individual maximum number of application attempts for each ApplicationMaster node, but this property sets a global upper bound that overrides the individual node configuration. The default, set in <code>yarn-default.xml</code> , is 2.
mapreduce.am.max-attempts	The maximum number of MapReduce application attempts. If this value is larger than the value set by the ResourceManager, the ResourceManager value will override this value. The default number is set to 2, to allow at least one retry for AM. This property is set in <code>mapred-default.xml</code> .
yarn.resourcemanager.fs.state-store.uri	URI pointing to the location of the FileSystem path where the ResourceManager state is stored. The default value is configured to the path for the ResourceManager volume ( <code>/var/mapr/cluster/yarn/rm/system</code> ). If the FileSystem name is not provided, the system uses the value specified in the <code>fs.default.name</code> specified in the <code>core-site.xml</code> file.

Property	Description
yarn.resourcemanager.fs.state-store.retry-policy-spec	<p>Specifies the retry policy for the file system client.</p> <p>This policy is specified in pairs of values for the sleep time, in milliseconds, and number of retries.</p> <p>Each pair is enclosed in parentheses, such as (1000,20), (2000,30).</p> <p>The previous example sleeps for 1000 milliseconds for twenty retries, then thirty more retries 2000 milliseconds apart.</p> <p>The default, set in yarn-default.xml, is (2000,500).</p>
yarn.resourcemanager.store.class	<p>The class name of the state-store to be used for saving application/attempt state and the credentials.</p> <p>The available state-store implementations are <code>org.apache.hadoop.yarn.server.resourcemanager.recovery.ZKRMStateStore</code>, a ZooKeeper based state-store implementation, and <code>org.apache.hadoop.yarn.server.resourcemanager.recovery.FileSystemRMStateStore</code>, a state-store implementation based on file system.</p> <p>The default, yarn-default.xml, is <code>org.apache.hadoop.yarn.server.resourcemanager.recovery.FileSystemRMStateStore</code>.</p>
yarn.resourcemanager.state-store.max-completed-applications	<p>The maximum number of completed applications that the state store retains, which is a number less than or equal to \$ {<code>yarn.resourcemanager.max-completed-applications</code>}.</p> <p>The default value is 10000. This setting ensures that the applications kept in the state store are consistent with the applications in ResourceManager memory.</p> <p>Any value larger than \$ {<code>yarn.resourcemanager.max-completed-applications</code>} is reset to the default.</p> <p>The value of this property affects ResourceManager recovery performance. Typically, a smaller value optimizes performance for recovery.</p>
yarn.resourcemanager.zk-address	<p>A comma-separated list of Host:Port pairs. Each corresponds to a ZooKeeper server, such as 127.0.0.1:5181,127.0.0.1:5181,127.0.0.1:5181.</p> <p>These hosts are used by the ResourceManager to store state.</p>
yarn.resourcemanager.zk-state-store.parent-path	<p>The full path of the root znode where ResourceManager state is stored. The default value is <code>/rmstore</code>.</p>
yarn.resourcemanager.zk-num-retries	<p>Number of times the ResourceManager tries to connect to the ZooKeeper server when the connection is lost.</p> <p>The default value is 500.</p>
yarn.resourcemanager.zk-retry-interval-ms	<p>The interval between retries, in milliseconds, when connecting to a ZooKeeper server. The default value is 2000.</p>

Property	Description
yarn.resourcemanager.zk-timeout-ms	The ZooKeeper session timeout in milliseconds. The ZooKeeper server uses this configuration to determine session expiration.  Sessions expire when the server does not receive a heartbeat from the client within the session timeout period. The default value is 10000.
yarn.resourcemanager.zk-acl	ACLs that set permissions on ZooKeeper znodes. The default value is <code>world:anyone:rwcd</code>

## Administrator's Reference

This section contains in-depth reference information for the administrator.

### maprcli and REST API Syntax

This section provides information about the HPE Ezmeral Data Fabric command API. Most commands can be run on the command-line interface (CLI), or by making REST requests programmatically or in a browser.

To run CLI commands, use an ssh connection to any node in the cluster. To use the REST interface, make HTTP requests to a node that is running the WebServer service.

#### Overview

Each command reference page includes the command syntax, a table that describes the parameters, and examples of command usage.

In each parameter table, required parameters are in **bold** text. For output commands, the reference pages include tables that describe the output fields. Values that do not apply to particular combinations are marked **NA**.

#### REST API Syntax

Describes the Data Fabric REST API syntax format.

REST calls use the following format to interact with [REST API server](#) over the HTTPS protocol:

```
https://<host>:<port>/rest/<command>[/<subcommand>...]?<parameters>
```

In the aforementioned statement, `<command>` is a [maprcli command](#), and `<subcommand>` is the command's subcommand. Refer to the respective command documentation for its subcommands.

Construct the `<parameters>` list from the required and optional parameters, in the format `<parameter>=<value>` separated by the ampersand (&) character. Example:

```
https://rln1.qa.sj.ca.us:8443/rest/volume/mount?name=test-volume&path=/test
```

**NOTE:** If used on a command line, the & must be surrounded by quotes, to prevent the shell interpreting it as the background character. Values in REST API calls must be URL-encoded. For readability, the values in this document use the actual characters, rather than the URL-encoded versions.

#### Authentication

There are 2 main methods to authenticate to REST API, in general:

- Basic authentication without cookies- Basic authentication is done without cookies

- Authentication with session cookies - There are three ways of authentication with session cookies.
  - Basic authentication
  - Form-based authentication
  - SPNEGO

**NOTE:** All methods will use PAM. To configure PAM for REST API, see [PAM Configuration](#).

### Basic Authentication without Cookies

To authenticate using basic authentication, send a request with a basic authorization header, which has a user ID and password.

**NOTE:** This method has a higher overhead than session cookies because each request is re-authenticated, due to absence of session cookies.

For example, with cURL and wget:

#### cURL Syntax

```
curl -u <username> https://<host>:<port>/rest/<command>...
```

**IMPORTANT:** To keep your password secure, do not provide it on the command line. Enter your password securely when cURL prompts you for your password.

#### wget Syntax

```
wget --user <username> --ask-password https://<host>:<port>/rest/  
<command>...
```

**IMPORTANT:** To keep your password secure, do not provide it on the command line. Use the `--ask-password` option instead. You can enter your password securely, when `wget` prompts you for your password.

### Authentication with Session Cookies

**NOTE:** Session cookies have an idle time of 30 minutes, that is, they will expire if not used within 30 minutes, and have a maximum lifetime of 24 hours.

#### Basic Authentication

To authenticate using basic authentication, send a request with a basic authorization header, which has a user ID and password. For example, run the following command to save cookies into `cookiejar.txt`, in your home directory:

```
curl -u <username> -c ~/cookiejar.txt  
https://<host>:<port>
```

#### Form-based Authentication

To use form based auth to generate a session cookie, send a POST request to `/login` with the username and password parameters in the form data, for example with curl:

```
curl -X POST -c ~/cookiejar.txt  
https://<host>:<port>/login -d  
'username=<name>&password=<passwd>'
```

## SPNEGO

To authenticate using SPNEGO, ensure that the apiserver nodes are [configured for SPNEGO](#). After configuring, send a negotiate authorization header. For example, to authenticate with the SPNEGO token and save the cookie in a text file named `cookiejar.txt` in your home directory, run the following command:

```
curl --negotiate -u : -b ~/
cookiejar.txt -c ~/cookiejar.txt
https://<web server node>:8443/rest/
<API call> -v
```

Once the session cookies are generated, the permission of the cookie file must be restricted with the following command:

```
chmod 600 ~/cookiejar.txt
```

The contents of the cookie is something similar to the following:

```
cat /tmp/cookiejar.txt
# Netscape HTTP Cookie File
# https://curl.haxx.se/docs/http-cookies.html
# This file was generated by libcurl! Edit at your own risk.

#HttpOnly_<webserver-hostname> FALSE / TRUE 1509486224
MAPR.APISERVER.JSESSIONID node014ukard563rhulns8umn2s6uft3709.node0
#HttpOnly_<webserver-hostname> FALSE / FALSE 0
MAPR.APISERVER.SESSIONID HZA9C20D084E614E36AA567F47FC9105A4
```

The cookiejar file (session cookie) can now be used to authenticate requests, for example, to retrieve the list of nodes on the cluster with cURL:

```
curl -sS -b ~/cookiejar.txt https://<host>:<port>/rest/node/list |
python -mjson.tool
```

**NOTE:** In the aforementioned command, `-sS` and `python -mjson.tool` are used to obtain well-formatted JSON content.

## REST API Calls to Remote Cluster

If you have secure clusters and you wish to make REST API calls to a remote secure cluster, you can specify the `cluster` parameter in the request if you have your environment configured for remote access. To set up your environment for API calls to remote secure cluster, follow the steps for [configuring secure clusters for running commands remotely](#).

### Command-Line Interface

Describes how the MapR CLI command syntax is documented.

The MapR CLI commands are documented using the following conventions:

- [Square brackets] indicate an optional parameter
- <Angle brackets> indicate a value to enter

The following syntax example shows that the `volume mount` command requires the `-name` parameter, for which you must enter a list of volumes, and all other parameters are optional:

```
maprcli volume mount
[ -cluster <cluster> ]
```

```
-name <volume list>
[ -path <path list> ]
```

For clarity, the syntax examples show each parameter on a separate line; in practical usage, the command and all parameters and options are typed on a single line. Example:

```
maprcli volume mount -name test-volume -path /test
```

### Common Parameters

Describes parameters that are available for many commands.

The following parameters are available for many commands in both the REST and command-line contexts.

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
zkconnect	A ZooKeeper connect string, which specifies a list of the hosts running ZooKeeper, and the port to use on each, in the format: ' <code>&lt;host&gt;[:&lt;port&gt;][,&lt;host&gt;[:&lt;port&gt;]]...</code> ' Default: 'localhost:5181' In most cases the ZooKeeper connect string can be omitted, but it is useful in certain cases when the CLDB is not running.

### Common Options

Describes options that are available for many commands.

The following options are available for most commands in the command-line context.

Option	Description
-noheader	When displaying tabular output from a command, omits the header row.
-long	Shows the entire value. This is useful when the command response contains complex information. When -long is omitted, complex information is displayed as an ellipsis (...).
-json	Displays command output in JSON format. When -json is omitted, the command output is displayed in tabular format.
-cli.loglevel	Specifies a log level for API output. Legal values for this option are: <ul style="list-style-type: none"> <li>• DEBUG</li> <li>• INFO</li> <li>• ERROR</li> <li>• WARN</li> <li>• TRACE</li> <li>• FATAL</li> </ul>

## Filters

Describes the use of filters with MapR CLI commands.

Some MapR CLI commands use *filters*, which let you specify large numbers of nodes or volumes by matching specified values in specified fields rather than by typing each name explicitly.

Filters use the following format:

```
[<field><operator>"<value>" ]<and>[<field><operator>"<value>" ] ...
```

field	Field on which to filter. The <a href="#">field</a> depends on the command with which the filter is used.
operator	An operator for that field: <ul style="list-style-type: none"> <li>• == - Exact match</li> <li>• != - Does not match</li> <li>• &gt; - Greater than</li> <li>• &lt; - Less than</li> <li>• &gt;= - Greater than or equal to</li> <li>• &lt;= - Less than or equal to</li> </ul>
value	Value on which to filter. Wildcards (using *) are allowed for operators == and !=. There is a special value <code>all</code> that matches all values.

You can use the wildcard (\*) for partial matches. For example, you can display all volumes whose owner is `root` and whose name begins with `test` as follows:

```
maprcli volume list -filter [n=="test*"]and[on=="root"]
```

**NOTE:** maprcli commands and REST APIs do not support OR conditions.

If you are using the `<`, `>`, `<=`, or `>=` symbols in the filter expression, ensure that you enclose the expression in single or double quotes. For example, `-filter '[quota>=1234]'` or `-filter "[quota>=1234]"`

## Response

Describes the different return responses.

The commands return responses in JSON or in a tabular format. When you run commands from the command line, the response is returned in tabular format unless you specify JSON using the `-json` option; when you run commands through the REST interface, the response is returned in JSON.

**NOTE:** The columns returned by operations such as `get`, `list`, `info`, and so on are not sorted in any particular order.

## Success

On a successful call, each command returns the error code zero (OK) and any data requested. When JSON output is specified, the data is returned as an array of records along with the status code and the total number of records. In the tabular format, the data is returned as a sequence of rows, each of which contains the fields in the record separated by tabs.

**JSON**

```
{
    "status": "OK",
    "total": <number of
records>,
    "data": [
        {
        <record>
        }
        ...
    ]
}
```

**Tabular**

```
status
0
```

Or

```
<heading>  <heading>  <heading> ...
            <field>   <field>
<field> ...
            ...
```

**Error**

When an error occurs, the command returns the error code and descriptive message.

**JSON**

```
{
    "status": "ERROR",
    "errors": [
        {
        "id": <error code>,
        "desc": "<command>: <error
message>"
        }
    ]
}
```

**Tabular**

```
ERROR (<error code>) - <command>:
<error message>
```

**acerole validate**

Verifies given user roles for ACEs exists in the `/opt/mapr/conf/m7_permissions_roles_refimpl.conf` file.

This command returns `true` if role exists in the `/opt/mapr/conf/m7_permissions_roles_refimpl.conf` file and `false` if given role is not in the file. If the `MAPR_ROLES_LIB_ENABLE_TRACE` environment variable is set to `TRUE`, the command returns also the number of users assigned to the specified role and the number of roles in the file.

**Syntax****CLI**

```
maprcli acerole validate
    -role role which need to be
    validate
```

**REST**

Request Type	GET
Request URL	http[s]://<host:port>/rest/acerole/validate?<parameters>

**Parameters**

Parameter	Description
role	(Required) The role to validate.

**Examples**

Verifies whether given role exists when the MAPR\_ROLES\_LIB\_ENABLE\_TRACE environment variable is not set:

**CLI**

```
maprcli acerole validate -role Role_1
maprcli acerole validate command
returned : true
```

**REST**

```
curl -X
GET 'https://server.sj.us:8443/rest/acerole/validate?role=Role_1' --user
<username>:<password>
```

Verifies whether given role exists when the MAPR\_ROLES\_LIB\_ENABLE\_TRACE environment variable is set:

**CLI**

```
export
MAPR_ROLES_LIB_ENABLE_TRACE=TRUE

echo $MAPR_ROLES_LIB_ENABLE_TRACE
TRUE

maprcli acerole validate -role Role_1
RoleMap: Added user 500 with role
'Role_1'
RoleMap: Added user 1000 with role
'Role_1'
RoleMap: found 2 users and 2 roles.
maprcli acerole validate command
returned : true
```

**REST**

```
export
MAPR_ROLES_LIB_ENABLE_TRACE=TRUE

echo $MAPR_ROLES_LIB_ENABLE_TRACE
TRUE
curl -X
GET 'https://abc.sj.us:8443/rest/
acerole/validate?role=Role_1' --user
<username>:<password>
```

**acl**

Describes the `acl` commands used to access control lists (ACLs).

**Specifying Permissions**

Specify permissions for a user or group with a string that lists the permissions for that user or group. To specify permissions for multiple users or groups, use a string for each, separated by spaces. The format is as follows:

- Users -

```
<user>:<action>[ ,<action>... ][<user>:<action>[ ,<action>... ]]
```

- Groups -

```
<group>:<action>[ ,<action>... ][<group>:<action>[ ,<action>... ]]
```

To use the `acl edit` command, you must have full control (`fc`) permission on the cluster or volume for which you are running the command.

The following tables list the permission codes used by the `acl` commands.

**Cluster Permission Codes**

Permission Code	Allowed Action
login	Log in to the MapR Control System, use the API and command-line interface, read access on cluster and volumes.
ss	Start/stop services.
cv	Create volumes.
a	Administrative access to cluster ACLs. Grants no other permissions.
fc	Full control over the cluster. This enables all cluster-related administrative options with the exception of changing the cluster ACLs.
cp	Create security policies

**Volume Permission Codes**

Code	Allowed Action
dump	Dump the volume.
restore	Mirror or restore the volume.
m	Modify volume properties, create and delete snapshots.
d	Delete a volume.
a	Administrative access to volume ACLs.
fc	Full control (admin access and permission to change volume ACL).

**Security Policy Permission Codes**

Code	Allowed Action
a (admin)	View and modify the permissions on a security policy; cannot view or modify the security policy.
fc (full control)	View and modify the security policy, including data access ACEs; cannot view or modify the permissions on a security policy.
r (read)	View all parts of a security policy; cannot modify the security policy.

**acl edit**

Modifies a specific user's access to a cluster, volume, or security policy.

**Permissions Required**

The `acl edit` command grants one or more specific volume or cluster permissions to a user. To use the `acl edit` command, you must have administrative (a) permissions on the volume and cluster for which you are running the command. The permissions are specified as a comma-separated list of permission codes. See [acl](#) on page 1993.

**Syntax****CLI**

```
maprcli acl edit
  [ -cluster <cluster name> ]
  [ -group <group> ]
  [ -name <name> ]
  -type cluster|volume|
securitypolicy
  [ -user <user> ]
```

**REST**

Request Type	POST
--------------	------

Request URL	http[s]://<host:port>/rest/acl/edit?<parameters>
-------------	--------------------------------------------------

## Parameters

Parameter	Description
cluster	(Optional) The cluster on which to run the command.
group	(Optional) Groups and allowed actions for each group. See <a href="#">acl</a> on page 1993. Format: <group>:<action>[,<action>...] [ <group>:<action>[,<action>...]]. You must specify either a user or a group.
name	(Optional) The object name. For a volume, specify the name of the volume in this parameter.  To set security policy level permissions, specify the name of the security policy in this parameter.
type	(Required) The object type. Allowed values are cluster, volume or securitypolicy.
user	(Optional) Users and allowed actions for each user. See <a href="#">acl</a> on page 1993. Format: <user>:<action>[,<action>...] [ <user>:<action>[,<action>...]]. You must specify either a user or a group.

## Examples

Give the user *jsmith* dump, restore, and delete permissions for "test-volume":

### CLI

```
maprcli acl edit -type
volume -name test-volume -user
jsmith:dump,restore,d
```

### REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/acl/edit?
type=volume&name=test-volume&user=jsmi
th%3Adump,restore,d' --user mapr:mapr
```

## acl set

Modifies the Access Control List (ACL) for a cluster, volume, or security policy.

The `acl set` command specifies the [ACL](#) for a cluster or volume. Any previous permissions are overwritten by the new values, and any permissions omitted are removed. To use the `acl set` command, you must have administrative (a) permissions on the volume and cluster for which you are running the command. The [ACL permissions](#) are specified as a comma-separated list of permission codes. See [acl](#) on page 1993. You must specify either a `user` or a `group`. When the `type` is `volume`, you must specify a volume name using the `name` parameter.

The `acl set` command removes any previous [ACL](#) values. To preserve some of the permissions, you should either use the `acl edit` command instead of `acl set`, or use `acl show` to list the values before overwriting them.

## Syntax

### CLI

```
maprcli acl set
  [ -cluster <cluster name> ]
  [ -group <group> ]
  [ -name <name> ]
  -type cluster|volume|
securitypolicy
  [ -user <user> ]
```

### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/acl/set?<parameters>

## Parameters

Parameter	Description
cluster	( <i>Optional</i> ) The cluster on which to run the command.
group	( <i>Optional</i> ) Groups and allowed actions for each group. See <a href="#">acl</a> on page 1993. Format: <group>:<action>[,<action>...] [ <group>:<action>[,<action>...]]
name	( <i>Optional</i> ) The object name. For a volume, specify the name of the volume in this parameter. To set security policy level permissions, specify the name of the security policy, in this parameter.
type	( <i>Required</i> ) The object type. Allowed values are <code>cluster</code> , <code>volume</code> or <code>securitypolicy</code> .
user	( <i>Optional</i> ) Users and allowed actions for each user. See <a href="#">acl</a> on page 1993. Format: <user>:<action>[,<action>...] [ <user>:<action>[,<action>...]]

## Examples

Give the user `root` full control of the `my.cluster.com` cluster and remove all permissions for all other users:

### CLI

```
maprcli acl set -type cluster -user
user10:fc
```

**REST**

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/acl/set?
type=cluster&user=user10%3Afc' --user
mapr:mapr
{"timestamp":1525462091620,"timeofday"
:"2018-05-04 12:28:11.620 GMT-0700
PM","status":"OK","total":0,"data":[]}
```

**Usage Example**

```
# maprcli acl show -type cluster
Allowed actions      Principal
[login, ss, cv, a, fc, cp] User mapr
[login, ss, cv, a, fc, cp] User root
[login, cp] User fuser1

maprcli acl set -type cluster -cluster my.cluster.com -user root:fc
maprcli acl show -type cluster
Principal Allowed actions
User root [login, ss, cv, a, fc, cp]
```

**WARNING:** Notice that the specified permissions have overwritten the existing [ACL](#).

Give multiple users specific permissions for the `egVoll` volume and remove all permissions for all other users:

**CLI**

```
maprcli acl set -type volume -name
egVoll -user m7user5:dump,restore,m
m7user4:fc -json
{
  "timestamp":1525462647371,
  "timeofday":"2018-05-04
12:37:27.371 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
    ]
}
```

**REST**

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/acl/set?
type=volume&name=egVoll&user=m7user5%3
Adump,restore,m%20m7user4%3Afc' --user
mapr:mapr
{"timestamp":1525463080941,"timeofday"
:"2018-05-04 12:44:40.941 GMT-0700
PM","status":"OK","total":0,"data":[]}
```

**acl show**

Displays the ACL associated with an object (cluster or a volume).

**Syntax**

An ACL contains the list of users who can perform specific actions.

**CLI**

```
maprcli acl show
    -type object type [cluster|
volume|securitypolicy]
    [ -name name ]
    [ -cluster cluster name ]
    [ -user userName whose ACL is
queried ]
    [ -group groupName whose ACL is
queried ]
    [ -output output format short|
long|terse (default short). default:
short ]
    [ -perm list of available
permissions Parameter takes no
value ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/acl/show?<parameters>

**Parameters**

Parameter	Description
cluster	(Optional) The name of the cluster on which to run the command.- The default is the cluster on which the command is run.
group	(Optional) The group for which to display permissions. By default, displays permissions for all groups by default.
name	(Conditionally Required) The object name. To view security policy level permissions, specify the name of the security policy in this parameter. This parameter is required for the securitypolicy ACL type.
output	(Optional) The output format: <ul style="list-style-type: none"> <li>• long</li> <li>• short</li> <li>• terse</li> </ul> The default format is short.
perm	(Optional) When you specify this option, acl show displays the permissions available for the object type specified in the type parameter.
type	(Required) The object type. Allowed values are cluster, volume or securitypolicy. To get security policy level permissions, specify the type as securitypolicy.

Parameter	Description
user	(Optional) The user for whom to display permissions. By default, displays permissions for all users.

## Output

The actions that each user or group is allowed to perform on the cluster or the specified volume. For information about each allowed action, see [acl](#) on page 1993.

```
Principal    Allowed actions
User root    [login, ss, cv, a, fc, cp]
Group root   [login, ss, cv, a, fc, cp]
All users    [login]
```

## Examples

### Show the ACL for the cluster:

#### CLI

```
maprcli acl show -type cluster -json
{
  "timestamp":1555494572399,
  "timeofday":"2019-04-17
02:49:32.399 GMT-0700 AM",
  "status":"OK",
  "total":2,
  "data":[
    {
      "Principal":"User mapr",
      "Allowed
actions":"[login, ss, cv, a, fc, cp]"
    },
    {
      "Principal":"User root",
      "Allowed
actions":"[login, ss, cv, a, fc, cp]"
    }
  ]
}
```

#### REST

```
curl -u mapr:mapr -X GET -k "https://
abc.sj.us:8443/rest/acl/show?
type=cluster"
{"timestamp":1555494852652,"timeofday"
:"2019-04-17 02:54:12.652 GMT-0700
AM","status":"OK","total":2,"data":
[{"Principal":"User mapr","Allowed
actions":"[login, ss, cv, a, fc,
cp]"}, {"Principal":"User
root","Allowed actions":"[login, ss,
cv, a, fc, cp]}]}
```

### Show the ACL for "test-volume":

#### CLI

```
maprcli acl show -type volume -name
sampleVoll
```

```

Allowed actions
Principal
[dump, restore, m, a, d, fc] User
mapr
[dump, restore, m, d, fc] User
foo
[dump, restore, a] User
bar
[m, d] User abc

```

**REST**

```

curl -u mapr:mapr -X GET -k "https://
abc.sj.us:8443/rest/acl/show?
type=volume&name=sampleVoll"
{"timestamp":1525461068100,"timeofday"
:"2018-05-04 12:11:08.100 GMT-0700
PM","status":"OK","total":4,"data":
[{"Principal":"User mapr","Allowed
actions":"[dump, restore, m, a, d,
fc]"}, {"Principal":"User
foo","Allowed actions":"[dump,
restore, m, d, fc]"},
{"Principal":"User bar","Allowed
actions":"[dump, restore, a]"},
{"Principal":"User abc","Allowed
actions":"[m, d]"}]}

```

**Show the permissions that can be set on a cluster:****CLI**

```

maprcli acl show -type cluster -perm
Permissions
Description
login Login
access
ss Start/stop services in
the cluster
cv Create
volumes
a
Administrator
fc Full
control
cp Create security policies

```

**REST**

```

curl -u mapr:mapr -X GET -k "https://
abc.sj.us:8443/rest/acl/show?
type=cluster&perm"
{"timestamp":1555497261931,"timeofday"
:"2019-04-17 03:34:21.931 GMT-0700
AM","status":"OK","total":6,"data":
[{"Permissions":"login","Description":
"Login access"},
{"Permissions":"ss","Description":"Sta
rt/stop services in the cluster"},
{"Permissions":"cv","Description":"Cre
ate volumes"},
{"Permissions":"a","Description":"Admi
nistrator"},
{"Permissions":"fc","Description":"Ful

```

```
l control"},
{"Permissions":"cp","Description":"Create security policies"}]}
```

### Display the available security-level permissions:

#### CLI

```
maprcli acl show -type
securitypolicy -perm -name hipaa
Permissions
Description
r Read
a Admin
fc Full control
```

#### REST

```
curl -u mapr:mapr -X GET -k "https://
abc.sj.us:8443/rest/acl/show?
type=securitypolicy&perm&name=hipaa"

{"timestamp":1525459863777,"timeofday":
"2019-02-04 11:51:03.777 GMT-0700
AM","status":"OK","total":3,"data":
[{"Permissions":"r","Description":"Read"},
{"Permissions":"a","Description":"Read"},
{"Permissions":"fc","Description":"Full control"}]}
```

### Display list of users and security policy permissions:

#### CLI

Run the `maprcli acl show -type securitypolicy` command without the `-perm` option, to display the list of users who have security policy level permissions for the policy, and the respective permissions:

```
maprcli acl show -type
securitypolicy -name hipaa
Allowed actions Principal
[r, a, fc] User tom
[a] User
harry
```

#### REST

```
curl -u mapr:mapr -X GET -k "https://
abc.sj.us:8443/rest/acl/show?
type=securitypolicy&name=hipaa"
{"timestamp":1555498377874,"timeofday":
"2019-04-17 03:52:57.874 GMT-0700
AM","status":"OK","total":2,"data":
[{"Principal":"User tom","Allowed
actions":"[r, a, fc]"},
{"Principal":"User harry","Allowed
actions":"[a]"}]}
```

**Displays only name, ID and ACL for a user having ONLY policy level admin permissions.**

**CLI**

```

maprcli security policy create -name
testpolicy1 -user root:r,a,fc
fuser1:a fuser2:fc -readfileace
u:fuser1

maprcli acl
show -type securitypolicy -name
testpolicy1 -user fuser2
    Allowed actions Principal
    [r, fc] User fuser2

maprcli acl
show -type securitypolicy -name
testpolicy1 -user fuser1
    Allowed actions Principal
    [a] User fuser1

maprcli security policy info -name
testpolicy1 -json
{
  "timestamp":1551432309820,
    "timeofday":"2019-03-01
01:25:09.820 GMT-0800 AM",
    "status":"OK",
    "total":1,
    "data":[
      {
        "policyname":"testpolicy1",
        "policyid":19,
        "acl":[
          {
            "Principal":"User root",
            "Allowed actions":"[r,
a, fc]"
          },
          {
            "Principal":"User
fuser1",
            "Allowed actions":"[a]"
          },
          {
            "Principal":"User
fuser2",
            "Allowed actions":"[r,
fc]"
          }
        ]
      }
    ]
  }
}

```

**alarm**

Describes the alarm commands that perform functions related to system alarms.

**Alarm Notification Fields**

The following fields specify the configuration of alarm notifications.

Field	Description
alarm	The named alarm.
individual	Specifies whether individual alarm notifications are sent to the default email address for the alarm type: <ul style="list-style-type: none"> <li>• 0 - do not send notifications to the default email address for the alarm type</li> <li>• 1 - send notifications to the default email address for the alarm type</li> </ul>
email	A custom email address for notifications about this alarm type. If specified, alarm notifications are sent to this email address, regardless of whether they are sent to the default email address.

### Alarm Types

See [Alarms Reference](#).

### Alarm History

To see a history of alarms that have been raised, look at the file `/opt/mapr/logs/cldb.log` on the master CLDB node. Example:

```
grep ALARM /opt/mapr/logs/cldb.log
```

### alarm clear

Clears one or more alarms. Permissions required: `fc` or `a`.

### Syntax

#### CLI

```
maprcli alarm clear
  -alarm <alarm>
  [ -cluster <cluster> ]
  [ -entity entity (hostname OR
volume name OR Ae name) ]
```

#### REST

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/alarm/clear?&lt;parameters&gt;</code>

### Parameters

Parameter	Description
alarm	<i>(Required)</i> The named alarm to clear. See <a href="#">Alarm Types</a> .
cluster	<i>(Optional)</i> The cluster on which to run the command. By default, this is the cluster on which this command is run.

Parameter	Description
entity	(Optional) The entity on which to clear the alarm. To be able to use this option, you must have your cluster configured to run commands remotely on other clusters. Refer to <a href="#">Configuring Secure Clusters for Running Commands Remotely</a> on page 1943 for information on configuring clusters to run commands remotely on other clusters.

## Examples

### Clear a specific alarm:

#### CLI

```
maprcli alarm clear -alarm
NODE_ALARM_DEBUG_LOGGING
```

#### REST

**NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X POST -u <username> 'https://
abcorp.nj.us:8443/rest/alarm/clear?
alarm=NODE_ALARM_DEBUG_LOGGING'
{"timestamp":1666166640211,"timeofday"
:"2022-10-19 08:04:00.211 GMT+0000
AM","status":"OK","total":0,"data":[]}
```

### alarm clearmulti

Clears all alarm occurrences of specified multiple alarm types. Permissions required: fc or a.

## Syntax

#### CLI

```
maprcli alarm clearmulti
[ -cluster cluster_name ]
-alarm alarm[:entity][:aetype]
<comma seperated alarms>
```

#### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/clearmulti?<parameters>

## Parameters

Parameter	Description
alarm	(Required) Comma seperated list of alarm types to clear.
cluster	(Optional) The cluster on which to run the command. Default is the current cluster.

**Example**

**Clear a specific alarm:**

**CLI**

```
maprcli alarm clear -alarm
NODE_ALARM_DEBUG_LOGGING,VOLUME_ALARM_
COMPACTION_FAILURE
```

**REST**

**NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/clearmulti?
alarm=CLUSTER_ALARM_LICENSE_NEAR_EXPIR
ATION,CLUSTER_ALARM_TOO_MANY_COMPOSITE
_IDS
{"timestamp":1668768353611,"timeofday"
:"2022-11-18 10:45:53.611 GMT+0000
AM","status":"OK","total":0,"data":[]}
```

**alarm clearall**

Clears all alarms. Permissions required: fc or a.

**Syntax**

**CLI**

```
maprcli alarm clearall
[ -cluster <cluster> ]
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/clearall?<parameters>

**Parameters**

Parameter	Description
cluster	(Optional) The cluster on which to run the command. By default, this is the cluster on which the command is run.

**Examples**

**Clear all alarms:**

**CLI**

```
maprcli alarm clearall
```

**REST**

**NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/clearall
{"timestamp":1666948082631,"timeofday"
:"2022-10-28 09:08:02.631 GMT+0000
AM","status":"OK","total":0,"data":[]}
```

**alarm config load**

Displays the configuration of alarm notifications. Permission required: login

**Syntax**

**CLI**

```
maprcli alarm config load
[ -cluster <cluster> ]
[ -output terse|verbose ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/alarm/config/load?<parameters>

**Parameters**

Parameter	Description
cluster	(Optional) The cluster on which to run the command. The default is the cluster on which the command is run.
output	(Optional) Whether the output should be terse or verbose. The default is verbose.

**Output**

A list of configuration values for alarm notifications.

**Output Fields**

See [Alarm Notification Fields](#).

**Sample output**

```
alarm individual email

```

### alarm config save

Sets notification preferences for alarms. Permissions required: fc or a.

Alarm notifications can be sent to the default email address and a specific email address for each named alarm. If `individual` is set to 1 for a specific alarm, then notifications for that alarm are sent to the default email address for the alarm type. If a custom email address is provided, notifications are sent there regardless of whether they are also sent to the default email address.

### Syntax

#### CLI

```
maprcli alarm config save
[ -cluster <cluster> ]
-values <values>
```

#### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/config/save?<parameters>

### Parameters

Parameter	Description
cluster	(Optional) The cluster on which to run the command. The default is the cluster on which to run the command.
values	(Required) A comma-separated list of configuration values for one or more alarms, in the following format: <alarm>,<individual>,<email> See <a href="#">Alarm Notification Fields</a> .

## Examples

Send alert emails for the AE\_ALARM\_AEQUOTA\_EXCEEDED alarm to the default email address and a custom email address:

### CLI

```
maprcli alarm config save -values
"AE_ALARM_AEQUOTA_EXCEEDED,1,test@example.com"
```

### REST

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/config/save?
values=AE_ALARM_AEQUOTA_EXCEEDED,1,tes
t@example.com
```

## alarm group

Alarm groups are groups of alarms for which email addresses of users/groups can be set (to send alert to when an alarm is raised) and removed.

**Permissions required:** fc or a

*alarm group addAlarms*

Add alarms to a group.

## Syntax

### CLI

```
maprcli alarm group addAlarms
[ -cluster cluster_name ]
-groupname <group name>
-alarms <alarm name>
```

### REST API

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/group/addAlarms??<parameters>

## Parameters

Parameter	Description
cluster	<i>(Optional)</i> The cluster on which to run the command. The default is the cluster on which the command is run.
groupname	<i>(Required)</i> The name of the alarm group to create. If necessary, run listGroup to retrieve the list of alarm groups.
alarms	<i>(Required)</i> The comma-separated list of alarms to add to the group.

## Example

Add alarms to the alarm group:

**CLI**

```
maprcli alarm group addAlarms
  -groupname cldb.alarm.group.info
  -alarms
NODE_ALARM_HB_PROCESSING_SLOW,CLUSTER_
_ALARM_CLUSTER_ALMOST_FULLL
```

**REST**

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/group/
addAlarms?
groupname=cldb.alarm.group.info&alarms
=NODE_ALARM_HB_PROCESSING_SLOW,CLUSTER_
_ALARM_CLUSTER_ALMOST_FULLL
```

*alarm group addEmails*

Adds the email addresses of users/groups to send alert to when an alarm is raised.

**Syntax**

**CLI**

```
maprcli alarm group addEmails
  [ -cluster <cluster_name> ]
  -groupname <group name>
  -emails <email addresses>
```

**REST API**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/group/addEmails?<parameters>

**Parameters**

Parameter	Description
cluster	(Optional) The cluster on which to run this command. The default is the cluster on which this command is run.,
groupname	(Required) The name of the alarm group to add the email addresses to. When an alarm in the group is raised, an alert email will be sent to the users/groups. If necessary, run listgroup to retrieve the list of alarm groups.
emails	(Required) The comma-separated list of email addresses of users to send alert emails to when an alarm is raised.

**Example**

Add email addresses to cldb.alarm.group.error group.

**CLI**

```
maprcli alarm
group addEmails -groupname
cldb.alarm.group.error -emails
abc@gmail.com,xyz@gmail.com
```

**REST**

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/group/
addEmails?
groupname=cldb.alarm.group.error&email
s=abc@gmail.com,xyz@gmail.com
```

*alarm group deleteAlarms*

Delete alarms in an alarm group.

**Syntax**

**CLI**

```
maprcli alarm group deleteAlarms
[ -cluster cluster_name ]
-groupname group name
-alarms alarm names
```

**REST API**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/group/deleteAlarms?<parameters>

**Parameters**

Parameter	Description
cluster	(Optional) The cluster on which to run the command. By default, this is the cluster on which the command is run.
groupname	(Required) The name of the alarm group to remove alarms from.
alarms	(Required) The comma-separated list of alarms to remove from the group.

**Example**

Delete NODE\_ALARM\_HB\_PROCESSING\_SLOW and CLUSTER\_ALARM\_CLUSTER\_ALMOST\_FULL alarms in the cldb.alarm.group.info group:

**CLI**

```
maprcli alarm group deleteAlarms
-groupname cldb.alarm.group.info
-alarms
NODE_ALARM_HB_PROCESSING_SLOW,CLUSTER_
ALARM_CLUSTER_ALMOST_FULL
```

**REST**

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/group/
deleteAlarms?
groupname=cldb.alarm.group.info&alarms
=NODE_ALARM_HB_PROCESSING_SLOW,CLUSTER_
_ALARM_CLUSTER_ALMOST_FULL
```

*alarm group deleteEmails*

Deletes the email addresses of users/groups.

**Syntax****CLI**

```
maprcli alarm group deleteEmails
[ -cluster <cluster_name> ]
-groupname <group name>
-emails <email addresses>
```

**REST API**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/group/deleteEmails?<parameters>

**Parameters**

Parameter	Description
cluster	<i>(Optional)</i> The cluster on which to run the command. The default is the cluster on which the command is run.
groupname	<i>(Required)</i> The name of the alarm group to remove the email addresses from. If necessary, run <code>listgroup</code> to retrieve the list of alarm groups.
emails	<i>(Required)</i> The comma-separated list of email addresses of users/groups to remove.

**Example**

Delete the given emails associated with the `cldb.alarm.group.error` group:

**CLI**

```
maprcli alarm
group deleteEmails -groupname
cldb.alarm.group.error -emails
xyz@gmail.com,abc@gmail.com
```

**REST**

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/group/
deleteEmails?
groupname=cldb.alarm.group.errorinfo&e
mails=xyz@gmail.com,abc@gmail.com
```

*alarm group listGroup*

Lists the alarm groups.

**NOTE:** The three dots in the output indicate multiple alarms in the group. Use `-json` to format the output.

**Syntax**

**CLI**

```
maprcli alarm group listGroup
  [ -cluster cluster_name ]
  [ -start start. default: 0 ]
  [ -limit limit. default:
2147483647 ]
  [ -output output. default:
verbose ]
```

**REST API**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/alarm/group/listGroup?<parameters>

**Parameters**

Parameter	Description
cluster	(Optional) The cluster on which to run the command. The default is the cluster on which the command is run.
start	(Optional) The list offset at which to start. Default: 0
limit	(Optional) The number of records to retrieve. Default value is 2147483647.
output	(Optional) The output format: <ul style="list-style-type: none"> <li>terse</li> <li>verbose</li> </ul> Default value is verbose.

**Example**

Return the list of alarms and associated email addresses.

**CLI**

```
# maprcli alarm group listGroup
alarm name emails group name
... abc@mapr.com
cldb.alarm.group.error
... cldb.alarm.group.info
... cldb.alarm.group.warn
```

**In JSON Format:**

```
maprcli alarm group listGroup -json
{
  "timestamp":1495018857252,
  "timeofday":"2017-05-17
11:00:57.252 GMT+0000",
  "status":"OK",
  "total":3,
  "data":[
  {
```

```

"group
name": "cldb.alarm.group.error",
"emails": "abc@mapr.com",
"alarm name": [
  "NODE_ALARM_DISK_FAILURE",

  "VOLUME_ALARM_QUOTA_EXCEEDED",
  "VOLUME_ALARM_TOPOLOGY_FULL",
  "NODE_ALARM_PAM_MISCONFIGURED",
  "NODE_ALARM_MEMORY_ALLOCATION_EXCEEDED",
  "NODE_ALARM_TOO_MANY_CONTAINERS",
  "NODE_ALARM_NUM_INSTANCES_MISMATCH",
  "AE_ALARM_AEQUOTA_EXCEEDED"
]
}

```

## REST

```

curl -X GET -u
<username> https://abc.sj.us:8443/
rest/alarm/group/listGroup

```

### alarm list

Lists alarms in the system. Permissions required: login.

You can list all alarms, alarms by type (Cluster, Node or Volume), or alarms on a particular node or volume. To retrieve a count of all alarm types, pass 1 in the `summary` parameter. You can specify the alarms to return by filtering on type and entity. Use `start` and `limit` to retrieve only a specified window of data.

## Syntax

### CLI

```

maprcli alarm list
[ -alarm alarm name ]
[ -all list all raised alarms
including the ones which are muted
Parameter takes no value ]
[ -cluster cluster_name ]
[ -entity entity (hostname OR
volume name OR Ae name) ]

```

```
[ -entitylimit entitylimit ]
[ -filter none. default: none ]
[ -from alarms raised after
time(in millis) ]
[ -getcount Send count of
currently raised alarms Parameter
takes no value ]
[ -history list cleared up alarms
only Parameter takes no value ]
[ -limit limit. default:
2147483647 ]
[ -muted list alarms configured
to be mute Parameter takes no value ]
[ -output output. default:
verbose ]
[ -sortby <alarmname|
alarmdescription|alarmtype|alarmstate|
alarmraised|alarmcleared|alarmentity|
alarmmutetime|alarmmuteupto|
alarmmuteduration|alarmgroups> ]
[ -sortorder <asc|desc> ]
[ -start start. default: 0 ]
[ -summary summary ]
[ -till alarms raised
before time(in millis) ]
[ -type type (CLUSTER
OR NODE OR VOLUME OR AE) ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/alarm/list?<parameters>

**Parameters**

Parameter	Description
alarm	(Optional) The alarm name for which to return information. The default is to list all alarms.
all	The list of all raised and muted alarms. This is the default.
cluster	(Optional) The cluster on which to list alarms. The default is the cluster on which the command is run.
entity	(Optional) The name of the cluster, node, volume, user, or group to check for alarms. The default is the anme of the cluster on which the command is run.
entitylimit	(Optional) The number of alarm occurrences to return per alarm type. For example, if there are 10 alarms of type VOLUME_ALARM_COMPACTON_FAILURE and the entity limit is set to 4, then only the four latest alarm occurrences of type VOLUME_ALARM_COMPACTON_FAILURE are listed.
filter	(Optional) A filter specifying alarms to list. See <a href="#">Filters</a> for more information. Default: none

Parameter	Description
from	( <i>Optional</i> ) The list of alarms raised after a moment in time (specified in ms). Use <code>from</code> in conjunction with <code>till</code> to list alarms that have been raised within the specified period.
getcount	( <i>Optional</i> ) The count of all alarms raised at the moment in time when you invoke this command.
history	( <i>Optional</i> ) The list of all alarms cleared in the last 30 days. Muted alarms are not displayed in the output.
limit	( <i>Optional</i> ) The number of records to retrieve. Default: 2147483647
muted	( <i>Optional</i> ) The list of alarms that are muted.
output	( <i>Optional</i> ) Indicates whether the output should be terse or verbose. Default: verbose
sortby	( <i>Optional</i> ) Specifies one of the following attributes by which to sort the list of alarms: <code>alarmname</code> , <code>alarmdescripton</code> , <code>alarmtype</code> , <code>alarmstate</code> , <code>alarmraised</code> , <code>alarmcleared</code> , <code>alarmentity</code> , <code>alarmmutetime</code> , <code>alarmmuteupto</code> , <code>alarmmuteduration</code> , <code>alarmgroups</code> . By default, the list of alarms is sorted by <code>alarmtype</code> .
sortorder	( <i>Optional</i> ) Sorts the output in either ascending or descending order.
start	( <i>Optional</i> ) The list offset at which to start. Default: 0
summary	( <i>Optional</i> ) Specifies the type of data to return: <ul style="list-style-type: none"> <li>• 1 = count by alarm type</li> <li>• 0 = List of alarms</li> </ul> Default: false (0)
till	( <i>Optional</i> ) The list of alarms raised before a moment in time (specified in ms). Use <code>till</code> in conjunction with <code>from</code> to list alarms that have been raised within the specified period.
type	The entity type: <ul style="list-style-type: none"> <li>• cluster</li> <li>• node</li> <li>• volume</li> <li>• ae</li> </ul> All alarm types are listed by default, if you do not specify this parameter.

## Output

Information about one or more named alarms on the cluster, or for a specified node, volume, user, or group.

## Output Fields

Field	Description
alarm state	State of the alarm: <ul style="list-style-type: none"> <li>0 = Clear</li> <li>1 = Raised</li> </ul>
description	A description of the condition that raised the alarm.
entity	The name of the volume, node, user, or group.
alarm name	The name of the alarm.
alarm statechange time	The date and time when the alarm was most recently raised.

### Sample Output

```
alarm state
description
entity                alarm name
alarm statechange time
1                    Volume desired replication is 1, current
replication is 0    mapr.qa-nodel73.qa.prv.local.logs

```

### Examples

**NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

#### List a summary of all alarms

##### CLI

```
maprcli alarm list -summary 1
```

##### REST

```
curl -X GET -u <username> https://
rln1.sj.us:8443/rest/alarm/list?
summary=1
{"timestamp":1668751802813,"timeofday"

1495703499201 vol2
VOLUME_ALARM_DATA_UNDER_REPLICATED
15 mins      1495702964188
1495703864188 vol1
VOLUME_ALARM_DATA_UNDER_REPLICATED
```

### REST API

```
curl -X GET -u <username> https://
rln1.sj.us:8443/rest/alarm/list?muted
{"timestamp": 1668751520474, "timeofday": "2022-11-18 06:05:20.474 GMT+0000 AM", "status": "OK", "total": 0, "data": []}
```

### alarm mute

Mutes an active alarm for the specified amount of time.

## Syntax

### CLI

```
maprcli alarm mute
  -alarm alarm[:entity][:aetype]
  [:mute_duration] <comma seperated
  alarms>
  [ -cluster cluster_name ]
  [ -muteminutes <mute_period> ]
```

### REST API

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/mute?<parameters>

## Parameters

Parameter	Description
alarm	<i>(Required)</i> The comma-separated list of the active alarms to mute. To mute an active alarm associated with an entity (such as volume, node, etc.) or type of accountable entity, you must also specify the name of the entity or the type of accountable entity separated by a colon (:).
cluster	<i>(Optional)</i> The cluster on which to run the command. The default is the cluster on which the command is run.
muteminutes	<p><i>(Optional)</i> The amount of time, in minutes, to mute the alarm.</p> <p>This can be specified separately or specified after the colon (:&lt;mute_period&gt;) immediately following the alarm name. For example, if multiple alarms are being muted for different periods of time, use colon (:&lt;mute_period&gt;) to specify the mute period for each alarm.</p> <p>Specifying this separately is optional if colon (:&lt;mute_period&gt;) is used to specify the amount of time to mute an alarm. For example, when specifying a list of alarms to mute, use this parameter to specify the amount of time to mute the alarm for which no time period is specified using colon (:&lt;mute_period&gt;).</p> <p> <b>NOTE:</b> Either the value for this parameter or colon (:&lt;mute_period&gt;) is required to specify the amount of time for which to mute the alarm.</p>

## Examples

Mute an active alarm for 10 minutes using one of the following:

### CLI

```
maprcli alarm mute -alarm
  CLUSTER_ALARM_LICENSE_NEAR_EXPIRATION:
  10 (or)
maprcli alarm mute -alarm
```

```
CLUSTER_ALARM_LICENSE_NEAR_EXPIRATION
-muteminutes 10
```

**REST**

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/mute?
alarm=CLUSTER_ALARM_LICENSE_NEAR_EXPIR
ATION:10 (or)
```

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/mute?
alarm=CLUSTER_ALARM_LICENSE_NEAR_EXPIR
ATION&muteminutes=10
```

Mute an active volume alarm on volume1 for 10 minutes using one of the following:

**CLI**

```
maprcli alarm mute -alarm
VOLUME_ALARM_DATA_UNDER_REPLICATED:vol
ume1:10 (or)
```

```
maprcli alarm mute -alarm
VOLUME_ALARM_DATA_UNDER_REPLICATED:vol
ume1 -muteminutes 10
```

**REST**

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/mute?
alarm=VOLUME_ALARM_DATA_UNDER_REPLICAT
ED:volumel:10 (or)
```

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/mute?
alarm=VOLUME_ALARM_DATA_UNDER_REPLICAT
ED:volumel&muteminutes=10
```

Mute active volume alarm on volume1 for 10 minutes, active cluster alarm for 20 minutes, and active volume alarm on volume2 for 30 minutes using one of the following:

**CLI**

```
maprcli alarm mute -alarm
VOLUME_ALARM_DATA_UNDER_REPLICATED:vol
ume1:10,
```

```
CLUSTER_ALARM_LICENSE_NEAR_EXPIRATION:
20,
```

```
VOLUME_ALARM_DATA_UNDER_REPLICATED:vol
ume2:30
```

**(or)**

```
maprcli alarm mute -alarm
```

```
VOLUME_ALARM_DATA_UNDER_REPLICATED:vol
ume1:10,
```

```
CLUSTER_ALARM_LICENSE_NEAR_EXPIRATION:
20,
```

```
VOLUME_ALARM_DATA_UNDER_REPLICATED:volume2
-muteminutes 30
```

**REST**

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/mute?
alarm=VOLUME_ALARM_DATA_UNDER_REPLICAT
ED:volume1:10,
CLUSTER_ALARM_LICENSE_NEAR_EXPIRATION:
20,VOLUME_ALARM_DATA_UNDER_REPLICATED:
volume2:30
```

**(or)**

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/mute?
alarm=VOLUME_ALARM_DATA_UNDER_REPLICAT
ED:volume1:10,
CLUSTER_ALARM_LICENSE_NEAR_EXPIRATION:
20,VOLUME_ALARM_DATA_UNDER_REPLICATED:
volume2&muteminutes=30
```

**alarm names**

Displays a list of alarm names. Permissions required: login

**Syntax**

**CLI**

```
maprcli alarm names
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/alarm/names

**Output**

 **ATTENTION:** The list of alarms depends on the ecosystem components installed. Your output may vary depending on the ecosystem components that you have installed.

## Example

Display all alarm names:

### CLI

```
maprcli alarm names
```

### REST

```
curl -X GET -u <username> https://
rlnl.sj.us:8443/rest/alarm/names
```

## alarm raise

Raises a specified alarm or alarms. Permissions required: `fc` or `a`.

## Syntax

### CLI

```
maprcli alarm raise
  -alarm <alarm>
  [ -cluster <cluster> ]
  [ -description <description> ]
  [ -entity <cluster, entity, host,
node, or volume> ]
```

### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/raise?<parameters>

## Parameters

Parameter	Description
alarm	(Required) The alarm type to raise. See <a href="#">Alarm Types</a> .
cluster	(Optional) The cluster on which to run the command. The default is the cluster on which the command is run,
description	(Optional) A brief description.
entity	(Optional) The entity on which to raise alarms. To be able to use this option, you must have your cluster configured to run commands remotely on other clusters. Refer to <a href="#">Configuring Secure Clusters for Running Commands Remotely</a> on page 1943 for information on configuring clusters to run commands remotely on other clusters.. The default is the hostname of the host on which the command is run.

## Examples

### Raise a specific alarm:

#### CLI

```
maprcli alarm raise -alarm
NODE_ALARM_DEBUG_LOGGING
```

#### REST

**NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X POST -u <username> 'https://
rln1.sj.us:8443/rest/alarm/raise?
alarm=NODE_ALARM_DEBUG_LOGGING'
{"timestamp":1666002682984,"timeofday"
:"2022-10-17 10:31:22.984 GMT+0000
AM","status":"OK","total":0,"data":[]}
```

### alarm unmute

Unmute a muted alarm.

## Syntax

#### CLI

```
maprcli alarm unmute
-alarm [<alarm
name>[:<entity>[:<aetype>]]]+
[ -cluster cluster_name ]
```

#### REST API

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/unmute?<parameters>

## Parameters

Parameter	Description
alarm	( <i>Required</i> ) The comma-separated list of the muted alarms to unmute. To unmute an alarm associated with an entity (such as volume, node, etc.) or type of accountable entity, you can specify also the name of the entity or the type of accountable entity separated by a colon (:).
cluster	( <i>Optional</i> ) The name of the cluster on which to run the command. The default is the cluster on which the command is run.

### Example

Unmute alarm NODE\_ALARM\_SERVICE\_APISERVER\_DOWN

#### CLI

```
maprcli alarm unmute
NODE_ALARM_SERVICE_APISERVER_DOWN
```

#### REST

```
curl -X POST -u <username> https://
rln1.sj.us:8443/rest/alarm/unmute?
slarm=NODE_ALARM_SERVICE_APISERVER_DOW
N
```

### audit

Describes commands used to audit operations related to cluster management and data access.

#### audit cluster

Enables and disables auditing of operations that are related to the administration of a data-fabric cluster.

Only the `mapr` user for the cluster can run this command. For more information about the `mapr` user, see [Managing Users and Groups](#).

For information about auditing cluster-administration operations, see [Auditing of Activity Related to Cluster Administration](#).

### Syntax

#### CLI

```
maprcli audit cluster
-enabled <true | false>
```

#### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/audit/cluster?enabled=true_or_false

## Parameters

Parameter	Description
enabled	(Required) The value <code>true</code> enables auditing, the value <code>false</code> (default) disables it.

### CLI

**NOTE:** Before running the `maprcli audit cluster` command, you must obtain a ticket using `maprlogin`. To obtain a ticket using `maprlogin`, run the `maprlogin password` command and enter the password for the `root` user.

```
maprcli audit cluster -enabled
true -json
    {
"timestamp":1669010238977,
"timeofday":"2022-11-21 05:57:18.977
GMT+0000 AM",
        "status":"OK",
        "total":0,
        "data":[
    ]
    }
```

### REST

**NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following `curl` command, according to your SSL setup.

```
curl -X GET -u <username> https://
abc.sj.us:8443/rest/audit/cluster?
enabled=true
{"timestamp":1669008214186,"timeofday"
:"2022-11-21 05:23:34.186 GMT+0000
AM","status":"OK","total":0,"data":[]}
```

### audit data

Enables and disables auditing of file system and table operations.

See [Auditing of File System Operations and Table Operations](#) for a list of these operations.

All administrative users for the cluster can run this command. For more information, see [Managing Users and Groups](#).

### Syntax

#### CLI

```
maprcli audit data
[ -cluster cluster_name ]
[ -enabled enable audit for data
access ]
[ -maxsize size of audit volume per
node ]
[ -retention retention period of
audit logs in days ]
```

**REST**

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/audit/data?&lt;parameters&gt;</code>

**Parameters**

Parameter	Description
cluster	( <i>Optional</i> ) The path and name of a remote cluster. The default is the current cluster on which this command is run.
enabled	( <i>Optional</i> ) The value <code>true</code> enables auditing, the value <code>false</code> (default) disables it.
maxsize	( <i>Optional</i> ) The size in GB at which the system sends an alarm to the dashboard in the Control System. The alarm notifies the cluster administrator that the audit log is becoming large enough that the administrator might want to take action. For more information about this parameter, the alarm, and possible actions, see <a href="#">Managing Audit Logs for File System and Table Operations</a> .  The audit log grows until the administrator takes action or until the retention period ends.  The default value is 32.
retention	( <i>Optional</i> ) The period of time in days for which to keep the data in the audit log for data access. After this period elapses, the file's content is deleted, and new entries are added until the next retention period elapses.  The default retention period is 30 days.

**Examples****CLI**

```
# maprcli audit data -maxsize
200 -json
{
  "timestamp":1669022864689,
  "timeofday":"2022-11-21
09:27:44.689 GMT+0000 AM",
  "status":"OK",
  "total":0,
  "data":[
  ]
}
```

**REST**

**NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/audit/data?
```

```
maxsize=200
{"timestamp":1669023856431,"timeofday":
:"2022-11-21 09:44:16.431 GMT+0000
AM","status":"OK","total":0,"data":
[]}
```

### audit info

This shows whether auditing of cluster-management operations and auditing of data-access operations are enabled. Also, displays the `maxSize` and retention values for these two levels of auditing.

Only the `mapr` user for the cluster can run this command. For more information about the `mapr` user, see [Managing Users and Groups](#).

### Syntax

#### CLI

```
maprcli audit info
[ -cluster <cluster_name> ]
```

#### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/audit/info?<parameters>

### Parameter

Parameter	Description
cluster	(Optional) The name of the cluster on which to run the command. The default is the cluster on which the command is run.

### Example Output

This output shows that auditing of operations on data and auditing of cluster-level operations are both enabled. For descriptions of `maxSizeGB` and `retentionDays`, see the commands [maprcli audit cluster](#) and [maprcli audit data](#).

#### CLI

```
# maprcli audit info -json
{
  "timestamp":1434458923034,
  "timeofday":"2015-06-16 12:48:43.034
GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "data":{
        "enabled":"1",
        "maxSizeGB":"32",
        "retentionDays":"30"
      }
    }
  ],
}
```

```

        "cluster":{
            "enabled":"1",
            "maxSizeGB":"NA",

"retentionDays":"NA"
        }
    ]
}
    
```

**REST**

 **NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```

curl -X POST -u <username> https://
abc.sj.us:8443/rest/audit/info
{"timestamp":1669013470770,"timeofday"
:"2022-11-21 06:51:10.770 GMT+0000
AM","status":"OK","total":1,"data":
[{"data":
{"enabled":"0","maxSizeGB":"32","reten
tionDays":"30"},"cluster":
{"enabled":"1"}}]}
    
```

**blockaccess**

Describes commands used to include users in the blocklist and to list users who are in the blocklist.

**blockaccess user**

Blocks a user on a specific cluster.

This action cancels all existing tickets for the specified user. For information about blocking, see [How Tickets Work](#).

**Syntax**

**CLI**

```

maprcli blockaccess user
    -name username to be added to
    blocked users
    [ -blockaccesstime millis from
    epoch or date in MM/DD/YYYY format ]
    [ -cluster name of the cluster ]
    
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/blockaccess/user?<parameters>

**Parameters**

Parameter	Description
name	(Required) Username to block.

Parameter	Description
blockaccesstime	( <i>Optional</i> ) Invalidates all user's tickets raised before the specified date (in the format <MM/DD/YYYY>). Alternatively, you can set the time in milliseconds from epoch time (the number of milliseconds that have elapsed since Jan 1, 1970, midnight UTC).
cluster	( <i>Optional</i> ) Name of the cluster from which to block the user. The default is the cluster on which the command is run.

### Example

Block the *rogueuser* user name from the cluster *my.cluster.com*:

#### CLI

```
maprcli blockaccess user -name
rogueuser -cluster my.cluster.com
```

#### REST

```
curl -X POST -u <username> https://
rln1.sj.us:8443/rest/blockaccess/user?
name=rogueuser&cluster=my.cluster.com
```

Deny the *rogueuser* user's tickets that were raised prior to *1st September 2020* from the cluster *my.cluster.com*:

#### CLI

```
maprcli blockaccess
user -name rogueuser -cluster
my.cluster.com -blockaccesstime
09/01/2020
```

#### REST

```
curl -X POST -u <username> https://
rln1.sj.us:8443/rest/blockaccess/user?
name=rogueuser&cluster=my.cluster.com&
blockaccesstime=09/01/2020
```

Deny the *rogueuser* user's tickets that were raised prior to *1605418200155* milliseconds from epoch, from the cluster *my.cluster.com*:

#### CLI

```
maprcli blockaccess
user -name rogueuser -cluster
my.cluster.com -blockaccesstime
1605418200155
```

#### REST

```
curl -X POST -u <username> https://
rln1.sj.us:8443/rest/blockaccess/user?
name=rogueuser&cluster=my.cluster.com&
blockaccesstime=1605418200155
```

The value *1605418200155* corresponds to the time *November 15th 2020, 11:00:00 am IST+05:30*. Therefore, all *rogueuser* tickets that were raised prior to *November 15th 2020, 11:00:00 am IST+05:30* are blocked.

## Related Log File

The log file `/opt/mapr/logs/cldbaudit.log.json` contains the log of the deny operation including the updated deny time. For example:

```

{"timestamp":
{"$date": "2020-11-13T08:37:36.524Z"}, "resource": "mapruser4", "operation": "blacklist",

"username": "root", "uid": 0, "clientip": "10.10.50.42", "properties":

[{"property": "denylisttime", "oldvalue": "1605254599376", "newvalue": "1605875766173"}],

      "status": 0}{ "timestamp":
{"$date": "2020-11-13T08:37:45.020Z"}, "resource": "cluster",
      "operation": "listBlacklist", "username": "root", "uid": 0,
      "clientip": "10.10.50.42", "status": 0}

```

Here the old deny list time was `1605254599376` milliseconds (November 13, 2020 1:33:19 PM IST) and is now updated to `1605875766173` milliseconds (Friday, November 20, 2020 6:06:06 PM IST).

## blockaccess listusers

Lists users who are blocked on a specific cluster.

By default, this command lists users that have been blocked from the cluster where the command is run. There is no REST equivalent command. For information about blocking, see [How Tickets Work](#).

## Syntax

### CLI

```
maprcli blockaccess listusers
[ -cluster <cluster name> ]
```

### REST

Request Type	GET
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/blockaccess/listusers?&lt;parameters&gt;</code>

## Parameters

Parameter	Description
cluster	(Optional) Name of the cluster for which the blocked users must be listed. The default is the cluster on which the command is run.

## Examples

Show blocked users for the cluster `my.cluster.com`:

### CLI

```
maprcli blockaccess
listusers -cluster my.cluster.com
```

**REST**

```
curl -X GET -u <username> https://
rlnl.sj.us:8443/rest/blockaccess/
listusers?cluster=my.cluster.com
```

**cluster**

Manages cluster features, gateways, and cluster-wide settings.

**cluster feature enable**

Allows features to be enabled. Used after upgrading.

**NOTE:** Run the `cluster feature list` on page 2037 command to retrieve the list of features that can be enabled.

**Syntax****CLI**

```
maprcli cluster feature enable
[ -name <feature name>]
[ -force <true|false>]
[ -all ]
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/cluster/feature/enable?<parameters>

**Parameters**

Parameter	Description
name	( <i>Conditionally required</i> ) Enable <b>only the specified feature</b> . Mandatorily pass either this parameter or the <code>all</code> parameter to enable either the specified feature or all features. <b>NOTE:</b> You can enable IPv6 addressing support on a fabric by using <code>cldb.ipv6.support</code> as the value for the <code>name</code> parameter.
force	( <i>Optional</i> ) Set it to <code>true</code> to enable all dependent features for every enabled feature.
all	( <i>Conditionally required</i> ) Enable <b>all</b> features. Mandatorily pass either this parameter or the <code>name</code> parameter to enable all features or the specified feature.

**NOTE:** Once you enable a feature, you cannot disable it.

**Example****CLI**

To enable all features, use the `cluster feature enable -all` command.

```
maprcli cluster feature enable -all
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X
POST https://abc.sj.us:8443/rest/
cluster/feature/enable?all
```

**CLI**

To enable IPv6 on a fabric, use the value `cldb.ipv6.support` for the `name` parameter in the `cluster feature enable` command.

```
maprcli cluster feature enable -name
cldb.ipv6.support
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/cluster/feature/
enable?name=cldb.ipv6.support
```

**CLI**

To enable auditing on a fabric, run the following command.

```
maprcli cluster feature enable -name
mfs.feature.audit.support
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/cluster/feature/
enable?name=mfs.feature.audit.support
```

**NOTE:** The CLDB operates on IPv4 only, even if it is a dual-stack system with both IPv4 and IPv6 addresses associated with it.

**cluster feature list**

Lists the status of features. Used after upgrading.

## Syntax

### CLI

```
maprcli cluster feature list
  [ -name <feature name > ]
  [ -enabled ]
  [ -disabled ]
```

### REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/cluster/feature/list?<parameters>

## Parameters

Parameter	Description
name	(optional) Lists whether the specified feature is enabled or disabled.
enabled	(optional) Lists only the enabled features.
disabled	(optional) Lists only the disabled features.

**TIP:** The three dots in the output indicate multiple entries. Use `-json` to format the output.

**NOTICE:** Running this command without any parameters lists the status for **all** features.

## Examples

### CLI

#### Lists the disabled features

```
maprcli cluster feature list -disabled
dependency
name
description      enabled

mfs.feature.audit.support
false
```

### REST

**NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X GET -u <username> https://
abc.sj.us:8443/rest/cluster/feature/
list?disabled
{"timestamp":1669281643862,"timeofday"
:"2022-11-24 09:20:43.862 GMT+0000
AM","status":"OK","total":0,"data":[]}
```

**CLI****Lists the status of all features**

```

maprcli cluster feature list
dependency
name
description

e.enabled
                                true

mfs.feature.disk.flush
    Support for Disk
Flush

```

**TIP:** Use `-json` to format the output.

**REST**

Lists the status for the 'mfs.feature.devicefile.support' feature

**NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X GET -u <username> https://
abc.sj.us:8443/rest/cluster/feature/
list?
name=mfs.feature.devicefile.support
{"timestamp":1669279328178,"timeofday"
:"2022-11-24 08:42:08.178 GMT+0000
AM","status":"OK","total":1,"data":
[{"name":"mfs.feature.devicefile.supp
ort","enabled":true}]}
```

**cluster gateway delete**

Deletes the list of Data Fabric gateways from a source Data Fabric cluster.

Source data-fabric clusters can use such lists to locate the gateways that enable replication of table data to a particular data-fabric cluster or indexing table data in a specific Elasticsearch cluster. You create lists of gateways by running the [cluster gateway set](#) command.

There are three methods of specifying the location of gateways to a data-fabric cluster that is a source for table replication

or indexing in Elasticsearch. If a source data-fabric cluster relies on DNS records to find out the location of the gateways, or the cluster relies on the mapr-clusters.conf file to locate gateways, there is no list for the cluster gateway delete command to delete.

**NOTE:** When you delete a list of gateways with the `maprcli cluster gateway delete` command, it's crucial to understand that this action does not uninstall the listed gateways from the data-fabric cluster where they are located. The gateways will remain in the cluster but no longer be part of the list.

**Syntax****CLI**

```
maprcli cluster gateway delete
[ -cluster <cluster on which the
command needs to be run> ]
-dstcluster <cluster name>
```

**REST**

Request Type	DELETE
Request URL	http[s]://<host>:<port>/rest/cluster/gateway/delete?<parameters>

**Parameters**

Parameter	Description
cluster	(Optional) The name of the cluster on which this command should be run. By default, this is the cluster on which the command is run.

Parameter	Description
dstcluster	<p>(<i>Required</i>) The name of the cluster on which the gateways are located.</p> <p>If you are replicating table data to another Data Fabric cluster, specify the name of that destination cluster. This destination cluster could be the source cluster if you are performing intra-cluster replication.</p> <p>If you are indexing table data in an Elasticsearch cluster, specify the name of the source Data Fabric cluster because that is where the gateways are located.</p>

### Example

Deletes a list of gateways that is stored on a source Data Fabric cluster. The gateways that are being used for table replication are located in the destination Data Fabric cluster `newyork`.

#### CLI

```
maprcli cluster gateway
delete -dstcluster newyork
```

#### REST

```
curl -X DELETE -u <username> https://
abc.sj.us:8443/rest/cluster/gateway/
delete?dstcluster=newyork
```

### Related concepts

[Administering Data Fabric Gateways](#) on page 1519

A HPE Ezmeral Data Fabric gateway mediates one-way communication between a source HPE Ezmeral Data Fabric cluster and a destination cluster. You can replicate HPE Ezmeral Data Fabric Database tables (binary and JSON) and HPE Ezmeral Data Fabric Streams streams. HPE Ezmeral Data Fabric gateways also apply updates from JSON tables to their secondary indexes and propagate Change Data Capture (CDC) logs.

[Configuring Gateways for Table and Stream Replication](#) on page 1521

Configuring gateways involves installing the `mapr-gateway` package on nodes on a Data Fabric destination cluster and then configuring the Data Fabric source cluster to communicate with the destination cluster. The Data Fabric source cluster is configured by specifying the destination cluster's CLDB node and gateway nodes.

[gateway.conf](#) on page 2985

[Gateways for Replicating HPE Ezmeral Data Fabric Database Tables](#) on page 752

In HPE Ezmeral Data Fabric Database table replication, HPE Ezmeral Data Fabric Database replicates updates to tables (binary and JSON) on source Data Fabric clusters to replicas of those tables on destination Data Fabric clusters. Gateways are services that receive these updates and apply them to the replicas. These gateways also propagate updates from JSON tables to their secondary indexes.

Lists the gateways configured on the Data Fabric cluster on which this command is run.

[cluster gateway resolve](#) on page 2052

Lists the gateways configured on a Data Fabric cluster that are running at the time that the command is issued.

[cluster gateway set](#) on page 2054

Specifies the locations of the Data Fabric gateways that a source Data Fabric cluster can use for table replication to a destination Data Fabric cluster or for indexing table data in an Elasticsearch cluster.

### More information

[Managing Gateways](#) on page 1523

Describes the commands for listing gateways, checking status of gateways, managing gateways if they fail, and troubleshooting gateways.

### cluster gateway get

Lists the Data Fabric gateways that a source Data Fabric cluster is using.

The source data-fabric cluster might use the data-fabric gateways to replicate table data to a destination data-fabric cluster or index data in an Elasticsearch cluster.

The [cluster gateway set](#) command creates this list of gateways.

### Syntax

#### CLI

```
maprcli cluster gateway get
[ -cluster <sourceCluster> ]
-dstcluster
<destinationCluster>
```

#### REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/cluster/gateway/get?<parameters>

### Parameters

Parameter	Description
cluster	<i>(Optional)</i> The name of the source cluster on which this command should run. By default, this is the cluster on which you run this command.
dstcluster	<i>(Required)</i> The name of the cluster on which the gateways are located.  If you are replicating table data to another Data Fabric cluster, specify the name of that destination cluster. This destination cluster could be the source cluster if you are performing intra-cluster replication.  If you are indexing table data in an Elasticsearch cluster, specify the name of the source Data Fabric cluster because that is where the gateways are located.

## Example

Gets the list of gateways that is stored on a source Data Fabric cluster. The gateways are being used for table replication and are located in the destination Data Fabric cluster `sfcluster`.

### CLI

```
maprcli cluster gateway
get -dstcluster sfcluster
```

### REST

```
curl -X GET -u <username> https://
abc.sj.us:8443/rest/cluster/gateway/
get?dstcluster=sfcluster
```

### Example Output

```
cluster gatewayConfig
sfcluster gw1 gw2
```

Deletes the list of Data Fabric gateways from a source Data Fabric cluster.

[cluster gateway get](#) on page 2046

Lists the Data Fabric gateways that a source Data Fabric cluster is using.

[cluster gateway list](#) on page 2048

Lists all the gateways that a source Data Fabric cluster is using.

[cluster gateway resolve](#) on page 2052

Lists the gateways configured on a Data Fabric cluster that are running at the time that the command is issued.

[cluster gateway set](#) on page 2054

Specifies the locations of the Data Fabric gateways that a source Data Fabric cluster can use for table replication to a destination Data Fabric cluster or for indexing table data in an Elasticsearch cluster.

**More information**

[Managing Gateways](#) on page 1523

Describes the commands for listing gateways, checking status of gateways, managing gateways if they fail, and troubleshooting gateways.

**cluster gateway resolve**

Lists the gateways configured on a Data Fabric cluster that are running at the time that the command is issued.

Run this command on a source Data Fabric cluster to find out how many gateways are available for table replication to a destination Data Fabric cluster or for indexing table data in an Elasticsearch cluster.

This command uses the following criteria to get the list:

- Rest assured, if you have specified the locations of the gateways with the [cluster gateway set](#) on page 2054 command, the `maprcli cluster gateway resolve` command will reliably return a list of them.
- If you have specified the locations of the gateways only with a DNS record, this command performs a DNS lookup for gateways on the specified Data Fabric cluster and returns the list it finds.
- Suppose you have not specified the locations of the gateways using the previously listed methods. This command assumes that gateways are located on the CLDB nodes configured in the `mapr-clusters.conf` file on the Data Fabric cluster where you run this command.

**NOTE:** Unresponsive gateways are not included in the list.

For more information about gateways, see [MapR Gateways](#).

**Syntax****CLI**

```
maprcli cluster gateway resolve
[ -cluster <cluster on which the
command is to be run> ]
-dstcluster <destination cluster
name>
```

**REST**

Request Type	GET
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/cluster/gateway/resolve?&lt;parameters&gt;</code>

**Parameters**

Parameter	Description
<code>cluster</code>	<i>(Optional)</i> The name of the cluster on which this command should be run. By default, this is the cluster on which you run this command.

Parameter	Description
dstcluster	<p><i>(Required)</i> The name of the cluster for which to list the available gateways.</p> <p>If you are replicating table data to another Data Fabric cluster, specify the name of that destination cluster. This destination cluster can be the source cluster if you are performing intra-cluster replication.</p> <p>If you are indexing table data in an Elasticsearch cluster, specify the name of the source Data Fabric cluster because that is where the gateways are located.</p>

### Example

The following example shows that only one gateway is running on the Data Fabric cluster `cluster1`. The IP address of this gateway was found in a DNS record, as indicated by the `Source` field.

#### CLI

```
maprcli cluster gateway
resolve -dstcluster cluster1 -json
```

#### REST

```
curl -X GET -u <username> https://
abc.sj.us:8443/rest/cluster/gateway/
resolve?dstcluster=cluster1
```

#### Example Output

```
{
  "timestamp":1424266395862,
  "timeofday":"2015-02-18
01:33:15.862 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "GatewayHosts":"10.10.20.12:7660",
      "Source":"DNS"
    }
  ]
}
```

### Related concepts

[Administering Data Fabric Gateways](#) on page 1519

A HPE Ezmeral Data Fabric gateway mediates one-way communication between a source HPE Ezmeral Data Fabric cluster and a destination cluster. You can replicate HPE Ezmeral Data Fabric Database tables (binary and JSON) and HPE Ezmeral Data Fabric Streams streams. HPE Ezmeral Data Fabric gateways also apply updates from JSON tables to their secondary indexes and propagate Change Data Capture (CDC) logs.

[Configuring Gateways for Table and Stream Replication](#) on page 1521

Configuring gateways involves installing the `mapr-gateway` package on nodes on a Data Fabric destination cluster and then configuring the Data Fabric source cluster to communicate with the destination cluster. The Data Fabric source cluster is configured by specifying the destination cluster's CLDB node and gateway nodes.

[gateway.conf](#) on page 2985

[Gateways for Replicating HPE Ezmeral Data Fabric Database Tables](#) on page 752

In HPE Ezmeral Data Fabric Database table replication, HPE Ezmeral Data Fabric Database replicates updates to tables (binary and JSON) on source Data Fabric clusters to replicas of those tables on destination Data Fabric clusters. Gateways are services that receive these updates and apply them to the replicas. These gateways also propagate updates from JSON tables to their secondary indexes.

#### Related tasks

[Specifying the Location of Gateways](#) on page 1077

Describes how to set the location of the HPE Ezmeral Data Fabric gateways using either the Control System or the CLI.

#### Related reference

[cluster gateway delete](#) on page 2044

Deletes the list of Data Fabric gateways from a source Data Fabric cluster.

[cluster gateway get](#) on page 2046

Lists the Data Fabric gateways that a source Data Fabric cluster is using.

[cluster gateway list](#) on page 2048

Lists all the gateways that a source Data Fabric cluster is using.

[cluster gateway local](#) on page 2049

Lists the gateways configured on the Data Fabric cluster on which this command is run.

[cluster gateway set](#) on page 2054

Specifies the locations of the Data Fabric gateways that a source Data Fabric cluster can use for table replication to a destination Data Fabric cluster or for indexing table data in an Elasticsearch cluster.

#### More information

[Managing Gateways](#) on page 1523

Describes the commands for listing gateways, checking status of gateways, managing gateways if they fail, and troubleshooting gateways.

#### cluster gateway set

Specifies the locations of the Data Fabric gateways that a source Data Fabric cluster can use for table replication to a destination Data Fabric cluster or for indexing table data in an Elasticsearch cluster.

In addition to this method, there are two other methods for specifying the locations of gateways that a source Data Fabric cluster can use when replicating to a particular Data Fabric cluster or when indexing in an Elasticsearch cluster. See [Configuring Gateways for Table and Stream Replication](#) for details about them.

## Syntax

### CLI

```
maprcli cluster gateway set
  [ -cluster <cluster on which
  command to be run> ]
  -dstcluster <cluster name>
  -gateways <space-separated list of
  hostnames>
```

### REST

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/cluster/gateway/set?&lt;parameters&gt;</code>

## Parameters

Parameter	Description
cluster	( <i>Optional</i> ) The cluster on which to run this command. By default, this is the cluster on which you run this command.
dstcluster	( <i>Required</i> ) The name of the Data Fabric cluster in which the gateways are located.  If you are replicating table data to another Data Fabric cluster, specify the name of the destination cluster. This destination cluster could be the source cluster if you are performing intra-cluster replication.  If you are indexing table data in an Elasticsearch cluster, specify the name of the source Data Fabric cluster because that is where the gateways are located.
gateways	( <i>Required</i> ) A space-delimited list of gateway hostnames or IP addresses. Place double quotation marks around the list of gateways, as in this example: <code>-gateways "gateway1 gateway2"</code>

## Example

This example specifies the hostnames of two gateways that are in the Data Fabric cluster `newyork`. Use this command in the following scenarios:

- The cluster `newyork` is the destination cluster for table replication from the source Data Fabric cluster.
- The cluster `newyork` is both a source and destination cluster for intra-cluster table replication.
- The cluster `newyork` is a source Data Fabric cluster that contains tables being indexed in one or more Elasticsearch clusters.

## CLI

```
maprcli cluster
gateway set -dstcluster
newyork -gateways "gw1.bigcompany.com
gw2.bigcompany.com"
```

## REST

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/cluster/gateway/
set?
dstcluster=newyork&gateways=gw1.bigcom
pany.com%20gw2.bigcompany.com
```

### cluster get billing usage

Displays billing information for specific data in BRIM (Billing and Revenue Innovation Management) format, and generates the file that you must upload to the Data Fabric billing portal for an air-gapped cluster.

In a connected environment, you can view the billing information that is sent automatically to HPE. Use the following `maprcli` command:

### Syntax

#### CLI

```
maprcli cluster getbillingusage
  [ -from start_time (UTC timestamp
  in millisecond or time in
  yyyy-MM-dd,HH:mm format) ]
  [ -till end_time (UTC timestamp
  in millisecond or time in
  yyyy-MM-dd,HH:mm format) ]
  [ -duration duration (in minutes.
  Minimum value is 60 minutes) ]
  [ -cluster cluster name ]
  -fileName fileName (file path)
  [ -clearText <true|false> true
  generates the file in clear text ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/cluster/getbillingusage?<parameters>

**Parameters**

Parameter	Description
from	Start time in yyyy-mm-dd, hh:mm format.
till	End time in yyyy-mm-dd, hh:mm format.
duration	Duration in minutes (minimum value is 60 minutes) .
cluster	Cluster name
fileName	File name (File path)
clearText	True or False. True generate the file in clear text format.

**Example**

```
maprcli cluster getbillingusage -fileName billing.txt -clearText true -json
{
  "timestamp":1688108615644,
  "timeofday":"2023-06-30 12:03:35.644 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Usage Metric data written to the file billing.txt"
  ]
}
```

**Related reference**

[cluster get metering usage](#) on page 2057

Lists the details of cluster usage for the given time period.

**cluster get metering usage**

Lists the details of cluster usage for the given time period.

In both connected and air-gapped environment, you can view the cluster metering data for the given user, or for a specific duration.

**Syntax****CLI**

```
maprcli cluster getmeteringusage
```

**REST**

Request Type	GET
--------------	-----

Request URL	http[s]://<host>:<port>/rest/cluster/getmeteringusage?<parameters>
-------------	--------------------------------------------------------------------

### Parameters

Parameter	Description
from	Start time in yyyy-mm-dd, hh:mm format.
till	End time in yyyy-mm-dd, hh:mm format.
duration	Duration in minutes (minimum value is 60 minutes) .
cluster	Cluster name

### Example

To list the information for a given time period, use the following command:

```
maprcli cluster getmeteringusage -from <time> -till <time>
```

For example:

```
maprcli cluster getmeteringusage -from 2023-06-20,00:00 -till 2023-06-21,23:00
userdata epoch          timestamp
1 Mb      1687244400000    Tue Jun 20 07:00:00 UTC 2023

1 Mb      1687269600000    Tue Jun 20 14:00:00 UTC 2023
1 Mb      1687273200000    Tue Jun 20 15:00:00 UTC 2023
2 Mb      1687276800000    Tue Jun 20 16:00:00 UTC 2023
2 Mb      1687280400000    Tue Jun 20 17:00:00 UTC 2023
3 Mb      1687284000000    Tue Jun 20 18:00:00 UTC 2023
3 Mb      1687287600000    Tue Jun 20 19:00:00 UTC 2023
3 Mb      1687291200000    Tue Jun 20 20:00:00 UTC 2023
3 Mb      1687294800000    Tue Jun 20 21:00:00 UTC 2023
3 Mb      1687298400000    Tue Jun 20 22:00:00 UTC 2023
4 Mb      1687302000000    Tue Jun 20 23:00:00 UTC 2023
4 Mb      1687305600000    Wed Jun 21 00:00:00 UTC 2023
4 Mb      1687309200000    Wed Jun 21 01:00:00 UTC 2023
4 Mb      1687312800000    Wed Jun 21 02:00:00 UTC 2023
4 Mb      1687316400000    Wed Jun 21 03:00:00 UTC 2023
```

To get the information for a duration, use the following command:

```
maprcli cluster getmeteringusage -duration <in minutes>
```

To get the information for a cluster, use the following command:

```
maprcli cluster getmeteringusage <cluster name>
```

**Related reference**

[cluster get billing usage](#) on page 2056

Displays billing information for specific data in BRIM (Billing and Revenue Innovation Management) format, and generates the file that you must upload to the Data Fabric billing portal for an air-gapped cluster.

**cluster getssoconf**

Fetches the cluster-level SSO parameters.

Note these considerations for using `cluster getssoconf`:

- You can run the `cluster getssoconf` command from any node.
- You must be the fabric manager or infrastructure admin user to run this command.

**Syntax****CLI**

```
cluster getssoconf
Usage : fetches the cluster level SSO
params
```

**Parameters**

Parameter	Description
<code>-json</code>	Renders the command output in JSON format.

**Example****CLI**

The following example shows the CLI output without using the `-json` option:

```
maprcli cluster getssoconf
clientid
clientsecret
providername issuerendpoint
myclient
PrXMbxOzsn3pXTKSZSlzhs8Syil0Wq4u
keycloak https://
<IP_address>:8443/realms/myrealm
```

The following example shows the CLI output with the `-json` option:

```
maprcli cluster getssoconf -json
{
  "timestamp":1695603854136,
  "timeofday":"2023-09-24
06:04:14.136 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "issuerendpoint":"https://
<IP_address>:8443/realms/myrealm",
      "providername":"keycloak",
      "clientid":"myclient",
```

```

"clientsecret": "PrXMbxOzsn3pXTKSZS1zhs
8Syi10Wq4u"
}
]
}

```

**REST**

N/A

**Related reference**[cluster setsoconf](#) on page 2067

Specifies how to configure the HPE Ezmeral Data Fabric to work with an SSO server.

**cluster info**

Returns the minimum and maximum values for key cluster attributes.

Following are the attributes for which the command returns minimum and maximum values:

- `VolumeSize` — The size of the volume.
- `VolumeQuotaSize` — The hard quota (disk space) for the volume.
- `VolumeAdvisoryQuota` — The advisory quota (disk space) for the volume.
- `VolumeLogicalUsedSize` — The logical size used by the volume.
- `VolumeNumContainers` — The number of replicas for the volume.
- `VolumeGuranteedNumContainers` — The number of guaranteed replicas for the volume.
- `VolumeNumNamespaceContainers` — The number of replicas for the name container associated with the volume.
- `VolumeGuranteedNumNamespaceContainers` — The number of guaranteed replicas for the name container associated with the volume.
- `VolumeNumSnapshots` — The number of snapshots of the volume.
- `VolumeCoalesceInterval` — The coalesce interval setting for the volume.
- `VolumeMaxInodesAlarmThreshold` — The threshold for triggering the `VOLUME_ALARM_INODES_EXCEEDED` alarm.
- `VolumeMaxNsSizeMbAlarmThreshold` — The threshold for triggering the `VOLUME_ALARM_INODES_EXCEEDED` alarm.
- `VolumeReReplicationTimeOut` — The timeout value for re-replication.
- `StoragePoolCapacitySize` — The total amount of disk space on the storage pool.
- `StoragePoolUsedSize` — The amount of used space on the storage pool.
- `StoragePoolAvailableSize` — The amount of available space on the storage pool.

## Syntax

### CLI

```
maprcli cluster info -getminmax
<attributes>
```

### REST API

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/cluster/info?<parameters>

## Parameters

Parameter	Description
getminmax	<i>(Required)</i> The comma-separated list of attributes for which to return the minimum and maximum values. Use the keyword <b>all</b> to retrieve the minimum and maximum values for all attributes.

## Examples

Retrieve the minimum and maximum values for all the attributes:

### CLI

```
# maprcli cluster info -getminmax all
unit min max name
MB 1668446 2505237
StoragePoolAvailableSize
MB 0 204800
VolumeAdvisoryQuota
Num 1 2
VolumeGuranteedNumContainers
Num 0 0
VolumeMaxInodesAlarmThreshold
MB 1669494 2506849
StoragePoolCapacitySize
MB 1048 1612
StoragePoolUsedSize
MB 0 972
VolumeLogicalUsedSize
Num 1 2
VolumeGuranteedNumNamespaceContainers
Num 1 3
VolumeNumContainers
MB 0 0
VolumeMaxNsSizeMbAlarmThreshold
MB 0 818 VolumeSize
Num 0 0
VolumeNumSnapshots
MB 0 0
VolumeQuotaSize
Sec 0 300
VolumeReReplicationTimeOut
Num 1 3
VolumeNumNamespaceContainers
Min 60 60
```

## REST

## VolumeCoalesceInterval

**NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

**NOTE:** When using a self-signed certificate pass the `-k` option to `curl` to avoid the certificate check.

  ]
}

```

**cluster mapreduce get**

Displays the cluster-wide default for the MapReduce mode.

 **WARNING:** This command is deprecated alongside MapReduce v1.

**Syntax**

**CLI**

```
maprcli cluster mapreduce get
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/cluster/mapreduce/get

## Output Fields

Field	Description
default_mode	Displays either <code>yarn</code> or <code>classic</code> .
mapreduce_version	Displays the Hadoop version associated with the <code>default_mode</code> .

## Sample Output

```
default_mode  mapreduce_version
classic      0.20.2
```

## Examples

### CLI

```
maprcli cluster mapreduce get
```

### REST

**NOTE:** When using a self-signed certificate pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X GET https://
abc.sj.us:8443/rest/cluster/
mapreduce/get
{"timestamp":1715235235867,"timeofday"
:"2024-05-08 11:13:55.867 GMT-0700
PM","status":"OK","total":1,"data":
[{"default_mode":"yarn","mapreduce_ver
sion":"3.3.5"}]}
```

## cluster mapreduce set

Sets the cluster-wide MapReduce mode.

**WARNING:** This command is deprecated alongside MapReduce v1.

## Syntax

### CLI

```
maprcli cluster mapreduce set -mode
yarn
```

### REST

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/cluster/mapreduce/set?&lt;parameters&gt;</code>

## Parameters

Parameter	Description
mode	The MapReduce mode of the cluster. Enter <code>yarn</code> to use the Resource Manager and Node Manager to run MapReduce jobs or applications.

## Examples

### Sets the MapReduce mode for the cluster to yarn.

#### CLI

```
maprcli cluster mapreduce set -mode
yarn
```

#### REST

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/cluster/mapreduce/
set?mode=yarn
{"timestamp":1715235732875,"timeofday"
:"2024-05-08 11:22:12.875 GMT-0700
PM","status":"OK","total":1,"data":
[{"default_mode":"yarn","mapreduce_ver
sion":"3.3.5"}]}
```

### cluster queryservice

Describes the commands to enable/disable and view the settings for the OJAI Distributed Query Service.

Enable the [OJAI Distributed Query Service](#) on page 632 if you want the following functionality when querying HPE Ezmeral Data Fabric Database JSON tables:

- Advanced secondary index selection
- Sorts of large data sets
- Parallel query execution

#### Permissions Required

If you enable the OJAI Distributed Query Service during installation, then you must be user `mapr` to run these commands. If you disable the service, and later re-enable it, then the user that re-enabled the service must run the command.

#### *cluster queryservice getconfig*

Retrieves the configuration of the OJAI Distributed Query Service.

#### Permissions Required

Only the user who enabled the OJAI Distributed Query Service can run this command. If the service was enabled during installation, the user `mapr` must run the command.

#### Syntax

##### CLI

```
maprcli cluster queryservice
getconfig -cluster < cluster-name >
```

##### REST

Request Type	GET
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/queryservice/getconfig</code>

### Parameters

Parameter	Description
cluster	(Optional) Name of the cluster that is using secondary indexes to query the HPE Ezmeral Data Fabric Database JSON table. By default, this is the cluster on which you run this command.

### Examples

#### CLI

```
maprcli cluster queryservice
getconfig -cluster my.cluster.com
```

#### REST

**NOTE:** When using a self-signed certificate pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X GET https://
abc.sj.us:8443/rest/cluster/
queryservice/getconfig?
cluster=my.cluster.com
{"timestamp":1715236085166,"timeofday"
:"2024-05-08 11:28:05.166 GMT-0700
PM","status":"OK","total":1,"data":
[{"enabled":false,"zookeeper":"m2-hux6
k-32-n1.mip.storage.hpecorp.net:5181,m
2-hux6k-32-n2.mip.storage.hpecorp.net:
5181,m2-hux6k-32-n3.mip.storage.hpecor
p.net:5181"}]}
```

#### *cluster queryservice setconfig*

Enables or disables the OJAI Distributed Query Service. When enabling the service, you can specify the configuration of the service.

### Permissions Required

Only the user that enabled the OJAI Distributed Query Service can run this command. If the service was enabled during installation, the user `mapr` must run the command.

### Syntax

#### CLI

```
maprcli cluster queryservice
setconfig
[ -cluster < cluster-name > ]
-enabled < true | false >
-clusterid < cluster-id of Data
Fabric Drill cluster >
-storageplugin < Name of Data
Fabric Drill Storage plug-in >
-znode < Root Zookeeper node
user by Data Fabric Drill cluster
>
```

#### REST

Request Type	POST
--------------	------

Request URL	http[s]://<host>:<port>/rest/queryservice/setconfig?<parameters>
-------------	------------------------------------------------------------------

## Parameters

Parameter	Description
cluster	( <i>Optional</i> ) Name of the cluster that is using secondary indexes to query HPE Ezmeral Data Fabric Database JSON tables
enabled	( <i>Required</i> ) Whether the OJAI Distributed Query Service is enabled. Values: true or false
clusterid	( <i>Required</i> ) Cluster ID of your Data Fabric Drill cluster. Refer to the value of the cluster-id parameter in the drill-distrib.conf file. You can find this file in the /opt/mapr/drill/drill-<version number>/conf directory.
storageplugin	( <i>Required</i> ) Name of the Data Fabric Drill Storage plug-in instance used to run OJAI queries (usually <b>dfs</b> )
znode	( <i>Required</i> ) Name of the root Zookeeper node used by the Data Fabric Drill cluster (usually <b>/drill</b> )

## Examples

### CLI

```
maprcli cluster queryservice
setconfig \
  -enabled true \
  -clusterid mycluster \
  -storageplugin dfs \
  -znode /drill
```

### REST

**NOTE:** When using a self-signed certificate pass the `-k` option to `curl` to avoid the certificate check.

```
curl -u <username> -X POST https://
server.sj.us:8443/rest/cluster/
queryservice/setconfig?
enabled=true&clusterid=mycluster&stora
geplugin=dfs&znode=/drill
```

### cluster setssoconf

Specifies how to configure the HPE Ezmeral Data Fabric to work with an SSO server.

Note the following considerations for using `cluster setssoconf`:

- For the Data Fabric software-as-a-service platform, run `cluster setssoconf` on the primary CLDB node of the primary fabric of the global namespace. For more information, see [Identifying All CLDB Nodes](#).
- For the Data Fabric customer-managed platform, run `cluster setssoconf` on the primary CLDB node of the cluster. For more information, see [Listing CLDB Nodes](#) on page 1539.

- To run the command, you must be the cluster admin (typically the `mapr` user) or a user with the fabric manager role.

## Syntax

### CLI

```
cluster setssoconf
    -issuerendpoint issuers
endpoint
    -providername sso provider
name keycloak
    [ -clientid client's id ]
    [ -clientsecret client's
secret ]
    [ -certfile sso certificate ]
```

### REST

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/cluster/setssoconf</code>

## Parameters

Parameter	Required or Optional	Description
<code>-issuerendpoint</code>	Required	The IP address of the SSO provider server.
<code>-providername</code>	Required	The name of your SSO provider. Currently, only <code>keycloak</code> is supported.
<code>-clientid</code>	Optional	An identifier that enables communication between Data Fabric and the SSO provider. For example: <code>0oa8m2onb7CAohGdW5d8</code>
<code>-clientsecret</code>	Optional	The key that is used to encrypt communication between Data Fabric and the SSO provider. For example: <code>_Bfj1zbnqNbnDprf0vnQDSyXcuzziMzyrbm0raB</code>
<code>-certfile</code>	Optional	The self-signed certificate ( <code>.crt</code> ) file from the SSO provider (Keycloak).
<code>-json</code>	Optional	Renders the command output in JSON format.

## Example

This example configures the endpoint, client information, and certificate file for a cluster to communicate with a Keycloak SSO server:

### CLI

```
# maprcli cluster
setssoconf -issuerendpoint https://
<IP_address>:8443/realms/TestReallm/
-providername keycloak -clientid
testclient -clientsecret <secret>
-certfile /tmp/
SAN_SignedCert.crt -json
{
  "timestamp":1693834990616,
  "timeofday":"2023-09-04
06:43:10.616 GMT-0700 AM",
```

```

"status": "OK",
"total": 1,
"data": [
  {
    "status": "SUCCESS:
SSO configuration set on CLDB."
  }
]
}

```

## REST

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```

curl -k -u <username> -v -X POST
https://abc.sj.us:8443/rest/cluster/
setsoconf?issuerendpoint="https://
<IP_address>:8443/realms/
TestReallm/"&providername=keycloak

```

[cluster getsoconf](#) on page 2059

Fetches the cluster-level SSO parameters.

## clustergroup

Adds, deletes and updates clusters from cluster groups/global namespace.

A global namespace stitches multiple data sources into a single accessible entity and provides multiple data access points, where each access point shows the same hierarchical namespace. The entire group of data sources could be accessed and operated by using any one of the access points, without any need to know the source's physical data location.

The global namespace is implemented using `clustergroup` command.

The following example shows the `clustergroup` command-line help:

```

/opt/mapr/bin/maprcli clustergroup

clustergroup
  setprimary
    -clustername name of the primary cluster of the group
    -cldbips "hostname1:port1 hostname2:port2..." of the
primary cluster
  -crossclusterticket cross cluster ticket of the primary
cluster

  updateprimary
    -clustername name of the existing cluster to be made as the
new primary

  remove
    -clustername name of the cluster/external server to be
removed from the group

  getcgtable
    [ -showprimary display cluster info for cluster group
primary only. default: false ]

```

```

    [ -clustername name of cluster ]
    [ -getlicenseinfo get license info. default: false ]

    addexternal
        -type Type of the external server being added, nfs/s3
        -externalservername External server name that would appear
in g lobal namespace
        [ -ips In case of NFS and Generic S3, comma seperated list
of ex ternal server ips ]
        [ -accesskey Access key in case of S3 server ]
        [ -secretkey Secret key in case of S3 server ]
Generic ]
        [ -s3vendor External S3 server vendor, either AWS OR
        [ -awsregion AWS region in case the S3 vendor type is AWS ]

    [ -force if provided skip checking external server ips Parameter
takes no value ]

    setupgrade
        -status set upgrade status for given cluster
        -clustername name of cluster

    showclustercert
        -clustername name of cluster

    getnfsexports
        -externalservername name of the external server for exports inf
o
        [ -start start. default: 0 ]
        [ -limit limit. default: 2147483647 ]

    generateclusterconf

```

**clustergroup get cgtable**

Retrieves the cluster group table information.

If you have imported an external NFS server or an external S3 server, the details of the external NFS server or the external S3 server are displayed when you run the command, alongside the details of clusters in the cluster group.

See [clustergroup addexternal](#) on page 2076 for details to add or import an external NFS server or an external S3 server into a cluster group.

**Syntax****CLI**

```

maprcli clustergroup getcgtable
    [ -showprimary display cluster
info for cluster group primary only.
default: false ]
    [ -clustername name of cluster ]
    [ -getlicenseinfo get license
info. default: false ]

```

**REST**

Request Type	GET
--------------	-----

Request URL	http[s]://<host>:<port>/rest/clustergroup/getcgtable?<parameters>
-------------	-------------------------------------------------------------------

## Parameters

Parameter	Description
showprimary	(Optional) Displays cluster information only for the primary cluster group. Default: false.
clustername	(Optional) Name of the cluster for which to fetch the cluster information. By default, the information is fetched only for the cluster to which the node on which the command is run belongs. You can specify the name of the external NFS server or the external S3 server that has been imported into the clustergroup, if you wish to view details of the external NFS server or the external S3 server.
getlicenseinfo	(Optional) Display the license information for the clusters in the cluster group. Default: false.

## Example

Returns the cluster group information:

```
# maprcli clustergroup getcgtable -json
{
  "timestamp":1698211002789,
  "timeofday":"2023-10-24 10:16:42.789 GMT-0700 PM",
  "status":"OK",
  "total":3,
  "data":[
    {
      "clustername":"secure-cluster1",
      "cldbips":"<ip address list>",
      "apiips":"<ip address list>",
      "clusterid":"4217876076225350765",
      "crossclusterticket":"<cross cluster ticket value>",
      "clustergroupprimary":true,
      "clusterupgradestate":"UPDATE_STATUS_UNKNOWN",
      "clusterlocation":"OnPrem",
      "clusterowner":"",
      "installtype":"MANUAL_INSTALL",
      "mossips":"<ip address list>",
      "gatewayips":"<ip address list>"
    },
    {
      "clustername":"secure-cluster3",
      "cldbips":"<ip address list>",
      "apiips":"<ip address list>",
      "clusterid":"1603384556630536671",
      "crossclusterticket":"<cross cluster ticket value>",
      "clusterupgradestate":"UPDATE_STATUS_UNKNOWN",
      "clusterlocation":"OnPrem",
      "clusterowner":"",
      "installtype":"MANUAL_INSTALL",
      "mossips":"<ip address list>"
    }
  ]
}
```

```

        "gatewayips": "<ip address list>"
    },
    {
        "externalservertype": "ExtNfs",
        "externalnfsserverpath": "extttestnfs",
        "externalnfsserverips": "10.161.163.160"
    }
]
}

```

Returns cluster group information for cluster group with external S3 servers.

```

# maprcli clustergroup getcgtable -json
{
  "timestamp":1698338893317,
  "timeofday":"2023-10-26 04:48:13.317 GMT+0000 PM",
  "status":"OK",
  "total":4,
  "data":[

      "clusterupgradestate":"UPDATE_STATUS_UNKNOWN",
      "clusterlocation":"GCP",
      "clusterowner":"admin",
      "installtype":"AUTO_INSTALL",
      "mossips":"<ip address list>",
      "gatewayips":"<ip address list>"
    },{
      "clustername":"al-s3gns-2610",
      "cldbips":"<ip address list>",
      "apiips":"<ip address list>",
      "clusterid":"8535743913630761757",
      "crossclusterticket":"<cross-cluster-ticket>",
      "clustergroupprimary":true,
      "clusterupgradestate":"UPDATE_STATUS_UNKNOWN",
      "clusterlocation":"AWS",
      "clusterowner":"mapr",
      "installtype":"AUTO_INSTALL",
      "mossips":"<ip address list>",
      "gatewayips":"<ip address list>"
    },
    {
      "externalservertype":"ExtS3",
      "externalservername":"exts3",
      "awsregion":"us-west-1",
      "s3vendor":"AWS"
    },
    {
      "externalservertype":"ExtS3",
      "externalservername":"myaws",
      "awsregion":"us-west-1",
      "s3vendor":"AWS"
    }
  ]
}

```

```
]
}
```

Shows the primary:

```
# maprcli clustergroup getcgtable -showprimary true -json
{
  "timestamp":1698213303438,
  "timeofday":"2023-10-24 10:55:03.438 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "clustername":"secure-cluster1",
      "cldbips":"<ip address list>",
      "apiips":"<ip address list>",
      "clusterid":"4217876076225350765",
      "crossclusterticket":"<cross cluster ticket value>",
      "clustergroupprimary":true,
      "clusterupgradestate":"UPDATE_STATUS_UNKNOWN",
      "clusterlocation":"OnPrem",
      "clusterowner":"","",
      "installtype":"MANUAL_INSTALL",
      "mossips":"<ip address list>",
      "gatewayips":"<ip address list>"
    }
  ]
}
```

Shows the cluster name:

```
# maprcli clustergroup getcgtable -clustername c3 -json
{
  "timestamp":1682487987480,
  "timeofday":"2023-04-25 10:46:27.480 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "clustername":"c3",
      "cldbips":"<cldb IP address list>",
      "apiips":"<api ip address list>",
      "clusterid":"5671109873516702505",
      "crossclusterticket":"<cross cluster ticket value>"
    }
  ]
}
```

## REST

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```

**clustergroup setprimary**

Sets the primary cluster for the group.

Each cluster must know the location and the cross cluster ticket of the primary of the group, so that it can update its own cluster group table by periodically fetching the table from the primary.

The `setprimary` command sets the given cluster as the primary for the current cluster on which the command is run, and adds the current cluster to the cluster group.

## Syntax

### CLI

```
maprcli clustergroup setprimary
    -clustername name of the primary
    cluster of the group
    -cldbips "hostname1:port1
hostname2:port2..." of the primary
    cluster
    [ -crossclusterticket cross
    cluster ticket of the primary
    cluster ]
    [ -cctktfilepath cross cluster
    ticket file path of the primary
    cluster ]
```

### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/clustergroup/setprimary?<parameters>

## Parameters

Parameter	Description
clustername	<i>(Required)</i> Name of the cluster to set as the primary cluster.
cldbips	<i>(Required)</i> IP addresses/host names of the CLDB nodes separated with spaces.
crossclusterticket	<i>(Conditionally Required)</i> Cross-cluster ticket of the cluster. Must pass either this parameter or the <code>cctktfilepath</code> parameter.
cctktfilepath	<i>(Conditionally Required)</i> The file path of the cross cluster ticket of the primary cluster. Must pass either this parameter or the <code>crossclusterticket</code> parameter.

## Example

### CLI

Sets the primary cluster for the group to `cluster1`.

```
maprcli clustergroup
setprimary -clustername
cluster1 -cldbips
"m2-r2600-49-n4.mip.storage.hpescorp.net:7222" -crossclusterticket "XXXX"
```

### REST

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/clustergroup/
setprimary?
clustername=cluster1&cldbips="m2-r260
```

```
0-49-n4.mip.storage.hpecorp.net:7222"&
crossclusterticket="XXXX"
```

**clustergroup updateprimary**

Updates the primary cluster for the group.

Makes an existing cluster the primary for the cluster group. The difference between `setprimary` and `updateprimary` is that the `setprimary` command adds a new entry in the cluster group, while the `updateprimary` command elevates an existing entry as the primary.

**Syntax****CLI**

```
maprcli clustergroup updateprimary
-clustername <name>
```

**REST**

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/clustergroup/updateprimary?&lt;parameters&gt;</code>

**Parameters**

Parameter	Description
<code>clustername</code>	<i>(Required)</i> Name of the cluster to elevate as the primary cluster.

**Example****CLI**

Updates the primary cluster for the cluster group to `cluster2`.

```
maprcli clustergroup
updateprimary -clustername cluster2
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/clustergroup/
updateprimary?clustername=cluster2
```

**clustergroup addexternal**

Imports an external NFS server or an external s3 server into a cluster group/global namespace.

The `addexternal` command adds an external NFS server or an external s3 server to the cluster group, thereby making it part of the NFS/S3 global namespace.

**NOTE:** An external NFS server is a network file server hosted on a remote network, typically in a different physical location.

Along with Data Fabric cluster entries, NFSv4 clients see a unified directory space across servers hosted from different locations. Data Fabric data can be copied to or transferred to an external NFS server, so that it is shareable across the clusters in the cluster group.

A NFSv4 client is referred directly to the external NFS server. Data Fabric comes into the picture only when the referral point (like a soft link) is accessed, and after that the client directly communicates with the NFS server. The authentication mechanism will be the same that is used for mounting the global namespace (`sec=none` OR `sec=system` OR `sec=krb5`).

**!** **IMPORTANT:** If your external NFS server uses authentication mechanism (`sec=system`), Data Fabric and the external NFS should ideally be using same AD/LDAP. If the external NFS server is using Kerberos authentication (`sec=kerberos`), Data Fabric and the external NFS must be using the same AD/LDAP + KDC server, otherwise external NFS server access will be denied with EPERM.

To view external NFS server details by using the `maprcli`, see [clustergroup get cgtable](#) on page 2070. To remove the external NFS server from the cluster group by using `maprcli`, see [clustergroup remove cluster](#) on page 2082.

## Syntax

### CLI

```
maprcli clustergroup addexternal

        -type Type of the external
server being added, nfs/s3
        -externalservername External
server name that would appear in
global namespace
        [ -ips In case of NFS and
Generic S3, comma seperated list of
external server ips ]
        [ -accesskey Access key in
case of S3 server ]
        [ -secretkey Secret key in
case of S3 server ]
        [ -s3vendor External S3
server vendor, either AWS OR Generic ]
        [ -awsregion AWS region in
case the S3 vendor type is AWS ]
        [ -force if provided
skip checking external server ips
Parameter takes no value ]
        [ -s3usetlsencryption Use
TLSEncryption for external s3.
default: true ]
        [ -s3serverport Port on
which s3server is listening, default
9000 ]
        [ -s3servercertfile External
S3 server certificate ]
        [ -s3servercertfilepath
External S3 server certificate file
path ]
        [ -s3servertransferproto S3
server transfer proto, either https
or http, default https.
```

### REST

Request Type	POST
--------------	------

Request URL

```
http[s]://<host>:<port>/
rest/clustergroup/
addexternal?<parameters>
```

### Parameters

Parameter	Description
type	<i>(Required)</i> Use <code>nfs</code> to add an external NFS server. Use <code>s3</code> to add external S3 server.
externalservername	<i>(Required)</i> Name of the external NFS server/S3 server to display on the global namespace.
ips	<i>(Conditionally Required)</i> Required for NFS and Generic S3 servers. List of one or more IP addresses. An NFS server with multiple network interface controllers (NIC) is identifiable by more than one IP address or host name. Use comma as the separator, when you are specifying multiple IP addresses for the parameter.
accesskey	<i>(Conditionally Required)</i> Required for S3 servers. The access key for the external AWS/generic S3 server.  <b>NOTE:</b> Enclose the <code>accesskey</code> parameter in quotes.
secretkey	<i>(Conditionally Required)</i> Required for AWS S3 servers. The secret key for the external AWS S3 server.  <b>NOTE:</b> Enclose the <code>secretkey</code> parameter in quotes.
awswebidrolearn	AWS web-identity role ARN for STS-based access. For more information about STS, see <a href="#">Integrating the AWS Security Token Service (STS) with Data Fabric</a> in the as-a-service documentation.
s3vendor	<i>(Conditionally Required)</i> Required for S3 servers. Type of S3 vendor. Use the value <code>AWS</code> while adding the AWS S3 server. For other S3 vendors, use the value <code>generic</code> .
awsregion	<i>(Conditionally Required)</i> Required for AWS S3 servers. AWS region for the buckets that contain your data.
gcpregion	GCP region for the buckets that contain your data. This field is applicable to GCP S3 server only.
force	<i>(Optional)</i> Pass the <code>force</code> parameter to skip checking the external server IPs. The parameter does not require a value to be specified.
s3usetlsencryption	<i>(Optional)</i> The field is applicable to generic S3 server import. This is a flag indicating if TLS encryption is to be used for the external S3 server. The default value for the flag is <code>true</code> . The HTTPS protocol relies on TLS encryption for secure communication.
s3serverport	<i>(Optional)</i> The port number for the generic S3 server at which the communication with Data Fabric must happen. The default value is <code>9000</code> .
s3servercertfile	<i>(Conditionally Required)</i> Required for S3 servers. The S3 server security certificate content. This is applicable if the communication is to happen over the HTTPS protocol.
s3servercertfilepath	<i>(Conditionally Required)</i> Required for S3 servers. The file path of the S3 server security certificate. This is applicable if the communication is to happen over the HTTPS protocol.

Parameter	Description
s3servertransferproto	(Optional) The protocol to use to transfer external S3 server data over the Internet. https and http are the allowed valid values. The default value is https.

## Example

### CLI

Add or import an external NFS server with the name `extnfs` and associated IP address `10.163.161.123`.

```
maprcli clustergroup
addexternal -type
nfs -externalservername extnfs -ips
10.163.161.123
```

### REST

```
curl -u <username> -X POST https://
abc.sj.us:8443/rest/clustergroup/
addexternal?
type=nfs&externalservername=extnfs&ips
=10.163.161.123
```

### CLI

Add or import an external AWS S3 server with the name `awsus1` and AWS region `us-west-1`.

```
maprcli clustergroup
addexternal -type
s3 -externalservername
awsus1 -accesskey
"<access-key>" -secretkey
"<secret-key>" -s3vendor
AWS -awsregion us-west-1
```

### REST

```
curl -u <username> -X POST https://
abc.sj.us:8443/rest/clustergroup/
addexternal?
type=s3&externalservername=awsus1&acce
sskey="<access-key>"&secretkey="<secre
t-key>"&s3vendor=AWS&awsregion=us-wes
t-1
```

### CLI

Add or import external Scality server having name `extscalitieserver`.

```
maprcli clustergroup
addexternal -type
s3 -externalservername
extscalitieserver -ips <scality
server ip> -accesskey
<access-key> -secretkey
<secret-key> -s3vendor
Generic -s3serverport
443 -s3servercertfilepath <file path
for server certificate>
```

**REST**

```
curl -u <username> -X POST https://
abc.sj.us:8443/rest/clustergroup/
addexternal?
type=s3&externalservername=extscalitys
erver&ips=<scality server
ip>&accesskey="<access-key>"&secretkey
="<secret-key>"&s3vendor=Generic&s3ser
verport=443&s3servercertfilepath=<file
path for server certificate>
```

**CLI**

Add or import an external Vast server with the name `extvastserver`.

```
maprcli clustergroup
addexternal -type
s3 -externalservername
extvastserver -ips <vast
server ip> -accesskey
<access-key> -secretkey
<secret-key> -s3vendor
Generic -s3serverport
<portnumber> -s3servercertfile
<server certificate content>
```

**REST**

```
curl -u <username> -X POST https://
abc.sj.us:8443/rest/clustergroup/
addexternal?
type=s3&externalservername=extvastserv
er&ips=<vast server
ip>&accesskey="<access-key>"&secretkey
="<secret-key>"&s3vendor=Generic&s3ser
verport=<portnumber>&s3servercertfile=
<server certificate content>
```

**clustergroup getnfsexports**

Displays the list of exports from the `/etc/exports` file of an external NFS server that has been imported into a cluster group or global namespace.

The entries for the external NFS exports accessible to a Data Fabric user are available in the `/etc/exports` file on the external NFS server. The Data Fabric user can read from and write to such NFS exports.

The `getnfsexports` command lists the exports from the `/etc/exports` file of an external NFS server imported into the global namespace/cluster group.

The command lists a summary of each export along with the total size of the export, used space, and free space available on the export.

**NOTE:** The command supports NFSv4 servers only.

See [clustergroup addexternal](#) on page 2076 to add or import an external NFS server into the global namespace/cluster group via `maprcli`.

See [clustergroup get cgtable](#) on page 2070 to view external NFS server details via `maprcli`.

See [clustergroup remove cluster](#) on page 2082 to remove the external NFS server from the cluster group via `maprcli`.

## Syntax

### CLI

```
maprcli clustergroup getnfsexports
  -externalservername name of
the external server for exports info
  [ -start start. default: 0 ]
  [ -limit limit. default:
2147483647 ]
```

### REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/clustergroup/getnfsexports?<parameters>

## Parameters

Parameter	Description
externalservername	<i>(Required)</i> Name of the external NFS server
start	<i>(Optional)</i> The entry to start from when listing. Default: 0 (first entry)
limit	<i>(Optional)</i> The number of records to list. Default: 2147483647

## Example

### CLI

Lists the export entries in the `/etc/exports` file for an external NFS server with the name `extnfs` along with the total, used, and free space on each export. Starts at the second entry and lists two entries.

```
maprcli clustergroup
getnfsexports -externalservername
extnfs -start 1 -limit 2 -json
{
  "timestamp":1698640394720,
  "timeofday":"2023-10-29
09:33:14.720 GMT-0700 PM",
  "status":"OK",
  "total":2,
  "data":[
    {
      "exportpath":"/test2",
      "size":"215G",
      "used":"15G",
      "avail":"200G"
    },
    {
      "exportpath":"/test1",
      "size":"215G",
      "used":"15G",
      "avail":"200G"
    }
  ]
}
```

```
}
}
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X GET https://
abc.sj.us:8443/rest/clustergroup/
getnfsexports?
externalservername=extnfs&start=1&limi
t=2
```

**clustergroup remove cluster**

Removes a cluster from a cluster group.

**Syntax**

Only the cluster that acts as the primary can remove other clusters.

Use this command to remove any external NFS servers or external S3 servers that are imported into the global namespace. To remove an external NFS server from a clustergroup, you must use the name of the external NFS server.

**CLI**

```
maprcli clustergroup remove
  -clustername <name of the cluster
or external NFS or S3 server to be
removed from the group>
```

**REST**

Request Type	DELETE
Request URL	http[s]://<host>:<port>/rest/clustergroup/remove?<parameters>

**Parameters**

Parameter	Description
clustername	(Required) Name of the cluster to remove from the group. If you wish to remove an external NFS server or an external S3 server, the parameter value must be the name of the external NFS server or the external S3 server.

**Example****CLI**

The following command removes the cluster/fabric, `cluster2`, from the cluster group.

```
maprcli clustergroup
remove -clustername "cluster2"
```

**REST**

**NOTE:** When using a self-signed certificate pass, the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X
DELETE https://
abc.sj.us:8443/rest/clustergroup/
remove?clustername=cluster2
```

**CLI**

The following command removes the external NFS server `extnfsstorage` from the cluster group.

```
maprcli clustergroup
remove -clustername "extnfsstorage"
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X
DELETE https://
abc.sj.us:8443/rest/clustergroup/
remove?clustername=extnfsstorage
```

**CLI**

The following command removes the external S3 server, "ext\_s\_three", from the cluster group.

```
maprcli clustergroup
remove -clustername "ext_s_three"
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X
DELETE https://
abc.sj.us:8443/rest/clustergroup/
remove?clustername=ext_s_three
```

**clustergroup s3gns**

Sets the S3 server to redirect or forward external S3 access requests, and enables S3 global namespace.

The `clustergroup s3gns` command defines the way how s3 global name space behaves.

The `clustergroup s3gns` command has the following options.

- `httpsmode`: Used to set the https mode for the S3 global namespace
- `enables3gns`: Used to enable or disable S3 global namespace.

See the individual topic for details on the subcommands.

*s3gns httpsmode*

S3gns subcommand to set the `httpsmode` for the S3 client - S3 server communication via Data Fabric.

Data Fabric acts as the intermediary between a S3 client and an external S3 server that is added to the cluster group/imported into the global namespace from the Data Fabric UI.

### S3 Client-External S3 Server Communication

S3 clients requests for access to external S3 servers in a cluster group are routed via Data Fabric. Data Fabric forwards requests coming from S3 clients to the external S3 server. The responses from the external S3 server are transported back to the requesting S3 clients via Data Fabric. The forwarding mechanism that happens during the S3 client-external S3 server communication via Data Fabric consumes CPU and memory resources on Data Fabric. This can impact the Data Fabric performance, depending on the use case for frequency of communication between the S3 client and external S3 server.

**NOTE:** Currently, there is no performance benchmark available on Data Fabric performance for S3 client-external S3 server communication.

### S3 Client - Native S3 Server Communication

Data Fabric can work in redirection mode for S3 client-native S3 server communication with the cluster group s3gns command. Data Fabric redirects an incoming S3 client request made to a native S3 server on another fabric in the same global namespace. Once the redirection is successful, the communication between the S3 client and the native S3 server on the other fabric takes place directly. In case of redirection, there is no impact on Data Fabric performance.

Some S3 clients such as the AWS client and the latest versions of minio client do not support the HTTPS redirect error. For such clients, you can use the **forward** mode.

*Forward mode is the **default** and all clients should work with this mode.*

### Syntax

```
maprcli clustergroup s3gns
  -httpsmode either forward OR redirect. In forward mode server sends the
  cross fabric request, while in redirect mode client.
```

### REST

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/clustergroup/s3gns?&lt;httpsmode=&lt;"value"&gt;&gt;</code>

### Parameters

Parameter	Description
httpsmode	<i>(Required)</i> The mode of operation - either <i>forward</i> (default) or <i>redirect</i> .

### Example

#### Redirect mode

Sets the mode of operation to `redirect`.

**CLI**

```
maprcli clustergroup s3gns -httpsmode
redirect
{
    "timestamp":1705411835609,
    "timeofday":"2024-01-16
05:30:35.609 GMT-0800 AM",
    "status":"OK",
    "total":0,
    "data":[
    ],
    "messages":[
        "Successfully
executed s3gns command"
    ]
}
```

**REST**

```
curl -u <username> -X
POST https://server.sj.us:8443/rest/
clustergroup/s3gns?httpsmode=redirect
```

*s3gns enables3gns*

S3gns subcommand to enable S3 global namespace.

A S3 client can authenticate to all the S3 storage across fabrics in the S3 global namespace, by using a single set of access key/secret key. This is achieved by way of enabling S3 global namespace by using the `clustergroup s3gns` command.

The S3 global namespace provides a unified data plane and control plane for all native S3 storage (S3 storage on fabrics).

The unified S3 storage across fabrics in the S3 global namespace comprises a primary fabric and one or more non-primary or secondary fabrics.

 **IMPORTANT:** The S3 global namespace can be enabled on the primary cluster/fabric only. To enable S3 global namespace on a cluster group, you must run the `clustergroup s3gns` command on the primary cluster/fabric. When you enable S3 global namespace on the primary cluster of a cluster group, the previous access key and secret key for all the non-primary clusters are overwritten with the access key and secret key that belong to the primary cluster. The S3 client can authenticate to the primary/non-primary clusters by using the access key and secret key of the primary cluster only.

Once a S3 global namespace is enabled, S3 storage on a fabric in the S3 global namespace can be accessed using the access point or IP address of any fabric in the cluster group.

**Syntax****CLI**

```
maprcli clustergroup s3gns
-enables3gns enabling S3GNS will
overwrite existing keys/IAM policies
of the non-primary cluster.
```

**REST**

Request Type	POST
--------------	------

Request  
URL

```
http[s]://<host>:<port>/
rest/clustergroup/s3gns?
enables3gns<parameters>
```

### Parameters

Parameter	Description
enables3gns	<p>(<i>Optional</i>) Set this option to <code>true</code> to enable S3 global namespace on the cluster group.</p> <p>This setting must be enabled only if you wish to access the objects and or buckets belonging to all clusters/fabrics in the cluster group from any cluster in the cluster group by way of a common pair of keys and by using a common access point.</p> <p>The default value for this option is <code>false</code>.</p> <p> <b>WARNING:</b> Enabling S3 global namespace overwrites all the keys and IAM policies on non-primary clusters/fabrics with the keys and IAM policies of the primary cluster. Ensure that relevant changes in your S3 client scripts are made, before you can enable S3 global namespace on your cluster group.</p>

### Example

#### CLI

```
maprcli clustergroup
s3gns -enables3gns true -json
{
  "timestamp":1720589652245,
  "timeofday": "2024-07-09
10:35:31.245 GMT-0700 PM",
  "status": "OK",
  "total":0,
  "data":[
    ],
  "messages":[
    "Successfully
executed s3gns command"
  ]
}
```

#### REST

```
curl -u <username> -X
POST https://server.sj.us:8443/rest/
clustergroup/s3gns?enables3gns=true
```

**NOTE:** If you run the `mc ls` command after enabling S3 global namespace, you should see all the native S3 servers listed, along with any external S3/NFS servers that are a part of the cluster group.

```
# /opt/mapr/bin/mc ls
mapralias/gns/
[2024-07-09 22:23:55 PDT] 1B
cluster-a
[2024-07-09 22:23:55 PDT] 7B
cluster-b
[2024-07-09 22:23:55 PDT] 4B
cluster-c
[2024-07-09 22:23:55 PDT] 9B
extcluster-1
```

**TIP:** If S3 global namespace is not enabled, the `mc ls` command would list only the cluster or fabric on which you are running the command, along with any external S3 servers in the cluster group, even if there are other native clusters/fabrics in the cluster group.

### clustergroup updates3user

Updates permissions for external S3 server.

As a cluster administrator, you can perform the following operations on an external S3 server that has been imported into Data Fabric.

- add access to users and/or groups
- revoke access from users and/or groups
- change the owner

Use the `clustergroup updates3user` CLI command to perform the aforementioned operations on an external S3 server that has been imported into Data Fabric.

### Syntax

#### CLI

```
maprcli clustergroup updates3user
  - externalservername name of the
  external server
  - action addaccessors/
  removeaccessors/updateowner
  [- accessorusers comma separated
  list of accessor users]
  [- accessorgroups comma separated
  list of accessor groups]
  [- owner owner name]
```

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/clustergroup/updates3user?&lt;parameters&gt;</code>

## Parameters

Parameter	Description
externalservername	<i>(Required)</i> The name of the imported external S3 server on which you wish to grant or revoke user access or group access or change owner.
action	<i>(Required)</i> Permissible values for this parameter are as follows: <ul style="list-style-type: none"> <li>• <code>addaccessors</code> - Use this value to add one or more users and/or groups as accessors that can access the external S3 server.</li> <li>• <code>removeaccessors</code> - Use this value to remove access that was previously granted to one or more users and/or groups on the external S3 server</li> <li>• <code>updateowner</code> - Use this value to update the owner of the imported external S3 server.</li> </ul>
accessorusers	<i>(Optional)</i> Enter a comma-separated list of users that you wish to provide access to or revoke access on the external S3 server. You could specify the <code>accessorgroups</code> when the value of <code>action</code> parameter is <code>addaccessors</code> or <code>removeaccessors</code> .
accessorgroups	<i>(Optional)</i> Enter a comma-separated list of groups that you wish to provide access to or revoke access on the external S3 server. You could specify the <code>accessorgroups</code> when the value of <code>action</code> parameter is <code>addaccessors</code> or <code>removeaccessors</code> .
owner	<i>(Optional)</i> Enter the name of the new owner for the imported external S3 server. Specify the owner when the value of <code>action</code> parameter is <code>updateowner</code> .

### Example

**NOTE:** You can use the [cluster group get cgtable](#) on page 2070 command, to view changes in the ownership and access to the external S3 server details, after the `cluster group updates3user` command runs successfully.

### Change owner for external S3 server

Change the owner on 'ext1' external S3 server to 'johndoe'.

#### CLI

```
maprcli cluster group
updates3user -externalservername
ext1 -action updateowner -owner
johndoe -json
```

#### REST

```
curl -u <username> -X POST https://
server.sj.us:8443/rest/cluster group/
updates3user?
externalservername=ext1&action=updateo
wner&owner=johndoe
```

### Grant access on external S3 server for user and group

Grant access on 'ext1' external S3 server to user, 'janedoe', and groups, 'sales' and 'qa'.

**CLI**

```
maprcli clustergroup
updates3user -externalservername
ext1 -action
addaccessors -accessorusers janedoe -
accessorgroups sales,qa -json
```

**REST**

```
curl -u <username> -X POST https://
server.sj.us:8443/rest/clustergroup/
updates3user?
externalservername=ext1&action=addacce
ssors&accessorusers=janedoe&accessogr
roups=sales,qa
```

**Revoke access on external S3 server for group**

Revoke access on 'ext2' external S3 server for groups, 'sales' and 'qa'.

**CLI**

```
maprcli clustergroup
updates3user -externalservername
ext2 -action removeaccessors -
accessorgroups sales,qa -json
```

**REST**

```
curl -u <username> -X POST https://
server.sj.us:8443/rest/clustergroup/
updates3user?
externalservername=ext2&action=removea
ccessors&accessorgroups=sales,qa
```

**cluster services**

Returns the activation status and enables restoration of a disabled fabric.

If you forget to pay your invoice or renew an expired license, HPE can disable a fabric (connected or air-gapped). If your contract terms are not met, HPE activates a "kill switch" that causes the CLDBs to shut down, eventually causing the fabric to enter a non-functional state.

If you suspect that the fabric has been disabled, contact HPE Support. HPE Support can supply a special activation key that you can use to restore the fabric. With the activation key, you can use the following method to restore the fabric:

**Syntax**

On all CLDB nodes of the fabric, paste the activation key into the following file:

```
/opt/mapr/conf/services-enable.token
```

To check the status, use the following command:

```
maprcli cluster services status
```

**Example****CLI**

Check the status of the cluster:

```
maprcli cluster services status -json
{
  "timestamp":1691042428101,
  "timeofday":"2023-08-02
11:00:28.101 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "status":"ENABLED"
    }
  ]
}
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X
GET https://abc.sj.us:8443/rest/
cluster/services/status
```

**cluster usage**

Describes the cluster usage commands that check the service activation URLs, register the cluster, and renew the activation for an air-gapped cluster.

**cluster usage export**

Checks the currently configured values for the service activation URLs.

**Syntax****CLI**

```
maprcli usage export status
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/usage/export/status

**Parameters**

Parameter	Description
status	Displays the status information for the given cluster. For details See the following example.

Parameter	Description
url	<ul style="list-style-type: none"> <li>• <b>Register URL</b> : The URL that is used to register the fabric.</li> <li>• <b>Renew URL</b> : The URL that is used to renew your activation monthly after the initial activation.</li> <li>• <b>Upload URL</b> : The URL that is used to upload billing information.</li> <li>• <b>Proxy URL</b> : The URL that enables your fabric to communicate with the billing service when a proxy is used. You do not need to configure the proxy URL if your organization does not use a proxy.</li> </ul>

## Examples

To check the current connection mode status for a cluster and display the current URL values:

```
# maprcli usage export status -json
{
  "timestamp":1684302853985,
  "timeofday":"2023-05-17 05:54:13.985 GMT+0000 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "clusterId":"6026083753908386969",
      "clusterUsageMode":"airgapped",
      "airgapped":{
        "Registered":"Yes",
        "activeTill":"2023-06-15 17:22:05.000
GMT+0000"
      },
      "email":{
        "customerEmail":"","
        "emailFrequency":"EmailNone"
      },
    }
  ]
}
```

To show parameters corresponding to the air-gapped mode, use the following command:

```
maprcli usage export status -summary airgapped -json
{
  "timestamp":1686736554240,
  "timeofday":"2023-06-14 02:55:54.240 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "clusterId":"8241412123680594388",
      "clusterUsageMode":"airgapped",
      "airgapped":{
        "Registered":"Yes",
        "activeTill":"2023-07-20 03:18:38.000
GMT-0700"
      },
    }
  ]
}
```

```
}
```

Once the activation key is applied, the key is valid (and the fabric is operational) until the **Activetill Date**. After the **Activetill Date**, a short grace period is applied to allow you to perform the steps to maintain activation.

To show parameters corresponding to the air-gapped mode, use the following command:

```
maprcli usage export status -summary airgapped -json
{
  "timestamp":1686736554240,
  "timeofday":"2023-06-14 02:55:54.240 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "clusterId":"8241412123680594388",
      "clusterUsageMode":"airgapped",
      "airgapped":{
        "Registered":"Yes",
        "activeTill":"2023-07-20 03:18:38.000
GMT-0700"
      }
    }
  ]
}
```

You can edit the default URL by using the following command with one of the following four options:

```
maprcli usage export url
[ -registerUrl <register-url> ]
[ -uploadUrl <upload-url> ]
[ -renewCredsUrl <renew-creds-url> ]
[ -proxyUrl <proxy-url> ]
```

For example:

```
maprcli usage export url -registerUrl <url name1> -uploadUrl <url
name2> -renewCredsUrl <url name3> -proxyUrl <url name4> -json
{
  "timestamp":1692170117568,
  "timeofday":"2023-08-16 12:15:17.568 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "export urls updated successfully! "
  ]
}
```

### cluster usage register

Registers an air-gapped Data Fabric cluster.

For a new air-gapped cluster, you must register it using the activation key provided by HPE Support when you ordered the product. After registration, the cluster is usable for a month with a 15-day grace period. It continues to be usable as long as you continue to pay your monthly bill and reapply new activation keys.

## Syntax

Use this command to register a new cluster:

### CLI

```
maprcli usage register
  [ -keyFile <path-to-keyfile> ]
  [ -key <key-as-string> ]
```

### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/cluster/usage/register?<parameters>

## Parameters

Parameter	Description
keyfile	<i>(Conditionally Required)</i> The file containing the registration key. Either this parameter or the <code>key</code> parameter is required.
key	<i>(Conditionally Required)</i> The registration key. Either this parameter or the <code>keyfile</code> parameter is required.

## Example

### CLI

Register a cluster.

```
maprcli usage register -keyfile
newact.key -json
{
  "TIMESTAMP":1684302620609,
  "TIMEOFDAY":"2023-05-17
05:50:20.609 GMT+0000 AM",
  "STATUS":"OK",
  "TOTAL":1,
  "DATA":[
    {
      "ACTIVETILL":"2023-06-13 15:24:12.000
GMT+0000"
    }
  ]
}
```

### REST

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST
https://abc.sj.us:8443/rest/cluster/
usage/register?keyfile=newact.key
```

## cluster usage renew

Renews the activation for an air-gapped Data Fabric cluster.

As long as you continue to provide usage records and pay your monthly invoice within the billing grace period, HPE will continue to provide an activation code that allows you to renew your activation.

After obtaining the new activation code from the customer portal, use the following `maprcli` command to renew your activation:

### Syntax

Use this command to register a new fabric:

#### CLI

```
maprcli usage renew
[ -keyFile <path-to-keyfile> ]
[ -key <key-as-string> ]
```

#### REST

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/cluster/usage/renew?&lt;parameters&gt;</code>

### Parameters

Parameter	Description
keyfile	<i>(Conditionally Required)</i> The file containing the registration key. Either this parameter or the <code>key</code> parameter is required.
key	<i>(Conditionally Required)</i> The registration key. Either this parameter or the <code>keyfile</code> parameter is required.

### Example

#### CLI

Renew a cluster.

```
maprcli usage renew -keyFile
act.txt -json
{
  "timestamp":1684302775148,
  "timeofday":"2023-05-17
05:52:55.148 GMT+0000 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "activeTill":"2023-06-15 17:22:05.000
GMT+0000"
    }
  ]
}
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X
POST https://abc.sj.us:8443/rest/
cluster/usage/renew?keyfile=act.txt
```

**config**

Lists configuration values for the Data Fabric cluster.

**Configuration Fields**

The following fields are configurable.

<code>cldb.balancer.disk.max.switches.in.nodes.percentage</code>	<i>Default Value:</i> 10 The maximum number of containers that can be balanced in parallel by the disk balancer. The value is a percentage of the number of nodes in the system.
<code>cldb.disk.balancer.enable</code>	<i>Default Value:</i> 1 (Disk Balancer is enabled) Enables (1) or disables (0) the Disk Balancer.
<code>cldb.balancer.disk.sleep.interval.sec</code>	<i>Default Value:</i> 120 The sleep interval (in seconds) between two successive runs of the Disk Balancer.
<code>cldb.balancer.disk.threshold.percentage</code>	<i>Default Value:</i> 70 Percentage of used space that causes containers in a storage pool to be distributed across other less used storage pools.
<code>cldb.balancer.logging</code>	<i>Default Value:</i> 0 Disables (0) or enables (1) the logging of messages in the Disk Balancer and Role Balancer.
<code>cldb.balancer.role.max.switches.in.nodes.percentage</code>	<i>Default Value:</i> 10 The percentage (of the number of nodes in the system) to use to determine the maximum number of containers whose roles (Masters and Tails) are balanced in parallel by the Role Balancer.  For example, suppose there are 500 nodes and the value of this parameter is 10(%). The number of containers whose roles are balanced in parallel is $(10/100)*500=50$ .
<code>cldb.balancer.role.paused</code>	<i>Default Value:</i> 1 Enables (0) or Disables (1) the Role Balancer.
<code>cldb.balancer.role.sleep.interval.sec</code>	<i>Default Value:</i> 900 The sleep interval (in seconds) between two successive runs of the Role Balancer.
<code>cldb.balancer.startup.interval.sec</code>	<i>Default Value:</i> 1800 The initial startup delay (in seconds) of the Role Balancer for existing clusters.
<code>cldb.cluster.almost.full.percentage</code>	<i>Default Value:</i> 90

<code>cldb.container.alloc.selector.algo</code>	<p>The percentage at which the <code>CLUSTER_ALARM_CLUSTER_ALMOST_FULL</code> alarm is triggered.</p> <p><i>Default Value:</i> 0</p> <p>The allocation algorithm to use when creating new containers. The value can be one of:</p> <ul style="list-style-type: none"> <li>• 0 - indicates Round Robin algorithm if the number of nodes is less than or equal to 100, Randomized algorithm otherwise.</li> <li>• 1 - indicates Round Robin algorithm. If selected, containers are allocated across nodes in a topology in a round robin fashion.</li> <li>• 2 - indicates Randomized algorithm. If selected, containers are allocated across nodes in a randomized way.</li> </ul>
<code>cldb.container.assign.buffer.sizemb</code>	<p><i>Default Value:</i> 1024</p> <p>The size of the container (in MB) that should be used as a buffer. When allocating a new container, this size is deducted from the maximum container size.</p> <p> <b>NOTE:</b> When you modify the value of <code>cldb.container.sizemb</code>, check and update the value of <code>cldb.container.assign.buffer.sizemb</code> to prevent new containers from being created when existing containers are not full.</p>
<code>cldb.container.create.diskfull.threshold</code>	<p><i>Default Value:</i> 85</p> <p>The percentage of space on a file server to use to classify the file server as full.</p>
<code>cldb.container.sizemb</code>	<p><i>Default Value:</i> 32768</p> <p>The maximum size for containers (in MB). This is a soft limit.</p> <p> <b>NOTE:</b> When <code>cldb.container.sizemb</code> value is modified, check and update the value of <code>cldb.container.assign.buffer.sizemb</code> to prevent new containers from being created when existing containers are not full.</p>
<code>cldb.default.chunk.sizemb</code>	<p><i>Default Value:</i> 256</p> <p>The size of each chunk (in MB) that make up a file in the Data Fabric file system.</p>
<code>cldb.default.volume.topology</code>	<p><i>Default Value:</i> /data</p> <p>The default topology for new volumes.</p>
<code>cldb.dialhome.metrics.file.rotation.period</code>	<p><i>Default Value:</i> 365</p> <p>The retention period of the files (in days) that is used to record Dialhome metrics. Files that are past their retention period are automatically deleted.</p>
<code>cldb.disable.alarm.history</code>	<p><i>Default Value:</i> 0 (false)</p> <p>Set this to 1 (true) to disable CLDB alarm history, as tracking and fetching the alarm history can degrade the performance of CLDB on large clusters.</p>
<code>cldb.fs.mark.rereplicate.sec</code>	<p><i>Default Value:</i> 3600</p>

<code>cldb.fs.reregistration.wait.time</code>	<p>The number of seconds that a node can fail to heartbeat before it is considered dead. Once a node is considered dead, the CLDB re-replicates any data contained on the node.</p> <p><i>Default Value:</i> 15</p> <p>The amount of time (in minutes) to wait before checking for inactive nodes.</p> <p> <b>NOTE:</b> Reduce the value to raise the <a href="#">No Heartbeat Alarm</a> on page 3023 without delay, after CLDB failover. To avoid spurious alarms, do not reduce this value below 5 (minutes).</p>
<code>cldb.log.fileserver.timeskew.interval.mins</code>	<p><i>Default Value:</i> 60</p> <p>The frequency (in minutes) at which CLDB should log messages about the time skew on the file server.</p>
<code>cldb.max.parallel.resyncs.star</code>	<p><i>Default Value:</i> 3</p> <p>The number of container replicas that can resync in parallel from the source for low-latency (star-replicated) volumes.</p>
<code>cldb.max.snapshots.per.volume</code>	<p><i>Default Value:</i> 4096</p> <p>The maximum number of snapshots that you can create for a volume. CLDB will fail snapshot creation once the number of snapshots reaches this limit. Increasing this value has performance implications. This should only be changed in consultation with the HPE Data Fabric support team.</p>
<code>cldb.mfs.heartbeat.timeout.multiple</code>	<p><i>Default Value:</i> 10</p> <p>Specifies a multiple heartbeat timeout. For small clusters, the heartbeat interval is 1 second and the multiple is 10 by default, which makes the heartbeat timeout 10 seconds.</p>
<code>cldb.min.fileservers</code>	<p><i>Default Value:</i> 1</p> <p>The number of file servers hosting the CLDB volume that is required for the master CLDB to complete the bootstrap process.</p>
<code>cldb.num.active.cg.containers</code>	<p><i>Default Value:</i> 20</p> <p>Number of containers to be assigned for a CG assign request. The value can be any integer between 0 and 100.</p>
<code>cldb.pbs.access.control.enabled</code>	<p><i>Default Value:</i> 1</p> <p>Enables and disables policy access controls (ACEs set in security policies) at the cluster level. When set to 0, the system does not enforce security policy ACEs for data operations in the cluster. See <a href="#">Disabling Policy Access Controls at the Cluster-Level</a> on page 1881 for additional information.</p>
<code>cldb.pbs.audit.only.policy.check</code>	<p><i>Default Value:</i> 0</p> <p>Set the value to 1 to enable audit-only policy checks (permissive mode). Permissive mode is useful during initial deployment when testing security policies. When permissive mode is enabled, the volume-level <code>enforcementmode</code> option <code>PolicyAceAuditAndDataAce</code> can be set. In this mode:</p>

- Resource-level ACEs are enforced.
- If security policies are tagged to data objects, the security policies are checked for access; any access denied events will be audited, but access will be allowed.

See [Setting Global Configuration Options for Policy-Based Security](#) on page 1880 for additional information.

`cldb.pbs.max.security.policy`

*Default Value:* 10000

Maximum number of configured security policies allowed. Prevents users from arbitrarily creating numerous security policies, which could impact performance.

`cldb.pbs.global.master`

*Default Value:* 0

Sets the master security policy cluster for the global namespace. You can configure a cluster to perform one of the following roles:

- Master — A master security policy cluster is required to create and manage security policies. Only one master security policy cluster can exist.
- Member — On a cluster designated as Member, you can view the security policies available and apply them to data objects.

By default, the host is set to member (0) upon a new installation or upgrade. To set the host to master, and enable the creation and modification of security policies, set the value of this property to 1.

For more information, see the [config save](#) on page 2105.

`cldb.replication.manager.critical.paused`

*Default Value:* 0

Disables (0) or enables (1) the processing of critically under-replicated containers. If enabled, the critically under-replicated containers are processed on a priority basis to increase the number of copies.

`cldb.replication.manager.max.resyncs.in.nodes.percentage`

*Default Value:* 1200

The number of containers that can be replicated in parallel, expressed as a percentage of the number of active nodes. If the value is 1200, the number of containers that can be replicated is 12 times the number of active nodes.

`cldb.replication.manager.over.paused`

*Default Value:* 0

Disables (0) or enables (1) the processing of over-replicated containers. Over-replicated containers are processed to delete extra copies, which is when the number of copies is more than the desired replication factor.

`cldb.replication.manager.start.mins`

*Default Value:* 15

The delay (in minutes) between CLDB startup and replication manager startup, to allow all nodes to register and heartbeat.

`cldb.replication.max.in.transit.containers.per.sp`

*Default Value:* 4

The maximum number of containers that can be in transit on a storage pool (SP). Containers that

<code>cldb.replication.sleep.interval.sec</code>	<p>serve either as the source or destination of a resync operation are considered as being in 'transit'.</p> <p><i>Default Value:</i> 15</p> <p>The sleep duration (in seconds) between consecutive runs of the Replication Manager.</p>
<code>cldb.replication.tablescan.interval.sec</code>	<p><i>Default Value:</i> 120</p> <p>The sleep duration (in seconds) between consecutive runs of the Replication Scanner. While the Replication Scanner classifies containers into different buckets, the Manager thread either replicates or removes additional copies.</p>
<code>cldb.rm.wait.rack.violated.fork.copy.mins</code>	<p><i>Default Value:</i> 720</p> <p>The buffer time (in minutes) after which all container copies found on the same rack are fixed.</p>
<code>cldb.rm.wait.fork.on.same.rack.mins</code>	<p><i>Default Value:</i> 180</p> <p>The time (in minutes) to defer creating containers on the same rack, for critically under-replicated containers, if there are at least two copies of the containers.</p>
<code>cldb.security.user.ticket.duration.seconds</code>	<p><i>Default Value:</i> 1209600</p> <p>The length of time (in seconds) before the user ticket (generated using the <a href="#">maprlogin password</a> command) expires.</p>
<code>cldb.security.user.ticket.max.duration.seconds</code>	<p><i>Default Value:</i> 2592000</p> <p>The maximum amount of time (in seconds) allowed for the user ticket (generated using the <a href="#">maprlogin password</a> command).</p>
<code>cldb.security.user.ticket.renew.duration.seconds</code>	<p><i>Default Value:</i> 2592000</p> <p>The length of time (in seconds) to renew the user ticket (generated using the <a href="#">maprlogin password</a> command).</p>
<code>cldb.security.user.ticket.renew.max.duration.seconds</code>	<p><i>Default Value:</i> 7776000</p> <p>The maximum duration allowed for a user ticket (generated using <a href="#">maprlogin password</a> command) renewal.</p>
<code>cldb.snapshot.restore.on.volume.unmount.only</code>	<p><i>Default Value:</i> 1 (true)</p> <p>Indicates whether the Snapshot Restore operation is allowed without first checking whether the volume is unmounted or not.</p> <p>By default, the volume restore operation is allowed only if the volume is unmounted, ensuring that no application is accessing any data in the volume.</p> <p>Set this flag to 0 (false) to perform the restore operation in a single step, without verifying whether the volume is unmounted or not.</p> <p>To set this flag to 0, run:</p>

```
/opt/mapr/bin/maprcli config \
  save -values
  '{"cldb.snapshot.restore.on.volume.unmount.only": "0"}' -json
```

<code>cldb.topology.almost.full.percentage</code>	<p><i>Default Value:</i> 90</p> <p>The threshold percentage that is used to raise alarms when the used space on the nodes of a topology exceed a certain percentage of total space.</p>
<code>cldb.volume.epoch</code>	<p><i>Default Value:</i> Not Applicable</p> <p>The starting epoch of a new Container. Epoch is used internally in the selection of the master container.</p>
<code>cldb.volumes.namespace.default.min.replication</code>	<p><i>Default Value:</i> 2</p> <p>The minimum replication factor for the name container. Containers with fewer copies than this value are replicated on a priority basis.</p> <p> <b>NOTE:</b> To modify, run the <code>maprli volume modify -name &lt;volume name&gt; -nsminreplication &lt;replication factor&gt;</code> command.</p>
<code>cldb.volumes.namespace.default.replication</code>	<p><i>Default Value:</i> 3</p> <p>The desired replication factor for the name container.</p> <p> <b>NOTE:</b> To modify, run the <code>maprli volume modify -name &lt;volume name&gt; -nsreplication &lt;replication factor&gt;</code> command.</p>
<code>mapr.fs.nocompression</code>	<p><i>Default Value:</i> "bz2,gz,tgz,tbz2, zip,z,Z,mp3,jpg, jpeg,mpg,mpeg,avi, gif,png,lzo,jar"</p> <p>The file types that should not be compressed. See <a href="#">File Extensions of Compressed Files</a> on page 1320.</p>
<code>mapr.fs.permissions.supergroup</code>	<p><i>Default Value:</i> root</p> <p>The <i>super group</i> of the Data Fabric file system layer.</p>
<code>mapr.fs.permissions.superuser</code>	<p><i>Default Value:</i> mapr</p> <p>The <i>super user</i> of the Data Fabric file system layer.</p>
<code>mapr.targetversion</code>	<p><i>Default Value:</i> Not Applicable</p> <p>The configuration variable to set the current version of the Data Fabric distribution. Failing to set this variable on an upgrade causes alarms to be missed when all the nodes in a cluster are not at the same version of the software.</p>
<code>mfs.db.parallel.copyregions</code>	<p><i>Default Value:</i> Not Applicable</p> <p>The number of parallel copy regions per MFS instance. Setting this field to a larger value increases the parallelism for data transfers during index updates, CDC propagation, and table replication. A larger value increases the transfer rate and reduces the initial synchronization time, but uses more system resources. The latter may impact the response time and performance of applications that read data from the same nodes.</p>
<code>mfs.high.memory.alarm.threshold</code>	<p><i>Default Value:</i> 110 (percentage of allocated memory)</p> <p>On initialization, the Data Fabric file system is allocated a certain amount of memory. There is some additional headroom that can be used if the Data Fabric file system is under memory pressure. However, if the Data Fabric file system exceeds the high memory threshold (default 10% over the allocated</p>

<code>mfs.feature.db.json.support</code>	<p>memory, that is 110%), the <a href="#">High FileServer Memory Alarm</a> on page 3020 is raised. This threshold can be 8% to 30% over the allocated memory (that is 108% to 130%) .</p> <p><i>Default Value:</i></p> <ul style="list-style-type: none"> <li>• 1 for new Data Fabric installations</li> <li>• 0 for upgraded Data Fabric installations</li> </ul> <p>Disables (0) or enables (1) Data Fabric streams and support in HPE Ezmeral Data Fabric Database for JSON documents and tables.</p>
<code>mfs.feature.devicefile.support</code>	<p><i>Default Value:</i> 1</p> <p>Disables (0) or enables (1) usage of Named Pipes over NFS.</p>
<code>mfs.resync.disk.throttle.factor</code>	<p><i>Default Value:</i>20</p> <p>The factor affects the wait time for Data Fabric file system during resync operations, to allow for other disk I/O operations to happen in tandem. The configuration variable can be used to determine and throttle the speed of disk I/O during resync operations. Increasing the value of the <code>mfs.resync.disk.throttle.factor</code> decreases the wait time and decreases throttling of disk bandwidth during resync operations, and vice-versa. If you wish to disable disk bandwidth throttling, set the value for <code>mfs.resync.disk.throttle.factor</code> to 10000 or higher.</p> <p> <b>WARNING:</b> When throttling is disabled, unthrottled resync operations can cause clients accessing hosts involved in the resync operations to be starved of disk bandwidth.</p>
<code>mfs.resync.network.throttle.factor</code>	<p><i>Default Value:</i> 20</p> <p>The factor affects the wait time for Data Fabric file system during resync operations, to allow for other network operations to happen in tandem. The configuration variable can be used to determine and throttle the network speed during resync operations. Increasing the value of the <code>mfs.resync.network.throttle.factor</code> decreases the wait time and decreases throttling of network bandwidth during resync operations, and vice-versa. If you wish to disable network bandwidth throttling, set the value for <code>mfs.resync.network.throttle.factor</code> to 10000 or higher.</p> <p> <b>WARNING:</b> When throttling is disabled, unthrottled resync operations can cause clients accessing hosts involved in the resync operations to be starved of network bandwidth.</p>
<code>pernode.numcntrs.alarm.thr</code>	<p><i>Default Value:</i> 50000</p> <p>The maximum number of Read/Write (RW) containers on each node beyond which performance may not be optimal. The optimal number for RW and snapshot containers combined is 10 times the value of this parameter.</p>
<code>mastgateway.recallexp.opt.enabled</code>	<p><i>Default Value:</i> 1</p>

	<p>The configuration variable controls the enabling or disabling of recall expiry optimization for non-large containers. When the value is set to 1, recall expiry optimization is enabled for non-large containers and vice-versa.</p> <p>If recall expiry optimization is enabled, the MAST gateway performs the recall expiry operation.</p> <p>Recall expiry optimization can be disabled by setting the value of the <code>mastgateway.recallexp.opt.enabled</code> variable to 0.</p>
<code>mastgateway.recallexp.opt.minpurgemb</code>	<p><i>Default Value:</i> 8 MB</p> <p>Recall threshold value in MB. used in conjunction with <code>mastgateway.recallexp.opt.enabled</code>. For non-large containers, recall expiry is run only if recall expiry optimization is enabled, and the size of recalled data on the container as determined by MAST gateway is larger than this configured threshold.</p>
<code>mastgateway.recallexp.opt.largenuminodes.minpurgemb</code>	<p><i>Default Value:</i> 2 GB</p> <p>The configuration variable is used to configure a recall-threshold value. For large containers, recall expiry is run only if recall expiry optimization is enabled, and the size of recalled data on the container as determined by MAST gateway is larger than this configured threshold.</p>
<code>mastgateway.offload.opt.largenuminodes</code>	<p><i>Default Value:</i> 8 million</p> <p>This configuration variable is used to define the criterion for the size of a container to be a large container. When the number of inodes in a container is greater than the value specified in the configuration variable, the container is classified as large container.</p>
<code>mastgateway.recallexp.opt.largenuminodes.enabled</code>	<p><i>Default Value:</i> 1</p> <p>The configuration variable is used to enable/disable recall expiry optimization for large containers. When the value is set to 1, the recall expiry optimization for large containers is enabled. When the value of the variable is set to 0, the recall expiry optimization for large containers is disabled.</p>
<code>mastgateway.ctc.opt.largenuminodes.enabled</code>	<p><i>Default Value:</i> 1</p> <p>This configuration variable is used to enable/disable large container compaction optimization. Compaction optimization for large containers can be disabled by setting this configuration variable to 0.</p>
<code>mastgateway.ctc.opt.largenuminodes.skipqualifiedctrs.enabled</code>	<p><i>Default Value:</i> 1</p> <p>When this configuration variable is set to 1, compaction is skipped for any large container(namespace container/data container) that has garbage of size higher than the value of <code>mastgateway.ctc.opt.largenuminodes.thresholdmb</code>. When the compaction is skipped in such a manner, the alarm, 'VOLUME_ALARM_COMPACTON_SKIPPED_LARGE_CONTAINER', is raised. The configuration variable enables administrators to decide whether or not to allow running scheduled compaction on large containers, since compaction on large containers can take time. The compaction can be run manually at a</p>

suitable time, such as non-peak hours. Refer to [Running the Compactor Using the CLI and REST API](#) on page 1256 for details on running the compactor manually via CLI or REST.

`mastgateway.ctc.opt.largenumbernodes.threshmb`

*Default Value:* 2 GB

This configuration variable represents the garbage threshold for large containers. For a large container, if the garbage size to reclaim is less than `mastgateway.ctc.opt.largenumbernodes.threshmb`, compaction is skipped for such container.

`mastgateway.offload.opt.largenumbernodes.mindatamb`

*Default Value:* 2 GB

This configuration variable represents the minimum data to offload threshold for large containers. For a large container, if the size of data to offload is less than `mastgateway.offload.opt.largenumbernodes.mindatamb`, offload is not be triggered on the container.

### config load

Displays information about the cluster configuration.

### Syntax

#### CLI

```
maprcli config load
[ -cluster <cluster> ]
[ -keys <keys> ]
```

#### REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/config/load?<parameters>

### Parameters

Parameter	Description
cluster	(Optional) The cluster for which to display values. The default is the cluster on which the command is run.
keys	(Optional) This parameter is used to specify the information to display. Comma-separated fields are used to display values; see the <a href="#">Configuration Fields</a> table. By default, the command displays <b>all</b> information.

### Output

Information about the cluster configuration. See the [Configuration Fields](#) table.

#### Sample Output

```
{
  "status": "OK",
  "total": 1,
  "data": [
```

```

    {
        "mapr.webui.http.port": "8080",
        "mapr.fs.permissions.superuser": "root",
        "mapr.smtp.port": "25",
        "mapr.fs.permissions.supergroup": "supergroup"
    }
]
}

```

## Examples

### Display several keys:

#### CLI

```
maprcli config load -keys
mapr.webui.http.port, mapr.webui.https.
port, mapr.webui.https.keystorepath, map
r.webui.https.keystorepassword, mapr.we
bui.https.keypassword, mapr.webui.timeo
ut
```

#### REST

 **NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X GET https://
abc.sj.us:8443/rest/config/load?
keys=mapr.webui.http.port, mapr.webui.h
ttps.port, mapr.webui.https.keystorepat
h, mapr.webui.https.keystorepassword, ma
pr.webui.https.keypassword, mapr.webui.
timeout
```

### View the security policy limit:

#### CLI

```
maprcli config load -keys
cldb.max.security.policies
```

#### REST

 **NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X GET
https://abc.sj.us:8443/rest/config/
load?keys=cldb.max.security.policies
```

### View the master security policy cluster:

#### CLI

```
maprcli config load -keys
cldb.pbs.global.master
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X GET
https://abc.sj.us:8443/rest/config/
load?keys=cldb.pbs.global.master
```

**View the number of containers to be assigned for a CG assign request:**

**CLI**

```
maprcli config load -keys
cldb.num.active.cg.containers
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X GET https://
abc.sj.us:8443/rest/config/load?
keys=cldb.num.active.cg.containers
```

**config save**

Saves configuration information, specified as key/value pairs. Permissions required: `fc` or `a`.

See the [Configuration Fields](#) table.

**WARNING:** Changing the cluster configuration may impact the way the cluster functions. Make sure you understand the change well, or else make the change under the guidance of data-fabric support.

**Syntax**

**CLI**

```
maprcli config save
    [ -cluster cluster name ]
    [-test test only. default: 0]
    -values JSON Object to
    comprise all config properties to save
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/config/save?<parameters>

**Parameters**

Parameter	Description
cluster	(Optional) The cluster on which to run the command.
values	(Required) A JSON object containing configuration fields; see the <a href="#">Configuration Fields</a> table.

Parameter	Description
test	(Optional) Set this to 1 to test the SMTP configuration without actually saving the values. The system sends a test email to check if the configuration is correct. This parameter is applicable only for SMTP configuration. The default value is 0.

## Examples

### Configure data-fabric SMTP settings:

#### CLI

```
maprcli config save -values
'{"mapr.smtp.provider":"gmail","mapr.smtp.server":"smtp.gmail.com","mapr.smtp.sslrequired":"true","mapr.smtp.port":
"465","mapr.smtp.sender.fullname":"Ab
Cd","mapr.smtp.sender.email":"xxx@gmail.com","mapr.smtp.sender.username":"xx
x@gmail.com","mapr.smtp.sender.password":"abc"}'
```

#### REST

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"mapr.smtp.provider":"gmail","
mapr.smtp.server":"smtp.gmail.com","ma
pr.smtp.sslrequired":"true","mapr.smtp
.port":"465","mapr.smtp.sender.fullnam
e":"Ab
Cd","mapr.smtp.sender.email":"xxx@gmai
l.com","mapr.smtp.sender.username":"xx
x@gmail.com","mapr.smtp.sender.passwor
d":"abc"}
```

### Define the maximum number of configured security policies:

#### CLI

```
maprcli config save -values
'{"cldb.max.security.policies":"2048"}
'
```

#### REST

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.max.security.policies":"
2048"}
```

### Set the master security policy cluster:

**CLI**

```
maprcli config save -values
'{"cldb.pbs.global.master":"1"}
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.pbs.global.master":"1"}
```

**Set the number of volumes to balance at a time:****CLI**

```
maprcli config save -values
'{"cldb.tier.gw.balance.num.vols.per.b
atch":"500"}
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.tier.gw.balance.num.vols
.per.batch":"500"}
```

**NOTE:** The maximum number of volumes that can be balanced at a time is 1000.

**Allocate CLDB memory for mirroring:****CLI**

```
maprcli config save -values
'{"cldb.mirror.memory.factor":"60"}
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.mirror.memory.factor":"6
0"}
```

**Related concepts**

[config](#) on page 2095

Lists configuration values for the Data Fabric cluster.

**dashboard info**

Displays a summary of information about the cluster.

## Syntax

### CLI

```
maprcli dashboard info
    [ -cluster cluster name ]
    [ -zkconnect
ZooKeeper Connect String:
'host:port,host:port,host:port,...' ]
    [ -version true|false.
default: false ]
    [ -multi_cluster_info true|
false. default: false ]
    -json
```

**NOTE:** The `-json` option is required.

### REST

Request Type	GET
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/dashboard/info[?&lt;parameters&gt;]</code>

## Parameters

Parameter	Description
<code>cluster</code>	( <i>Optional</i> ) The cluster on which to run the command. By default, the cluster is the one on which this command is run.
<code>multi_cluster_info</code>	( <i>Optional</i> ) Specifies whether to display cluster information from multiple clusters. Values: <code>true</code> or <code>false</code> . Default: <code>false</code> .
<code>version</code>	( <i>Optional</i> ) Specifies whether to display <b>ONLY</b> the version of the HPE Ezmeral Data Fabric. Values: <code>true</code> or <code>false</code> . Default: <code>false</code> .
<code>zkconnect</code>	( <i>Optional</i> ) <a href="#">Common Parameters</a> on page 1989
<code>json</code>	( <i>Required</i> ) Formats the output.

## Output

The following table summarizes information about the services, volumes, MapReduce applications, health, and utilization of the cluster.

### Output Fields

Field	Description
<code>timestamp</code>	The time at which the <code>dashboard info</code> data is retrieved, expressed as a Unix epoch time.
<code>timeofday</code>	The local time and date of the query.
<code>status</code>	The success status of the <code>dashboard info</code> command.

Field	Description
total	The number of clusters for which data is queried in the <code>dashboard info</code> command.
version	The data-fabric software version running on the cluster.
cluster	<p>Determines the following information about the cluster:</p> <ul style="list-style-type: none"> <li>• <code>name</code> — the cluster name</li> <li>• <code>secure</code> — whether or not the cluster is secure. Value: <code>true</code> (if enabled) or <code>false</code> (if disabled)</li> <li>• <code>dare</code> — whether or not the cluster is enabled for data at rest encryption. Value: <code>true</code> (if enabled) or <code>false</code> (if disabled)</li> <li>• <code>globalPolicyMaster</code> — whether or not the cluster is the master cluster for Policy Based Security. Yes if <code>true</code>, and no if <code>false</code>. You can create security policies only from the master cluster.</li> <li>• <code>ip</code> — the IP address of the active CLDB</li> <li>• <code>id</code> — the cluster ID</li> <li>• <code>nodesUsed</code> — number of nodes in the cluster</li> <li>• <code>totalNodesAllowed</code> — number of allowed nodes</li> </ul>
volumes	<p>The number and size (in GiB) of volumes that are:</p> <ul style="list-style-type: none"> <li>• Mounted</li> <li>• Unmounted</li> </ul>
mirrors	Indicates whether this cluster is a mirror or is mirrored, and the details of the mirrors, if any.

Field	Description
utilization	<p>The following summarizes utilization information:</p> <ul style="list-style-type: none"> <li>• CPU — utilization, total and active. CPU utilization % is calculated as (100% - idle%) on each node and then averaged across all nodes where hoststats is running.</li> <li>• Memory — total and active (in MiB).</li> <li>• Disk space — total and active (in GiB).</li> <li>• Compression — compressed and uncompressed data size</li> <li>• Tiering — following cluster-level tiering information: <ul style="list-style-type: none"> <li>• — amount of user data stored in tiered volumes (in GiB). This amount is independent of storage system operations relative to compression, replication, or offloading to a warm (erasure-coded) or cold tier. See <a href="#">Understanding how physical, logicalUsed, ecOffloaded data usage is calculated</a> for additional details.</li> <li>• replicatedLogicalUsed — amount of user data stored in tiered volumes (in GiB) multiplied by the configured replication factor for hot tier volume(s).  This value is calculated as follows: <i>logicalUsed by volume * number of replicas configured for the hot tier</i>. This value does not change as file data is removed from the hot tier and erasure-coded to the warm tier.</li> <li>• replicatedTotalUsed — amount of user data (after compression, if any) and snapshot user data (after compression, if any) stored in tiered volumes (in GiB) multiplied by the configured replication factor(s) for the hot tier volume(s).  This value is calculated as follows: <i>(logical user data after compression used by volume + logical user data after compression in snapshots) * number of replicas configured for the hot tier</i>. This value does not include EC-backend volumes and cache volumes since their replicatedTotalUsed is already accounted for by the front-end and parent volumes respectively.</li> </ul> </li> <li>• metaDBUsedMB — disk space (in MiB) used by the metadata volume associated with the tier.</li> <li>• replicatedMetaDBUsedMB — disk space (in MiB) used by the metadata volume associated with the tier multiplied by the configured replication factor for the hot tier.</li> <li>• offloaded — total physical data (in GiB) offloaded to the cold tier.  This value is calculated as follows: <i>amount of data purged from the hot tier (HPE Ezmeral Data Fabric data-fabric cluster) + amount of data recalled to the hot tier (Data Fabric data-fabric cluster)</i>.</li> <li>• recalled — total physical data (in GiB) recalled from the cold tier.  This value is calculated as follows: <i>amount of data recalled to the hot tier (Data Fabric cluster) + total amount of disk space used by the cache volume</i></li> </ul>

Field	Description
clusterReplication	The following cluster replication information: <ul style="list-style-type: none"> <li>bytesReceived</li> <li>bytesSend</li> </ul>
streamThroughput	The following stream throughput information: <ul style="list-style-type: none"> <li>bytesProduced</li> <li>bytesConsumed</li> </ul>
label_stats	Information about the labels registered and assigned.
services	The number of active, stopped, failed, and total installed services on the cluster, for example: <ul style="list-style-type: none"> <li>API server</li> <li>CLDB</li> <li>Fileserver</li> <li>File Migrate</li> <li>ResourceManager</li> <li>NodeManager</li> <li>NFSv4</li> <li>hoststats</li> <li>MAST Gateway</li> </ul>

**Understanding how physical, logicalUsed, ecOffloaded data usage is calculated**

Data usage calculations for physical, logicalUsed, and ecOffloaded can be calculated as shown in the following uncompressed and compressed scenarios.

**Scenario:**

There are two tiered volumes in a system (Vol3x and Vol6x), and:

- Vol3x is 3x replicated in the hot tier that uses 10+2 erasure coding
- Vol6x is 6x replicated in the hot tier that uses 4+2 erasure coding

**Data is Uncompressed**

If you write a 100GiB file uncompressed to each volume, for the two volumes:	
logicalUsed = 200	100GiB+100GiB=200GiB
replicatedLogicalUsed = 900	3*100GiB + 6*100GiB = 900GiB
replicatedTotalUsed = 900	For 3x replicated volume: 3*(100/1)=300GiB  For 6x replicated volume: 6*(100/1)=600GiB

ecOffloaded = 0	Nothing is offloaded to the warm tier.
ecTotalUsed = 0	Nothing is offloaded to the warm tier.
<b>If you offload both volumes to the warm tier:</b>	
logicalUsed = 200	200GiB
replicatedLogicalUsed = 900	Note that file data no longer resides on the hot tier, and physical disk space is not consumed. After it is offloaded, this number reflects the metadata of files that previously resided on the hot tier.
replicatedTotalUsed = 900	Note that file data no longer resides on the hot tier, and physical disk space is not consumed. After it is offloaded, this number reflects the metadata of files that previously resided on the hot tier.
ecOffloaded = 200	100GiB+100GiB=200GiB
ecTotalUsed = 270	$[100\text{GiB} * (10+2)/10] + [100\text{GiB} * (4+2)/4] = 120\text{GiB} + 150\text{GiB} = 270\text{GiB}$

**Data is Compressed**

<b>If the 100GiB of logical data in Vol3x and Vol6x is compressed by a factor of 4:1 and writes a100GiB file to each volume:</b>	
logicalUsed = 200	100GiB+100GiB=200GiB
replicatedLogicalUsed = 900	$(3*100\text{GiB}) + (6*100\text{GiB})=900\text{GiB}$
replicatedTotalUsed = 225	For 3x replicated volume: $3*(100/4)=75\text{GiB}$ For 6x replicated volume: $6(100/4)=150\text{GiB}$
ecOffloaded = 0	Nothing is offloaded to the warm tier.
ecTotalUsed = 0	Nothing is offloaded to the warm tier.
<b>If you offload both volumes to the warm tier:</b>	
logicalUsed equals	200GiB

replicatedLogicalUsed = 900	Note that file data no longer resides on the hot tier, and physical disk space is not consumed. After it is offloaded, this number reflects the metadata of files that previously resided on the hot tier.
replicatedTotalUsed = 900	Note that file data no longer resides on the hot tier, and physical disk space is not consumed. After it is offloaded, this number reflects the metadata of files that previously resided on the hot tier.
ecOffloaded = 50	$(100\text{GiB}+100\text{GiB})/4=50\text{GiB}$
ecTotalUsed = 68	$(100\text{GiB}/4) * ((10+2)/10) + (100\text{GiB}/4) * ((4+2)/4) = 30\text{GiB}+37.5\text{GiB} = 67.5\text{GiB}$

## Examples

### Display dashboard information:

#### CLI

```
maprcli dashboard info -json
{
  "timestamp":1599138960056,
  "timeofday":"2020-09-03

**REST**

 **NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X GET https://
abc.sj.us:8443/rest/dashboard/info
```

**View the master security policy cluster:**

**CLI**

```
maprcli dashboard info -json | grep
globalPolicyMaster
{
  "globalPolicyMaster":true
}
```

**dialhome**

The `dialhome` commands are used to change the Dial Home status of the cluster.

**dialhome ackdial**

Acknowledges the most recent Dial Home on the cluster. Permissions required: `login`

**Syntax**

**CLI**

```
maprcli dialhome ackdial
[ -forDay <date> ]
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/dialhome/ackdial[?<parameters>]

### Parameters

Parameter	Description
forDay	Date for which the recorded metrics were successfully dialed home. Accepted values: UTC timestamp or a UTC date in MM/DD/YY format. Default: yesterday

### Sample Output

```
# maprcli dialhome ackdial -forDate 5/26/15
dialhome ackdial
    -forDay Date for which the recorded metrics were successfully dialed
    home. Accepted values: UTC timestamp in millisecond or a UTC date in
    MM/DD/YY format. default: 5/31/15
```

### Examples

#### Acknowledge Dial Home:

##### CLI

```
maprcli dialhome ackdial
```

##### REST

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/dialhome/ackdial
```

#### dialhome enable

Enables Dial Home on the cluster. Permissions required: `fc` or `a`

### Syntax

##### CLI

```
maprcli dialhome enable
    -enable enable/disable dialhome.
    default: true
```

##### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/dialhome/enable

### Parameters

Parameter	Description
enable	Specifies whether to enable or disable Dial Home: <ul style="list-style-type: none"> <li>• false - Disable</li> <li>• true - Enable</li> </ul>

## Output

A success or failure message.

## Sample output

```
# maprcli dialhome enable -enable true
enabled
1

# maprcli dialhome status
enabled
1
```

## Examples

### Enable Dial Home:

#### CLI

```
maprcli dialhome enable -enable true
```

#### REST

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X
POST https://abc.sj.us:8443/rest/
dialhome/enable?enable=true
```

### dialhome lastdialed

Displays the date of the last successful Dial Home call in Unix Epoch time. Permissions required: `fc` or `a`.

## Syntax

#### CLI

```
maprcli dialhome lastdialed
```

#### REST

Request Type	GET
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/dialhome/lastdialed</code>

## Output

The date of the last successful Dial Home call in Unix Epoch time.

## Sample output

```
$ maprcli dialhome lastdialed
date
1322438400000
```

## Examples

### Show the date of the most recent Dial Home:

**CLI**

```
maprcli dialhome lastdialed
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X
GET https://abc.sj.us:8443/rest/
dialhome/lastdialed
```

**dialhome metrics**

Returns a compressed metrics object. Permissions required: `login`.

**Syntax****CLI**

```
maprcli dialhome metrics [ -forDay
<date> ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/dialhome/metrics

**Parameters**

Parameter	Description
forDay	Date for which the recorded metrics were successfully dialed home. Accepted values: UTC timestamp or a UTC date in MM/DD/YY format. Default: yesterday

**Output****Sample output**

```
$ maprcli dialhome metrics
metrics
[B@48067064
```

**Examples****Show the Dial Home metrics:****CLI**

```
maprcli dialhome metrics
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X GET https://
abc.sj.us:8443/rest/dialhome/metrics
```

**dialhome status**

Displays the Dial Home status. Permissions required: `login`.

**Syntax****CLI**

```
maprcli dialhome status
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/dialhome/status

**Output**

The current Dial Home status.

**Sample output**

```
$ maprcli dialhome status
enabled
1
```

**Examples****Display the Dial Home status:****CLI**

```
maprcli dialhome status
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X GET https://
abc.sj.us:8443/rest/dialhome/status
```

**disk**

Lists disk parameters.

**Disk Fields**

The following table shows the fields displayed in the output of the `disk list` and `disk list all` commands. You can choose which fields (columns) to display and sort them in ascending or descending order by any field.

**availablespace**

Terse Name: `dsa`

<b>diskname</b>	Description: Disk space available, in MB. Terse Name: n
<b>error</b>	Description: Name of the disk or partition Terse Name: err Description: Disk error message, in English. Only sent if <b>status</b> is 1.  <b>NOTE:</b> This message is <b>not</b> translated.
<b>failuretime</b>	Terse Name: ft Description: Disk failure time, This field is applicable only for MapR disks. Only sent if <b>status</b> is 1.
<b>firmwareversion</b>	Terse Name: fw Description: Firmware version
<b>fstype</b>	Terse Name: fs Description: File system type
<b>hostname</b>	Terse Name: hn Description: Hostname of the node that owns this disk/partition
<b>labelname</b>	Terse Name: ln Description: The label assigned to the disk. See <a href="#">Using Storage Labels</a> on page 1306 for more information on labels.
<b>modelnum</b>	Terse Name: mn Description: The model number of the disk
<b>mount</b>	Terse Name: mt Description: Disk mount status <ul style="list-style-type: none"> <li>• 0 = unmounted</li> <li>• 1 = mounted</li> </ul>
<b>powerstatus</b>	Terse Name: pst Description: Disk power status: <ul style="list-style-type: none"> <li>• 0 = Active/idle (normal operation)</li> <li>• 1 = Standby (low power mode)</li> <li>• 2 = Sleeping (lowest power mode, drive is completely shut down)</li> </ul>
<b>status</b>	Terse Name: st Description: Disk status: <ul style="list-style-type: none"> <li>• 0 = Good</li> <li>• 1 = Bad disk</li> <li>• 2 = Offline disk</li> </ul>
<b>storagepoolid</b>	Terse Name: sp Description: The ID of the storage pool that comprises the disk

<b>totalspace</b>	Terse Name: dst Description: Total disk space, in MB
<b>usedspace</b>	Terse Name: dsu Description: Disk space used, in MB
<b>uuid</b>	Terse Name: uid Description: A 128-bit number used to uniquely identify and reference disk partitions or volumes across different systems.
<b>vendor</b>	Terse Name: ven Description: Name of the disk vendor

**Related concepts**[node](#) on page 2260

Manages nodes in the cluster

**Related reference**[disk add](#) on page 2124Adds one or more disks to the specified node. Permissions required: `fc` or `a`.[disk setlabel](#) on page 2126Adds a label to disks or a storage pool. Permissions required: `fc` or `a`.[label add](#) on page 2251Registers a label. Permissions required: `fc` or `a`.[volume create](#) on page 2592

Creates a volume.

[volume move](#) on page 2701Moves the specified volume or mirror to a different topology. Permissions required: `m` or `fc` on the volume.[label list](#) on page 2255Lists registered labels. Permissions required: `fc` or `a`.[node list](#) on page 2270

Lists nodes in the cluster.

[dump volumeinfo](#) on page 2171Returns information about volumes and the associated containers. For JSON formatted output, use the `-json` option from the command line.[configure.sh](#) on page 2826Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Ezmeral Data Fabric client nodes, and configuring services for a node.**disk add**Adds one or more disks to the specified node. Permissions required: `fc` or `a`.**Syntax****CLI**

```
maprcli disk add
  -disks <disk names>
  -host <host>
  [ -label <class of the disks>]
  [ -stripeWidth <stripe-width> ]
```

**REST**

Request Type	POST
--------------	------

Request URL	http[s]://<host>:<port>/rest/disk/add?<parameters>
-------------	----------------------------------------------------

## Parameters

### Parameter: disks (Required)

*Default Value:* No default value

*Possible Values:* Any valid disk names

*Description:* A comma-separated list of disk names.

*Examples:*

- /dev/sdc
- /dev/sdd,/dev/sde,/dev/sdf

### Parameter: host (Required)

*Default Value:* No default value

*Possible Values:* Any valid host or IP

*Description:* The hostname or IP address of the machine on which to add the disk.

### Parameter: label (Optional)

*Default Value:* HDD

*Possible Values:* Any label

*Description:* The label to use for the storage pool. See [Using Storage Labels](#) on page 1306 for more information on labels.

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

### Parameter: stripeWidth (Optional)

*Default Value:* No default value

*Possible Values:* Any integer

*Description:* The number of disks per storage pool.

## Output

### Output Fields

Field	Description
ip	The IP address of the machine that owns the disk(s).
disk	The name of a disk or partition. Example <b>sca</b> or <b>sca/sca1</b>
all	The string <b>all</b> , meaning all unmounted disks for this node.

## Example

### Add a disk:

**CLI**

```
maprcli disk add -disks /dev/
sda1 -host 10.250.1.79
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST
https://abc.sj.us:8443/rest/disk/add?
disks=["/dev/sda1"]&host="10.250.1.79"
```

**Related concepts**

[node](#) on page 2260

Manages nodes in the cluster

[Using Storage Labels](#) on page 1306

Describes the Storage Labels feature.

**Related reference**

[disk setlabel](#) on page 2126

Adds a label to disks or a storage pool. Permissions required: `fc` or `a`.

[label add](#) on page 2251

Registers a label. Permissions required: `fc` or `a`.

[volume create](#) on page 2592

Creates a volume.

[volume move](#) on page 2701

Moves the specified volume or mirror to a different topology. Permissions required: `m` or `fc` on the volume.

[label list](#) on page 2255

Lists registered labels. Permissions required: `fc` or `a`.

[node list](#) on page 2270

Lists nodes in the cluster.

[configure.sh](#) on page 2826

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Ezmeral Data Fabric client nodes, and configuring services for a node.

**disk setlabel**

Adds a label to disks or a storage pool. Permissions required: `fc` or `a`.

**Syntax****CLI**

```
maprcli disk setlabel
  -host name/ip
  -disks comma-separated list of
disks
  -label label-name
[ -force Need this parameter to
reassign label to sp, otherwise
reassignment of label
will not happen on sp.
Parameter takes no value]
```

**REST**

Request Type	POST
--------------	------

Request URL	http[s]://<host>:<port>/rest/disk/setlabel?<parameters>
-------------	---------------------------------------------------------

## Parameters

### Parameter: **host** (*Required*)

*Default Value:* No default value

*Possible Values:* Any valid host or IP

*Description:* The hostname or IP address of the machine on which to set the label.

### Parameter: **disks** (*Required*)

*Default Value:* No default value

*Possible Values:* Any valid disk names

*Description:* A comma-separated list of disk names.  
Examples:

- /dev/sdc
- /dev/sdd,/dev/sde,/dev/sdf

### Parameter: **label** (*Required*)

*Default Value:* HDD

*Possible Values:* Any label

*Description:* The label to use for the storage pool. See [Using Storage Labels](#) on page 1306 for more information on labels.

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

### Parameter: **force** (*Optional*)

*Default Value:* Not Applicable

*Possible Values:* Not Applicable

*Description:* Forces reassignment of the label to a storage pool.

## Output

```
# maprcli disk setlabel -host atsqa4-161.qa.lab -disks /dev/sdd -label
label1 -json
{
  "timestamp":1590420155635,
  "timeofday":"2020-05-25 08:22:35.635 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ]
}
```

## Examples

Set label `label1` on disk `/dev/sdd`:

### CLI

```
# maprcli disk setlabel -host
atsqa4-161.qa.lab -disks /dev/sdd -lab
```

```
e1 label1 -json
{
    "timestamp":1590420155635,
    "timeofday":"2020-05-25
08:22:35.635 GMT-0700 AM",
    "status":"OK",
    "total":0,
    "data":[          ]
}
```

**REST**

**NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/disk/setlabel?
host="atsqa4-161.qa.lab"&disks=["/dev/
sdd"]&label="label1"
```

**disk list**

Lists the disks on a node.

**Syntax****CLI**

```
maprcli disk list
-host name/ip
```

```
[ -system 1/0 ]
[ -output <terse|verbose>. default:
verbose ]
[ -startdisk index of the first node
(starting from 0). default: 0 ]
[ -limitdisk number of nodes to
query. default: 2147483647 ]
[ -sortby <hostname|diskname|
mount|vendor|modelnum|serialnum|
firmwareversion|totalspace|usedspace|
availablespace|
fstype|powerstatus|status|errormsg|
storagepoolid|failuretime> ]
[ -sortorder <asc|desc> ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/disk/list?<parameters>

**Parameters**

Parameter	Description
host	<i>(Required)</i> The node on which to list the disks.
output	<i>(Optional)</i> Whether the output should be <code>terse</code> or <code>verbose</code> . Default is <code>verbose</code> .
sortby	<i>(Optional)</i> Specifies one of the following attributes to sort the list of disks by: <code>hostname</code> , <code>diskname</code> , <code>mount</code> , <code>vendor</code> , <code>modelnum</code> , <code>serialnum</code> , <code>firmwareversion</code> , <code>totalspace</code> , <code>usedspace</code> , <code>availablespace</code> , <code>fstype</code> , <code>powerstatus</code> , <code>status</code> , <code>errormsg</code> , <code>storagepoolid</code> , <code>failuretime</code> . Default: <i>Order in which the disks are detected.</i>
sortorder	<i>(Optional)</i> The order to sort the results by. Value can be: <ul style="list-style-type: none"> <li><code>asc</code> - for ascending order</li> <li><code>desc</code> - for descending order</li> </ul> Default: <i>Order in which the disks are detected</i>
startdisk	<i>(Optional)</i> The disk from which to start listing. Default: 0 (first disk)
limitdisk	<i>(Optional)</i> The number of disks to list starting from the <code>startdisk</code> parameter. Default: <code>all</code>

Parameter	Description
system	<p>(Optional) Show only operating system disks:</p> <ul style="list-style-type: none"> <li>• 0 - shows only file system disks</li> <li>• 1 - shows only operating system disks</li> <li>• Not specified - shows both file system and operating system disks (Default)</li> </ul>

## Output

Information about the specified disks. See the [Disk Fields](#) table.

## Sample Output

```
# maprcli disk list -host 10.10.82.23 -output terse
mn          pst          sp  fw  mt  fs          dsu  n          st  dsa
dst         hn          vn
Virtual_disk running      1.0  1  ext4      77  /dev/sda1  0  423

**disk listall**

Lists all disks.

## Syntax

### CLI

```
maprcli disk listall
[ -cluster <cluster> ]
[ -limit <limit>]
[ -output terse|verbose ]
[ -start <offset>]
```

### REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/disk/listall[?<parameters>]

## Parameters

Parameter	Description
cluster	The cluster on which to run the command.
limit	The number of rows to return, beginning at start. Default: 0
output	Always the string terse.
start	The offset from the starting row according to sort. Default: 0

## Output

Information about all disks. See the [Disk Fields](#) table.

### Sample Output

```
# maprcli disk listall -output terse
mn          pst      sp fw  mt fs      dsu  n      st  dsa
dst         hn          vn

```

## Examples

### List all disks:

#### CLI

```
maprcli disk listall
```

#### REST

```
https://abc.sj.us:8443/rest/disk/
listall
```

### disk remove

Removes a disk from file system. Permissions required: `fc` or `a`.

The `disk remove` command does not remove a disk containing unreplicated data, unless forced. To force disk removal, specify `-force` with the value `1` or `true`.

**NOTE:**

- Use the `-force 1`, or the equivalent `-force true` option only if you are sure that you do not need the data on the disk. This option removes the disk without regard to the replication factor or other data protection mechanisms, and may result in permanent data loss.
- Removing a disk in the storage pool that contains Container ID 1 stops the cluster. Container ID 1 contains CLDB data for the master CLDB. Run `disk remove` without the `-force 1`, or the equivalent `-force true` option first, and examine the warning messages to make sure that you are not removing the disk with Container ID 1. If you try to remove a disk associated with the storage pool that contains Container ID 1, you receive an error message similar to the following:

```
ERROR (151) - Failed operation for disk /dev/sdb, Operation may
bring
down cluster due to loss of cluster meta-data.
```

**TIP:** If necessary, run the following command for information on the disk associated with the storage pool that contains Container ID 1:

```
/opt/mapr/server/mrconfig info dumpcontainers | grep cid:1
```

The command output may look similar to the following:

```
cid:1 valid:1 sp:SP1:/dev/sdb
spid:82380c287085486f0058112ecf016b76
prev:0 next:0 issnap:0 isclone:0 deleteinprog:0 fixedbyfsck:0
stale:0
querycldb:0 resyncinprog:0 shared:0 owned:206 logical:206
snapusage:0
snapusageupdated:1 ismirror:0 isrwmirrorcapable:0 role:1
maxUniq:2100150
isResyncSnapshot:0 snapId:0 port:5660
```

To safely remove such a disk, first perform a [CLDB Failover](#) to make one of the other CLDB nodes the primary CLDB, and then remove the disk as normal.

**Syntax****CLI**

```
/opt/mapr/bin/maprcli disk remove
    -host name/ip
    -disks comma-separated list of
    disks
    [ -force <true|false OR 1|0>.
    Required to remove the disk when
    errors have been reported; otherwise,
    the command behaves like a test
    remove when errors are reported.
    If -force is set to false and there
    are no errors, the disk is removed.
    Default: false ]
    [ -cluster cluster_name ]
```

**REST**

Request Type	POST
--------------	------

Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/disk/remove?&lt;parameters&gt;</code>
-------------	--------------------------------------------------------------------------------------

### Parameters

Parameter	Description
<code>host</code>	The hostname or ip address of the node from which to remove the disk.
<code>disks</code>	A list of disks in the form: <code>[ "disk" ]or[ "disk", "disk", "disk"... ]or[ ]</code>
<code>force</code>	Whether to force disk removal. <ul style="list-style-type: none"> <li>• 0 or false (default) - do not remove the disk or disks if there is unreplicated data on the disk</li> <li>• 1 or true - remove the disk or disks regardless of data loss, or other consequences</li> </ul>
<code>cluster</code>	The cluster on which to run the command.

### Output

#### Output Fields

Field	Description
<code>disk</code>	The name of a disk or partition. Example: <code>sca</code> or <code>sca/sca1</code>
<code>all</code>	The string <code>all</code> , meaning all unmounted disks attached to the node.
<code>disks</code>	A comma-separated list of disks which have non-replicated volumes. For example, <code>"sca"</code> or <code>"sca/sca1,scb"</code>

### Examples

#### Remove a disk:

##### CLI

```
/opt/mapr/bin/maprcli disk
remove -disks /dev/sda
```

##### REST

```
https://abc.sj.us:8443/rest/disk/
remove?disks=/dev/sda
```

#### dump

Returns key information about volumes, containers, storage pools, and Data Fabric cluster services for debugging and troubleshooting.

**dump balancerinfo**

Returns detailed information about the storage pools on a cluster. If there are any active container moves, the command returns information about the source and destination storage pools.

The `maprcli dump balancerinfo` command enables you to see how much space is used in storage pools and to track active container moves. For best results, use the `-json` option when running `dump balancerinfo` from the command line.

The *disk space balancer* is a tool that balances disk space usage on a cluster by moving containers between storage pools. Whenever a storage pool is over 70% full (or a threshold defined by the `cldb.balancer.disk.threshold.percentage` parameter), the disk space balancer distributes containers to other storage pools that have lower utilization than the average for that cluster. The disk space balancer aims to ensure that the percentage of space used on all the disks in the node is similar. For more information, see [Disk Space Balancer](#).

**Syntax****CLI**

```
maprcli dump balancerinfo
[-cluster <cluster name>]
```

**REST**

N/A

**Parameters**

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.

**Output**

The `maprcli dump balancerinfo` command returns detailed information about the storage pools on a cluster. If there are any active container moves, the command returns information about the source and destination storage pools.

```
# maprcli dump balancerinfo -cluster my.cluster.com -json
{
  "timestamp":1337036566035,
  "status":"OK",
  "total":187,
  "data":[
    {
      "spid":"4bc329ce06752062004fala537abcdef",
      "fsid":5410063549464613987,
      "ip:port":"10.50.60.72:5660-",
      "capacityMB":1585096,
      "usedMB":1118099,
      "percentage":70,
      "fullnessLevel":"AboveAverage",
      "inTransitMB":0,
      "outTransitMB":31874
    },
    {
      "spid":"761fec1fabf32104004fad9630ghijkl",
      "fsid":3770844641152008527,
      "ip:port":"10.50.60.73:5660-",
```

```

        "capacityMB":1830364,
        "usedMB":793679,
        "percentage":47,
        "fullnessLevel": "BelowAverage",
        "inTransitMB":79096,
        "outTransitMB":0
    },
    ....
{
    "containerid":4034,
    "sizeMB":16046,
    "From fsid":5410063549464613987,
    "From IP:Port": "10.50.60.72:5660-",
    "From SP": "4bc329ce06752062004fala537abcefg",
    "To fsid":3770844641152008527,
    "To IP:Port": "10.50.60.73:5660-",
    "To SP": "761fec1fabf32104004fad9630ghijkl"
},

```

### Output fields

Field	Description
spid	The unique ID number of the storage pool.
fsid	The unique ID number of the file server. The FSID identifies an file system instance or a node that has file system running in the cluster. Typically, each node has a group of storage pools, so the same FSID will correspond to multiple SPIDs.
ip:port	The host IP address and file system port.
capacityMB	The total capacity of the storage pool (in MB).
usedMB	The amount of space used on the storage pool (in MB).
percentage	The percentage of the storage pool currently utilized. A ratio of the space used ( <i>usedMB</i> ) to the total capacity ( <i>capacityMB</i> ) of the storage pool.
fullnessLevel	The fullness of the storage pool relative to the fullness of the rest of the cluster. Possible values are <i>OverUsed</i> , <i>AboveAverage</i> , <i>Average</i> , <i>BelowAverage</i> , and <i>UnderUsed</i> . For more information, see Monitoring storage pool space usage below.
inTransitMB	The amount of data (in MB) that the disk space balancer is currently moving into a storage pool.
outTransitMB	The amount of data (in MB) that the disk space balancer is currently moving out of a storage pool.

The following fields are returned only if the disk space balancer is actively moving one or more containers at the time the command is run.

Field	Description
containerid	The unique ID number of the container.
sizeMB	The amount of data (in MB) being moved.
From fsid	The FSID (file server ID number) of the source file server.
From IP:Port	The IP address and port number of the source node.
From SP	The SPID (storage pool ID) of the source storage pool.
To fsid	The FSID (file server ID number) of the destination file server.
To IP:Port	The IP address and port number of the destination node.
To SP	The SPID (storage pool ID number) of the destination storage pool.

## Examples

### Monitoring storage pool space usage

You can use the `maprcli dump balancerinfo` command to monitor space usage on storage pools.

```
# maprcli dump balancerinfo -json

{
    ...
    "spid": "4bc329ce06752062004fala537abcefg",
    "fsid": "5410063549464613987",
    "ip:port": "10.50.60.72:5660-",
    "capacityMB": 1585096,
    "usedMB": 1118099,
    "percentage": 70,
    "fullnessLevel": "AboveAverage",
    "inTransitMB": 0,
    "outTransitMB": 31874
},
```

### Tracking active container moves

Using the `maprcli dump balancerinfo` command you can monitor the activity of the disk space balancer. Whenever there are active container moves, the command returns information about the source and destination storage pools.

```
# maprcli dump balancerinfo -json

{
    ...
    "containerid": 7840,
    "sizeMB": 15634,
    "From fsid": "8081858704500413174",
    "From IP:Port": "10.50.60.64:5660-",
    "From SP": "9e649bf0ac6fb9f7004fal9d20rstuvw",
    "To fsid": "3770844641152008527",
    "To IP:Port": "10.50.60.73:5660-",
    "To SP": "fefcc342475f0286004fad963flmnopq"
}
```

The example shows that a container (7840) is being moved from a storage pool on node 10.50.60.64 to a storage pool on node 10.50.60.73.

**TIP:** You can use the storage pool IDs (SPIDs) to search the CLDB and file system logs for activity (balancer moves, container moves, creates, deletes, etc.) related to specific storage pools.

### dump balancermetrics

Returns a cumulative count of container moves and MB of data moved between storage pools.

The `maprcli dump balancermetrics` command returns a cumulative count of container moves and MB of data moved between storage pools. You can run this command periodically to determine how much data has been moved by the disk space balancer between two intervals. For best results, use the `-json` option when running `dump balancermetrics` from the command line.

The *disk space balancer* is a tool that balances disk space usage on a cluster by moving containers between storage pools. Whenever a storage pool is over 70% full (or it reaches a threshold defined by the `cldb.balancer.disk.threshold.percentage` parameter), the disk space balancer distributes containers to other storage pools that have lower utilization than the average for that cluster. The disk space balancer aims to ensure that the percentage of space used on all the disks in the node is similar. For more information, see [Disk Space Balancer](#).

### Syntax

#### CLI

```
maprcli dump balancermetrics
[-cluster <cluster name>]
```

#### REST

N/A

### Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.

### Output

The `maprcli dump balancermetrics` command returns a cumulative count of container moves and MB of data moved between storage pools since the current CLDB became the master CLDB.

```
# maprcli dump balancermetrics -json
{
  "timestamp":1337770325979,
  "status":"OK",
  "total":1,
  "data":[
    {
      "numContainersMoved":10090,
      "numMBMoved":3147147,
      "timeOfLastMove": "Wed May 23 03:51:44 PDT 2012"
    }
  ]
}
```

### Output fields

Field	Description
numContainersMoved	The number of containers moved between storage pools by the disk space balancer.
numMBMoved	The total MB of data moved between storage pools on the cluster.
timeOfLastMove	The date and time of most recent container move.

### Example

#### CLI

```
maprcli dump balancermetrics -cluster
10.10.82.23 -json
```

### dump cldbnodes

Lists the nodes that contain *container location database* (CLDB) data.

The CLDB is a service running on one or more Data Fabric nodes that maintains the location of cluster containers, services, and other information. The CLDB automatically replicates its data to other nodes in the cluster, preserving at least two (and generally three) copies of the CLDB data. If the CLDB process dies, it is automatically restarted on the node.

### Syntax

#### CLI

```
maprcli dump cldbnodes
[-cluster <cluster name>]
-zkconnect <ZooKeeper Connect
String>
-json | -long
```

**NOTE:** For best results, use the `-json` option from the command line.

#### REST

N/A

### Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
zkconnect	A ZooKeeper connect string, which specifies a list of the hosts running ZooKeeper, and the port to use on each, in the format: ' <code>&lt;host&gt;[:&lt;port&gt;][,&lt;host&gt;[:&lt;port&gt;]...]</code> '. To obtain zookeeper connection strings, use the <code>maprcli node listzookeepers</code> command.
json   long	This command returns multiple levels of data. You need to specify either JSON format or "long" format to see the full output.

## Output

The `maprcli dump cldbnodes` command returns the IP address and port number of the CLDB nodes on the cluster.

```
$ maprcli dump cldbnodes -zkconnect centos23.lab:5181 -json
{
  "timestamp":1433270634424,
  "timeofday":"2015-06-02 06:43:54.424 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "valid":[
        "10.10.82.23:5660-",
        "10.10.82.28:5660-",
        "10.10.82.29:5660-",
        "10.10.82.22:5660-"
      ]
    }
  ]
}
```

## Example

### CLI

```
maprcli dump cldbnodes -zkconnect
centos23.lab:5181 -json
```

### dump containerinfo

Returns detailed information about one or more specified containers.

A *container* is a unit of sharded storage in a data-fabric cluster. Every container in a data-fabric volume is either a *name container* or a *data container*.

**TIP:** For an explanation of sharding, see the [Configuring the Chunk Size](#) topic.

The name container is the first container in a volume and holds that volume's namespace and file chunk locations. Depending on its replication role, a name container may be either a *master container* (part of the original copy of the volume) or a *replica container* (one of the replicas in the replication chain).

Every data container is either a *master container*, an *intermediate container*, or a *tail container*.

## Syntax

### CLI

```
maprcli dump containerinfo
[-cluster <cluster name>]
-ids <id1,id2,id3 ...>
[-ctime <true|false>]
```

**NOTE:** For best results, use the `-json` option from the command line.

### REST

N/A

## Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
ids	Specifies one or more container IDs. Container IDs are comma separated. The <code>maprcli dump containers</code> command provides the container ID required for <code>-ids</code> parameter.
ctime	Set to <code>true</code> to display container state/role change time. Default: <code>false</code>

## Output

The `maprcli dump containerinfo` command returns information about one or more containers.

```
# maprcli dump containerinfo -ids 1 -ctime true -json
{
  "timestamp":1507024362685,
  "timeofday":"2017-10-03 02:52:42.685 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "ContainerId":1,
      "Epoch":9,
      "Master":"10.10.105.35:5660--9-VALID",
      "ActiveServers":{
        "IP":[
          "10.10.105.35:5660-192.168.122.1:5660--3-VALID, ctime: 2020-09-07 23:15:40"
          "10.10.105.36:5660-192.168.122.1:5660--3-VALID, ctime: 2020-09-07 23:44:40"
          "10.10.105.37:5660-192.168.122.1:5660--3-VALID, ctime: 2020-09-07 23:46:40"
        ],
        "ExtIP":[
          "10.10.104.35:5660-10.10.104.35:5692",

          "10.10.104.37:5660-10.10.104.37:5692"
        ]
      },
      "InactiveServers":{
      },
      "UnusedServers":{
      },
      "OwnedSizeMB":"0 MB",
      "SharedSizeMB":"0 MB",
      "LogicalSizeMB":"0 MB",
      "TotalSizeMB":"0 MB",
    }
  ]
}
```

```

        "NameContainer": "true",
        "CreatorContainerId": 0,
        "CreatorVolumeUuid": "",
        "UseActualCreatorId": false,
        "VolumeName": "mapr.cldb.internal",
        "VolumeId": 1,
        "VolumeReplication": 3,
        "NameSpaceReplication": 3,
        "VolumeMounted": false,
        "AccessTime": "September 29, 2017"
    }
}

```

### Output fields

Field	Description
ContainerID	The unique ID number for the container.
Epoch	A sequence number that indicates the most recent copy of the container. The CLDB uses the epoch to ensure that an out-of-date copy cannot become the master for the container.
Master	The physical IP address and port number of the <i>master copy</i> . The master copy is part of the original copy of the volume.
ActiveServers	The physical IP address and port number of each active node on which the container resides.
InactiveServers	The physical IP address and port number of each inactive node on which the container resides.
UnusedServers	The physical IP address and port number of servers from which no "heartbeat" has been received for quite some time.
OwnedSizeMB	The size on disk (in MB) dedicated to the container.
SharedSizeMB	The size on disk (in MB) shared by the container.
LogicalSizeMB	The logical size on disk (in MB) of the container.
TotalSizeMB	The total size on disk (in MB) allocated to the container. Combines the Owned Size and Shared Size.
Mtime	The time of the last modification to the contents of the container.
NameContainer	Indicates if the container is the <i>name container</i> for the volume. If <code>true</code> , the container holds the volume's namespace information and file chunk locations.
VolumeName	The name of the volume.
VolumeId	The unique ID number of the volume.
VolumeReplication	The <i>replication factor</i> , the number of copies of a volume excluding the original.

Field	Description
VolumeMounted	Indicates whether the volume is mounted. If <code>true</code> , the volume is currently mounted. If <code>false</code> , the volume is not mounted.

### Example

#### CLI

```
maprcli dump containerinfo -ids 2049
-ctime true -json
```

### dump cldbmetainfo

Prints metadata from the *container location database* (CLDB) tables.

### Syntax

#### CLI

```
maprcli dump cldbmetainfo
-json
```

**NOTE:** For formatted results, use the `-json` option from the command line.

#### REST

N/A

### Parameters

Parameter	Description
<code>json</code>	Returns formatted output

### Output

The `maprcli dump cldbmetainfo` command lists meta information from the CLDB tables, For an explanation of the output fields, see [fid stat](#) on page 2193.

```
$ maprcli dump cldbmetainfo -json
{
  "timestamp":1433270634424,
  "timeofday":"2020-06-02 06:43:54.424 GMT+0000",
  "status":"OK",
  "total":2,
  "data":[
    {
      "name":"cntrSzTable7",
      "type":"FTKvstore",
      "parent fid":"<parentCID>.32.131332",
      "fid":"1.97.131462",
      "size":7,
      "nblocks":1,
      "lblocks":0,

        "networkencryption":false,
        "diskflush":false,
        "nlevels":0
    }
]
}

```

**Example****CLI**

```
maprcli dump cldbmetainfo -json
```

**dump cldbstate**

Prints the state of the *container location database* (CLDB).

**Syntax****CLI**

```
maprcli dump cldbstate
[ -cluster cluster_name ]
[ -hostip host name or ip ]
```

**REST**

Request Type	POST
Request URL	http[s]://<host:port>/rest/dump/cldbstate

## Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
hostip	The node from which to retrieve the state of CLDB. If this parameter is omitted, the command returns the CLDB state from all nodes in the cluster.

## Output

The `maprcli dump cldbstate` command lists the state of the CLDB database.

```
$ maprcli dump cldbstate
mode          ip          state          stateDuration desc
SLAVE_READ_ONLY x.x.x.x CLDB_IS_SLAVE_READ_ONLY 03:54:25 cldb
running as slave
SLAVE_READ_ONLY x.x.x.x CLDB_IS_SLAVE_READ_ONLY 03:54:16 cldb
running as slave
MASTER_READ_WRITE x.x.x.x CLDB_IS_MASTER_READ_WRITE 04:07:58 kvstore
tables loading complete,
cldb
running as master
```

Field	Description
mode	The CLDB mode. A CLDB instance can either run as a Primary or a Secondary instance. The only two states that a CLDB instance should settle in are: <ul style="list-style-type: none"> <li>SLAVE_READ_ONLY</li> <li>MASTER_READ_WRITE</li> </ul> If a CLDB instance spends a significant amount of time in a state other than these two, then it is highly likely that there is an issue that requires administrative intervention.
ip	The IP address of the node from which the CLDB state is retrieved.
state	Indicates whether the CLDB instance is run as a Secondary with READ_ONLY privilege, or as a Primary with READ_WRITE privilege.
stateDuration	The amount of time in HH:MM:SS format that the CLDB instance has spent in this state.
desc	The description of the state (either Primary or Secondary).

## Example

### dump cldbstate command without any parameter

#### CLI

```
# maprcli dump cldbstate
mode          s3Info ip
state          stateDuration desc

**dump containers**

Returns information about containers in a cluster.

This command provides information about containers based on the following `-type` criteria:

- `offline` - Returns information about containers that have no valid copies online. This command is useful when you need to find out exactly what data is offline (for example, when a "volume data unavailable" alarm is raised).
- `resync` - Returns information about containers that are resynchronizing.
- `bm` - Returns information about containers that are becoming master but are not yet master.
- `unused` - Returns information about containers that are unused.

- `waiting` - Returns information about containers that are waiting for a role.

A *container* is a unit of sharded storage in a HPE Ezmeral Data Fabric cluster. Every container in a HPE Ezmeral Data Fabric volume is either a *name container* or a *data container*. The name container is the first container in a volume and holds that volume's namespace and file chunk locations. Depending on its replication role, a name container may be either a *master container* (part of the original copy of the volume) or a *replica container* (one of the replicas in the replication chain).

Every data container is either a *master container*, an *intermediate container*, or a *tail container*.

### Syntax

#### CLI

```
maprcli dump containers
  [ -cluster <cluster_name> ]
  -type offline|resync|bm|waiting|
  unused
```

 **NOTE:** For best results, use the `-json` option from the command line.

#### REST

N/A

### Parameters

Parameter	Description
<code>cluster</code>	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
<code>type</code>	Specifies the type of information that is returned about the containers: <ul style="list-style-type: none"> <li>• <code>offline</code> - Returns information about containers that have no valid copies online.</li> <li>• <code>resync</code> - Returns information about containers that are resynchronizing.</li> <li>• <code>bm</code> - Returns information about containers that are becoming master but are not yet master.</li> <li>• <code>unused</code> - Returns information about containers that are unused.</li> <li>• <code>waiting</code> - Returns information about containers that are waiting for a role.</li> </ul>

### Output fields

Field	Description
ContainerID	The unique ID number for the container.

Field	Description
Epoch	A sequence number that indicates the most recent copy of the container. The CLDB uses the epoch to ensure that an out-of-date copy cannot become the master for the container.
	The physical IP address and port number of the <i>primary copy</i> . The primary copy is part of the original copy of the volume.
ActiveServers	The physical IP address and port number of each active node on which the container resides.
InactiveServers	The physical IP address and port number of each inactive node on which the container resides.
UnusedServers	The physical IP address and port number of servers from which no "heartbeat" has been received for quite some time.
OwnedSizeMB	The size on disk (in MB) dedicated to the container.
SharedSizeMB	The size on disk (in MB) shared by the container.
LogicalSizeMB	The logical size on disk (in MB) of the container.
TotalSizeMB	The total size on disk (in MB) allocated to the container. Combines the Owned Size and Shared Size.
Mtime	The time of the last modification to the contents of the container.
NameContainer	Indicates if the container is the <i>name container</i> for the volume. If <code>true</code> , the container holds the volume's namespace information and file chunk locations.
VolumeName	The name of the volume.
VolumeId	The unique ID number of the volume.
VolumeReplication	The <i>replication factor</i> , the number of copies of a volume excluding the original.
VolumeMounted	Indicates whether the volume is mounted. If <code>true</code> , the volume is currently mounted. If <code>false</code> , the volume is not mounted.

### Example

#### CLI

```
maprcli dump containers -type
offline -cluster my.cluster -json
```

## Output Samples

The following `maprcli dump containers -type offline` command returns information about all offline containers.

```
# maprcli dump containers -type offline -json
{
  "timestamp":1348174731389,
  "status":"OK",
  "total":11,
  "data":[
    {
      "ContainerId":2060,
      "Epoch":3,
      : "unknown ip (0)-0-VALID",
      "ActiveServers":{
      },
      "InactiveServers":{
      },
      "UnusedServers":{
        "IP:Port":"10.10.20.39:5660--3"
      },
      "OwnedSizeMB":"0 MB",
      "SharedSizeMB":"0 MB",
      "LogicalSizeMB":"0 MB",
      "TotalSizeMB":"0 MB",
      "NameContainer":"true"
    },
    {
      "ContainerId":2185,
      "Epoch":3,
      : "unknown ip (0)-0-VALID",
      "ActiveServers":{
      },
      "InactiveServers":{
      },
      "UnusedServers":{
        "IP:Port":"10.10.20.39:5660--3"
      },
      "OwnedSizeMB":"0 MB",
      "SharedSizeMB":"0 MB",
      "LogicalSizeMB":"0 MB",
      "TotalSizeMB":"0 MB",
      "NameContainer":"false"
    },
    ...
  ],
}
```

The following `maprcli dump containers -type resync` command returns information about containers that are resynchronizing.

```
# maprcli dump containers -type resync -json
{
  "timestamp":1438666159569,
  "timeofday":"2015-08-03 10:29:19.569 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    {
      "InstanceCount":1,
    }
  ],
}
```

```

"ContainerId":2242,
"Epoch":4,
:"10.10.103.30:5660--4-VALID",
"ActiveServers":{
  "IP:Port":[
    "10.10.103.30:5660--4-VALID",
    "10.10.103.28:5660--4-VALID",
    "10.10.103.29:5660--3-RESYNC"
  ]
},
"InactiveServers":{
},
"UnusedServers":{
},
"OwnedSizeMB":"0 MB",
"SharedSizeMB":"0 MB",
"LogicalSizeMB":"0 MB",
"TotalSizeMB":"0 MB",
"NameContainer":"true",
"CreatorContainerId":0,
"CreatorVolumeUuid":""
}
]

```

**dump ecginfo**

Indicates whether rebuild is in progress for a container from CLDB.

**Syntax**

**CLI**

```

maprcli dump ecginfo -h
dump ecginfo
    [ -cluster cluster_name ]
    -ids ids

```

 **NOTE:** For best results, use the `-json` option from the command line.

**REST**

N/A

**Parameters**

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
ids	The container gateway ID to use to retrieve rebuild information.

**Output fields**

Field	Description
ContainerID	The unique ID number for the container.

Field	Description
Epoch	A sequence number that indicates the most recent copy of the container. The CLDB uses the epoch to ensure that an out-of-date copy cannot become the master for the container.
Master	The physical IP address and port number of the <i>master copy</i> . The master copy is part of the original copy of the volume.
ActiveServers	The physical IP address and port number of each active node on which the container resides.
InactiveServers	The physical IP address and port number of each inactive node on which the container resides.
UnusedServers	The physical IP address and port number of servers from which no "heartbeat" has been received for quite some time.
OwnedSizeMB	The size on disk (in MB) dedicated to the container.
SharedSizeMB	The size on disk (in MB) shared by the container.
LogicalSizeMB	The logical size on disk (in MB) of the container.
TotalSizeMB	The total size on disk (in MB) allocated to the container. Combines the Owned Size and Shared Size.
NumNodesInUse	The total number of nodes that this container occupies.
Mtime	The time of the last modification to the contents of the container.
NameContainer	Indicates if the container is the <i>name container</i> for the volume. If <code>true</code> , the container holds the volume's namespace information and file chunk locations.
ecCgid	The gateway ID of this container.
isRebuildInProgress	<code>true</code> indicates that the container is being rebuilt.
CreatorContainerId	ID for the container.
CreatorVolumeUuid	ID that supports the container chain identification for mirroring. The <code>creatorcontainerid</code> and <code>creatorvolumeuuid</code> fields combined form a unique identifier for the container chain.
UseActualCreatorId	Value can be true or false. ID of the user who created the container.

### Example

#### CLI

```
maprcli dump ecginfo -ids <cgid> -json
```

## Output Samples

The following command returns information about container gateway ID 2351 .

```
maprcli dump ecginfo -ids 2351 -json

"cid2":{
  "ContainerId":2353,
  "Epoch":5,
  "Master":"10.10.102.51:5660--5-VALID",
  "ActiveServers":{
    "IP":"10.10.102.51:5660--5-VALID"
  },
  "InactiveServers":{
  },
  "UnusedServers":{
    "IP":"10.10.102.49:5660--3"
  },
  "OwnedSizeMB":"381 MB",
  "SharedSizeMB":"0 MB",
  "LogicalSizeMB":"381 MB",
  "TotalSizeMB":"381 MB",
  "NumInodesInUse":229,
  "Mtime":"June 10, 2020",
  "NameContainer":"false",
  "ecCgId ":2351,
  "isRebuildInProgress ":true,
  "CreatorContainerId":0,
  "CreatorVolumeUuid":"","
  "UseActualCreatorId":true
},
```

### Related reference

[mastgateway ecgstats](#) on page 2953

Returns the list of containers under rebuild from CGManager.

### dump replicationmanagerinfo

Returns information about which containers are under or over replicated in a specified volume.

For each container, the command displays the current state of that container.

## Syntax

### CLI

```
maprcli dump replicationmanagerinfo
  [-cluster <cluster name>]
  -volumename <volume name>
  [-ctime <true|false>]
```

**NOTE:** For best results, use the `-json` option from the command line.

### REST

## Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
volumename	Specifies the name of the volume. To obtain a volume name, use the <code>maprcli volume list</code> command.
ctime	Set to <code>true</code> to display container state/role change time. Default: <code>false</code>

## Output

The `maprcli dump replicationmanagerinfo` returns information about volumes and the containers on those volumes including the nodes on which the containers have been replicated and the space allocated to each container. If replication activity is not underway when the `maprcli` command is executed, no container information is included. If replication activity is underway, details of containers are listed.

```
# maprcli dump replicationmanagerinfo -volumename mapr.metrics -ctime true
-json
{
  "timestamp":1433449934381,
  "timeofday":"2015-06-04 08:32:14.381 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {

      "Epoch":9,
      "Master":"10.250.1.15:5660-172.16.122.1:5660-192.168.115.1:5660--9-VALID",
      "ActiveServers":{
        "IP:Port":"10.250.1.15:5660-172.16.122.1:5660-192.168.115.1:5660--9-VALID",
        ctime: 2020-09-07 23:15:40"
      },
      "InactiveServers":{
      },
      "UnusedServers":{
      },
      "OwnedSizeMB":"1 MB",
      "SharedSizeMB":"0 MB",
```

```

        "LogicalSizeMB": "1 MB",
        "Mtime": "Mon Apr 30 16:40:41 PDT 2012",
        "NameContainer": "true"
    }
}

```

### Output fields

Field	Description
VolumeName	Indicates the name of the volume.
Volumeld	Indicates the ID number of the volume.
VolumeTopology	The volume topology corresponds to the node topology of the rack or nodes where the volume resides. By default, new volumes are created with a topology of / (root directory). For more information, see <a href="#">Volume Topology</a> .
VolumeUsedSizeMB	The size on disk (in MB) of the volume.
VolumeReplication	The desired replication factor, the number of copies of a volume excluding the original. The default value is 3.
VolumeMinReplication	The minimum replication factor, the number of copies of a volume (excluding the original) that should be maintained by the data-fabric cluster for normal operation. When the replication factor falls below this minimum, writes to the volume are disabled. The default value is 2.
MirrorThrottle	Specifies whether mirror throttling is enabled (true) or disabled (false). Throttling is set on the source volume and applies to all its mirrors. This property was introduced in version 4.0.2.
AccessTime	A value that can be used to determine which volumes are accessed regularly. This value is updated every 6 hours with the last time that an operation occurred on the volume. The access time is not updated for changes to volume properties, creation of a snapshot, or synchronization between a volume and a mirror. However, the volume access time is updated the first time you upgrade to a data-fabric version that includes this property. This property was introduced in version 4.0.2.
limitSpread	An internal flag for data-fabric volumes to control the growth of volume in terms of number of containers. When this flag is set, cldb tries to limit the number of new containers created depending on the present size of volume. If volume size (data in volume) is small, cldb tries to reuse space in existing containers to avoid the creation of new containers. This helps reduce the wasting of containers IDs in an environment that has small volumes.
ContainerId	The unique ID number for the container.
Epoch	A sequence number that indicates the most recent copy of the container. The CLDB uses the epoch to ensure that an out-of-date copy cannot become the master for the container.

Field	Description
Master	The physical IP address and port number of the <i>master copy</i> . The master copy is part of the original copy of the volume.
ActiveServers	The physical IP address and port number of each active node on which the container resides.
InactiveServers	The physical IP address and port number of each inactive node on which the container resides.
UnusedServers	The physical IP address and port number of each on which the container does not reside.
OwnedSizeMB	The size on disk (in MB) dedicated to the container.
SharedSizeMB	The size on disk (in MB) shared by the container.
LogicalSizeMB	The logical size on disk (in MB) of the container.
Mtime	Indicates the time of the last modification to the container's contents.
NameContainer	Indicates if the container is the <i>name container</i> for the volume. If <code>true</code> , the container is the volume's first container and replication occurs simultaneously from the master to the intermediate and tail containers.

### Example

#### CLI

```
maprcli dump
replicationmanagerinfo -cluster
docs41cluster -volumename
mapr.metrics -ctime true -json
```

### dump replicationmanagerqueueinfo

Returns information that enables you to check the status of containers in various replication manager queues like under-replicated containers, and over-replicated containers, etc.

### Syntax

#### CLI

```
maprcli dump
replicationmanagerqueueinfo
[-cluster <cluster name>]
-queue <queue>
```

**NOTE:** For best results, use the `-json` option from the command line.

#### REST

N/A

## Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
queue	The name of the queue. Valid values are 0, 1, 2, or 5. Queue 0 includes containers that have copies below the minimum replication factor for the volume. Queue 1 includes containers that have copies below the replication for the volume, but above the minimum replication factor. Queue 2 includes containers that are over-replicated. Queue 5 includes containers which are not rack aware.

## Output

The `maprcli dump replicationmanagerqueueinfo` command returns information about one of these queues: 0, 1, 2, or 5. Depending on the queue value entered, the command displays information about containers that are under-replicated or over-replicated. You can use this information to decide if you need to change the replication factor for that volume.

```
# maprcli dump replicationmanagerqueueinfo -queue 0
Mtime                               LogicalSizeMB  UnusedServers  ActiveServers
TotalSizeMB  NameContainer  InactiveServers  ContainerId

### Output fields

Field	Description
ContainerID	The unique ID number of the container.
Epoch	A sequence number that indicates the most recent copy of the container. The CLDB uses the epoch to ensure that an out-of-date copy cannot become the master for the container.

Field	Description
Master	The physical IP address and port number of the <i>master copy</i> . The master copy is part of the original copy of the volume.
ActiveServers	The physical IP address and port number of each active node on which the container resides.
InactiveServers	The physical IP address and port number of each inactive node on which the container resides.
UnusedServers	The physical IP address and port number of servers from which no "heartbeat" has been received for quite some time.
OwnedSizeMB	The size on disk (in MB) dedicated to the container.
SharedSizeMB	The size on disk (in MB) shared by the container.
LogicalSizeMB	The logical size on disk (in MB) of the container.
TotalSizeMB	The total size on disk (in MB) allocated to the container. Combines the Owned Size and Shared Size.
Mtime	The time of the last modification to the contents of the container.
NameContainer	Indicates if the container is the <i>name container</i> for the volume. If <code>true</code> , the container holds the volume's namespace information and file chunk locations.

### Example

#### CLI

```
maprcli dump
replicationmanagerqueueinfo -queue
0 -json
```

#### **dump rereplicationinfo**

Returns information about the ongoing re-replication of replica containers.

This information includes the destination IP address and port number, the ID number of the destination file server, and the ID number of the destination storage pool.

Re-replication occurs whenever the number of available replica containers drops below the number prescribed by that volume's replication factor. Re-replication may occur for a variety of reasons including replica container corruption, node unavailability, hard disk failure, or an increase in replication factor.

#### Syntax

#### CLI

```
maprcli dump rereplicationinfo
[-cluster <cluster name>]
```

**NOTE:** For best results, use the `-json` option from the command line.

#### REST

N/A

## Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.

## Output

The `maprcli dump rereplicationinfo` command returns information about the ongoing re-replication of replica containers including the destination IP address and port number, the ID number of the destination file server, and the ID number of the destination storage pool.

```
# maprcli dump rereplicationinfo -json
{
  "timestamp":1338222709331,
  "status":"OK",
  "total":7,
  "data":[
    {
      "containerid":2158,
      "replica":{
        "sizeMB":15467,
        "To fsid":9057314602141502940,
        "To IP:Port":"192.0.2.28:5660-",
        "To SP":"03b5970f41abbe48004f828abaabcdef"
      }
    },

        "To SP":"6cd440fad0426db7004f828b2amnopr"
      }
    },
    {
      "containerid":8833,
      "replica":{
        "sizeMB":7327,
        "To fsid":9057314602141502940,
```

```

        "To IP:Port" : "192.0.2.28:5660- " ,
        "To SP" : "33885e3c5be9a04d004f828abcstuvwxyz"
    }
}
    ]
}

```

**Output fields**

Field	Description
sizeMB	The amount of data (in MB) being moved.
To fsid	The ID number (FSID) of the destination file server.
To IP:Port	The IP address and port number of the destination node.
To SP	The ID number (SPID) of the destination storage pool.

**Example**

CLI

```
maprcli dump rereplicationinfo -json
```

**dump rereplicationmetrics**

Displays information about containers that were copied by the replication manager.

This command displays the following fields :

- numContainersCopied - The number of containers that were copied by the replication manager to maintain the volume's replication factor or topology since the current CLDB was the master.
- numMBCopied -The cumulative size of the containers that were copied by the replication manager to maintain the volume's replication factor or topology since the current CLDB was the master.

**Syntax**

CLI

```
maprcli dump rereplicationmetrics
[-cluster <cluster name>]
```

REST

N/A

**Parameters**

Parameter	Description
cluster	Cluster name.

**Example**

CLI

```
maprcli dump rereplicationmetrics
```

## Example Output

```
# maprcli dump rereplicationmetrics
numContainersCopied  numMBCopied
0                    0
```

### dump rolebalancerinfo

Returns information about active replication role switches.

Use the `dump rolebalancerinfo` command to see if the replication role balancer is currently switching the replication roles of any containers in a cluster. For example, if too many data containers with the master or intermediate roles exist within a storage pool, the replication role balancer switches the role of some of these containers to the tail role to evenly spread the load across nodes during the replication process. If the role balancer is not currently switching the roles of any containers, the command returns a message stating that there are no active role switches.

You can include some additional parameters with the `dump rolebalancerinfo` command, such as the `volumeinfo` parameter, which provides information about how the replication role balancer balanced container roles across each storage pool in a particular volume.

See [Replication Role Balancer](#) for more information about how the replication role balancer works.

For the best readability, use the `-json` option at the end of the command.

## Syntax

### CLI

```
maprcli dump rolebalancerinfo
      [ -cluster cluster_name ]
      [ -namectrinfo Get
NameContainers Info Parameter takes
no value ]
      [ -stats Gets RoleBalancer
AcitveSwitches Info Parameter takes
no value ]
      [ -volumeinfo Gets Balancing
Info for Volumes(s) Parameter takes
no value ]
      [ -volumename Specifies the
name of the volumes ]
```

### REST

N/A

## Parameters

Parameter	Description
cluster	The cluster on which to run the command. When you omit this parameter, the command runs on the same cluster where it is issued. In a multi-cluster environment, use this parameter to specify a particular cluster.
stats	Provides a list of active switches for the role balancer. The command returns the same information with or without this parameter.
volumeinfo	Provides the volume balancing information and details how the container roles are balanced across each storage pool in a volume. Requires the <code>volumename</code> parameter.
volumename	The name of the volume. To obtain volume names, use the <code>maprcli volume list</code> command.

namectrinfo	Provides information about how the name containers are distributed across the storage pools in the cluster, including how many name containers are master and tail containers. Useful when the replication role balancer is configured to balance container roles by count instead of size.
-------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Output

The following example shows the output of the `dump rolebalancerinfo` command when the replication role balancer switches a container to the tail role:

```
# maprcli dump rolebalancerinfo -json
{
  "timestamp":1452150159265,
  "timeofday":"2016-01-07 07:02:39.265 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "containerid":57482,
      "Tail IP:Port":"10.10.104.37:5660-10.10.105.37:5660-",
      "Updates blocked Since":"Thu Jan 07 07:02:24 UTC 2016"
    }
  ]
}
```

The following example shows the `dump rolebalancerinfo -volumeinfo -volumename` command:

```
# maprcli dump rolebalancerinfo -volumeinfo -volumename vol2 -json
{
  "timestamp":1452218225547,
  "timeofday":"2016-01-08 01:57:05.547 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "VolumeBalancingInfo":{
        "Volume":"vol2",
        "Assign Cache Containers Count":60,
        "Assign Cache Containers Size":951171,
        "Zero Size Containers Count":5,

      :0,
      :35849,
      "SizeOfTails":48267,
      "DesiredSizeOfTails":35849,
      "Assign Cache Containers Count":0,
      "Assign Cache Containers Size":0
    }
  ]
}

```

### Output

Field	Description
containerID	The unique ID number of the container.
Tail IP:Port	The IP address and port number of the tail container node.
Updates blocked Since	During a replication role switch, updates to that container are blocked during the date and time indicated.
Volume	Name of the volume.
Assign Cache Containers Count	The total number of containers in the assign cache. The assign cache is a list of containers that the CLDB has reserved on a particular file server node. The CLDB allocates containers from the cache when it receives a request from the file server for more containers.
Assign Cache Containers Size	The total size of the containers in the assigned cache. The assign cache is a list of containers that the CLDB has reserved on a particular file server node. The CLDB allocates containers from the cache when it receives a request from the file server for more containers.
Zero Size Containers Count	The number of empty cache containers.
Storage Pools	The list of storage pools in the specified volume.
SpId	The ID of the storage pool located within the specified volume.
HostAddress	The server on which the storage pool resides.
NumContainers	The total number of containers that reside on the storage pool in the specified volume.

	The total number of master containers that reside on the storage pool in the specified volume.
NumTails	The total number of tail containers that reside on the storage pool in the specified volume.
SizeOfContainers	The total size of the containers that reside on the storage pool in the specified volume.
	The total size of the master containers that reside on the storage pool in the specified volume.
	The cumulative size of master replicas on a specific storage pool within a volume. Typically, this is $1/\text{ReplicationFactor}$ of all containers on a storage pool for a particular volume. For example, if the replication factor is set to 3, then $1/3$ of all containers on a storage pool should have the master container role.
SizeOfTails	The total size of the tail containers that reside on the storage pool in the specified volume.
DesiredSizeOfTails	The cumulative size of tail replicas on a specific storage pool within a volume. Typically, this is $1/\text{ReplicationFactor}$ of all containers on a storage pool for a particular volume. For example, if the replication factor is set to 3, then $1/3$ of all containers on a storage pool should have the tail container role.

## Example

### CLI

```
maprcli dump rolebalancerinfo -json
```

### dump rolebalancermetrics

Returns the cumulative number of times that the replication role balancer has switched the replication role of name containers and data containers on the cluster.

The `maprcli dump rolebalancermetrics` command enables you to view the number of times that the replication role balancer has switched the replication role of the name containers and data containers to ensure that containers are balanced across the nodes in the cluster. For best results, use the `-json` option when running `dump rolebalancermetrics` from the command line.

The *replication role balancer* is a tool that switches the replication roles of containers to ensure that every node has an equal share of master and replica containers (for name containers) and an equal share of master, intermediate, and tail containers (for data containers).

The replication role balancer changes the replication role of the containers in a cluster so that network bandwidth is spread evenly across all nodes during the replication process. A container's replication role determines how it is replicated to the other nodes in the cluster. For *name containers* (the volume's first container), replication occurs simultaneously from the master to all replica containers. For *data containers*, replication proceeds from the master to the intermediate container(s) until it reaches the tail containers. For more information, see [Replication Role Balancer](#).

## Syntax

### CLI

```
maprcli dump rolebalancermetrics
[-cluster <cluster name>]
```

### REST

N/A

## Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.

## Output

The `maprcli dump rolebalancerinfo` command returns the cumulative number of times that the replication role balancer has switched the replication role of name containers and data containers on the cluster.

```
# maprcli dump rolebalancermetrics -json
{
  "timestamp":1433372048169,
  "timeofday":"2015-06-03 10:54:08.169 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "numNameContainerSwitches":60,
      "numDataContainerSwitches":28,
      "timeOfLastMove":"Wed May 23 05:48:00 PDT 2015"
    }
  ]
}
```

## Output fields

Field	Description
numNameContainerSwitches	The number of times that the replication role balancer has switched the replication role of name containers.
numDataContainerSwitches	The number of times that the replication role balancer has switched the replication role of data containers.
timeOfLastMove	The date and time of the last replication role change.

## Example

### CLI

```
maprcli dump rolebalancermetrics -json
```

### dump supportdump

Collects logs and other information about the node to help troubleshoot issues.

## Syntax

### CLI

```
maprcli dump supportdump [ -cluster
<cluster name> ] [ -nodes <node
names> ] [ -params <parameter
string> ] [ -zkconnect <ZK connect
string> ]
```

REST

N/A

**Parameters**

Parameter	Description
cluster	Cluster name.
nodes	Node names for which support dump is needed. Space separated. Default: all
params	Parameter string to create a dump.
zkconnect	ZK connection string.

**Output**

```
# maprcli dump supportdump
node
centos29.lab
centos23.lab
centos28.lab
centos22.lab
```

**Example**

CLI

maprcli dump supportdump

**dump volumeinfo**

Returns information about volumes and the associated containers. For JSON formatted output, use the `-json` option from the command line.

A *volume* is a logical unit that allows you to apply policies to a set of files, directories, and sub-volumes. Using volumes, you can enforce disk usage limits, set replication levels, establish ownership and accountability, and measure the cost generated by different projects or departments. For more information, see [Administering Volumes](#) on page 1161.

**Syntax**

CLI

```
maprcli dump volumeinfo
  [-cluster <cluster name>]
  -volumename <volume name>
  [-ctime <true|false>]
```

REST

N/A

**Parameters****ctime**Set to `true` to display container state/role change time.Default: `false`**cluster**

The cluster on which to run the command. If this parameter is omitted, the command is run on the cluster on which it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.

**volumename** The name of the volume. To obtain volume names, use the [volume list](#) on page 2652 `maprcli volume list` command. This parameter is mandatory.

## Output

The `maprcli volume info` returns information about the volume and the containers associated with that volume. Volume information includes the ID, volume name, and replication factor. For each container on the specified volume, the command returns information about nodes and storage. See the following [Example](#) on page 2174 for sample output.

<b>AccessTime</b>	Indicates the volumes that are accessed regularly. This value is updated every 6 hours with the last time that an operation occurred on the volume. The access time is not updated for changes to volume properties, creation of a snapshot, or synchronization between a volume and a mirror. However, the volume access time is updated the first time you upgrade to a data-fabric version that includes this property. This property was introduced in data-fabric version 4.0.2.
<b>ActiveServers</b>	The IP address and port number of each active node on which the container resides.
<b>allowGrant</b>	Indicates whether ( <code>true</code> ) or not ( <code>false</code> ) a parent volume grants permission for a child volume to inherit its properties.
<b>Audited</b>	Indicates whether (1) or not (0) auditing is enabled for the volume.
<b>AuditVolume</b>	Indicates whether (1) or not (0) the volume accommodates audit logs.
<b>CoalesceInterval</b>	The interval of time to elapse after the first instance of an operation on a node is recorded in audit logs, if auditing is enabled. Subsequent identical operations performed on the same node from the same client are ignored during the interval.
<b>ContainerId</b>	The unique ID number of the container.
<b>CreatorContainerId</b>	The container ID of the read-write container. The container ID is retained in all mirrors of those containers (in all mirrors of the volume). The container ID enables the identification of the correct containers to source from, when mirror sources are changed in a mirror chain.
<b>CreatorVolumeUuid</b>	A randomly generated unique ID that is shared by all mirrors of a volume, and all containers of them. You can use this ID to avoid undesirable chaining of containers when mirror sources are changed in a mirror chain.
<b>dareEnabled</b>	Indicates whether (1) or not (0) data-at-rest encryption (DARE) is enabled for the volume.
<b>DisabledDataAuditOperations</b>	The list of operations excluded from auditing.
<b>EnabledDataAuditOperations</b>	The list of operations selected for auditing.
<b>enforcementMode</b>	The data access enforcement mode.
<b>Epoch</b>	A sequence number that indicates the most recent copy of the container. The CLDB uses the epoch to ensure that an out-of-date copy cannot become the master for the container.

<b>fixCreatorId</b>	An internal flag for data-fabric volumes to fix the creator container ID.
<b>ForceAudit</b>	Indicates whether (1) or not (0) to force audit of operations on all files, tables, and streams in the volume.
<b>InactiveServers</b>	The IP address and port number of each inactive node on which the container resides.
<b>label</b>	The label associated with the volume. See <a href="#">Using Storage Labels</a> on page 1306 for more information on labels.
<b>limitSpread</b>	An internal flag for data-fabric volumes to control the growth of a volume in terms of number of containers. When this flag is set, CLDB tries to limit the number of new containers created, depending on the present size of a volume. If a volume size (data in volume) is small, CLDB tries to reuse space in existing containers to avoid the creation of new containers. This reuse helps reduce wastage of containers IDs in an environment that has small volumes.
<b>LogicalSizeMB</b>	The logical size on disk (in MB) of the container.
<b>Master</b>	The IP address and port number of the <i>master copy</i> . The master copy is part of the original copy of the volume.
<b>MetricsEnabled</b>	Indicates whether (1) or not (0) metrics collection is enabled for the volume.
<b>MirrorThrottle</b>	Specifies whether mirror throttling is enabled (true) or disabled (false). Throttling is set on the source volume and applies to all its mirrors. This property was introduced in MapR version 4.0.2.
<b>Mtime</b>	Indicates the time when the last modification was made to the contents of the container.
<b>NameContainer</b>	Indicates if the container is the <i>name container</i> for the volume. If <code>true</code> , the container is the first container of the volume. Replication then occurs simultaneously from the master to the intermediate and tail containers.
<b>NameSpaceMinReplication</b>	The minimum replication factor or the number of copies of the name container associated with the volume that should be maintained by the data-fabric cluster for normal operation. When the replication factor falls below this minimum value, writes to the volume are disabled. The default value is 2.
<b>NameSpaceReplication</b>	The desired replication factor or the number of copies of the name container associated with the volume. The default value is 3. The maximum value is 6.
<b>nslabel</b>	The name container label. See <a href="#">Using Storage Labels</a> on page 1306 for more information on labels.
<b>NumInodesInUse</b>	Indicates the number of inodes used by the container.
<b>OwnedSizeMB</b>	The size on disk (in MB) dedicated to the container.
<b>ReReplicationTimeOutSec</b>	The timeout (in seconds) period until CLDB starts re-replicating the containers on the node of the volume, when CLDB stops receiving a heartbeat from the node.
<b>securityPolicyTags</b>	The list of security policy tags to be associated with this volume.

<b>SharedSizeMB</b>	The size on disk (in MB) shared by the container.
<b>TenantUser</b>	Displays the name of the tenant user, if any.
<b>TotalSizeMB</b>	The total size on disk (in MB) allocated to the container. Combines the Owned Size and Shared Size.
<b>UnusedServers</b>	The IP address and port number of servers from which no "heartbeat" has been received for quite some time.
<b>VolumeId</b>	The unique ID number of the volume.
<b>VolumeMinReplication</b>	The minimum replication factor. Indicates the number of copies of a volume (including the original) that should be maintained by the data-fabric cluster for normal operation. When the replication factor falls below this minimum value, writes to the volume are disabled. The default value is 2. A replication factor of 2 indicates that the number of copies of a volume is 2 (original +1 copy). A replication factor of 3 indicates that the number of copies of a volume is 3 (original + 2 copies).
<b>VolumeName</b>	The name of the volume.
<b>VolumeReplication</b>	The desired replication factor. Indicates the number of copies of a volume. The default value is 3. The maximum value is 6.
<b>VolumeTopology</b>	The volume topology corresponds to the node topology of the rack or nodes where the volume resides. By default, new volumes are created with a topology of / (root directory). For more information, see <a href="#">Setting Up Node Topology</a> on page 1104.
<b>VolumeUsedSizeMB</b>	The size on disk (in MB) of the volume.
<b>WireSecurityEnabled</b>	Indicates whether (1) or not (0) wire-level security is enabled.

**Example****Dump volume information****CLI**

```
# /opt/mapr/bin/maprcli dump

Lists nodes in the cluster.

[configure.sh](#) on page 2826Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Ezmeral Data Fabric client nodes, and configuring services for a node.**dump volumenodes**

Returns information about the nodes on a volume.

**Syntax****CLI**

```
maprcli dump volumenodes
  [-cluster <cluster name>]
  -volumename <volume name>
```

**NOTE:** For best results, use the `-json` option from the command line.**REST**

N/A

## Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
volumename	The name of the volume. To obtain volume names, use the <code>maprcli volume list</code> command.

## Output

The `maprcli dump volumenodes` command returns the IP address and port number of volume nodes.

```
# maprcli dump volumenodes -volumename mapr.hbase -json
{
  "timestamp":1433372931725,
  "timeofday":"2015-06-03 11:08:51.725 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "Servers":{
        "IP:Port":[
          "10.10.82.23:5660--3-VALID",
          "10.10.82.28:5660--3-VALID",
          "10.10.82.29:5660--3-VALID"
        ]
      }
    }
  ]
}
```

## Output fields

Field	Description
IP:Port	The IP address and file system port.

## Example

### CLI

```
maprcli dump volumenodes -volumename
mapr.hbase -json
```

### dump zkinfo

Returns the ZooKeeper znodes.

**NOTE:** This command is used by the `mapr-support-collect.sh` script to gather cluster diagnostics for troubleshooting.

This command enables you to view a snapshot of the data stored in Zookeeper as a result of cluster operations

ZooKeeper prevents service coordination conflicts by enforcing a rigid set of rules and conditions, provides cluster-wide information about running services and their configuration, and provides a mechanism for

almost instantaneous service failover. Warden will not start any services unless ZooKeeper is reachable and more than half of the configured ZooKeeper nodes are live.

The `mapr-support-collect.sh` script calls the `maprcli dump supportdump` command to gather cluster diagnostics for troubleshooting. For more information, see [mapr-support-collect.sh](#).

## Syntax

### CLI

```
maprcli dump zkinfo
  [-cluster <cluster name>]
  [-zkconnect <connect string>]
```

**NOTE:** For best results, use the `-json` option from the command line.

### REST

N/A

## Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
zkconnect	A ZooKeeper connect string, which specifies a list of the hosts running ZooKeeper, and the port to use on each, in the format: ' <code>&lt;host&gt;[:&lt;port&gt;][,&lt;host&gt;[:&lt;port&gt;]...]</code> '. To obtain zookeeper connection strings, use the <code>maprcli node listzookeepers</code> command.

## Output

The `maprcli dump zkinfo` command is run as part of support dump tools to view the current state of the Zookeeper service. The command should always be run using the `-json` option, since output in the default tabular format is not useful. Command output displays the data stored in the ZooKeeper hierarchical tree of znodes.

```
# maprcli dump zkinfo -json
{
  "timestamp":1335825202157,
  "status":"OK",
  "total":1,
  "data":[
    {
      "/_Stats":"\ncZxid = 0,ctime = Wed Dec 31 16:00:00 PST
1969,mZxid = 0,mtime = Wed Dec 31 16:00:00 PST 1969,pZxid = 516,cversion
= 12,dataVersion = 0,aclVersion = 0,ephemeralOwner = 0,dataLength =
0,numChildren = 13",
      "/" : [
        {
          ....
        }
      ]
    }
  ]
}
```

## Output fields

You can use the `maprcli dump zkinfo` command as you would use a database snapshot. The `/services`, `/services_config`, `/servers`, and `/*_locks` znodes are used by Warden to store and exchange information.

Field	Description
services	The <code>/services</code> directory is used by Warden to store and exchange information about services.
datacenter	The <code>/datacenter</code> directory contains CLDB "vital signs" that you can use to identify the CLDB master, the most recent epoch, and other key data. For more information, see <a href="#">Moving CLDB Data</a> .
services_config	The <code>/services_config</code> directory is used by Warden to store and exchange information.
zookeeper	The <code>/zookeeper</code> directory stores information about the ZooKeeper service.
servers	The <code>/servers</code> directory is used by Warden to store and exchange information.
nodes	The <code>/nodes</code> directory (znode) stores key information about the nodes.

### *Moving CLDB Data*

Describes how to move CLDB data to another node.

### About this task

In a Community Edition-licensed cluster, CLDB data must be recovered from a failed CLDB node and installed on another node. The cluster can continue normally as soon as the CLDB is started on another node.

For more information, see [CLDB Failover](#) on page 1962.

Use the `maprcli dump zkinfo` command to identify the latest epoch of the CLDB, identify the nodes where replicates of the CLDB are stored, and select one of those nodes to serve the new CLDB node. Perform the following steps on any cluster node:

### Procedure

1. Log in as `root` or use `sudo` for the following commands.
2. Issue the `maprcli dump zkinfo` command using the `-json` flag.
 

```
# maprcli dump zkinfo -json
```

 The output displays the ZooKeeper znodes.

3. In the `/datacenter/controlnodes/cldb/epoch/1` directory, locate the CLDB with the latest epoch.

```
{ "/datacenter/controlnodes/cldb/epoch/1/KvStoreContainerInfo": "
Container ID:1 VolumeId:1
Master:10.250.1.15:5660-172.16.122.1:5660-192.168.115.1:5660--13-VALID
Servers: 10.250.1.15:5660-172.16.122.1:5660-192.168.115.1:5660--13-VALID
Inactive Servers: Unused Servers: Latest epoch:13" }
```

The Latest Epoch field identifies the current epoch of the CLDB data. In this example, the latest epoch is 13.

4. Select a CLDB from among the copies at the latest epoch. For example, `10.250.2.41:5660--13-VALID` indicates that the node has a copy at epoch 13 (the latest epoch).

### entity

Manages *entities* (users and groups).

### entity info

Displays information about an entity.

### Syntax

#### CLI

```
maprcli entity info
[ -cluster <cluster> ]
-name <entity name>
[ -output terse|verbose ]
-type <type>
```

#### REST

Request Type	GET
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/entity/info?&lt;parameters&gt;</code>

### Parameters

Parameter	Description
cluster	The cluster on which to run the command.
name	The <i>entity</i> name. Obtain the entity name by running the <code>maprcli entity list</code> command.
output	Whether to display terse or verbose output.
type	The entity type. Obtain the entity type by running the <code>maprcli entity list</code> command.

### Output

#### Sample Output

```
DiskUsage EntityQuota EntityType EntityName VolumeCount
EntityAdvisoryquota EntityId
```

```
864415      0      0      root      208
0           0
```

## Output Fields

Field	Short Name	Description
DiskUsage	dsu	Disk space used by the user or group
EntityQuota	qta	The user or group quota
EntityType	t	The entity type
EntityName	n	The entity name
VolumeCount	vct	The number of volumes associated with the user or group
EntityAdvisoryquota	aqt	The user or group advisory quota
EntityId	id	The ID of the user or group

## Examples

## Display information for the user 'root':

## CLI

```
maprcli entity info -type 0 -name root
```

## REST

```
https://abc.sj.us:8443/rest/entity/info?type=0&name=root
```

**entity list**

Lists and displays information about entities.

## Syntax

## CLI

```
maprcli entity list
[ -alarmedentities true|false ]
[ -cluster <cluster> ]
[ -columns <columns> ]
[ -filter <filter> ]
[ -limit <rows> ]
[ -output terse|verbose ]
[ -sortby ]
[ -start <start> ]
```

## REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/entity/list[?<parameters>]

## Parameters

Parameter	Description
alarmedentities	Specifies whether to list only entities that have exceeded a quota or advisory quota.
cluster	The cluster on which to run the command.
columns	A comma-separated list of fields to return in the query. See the Fields table below.
filter	A filter specifying entities to display. See <a href="#">Filters</a> for more information.
limit	The number of rows to return, beginning at start. Default: 0
output	Specifies whether output should be <code>terse</code> or <code>verbose</code> .
sortby	Specifies one of the following attributes to sort the list of entities by: <code>entityname</code> , <code>entitytype</code> , <code>entityid</code> , <code>entityemail</code> , <code>entityquota</code> , <code>entityadvisoryquota</code> , <code>entitydiskusage</code> , <code>entityvolumecount</code> . By default, the list of entities sorted by <code>entityname</code> .
start	The offset from the starting row according to sort. Default: 0

## Output

Information about the users and groups. Only users and groups with associated volumes are returned in the output.

### Table

Field	Short Name	Description
EntityType	t	Entity type <ul style="list-style-type: none"> <li>0 = User</li> <li>1 = Group</li> </ul>
EntityName	n	User or Group name
EntityId	id	User or Group id
EntityQuota	qta	Quota, in MB. 0 = no quota.
EntityAdvisoryquota	aqt	Advisory quota, in MB. 0 = no advisory quota.
VolumeCount	vct	The number of volumes this entity owns.
DiskUsage	dsu	Disk space used for all entity's volumes, in MB.

## Sample Output

```
DiskUsage EntityQuota EntityType EntityName VolumeCount
EntityAdvisoryquota EntityId
5859220 0 0 root 209
0 0
```

## Examples

### List all entities:

#### CLI

```
maprcli entity list
```

#### REST

```
https://abc.sj.us:8443/rest/entity/
list
```

### Filter entities by entity name:

#### CLI

```
maprcli entity list -filter
"[EntityName==mapr]"
```

#### REST

```
https://abc.sj.us:8443/rest/entity/
list?filter=[EntityName%3D%3Dmapr]
```

### entity modify

Modifies a user or group quota or email address. Permissions required: `fc` or `a`.

## Syntax

#### CLI

```
maprcli entity modify
[ -advisoryquota <advisory quota>
[ -cluster <cluster> ]
[ -email <email>]
[ -entities <entities> ]
-name <entityname>
[ -quota <quota> ]
-type <type>
```

#### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/entity/modify?<parameters>

## Parameters

Parameter	Description
advisoryquota	The advisory quota.
cluster	The cluster on which to run the command.
email	Email address.
entities	A comma-separated list of entities, in the format <type>:<name>. Example: 0:<user1>,0:<user2>,1:<group1>,1:<group2>. ..
name	The <i>entity</i> name.

Parameter	Description
quota	The quota for the entity.
type	The entity type: <ul style="list-style-type: none"> <li>0=user</li> <li>1-group</li> </ul>

## Examples

### Modify the email address for the user 'root':

#### CLI

```
maprcli entity modify -name
root -type 0 -email test@example.com
```

#### REST

```
https://abc.sj.us:8443/rest/entity/
modify?
name=root&type=0&email=test@example.co
m
```

## Related tasks

[Setting Quota Defaults for Users and Groups](#) on page 1075

Explains how to set disk space quotas for users and groups.

## Related reference

[rlimit set](#) on page 2312

Sets the resource usage limit for the cluster's disk resource.

## entity remove

Removes an entity (specified by name and type).

**NOTE:** Entity can be removed only when there are no resources associated with the entity.

## Syntax

#### CLI

```
maprcli entity remove
-name <entity name>
-type <type>
```

#### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/entity/remove?<parameters>

## Parameters

Parameter	Description
name	The <i>entity</i> name. Obtain the entity name by running the <code>maprcli entity list</code> command.

Parameter	Description
type	<p>The entity type. Value can be:</p> <ul style="list-style-type: none"> <li>• 0 - for user</li> <li>• 1 - for group</li> </ul> <p>If necessary, obtain the entity type by running the <code>maprcli entity list</code> command.</p>

### Example

#### Remove an entity by name and type:

```
maprcli entity remove -name mapruser1 -type 1
```

### fid

Displays information about HPE Ezmeral Data Fabric Database or file-system components that are identified by a FID.

### fid dump

Displays detailed information for HPE Ezmeral Data Fabric Database or file-system components that are identified by an FID.

**NOTE:** Only the root user and the MAPR\_USER user (user under which HPE Ezmeral Data Fabric services runs) have permissions to run this command.

### Syntax

#### CLI

```
maprcli fid dump
  [ -cluster <cluster_name> ]
  -fid <file identified for the
  element>
  [ -startkey startkey ]
  [ -endkey endkey ]
  [ -maxkeys maxkeys ]
  [ -kvtype
  cldb kvtype: cinfo|csize|cmap|
  fsprop|spprop|vprop|sinfo|si2scid|
  sc2sid|policyinfo|compositeid|spmap|
  cgent|hashedstring|filefilterinfo ]
  [ -dirraw scan directory inode
  as kvstore. default: false ]
```

#### REST

N/A

### Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
fid	The file identifier for the element (region, kvstore, etc.) for which you want detailed information. The output of <a href="#">maprcli table region list</a> lists the FIDs for the table's regions.

Parameter	Description
startkey	starting key from where to dump the element
endkey	ending key till where to dump the element
maxkeys	maximum number of keys to dump
kvtype	type of kvstore (key-value store) to dump
dirraw	boolean value indicating whether to scan directory as raw/inode (set value as <code>true</code> ) or as kvstore (set value as <code>false</code> ). The default value is <code>false</code> .

 **NOTE:** You can run this command on any FID available on the HPE Ezmeral Data Fabric filesystem.

#### Tablet Map

Displays output for a tablet map includes the key for each tablet and its corresponding FID.

Each tablet contains a range of data starting with the key associated with the tablet and ending before the key associated with the next tablet

#### FID for a Tablet Map

Describes how to determine the FID for a tablet map.

#### About this task

##### To determine the FID for a tablet map:

#### Procedure

1. Run `hadoop mfs -ls <table path>` to determine the table FID. The table FID is the FID that displays after the "p."

Example:

```
[mapr@hostname ~]$ hadoop mfs -ls /testdst
Found 1 items
tr----- Z U 3 mapr mapr 2 2015-02-18 15:24 0 /
testdst
p 2049.49.131220 hostname:5660
r 2061.32.131258 hostname:5660
```

2. Run `maprcli fid dump` on the table FID to determine the tablet map FID.

Example:

```
2049.49.131220 [mapr@hostname ~]$ maprcli fid dump -fid
value key
{"value":{"fid":"<parentCID>.51.131224"}} schema
{"value":{"fid":"<parentCID>.50.131222"}}
tabletmap
```

3. Construct the tablet map FID for the `maprcli fid dump` command by replacing `<parentCID>` with the set of numbers before the first period four numbers in the table FID.

Example: `2049.50.131222`

#### Output Example for a Tablet Map

Example command and output.

```
maprcli fid dump -fid 2049.50.131222 -json
{
  "timestamp":1425579595296,
  "timeofday":"2015-03-05 06:19:55.296 GMT+0000",
  "status":"OK",
  "total":4,
  "data":[
    {
      "key":"",
      "value":{
        "fid":"2116.59.131462"
      }
    },
    {
      "key":"user3155781742051747178",
      "value":{
        "fid":"2114.49.131348"
      }
    },
    {
      "key":"user5238840414188136300",
      "value":{
        "fid":"2118.49.131394"
      }
    },
    {
      "key":"user7257930685533675764",
      "value":{
        "fid":"2115.59.131316"
      }
    }
  ]
}
```

#### Tablet

Describes output for a tablet.

The `maprcli fid dump` output for a tablet includes key and value pairs for the following:

- **startkey.** The first key value in the tablet.
- **pmap.** Each partition.
- **endkey.** The last key value in the tablet.

#### Output Fields for a Tablet

This table describes a majority of the output values for each partition (pmap) in the tablet.

Field	Description
key	The partition key.
segfid	The FID of the segment map associated with this partition.
isFrozen	A Boolean value that indicates if a partition is in a frozen state or not. Internally, a partition is sometimes temporarily marked as frozen in order for certain operations to complete.

Field	Description
inSplit	A Boolean value that indicates if a partition split is in progress for this partition.
useBucketDesc	This property is for internal use only.
lastFlushedBucketFid	The FID of the bucket file (WAL) which was last flushed for this partition.
numLogicalBlocks	The number of logical blocks (8K) for this partition.
numPhysicalBlocks	The number of physical blocks (8K) for this partition.
numRows	The number of rows stored in this partition.
numRowsWithDelete	The number of rows which are marked for delete in this partition.
numRemoteBlocks	The number of disk blocks which are not local to this partition. When a region splits, a partition moves from one node to another and it is possible to temporarily have some remote blocks.
numSpills	The number of spills.
numSegments	The number of segments.

### Output Example for a Tablet

```
maprcli fid dump -fid 2116.59.131462 -json
{
  "timestamp":1425579636931,
  "timeofday":"2015-03-05 06:20:36.931 GMT+0000",
  "status":"OK",
  "total":6,
  "data":[
    {
      "key":"endkey.user3155781742051747178",
      "value":{
      }
    },
    {
      "key":"pmap.",
      "value":{
        "segfid":"<parentCID>.1065.133486",
        "isFrozen":false,
        "inSplit":false,
        "useBucketDesc":true,
        "lastFlushedBucketFid":"2116.901.133158",
        "numLogicalBlocks":34921,
        "numPhysicalBlocks":21976,
        "numRows":9332,
        "numRowsWithDelete":0,
        "numRemoteBlocks":0,
        "numSpills":137,
        "numSegments":74
      }
    },
    {
      "key":"pmap.user1523186274532578170",
      "value":{
        "segfid":"<parentCID>.1066.133488",
```

    }
]
}

```

 **NOTE:** The postSpitCopy key and value are for internal use only.

### Segment Map

Describes output of a segment map.

The `maprcli fid dump` output of a segment map includes a map of row keys and the corresponding segment FID.

### Output Fields for a Segment Map

Field	Description
key	The row key
value	The FID corresponding to the segment associated with this key.

**Output Example for a Segment Map**

```
maprcli fid dump -fid 2116.1065.133486 -json
{
  "timestamp":1425579702407,
  "timeofday":"2015-03-05 06:21:42.407 GMT+0000",
  "status":"OK",
  "total":74,
  "data":[
    {
      "key":"",
      "value":{
        "fid":"<parentCID>.943.133242"
      }
    },
    {
      "key":"user1006417450462802131",
      "value":{
        "fid":"<parentCID>.945.133246"
      }
    }
  ],
  ...
}
```

**Segment**

Describes output for a segment.

The output of `maprcli fid dump` for a segment includes details about each spill.

**Output Fields for a Segment**

Field	Description
key	The index of the spill.
numRemoteBlocks	The number of remote blocks.
numspills	The number of spills.

Field	Description
value	<p>The property contains the following values:</p> <ul style="list-style-type: none"> <li>• <b>fid</b>: The FID of the spill containing row and value data.</li> <li>• <b>smeSize</b>: The spill map entry size.</li> <li>• <b>keyIdxOffset</b>: The offsets and length inside the spill for the index</li> <li>• <b>keyIdxLength</b>: The length inside the spill for the index</li> <li>• <b>ldbIdxLength</b>: The length of the index portion in the spill.</li> <li>• <b>bloomBitsPerKey</b>: The number of bits used in the bloom filter per key.</li> <li>• <b>numLogicalBlocks</b>: The number of logical blocks in the spill.</li> <li>• <b>numPhysicalBlocks</b>: The number of physical blocks in the spill.</li> <li>• <b>numRows</b>: The number of rows in the spill.</li> <li>• <b>numRowsWithDelete</b>: The number of rows which are marked for delete in the spill.</li> <li>• <b>families</b>: Information about the location of different column family data in the spill and the time range of that data.</li> </ul>

### Output Example for a Segment

```
maprcli fid dump -fid 2116.945.133246 -json
{
  "timestamp":1425579733821,
  "timeofday":"2015-03-05 06:22:13.821 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "key":0,
      "numRemoteBlocks":0,
      "numSpills":0,
      "numSegments":0,
      "value":{
        "fid":"<parentCID>.946.133248",
        "smeSize":55,
        "keyIdxOffset":12,
        "keyIdxLength":3587,
        "ldbIdxLength":20,
        "bloomBitsPerKey":80,
        "numLogicalBlocks":369,
        "numPhysicalBlocks":232,
        "numRows":99,
        "numRowsWithDelete":0,
        "families":{
          "id":1,
          "offset":524288,
          "length":2976835,
          "minTimeStamp":1425578650850,
```

```

    "maxTimeStamp" : 1425578856492
  }
}
]
}

```

**fid stat**

Displays statistics for HPE Ezmeral Data Fabric Database or file system components that are identified by a FID.

Only the root user and the MAPR\_USER user (user name under which Data Fabric services runs) have permissions to run this command.

**NOTE:** This command is similar to the UNIX `stat` command.

**Syntax****CLI**

```

/opt/mapr/bin/maprcli fid stat
[ -cluster <cluster name> ]
-fid <file identifier for the
element>

```

**REST**

N/A

**Parameters**

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
fid	The file identifier for the element (region, kvstore, etc.) for which you want detailed information. The output of the <code>maprcli table region list</code> command lists the FIDs for the regions of the table.

**Output Fields**

Columns	Description
atime	The last access time for this FID. For more information, see the <code>atimeUpdateTimeInterval</code> entry in <a href="#">volume create</a> on page 2592.
compression	The compression setting, either <code>on</code> or <code>off</code> . If <code>on</code> , this parameter displays the compression type.
deleteFlags	An internal delete flag that is set on the FID for transactions involving multiple nodes. If deleted, this parameter denotes the deletion type, either <code>self</code> or <code>recursive delete</code> .
diskflush	Indicates whether persistent flush is enabled ( <code>true</code> ) or not ( <code>false</code> ) for this inode.
gid	The group ID

Columns	Description
lblocks	Number of logical B-Tree blocks
mode	The UNIX style permission mode bits for the FID
mtime	Last modification time
nblocks	Total number of B-Tree blocks used
networkencryption	Indicates whether wire encryption is enabled or disabled
nlevels	Number of B-Tree levels
nlink	Number of links to this inode
parent	The parent FID
size	The size of the FID. Depending on the type of FID, it can be the actual size (in bytes), or the number of entries
subtype	The subtype of the FID
type	The type of the FID. For example, regular file, dir, filelet, kvstore, fidmap etc.
uid	The user ID of the owner
version	The current version of the FID.
xattrInum	The extended attribute of the FID

### Example

#### Displays statistics for a specified FID:

```
[user@hostname ~]$ maprcli fid stat -fid 2062.32.131252 -json
{
  "timestamp":1586935733623,
  "timeofday":"2020-04-15 12:28:53.623 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "type":"FTDirectory",
      "subtype":"FSTInval",
      "parent":"<parentCID>.35.131200",
      "size":1,
      "nblocks":1,
      "lblocks":0,
      "compression":"off",
      "deleteFlags":"DeleteTypeNone",
      "atime":1583751630,
      "mtime":1583751630,
      "mode":"755",
      "uid":1000,
      "gid":1000,
      "nlink":3,
      "xattrInum":0,
      "version":1048589,
      "networkencryption":true,
      "diskflush":false,
      "nlevels":1
    }
  ]
}
```

**file**

Lets you perform tiering operations at the file level.

**file offload**

Initiates offload of a file using a MAST Gateway.

**Permissions Required**

The user running the command must have (mode bit or [ACE](#)) permissions to write to the file.

**Syntax****CLI**

```
/opt/mapr/bin/maprcli file offload
-name <file_name>
```

**REST**

Request Type	POST
Request URL	http[s]://<host:port>/rest/file/offload?<parameters>

**Parameters**

Parameter	Description
name	The name (including the path) of the file to offload.

**Error Message**

The OP\_TIMEOUT message that indicates that the operation timed out, is returned if the connection to the gateway is lost.

**Example**

**Offload file named test1 in volume named vol1:**

**CLI**

```
/opt/mapr/bin/maprcli file
offload -name /vol1/test1
{
  "timestamp":1520277246831,
  "timeofday":"2018-03-05
07:14:06.831 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "status":12,
      "message":"File transfer
request queued.",
      "gateway":"10.10.88.200:8660",
      "jobid":"0x37d7c7738cd0991f.0xe35d5f0e
5b24cda.0x4"
    }
  ]
}
```

```
]
}
```

**REST**

```
curl -X POST 'https://
server.sj.us:8443/rest/file/offload?
name=/voll/test1' --user
<username>:<password>

{"timestamp":1520277246831,"timeofday"
:"2018-03-05 07:14:06.831
GMT+0000","status":"OK","total":1,
"data":
[{"status":12,"message":"File
transfer request
queued.", "gateway":"10.10.88.200:8660"
,
"jobid":"0x37d7c7738cd0991f.0xe35d5f0e
5b24cda.0x4"}]}
```

**Offload a file named mfs in volume named voll:****CLI**

```
/opt/mapr/bin/maprcli file
offload -name /voll/mfs -json
{
  "timestamp":1534141379576,
  "timeofday":"2018-08-12
11:22:59.576 GMT-0700 PM",
  "status":"ERROR",
  "errors":[
    {
      "id":6,
      "desc":"Lost connection
to gateway."
    }
  ]
}
```

**REST**

```
curl -X GET 'https://
server.sj.us:8443/rest/file/
tierjobstatus?name=/voll/mfs' --user
<username>:<password>

{"timestamp":1534141379576,"timeofday"
:"2018-08-12 11:22:59.576 GMT-0700
PM","status":"ERROR",
"errors":[{"id":6,"desc":"Lost
connection to gateway."}]}
```

**file recall**

Initiates recall of a file from a storage tier using a MAST Gateway.

**Permissions Required**

The user running the command must have (mode bit or [ACE](#)) permissions to write to the file.

**Syntax**

**CLI**

```
/opt/mapr/bin/maprcli file recall
-name <file_name>
```

**REST**

Request Type	GET
Request URL	http[s]://<host:port>/rest/file/recall?<parameters>

**Parameters**

Parameter	Description
name	The name (including the path) of the file to recall.

**Example**

**Recall file named file1 in volume named vol1:**

**CLI**

```
/opt/mapr/bin/maprcli file
recall -name /voll/test1 -json
{
  "timestamp":1516337242973,
  "timeofday":"2018-01-19
04:47:22.973 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[{"
    "status":12,
    "message":"File transfer
request
queued.",
    "gateway":"10.10.88.198:8660",

"jobid":"0xb76f872c64fe4677.0x3673092f
759a500d.0x1"
  }]}
}
```

**REST**

```
curl -X GET 'https://abc.sj.us:8443/
rest/file/recall?<parameters>' --user
<username>:<password>
{"timestamp":1516337242973,"timeofday"
:"2018-01-19 04:47:22.973
GMT+0000","status":"OK","total":1,"dat
a":[{"status":12,"message":"File
transfer request
queued.", "gateway":"10.10.88.198:8660"
,"jobid":"0xb76f872c64fe4677.0x3673092
f759a500d.0x1"}]}
```

**file tierjobterminate**

Initiates termination of an ongoing offload or recall operation.

## Permissions Required

The user running the command must have (mode bit or [ACE](#)) permissions to write to the file.

## Syntax

### CLI

```
/opt/mapr/bin/maprcli file
tierjobterminate
  -name <file_name>
  [ -job <jobID> ]
```

### REST

Request Type	POST
Request URL	<pre>http[s]:// &lt;host:port&gt;/rest/ file/tierjobterminate? &lt;parameters&gt;</pre>

## Parameters

Parameter	Description
name	The name (including the path) of the file being offloaded/recalled.
job	<p>The ID of the job, which was specified with the offload or recall command, to terminate. This must be specified to ensure that the correct offload or recall task is terminated. If this is not specified, the command picks a job to terminate in the following order:</p> <ol style="list-style-type: none"> <li>1. Job that is in “already terminating progress” status.</li> <li>2. Job that is in “running jobs with latest jobid” status.</li> </ol> <p>If there are no jobs in progress, the command returns “no active transfer in progress” error.</p>

## Examples

### CLI

```
/opt/mapr/bin/maprcli file
tierjobterminate -name /cl/
file5G -json
{
  "timestamp":1557734728770,
  "timeofday":"2019-05-13
01:05:28.770 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "status":10,
      "message":"File
transfer being terminated.",
      "gateway":"10.10.103.79:8660",
      "jobid":"0x140dea11228a3211.0x18565bc5
```

```
d5e4e4fe.0x2"
    }
  ]
}
```

**REST**

```
curl -X POST 'https://host:port/rest/
file/tierjobterminate?name=/c1/
file5G' --user <username>:<password>
{"timestamp":1557738947905,"timeofday"
:"2019-05-13 02:15:47.905 GMT-0700
AM","status":"OK","total":1,"data":
[{"status":10,"message":"File
transfer being
terminated.","gateway":"host:port","jo
bid":"0x140deal1228a3211.0x18565bc5d5e
4e4fe.0x3"}]}
```

**file tierjobstatus**

Checks the status of a previous offload or recall operation.

**Permissions Required**

The user running the command must have (mode bit or [ACE](#)) permissions to write to the file.

**Syntax**

**CLI**

```
/opt/mapr/bin/maprcli file
tierjobstatus
    -name <file_name>
    [ -job <jobID> ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host:port>/rest/file/tierjobstatus?<parameters>

**Parameters**

Parameter	Description
name	The name (including the path) of the file.
job	The ID of the job specified with the offload or recall command.

**Output**

The command returns **one** of the following messages:

**FTOS\_SUCCESS**

Indicates that the file tiering operation was successful. For example:

**CLI**

```

/opt/mapr/bin/
maprcli file
tierjobstatus -n
ame /v5/
nfile2 -json
{
  "timestamp":15335
55093521,
  "timeofday":"201
8-08-06
04:31:33.521
GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "status":0,
      "message":"File
offload
completed.",
      "gateway":"10.10.
104.21:8660",
      "op":"Offload",
      "completedFids":2
,
      "failedFids":0,
      "totalFids":2
    }
  ]
}

```

**REST**

```

curl -X GET
'https://
abc.sj.us/rest/
file/
tierjobstatus?
name=/v5/
nfile2' -- user
<username>:<passw
ord>

{"timestamp":1533
555093521,"timeof
day":"2018-08-06
04:31:33.521
GMT-0700
AM","status":"OK"
,"total":1,
"data":
[{"status":0,"mes

```

```
sage": "File
offload
completed.", "gate
way": "10.10.104.2
1:8660", "op": "Off
load",

"completedFids": 2
, "failedFids": 0, "
totalFids": 2}}}
```

**OP\_FAIL**

Indicates that the operation failed. For example:

**CLI**

```
/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /
volume_cold_aws/
sampleFile2 -json
{

"timestamp": 15339
37284242,

"timeofday": "201
8-08-10
02:41:24.242
GMT-0700 PM",

"status": "ERROR",
"errors": [
{

"id": 2,

"desc": "File
offload failed."
}
]
}

}
```

**REST**

```
curl -X GET
'https://
abc.sj.us:8443/
rest/file/
tierjobstatus?
name=/
volume_cold_aws/
sampleFile2' --us
er
<username>:<passw
ord>

{"timestamp": 1533
937284242, "timeof
day": "2018-08-10
02:41:24.242
GMT-0700
PM", "status": "ERR
```

```
OR",
  "errors":
  [{"id":2,"desc":
  "File offload
  failed."}]}
```

**INVALID\_FILE**

Indicates that the specified file does not exist. For example:

**CLI**

```
/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /ecvoll/
file3_24 -json
{
  "timestamp":15341
88250720,
  "timeofday":"201
8-08-13
12:24:10.720
GMT-0700 PM",
  "status":"ERROR",
  "errors":[
    {
      "id":3,
      "desc":"Tierfile
transfer failed,
Could not open
file /ecvoll/
file3_24"
    }
  ]
}
```

**REST**

```
curl -X GET
'https://
abc.sj.us:8443/
rest/file/
tierjobstatus?
name=/ecvoll/
file3_24' --user
<username>:<passw
ord>

{"timestamp":1534
188250720,"timeof
day":"2018-08-13
12:24:10.720
GMT-0700
PM","status":"ERR
OR",
  "errors":
  [{"id":3,"desc":
  "Tierfile
```

```
transfer failed,
Could not open
file /ecvoll/
file3_24" ]}]}
```

**FILE\_EMPTY**

Indicates that the file contains no data and is empty.  
For example:

**CLI**

```
/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /voll/
test1 -json
{
  "timestamp":15341
41220360,
  "timeofday":"201
8-08-12
11:20:20.360
GMT-0700 PM",
  "status":"ERROR",
  "errors":[
    {
      "id":5,
      "desc":"File
empty."
    }
  ]
}
```

**REST**

```
curl -X GET
'https://
server.sj.us:8443
/rest/file/
tierjobstatus?
name=/voll/
test1' --user
<username>:<passw
ord>
{"timestamp":1534
142083085,"timeof
day":"2018-08-12
11:34:43.085
GMT-0700
PM","status":"ERR
OR",
  "errors":
  [{"id":5,"desc":
"File empty."}]}
```

**NO\_GATEWAY**

Indicates that there is no MAST Gateway available. For example:

**CLI**

```

/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /ecvoll/
file2 -json
{
  "timestamp":15341
85984585,
  "timeofday":"201
8-08-13
11:46:24.585
GMT-0700 AM",
  "status":"ERROR",
  "errors":[
    {
      "id":6,
      "desc":"Lost
connection to
gateway."
    }
  ]
}

```

**REST**

```

curl -k -X GET
'https://
abc.sj.us:8443/
rest/file/
tierjobstatus?
name=/ecvoll/
file2' --user
mapr:mapr

{"timestamp":1534
185984585,"timeof
day":"2018-08-13
11:46:24.585
GMT-0700
AM","status":"ERR
OR",
  "errors":
  [{"id":6,"desc":
  "Lost connection
  to gateway."}]
}

```

**HAS\_LOCAL\_DATA**

Indicates that the data is still on the cluster. For example:

**CLI**

```

/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /voll/
mfs1 -json
File has local

```

```
data.
{
  "timestamp":1534141820011,
  "timeofday":"2018-08-12 11:30:20.011 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "status":8,
      "message":"File has local data."
    }
  ]
}
```

**REST**

```
curl -k -X GET
'https://
abc.sj.us:8443/
rest/file/
tierjobstatus?
name=/voll/
mfs1' --user
mapr:mapr
```

```
{"timestamp":1534141975490,"timeofday":
"2018-08-12 11:32:55.490 GMT-0700
PM","status":"OK",
"total":1,"data":
[{"status":8,"message":"File has
local data."}]}
```

**FTOS\_ABORTED**

Indicates that the file tiering operation was aborted.  
For example:

**CLI**

```
/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /v3/dataVol/
file5 -json
{
  "timestamp":1533845080525,
  "timeofday":"2018-08-09 01:04:40.525
```

```

GMT-0700 PM",
  "status": "OK",
  "total": 1,
  "data": [
    {
      "status": 9,
      "message": "Transfer aborted.",
      "gateway": "10.10.25.22:8660",
      "op": "Offload",
      "completedFids": 9,
      "failedFids": 0,
      "totalFids": 9
    }
  ]
}

```

### REST

```

curl -k -X GET
'https://
abc.sj.us:8443/
rest/file/
tierjobstatus?
name=/v3/dataVol/
file5' --user
mapr:mapr

{"timestamp":1533
845080525,"timeof
day":"2018-08-09
01:04:40.525

talFids":9}}]

```

### FTOS\_ABORT\_IN\_PROGRESS

Indicates that the file tiering operation is being aborted. For example:

**CLI**

```

/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /v3/dataVol/
file5 -json
{

"timestamp":15338
45004549,

"timeofday":"201
8-08-09
01:03:24.549
GMT-0700 PM",
"status":"OK",
"total":1,
"data":[
{

"status":10,

"message":"File
transfer being
aborted.",

"gateway":"10.10.
25.22:8660",

"op":"Offload",

"completedFids":5
,

"failedFids":0,

"totalFids":9
}
]
}

```

**REST**

```

curl -k -X GET
'https://
abc.sj.us:8443/
rest/file/
tierjobstatus?
name=/v3/dataVol/
file5' --user
mapr:mapr

{"timestamp":1533
845004549,"timeof
day":"2018-08-09
01:03:24.549
GMT-0700
PM","status":"OK"
,

"total":1,"data":
[{"status":10,"me
ssage":"File

```

```

660",

"op": "Offload", "c
ompletedFids": 5, "
failedFids": 0, "to
talFids": 9]]}
```

**FTOS\_TRANSFER\_IN\_PROGRESS**

Indicates that offload or recall of file data is currently in progress. For example:

**CLI**

```
/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /v3/dataVol/
file5 -json
{

"timestamp":15338
44965363,

"timeofday": "201
8-08-09
01:02:45.363
GMT-0700 PM",
  "status": "OK",
  "total": 1,
  "data": [
    {

"status": 11,

"message": "File
transfer in
progress.",

"gateway": "10.10.
25.22:8660",

"op": "Offload",

"completedFids": 2
,

"failedFids": 0,

"totalFids": 9
}
]
}
```

**REST**

```
curl -k -X GET
'https://
abc.sj.us:8443/
rest/file/
tierjobstatus?
name=/v3/dataVol/
```

```
file5' --user
mapr:mapr

{"timestamp":1533
844965363,"timeof
day":"2018-08-09
01:02:45.363
GMT-0700
PM","status":"OK"
,

"total":1,"data":
[{"status":11,"me
ssage":"File

ay":"10.10.25.22:
8660",

"op":"Offload", "c
ompletedFids":2, "
failedFids":0, "to
talFids":9}}]
```

**FTOS\_REQ\_QUEUED**

Indicates that the file is queued for offload. For example:

**CLI**

```
/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /v5/
egFile2 -json
{

"timestamp":15341
87988469,

"timeofday":"201
8-08-13
12:19:48.469
GMT-0700 PM",

"status":"OK",
  "total":1,
  "data":[
    {

"status":12,

"message":"File
transfer request
queued.",

"gateway":"10.10.
25.29:8660",

"op":"Offload",

"completedFids":0
,
```

```
"failedFids":0,
"totalFids":0
}
]
```

**REST**

```
curl -k -X GET
'https://
abc.sj.us:8443/
rest/file/
tierjobstatus?
name=/v5/
egFile2' --user
mapr:mapr

{"timestamp":1534
187988469,"timeof
day":"2018-08-13
12:19:48.469
GMT-0700
PM","status":"OK"
,
"total":1,"data":
[{"status":12,"me
ssage":"File
transfer request
queued.,"gateway
":"10.10.25.29:86
60",
"op":"Offload","c
ompletedFids":0,"
failedFids":0,"to
talFids":0}]}
```

**FTOS\_JOB\_NOT\_AVAILABLE**

Indicates that the job ID associated with the specified file tiering operation is not available or is invalid. For example:

**CLI**

```
/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /v5/
nfile2 -json
{
"timestamp":15338
41993320,
"timeofday":"201
8-08-09
12:13:13.320
GMT-0700 PM",
"status":"ERROR",
"errors":[
```

```

    {
      "id":13,
      "desc":"File has
no active
transfer in
progress."
    }
  ]
}

```

**REST**

```

curl -k -X GET
'https://
abc.sj.us:8443/
rest/file/
tierjobstatus?
name=/v5/
nfile2' --user
mapr:mapr

{"timestamp":1533
841993320,"timeof
day":"2018-08-09
12:13:13.320
GMT-0700
PM","status":"ERR
OR",
  "errors":
  [{"id":13,"desc":
"File has no
active transfer
in progress."}]}

```

**FTOS\_EPERM**

Indicates that the user cannot perform the tiering operation. For example:

**CLI**

```

/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /ecvoll/
file3_1 -json
{
  "timestamp":15341
88598543,
  "timeofday":"201
8-08-13
12:29:58.543
GMT-0700 PM",
  "status":"ERROR",
  "errors":[
    {
      "id":14,
      "desc":"File

```

```
transfer request
permission
denied."
    ]
}
```

**REST**

```
curl -k -X GET
'https://
abc.sj.us:8443/
rest/file/
tierjobstatus?
name=/ecvoll/
file3_1' --user
mapr:mapr

{"timestamp":1534
188598543,"timeof
day":"2018-08-13
12:29:58.543
GMT-0700
PM","status":"ERR
OR",
  "errors":
  [{"id":14,"desc":
  "File transfer
request
permission
denied."}]}
```

**file tierstatus**

Checks the status of the file offload operation and returns information on whether or not the file has any local data.

This command does not require a MAST Gateway.

**Syntax**

**CLI**

```
maprcli file tierstatus
-name <file_name>
```

**REST**

Request Type	GET
Request URL	http[s]://<host:port>/rest/file/tierstatus?<parameters>

**Parameters**

Parameter	Description
name	The name (including the path) of the file.

## Output

The output of this command varies based on whether or not data is local, was offloaded, or was recalled. The output returns *one* of the following messages:

- Data was completely offloaded:

```
File does not have local data
```

- Data could not be completely offloaded or data was recalled:

```
File has local data
```

- File is not configured for tiering:

```
File is not on a tiered volume
```

## Examples

Retrieve the status of file named `new2test4` in volume name `testvol2`:

### CLI

```
maprcli file tierstatus -name /
testvol2/new2test4 -json
File does not have local data.
{
  "timestamp":1514877988773,
  "timeofday":"2018-01-01
11:26:28.773 GMT-0800",
  "status":"OK",
  "total":1,
  "data":[
    {
      "status":1,
      "message":"File
does not have local data."
    }
  ]
}
```

### REST

Send a request of type GET. For example:

```
curl -X GET 'https://servr.sj.us:8443/
rest/file/tierstatus?name=/testvol2/
new2test4' --user
<username>:<password>

{"timestamp":1514877988773,"timeofday"
:"2018-01-01 11:26:28.773
GMT-0800","status":"OK","total":1,
  "data":[{"status":1,"message":"File
does not have local data."}]}
```

Retrieve the status of file named `new2test3` in volume named `testvol2`:

### CLI

```
maprcli file tierstatus -name /
testvol2/new2test3 -json
File has local data.
```

```

    {
      "timestamp":1514878021374,
      "timeofday":"2018-01-01
11:27:01.374 GMT-0800",
      "status":"OK",
      "total":1,
      "data":[
        {
          "status":0,
          "message":"File
has local data."
        }
      ]
    }

```

**REST**

Send a request of type GET. For example:

```

curl -X GET 'https://
server.sj.us:8443/rest/file/
tierstatus?name=/testvol2/
new2test3' --user
<username>:<password>

{"timestamp":1514878021374,"timeofday"
:"2018-01-01 11:27:01.374
GMT-0800","status":"OK","total":1,
"data":[{"status":0,"message":"File
has local data."}]}
```

**Retrieve the status of file named file0 in volume named dir1 inside a volume called std\_volume:**

**CLI**

```

/opt/mapr/bin/maprcli
file tierstatus -name /std_volume/
dir1/file0 -json
File is not on a tiered volume.
{
  "timestamp":1609831337961,
  "timeofday":"2021-01-04
11:22:17.961 GMT-0800 PM",
  "status":"ERROR",
  "errors":[
    {
      "id":4,
      "desc":"File is not on a
tiered volume."
    }
  ]
}

```

**REST**

Send a request of type GET. For example:

```

curl -X
GET 'https://server.sj.us:8443/rest/
file/tierstatus?name=/std_volume/dir1/
file0' --user <username>:<password>
```

**filefilter**

Creates and modifies filters to restrict certain file types from being stored on specified volumes.

### filefilter create

Creates a filter to disallow the specified file type.

#### Syntax

##### CLI

```
/opt/mapr/bin/maprcli filefilter
create
    -name name
    [ -description description ]
    -fileextensions extension
```

##### REST

Request Type	POST
Request URL	http[s]://<host:port>/rest/filefilter/create?<parameters>

#### Parameters

Parameter	Description
name	The name of the filter to create.
description	An optional description.
fileextensions	Comma separated list of extensions to block. For example, <i>exe,bat</i> blocks <i>exe</i> and <i>bat</i> files from being created and stored.   <b>NOTE:</b> The extensions are NOT case sensitive. Setting the extension to <i>exe</i> blocks <i>file1.exe</i> but does not block <i>file1.EXE</i> .

#### Example

Create a filter named *noxebat* to disallow *exe* and *bat* files:

##### CLI

```
/opt/mapr/bin/maprcli filefilter
create -name noxebat -description No
EXE and BAT files \
    -fileextensions
exe,bat -json
{
    "timestamp":1609740883440,
    "timeofday":"2021-01-03
10:14:43.440 GMT-0800 PM",
    "status":"OK",
    "total":0,
    "data":[
    ],
    "messages":[
        "Filter Created
successfully"
    ]
}
```

**REST**

```
curl -X POST 'https://abc.sj.us:8443/
rest/filefilter/create?
name=noexe&description=No%20EXE%20a
nd%20BAT%20files&fileextensions=exe,ba
t' --user <username>:<password>
{"timestamp":1609743797218,"timeofday"
:"2021-01-03 11:03:17.218 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Filter Created
successfully"]}
```

**filefilter modify**

Modifies a filter that disallows the specified file type.

**Syntax****CLI**

```
/opt/mapr/bin/maprcli filefilter
modify
    -name name
    [ -description description ]
    -fileextensions extension
```

**REST**

Request Type	POST
Request URL	http[s]://<host:port>/rest/filefilter/modify?<parameters>

**Parameters**

Parameter	Description
name	Identifies the filter to modify. The name cannot be modified.
description	An optional description.
fileextensions	Comma separated list of extensions to block. For example, <i>exe,bat</i> blocks <i>exe</i> and <i>bat</i> files from being created and stored.  <b>NOTE:</b> The extensions are NOT case sensitive. Setting the extension to <i>exe</i> blocks <i>file1.exe</i> but does not block <i>file1.EXE</i>

**NOTE:** Modifying file filters does not delete files already present in accordance with the current extensions. They only block new files henceforth. For example, if you modify a filter that currently has *jpg,png*, and now add *txt* to it, files with an extension of *txt* that are already present in the volume are not deleted. New files with the *txt* extension are prevented from being created hereafter.

**Example**

Modify a filter named *noxebat* to disallow *exe*, *bat*, and *sh* files:

**CLI**

```

/opt/mapr/bin/maprcli filefilter
modify -name noextbat -description No
EXE BAT and sh files \
      -fileextensions
exe,bat,sh -json
{
  "timestamp":1609747228371,
  "timeofday":"2021-01-04
12:00:28.371 GMT-0800 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":["
    "Filter Updated
successfully"
  ]
}

```

**REST**

```

curl -X POST 'https://abc.sj.us:8443/
rest/filefilter/modify?
name=noexeabat&description=No%20EXE%20B
AT%20and%20sh%20files&fileextensions=e
xe,bat,sh' --user
<username>:<password>
{"timestamp":1609747413152,"timeofday"
:"2021-01-04 12:03:33.152 GMT-0800
AM","status":"OK","total":0,"data":
[],"messages":["Filter Updated
successfully"]}

```

**filefilter list**

Lists filters specified by filtering criteria.

**Syntax****CLI**

```

/opt/mapr/bin/maprcli filefilter list
[ -columns all. default: all ]
[ -filter none. default:
none ]
[ -limit limit. default:
2147483647 ]
[ -output verbose. default:
verbose ]
[ -sortby <filtername|
filterid>, column names of supported
fields. ]
[ -sortorder <asc|desc> ]
[ -start start. default: 0 ]

```

**REST**

Request Type	POST
--------------	------

Request URL	http[s]://<host:port>/rest/filefilter/list?<parameters>
-------------	---------------------------------------------------------

### Parameters

Parameter	Description
columns	A comma-separated list of fields to return in the query.
filter	A filter specifying file filters to list. See <a href="#">Filters</a> on page 1990 for more information. Default: none
limit	Number of filters to list.
output	Either terse or verbose.
sortby	Field on which to sort the output.
sortorder	Either ascending or descending.
start	Filter to start with when listing multiple filters.

### Examples

#### List all file filters:

##### CLI

```

/opt/mapr/bin/maprcli filefilter
list -json

{
  "timestamp":1609826179089,
  "timeofday":"2021-01-04
09:56:19.089 GMT-0800 PM",
  "status":"OK",
  "total":3,
  "data":[
    {
      "filterid":1,
      "filtername":"nojpg",
      "description":"NO",
      "fileExtention":"jpg,txt"
    },
    {
      "filterid":3,
      "filtername":"notextjpg",
      "description":"No text jpg and mov
files",
      "fileExtention":"jpg,txt,mov"
    },
    {
      "filterid":4,

```

```

"filename":"noexec",
"description":"No",
"fileExtention":"exe,bat,sh"
    }
]
}

```

## REST

```

curl -X POST 'https://
server.sj.us:8443/rest/filefilter/
list' --user <username>:<password>
{"timestamp":1609826294528,"timeofday"
:"2021-01-04 09:58:14.528 GMT-0800
PM","status":"OK","total":3,"data":
[{"filterid":1,"filename":"nojpg","d
escription":"NO","fileExtention":"jpg,
txt"},
{"filterid":3,"filename":"notextjpg"
,"description":"No text jpg and mov
files","fileExtention":"jpg,txt,mov"},
{"filterid":4,"filename":"noexec","d
escription":"No","fileExtention":"exe,
bat,sh"}]}

```

### List the first two file filters

The `start` and `limit` parameters are useful for limiting the results. You can list the first two file filters as follows:

## CLI

```

/opt/mapr/bin/maprcli filefilter
list -start 0 -limit 2 -json
{
    "timestamp":1609826503471,
    "timeofday":"2021-01-04
10:01:43.471 GMT-0800 PM",
    "status":"OK",
    "total":2,
    "data":[
        {
            "filterid":1,
            "filename":"nojpg",
            "description":"NO",
            "fileExtention":"jpg,txt"
        },
        {
            "filterid":3,
            "filename":"notextjpg",
            "description":"No text jpg and mov
files",
            "fileExtention":"jpg,txt,mov"
        }
    ]
}

```

```
]
}
```

**REST**

```
curl -X GET 'https://
server.sj.us:8443/rest/filefilter/
list?start=0&limit=2' --user
<username>:<password>
{"timestamp":1609826617711,"timeofday"
:"2021-01-04 10:03:37.711 GMT-0800
PM","status":"OK","total":2,"data":
[{"filterid":1,"filtername":"nojpg","d
escription":"NO","fileExtention":"jpg,
txt"},
{"filterid":3,"filtername":"notextjpg"
,"description":"No text jpg and mov
files","fileExtention":"jpg,txt,mov"}]
}
```

**filefilter info**

Displays information about a specified filter.

**Syntax**

**CLI**

```
/opt/mapr/bin/maprcli filefilter info
-name filterName
```

**REST**

Request Type	POST
Request URL	http[s]://<host:port>/rest/filefilter/info?<parameters>

**Parameters**

Parameter	Description
name	Filter for which to display information.

**Examples**

Display information for the filter named notextjpg:

**CLI**

```
/opt/mapr/bin/maprcli filefilter
info -name notextjpg -json
{
  "timestamp":1609830546149,
  "timeofday":"2021-01-04
11:09:06.149 GMT-0800 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "filterid":3,
```

```
"filtername":"notextjpg",

"description":"No text jpg and mov
files",

"fileExtention":"jpg,txt,mov"
    }
]
}
```

**REST**

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/filefilter/info?
name=notextjpg' --user
<username>:<password>
{"timestamp":1609833232278,"timeofday"
:"2021-01-04 11:53:52.278 GMT-0800
PM","status":"OK","total":1,"data":
[{"filterid":3,"filtername":"notextjpg
","description":"No text jpg and mov
files","fileExtention":"jpg,txt,mov"}]
}
```

**filefilter remove**

Removes a file filter.

**Syntax**

**CLI**

```
/opt/mapr/bin/maprcli filefilter
remove
    -name filterName
```

**REST**

Request Type	POST
Request URL	http[s]://<host:port>/rest/filefilter/remove?<parameters>

**Parameters**

Parameter	Description
name	Filter to remove.

**NOTE:** Filters that are attached to volumes cannot be removed. [Modify the volumes](#) to remove the filters, before deleting the filters.

**Example**

**Remove filter :**

**CLI**

```
/opt/mapr/bin/maprcli filefilter
remove -name notextjpg -json
{
```

```

        "timestamp":1609834952199,
        "timeofday":"2021-01-05
12:22:32.199 GMT-0800 AM",
        "status":"OK",
        "total":0,
        "data":[

        ],
        "messages":[
            "Filter Removed
successfully"
        ]
    }

```

## REST

```

curl -k -X POST 'https://
abc.sj.us:8443/rest/filefilter/remove?
name=notextjpg' --user
<username>:<password>
{"timestamp":1609835456331,"timeofday"
:"2021-01-05 12:30:56.331 GMT-0800
AM","status":"OK","total":0,"data":
[],"messages":["Filter Removed
successfully"]}

```

## insight

Describes the `maprcli` command to enable insights and get information related to insights.

## Syntax

The `insight` command is used to manage the retrieval and pushing of audit log data by the insight service. The insight service retrieves and pushes audit log data related to MFS, CLDB, auth, and S3 services to Apache Iceberg tables. The data in the Apache Iceberg tables can be used for analysis related to anomalies in user behavior, such as authentication, authorization, file operations. Audit log data related to the individual services, MFS, CLDB, auth and S3, can be selectively pushed to Apache Iceberg tables.

Other operations related to insight data such as listing and specifying the retention period can be performed by using the `insight` command.

```

maprcli insight
cluster
  [ -enable set true/false ]
  [ -nodes node names space separated ]
  [ -type audit type [mfs, s3, auth, cldb] ]

info
  [ -nodes node names space separated ]
  [ -type audit type [mfs, s3, auth, cldb] ],
  [ -purge true/false ]

purge
  [ -retentionDays set retention days ]

```

See the individual subcommand help for details related to each subcommand.

### insight cluster

Enables or disables addition of audit data to Iceberg tables for the specified type.

**NOTE:** The insight service runs on a single node only.

## Syntax

### CLI

```
maprcli insight
cluster
  [ -enable set true/false ]
  [ -nodes node names space separated ]
  [ -type audit type [mfs, s3, auth, cldb] ]
```

### REST

Request Type	PUT
Request URL	http[s]://<host>:<port>/rest/insight/cluster?<parameters>

### Parameters

Parameter	Description
enable	<i>(Mandatory)</i> Set the value of this option to <code>true</code> to enable retrieval and adding of audit data to Iceberg tables. The default value is <code>false</code> , which means that audit data gathering is disabled. When you enable this without specifying a node name, the audit data gathering is enabled at the cluster level - all types of audit logs, that is, <code>cldb</code> , <code>mfs</code> , <code>auth</code> , and <code>s3</code> audit logs must be retrieved and pushed to the designated Iceberg table.
nodes	<i>(Optional)</i> The node name from which the audit data is to be retrieved and added to Iceberg table/retrieval and addition of audit data to Iceberg table is to be stopped. This option cannot be used in combination with <code>type</code> option. Specify the node name on which the insight service is running.  Specifying this option implies that for the specified node audit log gathering for all components is enabled or disabled.
type	<i>(Optional)</i> The type of audit log. The permissible values are <code>mfs</code> for file server logs, <code>s3</code> for S3 object store logs, <code>cldb</code> for cldb logs and <code>auth</code> for web server authentication logs. Use comma-separated list for more than one audit log type. When type-level insights are enabled/disabled, the configuration is effective for the type across all nodes in the cluster. If <code>s3</code> disabled, audit logs for S3 object store across all nodes are not added to Iceberg table.  This option cannot be used in combination with <code>node</code> option.

### Examples

**Enable audit logs data for all components, that is, `cldb`, `mfs`, `auth`, and `s3` across all nodes.**

 **NOTE:** Each type of audit log stream will have a dedicated Iceberg table. There are 4 tables that store the logs for the four types of audit logs, that is, cldb, mfs, auth and s3.

```
maprcli insight cluster -enable true -json
{
  "timestamp":1721998027792,
  "timeofday":"2024-07-26 05:47:07.792 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Updated insight Config Successfully. "
  ]
}
```

#### Enable audit logs data for cldb and s3 components across all nodes.

```
maprcli insight cluster -enable true -type cldb, s3 -json
{
  "timestamp":1721998093460,
  "timeofday":"2024-07-26 05:48:13.460 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Updated insight Config Successfully. "
  ]
}
```

#### Enable audit logs data for all components for the specified node.

```
maprcli insight cluster -enable true -nodes `hostname -f` -json
{
  "timestamp":1721998231593,
  "timeofday":"2024-07-26 05:50:31.593 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Updated insight Config Successfully. "
  ]
}
```

#### insight info

Prints the status of the component types and retention days for purging with respect to the insight service.

The `insight info` subcommand displays detailed information related to the following:

- whether the component types are enabled/disabled.
- The time the audit data was last added to the respective Iceberg table, along with relevant status code and a message in case of error.

- The clean-up time activity of older audit data based on the specified `retentionDays`.

**NOTE:** The value of `retentionDays` would be as configured by using the `insight purge` command.

### Syntax

#### CLI

```
maprcli insight
info
  [ -nodes node names space
separated ]
  [ -type audit type [mfs, s3,
auth, cldb] ],
  [ -purge true/false ]
```

#### REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/insight/info?<parameters>

### Parameters

Parameter	Description
nodes	<i>(Optional)</i> The node name for which the information from the insight service is to be displayed. Specifying this option implies that status for all the components is to be displayed for the specified node. This option cannot be used in combination with the <code>type</code> option.
type	<i>(Optional)</i> The audit component type for which the information from the insight service is to be displayed. The permissible values are <code>mfs</code> for file server logs, <code>s3</code> for S3 object store logs, <code>cldb</code> for cldb logs and <code>auth</code> for web server authentication logs. Use comma-separated list for more than one audit log type. When type-level insights are enabled/disabled, the configuration is effective for the type across all nodes in the cluster. If <code>s3</code> disabled, audit logs for S3 object store across all nodes are not added to Iceberg table.  This option cannot be used in combination with <code>node</code> option.
purge	<i>(Optional)</i> Use this option to view the purge activity of insight service. It is used to display the <code>retentionDays</code> , purge activity time related to the purge. The permissible values are <code>true</code> or <code>false</code> .  <code>true</code> denotes that only the purge information should be displayed in the command output.  Purge is enabled automatically for the components that have been enabled using <code>insight cluster</code> on page 2222command.

**Example****Display all insight information as a well-formatted output (node-wise component and purge details).**

```
# maprcli insight info -json
{
  "timestamp":1721994180316,
  "timeofday":"2024-07-26 04:43:00.316 GMT-0700 AM",

        }
      }
    ]
  }
}

```

### Display insight information pertaining to the specified component

```

# maprcli insight info -type cldb, mfs -json
{
  "timestamp":1721989983068,
  "timeofday":"2024-07-26 03:33:03.068 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":{
        "mfs":false,
        "cldb":true,
        "s3":false,
        "auth":false
      },
      "nodes":{
        "m2-mapreng-vm16655.mip.storage.hpecorp.net":{
          "enabled":true,
          "cldb":{
            "running":true,
            "status":0,
            "lastCommitTime":"2024-07-26 03:32:08.102 GMT-0700"
          },
          "mfs":{
            "running":false,
            "lastCommitTime":""
          }
        }
      }
    }
  ]
}

```

**insight purge**

Sets the retention period, in days, for the insights data on Apache Iceberg table.

Insight data is retained for the specified number of days in Apache Iceberg. Insight data that is older than the specified number of days specified as the retention period is purged from Apache Iceberg.

Use the `insight purge` subcommand to set the retention period for insight data, in days.

**Syntax****CLI**

```
maprcli insight
purge
  [ -retentionDays set retention
days ]
```

**REST**

Request Type	PUT
Request URL	http[s]://<host>:<port>/rest/insight/purge?<parameters>

**Parameters**

Parameter	Description
retentionDays	(Optional) The number of days for which the insight data present on Iceberg is to be retained. Default: 5. The number of days must be mentioned when you use the <code>retentionDays</code> option with the <code>insight purge</code> command.

**Example**

Set the retention period to 10 days.

```
# maprcli insight purge -retentionDays 10 -json
{
  "timestamp":1721997840346,
  "timeofday":"2024-07-26 05:44:00.346 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Set insight purge configuration Successfully. "
  ]
}
```

**installer**

Describes commands for the as-a-service HPE Ezmeral Data Fabric cluster installation and removal.

**installer checkforupdate**

Check if a software update is available for a cluster.

## Syntax

### CLI

```
# maprcli installer checkforupdate -h
usage: cluster_check_updates.py [-h]
[-j CLUSTER_JSON] [-f
CLUSTER_JSON_FILE]
                                [-y
CLUSTER_YAML_FILE]

Check if a s/w update is available
for the cluster

options:
  -h, --help                show this
help message and exit
  -j CLUSTER_JSON, --cluster_json
CLUSTER_JSON                URL Encoded
JSON string describing cluster's name,
                                type,
credentials, and specific to target
provider
  -f
CLUSTER_JSON_FILE, --cluster_json_file
CLUSTER_JSON_FILE          Path to JSON
file describing cluster's name, type,
                                credentials,
and specific to target provider
  -y
CLUSTER_YAML_FILE, --cluster_yaml_file
CLUSTER_YAML_FILE          Path to YAML
file describing cluster's name, type,
                                credentials,
and specific to target provider
```

### Parameters

Parameter	Description
-j   --cluster_json	Optional URL encoded JSON string defining the cluster to check for available software updates.
-f   --cluster_json_file	Optional path to a JSON file defining the cluster to check for available software updates. Specify either a JSON file or a YAML file.
-y   --cluster_yaml_file	Optional path to a YAML file defining the cluster to check for available software updates. Specify either a JSON file or a YAML file.

### Example

Check the cluster for updates:

### CLI

```
/opt/mapr/bin/maprcli
installer checkforupdate -j
'{"cluster_name":""}' -json
```

**installer clustercreate**

Creates a cluster.

**Syntax****CLI**

```

/opt/mapr/bin/maprcli installer
clustercreate
usage: create_cluster.py [-h]
                        [-pypath
pythonpath (optional, default is
python3, use -h for help) ]
                        -d
                        {AWS,Azure,GCP,OnPrem}
                        CLUSTER_JSON
                        [-j
                        CLUSTER_JSON_FILE] [-f
                        CLUSTER_YAML_FILE]

                        [--run_create_cluster]
                        [--no_run_create_cluster]

                        [--run_stanza] [--no_run_stanza]

                        [--add_to_cluster_group
                        ADD_TO_CLUSTER_GROUP]

                        [--add_to_sso ADD_TO_SSO]

```

**Parameters**

Parameter	Description
-pypath	Optional path to the python executable. Default executable is <code>python3</code> .
-d   --deploy_target	Deployment target. One of AWS, Azure, GCP, or OnPrem. Mandatory if you do not specify one of -j, -f or -y.
-j   --cluster_json	Optional URL encoded JSON string defining the cluster to create.
-f   --cluster_json_file	Optional path to a JSON file defining the cluster to create. Specify either a JSON file or a YAML file.
-y   --cluster_yaml_file	Optional path to a YAML file defining the cluster to create. Specify either a JSON file or a YAML file.
--run_create_cluster	Optional. Turn on create cluster execution. Specify either <code>--run_create_cluster</code> (default) or <code>--no_run_create_cluster</code> .
--no_run_create_cluster	Optional. Turn off create cluster execution. Specify either <code>--run_create_cluster</code> (default) or <code>--no_run_create_cluster</code> .
--run_stanza	Optional. Turn on stanza execution. Specify either <code>--run_stanza</code> or <code>--no_run_stanza</code> .
--no_run_stanza	Optional. Turn off stanza execution. Specify either <code>--run_stanza</code> or <code>--no_run_stanza</code> .

Parameter	Description
--add_to_cluster_group	Optional. Add the cluster to the cluster group of the initiating node.
--add_to_sso	Optional. Add the cluster to the SSO realm.

### JSON file example

```
{
  "deploy_target": "AWS",
  "cluster_name": "APR22kalyandfcluster100gb",

### Cluster creation example

Create a cluster:

#### CLI

```

/opt/mapr/bin/maprcli
installer clustercreate -j
aws_create_cluster_payload.json

```

#### installer clusterinfo

Retrieves cluster information.

**Syntax****CLI**

```

/opt/mapr/bin/maprcli installer
clusterinfo
usage: cluster_info.py
       [ -pypath pythonpath
(optional, default is python3, use -h
for help) ]
       [-h]
       -c CLUSTER_NAME

```

**Parameters**

Parameter	Description
-pypath	Optional path to the python executable. Default executable is <code>python3</code> .
-c   --cluster_name	Mandatory. Name of the cluster for which to retrieve the information.

**Cluster information example**

Retrieve the information for cluster NA3213:

**CLI**

```

/opt/mapr/bin/maprcli installer
clusterinfo -c NA3213

```

**installer cluster remove**

Removes a cluster.

Not implemented. To remove deployed clusters, see [Shutting Down a Cluster](#) on page 1093.

**installer clusterscale**

Initiates the cluster scaling operation.

**Syntax****CLI**

```

maprcli installer clusterscale
usage: cluster_scale.py [-h] [-j
CLUSTER_JSON] [-f CLUSTER_JSON_FILE]
[-y
CLUSTER_YAML_FILE]
options:
  -h, --help
  -j CLUSTER_JSON, --cluster_json
CLUSTER_JSON
  -f
CLUSTER_JSON_FILE, --cluster_json_file
CLUSTER_JSON_FILE
  -y
CLUSTER_YAML_FILE, --cluster_yaml_file
CLUSTER_YAML_FILE

```

**Examples:**

**Example 1:** here is a .yaml file for adding two nodes to on-premise fabric:

```
# This is an example YML/JSON payload that will be sent from the
Controller/MCS WebUI to the MCS Api Server
# Convert this to and from YML/JSON here: https://codebeautify.org/
yaml-to-json-xml-csv

#Create a DF Cluster
# POST /api/v1/df

#AWS | Azure | GCP | OnPrem
deploy_target: "OnPrem"
# deployment name
cluster_name: "onpremfab1"
# Anything related to be scaled nodes goes in here
onpreconfig:
  ip_addresses:
    - "<FQDN_node_1>"
    - "<FQDN_node_2>"
  ssh_username: "<username>"
  ssh_password: "<password>"

# optional
# airgap_repository: "http://package.ezmeral.hpe.com"
```

**Example 2:** here is a .yaml file for adding two nodes to AWS cloud fabric:

```
# This is an example YML/JSON payload that will be sent from the
Controller/MCS WebUI to the MCS Api Server
# Convert this to and from YML/JSON here: https://codebeautify.org/
yaml-to-json-xml-csv

deploy_target: AWS
cluster_name: <fabric_name>
scale_host_count: 2
awsconfig:
  access_key_id: <aws_access_key>
  secret_access_key: <aws_secret_key>
```

**Example 3:** here is a .yaml file for adding two nodes to Azure cloud fabric:

```
# This is an example YML/JSON payload that will be sent from the
Controller/MCS WebUI to the MCS Api Server
# Convert this to and from YML/JSON here: https://codebeautify.org/
yaml-to-json-xml-csv

deploy_target: Azure
cluster_name: dfaas-example.mapr.io
scale_host_count: 2
azureconfig:
  subscription_id: 8f2c24e5-d03d-405c-5555-7d64bdc8c6d6
  tenant_id: 8a843277-7f99-43a4-5555-b60b8ca9b3e9
  client_id: 1d9c61e3-9ed0-4b55-5555-2f5153aee726
  client_secret: 9ABAQ~EXAMPLENOTREALUZYtCXnDPvABra~7
```

**Example 3:** here is a .yaml file for adding two nodes to Azure cloud fabric:

```
# This is an example YML/JSON payload that will be sent from the
Controller/MCS WebUI to the MCS Api Server
# Convert this to and from YML/JSON here: https://codebeautify.org/
yaml-to-json-xml-csv
```

```

deploy_target: GCP
cluster_name: demo.fabric.io
scale_host_count: 2
gcpconfig:
  credentials: <credentials json>

```

### Cluster scale example

The following example scales a cluster by adding two nodes as specified in the payload file (see the previous example):

#### CLI

```

maprcli installer
clusterscale -y examples/mcs_payloads/
onprem_scale_cluster_payload.yml -json

```

### installer clusterscalestatus

Displays the status of the cluster scaling operation initiated using the `installer clusterscale` command.

### Syntax

#### CLI

```

maprcli installer clusterscalestatus
usage: create_scale_status.py [-h] -c
CLUSTER_NAME
options:
  -h, --help
  -c CLUSTER_NAME, --cluster_name
CLUSTER_NAME

```

### Parameters

Parameter	Description
-c   --cluster_name	Mandatory. Name of the cluster for which to retrieve the scaling status.

### Cluster scaling status example

Retrieve the scaling status for cluster `onpremfab1`:

#### CLI

```

maprcli installer
clusterscalestatus -c onpremfab1 -json
{
  "timestamp":1712067359570,
  "timeofday":"2024-04-02
07:16:24.373 GMT-0700 AM",
  "status":"OK",
  "total":0
  "data":[

  ],
  "messages":[
    { 'cluster_name':
'onpremfab1', 'status': { 'log':
{'host': '<nodename1>', 'path': '/opt/

```

```
mapr/installer/ezdfaas/logs/
onpremfab1-fabric_scale_24_04_02_07_15
_25_1781038.log'}, 'message':
'Starting fabric scaling with hosts :
['<nodename2>', '<nodename2>'],'
'percentage': 0, 'scale_complete':
false, 'scale_successful': false,
'stage': {'hosts' : [{'completion':
0, 'host': '<nodename1>', 'state':
'INSTALLING', 'status': 'Installing
HPE Ezmeral Data Fabric'}],
{'completion': 0, 'host':
'<nodename2>', 'state': 'QUEUED',
'status': 'Queued'}}}, 'status_code':
0, 'time': '2024-04-02 07:46:21'}\n"
]
}
```

**installer clusterstatus**

Displays the state of the cluster.

**Syntax****CLI**

```
/opt/mapr/bin/maprcli installer
clusterstatus
usage: create_cluster_status.py
      [ -pypath pythonpath
(optional, default is python3, use -h
for help) ]
      [-h]
      -c CLUSTER_NAME
      [-m]
      [-p]
```

**Parameters**

Parameter	Description
-pypath	Optional path to the python executable. Default executable is <code>python3</code> .
-c	Mandatory. Name of the cluster for which to retrieve the state.
-m   --mock_output	Optional. Display mock data for state.
-p   --pretty	Optional. Tidy the output for readability.

**Cluster status example**

Retrieve the status for cluster NA3213:

**CLI**

```
/opt/mapr/bin/maprcli installer
clusterstatus -c NA3213 -p
```

**installer clusterupgrade**

Upgrade a cluster.

## Syntax

### CLI

```

/opt/mapr/bin/maprcli installer
clusterupgrade -h
usage: cluster_upgrade.py [-h] [-j
CLUSTER_JSON] [-f CLUSTER_JSON_FILE]
                        [-y
CLUSTER_YAML_FILE]

options:
  -h, --help            show this
help message and exit
  -j CLUSTER_JSON, --cluster_json
CLUSTER_JSON            URL Encoded
                        JSON string describing cluster's name,
                        type,
credentials, and specific to target
provider
  -f CLUSTER_JSON_FILE, --cluster_json_file
CLUSTER_JSON_FILE     Path to JSON
file describing cluster's name, type,
                        credentials,
and specific to target provider
  -y CLUSTER_YAML_FILE, --cluster_yaml_file
CLUSTER_YAML_FILE     Path to YAML
file describing cluster's name, type,
                        credentials,
and specific to target provider
    
```

### Parameters

Parameter	Description
-j   --cluster_json	Optional URL encoded JSON string defining the cluster to upgrade.
-f   --cluster_json_file	Optional path to a JSON file defining the cluster to upgrade. Specify either a JSON file or a YAML file.
-y   --cluster_yaml_file	Optional path to a YAML file defining the cluster to upgrade. Specify either a JSON file or a YAML file.

### Example

Upgrade a cluster:

### CLI

```

/opt/mapr/bin/maprcli installer
clusterupgrade -j
'{"cluster_name":"","core_version":"","
"ssh_username":"","ssh_password":""}'
-json
    
```

### installer clusterupgradestatus

Check the upgrade status of a cluster.

## Syntax

### CLI

```

/opt/mapr/bin/maprcli installer
clusterupgradestatus -h
usage: cluster_upgrade_status.py
[-h] -c CLUSTER_NAME

options:
  -h, --help            show this
help message and exit
  -c CLUSTER_NAME, --cluster_name
CLUSTER_NAME
                        name of the
cluster to check upgrade status

```

## Parameters

Parameter	Description
-c   --cluster_name	Name of the cluster to check the upgrade status.

## Example

Check the upgrade status for the cluster NA3213:

### CLI

```

/opt/mapr/bin/maprcli installer
clusterupgradestatus -c NA3213 -json

```

## installer listdeployments

Lists all cluster deployments.

## Syntax

### CLI

```

/opt/mapr/bin/maprcli installer
listdeployments
usage: list_clusters.py
      [-pypath pythonpath
(optional, default is python3, use -h
for help)]
      [-h]
      [-p]
      [-ip]

```

## Parameters

Parameter	Description
-pypath	Optional path to the python executable. Default executable is <code>python3</code> .
-p   --pretty	Optional. Tidy the output for readability.
-ip   --inprogress	Optional. Only display clusters that are in the process of being deployed.

## List deployments example

List clusters that are being deployed.

### CLI

```
/opt/mapr/bin/maprcli installer
listdeployments -ip -p
```

## installer logs

Downloads a zip archive of the logs for an as-a-service Data Fabric. This command is not supported for customer-managed clusters because clusters do not have a deployment directory. Only as-a-service fabrics have a deployment directory.

## Syntax

### CLI

```
maprcli installer logs
usage: cluster_logs.py [-h] -c
CLUSTER_NAME [-i INSTALLER_LOGS]
options:
  -h, --help            show this
help message and exit
  -c CLUSTER_NAME,     --cluster_name
CLUSTER_NAME
  -i
INSTALLER_LOGS,     --installer_logs
INSTALLER_LOGS
                                type of
logs: ezdfaas(False - default)/
installer(True)
```

## Parameters

Parameter	Description
-h   --help	Shows help for the command.
-c   --cluster_name	Mandatory. Name of the fabric for which to obtain log information
-i   --installer_logs	Log type to download. Two types are available: <ul style="list-style-type: none"> <li>ezdfaas – False is the default value for this log type.</li> <li>installer – True is the default value for this log type.</li> </ul>

## Download Logs Example

Downloads a zip archive of the installer logs for fabric name fabric-25 to the /var/mapr/fabriclogs/fabric-25\_installer/ directory.

### CLI

```
# maprcli installer logs -c
fabric-25 -i true -a true -json
{
  "timestamp":1715853237475,
  "timeofday":"2024-05-16 02:53:57.475
GMT-0700 AM",
```

```
"status": "OK",
"total": 0,
"data": [
  ],
  "messages": [
    { 'cluster_name':
'fabric-25',
'installer_logs': 'true',
'log_path': '/var/mapr/fabriclogs/
fabric-25_installer/archive.zip' } ]
}
```

**job**

Manages Hadoop jobs running on the cluster.

**job linklogs**

Creates symbolic links to all the logs relating to the activity of a specific job.

The `maprcli job linklogs` command works with the [Centralized Logging](#) to provide a job-centric view or an application-centric view of all log files generated during job or application execution.

The output of `job linklogs` is a directory populated with symbolic links to all log files related to the specified job(s) or to the application. The command can be performed during or after a job or application is processed.

**Syntax****CLI**

```
maprcli job linklogs
  -jobid <jobPattern>
  -todir <desinationDirectory>
  [-jobconf <pathToJobXml>]
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/job/linklogs?<parameters>

**Parameters**

Parameter	Description
jobid	For MapReduce version 2, specify the application ID.
todir	The target directory for the symbolic links to the log files.
jobconf	For MapReduce version 2, this parameter is not applicable.

**Output**

For MapReduce version 2, the following directory will be created in the location specified by `todir` for the application ID that you specify for the `jobid` parameter:

- `<applicationId>/hosts/<host>/` contains symbolic links to log directories of tasks executed for `<applicationId>` on `<host>`

## Examples

Link logs for all jobs named "wordcount1" and dump output to /myvolume/joblogviewdir:

### CLI

```
maprcli job linklogs -jobid
job_*_wordcount1 -todir /myvolume/
joblogviewdir
```

### REST

```
https://abc.sj.us:8443/
rest/job/linklogs?
jobid=job_*_wordcount1&todir=/
myvolume/joblogviewdir
```

## license

Manages MapR licenses.

### license add

Adds a license. Permissions required: `fc` or `a`.

You can specify the license either by passing the license string itself to `license add`, or by specifying a file containing the license string. In a multinode cluster, add the license to one node (any node). Adding the same license to more than one node returns an error.

## Syntax

### CLI

```
maprcli license add
[ -cluster cluster name ]
[ -is_file true|false. default:
false ]
-license long_license_string
```

### REST

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/license/add?&lt;parameters&gt;</code>

## Parameters

Parameter	Description
<code>cluster</code>	The cluster on which to run the command.
<code>is_file</code>	Specifies whether the <code>license</code> specifies a file. If <code>false</code> , the <code>license</code> parameter contains a long license string.
<code>license</code>	The license to add to the cluster. If <code>-is_file</code> is <code>true</code> , <code>license</code> specifies the file name of a license file. Otherwise, <code>license</code> contains the license string itself.

## Examples

**NOTE:** After obtaining a valid license file from your data-fabric sale representative, copy the license file to a cluster node, for example in the path `/tmp/license.txt`.

To add a license from a file:

**CLI**

```
maprcli license add -is_file
true -license /tmp/license.txt
```

**REST**

```
https://abc.sj.us:8443/rest/license/
add?
is_file=true&license=%2Ftmp%2Flicen
se.txt
```

**Related concepts**

Removes a license. Permissions required: `fc` or `a`.

[license showid](#) on page 2250

Displays the cluster ID for use when creating a new license. Permissions required: `login`.

**license addcrl**

Adds a certificate revocation list (CRL). Permissions required: `fc` or `a`.

**Syntax****CLI**

```
maprcli license addcrl
[ -cluster <cluster> ]
-crl <crlstring>
[ -is_file true|false. default:
false ]
```

**REST**

Request Type	POST
--------------	------

Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/license/addcrl?&lt;parameters&gt;</code>
-------------	-----------------------------------------------------------------------------------------

### Parameters

Parameter	Description
cluster	The cluster on which to run the command.
crl	The CRL to add to the cluster. If file is set, <code>crl</code> specifies the filename of a CRL file. Otherwise, <code>crl</code> contains the CRL string itself.
is_file	Specifies whether the license is contained in a file.

### Examples

#### CLI

```
maprcli license addcrl
  -crl crl.txt
  -is_file true
```

#### REST

```
https://centos26.lab:8443/
rest/license/addcrl?
crl=crl.txt&is_file=true
```

## license list

Lists licenses on the cluster. Permissions required: `login`. For best results, use the `-json` option when running the command.

## Syntax

### CLI

```
maprcli license list
[ -cluster <cluster> ]
```

### REST

Request Type	GET
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/license/list[?&lt;parameters&gt;]</code>

## Parameters

Parameter	Description
cluster	The cluster on which to run the command.

**NOTE:** If you use the `-json` option with this command, and you pipe the output into another program, you may find that the result cannot be parsed by certain JSON libraries, such as the JSON library for Python. To work around this problem, you can replace the single-escape characters (`\`) in the JSON output that the `license list` command returns, with double-escape characters (`\\`).

## Output

### Sample Output

```
# maprcli license list -json
{

**Parameters**

Parameter	Description
cluster	The cluster on which to run the command.
showNodes	When set to true, displays both the number of nodes that the license supports, and the current number of nodes to which the license applies. A value of -1 indicates that there is no limit to the number of nodes to which this license applies. Default Value: false

**Output****Sample Output**

```
# maprcli license showid
id
5119043355327235351
```

```
# maprcli license showid -showNodes true
maxLicensedNodes  id          currentLicensedNodes
-1                5119043355327235351    1
```

**Examples****CLI**

```
maprcli license showid -showNodes true
```

**REST**

```
https://abc.sj.us:8443/rest/license/showid?showNodes=true
```

**Related concepts**

[Upgrading and Your License](#) on page 300

You do not need a new license to upgrade an HPE Ezmeral Data Fabric cluster. However, it's a good idea to check your cluster license periodically and renew the license before it expires.

### Related tasks

[Viewing the Licenses on the Cluster](#) on page 1072

List the licenses on the cluster using either the Control System or the CLI.

[Adding a License](#) on page 1071

Add a license through the Control System or the CLI.

[Removing a License](#) on page 1074

Describes how to remove a license using the Control System and the CLI.

### Related reference

[license add](#) on page 2241

Adds a license. Permissions required: `fc` or `a`.

[license addcrl](#) on page 2242

Adds a certificate revocation list (CRL). Permissions required: `fc` or `a`.

[license apps](#) on page 2244

Displays the features authorized for the current license. Permissions required: `login`

[license list](#) on page 2245

Lists licenses on the cluster. Permissions required: `login`. For best results, use the `-json` option when running the command.

[license listcrl](#) on page 2247

Lists certificate revocation lists (CRLs) on the cluster. Permissions required: `login`.

[license remove](#) on page 2248

Removes a license. Permissions required: `fc` or `a`.

### label

Manages registration and modification of labels.

#### label add

Registers a label. Permissions required: `fc` or `a`.

Registers a label. See [Using Storage Labels](#) on page 1306 for more information on labels. Attempting to register a label that is already registered, results in an error.

When registering a label for a Storage Pool, the label and its associated values apply to all the disks in the Storage Pool.

### Syntax

#### CLI

```
maprcli label add
  -label <label to be registered>
  [ -maxactiveioperdisk max active
io per disk ]
  [ -numdiskspersinstance num disks
per mfs instance ]
  [ -isssd is solid state drive ]
  [ -istrimenabled is trim enabled ]
```

#### REST

Request Type	POST
--------------	------

Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/label/add?&lt;parameters&gt;</code>
-------------	------------------------------------------------------------------------------------

## Parameters

### label

*Default Value:* default

Possible Values: Any label

Description: The label to use for the storage pool. See [Using Storage Labels](#) on page 1306 for more information on labels.

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

### maxactiveioperdisk

*Default Value:* 100

Possible Values: Any integer value between 100 and 50000.

The number of concurrent IO operations per second that can be issued on the disk. Not specifying this value uses the default value specified in the `mfs.conf` file.

### numdisksperinstance

*Default Value:* 20

Possible Values: Any integer value between 1 and 24.

Used in partitioning disks of the same type among multiple instances of file servers on the same node.

### isssd

*Default Value:* true

Possible Values: true or false

Set to `true` to indicate that the disk is an SSD.

### istrimenabled

*Default Value:* false

Possible Values: true or false

Set to `true` to indicate that the SSD disk is TRIM enabled.

TRIM enables the File System to inform a SSD disk which data blocks it can erase because they are no longer in use. The use of TRIM can improve the performance of writing data to SSDs and contribute to longer SSD life. Set this parameter to `true` only if the SSD vendor recommends it.

## Examples

1. Register a label, before using it to label a storage pool.

### CLI

```
maprcli label add -label WDcheetah
```

### REST

```
https://abc.sj.us:8443/rest/labels/add?label=WDcheetah
```

- Register a label with additional settings such as the maximum active IO per disk and marking it as a SSD, before using it to label a storage pool.

**CLI**

```
maprcli label add -label
WDCheetah -maxactiveioperdisk
5000 -isssd true -istrimenabled true
```

**REST**

```
https://abc.sj.us:8443/rest/labels/
add?
label=WDCheetah&maxactiveioperdisk=500
0&-isssd=true&istrimenabled=true
```

**Related concepts**

[node](#) on page 2260

Manages nodes in the cluster

[Using Storage Labels](#) on page 1306

Describes the Storage Labels feature.

**Related reference**

[disk add](#) on page 2124

Adds one or more disks to the specified node. Permissions required: `fc` or `a`.

[disk setlabel](#) on page 2126

Adds a label to disks or a storage pool. Permissions required: `fc` or `a`.

[volume create](#) on page 2592

Creates a volume.

[volume move](#) on page 2701

Moves the specified volume or mirror to a different topology. Permissions required: `m` or `fc` on the volume.

[label list](#) on page 2255

Lists registered labels. Permissions required: `fc` or `a`.

[node list](#) on page 2270

Lists nodes in the cluster.

[configure.sh](#) on page 2826

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Ezmeral Data Fabric client nodes, and configuring services for a node.

**label modify**

Modifies a label. Permissions required: `fc` or `a`.

Modifies a label. See [Using Storage Labels](#) on page 1306 for more information on labels.

When modifying a label for a Storage Pool, the label and its associated values apply to all the disks in the Storage Pool.

**Syntax****CLI**

```
maprcli label modify
  -label <label to be modified>
  [ -maxactiveioperdisk max active
io per disk ]
  [ -isssd is solid state drive ]
  [ -istrimenabled is trim enabled ]
```

**REST**

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/ label/modify?&lt;parameters&gt;</code>

**Parameters****label**

Possible Values: Any label

Description: The label to use for the storage pool. See [Using Storage Labels](#) on page 1306 for more information on labels.

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

**maxactiveioperdisk**

Possible Values: Any integer value between 100 and 50000.

Description: The number of concurrent IO operations per second that can be issued on the disk. Not specifying this value uses the default value specified in the `mfs.conf` file.

**isssd**Possible Values: `true` or `false`

Description: Set to `true` to indicate that the disk is an SSD.

**istrimenabled**Possible Values: `true` or `false`

Description: Set to `true` to indicate that the SSD disk is TRIM enabled.

TRIM enables the File System to inform a SSD disk which data blocks it can erase because they are no longer in use. The use of TRIM can improve the performance of writing data to SSDs and contribute to longer SSD life. Set this parameter to `true` only if the SSD vendor recommends it.

**Examples**

Modify a label:

**CLI**

```
maprcli label modify -label  
WDcheetah -maxactiveioperdisk  
5000 -isssd true -istrimenabled true
```

**REST**

```
https://abc.sj.us:8443/rest/labels/  
modify?  
label=WDcheetah&maxactiveioperdisk=5000  
&-isssd=true&istrimenabled=true
```

### nfsmgmt

Refreshes NFS exports and server cache.

#### nfsmgmt refreshexports

Refreshes the list of clusters and mount points available to mount with NFS. Permissions required: `fc` or `a`.

## Syntax

### CLI

```

[ -nfshost <ip or hostname> ]
[ -nfsport <port> ]
[ -isusermode <true | false> ]

```

### REST

N/A

**Parameters**

Parameter	Description
nfshost	The hostname of the node that is running the MapR NFS server. Default: 127.0.0.1
nfsport	The port to use. Default: 9998
isusermode	Specifies whether the mode for creating the ticket for NFS is in user mode or not. Options: True or False. The ticket can not be created for nfs in user mode. Default: false

**Example**

**CLI** `maprcli nfsmgmt refreshexports -nfshost 10.10.82.29 -nfsport 9998`

**nfsmgmt refreshgidcache**

Deletes the GID list (uidGidCache\_ entries) in NFS server cache. Permissions required: fc or a.

Useful for immediately reflecting the groups update.

**Syntax**

**CLI**

```
[ -nfshost <ip or hostname> ]
[ -nfsport <port> ]
[ -isusermode <true | false> ]
```

**REST**

N/A

**Parameters**

Parameter	Description
nfshost	The hostname of the node that is running the MapR NFS server. Default: 127.0.0.1
nfsport	The port to use. Default: 9998
isusermode	Specifies whether the mode for nfs is in user mode or not. Options: True or False. The ticket can not be created for nfs in user mode. Default: false

**Example**

**CLI** `maprcli nfsmgmt refreshgidcache -nfshost 10.10.82.29 -nfsport 9998`

**nfs4mgmt**

Manages NFSv4 server.

**nfs4mgmt add-export**

Adds an export.

## Syntax

### CLI

```
/opt/mapr/bin/maprcli nfs4mgmt
add-export
    [ -nfshost ip/hostname.
default: 127.0.0.1 ]
    [ -nfsport port. default:
9995 ]
    -exportid export id. default:
0
    -conffile conf file path
```

### REST

N/A

## Parameters

Parameter	Description
conffile	The path to the NFSv4 configuration file.
exportid	The export ID as specified in the configuration file. The default value is 0.
nfshost	The NFS server host. Value can be the IP address or the hostname of the NFS server host. The default value is 127.0.0.1.
nfsport	The NFS server port. The default value is 9995.

## Examples

### nfs4mgmt list-exports

Returns the list of exports.

## Syntax

### CLI

```
/opt/mapr/bin/maprcli nfs4mgmt
list-exports
    [ -nfshost ip/hostname.
default: 127.0.0.1 ]
    [ -nfsport port. default:
9995 ]
```

### REST

N/A

## Parameters

Parameter	Description
nfshost	The NFS server host. Value can be the IP address or the hostname of the NFS server host. The default value is 127.0.0.1.
nfsport	The NFS server port. The default value is 9995.

## Troubleshooting

For troubleshooting information, see [NFS Troubleshooting](#)

**nfs4mgmt remove-export**

Removes an export.

**Syntax****CLI**

```
/opt/mapr/bin/maprcli mfs4mgmt
remove-export
    [ -nfshost ip/hostname.
default: 127.0.0.1 ]
    [ -nfsport port. default:
9995 ]
    -exportid export id. default:
0
```

**REST**

N/A

**Parameters**

Parameter	Description
exportid	The export ID to remove as specified in the configuration file. The default value is 0.
nfshost	The NFS server host. Value can be the IP address or the hostname of the NFS server host. The default value is 127.0.0.1.
nfsport	The NFS server port. The default value is 9995.

**Examples****nfs4mgmt update-export**

Updates an export based on configuration changes.

**Syntax****CLI**

```
/opt/mapr/bin/maprcli mfs4mgmt
update-export
    [ -nfshost ip/hostname.
default: 127.0.0.1 ]
    [ -nfsport port. default:
9995 ]
    -exportid export id. default:
0
    -conffile conf file path
```

**REST**

N/A

**Parameters**

Parameter	Description
conffile	The path to the NFSv4 configuration file.
exportid	The export ID to update as specified in the configuration file. The default value is 0.

Parameter	Description
nfshost	The NFS server host. Value can be the IP address or the hostname of the NFS server host. The default value is 127.0.0.1.
nfssport	The NFS server port. The default value is 9995.

## Examples

### node

Manages nodes in the cluster

### Fields

The following table lists the data fields that provide information about each node. Each field has two names:

- Field name - displayed in the output of the `node list` command
- Short name - used to specify the columns displayed using the `columns` parameter

The short name is also used when specifying rows with a filter, for example when specifying nodes on which to perform an action with the `node services` command.

Field Name	Short Name	Description
blockMovesIn	bmi	Block moves in.
blockMovesOut	bmo	Block moves out.
bytesReceived	br	Bytes received by the node since the last CLDB heartbeat.
bytesSent	bs	Bytes sent by the node since the last CLDB heartbeat.
clienthealth	clhealth	The status of the client. Value can be one of the following: <ul style="list-style-type: none"> <li>• Active</li> <li>• Inactive</li> </ul>
clienttype	cltype	The type of client. For example, <code>posixclientgold</code> , <code>posixclientbasic</code> , <code>posixclientplatinum</code> , <code>LOOPBACK_NFS</code> , <code>NFS_V3</code> , <code>NFS_V4</code> .
configuredservice	csvc	Services that are configured as roles on the node.
CorePresentAlarm	ncp	Timestamp when the <a href="#">Core Present</a> alarm was raised.
cpus	cpc	The total number of CPUs on the node.
davail	dsa	Disk space available on the node, in GB.
DiskFailureAlarm	fda	Timestamp when <a href="#">Disk Failure</a> on page 3014 alarm was raised.

Field Name	Short Name	Description
disks	dsc	Total number of disks on the node.
dreadK	drk	Disk Kbytes read since the last heartbeat.
dreads	dro	Disk read operations since the last heartbeat.
DRILLDOWNALARM	nadrill	Timestamp when "Drill Service Down" alarm was raised.
dtotal	dst	Total disk space on the node, in GB.
dused	dsu	Disk space used on the node, in GB.
dwriteK	dwk	Disk Kbytes written since the last heartbeat.
dwrites	dwo	Disk write ops since the last heartbeat.
ESServerDown	naes	Timestamp when "Elasticsearch Server Down" alarm was raised.
faileddisks	nfd	Number of failed file system disks on the node. <ul style="list-style-type: none"> <li>0 = Clear</li> <li>1 = Raised</li> </ul>
fs-heartbeat	fhb	Time since the last heartbeat to the CLDB, in seconds.
GatewayServiceDown	nagwsd	Timestamp when "Gateway Service Down" alarm was raised.
HbaseThriftServiceDown	hbasethrift	Timestamp when "HBase Thrift Service Down" alarm was raised.
HbProcessingSlow	hbpsa	Timestamp when <a href="#">Heartbeat Processing Slow</a> on page 3016 alarm was raised.
health	h	Overall node health, calculated from various alarm states: <ul style="list-style-type: none"> <li>0 = Healthy</li> <li>1 = Needs attention</li> <li>2 = Degraded</li> <li>3 = Maintenance</li> <li>4 = Critical</li> </ul>
healthDesc	hd	The health description.
HighMfsMemoryAlarm	nhmm	Timestamp when <a href="#">MapR File System High Memory</a> alarm was raised.
HomeMapRFullAlarm	hmf	Timestamp when <a href="#">Installation Directory Full</a> alarm was raised.

Field Name	Short Name	Description
hostname	hn	The host name. In the output for the <code>clientsonly</code> option, this is the hostname where the client is running.
id	id	The node ID.
IncorrectTopologyAlarm	ita	Timestamp when <a href="#">Incorrect Topology</a> alarm was raised.
InstanceMismatch	nanim	Timestamp when <a href="#">Instance Mismatch</a> alarm was raised.
Insufficient memory for buckets	tbwarning	Timestamp when Tiny Bucket Flush alarm was raised.
ip	ip	A list of IP addresses associated with the node. In the output for the <code>clientsonly</code> option, this is the IP address of the host where the client is running.
isFips	isFips	The FIPS status of a node: <ul style="list-style-type: none"> <li>• 1 = Node is FIPS-enabled</li> <li>• 0 = Node is not FIPS-enabled</li> </ul>
JobHistoryServerDown	nasjhsd	Timestamp when "Job History Server Down" alarm was raised.
jt-heartbeat	jhb	Time since the last heartbeat to the JobTracker, in seconds.
labels	lbl	Labels associated with a node. See <a href="#">Using Storage Labels</a> on page 1306 for more information on labels.
lasthb	lhb	Time since the last heartbeat from the client host.
LogLevelAlarm	lla	Timestamp when Excess Logs alarm was raised.
MapRfs disks	nmd	Number of disks for use by file system
MemoryAllocationAlarm	maa	Timestamp when <a href="#">Memory Allocation</a> alarm was raised.
MemorySwapping	nams	Timestamp when <a href="#">Memory Usage</a> alarm was raised.
mtotal	mt	Total memory, in MB.
mused	mu	Memory used, in MB.
NodeDuplicateHostIdAlarm	ndh	Timestamp when <a href="#">Duplicate Host ID</a> on page 3015 alarm was raised.
NodeManagerDown	nanmd	Timestamp when "Node Manager Down" alarm was raised.
NodeMaprUserMismatchAlarm	nma	Timestamp when <a href="#">MapR User Mismatch</a> on page 3020 alarm was raised.
NodeNoHeartbeatAlarm	nha	Timestamp when <a href="#">No Heartbeat</a> alarm was raised.

Field Name	Short Name	Description
NodeTooManyContainersAlarm	nmc	Timestamp when <a href="#">Node Too Many Containers</a> on page 3024 alarm was raised.
NoDiskAttached	nanda	Timestamp when <a href="#">No Disk Attached</a> alarm was raised.
numInstances	ni	Number of configured file system instances.
numReportedInstances	nri	The number of running instances reported by file system to CLDB.
numResyncSlots	nrs	The number of resync slots.
numGetsInLastTenSeconds	ngl10s	Number of table get operations in last 10 seconds.
numGetsInLastMinute	ngl1m	Number of table get operations in last 1 minute.
numGetsInLastFiveMinutes	ngl5m	Number of table get operations in last 5 minutes.
numGetsInLastFifteenMinutes	ngl15m	Number of table get operations in last 15 minutes.
numPutsInLastTenSeconds	npl10s	Number of table put operations in last 10 seconds.
numPutsInLastMinute	npl1m	Number of table put operations in last 1 minute.
numPutsInLastFiveMinutes	npl5m	Number of table put operations in last 5 minutes
numPutsInLastFifteenMinutes	npl15m	Number of table put operations in last 15 minutes.
numScansInLastTenSeconds	nsl10s	Number of table scan operations in last 10 seconds.
numScansInLastMinute	nsl1m	Number of table scan operations in last 1 minute.
numScansInLastFiveMinutes	nsl5m	Number of table scan operations in last 5 minutes.
numScansInLastFifteenMinutes	nsl15m	Number of table scan operations in last 15 minutes.
PamMisconfiguredAlarm	pma	PAM misconfigured alarm (NODE_ALARM_PAM_MISCONFIGURED): <ul style="list-style-type: none"> <li>0 = Clear</li> <li>1 = Raised</li> </ul>
ResourceManagerDown	narnd	Timestamp when "Resource Manager Down" alarm is raised.
RootPartitionFullAlarm	rpf	Timestamp when <a href="#">Root Partition Full</a> alarm was raised.
rpcin	rpi	RPC bytes received since the last heartbeat.

Field Name	Short Name	Description
rpcout	rpo	RPC bytes sent since the last heartbeat.
rpcs	rpc	Number of RPCs since the last heartbeat.
service	svc	A comma-separated list of services running on the node: <ul style="list-style-type: none"> <li>cldb - CLDB</li> <li>fileserv - file system</li> <li>nfs - NFS Gateway Example: "cldb,fileserv,nfs"</li> </ul>
ServiceBeeswaxDownNotRunningAlarm	sbwa	Timestamp when "Beeswax Service Down" alarm was raised.
ServiceCLDBDownNotRunningAlarm	sca	Timestamp when <b>CLDB</b> alarm was raised.
ServiceFileservDownNotRunningAlarm	sfsa	Timestamp when <b>Fileserv</b> alarm was raised.
ServiceHiveDownNotRunningAlarm	shsma	Timestamp when <b>HiveMeta Service Down</b> alarm was raised.
ServiceHoststatsDownNotRunningAlarm	sha	Timestamp when <b>Hoststats</b> alarm was raised.
ServiceHs2DownNotRunningAlarm	shsa	Timestamp when <b>HS2 Service Down</b> alarm was raised.
ServiceHttpfsDownNotRunningAlarm	shfsa	Timestamp when "Httpfs Service Down" alarm is raised.
ServiceHueDownNotRunningAlarm	shuea	Timestamp when "Hue Service Down" alarm was raised.
ServiceNFSDownNotRunningAlarm	sna	Timestamp when <b>NFS</b> alarm was raised.
ServicesWebserverDownNotRunningAlarm	swa	Timestamp when <b>Webserver</b> alarm was raised.
spsPerInstance	nsp	Number of storage pools per file server instance.
TimeSkewAlarm	tfa	Timestamp when <b>Time Skew</b> alarm was raised.
racktopo	rp	The rack path.
uptime	cpt	Date when the node came up.
utilization	cpu	CPU use percentage since the last heartbeat.
VersionMismatchAlarm	vma	Timestamp when <b>Version</b> alarm was raised.
vip	vip	The virtuap IP address

Creates a volume.

[volume move](#) on page 2701

Moves the specified volume or mirror to a different topology. Permissions required: `m` or `fc` on the volume.

[label list](#) on page 2255

Lists registered labels. Permissions required: `fc` or `a`.

[node list](#) on page 2270

Lists nodes in the cluster.

[configure.sh](#) on page 2826

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Ezmeral Data Fabric client nodes, and configuring services for a node.

**node allow-into-cluster**

Allows host IDs to join the cluster after duplicates have been resolved.

When the CLDB detects duplicate nodes with the same host ID, all nodes with that host ID are removed from the cluster and prevented from joining it again. After making sure that all nodes have unique host IDs, you can use the `node allow-into-cluster` command to un-ban the host ID that was previously duplicated among several nodes.

**Syntax**

**CLI**

```
maprcli node allow-into-cluster
[ -hostids <host IDs> ]
```

**REST**

Request Type	POST
Request URL	<pre>http[s]:// &lt;host&gt;:&lt;port&gt;/rest/node/ allow-into-cluster[? &lt;parameters&gt;]</pre>

**Parameters**

Parameter	Description
hostids	A comma-separated list of host IDs.

## Examples

### Allow former duplicate host IDs node1 and node2 to join the cluster:

#### CLI

```
maprcli node
allow-into-cluster -hostids
node1,node2
```

#### REST

```
https://abc.sj.us:8443/rest/node/
allow-into-cluster?hostids=node1,node2
```

### node cldbprimary

Returns the address of the primary CLDB node.

The `node cldbprimary` API returns the server ID and hostname of the node serving as the CLDB primary node.

## Syntax

#### CLI

```
maprcli node cldbprimary
[ -cluster <cluster name> ]
```

#### REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/node/cldbprimary[?<parameters>]

## Parameters

Parameter	Description
cluster	The name of the cluster for which to return the CLDB primary node information.

## Examples

### Return the CLDB primary node information for the cluster my.cluster.com:

#### CLI

```
maprcli node cldbprimary -cluster
my.cluster.com
```

```
{
  "timestamp":1622099062802,
  "timeofday":"2021-05-27
07:04:22.802 GMT+0000 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cldbprimary":"ServerID:"
```

```
3523090783455785824 HostName:
m2-mapreng-vmm167214.xxxx"
    }
  ]
}
```

**REST**

```
curl -k -X
POST 'https://10.163.167.214:8443/
rest/node/cldbprimary?
cluster=my.cluster.com' --user
mapr:mapr
```

```
{"timestamp":1622099484367,"timeofday"
:"2021-05-27 07:11:24.367 GMT+0000
AM","status":"OK","total":1,"data":
[{"cldbprimary":"ServerID:
3523090783455785824 HostName:
m2-mapreng-vmm167214.mip.xxx"}]}
```

**node failover**

Fails over master containers and VIPs to another node.

When this command runs, all master and intermediate containers are moved off the node and VIPs are re-assigned.

**Syntax**

**CLI**

```
maprcli node failover
[ -nodes <node hostname> ]
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/node/failover[?<parameters>]

**Parameters**

Parameter	Description
nodes	The hostname of the node going down.

**Examples**

**Notify CLDB of the node, exampleHost, going down:**

**CLI**

```
maprcli node failover -nodes
exampleHost
```

**REST**

```
https://abc.sj.us:8443/rest/node/
failover?nodes=exampleHost
```

**node heatmap**

Displays a heatmap for the specified nodes.

**Syntax****CLI**

```
maprcli node heatmap
[ -cluster <cluster> ]
[ -filter <filter> ]
[ -view <view> ]
-json | -long
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/node/heatmap[?<parameters>]

**Parameters**

Parameter	Description
cluster	The cluster on which to run the command.
filter	A filter specifying snapshots to preserve. See <a href="#">Filters</a> for more information.
view	<p>Name of the heatmap view to show:</p> <ul style="list-style-type: none"> <li>status = Node status (the default view): <ul style="list-style-type: none"> <li>0 = Healthy</li> <li>1 = Needs attention</li> <li>2 = Degraded</li> <li>3 = Maintenance</li> <li>4 = Critical</li> </ul> </li> <li>cpu = CPU utilization, as a percent from 0-100.</li> <li>memory = Memory utilization, as a percent from 0-100.</li> <li>diskspace = MapR filesystem disk space utilization, as a percent from 0-100.</li> <li>NODE_* = Status of various alarms: 0 if clear, 1 if raised. For example: NODE_ALARM_DISK_FAILURE or NODE_ALARM_SERVICE_CLDB_DOWN. You can return a complete list of supported alarm parameters by running: <pre>maprcli node heatmap -view</pre> <p>See the lists of parameters below this table.</p> </li> </ul>

Parameter	Description
-json   -long	This command returns multiple levels of data. You must specify either JSON format or "long" format to see the full output.

### Alarm Parameters

You can view the status of a number of different alarms, including the status of alarms for services down and alarms for other conditions on the cluster.

### Service Down Alarms

```
NODE_ALARM_SERVICE_CLDB_DOWN NODE_ALARM_SERVICE_FILESERVER_DOWN
NODE_ALARM_SERVICE_JT_DOWN NODE_ALARM_SERVICE_TT_DOWN
NODE_ALARM_SERVICE_HBMASTER_DOWN NODE_ALARM_SERVICE_HBREGION_DOWN
NODE_ALARM_SERVICE_WEBSERVER_DOWN NODE_ALARM_SERVICE_NFS_DOWN
NODE_ALARM_SERVICE_HOSTSTATS_DOWN NODE_ALARM_SERVICE_OOZIE_DOWN
NODE_ALARM_SERVICE_HUE_DOWN NODE_ALARM_SERVICE_HTTPFS_DOWN
NODE_ALARM_SERVICE_BEESWAX_DOWN NODE_ALARM_SERVICE_HIVEMETA_DOWN
NODE_ALARM_SERVICE_HS2_DOWN
```

### Other Alarms

```
NODE_ALARM_DEBUG_LOGGING NODE_ALARM_DISK_FAILURE NODE_ALARM_VERSION_MISMATCH
NODE_ALARM_TIME_SKEW NODE_ALARM_ROOT_PARTITION_FULL
NODE_ALARM_OPT_MAPR_FULL NODE_ALARM_CORE_PRESENT NODE_ALARM_HIGH_MFS_MEMORY
NODE_ALARM_PAM_MISCONFIGURED NODE_ALARM_TT_LOCALDIR_FULL
NODE_ALARM_NO_HEARTBEAT NODE_ALARM_MAPRUSER_MISMATCH
NODE_ALARM_DUPLICATE_HOSTID NODE_ALARM_METRICS_WRITE_PROBLEM
NODE_ALARM_TOO_MANY_CONTAINERS
```

### Output

In general, the heatmap output looks like this (in JSON format).

```
{
  status: "OK",
  data: [{
    "{{rackTopology}}" : {
      "{{nodeName}}" : {{heatmapValue}},
      "{{nodeName}}" : {{heatmapValue}},
      "{{nodeName}}" : {{heatmapValue}},
      ...
    },
    "{{rackTopology}}" : {
      "{{nodeName}}" : {{heatmapValue}},
      "{{nodeName}}" : {{heatmapValue}},
      "{{nodeName}}" : {{heatmapValue}},
      ...
    },
    ...
  ]
}
```

Table

Field	Description
rackTopology	The topology for a particular rack.

Table (Continued)

Field	Description
nodeName	The name of the node in question.
heatmapValue	The value of the metric specified in the view parameter for this node, as an integer.

### Examples

#### Display a heat map with the node status (default view) for the default rack:

```
maprcli node heatmap -json
{
  "timestamp":1422567293873,
  "timeofday":"2015-01-29 01:34:53.873 GMT-0800",
  "status":"OK",
  "total":1,
  "data":[
    {"/data/default-rack":{
      "centos24":2}
    }
  ]
}
```

The equivalent REST API command would be:

```
https://rln1.sj.us:8443/rest/node/heatmap
```

#### Display memory usage for the default rack:

```
maprcli node heatmap -view memory -json
{
  "timestamp":1422585976631,
  "timeofday":"2015-01-29 06:46:16.631 GMT-0800",
  "status":"OK",
  "total":1,
  "data":[
    {"/data/default-rack":{
      "centos24":71}
    }
  ]
}
```

The equivalent REST API command would be:

```
https://rln1.sj.us:8443/rest/node/heatmap?view=memory
```

#### Display the value of `NODE_ALARM_DISK_FAILURE` for the default rack:

```
maprcli node heatmap -view NODE_ALARM_DISK_FAILURE -long
/data/default-rack
{"centos24":0}
```

### node list

Lists nodes in the cluster.

You can retrieve information for a set of nodes in several ways:

- To list only nodes with raised alarms, set `alarmednodes` to 1.
- To list only NFS nodes, set `nfsnodes` to 1.

- To view only a few nodes from the list, use the `start` and `limit` options to select only a portion of the results.
- To list nodes that match certain criteria, pass a filter to the `filter` parameter. See the [node](#) on page 2260 table for the filter options. See the [Filters](#) on page 1990 page for information on filters.

Using the `node list` command without the `-clientsonly true` or the `-nfsnodes true` option, does not list edge nodes. To include edge nodes, use the `-nfsnodes true` or the `-clientsonly true` option.

## Syntax

### CLI

```
/opt/mapr/bin/maprcli node list
[ -alarmednodes 0|1 ]
[ -cluster <cluster> ]
[ -clientsonly true|false ]
[ -columns <columns>|all ]
[ -filter <filter> ]
[ -limit <limit> ]
[ -nfsnodes true|false ]
[ -output terse|verbose ]
[ -sortby <attribute> ]
[ -sortorder asc|desc ]
[ -start <offset> ]
[ -zkconnect <ZooKeeper Connect String> ]
```

### REST

Request Type	GET
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/node/list[?&lt;parameters&gt;]</code>

## Parameters

Parameter	Description
<code>alarmednodes</code>	When set to 1, displays only nodes with raised alarms. You cannot use this parameter if <code>nfsnodes</code> is set.
<code>cluster</code>	The cluster on which to run the command.
<code>clientsonly</code>	Set this parameter to <code>true</code> to return the list of nodes running unique platinum FUSE-based POSIX clients, and NFSv3, and NFSv4 services. The command returns the following fields: <code>clienttype</code> , <code>clienthealth</code> , <code>hostname</code> , <code>ip</code> , <code>lasthb</code> , <code>id</code> . For more information, see the <a href="#">fields table</a> .  If you set this parameter to <code>false</code> , which is the default value, this parameter returns node-level information for all the services running on each node.
<code>columns</code>	A comma-separated list of fields to return in the query, specified by the short names.  When specifying this option, the <code>ip</code> and <code>hostname</code> columns are always returned in the query.

Parameter	Description
filter	A filter specifying nodes on which to start or stop services. See the Fields table on the <a href="#">node</a> page for the fields available to filter. See the <a href="#">maprcli and REST API Syntax</a> page for information on filters.
limit	The number of rows to return, beginning at start. Default: 0
nfsnodes	<p>Set this to <code>true</code> to display POSIX (edge) nodes:</p> <pre>maprcli node list -nfsnodes true -columns csvc</pre> <p>When set to <code>false</code>, edge nodes are not displayed. Cannot be used if <code>alarmednodes</code> is set.</p> <p>When you set the <code>cldb.ignore.posix.only.hb.alarm</code> parameter to 1, dead edge nodes are displayed for 4 minutes from the time they went down, as CLDB removes all the dead edge nodes after 4 minutes. However, when you set <code>cldb.ignore.posix.only.hb.alarm</code> parameter to 0, dead edge nodes are displayed for 24 hours.</p>
output	Specifies whether the output should be terse or verbose.
sortby	Specifies one of the following attributes by which to sort the list of nodes: <code>nodeid</code> , <code>nodeip</code> , <code>nodehostname</code> , <code>noderackpath</code> , <code>nodeswitchpath</code> , <code>nodestatus</code> , <code>nodeservices</code> , <code>nodefshb</code> , <code>nodejthb</code> , <code>nodedisktotal</code> , <code>nodediskused</code> , <code>nodediskavail</code> , <code>noderpc</code> , <code>noderpcin</code> , <code>noderpcout</code> , <code>nodediskcount</code> , <code>nodediskreadops</code> , <code>nodediskreadkbytes</code> , <code>nodediskwriteops</code> , <code>nodediskwritekbytes</code> , <code>nodecpucount</code> , <code>nodecpuutil</code> , <code>nodememtotal</code> , <code>nodememused</code> , <code>nodefaileddisks</code> , <code>nodevirtualip</code> , <code>nodevirtualipend</code> , <code>nodenetmask</code> , <code>nodemacaddress</code> , <code>nodegateway</code> , <code>nodebytesreceived</code> , <code>nodebytessent</code> , <code>nodecpuuptime</code> , <code>nodemaprdiskcount</code> , <code>nodestatusdesc</code> , <code>nodeblockmovesout</code> , <code>nodeblockmovesin</code> , <code>nodemaxcontainersthreshold</code> , <code>nodenuminstances</code> , <code>nodenumspsperinstance</code> , <code>nodenfsstate</code> , <code>nodeisposixclient</code> , <code>nodeisloopbacknfs</code> , <code>nodeisloopbacknfsrunning</code>
start	The offset from the starting row according to sort. Default: 0
zkconnect	<a href="#">ZooKeeper Connect String</a>

## Output

Information about the nodes. See the [fields](#) for more information.

## Sample Output

```
# /opt/mapr/bin/maprcli node list -json
{
  "timestamp":1555342212112,
  "timeofday":"2019-04-15 08:30:12.112 GMT-0700 AM",

## Fields

For definitions of the output fields, and short names for use with filters, see the [fields table](#).

## Examples

### List all nodes:

For neatly formatted results, use the `-json` option when listing all nodes or a large subset of node information.

### CLI

```

/opt/mapr/bin/maprcli node list -json
{
  "timestamp":1555342212112,
  "timeofday":"2019-04-15
08:30:12.112 GMT-0700 AM",
  "status":"OK",

```

```

    "total":1,
    "data":[
      {
        "id":"7146221175287263104",
        "ip":[
          "10.10.82.29",
          "172.17.0.1"
        ],
        "hostname":"doc29.lab",
        "racktopo":"/data/default-rack/doc29.lab",
        "health":2,
        "healthDesc":"One or more services is down",

        "service":"resourcemanager,fileserver,cldb,nfs4,mastgateway,nodemanager,gateway,hoststats,apiserver,posixclientbasic",

        "configuredservice":"resourcemanager,filemigrate,fileserver,cldb,nfs4,mastgateway,nodemanager,gateway,hoststats,apiserver,posixclientbasic",
        "fs-heartbeat":0,
        "jt-heartbeat":2,
        "dtotal":272,
        "dused":0,
        "davail":272,
        "rpcs":0,
        "rpcin":345,
        "rpcout":652,
        "disks":5,
        "MapRfs disks":3,
        "faileddisks":0,

}

```

**REST**

```

curl -u mapr:mapr -X GET -k "https://
host:8443/rest/node/list"

```

**List the health and configured service of all nodes:**

The following examples show the use of short forms for the `column` parameter.

**CLI**

```

/opt/mapr/bin/maprcli node
list -columns
service,health,configuredservice -json
/opt/mapr/bin/maprcli node
list -columns svc,h,csvc -json
{
  "timestamp":1555343115082,
  "timeofday":"2019-04-15
08:45:15.082 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "ip":[
        "10.10.82.29",
        "172.17.0.1"
      ],
      "hostname":"doc29.lab",
      "health":2,
      "service":"resourcemanager,fileserver,
cldb,nfs4,mastgateway,nodemanager,gate
way,hoststats,apiserver,posixclientbas

```

```
ic",
"configuredservice": "resourcemanager, filemigrate, fileserver, cldb, nfs4, mastgateway, nodemanager, gateway, hoststats, apiserver, posixclientbasic"
}
]
```

**REST**

```
curl -u mapr:mapr -X GET -k "https://host:8443/rest/node/list?columns=service%2Chealth%2Cconfiguredservice"

### Related concepts

[node](#) on page 2260

Manages nodes in the cluster

[Using Storage Labels](#) on page 1306

Describes the Storage Labels feature.

### Related reference

[disk add](#) on page 2124

Adds one or more disks to the specified node. Permissions required: `fc` or `a`.

[disk setlabel](#) on page 2126

Adds a label to disks or a storage pool. Permissions required: `fc` or `a`.

[label add](#) on page 2251

Registers a label. Permissions required: `fc` or `a`.

[volume create](#) on page 2592

Creates a volume.

[volume move](#) on page 2701

Moves the specified volume or mirror to a different topology. Permissions required: `m` or `fc` on the volume.

[label list](#) on page 2255

Lists registered labels. Permissions required: `fc` or `a`.

[dump volumeinfo](#) on page 2171

Returns information about volumes and the associated containers. For JSON formatted output, use the `-json` option from the command line.

[configure.sh](#) on page 2826

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Ezmeral Data Fabric client nodes, and configuring services for a node.

**node listcldbs**

Returns the hostnames of the nodes in the cluster that are running the CLDB service.

**Syntax****CLI**

```
maprcli node listcldbs
[ -cluster <cluster name> ]
[ -cldb <cldb hostname|ip:port> ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/node/listcldbs[?<parameters>]

**Parameters**

Parameter	Description
cluster	The name of the cluster for which to return the list of CLDB node hostnames.
cldb	The hostname or IP address and port number of a CLDB node.

**Examples**

Return the list of CLDB nodes for the cluster **my.cluster.com**:

**CLI**

```
# maprcli node listcldbs -cluster
my.cluster.com -json
{
  "timestamp":1529445021408,
  "timeofday":"2018-06-19
02:50:21.408 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "CLDBs":"in111-22.qa.lab,in111-24.qa.l
ab,in111-21.qa.lab"
    }
  ]
}
```

**REST**

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/node/listcldbs?
cluster=my.cluster.com' --user
mapr:mapr
{"timestamp":1529445190525,"timeofday"
:"2018-06-19 02:53:10.525 GMT-0700
PM","status":"OK","total":1,"data":
```

```
[{"CLDBs": "in111-22.qa.lab, in111-24.qa
.lab, in111-21.qa.lab"}]
```

### Related concepts

[Listing CLDB Nodes](#) on page 1539

Describes how to list CLDB nodes in the HPE Ezmeral Data Fabric.

[Viewing CLDB Information](#) on page 1535

Describes how to view CLDB information from the CLDB page, and provides an explanation of each field that the page displays.

### node listcldbzks

Returns the hostnames of the nodes in the cluster that are running the CLDB service and the IP addresses and port numbers for the nodes in the cluster that are running the ZooKeeper service.

### Syntax

#### CLI

```
maprcli node listcldbzks
[ -cluster <cluster name> ]
[ -cldb <cldb hostname|ip:port> ]
```

#### REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/node/listcldbzks[?<parameters>]

### Parameters

Parameter	Description
cluster	The name of the cluster for which to return the CLDB and ZooKeeper information.
cldb	The hostname or IP address and port number of a CLDB node.

### Examples

**Return CLDB and ZooKeeper node information for the cluster my.cluster.com:**

#### CLI

```
maprcli node listcldbzks -cluster
my.cluster.com
{
  "timestamp":1529445399193,
  "timeofday":"2018-06-19
02:56:39.193 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "CLDBs": "in111-22.qa.lab, in111-24.qa.l
```

```
ab,in111-21.qa.lab",
"Zookeepers": "in111-21.qa.lab:5181,in111-22.qa.lab:5181,in111-24.qa.lab:5181"
}
]
```

**REST**

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/node/listcldbzks?
cluster=my.cluster.com' --user
mapr:mapr
{"timestamp":1529445324540,"timeofday":
"2018-06-19 02:55:24.540 GMT-0700
PM","status":"OK","total":1,"data":
[{"CLDBs":"in111-22.qa.lab,in111-24.qa
.lab,in111-21.qa.lab","Zookeepers":"in
111-21.qa.lab:5181,in111-22.qa.lab:518
1,in111-24.qa.lab:5181"}]}
```

**node listzookeepers**

Returns the hostnames of the nodes in the cluster that are running the ZooKeeper service.

**Syntax**

**CLI**

```
maprcli node listzookeepers
[ -cluster <cluster name> ]
[ -cldb <cldb hostname|ip:port> ]
```

**REST**

Request Type	GET
Request URL	http[s]:// <host>:<port>/rest/ node/listzookeepers[? <parameters>]

**Parameters**

Parameter	Description
cluster	The name of the cluster for which to return the list of zookeeper node hostnames.
cldb	The hostname or IP address and port number of a valid CLDB node. The other CLDB nodes and zookeeper nodes can be discovered from this node.

**Examples**

**Return the list of zookeeper nodes for the cluster my.cluster.com**

If you know that the CLDB service is running on a node with hostname host1, you can enter:

**CLI**

```
maprcli node listzookeepers -cluster
my.cluster.com -cldb host1 -json
{
  "timestamp":1529451245796,
  "timeofday":"2018-06-19
04:34:05.796 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "Zookeepers":"in111-21.qa.lab:5181,in1
11-22.qa.lab:5181,in111-24.qa.lab:5181
"
    }
  ]
}
```

**REST**

```
https://abc.sj.us:8443/rest/node/
listzookeepers?
cluster=my.cluster.com&cldb=host1
{"timestamp":1529451245796,"timeofday"
:"2018-06-19 04:34:05.796 GMT-0700
PM","status":"OK","total":1,"data":
[{"Zookeepers":"in111-21.qa.lab:5181,i
n111-22.qa.lab:5181,in111-24.qa.lab:51
81"}]}
```

**node maintenance**

Places a node into a maintenance mode for a specified duration.

**IMPORTANT:** Stop CLDB if it is running on the node, before putting that node in maintenance mode. Else, the maintenance mode operation is not permitted. Run: `maprcli node services -name cldb -action stop -nodes mapr-<node>`

**NOTE:** You cannot put a master CLDB node in Maintenance mode.

For the duration of the maintenance mode, the cluster's CLDB does not consider the data of this node as lost and does not trigger a resync of the data on this node. See [Administering Nodes](#) on page 1095 for more information.

**Syntax****CLI**

```
/opt/mapr/bin/maprcli node maintenance
[ -cluster <cluster> ]
[ -serverids <serverids> ]
-nodes <node names>
-timeoutminutes <timeout in
minutes>
```

**REST**

Request Type	POST
--------------	------

Request URL	http[s]://<host>:<port>/rest/node/maintenance?<parameters>
-------------	------------------------------------------------------------

## Parameters

Parameter	Description
cluster	The cluster on which to run the command.
serverids	List of server IDs
nodes	List of nodes, space separated.
timeoutminutes	Duration of the maintenance mode in minutes

## Examples

### CLI

```
/opt/mapr/bin/maprcli
node maintenance -nodes
centos22.lab -timeoutminutes 20
```

### REST

```
curl -u mapr:mapr -X POST -k 'https://
abc.sj.us:8443/rest/node/maintenance?
nodes=centos22.lab&timeoutminutes=20'
```

## node metrics

Retrieves metrics information for nodes in a cluster.

 **WARNING:** This command is deprecated. See [Using HPE Ezmeral Data Fabric Monitoring \(Spyglass Initiative\)](#) on page 1688 for information about viewing metrics and logs for nodes, services, and applications.

This command retrieves and displays various metrics related to the operation of nodes. The data displayed comes from the files that each node updates periodically that are stored in the node local volume on each node in the cluster.

## Syntax

### CLI

```
maprcli node metrics
  -nodes <hostname>
  -start <start time>
  -end <end time>
  [ -interval <interval
timestamp> ]
  [ -events true|false ]
  [ -columns <column names> ]
  [ -cluster <cluster name> ]
```

## Parameters

Parameter	Description
<b>nodes</b>	A space-separated list of host names. The host name must be either the specific hostname (use the <code>maprcli node list -columns hostname</code> command to obtain the hostname value) or the name "hostname" if using the command line on the actual node. The IP address and "localhost" can not be used.
<b>start</b>	The start of the time range. Can be a UTC timestamp (in this case, a Java millisecond timestamp) or a UTC date in MM/DD/YY or MM/DD/YYYY format.
<b>end</b>	The end of the time range. Can be a UTC timestamp (in this case, a Java millisecond timestamp) or a UTC date in MM/DD/YY or MM/DD/YYYY format.
interval	Data measurement interval in seconds. The minimum value is 10 seconds.
events	Specify <code>TRUE</code> to return node events only. The default value of this parameter is <code>FALSE</code> .
columns	Comma-separated list of column names to return.
cluster	Cluster name.

### Column Name Parameters

The `node metrics` API always returns the `NODE` (node name) and `TIMESTAMP` (integer timestamp) columns. Use the `-columns` flag to specify a comma-separated list of column names to return.

**WARNING:** The `CPUNICE`, `CPUUSER`, and `CPUSYSTEM` parameters return information in *jiffies*. This unit measures one tick of the system timer interrupt and is usually equivalent to 10 milliseconds, but may vary depending on your particular node configuration. The reporting interval is the maximum possible value. In addition, the `CPU*` parameters accumulate and do not reset from report to report. Call `sysconf(_SC_CLK_TCK)` to determine the exact value for your node.

CPUNICE	Amount of CPU time used by processes with a positive nice value.	
CPUUSER	Amount of CPU time used by user processes.	
CPUSYSTEM	Amount of CPU time used by system processes.	
LOAD5PERCENT	Percentage of time this node spent at load 5 or below	
LOAD1PERCENT	Percentage of time this node spent at load 1 or below	
MEMORYCACHED	Memory cache size in bytes	
MEMORYSHARED	Shared memory size in bytes	

MEMORYBUFFERS	Memory buffer size in bytes	
MEMORYUSED	Memory used in megabytes	
PROCRUN	Number of processes running	
RPCCOUNT	Number of data-fabric RPC calls	
RPCINBYTES	Number of bytes passed in by data-fabric RPC calls	
RPCOUTBYTES	Number of bytes passed out by data-fabric RPC calls	
SERVAVALLSIZEMB	Server storage available in megabytes	
SERVUSEDSEIZEMB	Server storage used in megabytes	
SWAPFREE	Free swap space in bytes	
TTMAPUSED	Number of TaskTracker slots used for map tasks	
TTREDUCEUSED	Number of TaskTracker slots used for reduce tasks	

Three column name parameters return data that is too granular to display in a standard table. Use the `-json` option to return this information as a JSON object.

Parameter	Description	Metrics Returned
CPUS	Activity on this node's CPUs. Each CPU on the node is numbered from zero, <code>cpu0</code> to <code>cpuN</code> . Metrics returned are for each CPU.	CPUIDLE: Amount of CPU time spent idle. Reported as <i>jiffies</i> . CPUWAIT: Amount of CPU time spent waiting for I/O operations. Reported as <i>jiffies</i> . CPUTOTAL: Total amount of CPU time. Reported as <i>jiffies</i> .
DISKS	Activity on this node's disks. Metrics returned are for each partition.	READOPS: Number of read operations. READKB: Number of kilobytes read. WRITEOPS: Number of write operations. WRITEKB: Number of kilobytes written.
NETWORK	Activity on this node's network interfaces. Metrics returned are for each interface.	BYTESIN: Number of bytes received. BYTESOUT: Number of bytes sent. PKTSIN: Number of packets received. PKTSOUT: Number of packets sent.

## Examples

### Retrieving the percentage of time that a node spent at the 1 and 5 load levels between dates

```
$ maprcli node metrics
  -nodes centos24.lab
  -start 08/02/15
  -end 08/03/15
```

```
-interval 7200
-columns LOAD5PERCENT,LOAD1PERCENT
```

### Sample Output

NODE	LOAD5PERCENT	LOAD1PERCENT	TIMESTAMPSTR
centos24.lab 1438473608000	15	9	Sat Aug 01 17:00:08 PDT 2015
centos24.lab 1438480813000	20	20	Sat Aug 01 19:00:13 PDT 2015
centos24.lab 1438488018000	14	9	Sat Aug 01 21:00:18 PDT 2015
centos24.lab 1438495224000	13	11	Sat Aug 01 23:00:24 PDT 2015
centos24.lab 1438502429000	11	1	Sun Aug 02 01:00:29 PDT 2015
centos24.lab 1438509634000	14	8	Sun Aug 02 03:00:34 PDT 2015
centos24.lab 1438516839000	13	22	Sun Aug 02 05:00:39 PDT 2015
centos24.lab 1438524044000	24	46	Sun Aug 02 07:00:44 PDT 2015
centos24.lab 1438531249000	18	21	Sun Aug 02 09:00:49 PDT 2015
centos24.lab 1438538454000	10	2	Sun Aug 02 11:00:54 PDT 2015
centos24.lab 1438545659000	24	24	Sun Aug 02 13:00:59 PDT 2015
centos24.lab 1438552864000	8	0	Sun Aug 02 15:01:04 PDT 2015
centos24.lab 1438560069000	14	10	Sun Aug 02 17:01:09 PDT 2015
centos24.lab 1438567274000	10	2	Sun Aug 02 19:01:14 PDT 2015
centos24.lab 1438574479000	17	21	Sun Aug 02 21:01:19 PDT 2015
centos24.lab 1438581684000	15	8	Sun Aug 02 23:01:24 PDT 2015
centos24.lab 1438588889000	28	66	Mon Aug 03 01:01:29 PDT 2015
centos24.lab 1438596094000	16	28	Mon Aug 03 03:01:34 PDT 2015
centos24.lab 1438603300000	20	26	Mon Aug 03 05:01:40 PDT 2015
centos24.lab 1438610505000	22	39	Mon Aug 03 07:01:45 PDT 2015
centos24.lab 1438617710000	16	18	Mon Aug 03 09:01:50 PDT 2015
centos24.lab 1438624915000	16	17	Mon Aug 03 11:01:55 PDT 2015
centos24.lab 1438632120000	18	35	Mon Aug 03 13:02:00 PDT 2015
centos24.lab 1438639325000	11	10	Mon Aug 03 15:02:05 PDT 2015

### Retrieving time percentage at load 1 and 5 levels and CPU usage between timestamps

```
$ maprcli node metrics
  -nodes centos24.lab
  -start 1438502429000
  -end 1438581684000
  -interval 28800
```

```
-columns LOAD5PERCENT,LOAD1PERCENT,CPUS
-json
```

### Sample JSON output

```
{

}
```

### node move

Moves one or more nodes to a different topology. Permissions required: `fc` or `a`.

### Syntax

#### CLI

```
maprcli node move
[ -cluster <cluster> ]
-serverids <server IDs>
-topology <topology>
```

#### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/node/move?<parameters>

### Parameters

Parameter	Description
cluster	The cluster on which to run the command.

Parameter	Description
<b>serverids</b>	The comma-separated list of server IDs of the nodes to move. If you insert spaces between server IDs, the command only operates on the first server ID in the list.
<b>topology</b>	The new topology.

To obtain existing topology, run

```
maprcli node topo
```

To obtain the server ID, run

```
maprcli node list -columns id
```

Sample output from `maprcli node list -columns id` is shown below. The resulting server ID(s) can be copied and pasted into the `maprcli node move` command.

```
id                hostname          ip
547819249997313015  node-34.lab      10.10.40.34,10.10.88.34
2130988050310536949  node-36.lab      10.10.40.36,10.10.88.36
8683110801227243688  node-37.lab      10.10.40.37,10.10.88.37
5056865595028557458  node-38.lab      10.10.40.38,10.10.88.38
3111141192171195352  node-39.lab      10.10.40.39,10.10.88.39
```

## Examples

### CLI

```
maprcli node move
  -topology /newData
  -serverids 547819249997313015
```

### REST

```
https://abc.sj.us:8443/rest/node/move?
topology=%2FnewData&serverids=54781924
9997313015
```

### node remove

Removes one or more server nodes from the system. Permissions required: `fc` or `a`.

After issuing the `node remove` command, wait several minutes to ensure that the node has been properly and completely removed.

### Syntax

#### CLI

```
maprcli node remove
  [ -filter "<filter>" ]
  [ -hostids <host IDs> ]
  [ -nodes <node names> ]
  [ -service <fileserver or
nfsserver> ]
  [ -zkconnect <ZooKeeper Connect
String> ]
```

#### REST

Request Type	POST
--------------	------

Request URL	http[s]://<host>:<port>/rest/node/remove[?<parameters>]
-------------	---------------------------------------------------------

## Parameters

Parameter	Description
filter	A filter specifying nodes on which to start or stop services. See <a href="#">Filters</a> for more information.
hostids	A list of host IDs, separated by spaces.
nodes	A list of node names, separated by spaces.
service	Service to be removed. Either fileserver or nfsserver.
zkconnect	<a href="#">ZooKeeper Connect String</a> . Example: 'host:port,host:port,host:port,...'. To obtain zookeeper connection strings, use the <code>maprcli node listzookeepers</code> command. Default: localhost:5181

## Examples

### CLI

```
maprcli node remove -nodes 10.20.30.40
```

### REST

```
https://abc.sj.us:8443/rest/node/remove?nodes=10.20.30.40
```

## node services

Starts, stops, or restarts services on one or more server nodes. Permissions required: `ss`, `fc` or `a`.

To start or stop services, you must specify the service name, the action (start, stop, or restart), and the nodes on which to perform the action. You can specify the nodes in one of two ways:

- Use the `nodes` parameter to specify a space-delimited list of node names.
- Use the `filter` parameter to specify all nodes that match a certain pattern. See [Filters](#) for more information.

## Syntax

### CLI

```
/opt/mapr/bin/maprcli node services -h

node services
  [ -cluster cluster name ]
  [ -filter node names filter.
Please put it in quotes" ]
  [ -zkconnect
ZooKeeper Connect String:
'host:port,host:port,host:port,...' ]
  [ -nodes node names space
separated ]
```

```

[ -cldb managing cldb
service: [start, stop, suspend,
resume, restart, enable, disable] ]
[ -fileserver managing
fileserver service: [start, stop,
suspend, resume, restart, enable,
disable] ]
[ -hbmaster managing
hbprimary service: [start, stop,
suspend, resume, restart, enable,
disable] ]
[ -hbregionserver managing
hbregionserver service: [start, stop,
suspend, resume, restart, enable,
disable] ]
[ -jobtracker managing
jobtracker service: [start, stop,
suspend, resume, restart, enable,
disable] ]
[ -nfs managing nfs service:
[start, stop, suspend, resume,
restart, enable, disable] ]
[ -tasktracker managing
tasktracker service: [start, stop,
suspend, resume, restart, enable,
disable] ]
[ -apiserver managing
apiserver service: [start, stop,
suspend, resume, restart, enable,
disable] ]
[ -name service name to
perform action on ]
[ -action service action. One
of: [start, stop, suspend, resume,
restart, enable, disable] ]
[ -nfs4 managing nfs4
service: [start, stop, suspend,
resume, restart, enable, disable] ]
[ -s3server managing s3server
service: [start, stop, suspend,
resume, restart, enable, disable] ]
[ -keycloak managing keycloak
service: [start, stop, suspend,
resume, restart, enable, disable]]

```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/node/services[?<parameters>]

**Parameters**

To perform an action on a service, on a particular set of nodes, you must specify the following three parameters:

- **action**- the action to perform:
  - Start, stop, restart a service.

- Disable a service to prevent it from starting when Warden restarts and enable a service to allow the service to start when Warden restarts.

**NOTE:** Suspend and resume are not supported.

- `node` or `filter` - the nodes on which to perform the action; either a list of nodes, or a filter that matches a set of nodes
- `name` - the service on which to perform the action

The following table lists the parameters available with the `node services` command.

Parameter	Description
<code>action</code>	An action to perform on a service specified in the <code>name</code> parameter: Values: start, stop, suspend, resume, restart, enable, or disable
<code>apiserver</code>	Starts, stops, or restarts the apiserver. Values: start, stop, restart, enable, or disable
<code>cldb</code>	Starts, stops, or restarts the cldb service. Values: start, stop, suspend, resume, restart, enable, or disable
<code>cluster</code>	The cluster on which to run the command.
<code>fileserver</code>	Starts, stops, or restarts the fileserver service. Values: start, stop, suspend, resume, restart, enable, or disable
<code>filter</code>	A filter specifying nodes on which to start or stop services. For fields to use with the filter, see the <a href="#">node</a> on page 2260 table. See <a href="#">Filters</a> on page 1990 for more information about filters.  <b>NOTE:</b> You must specify either the <code>filter</code> parameter or the <code>nodes</code> parameter.
<code>name</code>	A service on which to perform an action specified by the <code>action</code> parameter. Any service can be specified with this option, but the following services can be specified only with the <code>name</code> option: <code>collectd</code> , <code>elasticsearch</code> , <code>fluentd</code> , <code>grafana</code> , <code>historyserver</code> , <code>hivemeta</code> , <code>hoststats</code> , <code>hs2</code> , <code>httpfs</code> , <code>hue</code> , <code>kibana</code> , <code>nodemanager</code> , <code>opentsdb</code> , <code>oozie</code> , and <code>resource manager</code> .
<code>nfs</code>	Starts, stops, or restarts the nfs service. Values: start, stop, suspend, resume, restart, enable, or disable
<code>nfs4</code>	Starts, stops, or restarts the NFSv4 service. Values: start, stop, restart, enable, or disable
<code>nodes</code>	A list of node names, separated by spaces.  <b>NOTE:</b> Either this or <code>filter</code> is required.
<code>zkconnect</code>	The <a href="#">ZooKeeper Connect String</a> .
<code>s3server</code>	The parameter can be used to perform an action on the MOSS or s3server service that runs as part of a cluster or fabric. One of the action words, <code>start</code> , <code>stop</code> , <code>suspend</code> , <code>resume</code> , <code>restart</code> , <code>enable</code> , <code>disable</code> , must be used after the parameter to indicate the action to be taken with respect to the s3server service.

Parameter	Description
keycloak	The parameter can be used to perform an action on the keycloak service. One of the action words, start, stop, suspend, resume, restart, enable, disable, must be used after the parameter to indicate the action to be taken with respect to the keycloak service.

## Examples

### Start the NodeManager Service

```
/opt/mapr/bin/maprcli node services -name nodemanager -nodes
abc.sj.us -action start
```

### Stop the ResourceManager Service

```
/opt/mapr/bin/maprcli node services -name resourcemanager -nodes
abc.sj.us -action stop
```

### Restart the ResourceManager Service

```
/opt/mapr/bin/maprcli node services -name resourcemanager -nodes
abc.sj.us -action restart
```

### Restart NFS4 server

```
/opt/mapr/bin/maprcli node services -nodes abc.sj.us -nfs4 restart
```

### Restart NFS4 server using a filter

Using a filter is common, especially in HBase environments, where full restarts of region and master servers are needed.

```
/opt/mapr/bin/maprcli node services -filter ["csvc==nfs"] -nfs4 restart
```

### Start the Hue Service

```
/opt/mapr/bin/maprcli node services -name hue -action start -nodes <node n>
```

### Restart the hoststats service

Restart the hoststats service after making changes to the HPE Ezmeral Data Fabric Metrics database. You do not need to restart warden.

```
/opt/mapr/bin/maprcli node services -name hoststats -action restart -nodes
<nodes>
```

OR

```
/opt/mapr/bin/maprcli node services -name hoststats -action restart -filter
'["csvc==hoststats"]'
```

### Restart the MOSS service

```
maprcli node services -nodes <host FQDN for node> -s3server restart
```

**Stop the MOSS service**

```
maprcli node services -nodes <host FQDN for node> -s3server stop
```

**Stop the keycloak service**

```
maprcli node services -nodes <host FQDN for node> -keycloak stop
```

**node topo**

Lists cluster topology information.

Lists internal nodes only (switches/racks/etc) and not leaf nodes (server nodes).

**Syntax****CLI**

```
maprcli node topo
[ -cluster <cluster> ]
[ -path <path> ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/node/topo?<parameters>

**Parameters**

Parameter	Description
cluster	The cluster on which to run the command.
path	The path on which to list node topology.

**Output**

Node topology information.

**Sample output**

```
{
  "timestamp":1433545849048,
  "timeofday":"2015-06-05 11:10:49.048 GMT+0000",
  "status":"OK",
  "total":4,
  "data":[
    {
      "path":"/"
    },
    {
      "path":"/data"
    },
    {
      "path":"/data/default-rack"
    },
    {
      "path":"/default-rack"
    }
  ]
}
```

```
} ]
```

### Output Fields

Field	Description
path	The physical topology path to the node.

### Examples

#### CLI

```
# maprcli node topo
path
/
/data
/data/default-rack
/default-rack
```

#### REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/node/topo' --user
mapr:mapr
{"timestamp":1529382835319,"timeofday"
:"2018-06-18 09:33:55.319 GMT-0700
PM","status":"OK","total":4,"data":
[{"path":"/"}, {"path":"/data"},
{"path":"/data/default-rack"},
{"path":"/default-rack"}]}
```

### node topsize

Lists disk space utilization for each topology.

### Syntax

#### CLI

```
maprcli node topsize
[ -cluster <cluster> ]
```

#### REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/node/topsize[?<parameters>]

### Parameters

Parameter	Description
cluster	The cluster on which to run the command.

### Output

Field	Description
AvailableSpace	The amount of available disk space (in GB).

Field	Description
path	The cluster rack path to the node (or topology of the node).
TotalSpace	The amount of total disk space (in GB).
UsedSpace	The amount of utilized disk space (in GB).

### Example

Retrieve topology-based disk utilization information:

#### CLI

```
# maprcli node toposize
path
TotalSpace(GB)  UsedSpace(GB)
AvailableSpace(GB)
/
1584              18              1563
/abcd
432               6               425
/abcd/test
288              0               288
/abcd/test/test1
144              0               144
/cldb
576              6               569
/cldb/test
432              0               432
/cldb/test/test1
288              0               288
/cldb/test/test1/test2
144              0               144
/ecvol
288              0               288
/ecvol/test
288              0               288
/ecvol/test/test1
144              0               144
/ecvol/test/test1/test2
144              0               144
/ecvol/test/test1/test2/test3
144              0               144
/ecvol/test/test1/test2/test3/test4
144              0               144
```

#### REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/node/
toposize' --user mapr:mapr
{"timestamp":1533655046390,"timeofday"

```

```
edSpace(GB)":0,"AvailableSpace(GB)":272}}}
```

**otel**

Commands for managing Open Telemetry (OTel) end points.

For more information on Open Telemetry, see [OTel](#) on page 4595.

**otelendpoint add**

Adds an Open Telemetry end point for data collection.

**Syntax**

**CLI**

```
maprcli otelendpoint add
    -name end point name
    -url http[s]://hostname
    [ -port port ]
    [ -key Base64 encoded key ]
    [ -keyfile key file path ]
    [ -cert Base64 encoded certificate ]
    [ -certfile certificate file path ]
    [ -customopts json formatted custom options ]
    [ -customoptsfile path to json formatted custom options ]
    [ -cluster cluster_name ]
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/otelendpoint/add?<parameters>

**Parameters**

Parameter	Description
name	Name of the end point.
url	The server from which to collect the data.
port	(optional) The server port if not already specified in the url field.

Parameter	Description
key	(conditionally required) The client key used by the collector that is acting as the client with the server.  <b>NOTE:</b> Required only for secure communication between the collector and the server.
keyfile	(conditionally required) Pass the client key in a file instead of directly on the command line.  <b>NOTE:</b> Required only for secure communication between the collector and the server.
cert	(conditionally required) The client certificate used by the collector that is acting as the client with the server.  <b>NOTE:</b> Required only for secure communication between the collector and the server.
certfile	(conditionally required) Pass the client certificate in a file instead of directly on the command line.  <b>NOTE:</b> Required only for secure communication between the collector and the server.
customopts	(optional) Custom options for metric collection. At present, the custom options are: <ul style="list-style-type: none"> <li>• <code>exportlogs</code>: Set to <code>true</code> (by default) to export logs for collection.</li> <li>• <code>exportmetrics</code>: Set to <code>true</code> (by default) to export metrics for collection.</li> </ul>
customoptsfile	(optional) Pass the custom options in a file instead of directly on the command line.
cluster	(optional) The cluster on which to add the end point. By default, this is the cluster on which this command is run.

### Example

Add an *attacks* endpoint to collect metrics from the server *http://starrynova.com* on port *16684* with a custom certificate and key:

#### CLI

```
maprcli otelendpoint add -name
attacks -url http://
starrynova.com:16684 -certfile /root/
cfssl/cert.pem -keyfile /root/cfssl/
cert-key.pem -json

{
  "timestamp":1702557061912,
  "timeofday": "2023-12-14
04:31:01.912 GMT-0800 AM",
  "status": "OK",
  "total":0,
  "data":[

  ],
  "messages": [
```

```

        "end point added
successfully"
    ]
}
    
```

**REST**

```

https://abc.sj.us:8443/
rest/otelendpoint/add?
name=attacks&url=http://
starrynova.com:16684&certfile=/root/
cfssl/cert.pem&keyfile=/root/cfssl/
cert-key.pem
    
```

**otelendpoint info**

Displays information about an Open Telemetry end point.

**Syntax**

**CLI**

```

maprcli otelendpoint info
        -name end point name
        [ -cluster cluster_name ]
    
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/otelendpoint/info?<parameters>

**Parameters**

Parameter	Description
name	Name of the end point.
cluster	(optional) The cluster on which the end point resides. By default, this is the cluster on which this command is run.

**Example**

Display information about the *attacks* endpoint:

**CLI**

```

maprcli otelendpoint info -name
attacks -json
{
    "timestamp":1702558600087,
    "timeofday":"2023-12-14
04:56:40.087 GMT-0800 AM",
    "status":"OK",
    "total":1,
    "data":[
        {
            "name":"attacks",
            "url":"http://
    
```

```
starrynova.com",
    "port":16486
  }
]
```

**REST**

```
https://abc.sj.us:8443/rest/
otelendpoint/info?name=attacks
```

**otelendpoint list**

Lists all Open Telemetry end points.

**Syntax**

**CLI**

```
maprcli otelendpoint list
[ -cluster cluster_name ]
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/otelendpoint/list?<parameters>

**Parameters**

Parameter	Description
cluster	(optional) The cluster from which to retrieve the end points. By default, this is the cluster on which this command is run.

**Example**

List all endpoints:

**CLI**

```
maprcli otelendpoint list -json
{
  "timestamp":1702560372484,
  "timeofday":"2023-12-14
05:26:12.484 GMT-0800 AM",
  "status":"OK",
  "total":2,
  "data":[
    {
      "name":"default",
      "url":"https://hpe-ezcentral.com"
    },
    {
      "name":"attacks",
      "url":"http://
starrynova.com"
```

```
    ]
  }
}
```

**REST**

```
https://abc.sj.us:8443/rest/
otelendpoint/list
```

**otelendpoint remove**

Removes an Open Telemetry end point.

**Syntax**

**CLI**

```
maprcli otelendpoint remove
      -name end point name
      [ -cluster cluster_name ]
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/otelendpoint/remove?<parameters>

**Parameters**

Parameter	Description
cluster	(optional) The cluster on which the end point resides. By default, this is the cluster on which this command is run.

**Example**

Remove endpoint *attacks*:

**CLI**

```
maprcli otelendpoint remove -name
attacks -json
{
  "timestamp":1702561268122,
  "timeofday":"2023-12-14
05:41:08.122 GMT-0800 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "end point removed
successfully"
  ]
}
```

**REST**

```
https://abc.sj.us:8443/rest/
otelendpoint/remove?name=attacks
```

**otelendpoint update**

Updates details for an Open Telemetry end point.

**Syntax****CLI**

```
maprcli otelendpoint update
    -name end point name
    -url http[s]://hostname
    [ -port port ]
    [ -key Base64 encoded key ]
    [ -keyfile key file path ]
    [ -cert Base64 encoded certificate ]
    [ -certfile certificate file path ]
    [ -customopts json formatted custom
options ]
    [ -customoptsfile path to json
formatted custom options ]
    [ -cluster cluster_name ]
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/otelendpoint/update?<parameters>

**Parameters**

Parameter	Description
name	Name of the end point.
url	The server from which to collect the data.
port	(optional) The server port if not already specified in the url field.
key	(conditionally required) The client key used by the collector that is acting as the client with the server.  <b>NOTE:</b> Required only for secure communication between the collector and the server.
keyfile	(conditionally required) Pass the client key in a file instead of directly on the command line.  <b>NOTE:</b> Required only for secure communication between the collector and the server.

Parameter	Description
cert	(conditionally required) The client certificate used by the collector that is acting as the client with the server.  <b>NOTE:</b> Required only for secure communication between the collector and the server.
certfile	(conditionally required) Pass the client certificate in a file instead of directly on the command line.  <b>NOTE:</b> Required only for secure communication between the collector and the server.
customopts	(optional) Custom options for metric collection. At present, the custom options are: <ul style="list-style-type: none"> <li>• <code>exportlogs</code>: Set to <code>true</code> (by default) to export logs for collection.</li> <li>• <code>exportmetrics</code>: Set to <code>true</code> (by default) to export metrics for collection.</li> </ul>
customoptsfile	(optional) Pass the custom options in a file instead of directly on the command line.
cluster	(optional) The cluster on which the end point resides. By default, this is the cluster on which this command is run.

### Example

Update the *attacks* endpoint on server *http://starrynova.com* to port *16486*:

#### CLI

```
maprcli otelexportpoint
update -name attacks -url http://
starrynova.com:16486 -json
{
  "timestamp":1702560856968,
  "timeofday":"2023-12-14
05:34:16.968 GMT-0800 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "end point updated
successfully"
  ]
}
```

#### REST

```
https://abc.sj.us:8443/
rest/otepoint/update?
name=attacks&url=http://
starrynova.com:16486
```

#### rlimit

Manages resource usage limits for the cluster.

#### rlimit get

Returns the resource usage limit for the cluster's disk resource.

**Syntax****CLI**

```
maprcli rlimit get
  -resource disk
  [ -cluster <cluster name> ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/rlimit/get?<parameters>

**Parameters**

Parameter	Description
resource	The type of resource to get the usage limit for. Currently only the value <code>disk</code> is supported.
cluster	The name of the cluster whose usage limit is being queried.

**Examples**

Return the disk usage limit for the cluster `my.cluster.com`:

**CLI**

```
# maprcli rlimit get -resource
disk -cluster ksTest -json
{
  "timestamp":1529382231966,
  "timeofday":"2018-06-18
09:23:51.966 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "limit":"251947MB",
      "clusterSize":"279942MB",
      "currentUsage":"3MB"
    }
  ]
}
```

**REST**

```
# curl -X GET 'https://
server.sj.us:8443/rest/rlimit/get?
cluster=ksTest' --user
<username>:<password>
{"timestamp":1529382231966,"timeofday":
"2018-06-18 09:23:51.966 GMT-0700
PM","status":"OK","total":1,"data":
[{"limit":"251947MB","clusterSize":"27
9942MB","currentUsage":"3MB"}]}
```

**rlimit set**

Sets the resource usage limit for the cluster's disk resource.

## Syntax

### CLI

```
maprcli rlimit set
  -resource disk
  [ -cluster <cluster name> ]
  -value <limit>
```

### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/rlimit/set?<parameters>

## Parameters

Parameter	Description
resource	The type of resource for which to set the usage limit. Currently <code>disk</code> is the only value that is supported.
cluster	The name of the cluster whose usage limit is being set.
value	The value of the limit being set. You can express the value as KB, MB, GB, or TB.

## Examples

### Set the disk usage limit for the cluster `my.cluster.com` to 80TB:

#### CLI

```
maprcli rlimit set -resource
disk -cluster my.cluster.com -value
80TB
```

#### REST

```
https://abc.sj.us:8443/rest/rlimit/
get?
resource=disk&cluster=my.cluster.com&v
alue=80TB
```

## Related tasks

[Setting Quota Defaults for Users and Groups](#) on page 1075

Explains how to set disk space quotas for users and groups.

## Related reference

[entity modify](#) on page 2184

Modifies a user or group quota or email address. Permissions required: `fc` or `a`.

## schedule

Manages schedules.

## Schedule Fields

The schedule object contains the following fields:

Field	Value
id	The ID of the schedule.
name	The name of the schedule.
inuse	Indicates whether the schedule is associated with an action.
rules	An array of JSON objects specifying how often the scheduled action occurs. See Rule Fields below.

### Rule Fields

The following table shows the fields to use when creating a rules object.

Field	Values
frequency	<p>How often to perform the action:</p> <ul style="list-style-type: none"> <li>• <code>once</code> - Once</li> <li>• <code>yearly</code> - Yearly</li> <li>• <code>monthly</code> - Monthly</li> <li>• <code>weekly</code> - Weekly</li> <li>• <code>daily</code> - Daily</li> <li>• <code>hourly</code> - Hourly</li> <li>• <code>semihourly</code> - Every 30 minutes</li> <li>• <code>quarterhourly</code> - Every 15 minutes</li> <li>• <code>fiveminutes</code> - Every 5 minutes</li> <li>• <code>minute</code> - Every minute</li> </ul>
retain	<p>How long to retain the data resulting from the action. For example, if the schedule creates a snapshot, the <code>retain</code> field sets the snapshot's expiration. The <code>retain</code> field consists of an integer and one of the following units of time:</p> <ul style="list-style-type: none"> <li>• <code>mi</code> - minutes</li> <li>• <code>h</code> - hours</li> <li>• <code>d</code> - days</li> <li>• <code>w</code> - weeks</li> <li>• <code>m</code> - months</li> <li>• <code>y</code> - years</li> </ul> <p> <b>NOTE:</b> For offload schedule, set the value for this to 0.</p>

Field	Values
time	The time of day to perform the action, in 24-hour format: HH
date	The date on which to perform the action: <ul style="list-style-type: none"> <li>For single occurrences, specify month, day and year: MM/DD/YYYY</li> <li>For yearly occurrences, specify the month and day: MM/DD</li> <li>For monthly occurrences occurrences, specify the day: DD Daily and hourly occurrences do not require the date field.</li> </ul>

### Example

The following example JSON shows a schedule called "snapshot," with three rules.

```
{
  "id": 8,
  "name": "snapshot",
  "inuse": 0,
  "rules": [
    {
      "frequency": "monthly",
      "date": "8",
      "time": 14,
      "retain": "1m"
    },
    {
      "frequency": "weekly",
      "date": "sat",
      "time": 14,
      "retain": "2w"
    },
    {
      "frequency": "hourly",
      "retain": "1d"
    }
  ]
}
```

### schedule create

Creates a schedule. Permissions required: `fc` or `a`.

A schedule can be associated with a volume to automate mirror syncing, snapshot creation, and data offload. See [volume create](#) and [volume modify](#).

### Syntax

#### CLI

```
maprcli schedule create
[ -cluster <cluster> ]
-schedule <JSON>
```

#### REST

Request Type	POST
--------------	------

Request URL	http[s]://<host>:<port>/rest/schedule/create?<parameters>
-------------	-----------------------------------------------------------

### Parameters

Parameter	Description
cluster	The cluster on which to run the command.
schedule	A JSON object describing the schedule. See <a href="#">Schedule Objects</a> for more information.

### Examples

#### Scheduling a Single Occurrence

##### CLI

```
maprcli schedule create -schedule
'{"name":"Schedule-1","rules":
[{"frequency":"once","retain":"1w","time":13,"date":"12/5/2010"}]}'
```

##### REST

```
https://abc.sj.us:8443/rest/schedule/
create?
schedule={"name":"Schedule-1","rules":
[{"frequency":"once","retain":"1w","time":13,"date":"12/5/2010"}]}
```

#### A Schedule with Several Rules

##### CLI

```
maprcli schedule create -schedule
'{"name":"Schedule-2","rules":
[{"frequency":"weekly","date":"sun","time":7,"retain":"2w"},
{"frequency":"daily","time":14,"retain":"1w"},
{"frequency":"hourly","retain":"1w"},
{"frequency":"yearly","date":"11/5","time":14,"retain":"1w"}]}'
```

##### REST

```
https://abc.sj.us:8443/rest/schedule/
create?
schedule={"name":"Schedule-1","rules":
[{"frequency":"weekly","date":"sun","time":7,"retain":"2w"},
{"frequency":"daily","time":14,"retain":"1w"},
{"frequency":"hourly","retain":"1w"},
{"frequency":"yearly","date":"11/5","time":14,"retain":"1w"}]}
```

#### schedule list

Lists the schedules on the cluster.

## Syntax

### CLI

```
maprcli schedule list
  [ -cluster <cluster> ]
  [ -output terse|verbose ]
  [ -sortby ]
```

### REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/schedule/list[?<parameters>]

## Parameters

Parameter	Description
cluster	The cluster on which to run the command.
output	Specifies whether the output should be terse or verbose.
sortby	Specifies one of the following attributes to sort the list of schedules by: scheduleid, schedulename, schedulerulefrequency, scheduleruledate, scheduleruletime, scheduleruleminutes, scheduleruleretaintime, scheduleinuse. By default, the list of schedules sorted by schedulename.

## Output

A list of all schedules on the cluster. See [Schedule Objects](#) for more information.

### Sample Output

```
# maprcli schedule list
id name          inuse rules
1  Critical data  0     ...
2  Important data 0     ...
3  Normal data   0     ...
```

## Examples

### List schedules:

#### CLI

```
# maprcli schedule list -json
{
  "timestamp":1531004445284,
  "timeofday":"2018-07-07
04:00:45.284 GMT-0700 PM",
  "status":"OK",
  "total":4,
  "data":[
    {
      "id":4,
      "name":"Automatic Tiering
Scheduler",
```

```

        "inuse":0,
        "description":"Automatic
Scheduler for EC and Cold Tier: It
uses internal policies to schedule
the task",
        "rules":{
            }
        },
        {
            "id":1,
            "name":"Critical data",
            "inuse":0,
            "rules":[
                {
                    "frequency":"hourly",

    ]}]
}

```

**schedule modify**

Modifies an existing schedule, specified by ID. Permissions required: `fc` or `a`.

To find a schedule's ID:

1. Use the [schedule list](#) command to list the schedules.
2. Select the schedule to modify.
3. Pass the selected schedule's ID in the `-id` parameter to the `schedule modify` command.

**Syntax****CLI**

```

maprcli schedule modify
  [ -cluster <cluster> ]
  -id <schedule ID>
  [ -name <schedule name> ]
  [ -rules <JSON>]

```

**REST**

Request Type	POST
Request URL	<pre> http[s]://&lt;host&gt;:&lt;port&gt;/ rest/schedule/modify? &lt;parameters&gt; </pre>

## Parameters

Parameter	Description
cluster	The cluster on which to run the command.
id	The ID of the schedule to modify.
name	The new name of the schedule.
rules	A JSON object describing the rules for the schedule. If specified, replaces the entire existing rules object in the schedule. For information about the fields to use in the JSON object, see <a href="#">Rule Fields</a> .

## Examples

### Modify a schedule

#### CLI

```
maprcli schedule modify -id 0 -name
Newname -rules
' [{"frequency": "weekly", "date": "sun", "
time": 7, "retain": "2w"},
{"frequency": "daily", "time": 14, "retain
": "1w"} ]'
```

#### REST

```
https://abc.sj.us:8443/rest/schedule/
modify?
id=0&name=Newname&rules=[{"frequency":
"weekly", "date": "sun", "time": 7, "retain
": "2w"},
{"frequency": "daily", "time": 14, "retain
": "1w"} ]
```

### schedule remove

Removes a schedule.

A schedule can only be removed if it is not associated with any volumes. See [volume modify](#).

## Syntax

#### CLI

```
maprcli schedule remove
[ -cluster <cluster> ]
-id <schedule ID>
```

#### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/schedule/remove?<parameters>

## Parameters

Parameter	Description
cluster	The cluster on which to run the command.

Parameter	Description
id	The ID of the schedule to remove.

## Examples

### Remove schedule with ID 0:

#### CLI

```
maprcli schedule remove -id 0
```

#### REST

```
https://abc.sj.us:8443/rest/schedule/
remove?id=0
```

## security

Configures security options.

### genkey

Generates keys and certificates.

This command is for internal use only. You must use `configure.sh` with the `genkeys` option instead.

### genticket

Generates tickets.

This command is for internal use only. You must use the [maprlogin](#) utility instead.

### policy create

Describes how to create a security policy using the CLI.

## Syntax

#### CLI

```
/opt/mapr/bin/maprcli security policy
create
        -name
<security-policy-name>
        [ -description
<description> ]
        [ -cluster cluster-name]
        [ -allowtagging true|
false ]
        [ -accesscontrol Armed|
Disarmed|Denied ]
        [ -auditenabled true|
false ]
        [ -dataauditops <+|-
operations>|all ]
        [ -wiresecurityenabled
true|false ]
        [ -readfileace <file
read ACE> ]
        [ -writefileace <file
write ACE> ]
        [ -executefileace <file
execute ACE> ]
        [ -readdirace
<directory read ACE> ]
        [ -addchildace
<directory add child ACE> ]
```

```

        [ -deletechildace
<directory delete child ACE> ]
        [ -lookupdirace
<directory lookup ACE> ]
        [ -readdbace <db cf
read ACE]> ]
        [ -writedbace <db cf
write ACE]> ]
        [ -traversedbace <db cf
traverse ACE> ]
        [ -readaces <file,
directory, db, streams ACE> ]
        [ -writeaces <file,
directory, db, streams ACE> ]
        [ -unmaskedreaddbace
<DB unmasked read ace> ]
        [ -user
<user:permission,permission,...
user:permission,permission,...> ]
        [ -group
<group:permission,permission,...
group:permission,permission,...> ]
    
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/security/policy/create?<parameters>

**Parameters**

Parameter	Description
name	The name of this security policy. Security policy names must be unique within the cluster and must contain only alphanumeric characters, hyphen (-) and underscore (_). Other characters like space and commas are not allowed. Maximum length of the security policy name is 128 characters. This parameter is mandatory.
description	The description of the policy. The maximum length of the description is <b>128</b> characters.
cluster	The cluster name on which to run the command. This parameter is optional. The local cluster is the default cluster.
allowtagging	Allows or disallows tagging for the security policy. If set to true, this security policy can be used to tag HPE Ezmeral Data Fabric filesystem resources. When the security policy is first created, the allowtagging flag is set to false to give the administrator time to configure the security policy, before allowing users to tag HPE Ezmeral Data Fabric resources with this security policy. Default is false.

Parameter	Description
accesscontrol	<p>Determines whether the relevant <a href="#">ACEs</a> in this security policy are enforced for HPE Ezmeral Data Fabric resources that are tagged with this security policy. The following settings are supported:</p> <ul style="list-style-type: none"> <li>• <b>Armed:</b> When a HPE Ezmeral Data Fabric resource is tagged with this security policy, the relevant <a href="#">ACEs</a> in this security policy are enforced when the resource is accessed. This is the normal operation mode.</li> <li>• <b>Disarmed (default setting):</b> Even if a HPE Ezmeral Data Fabric resource is tagged with this security policy, the <a href="#">ACEs</a> in this security policy are NOT enforced. This setting can be used as an emergency switch when an incorrectly configured security policy denies authorized users from accessing resources.</li> <li>• <b>Denied:</b> Access is always denied to any HPE Ezmeral Data Fabric resources tagged with this security policy. Use this setting for security policies that are no longer in use, but are still tagged to some HPE Ezmeral Data Fabric resources. Administrators can look at the audit logs to determine the root cause.</li> </ul>
auditenabled	<p>Specifies whether or not to enable auditing for this policy. Set to <code>true</code> to enable auditing, and <code>false</code> to disable auditing.</p> <p>Default: <code>false</code>.</p>

Parameter	Description
<p>dataauditops</p>	<p>The comma separated list of filesystem operations to include (specified with a preceding plus sign (+)), or exclude (specified with a preceding minus sign (-)) from auditing.</p> <p>To exclude the first operation in the list of operations from auditing, precede the operation by two minus (--) signs. Precede subsequent operations to exclude by only a single minus (-) sign, irrespective of whether the first operation was included (using a plus (+) sign) or excluded (using two minus (--) signs). If neither sign is specified, the given operation is included for auditing.</p> <p>The operations that can be included (+) or excluded (-) from auditing are listed in <a href="#">Auditing Data-Access Operations</a>. Alternatively, you can group all the operations using the keyword <b>all</b>, which:</p> <ul style="list-style-type: none"> <li>• If included (+), cannot be specified with a list of other included operations.</li> <li>• If excluded (-), cannot be specified with a list of other excluded operations.</li> </ul> <p>All specified operations must either be included or excluded from auditing. You cannot specify a mixed list of included and excluded operations. Other than the specified operations, by default, all other operations are:</p> <ul style="list-style-type: none"> <li>• Included for auditing, if the specified list is a list of excluded operations.</li> <li>• Excluded from auditing, if the specified list is a list of included operations.</li> </ul> <p>Including <code>setattr</code> automatically enables the following operations:</p> <ul style="list-style-type: none"> <li>• <code>chown</code></li> <li>• <code>chgrp</code></li> <li>• <code>chperm</code></li> </ul> <p>If you exclude <code>setattr</code>, these operations are automatically disabled. If you do nothing with <code>setattr</code> (neither enable nor disable), you can enable or disable <code>chown</code>, <code>chgrp</code>, and <code>chperm</code> in any combination.</p>
<p>wiresecurityenabled</p>	<p>Determines whether or not to perform wire-level encryption on the returned data. Set to <code>true</code> to enable wire-level encryption, and <code>false</code> to disable wire-level encryption.</p> <p>Default: <code>true</code></p>

Parameter	Description
readfileace	<p>An <b>ACE</b> that controls who can read from this file. If you do not set an <b>ACE</b>, basic file permissions are used. Files created with basic file permissions have mode 0755. Anyone can read the file contents. To read a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Read permission to the volume</li> <li>• Read permission to the file</li> </ul>
writefileace	<p>An <b>ACE</b> that controls who can write to this file. If you do not set an <b>ACE</b>, basic file permissions are used. Files created with basic file permissions have mode 0755. Only the owner can write to the file. To write to a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Write permission to the volume</li> <li>• Write permission to the file</li> </ul>
executefileace	<p>An <b>ACE</b> that controls who can execute this file. If you do not set an <b>ACE</b> expression, basic file permissions are used. Files created with basic file permissions have mode 0755. Anyone can execute this file (assuming that the contents are executable). To execute a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Read permission to the volume</li> <li>• Read and execute permissions to the file</li> </ul>
readdirace	<p>Controls who can read the contents of files in this directory. If you do not set an <b>ACE</b>, basic file permissions are used. Directories created with basic file permissions have mode 0755. Anyone can read the contents of files in this directory. To read the contents of a file in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Read permission to the volume</li> <li>• Read permission to the parent directory</li> <li>• Read permission to the file</li> </ul>

Parameter	Description
addchildace	<p>Controls who can create objects (files and directories) in this directory. If you do not set an <a href="#">ACE</a>, basic file permissions are used. Directories created with basic file permissions have mode 0755. By default, only the owner can create files and directories in this directory. To create files and directories in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Add child permission for the parent directory</li> <li>• Read and execute permissions to all directories in the path</li> <li>• Write permission to the parent directory, and</li> <li>• Write permission to the volume.</li> </ul>
deletechildace	<p>Controls who can delete objects (files and directories) in this directory. If you do not set an <a href="#">ACE</a>, basic file permissions are used. Directories created with basic file permissions have mode 0755. By default, only the owner can delete files and directories in this directory. To delete files and directories in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Delete child permission for the parent directory</li> <li>• Read and execute access to all directories in the path</li> <li>• Write permission to the parent directory</li> <li>• Write permission to the volume</li> </ul>
lookupdirace	<p>Controls who can list the contents (files and directories) of this directory. If you do not set an <a href="#">ACE</a>, basic file permissions are used. Directories created with basic file permissions have mode 0755. Anyone can list the files in this directory. To list the contents of a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Read permission to the directory</li> <li>• Read permission to the volume</li> </ul>
readdbace	<p>The <a href="#">ACE</a> for <i>column reads</i>. Fields within the <i>column family</i> inherit this permission.</p> <p>Default: <code>u:creator</code>.</p> <p>To read fields in <i>JSON DB column families</i> tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Read permission to the DB column family</li> <li>• Read and execute permissions to all directories in the path</li> <li>• Read permission to the volume</li> </ul>

Parameter	Description
writedbace	<p>The <a href="#">ACE</a> for <i>column writes</i> (puts and deletes). Fields within the <i>column family</i> inherit this permission.</p> <p>Default: <code>u:creator</code>.</p> <p>To perform column writes, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Write permission to the DB column family</li> <li>• Read and execute permission to all directories in the path</li> <li>• Write permission to the parent directory</li> <li>• Write permission to the volume</li> </ul>
traversedbace	<p>DB CF traverse permission settings, which determine the permission to pass over fields in JSON documents. Fields within the <i>column family</i> inherit this permission.</p> <p>Default: <code>u:creator</code>.</p> <p>To traverse fields in <i>JSON DB column families</i> tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Traverse permission to the DB column family</li> <li>• Read and execute permissions to all directories in the path</li> <li>• Read permission to the volume</li> </ul>
readaces	<p>A convenience option to set read permissions for all objects. This is equivalent to setting the same <a href="#">ACE</a> for the <code>readfileace</code>, <code>readdirace</code>, <code>lookupdirace</code>, <code>readdbace</code>, and <code>traversedbace</code> options.</p>
writeaces	<p>A convenience option to set write permissions for all objects. This is equivalent to setting the same <a href="#">ACE</a> for <code>writefileace</code>, <code>addchildace</code>, <code>deletetchildace</code>, and <code>writedbace</code> options.</p>
unmaskedreaddbace	<p>This is the ACE for determining whether the users have the <code>unmaskedreadperm</code> permission to enable them to read the masked column data unmasked. These users must also have <code>readdbace</code> permission. The <code>unmaskedreadperm</code> permission will not be automatically set when using the convenience <code>readaces</code> parameter. The <code>unmaskedreadperm</code> permission must be specifically enabled in the security policy by using the <code>unmaskedreaddbace</code> ACE. See <a href="#">Dynamic Data Masking</a> on page 876 for more information.</p>

Parameter	Description
user	<p>Space separated list of <code>user:permission,permission</code> pairs. Use commas to separate each permission, and spaces to separate each user. For example, to give user <code>tom</code>, <code>admin (a)</code> and full control (<code>fc</code>) permissions, and user <code>jane</code>, <code>admin (a)</code> permission, use <code>-user tom:a,fc jane:a</code></p> <p>If you do not specify this option, a security policy level administrative ACL is added for the administrator who created this security policy to have full privileges by default, that is <code>[r,a,fc]</code>. However, another user with <code>admin (a)</code> privilege for this security policy can subsequently remove this privilege . Specifying this option overwrites the default setting to give security policy level privileges only to the users specified in the <code>-user</code> list.</p> <p> <b>CAUTION:</b> You must specify <code>admin (a)</code> privilege for at least one administrator (for example, <code>-user admin1:r,a,fc</code>) in addition to privileges for any other users to modify this security policy after creation. If the <code>-user</code> or <code>-group</code> options are specified but without <code>admin (a)</code> or full control (<code>fc</code>) permission, (for example, <code>-user operator:r</code>), only the <code>mapr</code> user can modify the security policy.</p>
group	<p>Space separated list of <code>group:permission,permission</code> pairs. Use commas to separate each permission, and spaces to separate each group. For example, to give group operators <code>read (r)</code> permission, and group <code>secadmin</code> full control (<code>fc</code>) permission, use <code>-group operators:r secadmin:a,fc</code></p>

## Examples

### CLI

```

/opt/mapr/bin/maprcli security policy
create -name TOPSECRET -allowtagging
true -accesscontrol
Armed -wiresecurityenabled true -user
"user7:a,fc user10:a"

/opt/mapr/bin/maprcli security policy
info -name TOPSECRET -json

```

**policy export**

Exports security policies.

**Syntax**

**CLI**

Use the `maprcli security policy export` command to export all security policies from the master node. You can then use the [policy import](#) on page 2341 command to import policies.

```
/opt/mapr/bin/maprcli security policy
export
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/security/policy/export

**Parameters**

None

**CLI**

The `maprcli security policy export` command dumps the security policies to the standard output. Use redirection to redirect the output to a file. For example, the following command redirects output to the `/tmp/polfile` file.

```
/opt/mapr/bin/maprcli security policy
export > /tmp/polfile
```

**REST**

```
curl -u mapr:mapr -X GET -k "https://
host:8443/rest/security/policy/export
> /tmp/polfile
```

**datamask info**

Displays data mask information.

### Syntax

#### CLI

Use the `maprcli security datamask info` command to view the details of a [data mask](#) or the mask information for a table or array.

```
maprcli security datamask info
  -name <mask-name>
  [ -cluster <cluster-name> ]
  [ -output terse | verbose ]
  [ -columns <comma-separated list
of column names> ]
```

#### REST

Request Type	GET
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/security/datamask/info?&lt;parameters&gt;</code>

### Parameters

Parameter	Description						
name	Name of the data mask.						
cluster	The cluster on which to run the command. The default cluster is the local cluster.						
output	Specifies whether the output should be terse or verbose. Default: <code>verbose</code> .						
columns	<p>A comma-separated list of columns to return in the query. By default, all columns are displayed. Supported column names are as follows:</p> <table border="0"> <tr> <td style="padding-right: 20px;"><b>name</b></td> <td>The name of the dynamic data mask. All predefined dynamic data mask names are prefixed with <code>mrddm_</code>.</td> </tr> <tr> <td><b>description</b></td> <td>The description of the dynamic data mask.</td> </tr> <tr> <td><b>applicability</b></td> <td>A comma-separated list of data types for which the data mask is applicable. The JSON document data types are listed in <a href="#">JSON Document Types</a>.</td> </tr> </table>	<b>name</b>	The name of the dynamic data mask. All predefined dynamic data mask names are prefixed with <code>mrddm_</code> .	<b>description</b>	The description of the dynamic data mask.	<b>applicability</b>	A comma-separated list of data types for which the data mask is applicable. The JSON document data types are listed in <a href="#">JSON Document Types</a> .
<b>name</b>	The name of the dynamic data mask. All predefined dynamic data mask names are prefixed with <code>mrddm_</code> .						
<b>description</b>	The description of the dynamic data mask.						
<b>applicability</b>	A comma-separated list of data types for which the data mask is applicable. The JSON document data types are listed in <a href="#">JSON Document Types</a> .						

### Example

1. Display the information for a particular mask:

#### CLI

```
maprcli security datamask
info -name mrddm_hash -json
{
  "timestamp":1625172427915,
  "timeofday":"2021-07-01
01:47:07.915 GMT-0700 PM",
```

```

"status": "OK",
"total": 1,
"data": [
  {
    "id": 5,
    "name": "mrddm_hash",
    "description": "Show the
hash of the data",
"applicability": "[String]"
  }
]
}

```

**REST**

```

curl -k -X POST \
'https://
r1n1.sj.us:8443/rest/security/
datamask/info?name=mrddm_hash' \
-u <username>:<password>

```

**2. Display mask information for a table:****CLI**

```

maprcli table info -path /
table1 -json
{
  "timestamp": 1612218564113,
  "timeofday": "2021-02-01
02:29:24.113 GMT-0800 PM",
  "status": "OK",
  "total": 1,
  "data": [
    {
      "path": "/table1",
      ...
      "defaultreadperm": "u:mapr",
      "defaultunmaskedreadperm":
      "u:mapr",

```

```

    ...
  }
]
}

```

**REST**

```

curl -k -X POST \
  'https://r1n1.sj.us:8443/
rest/security/datamask/info?path="/
table1"' \
  -u <username>:<password>

```

Sets access control expressions (ACEs) for a specified column.

[Specify a Data Mask During Security Policy Creation](#) on page 2322

Describes how to create a security policy using the CLI.

[Modify a Security Policy Data Mask](#) on page 2352

Modify a security policy using the CLI.

**datamask list**

Lists all available data masks.

## Syntax

### CLI

Use the `maprcli security datamask list` command to list all [data masks](#).

```
maprcli security datamask list
  [ -cluster <cluster-name> ]
  [ -output terse | verbose ]
  [ -columns <comma-separated list
of column names> ]
```

### REST

Request Type	GET
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/security/datamask/list?&lt;parameters&gt;</code>

## Parameters

Parameter	Description								
cluster	The cluster on which to run the command. The default cluster is the local cluster.								
output	Specifies whether the output should be terse or verbose. Default: <code>verbose</code> .								
columns	<p>A comma-separated list of columns to return in the query. By default, all columns are displayed.</p> <p>Supported column names are as follows:</p> <table border="0"> <tr> <td><b>name</b></td> <td>The name of the dynamic data mask. All predefined dynamic data mask names are prefixed with <code>mrddm_</code>.</td> </tr> <tr> <td><b>description</b></td> <td>The description of the dynamic data mask.</td> </tr> <tr> <td><b>type</b></td> <td>The type of dynamic data mask. This is <code>predefined</code> for predefined dynamic data masks.</td> </tr> <tr> <td><b>applicability</b></td> <td>A comma-separated list of data types for which the data mask is applicable. The JSON document data types are listed in <a href="#">JSON Document Types</a>.</td> </tr> </table>	<b>name</b>	The name of the dynamic data mask. All predefined dynamic data mask names are prefixed with <code>mrddm_</code> .	<b>description</b>	The description of the dynamic data mask.	<b>type</b>	The type of dynamic data mask. This is <code>predefined</code> for predefined dynamic data masks.	<b>applicability</b>	A comma-separated list of data types for which the data mask is applicable. The JSON document data types are listed in <a href="#">JSON Document Types</a> .
<b>name</b>	The name of the dynamic data mask. All predefined dynamic data mask names are prefixed with <code>mrddm_</code> .								
<b>description</b>	The description of the dynamic data mask.								
<b>type</b>	The type of dynamic data mask. This is <code>predefined</code> for predefined dynamic data masks.								
<b>applicability</b>	A comma-separated list of data types for which the data mask is applicable. The JSON document data types are listed in <a href="#">JSON Document Types</a> .								

## Example

### CLI

```
maprcli security datamask list -json
{
  "timestamp":1644285413233,
  "timeofday":"2022-02-07"

Modify a security policy using the CLI.

### policy info

Display security policy information using the CLI.

## Syntax

### CLI

Use the `maprcli security policy info` command to display the details of the specified security policy.

```
/opt/mapr/bin/maprcli security policy
info
  -name policy name
  [ -cluster cluster name ]
  [ -output terse|verbose. Default:
verbose ]
  [ -columns <comma-separated list of
column names>. Default: all ]
  [ -expandaces true|false. Default:
false ]
```

### REST

Request Type	GET
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/security/policy/info?&lt;parameters&gt;</code>

## Parameters

Parameter	Description
name	The name of the security policy. This parameter is mandatory.
cluster	The cluster name on which to run the command. This parameter is optional. The local cluster is the default cluster.
output	Specifies whether the output should be <code>terse</code> or <code>verbose</code> . Default: <code>verbose</code>
columns	A comma-separated list of fields to return in the query. See <a href="#">policy create</a> on page 2322 for the list of column names.  When issuing <code>maprcli security policy info -columns</code> and <code>maprcli security policy list -columns</code> commands, the column for the policy name is <code>name</code> .
expandaces	Expand <a href="#">ACE</a> into their respective fields for display. Default: <code>false</code>

## Examples

Display security policy information with the [ACE](#) information expanded.

### CLI

```
/opt/mapr/bin/maprcli security policy
info -name TOPSECRET -expandaces
TRUE -json
```

```

```

**policy attach**

Attach one or more security policies to one or more volumes on a cluster.

**Syntax**

**CLI**

Use the `maprcli security policy attach` command to display the details of the specified security policy.

```
/opt/mapr/bin/maprcli security policy
attach
        -securitypolicy
securityPolicyName
        -volumes volumeNames
        [ -cluster cluster ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/security/policy/attach?<parameters>

## Parameters

Parameter	Description
securitypolicy	The name of the security policy to attach. This is a mandatory parameter. You can specify more than one security policies as a comma-separated list to attach to more than one volumes.
volumes	The volume or volumes to which the security policy is to be attached. This is a mandatory parameter. You can specify a comma-separated list of volumes if there are more than one volumes to which the specified security policy or security policies must be attached.
cluster	The cluster to which the volumes belong. This parameter is optional. The local cluster is the default cluster.

## Examples

Attach a security policy named sp\_salesdept to volumes, salesdec and salesnov, on cluster sales20.

### CLI

```
/opt/mapr/bin/maprcli security
policy attach -securitypolicy
sp_salesdept -volumes
salesdec,salesnov -cluster
sales20 --json
```

Attach a security policy named sp\_salesold, sp\_salesnew to volumes, salesdec and salesnov, on cluster sales20.

### CLI

```
/opt/mapr/bin/maprcli security
policy attach -securitypolicy
sp_salesold,sp_salesnew -volumes
salesdec,salesnov -cluster
sales20 --json
```

## policy import

Imports security policies.

## Syntax

### CLI

Use the `maprcli security policy import` command to import the exported security policies.

```
/opt/mapr/bin/maprcli security policy
import
-filename fileName
```

### REST

Request Type	GET
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/security/policy/import?&lt;parameters&gt;</code>

**Parameters**

Parameter	Description
filename	The file that contains the policies to import. Policies are exported to this file when running the <a href="#">policy export</a> on page 2331 command.

**CLI**

```
/opt/mapr/bin/maprcli security
policy import -filename /tmp/
polfile
```

**REST**

```
curl -u mapr:mapr -X GET -k "https://
host:8443/rest/security/policy/import?
filename=/tmp/polfile"
```

**policy list**

List security policies using the CLI.

**Syntax****CLI**

Use the following command to display the list of security policies. This command returns just the list of security policies that the user is allowed to view. Therefore, if there are a total of 10 security policies, but the administrative privileges only allow the user to view 6 of them, then this command returns the details of the 6 security policies.

For the 4 remaining security policies, this command returns just the name and ID fields:

```
/opt/mapr/bin/maprcli security policy
list
[ -cluster cluster-name]
[ -output terse|verbose. Default:
verbose]
[ -start <start record number,
starting from 0>. Default: 0 ]
[ -limit <limit>. Default:
2147483647 ]
[ -filter <filters>. Default: none ]
[ -columns <comma-separated list of
column names>. Default: all ]
[ -sortby <sort field> ]
[ -sortorder asc|desc ]
[ -expandaces true|false. Default:
false ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/security/policy/list?<parameters>

## Parameters

Parameter	Description																											
cluster	The cluster name on which to run the command. This parameter is optional. The local cluster is the default cluster.																											
output	Specifies whether the output should be <code>terse</code> or <code>verbose</code> . Default: <code>verbose</code>																											
start	Starting record to return. Default: 0																											
limit	Number of rows to return, beginning at <code>start</code> . Default: 2147483647 ( $2^{31} - 1$ )																											
filter	A filter specifying the policies to display. The supported filters are as follows: <table border="1" data-bbox="820 793 1461 1304"> <thead> <tr> <th>Abbreviated Name</th> <th>Filter Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>n</td> <td>policyname</td> <td>Name</td> </tr> <tr> <td>id</td> <td>policyid</td> <td>Policy ID</td> </tr> <tr> <td>ct</td> <td>ctime</td> <td>Creation time</td> </tr> <tr> <td>mt</td> <td>mtime</td> <td>Modification time</td> </tr> <tr> <td>ea</td> <td>audited</td> <td>Audit enabled</td> </tr> <tr> <td>ws</td> <td>wiresecurity</td> <td>Wire security enabled</td> </tr> <tr> <td>at</td> <td>allowtagging</td> <td>Allow tagging</td> </tr> <tr> <td>ac</td> <td>accesscontrol</td> <td>Access control</td> </tr> </tbody> </table>	Abbreviated Name	Filter Name	Description	n	policyname	Name	id	policyid	Policy ID	ct	ctime	Creation time	mt	mtime	Modification time	ea	audited	Audit enabled	ws	wiresecurity	Wire security enabled	at	allowtagging	Allow tagging	ac	accesscontrol	Access control
Abbreviated Name	Filter Name	Description																										
n	policyname	Name																										
id	policyid	Policy ID																										
ct	ctime	Creation time																										
mt	mtime	Modification time																										
ea	audited	Audit enabled																										
ws	wiresecurity	Wire security enabled																										
at	allowtagging	Allow tagging																										
ac	accesscontrol	Access control																										
columns	A comma-separated list of fields to return in the query. See the <a href="#">parameters</a> for the list of column names.  When issuing <code>maprcli security policy info -columns</code> and <code>maprcli security policy list -columns</code> commands, the column for the policy name is <code>name</code> .																											

Parameter	Description																											
sortby	<p>The field on which the results should be sorted. You can use either of the two long names or the shortname. Valid values are:</p> <table border="1"> <thead> <tr> <th>Long Name</th> <th>Short Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>polycyname/ securitypolycyname</td> <td>n</td> <td>Name</td> </tr> <tr> <td>policyid/ securitypolicyid</td> <td>id</td> <td>Policy ID</td> </tr> <tr> <td>ctime/ securitypolycytime</td> <td>ct</td> <td>Creation time</td> </tr> <tr> <td>mtime/ securitypolycymtime</td> <td>mt</td> <td>Modification time</td> </tr> <tr> <td>audited/ securitypolicyauditdataaccess</td> <td>ea</td> <td>Audit enabled</td> </tr> <tr> <td>wiresecurity/ securitypolicywiresecurityenabled</td> <td>ws</td> <td>Wire encryption enabled</td> </tr> <tr> <td>allowtagging/ securitypolicyallowtagging</td> <td>at</td> <td>Allow tagging</td> </tr> <tr> <td>accesscontrol/ securitypolicyaccesscontrol</td> <td>ac</td> <td>Access control flag</td> </tr> </tbody> </table>	Long Name	Short Name	Description	polycyname/ securitypolycyname	n	Name	policyid/ securitypolicyid	id	Policy ID	ctime/ securitypolycytime	ct	Creation time	mtime/ securitypolycymtime	mt	Modification time	audited/ securitypolicyauditdataaccess	ea	Audit enabled	wiresecurity/ securitypolicywiresecurityenabled	ws	Wire encryption enabled	allowtagging/ securitypolicyallowtagging	at	Allow tagging	accesscontrol/ securitypolicyaccesscontrol	ac	Access control flag
Long Name	Short Name	Description																										
polycyname/ securitypolycyname	n	Name																										
policyid/ securitypolicyid	id	Policy ID																										
ctime/ securitypolycytime	ct	Creation time																										
mtime/ securitypolycymtime	mt	Modification time																										
audited/ securitypolicyauditdataaccess	ea	Audit enabled																										
wiresecurity/ securitypolicywiresecurityenabled	ws	Wire encryption enabled																										
allowtagging/ securitypolicyallowtagging	at	Allow tagging																										
accesscontrol/ securitypolicyaccesscontrol	ac	Access control flag																										
sortorder	The sort order. Valid values are asc (ascending) or desc (descending).																											
expandaces	Expand ACEs into their respective fields for display. Default: false																											

### Examples

#### Example 1

A user without administrative privileges can only view the security policy name and ID. In the following example, there are 2 security policies pci and hipaa. test1 is a user with a regular user ticket, but without administrative privileges. This user can only view the name and id fields of the security policies:

#### CLI

```
/opt/mapr/bin/maprcli security policy
list -json
{
  "timestamp":1548363754194,
  "timeofday":"2019-01-24
01:02:34.194 GMT-0800 PM",
```

```

"status":"OK",
"total":2,
"data":[
  {
    "policyname":"pci",
    "policyid":1
  },
  {
    "policyname":"hipaa",
    "policyid":2
  }
]
}

```

**REST**

```

curl -u mapr:mapr -X GET -k "https://
host:8443/rest/security/policy/list"
{"timestamp":1548363754194,"timeofday"
:"2019-01-24 01:02:34.194 GMT-0800
PM","status":"OK","total":2,"data":
[{"policyname":"pci","policyid":1},
{"policyname":"hipaa","policyid":2}]}

```

**Example 2**

List the policies sorted by their name. You can use either of the two `sortby` long names parameters, or the `shortname` parameter to sort the policies. In this example, the two policies are `MILITARY` and `TOPSECRET`. The policies are displayed in the ascending order of their name.

**CLI**

```

/opt/mapr/bin/maprcli security policy
list -sortby securitypolicyname -json
{
  "timestamp":1554957377267,
  "timeofday":"2019-04-10
09:36:17.267 GMT-0700 PM",
  "status":"OK",
  "total":2,
  "data":[
    {
      "policyname":"MILITARY",
      "policyid":2,
      "mtime":"Tue Apr 09
06:07:54 PDT 2019",
      "ctime":"Tue Apr 09
04:19:00 PDT 2019",
      "wiresecurity":"1",
      "audited":"0",
      "allowtagging":"1",

      "accesscontrol":"Disarmed",

      "enableddataauditoperations":"getattr,
setattr,chown,chperm,chgrp,getxattr,li
stxattr,setxattr,removexattr,read,writ
e,create,delete,mkdir,readdir,rmdir,cr

te,tablecfcreate,tablecfdelete,tablecf
modify,tablecfScan,tableget,tableput,t
ablescan,tablecreate,tableinfo,tablemo
dify,getperm,getpathforfid,hardlink,fi

```

```

lescan,fileoffload,filerecall,filetier
jobstatus,filetierjobabort,filetieroff
loadevent,filetierrecallevent",

"disableddataauditoperations":"","
    "acl":{
        "Principal":"User
root",
        "Allowed
actions":"[r, a, fc]"
    },
    "aces":{
        "writeaces":"u:user7
| u:user10"

"unmaskedreaddbace":"u:user7"
    }
},
{
    "policyname":"TOPSECRET",
    "policyid":1,
    "mtime":"Mon Apr 08
22:33:52 PDT 2019",
    "ctime":"Mon Apr 08
22:33:52 PDT 2019",
    "wiresecurity":"1",
    "audited":"0",
    "allowtagging":"1",
    "accesscontrol":"Armed",

"enableddataauditoperations":"getattr,
setattr,chown,chperm,chgrp,getattr,li
stxattr,setxattr,removexattr,read,writ
e,create,delete,mkdir,readdir,rmdir,cr
eatesym,lookup,rename,createdev,trunca
te,tablecfcreate,tablecfdelete,tablecf
modify,tablecfScan,tableget,tableput,t
ablescan,tablecreate,tableinfo,tablemo
dify,getperm,getpathforfid,hardlink,fi
lescan,fileoffload,filerecall,filetier
jobstatus,filetierjobabort,filetieroff
loadevent,filetierrecallevent",

"disableddataauditoperations":"","
    "acl":[
        {
            "Principal":"User
user7",
            "Allowed
actions":"[r, a, fc]"
        },
        {
            "Principal":"User
user10",
            "Allowed
actions":"[a]"
        }
    ]
}
]
}

```

Now use the other long name parameter to see if you get the same result:

```
/opt/mapr/bin/maprcli security policy
list -sortby policyname -json
{
  "timestamp":1554957411992,
  "timeofday":"2019-04-10
09:36:51.992 GMT-0700 PM",
  "status":"OK",
  "total":2,
  "data":[
    {
      "policyname":"MILITARY",
      "policyid":2,
      "mtime":"Tue Apr 09
06:07:54 PDT 2019",
      "ctime":"Tue Apr 09
04:19:00 PDT 2019",
      "wiresecurity":"1",
      "audited":"0",
      "allowtagging":"1",

      "accesscontrol":"Disarmed",

      "enableddataauditoperations":"getattr,
setattr,chown,chperm,chgrp,getxattr,li
stxattr,setxattr,removexattr,read,writ
e,create,delete,mkdir,readdir,rmdir,cr
eatesym,lookup,rename,createdev,trunca
te,tablecfcreate,tablecfdelete,tablecf
modify,tablecfScan,tableget,tableput,t
ablescan,tablecreate,tableinfo,tablemo
dify,getperm,getpathforfid,hardlink,fi
lescan,fileoffload,filerecall,filetier
jobstatus,filetierjobabort,filetieroff
loadevent,filetierrecallevent",

      "disableddataauditoperations":"",
      "acl":{
        "Principal":"User
root",
          "Allowed
actions":["r, a, fc]"
        },
        "aces":{
          "writeaces":"u:user7
| u:user10"

      "unmaskedreadbace":"u:user7"
        }
      },
      {
        "policyname":"TOPSECRET",
        "policyid":1,
        "mtime":"Mon Apr 08
22:33:52 PDT 2019",
        "ctime":"Mon Apr 08
22:33:52 PDT 2019",
        "wiresecurity":"1",
        "audited":"0",
        "allowtagging":"1",
```

```

        "accesscontrol": "Armed",

        "enableddataauditoperations": "getattr,
setattr, chown, chperm, chgrp, getxattr, li
stxattr, setxattr, removexattr, read, writ
e, create, delete, mkdir, readdir, rmdir, cr
eatesym, lookup, rename, createdev, trunca
te, tablecfcreate, tablecfdelete, tablecf
modify, tablecfScan, tableget, tableput, t
ablescan, tablecreate, tableinfo, tablemo
dify, getperm, getpathforfid, hardlink, fi
lescan, fileoffload, filerecall, filetier
jobstatus, filetierjobabort, filetieroff
loadevent, filetierrecallevent",

        "disableddataauditoperations": "",
        "acl": [
            {
                "Principal": "User
user7",
                "Allowed
actions": "[r, a, fc]"
            },
            {
                "Principal": "User
user10",
                "Allowed
actions": "[a]"
            }
        ]
    ]
}

```

Finally, use the shortname to check if you get the same result:

```

/opt/mapr/bin/maprcli security policy
list -sortby n -json
{
    "timestamp": 1554957425876,
    "timeofday": "2019-04-10
09:37:05.876 GMT-0700 PM",
    "status": "OK",
    "total": 2,
    "data": [
        {
            "policyname": "MILITARY",
            "policyid": 2,
            "mtime": "Tue Apr 09
06:07:54 PDT 2019",
            "ctime": "Tue Apr 09
04:19:00 PDT 2019",
            "wiresecurity": "1",

```

**Example 3**

Display just the name of the policy and the access control state.

#### CLI

```
/opt/mapr/bin/maprcli security
policy list -columns
"policyname,accesscontrol"
accesscontrol  policyname
Armed          TOPSECRET
Disarmed       MILITARY
```

#### REST

```
curl -u mapr:mapr -X GET -k "https://
host:8443/rest/security/policy/list?
&sortby=securitypolicyname&columns=pol
icyname,accesscontrol"
{"timestamp":1554959313985,"timeofday"
:"2019-04-10 10:08:33.985 GMT-0700
PM","status":"OK","total":2,"data":
[{"policyname":"MILITARY","accesscontr
ol":"Disarmed"},
{"policyname":"TOPSECRET","accesscontr
ol":"Armed"}]}
```

### **Example 4**

Use a filter to search for matching policy(ies):

#### CLI

```
/opt/mapr/bin/maprcli security policy
list -filter \[n!="TOP*" \] -json
{
  "timestamp":1554963795805,
  "timeofday":"2019-04-10
11:23:15.805 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "policyname":"TOPSECRET",
      "policyid":1,
      "mtime":"Mon Apr 08
22:33:52 PDT 2019",
      "ctime":"Mon Apr 08
22:33:52 PDT 2019",
      "wiresecurity":"1",
      "audited":"0",
      "allowtagging":"1",
      "accesscontrol":"Armed",

      "enableddataauditoperations":"getattr,

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/security/policy/modify?<parameters>

**Parameters**

You must specify either name or path, but not both.

Parameter	Description
name	The name of this security policy. Security policy names must be unique within the cluster and must contain only alphanumeric characters, hyphen (-) and underscore (_). Other characters like space and commas are not allowed. Maximum length of the security policy name is 32 characters. This parameter is mandatory.
description	An ASCII string that gives a user-readable description of the policy.
cluster	The cluster name on which to run the command. If the cluster name is not supplied, the command is run on the current cluster.
allowtagging	Allows or disallows tagging for the security policy. If set to <code>true</code> , this security policy can be used to tag HPE Ezmeral Data Fabric file system resources. When the security policy is first created, the <code>allowtagging</code> flag is set to <code>false</code> to give the administrator time to configure the security policy, before allowing users to tag HPE Ezmeral Data Fabric resources with this security policy. Default is <code>false</code> .
accesscontrol	Determines whether the relevant <a href="#">ACEs</a> in this security policy are enforced for HPE Ezmeral Data Fabric resources that are tagged with this security policy. The following settings are supported: <ul style="list-style-type: none"> <li>• <b>Armed:</b> When a HPE Ezmeral Data Fabric resource is tagged with this security policy, the relevant <a href="#">ACEs</a> in this security policy are enforced when the resource is accessed. This is the normal operation mode.</li> <li>• <b>Disarmed (default setting):</b> Even if a HPE Ezmeral Data Fabric resource is tagged with this security policy, the <a href="#">ACEs</a> in this security policy are NOT enforced. Use this setting as an emergency switch when an incorrectly configured security policy denies authorized users from accessing resources.</li> <li>• <b>Denied:</b> Access is always denied to any HPE Ezmeral Data Fabric resources tagged with this security policy. Use this setting for security policies that are no longer in use, but are still tagged to some HPE Ezmeral Data Fabric resources. Administrators can look at the audit logs to determine the root cause.</li> </ul>
auditenabled	Specifies whether or not to audit operation on the resource on which the policy is tagged. Set to <code>true</code> to enable auditing, and <code>false</code> to disable auditing. Default: <code>false</code> .

Parameter	Description
dataauditops	<p>The comma separated list of file system operations to include (specified with a preceding plus sign (+)), or exclude (specified with a preceding minus sign (-)) from auditing.</p> <p>To exclude the first operation in the list of operations from auditing, you must precede the operation by two minus (--) signs. You must precede subsequent operations to exclude, by only a single minus (-) sign, irrespective of whether the first operation was included (using a plus (+) sign) or excluded (using two minus (--) signs). If neither sign is specified, the given operation is included for auditing.</p> <p>The operations that can be included (+) or excluded (-) from auditing are listed in <a href="#">Auditing Data Access Operations</a> on page 840. You can, alternatively, group all the operations using the keyword <b>all</b>, which:</p> <ul style="list-style-type: none"> <li>• If included (+), cannot be specified with a list of other included operations.</li> <li>• If excluded (-), cannot be specified with a list of other excluded operations.</li> </ul> <p>All specified operations must either be included or excluded from auditing. You cannot specify a mixed list of included and excluded operations. Other than the specified operations, by default, all other operations are:</p> <ul style="list-style-type: none"> <li>• Included for auditing, if the specified list is a list of excluded operations.</li> <li>• Excluded from auditing, if the specified list is a list of included operations.</li> </ul> <p>Including <code>setattr</code> automatically enables the following operations:</p> <ul style="list-style-type: none"> <li>• <code>chown</code></li> <li>• <code>chgrp</code></li> <li>• <code>chperm</code></li> </ul> <p>If you do nothing with <code>setattr</code> (neither enable nor disable), you can enable or disable <code>chown</code>, <code>chgrp</code>, and <code>chperm</code> in any combination.</p>
disableddataauditops	<p>The comma-separated list of disabled file system audit operations to set. This is an alternate way of setting audit operations from the <code>dataauditops</code> option.</p> <p>No plus (+) or minus signs (-) are allowed for this option.</p> <p>Any audit operations specified with this option replace any existing disabled audit operations configured for this security policy, while any audit operations that are not specified, are enabled.</p> <p>Merging of the specified audit operations with existing audit operations is not done, as compared to the <code>dataauditops</code> option.</p> <p>Excluding <code>setattr</code> automatically disables the following operations:</p> <ul style="list-style-type: none"> <li>• <code>chown</code></li> <li>• <code>chgrp</code></li> <li>• <code>chperm</code></li> </ul> <p>If you do nothing with <code>setattr</code> (neither enable nor disable), you can enable or disable <code>chown</code>, <code>chgrp</code>, and <code>chperm</code> in any combination.</p>
wiresecurityenabled	<p>Determines whether or not to perform wire-level encryption for data of resource on which security is tagged. Set to <code>true</code> to enable wire-level encryption, and <code>false</code> to disable wire-level encryption.</p> <p>Default: <code>true</code></p>

Parameter	Description
readfileace	<p>An <b>ACE</b> that controls who can read from this file. If you do not set an <b>ACE</b>, basic file permissions are used. Files created with basic file permissions have mode 0755. Anyone can read the file contents. To read a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Read permission to the volume</li> <li>• Read permission to the file</li> </ul>
writefileace	<p>An <b>ACE</b> that controls who can write to this file. If you do not set an <b>ACE</b>, basic file permissions are used. Files created with basic file permissions have mode 0755. Only the owner can write to the file. To write to a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Write permission to the volume</li> <li>• Write permission to the file</li> </ul>
executefileace	<p>An <b>ACE</b> that controls who can execute this file. If you do not set an <b>ACE</b>, basic file permissions are used. Files created with basic file permissions have mode 0755. Anyone can execute this file (assuming that the contents are executable). To execute a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Read permission to the volume</li> <li>• Read and execute permissions to the file</li> </ul>
readdirace	<p>Controls who can read the contents of files in this directory. If you do not set an <b>ACE</b>, basic file permissions are used. Directories created with basic file permissions have mode 0755. Anyone can read the contents of files in this directory. To read the contents of a file in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Read permission to the volume</li> <li>• Read permission to the parent directory</li> <li>• Read permission to the file</li> </ul>
addchildace	<p>Controls who can create objects (files and directories) in this directory. If you do not set an <b>ACE</b>, basic file permissions are used. Directories created with basic file permissions have mode 0755. By default, only the owner can create files and directories in this directory. To create files and directories in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Add child permission for the parent directory</li> <li>• Read and execute permissions to all directories in the path</li> <li>• Write permission to the parent directory, and</li> <li>• Write permission to the volume.</li> </ul>

Parameter	Description
deletetechildace	<p>Controls who can delete objects (files and directories) in this directory. If you do not set an <a href="#">ACE</a>, basic file permissions are used. Directories created with basic file permissions have mode 0755. By default, only the owner can delete files and directories in this directory. To delete files and directories in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Delete child permission for the parent directory</li> <li>• Read and execute access to all directories in the path</li> <li>• Write permission to the parent directory</li> <li>• Write permission to the volume</li> </ul>
lookupdirace	<p>Controls who can list the contents (files and directories) of this directory. If you do not set an <a href="#">ACE</a>, basic file permissions are used. Directories created with basic file permissions have mode 0755. Anyone can list the files in this directory. To list the contents of a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Read permission to the directory</li> <li>• Read permission to the volume</li> </ul>
readdbace	<p>The <a href="#">ACE</a> for <i>column reads</i>. Fields within the <i>column family</i> inherit this permission. Default: <code>u:creator</code>.</p> <p>To read fields in <i>JSON DB column families</i> tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Read permission to the DB column family</li> <li>• Read and execute permissions to all directories in the path</li> <li>• Read permission to the volume</li> </ul>
writetdbace	<p>The <a href="#">ACE</a> for <i>column writes</i> (puts and deletes). Fields within the <i>column family</i> inherit this permission. Default: <code>u:creator</code>.</p> <p>To perform column writes, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Write permission to the DB column family</li> <li>• Read and execute permission to all directories in the path</li> <li>• Write permission to the parent directory</li> <li>• Write permission to the volume</li> </ul>

Parameter	Description
traversedbace	<p>DB CF traverse permission settings, which determine the permission to pass over fields in JSON documents. Fields within the <i>column family</i> inherit this permission.</p> <p>Default: <code>u:creator</code>.</p> <p>To traverse fields in <i>JSON DB column families</i> tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> <li>• Traverse permission to the DB column family</li> <li>• Read and execute permissions to all directories in the path</li> <li>• Read permission to the volume</li> </ul>
readaces	A convenience option to set read permissions for all objects. This is equivalent to setting the same <a href="#">ACE</a> for the <code>readfileace</code> , <code>readdirace</code> , <code>lookupdirace</code> , <code>readdbace</code> , and <code>traversedbace</code> options.
writeaces	A convenience option to set write permissions for all objects. This is equivalent to setting the same <a href="#">ACE</a> for <code>writefileace</code> , <code>addchildace</code> , <code>deletetchildace</code> , and <code>writedbace</code> options.
unmaskedreaddbace	This is the ACE for determining whether the users have the <code>unmaskedreadperm</code> permission to enable them to read the masked column data unmasked. These users must also have <code>readdbace</code> permission. The <code>unmaskedreadperm</code> permission will not be automatically set when using the convenience <code>readaces</code> parameter. The <code>unmaskedreadperm</code> permission must be specifically enabled in the security policy by using the <code>unmaskedreaddbace</code> ACE. See <a href="#">Dynamic Data Masking</a> on page 876 for more information.
user	<p>Space separated list of <code>user:permission,permission</code> pairs. Use commas to separate each permission, and spaces to separate each user. For example, to give user <code>tom</code>, <code>admin (a)</code> and full control (<code>fc</code>) permissions, and user <code>jane</code>, <code>admin (a)</code> permission, use <code>-user tom:a,fc jane:a</code></p> <p>If you do not specify this option, a security policy level administrative ACL is added for the administrator who created this security policy to have full privileges by default, that is <code>[r,a,fc]</code>. However, any other user with <code>admin (a)</code> privilege for this security policy can remove this privilege. Specifying this option overwrites the default setting to give security policy level privileges only to the users specified in the <code>-user</code> list.</p> <p>Use this option with care. You MUST specify <code>admin (a)</code> privilege for at least one administrator (for example, <code>-user admin1:r,a,fc</code>) in addition to privileges for any other users, to modify this security policy after creation. Otherwise, if the <code>-user</code> or <code>-group</code> options are specified but without <code>admin (a)</code> or full control (<code>fc</code>) permission, (for example, <code>-user operator:r</code>), no one other than the map administrator can modify the security policy.</p>
group	Space separated list of <code>group:permission,permission</code> pairs. Use commas to separate each permission, and spaces to separate each group. For example, to give group operators <code>read (r)</code> permission, and group <code>secadmin</code> full control ( <code>fc</code> ) permission, use <code>-group operators:r secadmin:a,fc</code>

### ACE Handling Behaviour

Specified [ACE](#) are merged with the existing [ACE](#) for the security policy. For example, assume there is a security policy `hipaa` that currently only has `readfileace` and `writefileace` specified, with all other [ACEs](#) not specified:

ACE Type	ACE Value
readfileace	g:staff
writefileace	g:staff

Use the `maprcli security policy modify` command to set the `writefileace` and `addchildace` ACE:

```
maprcli security policy modify -name hipaa -writefileace g:mapr -addchildace g:admin
```

Here, the value of `readfileace` remains as `g:staff`, `writefileace` is replaced by the new value `g:mapr`, and `addchildace` is added to the list of ACE for this security policy:

ACE Type	ACE Value
readfileace	g:staff
writefileace	g:mapr (overwrites older value)
addchildace	g:admin (new ACE)

### Using the readaces convenience

The following example illustrates how to use the `readaces` convenience feature.

You create a security policy named `hipaa`, and set the `readfileace` and `writefileace` to `u:mapr`:

```
/opt/mapr/bin/maprcli security policy create -name hipaa -readfileace u:mapr -writefileace u:mapr

/opt/mapr/bin/maprcli security policy info -name hipaa -json
{
  "timestamp":1548660146619,
  "timeofday":"2019-01-27 11:22:26.619 GMT-0800 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "name":"hipaa",
      "id":3,
      "mtime":"Sun Jan 27 23:22:08 PST 2019",
      "ctime":"Sun Jan 27 23:22:08 PST 2019",
      "wireEncrypt":true,
      "auditEnabled":false,
      "allowTagging":false,
      "accessControl":"Disarmed",

      "enabled_dataAuditOps":["getattr,setattr,chown,chperm,chgrp,getxattr,listxattr,
      setxattr,removexattr,read,write,create,delete,mkdir,readdir,rmdir,createsy
      m,lookup,rename,createdev,truncate,tablecfcreate,tablecfdelete,tablecfmodify
      ,tablecfScan,tableget,tableput,tablescan,tablecreate,tableinfo,tablemodify,g
      etperm,getpathforfid,hardlink,filesan,fileoffload,filerecall,filetierjobsta
      tus,filetierjobabort,filetieroffloadevent,filetierrecallevnt",
      "disabled_dataAuditOps":"","",
      "acl":{
        "Principal":"User test1",
        "Allowed actions":["r, a, fc]"
      },
      "securityPolicyAces":{
        "readfileace":"u:mapr",
        "writefileace":"u:mapr"
      }
    }
  ]
}
```

```
}
}
]
}
```

You use the `maprcli security policy modify` command to change all the read [ACE](#), using the `readaces` option. `readaces` replaces all read [ACE](#) (`executefileace`, `readfileace`, `lookupdirace`, `readdirace`, `readdbace`, `traversedbace`) with the specified [ACE](#), leaving the write [ACE](#) intact:

```
/opt/mpr/bin/maprcli security policy modify -name hipaa -readaces g:mapr

/opt/mpr/bin/maprcli security policy info -name hipaa -json
{
  "timestamp":1548660250167,

    }
  ]
}
```

## Examples

### CLI

For example, add the `writeaces` [ACE](#) setting to the existing security policy `MILITARY`:

```
/opt/mpr/bin/maprcli security policy
modify -name MILITARY -writeaces
"u:user7|u:user10" -json
```

```
{
  "timestamp":1554814308487,
  "timeofday":"2019-04-09
05:51:48.487 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully updated
security policy 'MILITARY'"
  ]
}
```

**REST**

```
curl -u mapr:mapr -X POST -k "https://
host:8443/rest/security/policy/modify?
name=MILITARY&writeaces=u%3auser7|
u%3auser10"
{"timestamp":1554815274740,"timeofday"
:"2019-04-09 06:07:54.740 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully updated
security policy 'MILITARY'"]}
```

**service list**

Lists all services on the specified node, the memory allocated for each service, the state of each service, and log path for each service.

**Syntax**

**CLI**

```
/opt/mapr/bin/maprcli service list
-node <node name>
[ -cluster <cluster name> ]
[ -zkconnect <ZooKeeper connect
string> ]
[ -output terse|verbose ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/service/list?<parameters>

**Parameters**

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.

Parameter	Description
node	The node for which to list services. Default: localhost. If this is not specified, the <code>/etc/hosts</code> file must include the IP address or hostname for the localhost.
output	Whether the output should be terse or verbose. Default: verbose.
zkconnect	A ZooKeeper connect string, which specifies a list of the hosts running ZooKeeper, and the port to use on each, in the format: ' <code>&lt;host&gt;[:&lt;port&gt;][,&lt;host&gt;[:&lt;port&gt;]...]</code> '. To obtain zookeeper connection strings, use the <code>maprcli node listzookeepers</code> command.

### Output Fields

Field	Description
name	Service name.
state	Current state of the service. See <a href="#">Service States</a> on page 2362.
logpath	Path to the log files for the service.
displayname	Display name of the service in the Control System.

### Service States

The following table lists the service states with their descriptions:

State	Description
0	Not configured. The package for the service is not installed and/or the service is not configured ( <code>configure.sh</code> has not run). This state is also returned for all the services if you run the command without specifying a node.
1	Configured. The package for the service is installed and configured.
2	Running. The service is installed, started by the warden, and is currently running.
3	Stopped. The service is installed and <code>configure.sh</code> has run, but the service is not running.
4	Failed. The service is installed and configured, but not running.
5	Stand by. The service is installed and is in standby mode, waiting to take over in case of failure of another instance.

### Examples

#### CLI Example

The following output is an example of the service information returned when you run the `service list` command without specifying the node:

```
# /opt/mapr/bin/maprcli service list -json
{
  "timestamp":1555048050131,
```

```

"timeofday": "2019-04-11 10:47:30.131 GMT-0700 PM",
"status": "OK",
"total": 10,
"data": [
  {
    "name": "fileserver",
    "state": 0,
    "logpath": "/opt/mapr/logs/mfs.log",
    "displayname": "FileServer"
  },
  {
    "name": "resourcemanager",
    "state": 0,
    "logpath": "/opt/mapr/hadoop/hadoop-2.7.4/logs",
    "displayname": "ResourceManager"
  },
  {
    "name": "filemigrate",
    "state": 0,
    "logpath": "/opt/mapr/filemigrate/filemigrate-1.0.0/logs",
    "displayname": "FileMigrate"
  },
  {
    "name": "cldb",
    "state": 0,
    "logpath": "/opt/mapr/logs/cldb.log",
    "displayname": "CLDB"
  },
  {
    "name": "nfs4",
    "state": 0,
    "logpath": "/opt/mapr/logs/nfs4/nfs4server.log",
    "displayname": "NFS4 Gateway"
  },
  {
    "name": "mastgateway",
    "state": 0,
    "logpath": "/opt/mapr/logs/mastgateway.log",
    "displayname": "MASTGatewayService"
  },
  {
    "name": "nodemanager",
    "state": 0,
    "logpath": "/opt/mapr/hadoop/hadoop-2.7.4/logs",
    "displayname": "NodeManager"
  },
  {
    "name": "gateway",
    "state": 0,
    "logpath": "/opt/mapr/logs/gateway.log",
    "displayname": "GatewayService"
  },
  {
    "name": "hoststats",
    "state": 0,
    "logpath": "/opt/mapr/logs/hoststats.log",
    "displayname": "HostStats"
  },
  {
    "name": "apiserver",
    "state": 0,
    "logpath": "/opt/mapr/apiserver/logs/apiserver.log",
    "displayname": "APIServer"
  }
]

```

```
    }
  ]
}
```

## REST Example

The following output is an example of the service information returned when you issue the `service list` REST API call, without specifying a node:

```
# curl -k -X GET 'https://abc.sj.us:8443/rest/service/list' --user mapr:mapr
{"timestamp":1529380971417,"timeofday":"2018-06-18
09:02:51.417 GMT-0700 PM","status":"OK","total":9,"data":
[{"name":"fileserver","state":0,"logpath":"/opt/
mapr/logs/mfs.log","displayname":"FileServer"},
{"name":"resourcemanager","state":0,"logpath":"/opt/mapr/
hadoop/hadoop-2.7.0/logs","displayname":"ResourceManager"},
{"name":"cldb","state":0,"logpath":"/opt/mapr/logs/
cldb.log","displayname":"CLDB"},{"name":"nfs4","state":0,"logpath":"/opt/
mapr/logs/nfs4/nfs4server.log","displayname":"NFS4
Gateway"},{"name":"mastgateway","state":0,"logpath":"/opt/
mapr/logs/mastgateway.log","displayname":"MASTGatewayService"},
{"name":"nodemanager","state":0,"logpath":"/opt/mapr/
hadoop/hadoop-2.7.0/logs","displayname":"NodeManager"},
{"name":"gateway","state":0,"logpath":"/opt/mapr/
logs/gateway.log","displayname":"GatewayService"},
{"name":"hoststats","state":0,"logpath":"/opt/mapr/
logs/hoststats.log","displayname":"HostStats"},
{"name":"apiserver","state":0,"logpath":"/opt/mapr/apiserver/logs/
apiserver.log","displayname":"APIServer"}]}
```

The following output is an example of the service information returned when you run the `service list` command after specifying a node:

```
/opt/mapr/bin/maprcli service list -node 10.10.82.29 -json
{
  "timestamp":1555049507312,
  "timeofday":"2019-04-11 11:11:47.312 GMT-0700 PM",
  "status":"OK",
  "total":10,
  "data":[
    {
      "name":"fileserver",
      "state":2,
      "memallocated":"8382.0",
      "logpath":"/opt/mapr/logs/mfs.log",
      "displayname":"FileServer"
    },
    {
      "name":"resourcemanager",
      "state":2,
      "memallocated":"2395.0",
      "logpath":"/opt/mapr/hadoop/hadoop-2.7.4/logs",
      "displayname":"ResourceManager"
    },
    {
      "name":"filemigrate",
      "state":4,
      "logpath":"/opt/mapr/filemigrate/filemigrate-1.0.0/logs",
      "displayname":"FileMigrate"
    },
    {
      "name":"cldb",
      "state":2,
      "memallocated":"1916.0",
```

```

    "logpath" : "/opt/mapr/logs/cldb.log" ,
    "displayname" : "CLDB"
  } ,
  {
    "name" : "nfs4" ,
    "state" : 2 ,
    "memallocated" : "2048.0" ,

    "displayname" : "HostStats"
  } ,
  {
    "name" : "apiserver" ,
    "state" : 2 ,
    "memallocated" : "1000.0" ,
    "logpath" : "/opt/mapr/apiserver/logs/apiserver.log" ,
    "displayname" : "APIServer"
  }
]
}

```

## REST Example

The following output is an example of the service information returned when you issue the `service list` REST API call, after specifying a node:

```

curl -k -X GET 'https://abc.sj.us:8443/rest/service/list' --user mapr:mapr
{"timestamp":1529380971417,"timeofday":"2018-06-18
09:02:51.417 GMT-0700 PM","status":"OK","total":9,"data":
[{"name":"fileserver","state":0,"logpath":"/opt/
mapr/logs/mfs.log","displayname":"FileServer"},
{"name":"resourcemanager","state":0,"logpath":"/opt/mapr/
hadoop/hadoop-2.7.0/logs","displayname":"ResourceManager"},
{"name":"cldb","state":0,"logpath":"/opt/mapr/logs/
cldb.log","displayname":"CLDB"},{"name":"nfs4","state":0,"logpath":"/opt/
mapr/logs/nfs4/nfs4server.log","displayname":"NFS4

```

```
Gateway"} , {"name": "mastgateway", "state": 0, "logpath": "/opt/
mapr/logs/mastgateway.log", "displayname": "MASTGatewayService"},
{"name": "nodemanager", "state": 0, "logpath": "/opt/mapr/
hadoop/hadoop-2.7.0/logs", "displayname": "NodeManager"},
{"name": "gateway", "state": 0, "logpath": "/opt/mapr/
logs/gateway.log", "displayname": "GatewayService"},
{"name": "hoststats", "state": 0, "logpath": "/opt/mapr/
logs/hoststats.log", "displayname": "HostStats"},
{"name": "apiserver", "state": 0, "logpath": "/opt/mapr/apiserver/logs/
apiserver.log", "displayname": "APIServer"}]}
```

**NOTE:** When you configure high availability for the ResourceManager, the status of the standby ResourceManager service differs based on the selected failover implementation. When the cluster uses manual or automatic failover for the ResourceManager, standby ResourceManagers have a state equal to 2 (running). When the cluster uses zero configuration failover for the ResourceManager, standby ResourceManagers have a state equal to 5 (stand by).

### setloglevel

Sets log level on individual services.

### setloglevel cldb

Sets the log level on the CLDB service. Permissions required: fc or a.

### Syntax

#### CLI

```
maprcli setloglevel cldb
  -classname <class>
  -loglevel DEBUG|ERROR|FATAL|INFO|
TRACE|WARN
  -node <node>
  -port <port>
```

#### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/setloglevel/cldb?<parameters>

### Parameters

Parameter	Description
classname	The name of the class for which to set the log level. The class can be at the package level or a specific class. Contact MapR Support for this parameter.

Parameter	Description
loglevel	The log level to set. Default: INFO <ul style="list-style-type: none"> <li>• DEBUG</li> <li>• ERROR</li> <li>• FATAL</li> <li>• INFO</li> <li>• TRACE</li> <li>• WARN</li> </ul>
node	The node on which to set the log level.
port	The CLDB port. Default: 7222

## Examples

### CLI

```
maprcli setloglevel cldb
  -classname
  com.mapr.fs.cldb.CLDBServer
  -loglevel debug
  -node abc.sj.us
```

### REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/setloglevel/cldb?
classname=com.mapr.fs.cldb.CLDBServer&
loglevel=debug&node=abc.sj.us' --user
mapr:mapr
{"timestamp":1529380341288,"timeofday"
:"2018-06-18 08:52:21.288 GMT-0700
PM","status":"OK","total":0,"data":[]}
```

## setloglevel fileserver

Sets the log level on the FileServer service. Permissions required: fc or a.

## Syntax

### CLI

```
maprcli setloglevel fileserver
  -classname <class>
  -loglevel DEBUG|ERROR|FATAL|INFO|
TRACE|WARN
  -node <node>
  -port <port>
```

### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/setloglevel/fileserver?<parameters>

## Parameters

Parameter	Description
<code>classname</code>	The name of the class for which to set the log level. The classname is listed under the <code>maprcli trace info</code> command. Contact HPE Support for this parameter.
<code>loglevel</code>	The log level to set. Default: INFO <ul style="list-style-type: none"> <li>• DEBUG</li> <li>• ERROR</li> <li>• FATAL</li> <li>• INFO</li> <li>• TRACE</li> <li>• WARN</li> </ul>
<code>node</code>	The node on which to set the log level.
<code>port</code>	The file system port. Default: 5660

## Examples

### CLI

```
maprcli setloglevel fileserver
  -classname FileServer
  -loglevel debug
  -node centos26.lab
```

### REST

```
https://server.sj.us:8443/rest/
setloglevel/fileserver?
classname=FileServer&loglevel=debug&no
de=centos26.lab
```

### setloglevel hbmaster

Sets the log level on the HBase Master service. Permissions required: `fc` or `a`.

## Syntax

### CLI

```
maprcli setloglevel hbmaster
  -classname <class>
  -loglevel DEBUG|ERROR|FATAL|INFO|
TRACE|WARN
  -node <node>
  -port <port>
```

### REST

```
http[s]://<host>:<port>/rest/
setloglevel/hbmaster?<parameters>
```

## Parameters

Parameter	Description
<b>classname</b>	The name of the class for which to set the log level. The class can be specified at the package level or for a specific class. Contact HPE Support for this parameter.
<b>loglevel</b>	The log level to set. Default: INFO <ul style="list-style-type: none"> <li>• DEBUG</li> <li>• ERROR</li> <li>• FATAL</li> <li>• INFO</li> <li>• TRACE</li> <li>• WARN</li> </ul>
<b>node</b>	The node on which to set the log level.
<b>port</b>	The HBase Master webserver port. Default: 16000 (16010 for the WebUI)

## Examples

### CLI

```
maprcli setloglevel hbmaster
  -classname
  org.apache.hadoop.hbase.master
  -loglevel debug
  -node centos26.lab
  -port 16000
```

### REST

```
https://centos26.lab:8443/rest/
setloglevel/hbmaster?
classname=org.apache.hadoop.hbase.mast
er&loglevel=debug&node=centos26.lab&po
rt=16000
```

### setloglevel hbregionserver

Sets the log level on the HBase RegionServer service. Permissions required: `fc` or `a`.

## Syntax

### CLI

```
maprcli setloglevel hbregionserver
  -classname <class>
  -loglevel DEBUG|ERROR|FATAL|INFO|
TRACE|WARN
  -node <node>
  -port <port>
```

**REST**

```
http[s]://<host>:<port>/rest/
setloglevel/hbregionserver?
<parameters>
```

**Parameters**

Parameter	Description
<b>classname</b>	The name of the class for which to set the log level. The class can be specified at the package level or for a specific class. Contact HPE Support for this parameter.
<b>loglevel</b>	The log level to set. Default: INFO <ul style="list-style-type: none"> <li>• DEBUG</li> <li>• ERROR</li> <li>• FATAL</li> <li>• INFO</li> <li>• TRACE</li> <li>• WARN</li> </ul>
<b>node</b>	The node on which to set the log level.
<b>port</b>	The HBase Region Server webserver port. Default: 16020 (16030 for the WebUI)

**Examples****CLI**

```
maprcli setloglevel hbregionserver
-classname
org.apache.hadoop.hbase.regionserver
-loglevel debug
-node centos26.lab
-port 16020
```

**REST**

```
https://centos26.lab:8443/rest/
setloglevel/hbregionserver?
classname=org.apache.hadoop.hbase.regi
onserver&loglevel=debug&node=centos26.
lab&port=16020
```

**setloglevel nfs**

Sets the log level on the NFS service. Permissions required: fc or a.

**Syntax****CLI**

```
maprcli setloglevel nfs
-classname <class>
-loglevel DEBUG|ERROR|FATAL|INFO|
TRACE|WARN
```

```
-node <node>
-port <port>
-isusermode <TRUE|FALSE>
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/setloglevel/nfs?<parameters>

**Parameters**

Parameter	Description
classname	The name of the class for which to set the log level. The classname is listed under the <code>maprcli trace info</code> command. Contact HPE Support for this parameter.
loglevel	The log level to set. Default: INFO <ul style="list-style-type: none"> <li>• DEBUG</li> <li>• ERROR</li> <li>• FATAL</li> <li>• INFO</li> <li>• TRACE</li> <li>• WARN</li> </ul>
node	The node on which to set the log level.
port	The NFS port. Default: 9998
isusermode	Whether or not is the request is for user mode.

**Examples**

**CLI**

```
maprcli setloglevel nfs
-classname NFSD
-loglevel debug
-node centos26.lab
```

**REST**

```
https://server.sj.us:8443/rest/setloglevel/nfs?classname=NFSD&loglevel=debug&node=centos26.lab
```

**stream**

Manages stream functionality.

**stream assign list**

For the given stream, lists consumers and the topics and partitions that the consumers are reading messages from.

### Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the path
- `adminperm`, `consumeperm`, `produceperm`, or `topicperm` permission on the stream

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Syntax

<b>CLI</b>	<pre>maprcli stream assign list   -path &lt;Stream Path &gt;   [ -consumergroup &lt;Consumer Group ID&gt; ]   [ -topic &lt;Topic Name&gt; ]   [ -partition &lt;Partition ID&gt; ]   [ -detail &lt;Detail Parameter takes no value&gt; ]</pre>
<b>REST</b>	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/assign/list?path=&lt;path&gt;</code>

### Parameters

Parameter	Description
<code>path</code>	The path and name of the stream.
<code>consumergroup</code>	Specifies the ID of a particular consumer group that you want to list the consumers for.
<code>topic</code>	The name of a topic to list the consumers for. If you also specify the <code>-partition</code> parameter, only the consumers that are reading from the indicated partition are listed.
<code>partition</code>	The ID of a specific partition. If you specify this ID, you must also use the <code>-topic</code> parameter.
<code>detail</code>	Includes the values of additional parameters in the output. These parameters are used internally.

### Sample Output

With the `-detail` parameter:

```
# maprcli stream assign list -path /s1 -json -detail
{
  "timestamp":1441965109585,
  "timeofday":"2015-09-11 02:51:49.585 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    {
      "consumergroup":"xyzt1",
      "topic":"topic1",
      "assignseqnum":1,
      "consumerguid":"F3693413-2600-0876-CC91-052FA4F25500",
      "consumer":"ravindra.perf",
      "consumerip":"10.10.30.200",
```

```

        "consumerpid": "30768",
        "assignment": "0,1,2,3"
    }
]
}

```

Without the `-detail` parameter:

```

# maprcli stream assign list -path /s1 -json
{
  "timestamp": 1441965116100,
  "timeofday": "2015-09-11 02:51:56.100 GMT-0700",
  "status": "OK",
  "total": 1,
  "data": [
    {
      "consumergroup": "xyzt1",
      "topic": "topic1",
      "consumer": "ravindra.perf",
      "consumerip": "10.10.30.200",
      "consumerpid": "30768",
      "assignment": "0,1,2,3"
    }
  ]
}

```

## Field Descriptions

<b>consumergroup</b>	The name of the consumer group that is reading messages from this topic partition.
<b>topic</b>	The name of the topic.
<b>assignseqnum</b>	The sequence number of the current assignment of this partition. This value is used internally.
<b>consumerguid</b>	The globally unique identifier for the consumer. This value is used internally.
<b>consumer</b>	The ID of the consumer. This value is set with the <code>client.id</code> configuration parameter.
<b>consumerip</b>	The IP address of the consumer.
<b>consumerpid</b>	The process ID of the consumer.
<b>assignment</b>	The index numbers of the partitions that are assigned to this consumer.

### **stream create**

Creates a new stream.

After you create a stream, you can edit the values of its parameters with the command `maprcli stream edit`.

To see the value of a stream's parameters, use the command `maprcli stream info`.

To run this command, your user ID must have write permission on the directory in which you want to create a stream.

### **Permissions Required**

To run this command, your user ID must have the following permissions:

- readAce and writeAce on the volume

- lookupdir on directories in the path

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Syntax

CLI	<pre>maprcli stream create   -path &lt;Stream Path&gt;   [ -ttl &lt;Time to live in second&gt; default:604800 ]   [ -autocreate &lt;Auto create topics&gt; default:true ]   [ -defaultpartitions &lt;Default partitions per topic&gt; default:1 ]   [ -compression off lz4 lzf zlib. default: inherit from parent   directory ]   [ -produceperm &lt;Producer access control expression&gt; default   u:creator ]   [ -consumeperm &lt;Consumer access control expression&gt; default   u:creator ]   [ -topicperm &lt;Topic CRUD access control expression&gt; default   u:creator ]   [ -copyperm &lt;Stream copy access control expression&gt; default   u:creator ]   [ -adminperm &lt;Stream administration access control expression&gt;   default u:creator ]   [ -copymetafrom &lt;Stream to copy attributes from&gt; default:none ]   [ -ischangelog &lt;true false&gt; default: false ]   [ -defaulttimestamp type timestamp type: createtime     logapptime. default: createtime ]   [ -pidexpirysecs &lt;Producer ID expiry time in seconds. Default:   6048000&gt; ]   [ -mincompactionlag &lt;Set time in milliseconds for which a   message remains uncompactd. Default: 0&gt; ]   [ -deleteretention &lt;Set the time in milliseconds for which   delete records are retained.   Default: 86400000&gt; ]</pre>
REST	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/create?path=&lt;path&gt;</code>

### Parameters

Parameter	Description
path	<p>The path and name of the stream to create.</p> <p>The path to the stream can include any character allowed by Data Fabric. For example, <code>/my/path/with:/to/mystream</code> is valid, but <code>/my/path/with:/to/mystream:withcolon</code> is invalid.</p> <p>The name of the stream cannot include a colon (:) or a forward slash (/).</p>

Parameter	Description
ttl	<p>Specifies the number of seconds to elapse between the publication of a message in a topic in this stream and the expiration of that message.</p> <p>Consumers do not see messages that have expired.</p> <p>Messages that have expired are deleted during the next purge process. See <a href="#">Time-to-Live for Messages</a> for details.</p> <p>A value of 0 causes messages to be retained indefinitely.</p>
autocreate	<p>Specifies whether to create a topic automatically when a producer tries to write the first message to it. Values are <code>true</code> and <code>false</code>. The default is <code>true</code>.</p>
defaultpartitions	<p>Specifies the default number of partitions to allocate to new topics in the stream.</p>
compression	<p>Specifies the compression setting to use for the stream. Producer client libraries can bundle messages that are to be published on the same partition and compress them. The messages are sent to the server compressed, are stored compressed, are replicated to other containers compressed, and (if stream replication is configured) replicated to replica streams compressed. Consumer client libraries receive compressed data, decompresses it, and passes it to client applications.</p> <p>Valid options are <code>off</code>, <code>lzf</code>, <code>lz4</code>, and <code>zlib</code>. The default setting is the type of compression that is set for the directory in which the stream is located.</p> <p>For more information, see <a href="#">Compression</a>.</p>
produceperm	<p>Specifies the access-control expression that controls who can publish messages to topics in the stream. See <a href="#">ACE Syntax</a>.</p>
consumeperm	<p>Specifies the access-control expression that controls who can who can listen to topics in the stream. See <a href="#">ACE Syntax</a>.</p>
topicperm	<p>Specifies the access-control expression that controls who can create, edit, or remove topics in the stream. See <a href="#">ACE Syntax</a>.</p>
copyperm	<p>Specifies the access-control expression that controls who can use <code>mapr copystream</code> or <code>mapr diffstreams</code> on the stream. See <a href="#">ACE Syntax</a>.</p>
adminperm	<p>Determines which users can modify ACEs for a stream, set up replication of a stream, and modify other attributes of a stream. By default, the stream owner and the <a href="#">Data Fabric user</a> can modify this setting. See <a href="#">ACE Syntax</a>.</p> <p>This permission includes the <code>topicperm</code> permission.</p>
copymetafrom	<p>If you plan to replicate messages to this stream from another stream, specify the path to that other stream. The metadata from that stream will be copied to the new stream when the new stream is created.</p>

Parameter	Description
ischangelog	<p>Specifies whether the stream is for the Change Data Capture feature's changed data records. Value: true false. Default: false.</p> <ul style="list-style-type: none"> <li>If you want to use a non-default partition value (Default: 1) for the topic, use the <code>maprcli stream create -path &lt;/mypath/stream:topic&gt; -ischangelog true -defaultpartitions &lt; value other than 1 &gt;</code> command to create the stream and then create the topic with the <code>maprcli streams topic create</code> command.</li> <li>If you want to use the default partitions value (1) for the Change Data Capture feature, use the <code>maprcli stream create -path &lt;/mypath/stream&gt; -ischangelog true</code> command to create the stream and then use the <code>maprcli table changelog add -path &lt;mypath/stream:topic&gt;</code> command to set up the Change Data Capture feature and create the topic.</li> </ul>
defaulttimestamptype	<p>Specifies the type of timestamp stored in the topic's message. Value: createtime   logappendtime Default: createtime. The topic inherits the default value from the stream unless the topic sets the timestamp type to a different value.</p> <p>A <code>createtime</code> value is the time defined by the user or application (when creating the message). If user or application does not define this value (or passes null), the client uses the current system timestamp.</p> <p>A <code>logappendtime</code> value is the time when the message (log) was appended to the server.</p>
pidexpirysecs	<p>Specifies the expiration time for the Producer ID. This parameter fixes the lifetime for the Producer ID. Default: 604800</p>
mincompactionlag	<p>Sets the <b>minimum</b> delay (in milliseconds) before which messages are <b>not</b> compacted. It is the <b>minimum</b> time that the messages are available for consumption. Beyond this time period, the messages <b>may</b> be compacted. Default: 0</p> <p>The lag is calculated from the time that a message was produced to the stream topic-partition.</p> <p> <b>NOTE:</b> Compaction is set only when you edit the stream. See <a href="#">stream edit</a> on page 2380.</p>
deleteretention	<p>Sets the <b>minimum</b> time (in milliseconds) before which deleted records are removed. It is the <b>minimum</b> time that the deleted records are still available. Beyond this time period, the deleted messages <b>may</b> be removed. Default: 86400000</p> <p>Used with log compaction.</p>

**stream cursor delete**

Deletes committed cursors that are in the partitions in a stream.

 **NOTE:** Deleting the committed cursors for active consumers has no effect on the consumers. Consumers use read cursors to keep track of where they currently are in partitions.

For example, the consumer `consumer1` continues reading the messages in a partition from the position of the consumer's read cursor even after the consumer's committed cursor is deleted. However, if `consumer1` goes offline and the partition is reassigned to another consumer (`consumer2`) in the same consumer group before `consumer1` creates another committed cursor, `consumer2` starts reading the partition at the most recent message.

### Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` or `consumeperm` permission on the stream

 **NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Syntax

<b>CLI</b>	<pre>maprcli stream cursor delete   -path &lt;Stream Path&gt;   [ -consumergroup &lt;Consumer Group ID&gt; ]   [ -topic &lt;Topic Name&gt; ]   [ -partition &lt;Partition ID&gt; ]</pre>
<b>REST</b>	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/cursor/delete?path=&lt;path&gt;</code>

### Parameters

Parameter	Description
<code>path</code>	The path and name of the stream in which the committed cursors are located.
<code>consumergroup</code>	Specifies the ID of a particular consumer group that you want to delete the committed cursors for.
<code>topic</code>	The name of a topic to delete committed cursors from. If you also specify the <code>-partition</code> parameter, only the committed cursors in the indicated partition are deleted.
<code>partition</code>	The ID of the partition where the committed cursors that you want to delete is located. If you specify this ID, you must also use the <code>-topic</code> parameter.

#### `stream cursor list`

Lists the cursors for the consumers of a stream.

### Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume

- `lookupdir` on directories in the path
- `adminperm`, `consumeperm`, `produceperm`, or `topicperm` permission on the stream

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Syntax

<b>CLI</b>	<pre>maprcli stream cursor list   -path &lt;Stream Path&gt;   [ -consumergroup &lt;Consumer Group ID&gt; ]   [ -topic &lt;Topic Name&gt; ]   [ -partition &lt;Partition ID&gt; ]</pre>
<b>REST</b>	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/cursor/list?path=&lt;path&gt;</code>

### Parameters

Parameter	Description
<code>path</code>	The path and name of the stream in which the cursors are located.
<code>consumergroup</code>	Specifies the ID of a particular consumer group that you want to list the cursors for.
<code>topic</code>	The name of a topic to list committed cursors from. If you also specify the <code>-partition</code> parameter, only the committed cursors in the indicated partition are listed.
<code>partition</code>	The ID of the partition where the particular cursor that you want to list is located. If you specify this ID, you must also use the <code>-topic</code> parameter.

### Sample Output

```
# maprcli stream cursor list -path /s1 -topic topic0 -json
{
  "timestamp":1441883091373,
  "timeofday":"2015-09-10 04:04:51.373 GMT-0700",
  "status":"OK",
  "total":4,
  "data":[
    {

        "consumertimestamp": "2015-09-10T03:48:07.769-0700",
        "consumerlagmillis": "6313"
    },
]
}

```

## Field Descriptions

<b>consumergroup</b>	The ID of the consumer group to which belongs the consumer that owns the committed cursor.
<b>committedoffset</b>	The last offset that was committed by the consumer that is reading from the listed partition and that belongs to the listed consumer group.
<b>consumerlagmillis</b>	The difference in milliseconds between the timestamp of the last published message and the timestamp of the last message consumed by the consumer.
<b>consumertimestamp</b>	The timestamp of the most recent message that the consumer has consumed.
<b>partitionid</b>	The index number of the partition within the topic. The first partition in a topic has an index of 0, the next partition an index of 1, and so on.
<b>produceroffset</b>	The maximum offset produced for this partition.
<b>topic</b>	The name of the topic that the cursor corresponds to.
<b>stream delete</b>	Deletes the specified stream. Deleted streams cannot be recovered unless they were previously replicated. Producers are no longer able to publish messages to topics in the stream, and consumers are no longer able to read messages from topics in the stream.

## Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Syntax

CLI	<pre>maprcli stream delete -path &lt;Stream Path&gt;</pre>
REST	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/delete?path=&lt;path&gt;</code>

### Parameters

Parameter	Description
<code>path</code>	The path and name of the stream to delete.

#### **stream edit**

Edits the values of parameters for the specified stream.

#### **Permissions Required**

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` permission on the stream

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax**

CLI	<pre> maprcli stream edit   -path Stream Path   [ -ttl &lt;Time to live in seconds&gt; ]   [ -autocreate true false ]   [ -defaultpartitions &lt;Default partitions per topic&gt; ]   [ -compression off lz4 lzf zlib ]   [ -produceperm &lt;Producer access control expression&gt; default u:creator ]   [ -consumeperm &lt;Consumer access control expression&gt; default u:creator ]   [ -topicperm &lt;Topic CRUD access control expression&gt; default u:creator ]   [ -copyperm &lt;Stream copy access control expression&gt; default u:creator ]   [ -adminperm &lt;Stream administration access control expression&gt; default u:creator ]   [ -defaulttimestamptype timestamp type: createtime   logappendtime. default: createtime ]   [ -compact &lt;Sets log compaction for a stream. Value: true   false default: false&gt; ]   [ -pidexpirysecs &lt;Producer ID expiry time in seconds. Default: 604800&gt; ]   [ -mincompactionlag &lt;Sets time in milliseconds for which a message remains uncompactd. default: 0&gt; ]   [ -deleteretention &lt;Sets the time in milliseconds for which delete records are retained. Default: 86400000&gt; ]   [ -force &lt;When used with -compact, forces enabling log compaction on a stream. Parameter takes no value.&gt; ] </pre>
REST	http[s]://<host>:<port>/rest/stream/edit?path=<path>

**Parameters**

Parameter	Description
path	The path and name of the stream to create.
ttl	<p>Specifies the number of seconds to elapse between the publication of a message in a topic in this stream and the expiration of that message.</p> <p>Consumers do not see messages that have expired.</p> <p>Messages that have expired are deleted during the next purge process. See <a href="#">Time-to-Live for Messages</a> for details.</p> <p>A value of 0 causes messages to be retained indefinitely.</p>
autocreate	Specifies whether to create a topic automatically when a producer tries to write the first message to it. Values are <code>true</code> and <code>false</code> . The default is <code>true</code> .
defaultpartitions	Specifies the default number of partitions to allocate to new topics in the stream.

Parameter	Description
compression	<p>Specifies the compression setting to use for the stream. Producer client libraries can bundle messages that are to be published on the same partition and compress them. The messages are sent to the server compressed, are stored compressed, are replicated to other containers compressed, and (if stream replication is configured) replicated to replica streams compressed. Consumer client libraries receive compressed data, decompresses it, and passes it to client applications.</p> <p>Valid options are <code>off</code>, <code>lzf</code>, <code>lz4</code>, and <code>zlib</code>. The default setting is the type of compression that is set for the directory in which the stream is located.</p> <p>For more information, see <a href="#">Compression</a>.</p>
produceperm	Specifies the access-control expression that controls who can publish messages to topics in the stream. See <a href="#">ACE Syntax</a> .
consumeperm	Specifies the access-control expression that controls who can who can listen to topics in the stream. See <a href="#">ACE Syntax</a> .
topicperm	Specifies the access-control expression that controls who can create, edit, or remove topics in the stream. See <a href="#">ACE Syntax</a> .
copyperm	Specifies the access-control expression that controls who can use <code>mapr copystream</code> or <code>mapr diffstreams</code> on the stream. See <a href="#">ACE Syntax</a> .
adminperm	<p>Determines which users can modify ACEs for a stream, set up replication of a stream, and modify other attributes of a stream. By default, the stream owner and the <a href="#">Data Fabric user</a> can modify this setting. See <a href="#">ACE Syntax</a>.</p> <p>This permission includes the <code>topicperm</code> permission.</p>
defaulttimestamptype	<p>Specifies the type of timestamp stored in the topic's message. Value: <code>createtime</code>   <code>logappendtime</code> Default: <code>createtime</code>. The topic inherits the default value from the stream unless the topic sets the timestamp type to a different value.</p> <p>A <code>createtime</code> value is the time defined by the user or application (when creating the message). If user or application does not define this value (or passes null), the client uses the current system timestamp.</p> <p>A <code>logappendtime</code> value is the time when the message (log) was appended to the server.</p>
pidexpirysecs	Specifies the expiration time for the Producer ID. This parameter fixes the lifetime for the Producer ID. Default: 604800
compact	<p>Sets log compaction for stream. When set to true, enables log compaction. When set to false, disables log compaction.</p> <p>Value: <code>true</code> <code>false</code> Default: <code>false</code></p> <p> <b>NOTE:</b> A license is required to run the <code>-compact</code> option; otherwise, the command hangs. See <a href="#">Adding a License</a> on page 1071.</p>
mincompactionlag	<p>Sets the <b>minimum</b> delay (in milliseconds) before which messages are <b>not</b> compacted. It is the <b>minimum</b> time that the messages are available for consumption. Beyond this time period, the messages <b>may</b> be compacted. Default: 0</p> <p>The lag is calculated from the time that a message was produced to the stream topic-partition.</p>
deleteretention	<p>Sets the <b>minimum</b> time (in milliseconds) before which deleted records are removed. It is the <b>minimum</b> time that the deleted records are still available. Beyond this time period, the deleted messages <b>may</b> be removed. Default: 86400000</p>

Parameter	Description
force	Used with the <code>-compact</code> parameter to force log compaction on a stream parameter. No values are passed. Used for backward compatibility.

**stream info**

Displays the values of the parameters of the specified stream.

**Permissions Required**

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the path
- `adminperm`

When a user with this permission runs the command, the output includes the access-control expressions for the `adminperm` and `topicperm` permissions.
- `produceperm, consumeperm, or topicperm`

When a user with one of these permissions runs the command, the output does not include any access-control expressions.

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax**

CLI	<code>maprcli stream info -path &lt;Stream Path&gt;</code>
REST	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/info?path=&lt;path&gt;</code>

**Parameters**

Parameter	Description
path	The path and name of the stream that you want to see information about.

**Sample Output**

```
maprcli stream info -path /streamVol/stream1 -json
{
  "timestamp":1521233326943,
  "timeofday":"2018-03-16 01:48:46.943 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "path":"/streamVol/stream1",
      "physicalsize":57344,
      "logicalsize":32768,
      "numtopics":1,
      "defaultpartitions":1,
      "ttl":604800,
      "compression":"lz4",
      "autocreate":true,
```

```

        "produceperm": "u:root",
        "consumeperm": "u:root",
        "topicperm": "u:root",
        "copyperm": "u:root",
        "adminperm": "u:root",
        "ischangelog": false,
        "timestamptype": "createtime"
    }
]
}

```

**stream purge**

Runs the purge process, removing messages that are marked for deletion and reclaiming disk space.

For information about the purge process, see [Time-to-Live for Messages](#).

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Permissions Required**

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- `adminperm` permission on the stream

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax**

CLI	<pre>maprcli stream purge -path &lt;Stream Path&gt;</pre>
REST	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/purge?path=&lt;path&gt;</code>

**Parameters**

Parameter	Description
<code>path</code>	The path and name of the stream to reclaim disk space from.

**stream replica add**

Registers an existing stream as a replica of the specified stream.

**NOTE:** A license is required to run this command. Running this command without a license can cause the command to hang. See [Adding a License](#) on page 1071.

**Permissions Required at the Source Cluster**

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume

- `lookupdir` on directories in the path
- `adminperm` and `copyperm` permissions on the source stream

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Permissions Required at the Target Cluster**

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path

**Syntax**

CLI	<pre>maprcli stream replica add   -path &lt;stream path&gt;   -replica &lt;remote stream path&gt;   [ -paused &lt;start replication in paused state&gt; default: false ]   [ -throttle &lt;throttle replication operations under load&gt; default: false ]   [ -networkencryption &lt;enable on-wire encryption&gt; default: false ]   [ -synchronous &lt;replicate to remote stream before acknowledging producers&gt; default: false ]   [ -networkcompression &lt;on-wire compression type: off lz4 lzf zlib&gt; default: compression setting on stream ]</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/replica/add? path=&lt;path&gt;&amp;replica=&lt;name&gt;</pre>

**Parameters**

Parameter	Description
<code>path</code>	The path and name of the stream that you want to create a replica for.
<code>replica</code>	The path and name of the stream that you want to create as a replica of the stream that you specified with the <code>-path</code> parameter.

Parameter	Description
paused	<p>A boolean value that specifies whether to pause the replication so that it does not start immediately. The replication can be resumed using the replica resume command at a later time. The values are <code>true</code> or <code>false</code>. The default is <code>false</code>.</p> <p>Set <code>-paused</code> to <code>true</code> if you want to run <code>mapr copystream</code> to load the replica stream before starting replication. If it is not paused, replication starts immediately after you run the commands <code>maprcli stream replica add</code> and <code>maprcli stream upstream add</code>, in which case the replica stream starts empty and accumulates messages over time. If you are interested only in the messages that are published to the source stream after replication starts, then you do not need to pause replication initially. However, if you want the full set of messages from the source stream that have not yet been purged or marked for deletion, then pause replication initially.</p>
throttle	<p>A boolean value that specifies whether to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The values are <code>true</code> or <code>false</code>. The default is <code>false</code>.</p> <p>Throttling has two effects, both of which allow HPE Ezmeral Data Fabric Streams to use more system resources to process new messages:</p> <ul style="list-style-type: none"> <li>• Throttling slows down the rate at which changes to a stream are replicated.</li> <li>• Throttling slows down the rate at which messages to be replicated are read from disk.</li> </ul>
networkencryption	<p>A boolean value that specifies whether or not to enable on-wire encryption. The values are <code>true</code> or <code>false</code>. The default is <code>false</code>. If you set the value to <code>true</code>, the local cluster and any other cluster that is part of the replication process must be enabled for security.</p>
synchronous	<p>A boolean value that specifies whether replication is synchronous or asynchronous. The values are <code>true</code> or <code>false</code>. The default is <code>false</code> and specifies asynchronous replication.</p>
networkcompression	<p>Specifies the type of compression to use when replicating messages. For more information, see <a href="#">Managing Compression</a>.</p>

#### **stream replica autoseup**

Sets up and starts replication between a source stream and replica stream.

The `maprcli stream replica autoseup` command performs the following steps to set up replication:

1. Creates a stream in the destination cluster.
2. Declares the new stream to be a replica of the source stream and ensures that replication does not begin immediately after the next step.
3. Declares the source stream as the original of the replica stream.

4. Runs the `mapr costream` utility to load a copy of the source data into the replica.
5. For multi-master replication, it declares the source stream to be a replica of the new stream and then declares the new stream to be an upstream source for the source stream.
6. Clears the paused replication state to start replication.

For more information about the automatic setup process, see [Replica Autosetup for Streams](#) on page 790.

**NOTE:** Before you set up replication for a stream, verify that the cluster is setup for replication. For more information, see [Preparing Clusters for Stream Replication](#) on page 1495.

### Permissions Required at the Source Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` and `copyperm` permissions on the source stream

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Permissions Required at the Target Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path

### Syntax

CLI	<pre>maprcli stream replica autosetup   -path &lt;stream path&gt;   -replica &lt;remote stream path&gt;   [ -synchronous &lt;replicate to remote stream before acknowledging   producers&gt; default: false ]   [ -multimaster &lt;set up bi-directional replication&gt; default: false ]   [ -throttle &lt;throttle replication operations under load&gt; default:   false ]   [ -networkencryption &lt;enable on-wire encryption&gt; default: false ]   [ -networkcompression &lt;on-wire compression type: off lz4 lzf zlib&gt;   default: compression setting on stream ]   [ -directcopy enable directcopy. default: true ]   [ -useexistingreplica use existing replica table if present.   default: false ]</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/replica/autosetup? path=&lt;path&gt;&amp;replica=&lt;name&gt;</pre>

**Parameters**

Parameter	Description
<code>path</code>	The path and name of the stream that you want to create a replica for.
<code>replica</code>	The path and name of the stream that you want to create as a replica of the stream that you specified with the <code>-path</code> parameter.
<code>synchronous</code>	A boolean value that specifies whether replication is synchronous or asynchronous. The values are <code>true</code> or <code>false</code> . The default is <code>false</code> and specifies asynchronous replication.
<code>multimaster</code>	A boolean value that specifies whether or not to set up a multi-master topology. The values are <code>true</code> or <code>false</code> . The default is <code>false</code> and specifies to use the basic primary-secondary topology, rather than the multi-master topology.
<code>throttle</code>	<p>A boolean value that specifies whether to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The values are <code>true</code> or <code>false</code>. The default is <code>false</code>.</p> <p>Throttling has two effects, both of which allow HPE Ezmeral Data Fabric Streams to use more system resources to process new messages:</p> <ul style="list-style-type: none"> <li>• Throttling slows down the rate at which changes to a stream are replicated.</li> <li>• Throttling slows down the rate at which messages to be replicated are read from disk.</li> </ul>
<code>networkencryption</code>	A boolean value that specifies whether or not to enable on-wire encryption. The values are <code>true</code> or <code>false</code> . The default is <code>false</code> . If you set the value to <code>true</code> , the local cluster and any other cluster that is part of the replication process must be enabled for security.
<code>networkcompression</code>	Specifies the type of compression to use when replicating messages. For more information, see <a href="#">Managing Compression</a> .
<code>directcopy</code>	A Boolean value that specifies whether or not autoseup will use the <code>directcopy</code> option. The values are <code>true</code> or <code>false</code> . Autoseup with <code>direct copy</code> ( <code>true</code> ) is the default. If you set this parameter to <code>false</code> , the cluster will run autoseup without the <code>directcopy</code> option. For more information, see <a href="#">Replica Autoseup for Streams</a> on page 790.
<code>useexistingreplica</code>	When the <code>directcopy</code> parameter is set to <code>true</code> (default), this Boolean value specifies whether or not an existing stream can be used as the replica stream. The values for this parameter are <code>true</code> or <code>false</code> . No reuse of existing tables ( <code>false</code> ) is the default. If a stream exists with the specified name, and this parameter is set to <code>false</code> , the create stream operation will fail.

**stream replica edit**

Modifies the way in which messages are replicated from one stream to another.

**Permissions Required at the Source Cluster**

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` permission on the source stream

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Permissions Required at the Target Cluster**

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path

**Syntax**

CLI	<pre>maprcli stream replica edit   -path &lt;stream path&gt;   -replica &lt;remote stream path&gt;   [ -newreplica &lt;renamed stream path&gt; ]   [ -throttle &lt;throttle replication operations under load&gt; ]   [ -networkencryption &lt;enable on-wire encryption&gt; ]   [ -synchronous &lt;replicate to remote stream before acknowledging   producers&gt; ]   [ -networkcompression &lt;on-wire compression type: off lz4 lzf    zlib&gt; ]</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/replica/edit? path=&lt;path&gt;&amp;replica=&lt;name&gt;</pre>

**Parameters**

Parameter	Description
<code>path</code>	The path and name of the stream that you want to create a replica for.
<code>replica</code>	The path and name of the stream that you want to create as a replica of the stream that you specified with the <code>-path</code> parameter.
<code>newreplica</code>	Specifies a new name to give to the replica stream.

Parameter	Description
throttle	<p>A boolean value that specifies whether to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The values are <code>true</code> or <code>false</code>. The default is <code>false</code>.</p> <p>Throttling has two effects, both of which allow HPE Ezmeral Data Fabric Streams to use more system resources to process new messages:</p> <ul style="list-style-type: none"> <li>• Throttling slows down the rate at which changes to a stream are replicated.</li> <li>• Throttling slows down the rate at which messages to be replicated are read from disk.</li> </ul>
networkencryption	<p>A boolean value that specifies whether or not to enable on-wire encryption. The values are <code>true</code> or <code>false</code>. The default is <code>false</code>. If you set the value to <code>true</code>, the local cluster and any other cluster that is part of the replication process must be enabled for security.</p>
synchronous	<p>A boolean value that specifies whether replication is synchronous or asynchronous. The values are <code>true</code> or <code>false</code>. The default is <code>false</code> and specifies asynchronous replication.</p>
networkcompression	<p>Specifies the type of compression to use when replicating messages. For more information, see <a href="#">Managing Compression</a>.</p>

#### **stream replica list**

Lists the replicas of a given stream.

#### **Permissions Required on the Source Cluster**

To run this command, your user ID must have the following permissions:

- [readAce](#) on the volume
- [lookupdir](#) on directories in the path
- `adminperm` permission on the source stream

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

#### **Syntax**

CLI	<pre>maprcli stream replica list   -path &lt;stream path&gt;   [ -refreshnow &lt;immediately refresh replication statistics&gt;   default: false ]</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/replica/list?path=&lt;path&gt;</pre>

## Parameters

Parameter	Description
path	The path and name of the stream that you want to list the replicas of.
refreshnow	A boolean value that specifies whether to trigger an immediate update of the replica statistics. The values are true or false. By default, the value is false and the command lists the current version of the replica statistics, which could be a maximum of five minutes old.

## Sample with Output

```
# maprcli stream replica list -path /srcVol/srcStream -json
{
  "timestamp":1507758209755,
  "timeofday":"2017-10-11 02:43:29.755 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"my.cluster.com",
      "stream":"/destVol",
      "type":"MapRStream",
      "replicaPath":"/destVol",
      "replicaState":"REPLICA_STATE_CREATE_SCHEDULE",
      "paused":false,
      "throttle":false,
      "idx":1,
      "networkencryption":false,
      "synchronous":false,
      "networkcompression":"lz4",
      "propagateExistingData":false,
      "isUptodate":true,
      "minPendingTS":0,
      "maxPendingTS":0,
      "bytesPending":0,
      "bucketsPending":0,
      "copyTableCompletionPercentage":0,
    }
  ]
}
```

## Data Fields

Data Fields	Description
cluster	The cluster on which the replica stream resides.
stream	The path of the replica stream.
type	Identifies the type of table: HPE Ezmeral Data Fabric Database table or HPE Ezmeral Data Fabric Streams stream.
replicaPath	The replica location of the source stream.
replicaState	The replication state indicates when stream replication is in progress and it also displays the status of operations related to replica autoseup with directcopy.
paused	A Boolean values that specifies if replication is paused.
throttle	A Boolean value that specifies if replication is throttled.

Data Fields	Description
idx	The index number of the replica stream.
networkencryption	A Boolean value that specifies if replication is encrypted.
synchronous	A Boolean value that specifies whether replication is synchronous or asynchronous.
networkcompression	The type of on-wire compression.
propagateExistingData	Used to identify whether existing data in a CDC table is propagated to stream topic.
isUptodate	A Boolean value that specifies if the replica is up-to-date.
minPendingTS	The epoch time in milliseconds of the oldest message that has yet to be replicated.
maxPendingTS	The epoch time in milliseconds of the newest message that has yet to be replicated.
bytesPending	The number of bytes that have yet to be replicated.
bucketsPending	The number of buckets that have yet to be replicated.
copyTableCompletionPercentage	<p>The percentage of data replication completed from the source stream to the destination stream.</p> <p> <b>NOTE:</b> When replicating HPE Ezmeral Data Fabric Database data, the copyTablePercentageCompletion data may re-adjust to a lower rate. This depends on table region (also referred to as tablets) splits and merges as well as the rate of incoming data to replicating data.</p>

**stream replica pause**

Pauses replication from a *source* stream to a *replica* stream during autoseup and replication phases.

**Permissions Required on the Source Cluster**

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` permission on the source stream

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax**

CLI	<pre>maprcli stream replica pause   -path &lt;stream path&gt;   -replica &lt;remote stream path&gt;</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/replica/pause? path=&lt;path&gt;&amp;replica=&lt;name&gt;</pre>

## Parameters

Parameter	Description
path	The path and name of the stream that is the source for the replica that you want to pause replication to.
replica	The path and name of the stream replica that you want to pause replication to.

### **stream replica remove**

Unregisters a stream as the replica of another stream.

### **Permissions Required on the Source Cluster**

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- `adminperm` permission on the source stream

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Syntax

CLI	<pre>maprcli stream replica remove   -path &lt;stream path&gt;   -replica &lt;remote stream path&gt;</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/replica/remove? path=&lt;path&gt;&amp;replica=&lt;name&gt;</pre>

## Parameters

Parameter	Description
path	The path and name of the stream that is the source for the replica that you want to remove.
replica	The path and name of the stream replica that you want to remove.

### **stream replica resume**

Resumes replication from one stream to another stream. Replication can be paused during autosetup and replication phases. When replication resumes, it continues from where it left off.

### **Permissions Required on the Source Cluster**

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- `adminperm` permission on the source stream

 **NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Syntax

CLI	<pre>maprcli stream replica resume -path &lt;stream path&gt; -replica &lt;remote stream path&gt;</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/replica/resume? path=&lt;path&gt;&amp;replica=&lt;name&gt;</pre>

### Parameters

Parameter	Description
path	The path and name of the stream that is the source for the replica that you want to resume replicating to.
replica	The path and name of the stream replica that you want to resume replicating to.

#### **stream upstream add**

Registers a stream as an upstream source for a given stream. For example, if you wanted to replicate messages from `Stream_A` to `Stream_B`, `Stream_A` would be the upstream source for `Stream_B`.

#### Permissions Required on the Target Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` permission on the source stream

 **NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Syntax

CLI	<pre>maprcli stream upstream add -path &lt;stream path&gt; -upstream &lt;upstream stream path&gt;</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/upstream/add? path=&lt;path&gt;&amp;upstream=&lt;name&gt;</pre>

### Parameters

Parameter	Description
path	The path and name of the stream that you want to specify a source stream for.

Parameter	Description
upstream	The path and name of the stream that you want to use as a source for the stream that you specified with the <code>-path</code> parameter.

**stream upstream list**

Lists all of the streams that are replicating to a given stream.

**Permissions Required on the Target Cluster**

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` permission on the source stream

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax**

CLI	<pre>maprcli stream upstream list -path &lt;Stream Path&gt;</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/upstream/list?path=&lt;path&gt;</pre>

**Parameters**

Parameter	Description
path	The path and name of the stream that you want to list the source streams for.

**Sample Output**

```
# maprcli stream upstream list -path /dst -json
{
  "timestamp":1437992841303,
  "timeofday":"2015-07-27 03:27:21.303 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"my.cluster.com",
      "stream":"/src",
      "idx":1,
      "uuid":"3e98ee93-d88a-f3d6-bc80-001b02b65500"
    }
  ]
}
```

## Field Descriptions

<code>cluster</code>	The name of the Data Fabric cluster in which the upstream stream is located.
<code>stream</code>	The name of the upstream stream.
<code>idx</code>	The index number of the upstream stream.
<code>uuid</code>	The upstream stream's universally unique identifier.

### `stream upstream remove`

Unregisters a stream as an upstream source for a given stream.

### Permissions Required on the Target Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` permission on the source stream

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Syntax

CLI	<pre>maprcli stream upstream remove -path &lt;stream path&gt; -upstream &lt;upstream stream path&gt;</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/upstream/remove? path=&lt;path&gt;&amp;upstream=&lt;name&gt;</pre>

## Parameters

Parameter	Description
<code>path</code>	The path and name of the stream that you want to remove a source stream from.
<code>upstream</code>	The path and name of the stream that you want to remove as a source for the stream that you specified with the <code>-path</code> parameter.

### `stream topic create`

Creates a topic in the specified stream.

### Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `topicperm` permission on the stream

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Syntax

CLI	<pre>maprcli stream topic create   -path &lt;Stream Path&gt;   -topic &lt;Topic Name&gt;   [ -partitions &lt;Number of partitions&gt; default: attribute   defaultpartitions on the stream ]   [ -timestamptype Timestamp type: createtime   logappendtime   default: createtime ]</pre>
REST	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/topic/create?path=&lt;path&gt;&amp;topic=&lt;name&gt;</code>

### Parameters

Parameter	Description
<code>path</code>	The path and name of the stream in which to create the topic.
<code>topic</code>	The name of the topic to create. A name can include alphanumeric characters and the period, underscore, and dash characters.
<code>partitions</code>	<p>The number of partitions to use for the topic. After you create the topic, you can increase the number of partitions, but you cannot reduce the number. The default number of partitions for new topics is set by the <code>defaultpartitions</code> parameter in the commands <code>maprcli stream create</code> and <code>maprcli stream edit</code>.</p> <p> <b>IMPORTANT:</b> A CDC changelog stream's default partitions can impact how many partitions a stream topic can have. This is because once you create a stream topic for a changelog stream, the number of topic partitions is <i>locked</i>. The number of topic partitions cannot change.</p> <ul style="list-style-type: none"> <li>If the <code>stream topic create</code> command is used to create a stream topic, then the number of topic partitions can be set at creation time and then is <i>locked</i>.</li> <li>If the <a href="#">table changelog add</a> on page 2463 command is used to add a stream topic (as well as establish a relationship between the source table and the changelog stream), then the number of topic partitions is inherited from the changelog stream and is <i>locked</i>.</li> </ul>

Parameter	Description
timestamptype	<p>Specifies the type of timestamp stored in the topic's message. Value: createtime   logappendtime Default: createtime. The topic inherits the default value from the stream unless the topic sets the timestamp type to a different value.</p> <p>A createtime value is the time defined by the user or application (when creating the message). If user or application does not define this value (or passes null), the client uses the current system timestamp.</p> <p>A logappendtime value is the time when the message (log) was appended to the server.</p>

**stream topic delete**

Deletes the specified topic from the specified stream.

Consumers do not have to stop consuming from a topic before the topic is deleted.

The deletion of the topic and the messages is immediate. However, the command also starts a background process for the purging the topic and messages to reclaim disk space.

If the parameter `-autocreate` for the stream is set to `true`, a topic with the same name is created if a producer writes a message to a topic of the same name. For example, if you delete the topic `Topic_A` and then a producer writes a message to the topic `Topic_A`, HPE Ezmeral Data Fabric Streams creates a topic that is named `Topic_A`. Aside from the name, the new topic `Topic_A` shares nothing with the deleted topic `Topic_A`.

**Permissions Required**

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `topicperm` permission on the stream

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax**

CLI	<pre>maprcli stream topic delete   -path &lt;Stream Path&gt;   -topic &lt;Topic Name&gt;</pre>
REST	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/topic/delete?path=&lt;path&gt;&amp;topic=&lt;name&gt;</code>

**Parameters**

Parameter	Description
path	The path and name of the stream from which to delete the topic.
topic	The name of the topic to delete.

**stream topic edit**

Allows you to increase the number of partitions that are in the specified topic.

**Permissions Required**

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `topicperm` permission on the stream

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax**

CLI	<pre>maprcli stream topic edit   -path &lt;Stream Path&gt;   -topic &lt;Topic Name&gt;   [ -partitions &lt;Number of partitions&gt; ]   [ -timestamptype Timestamp type: createtime   logappendtime   default: createtime ]</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/topic/edit? path=&lt;path&gt;&amp;topic=&lt;name&gt;&amp;partitions=&lt;number&gt;</pre>

**Parameters**

Parameter	Description
<code>path</code>	The path and name of the stream in which the topic is located.
<code>topic</code>	The name of the topic to edit.

Parameter	Description
partitions	<p>The number of partitions to use for the topic. You cannot reduce the number of partitions.</p> <p>To find out how many partitions a topic is currently using, run the command <code>maprcli stream topic info</code>.</p> <p> <b>IMPORTANT:</b> A CDC changelog stream's default partitions can impact how many partitions a stream topic can have. This is because once you create a stream topic for a changelog stream, the number of topic partitions is <i>locked</i>. The number of topic partitions cannot change and the <code>stream topic edit</code> command can not modify the topic's partition number.</p> <ul style="list-style-type: none"> <li>• If the <code>stream topic create</code> command is used to create a stream topic, then the number of topic partitions can be set at creation time and then is <i>locked</i>.</li> <li>• If the <a href="#">table changelog add</a> on page 2463 command is used to add a stream topic (as well as establish a relationship between the source table and the changelog stream), then the number of topic partitions is inherited from the changelog stream and is <i>locked</i>.</li> </ul>
timestamptype	<p>Specifies the type of timestamp stored in the topic's message. Value: <code>createtime</code>   <code>logappendtime</code> Default: <code>createtime</code>. The topic inherits the default value from the stream unless the topic sets the timestamp type to a different value.</p> <p>A <code>createtime</code> value is the time defined by the user or application (when creating the message). If user or application does not define this value (or passes null), the client uses the current system timestamp.</p> <p>A <code>logappendtime</code> value is the time when the message (log) was appended to the server.</p>

**stream topic info**

Lists information about a stream's topic, grouped by partition ID.

**Permissions Required**

To run this command, your user ID must have the following permissions:

- [readAce](#) on the volume
- [lookupdir](#) on directories in the path
- `adminperm`, `consumeperm`, `produceperm`, or `topicperm` permission on the stream

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Syntax

CLI	<pre>maprcli stream topic info   -path &lt;Stream Path&gt;   -topic &lt;Topic Name&gt;</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/topic/info?path=&lt;path&gt;&amp;topic=&lt;name&gt;</pre>

## Parameters

Parameter	Description
path	The path and name of the stream for which you want to display information about topics.
topic	The name of the topic for which you want to display information.

## Sample Output

```
maprcli stream topic info -path /streamVol/stream1 -topic topic1 -json
{
  "timestamp":1521232252550,
  "timeofday":"2018-03-16 01:30:52.550 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "partitionid":0,
      "physicalsize":0,
      "logicalsize":0,
      "maxoffset":-1,
      "minoffsetacrossconsumers":0,
      "mintimestamp":"1969-12-31T04:00:00.000-0800 PM",

      "logcompactionlastcompleted":"1969-12-31T04:00:00.000-0800 PM",
      "logcompactionstatus":"not started"
    }
  ]
}
```

## Field Descriptions

<b>partitionid</b>	The index number of the partition within the topic. The first partition in a topic has an index of 0, the next partition an index of 1, and so on.
<b>physicalsize</b>	The physical size (in bytes) of the stream topic with data compression.
<b>logicalsize</b>	The logical size (in bytes) of the stream topic without data compression.

<code>maxoffset</code>	The maximum offset for this partition.
<code>minoffsetacrossconsumers</code>	All known consumers for this partition have consumed messages at least up to this offset.
<code>mintimestamp</code>	The timestamp of oldest message in the partition.
<code>maxtimestamp</code>	The timestamp of newest message in the partition.
<code>mintimestampacrossconsumers</code>	All known consumers for this partition have consumed messages older than this timestamp.
<code>fid</code>	The inode hosting the head of the partition.
<code>master</code>	<i>For use by HPE support:</i> The master server that is hosting the head of the partition.
<code>servers</code>	<i>For use by HPE support:</i> Lists all of the servers that are hosting the head of the partition.
<code>timestamptype</code>	The type of timestamp stored in the topic's message. Possible values: createtime (default) and logappendtime.
<code>logcompactionlaststarted</code>	Displays the last time log compaction was started if log compaction was enabled. The value is displayed in epoch time. This field displays when there is a change in the value for this field.
<code>logcompactionlastcompleted</code>	Displays the last time log compaction completed if log compaction was enabled. The value is displayed in epoch time. This field displays when there is a change in the value for this field.
<code>logcompactionstatus</code>	Displays whether log compaction was started or completed.
<code>stream topic list</code>	Lists the topics that are in a stream, as well as the number of partitions in each topic.

### Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the path
- `adminperm`, `consumeperm`, `produceperm`, or `topicperm` permission on the stream

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Syntax

CLI	<pre>maprcli stream topic list -path &lt;Stream Path&gt;</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/stream/topic/list?path=&lt;path&gt;</pre>

## Parameters

Parameter	Description
path	The path and name of the stream for which you want to list the topics.

## Sample Output

```
# maprcli stream topic list -path /s1 -json
{
  "timestamp":1441882201851,
  "timeofday":"2015-09-10 03:50:01.851 GMT-0700",
  "status":"OK",
  "total":2,
  "data":[
    {
      "topic":"topic0",
      "partitions":4,
      "consumers":8,
      "physicalsize":148373504,
      "logicalsize":1009713152,
      "maxlag":6314
    },
    {
      "topic":"topic1",
      "partitions":4,
      "consumers":8,
      "physicalsize":148373504,
      "logicalsize":1009713152,
      "maxlag":6385
    }
  ]
}
```

## kafkatopic

Displays help for the maprcli commands related to Kafka topics that are available in Data Fabric.

### kafkatopic create

Creates a Kafka topic.

## Syntax

 **IMPORTANT:** Ensure that the `mapr-kafka` package is installed on the server node, before running the `kafkatopic create` command. When `mapr-kafka` package is not installed, the following error is encountered: Command execution failed! 'kafkatopic' commands requires 'mapr-kafka' package.

### CLI

The maprcli command creates a Kafka topic.

```
$ maprcli kafkatopic create -topic
<topicname> [-parameter <parameter
value> -parameter <parameter value>..]
```

### REST

```
http[s]://<host>:<port>/rest/
kafkatopic/create?
topic=<topicname>&parameter=<value>&pa
rameter=<value>&parameter=<value>
```

## Parameters

Parameter	Description
-topic	The topic name. This is a mandatory parameter.
-partitions	The number of partitions. Default value is 1. This is an optional parameter.
-ttl	The time to live in seconds. Default value is 604800. This is an optional parameter.
-ownvolume	specifies if the topic is created in its own Data Fabric volume. Only users with Create Volumes (cv) or Full Control (fc) can specify "true" for this parameter. Default value is false. This is an optional parameter.
-compression	Turn compression on or off with this parameter. lz4, zlib are the supported compression schemes. Default value is off. This is an optional parameter.

## Examples

Use the command `maprcli kafkatopic create -topic` to create a topic by the name `day_temperature`.

```
$ maprcli kafkatopic create -topic day_temperature
```

**TIP:** Verify the topic creation with the `maprcli kafkatopic info` command.

```
$ maprcli kafkatopic info -topic day_temperature -json
{
  "timestamp":1681933868166,
  "timeofday":"2023-04-19 12:51:08.166 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "topic":"day_temperature",
      "owner":"root",
      "partitions":1,
      "ttl":604800,
      "compression":"off",
      "size":0,
      "ownvolume":false
    }
  ]
}
```

Create a topic `night_temp` with time to live as 40000 seconds, 4 partitions and `zlib` compression scheme.

```
$ maprcli kafkatopic create -topic night_temp -ttl 40000 -partitions
4 -compression zlib
```

## kafkatopic list

Lists existing Kafka topics.

## Syntax

**!** **IMPORTANT:** Ensure that the `mapr-kafka` package is installed on the server node, before running the `kafkatopic list` command. When `mapr-kafka` package is not installed, the following error is encountered: Command execution failed! 'kafkatopic' commands requires 'mapr-kafka' package.

### CLI

The `maprcli` command lists existing Kafka topics in a cluster/fabric.

```
$ maprcli kafkatopic list
[-topicregex <regular expression>]
```

### REST

```
http[s]://<host>:<port>/rest/
kafkatopic/list
```

## Parameters

Parameter	Description
<code>-topicregex</code>	regular expression to filter topic names for topic listing. This is an optional parameter.

## Examples

Verify the existing topics with the `maprcli kafkatopic list` command.

```
$ maprcli kafkatopic list
owner  partitions  volume  size  topic  compression  ttl
root   1              false   100  day_temp  lz4          604800
root   4              false   256  nght_temp off          604800
```

List topics with name starting with `dayT`.

**NOTE:** Use single quotes or double quotes to enclose special Linux shell characters such as `.` or `*` on the command line. The `kafkatopic list` command returns inaccurate results if you use special Linux shell characters in the regular expression, without enclosing the regular expression in quotes.

```
$ maprcli kafkatopic list -topicregex "dayT.*"
owner  partitions  ownvolume  size  topic  compression  ttl
root   1          false      20    dayTemp2305  lz4          604800
root   1          false      20    dayTemp2405  lz4          604800
root   1          false      20    dayTemp2505  lz4          604800
root   1          false      20    dayTemp2605  lz4          604800
root   1          false      20    dayTemp2705  lz4          604800
```

## kafkatopic edit

Edit a Kafka topic.

## Syntax

**!** **IMPORTANT:** Ensure that the `mapr-kafka` package is installed on the server node, before running the `kafkatopic edit` command. When `mapr-kafka` package is not installed, the following error is encountered: Command execution failed! 'kafkatopic' commands requires 'mapr-kafka' package.

**CLI**

The command facilitates editing of a Kafka topic.

```
$ maprcli kafkatopic edit -topic
<topicname> [-parameter <parameter
value> -parameter <parameter value>..]
```

**REST**

```
http[s]://<host>:<port>/rest/
kafkatopic/edit?topic=<topicname>
```

**Parameters**

Parameter	Description
-topic	The topic name. This is a mandatory parameter.
-partitions	The number of partitions. Default value is 1. This is an optional parameter.
-ttl	The time to live in seconds. Default value is 604800. This is an optional parameter.
-compression	Turn compression on or off with this parameter. <code>lzf</code> , <code>lz4</code> , <code>zlib</code> are the supported compression schemes. Default value is <code>off</code> . This is an optional parameter.

**Examples**

Edit a topic `night_temp` with time to live as 40000 seconds, 4 partitions and `zlib` compression scheme.

```
$ maprcli kafkatopic edit -topic night_temp -ttl 40000 -partitions
4 -compression zlib
```

**TIP:** Verify the topic edit with the `maprcli kafkatopic info` command.

**kafkatopic info**

Provides detailed information about a Kafka topic.

**Syntax**

**IMPORTANT:** Ensure that the `mapr-kafka` package is installed on the server node, before running the `kafkatopic info` command. When `mapr-kafka` package is not installed, the following error is encountered: Command execution failed! 'kafkatopic' commands requires 'mapr-kafka' package.

**CLI**

The command provides details of an existing Kafka topic.

```
$ maprcli kafkatopic info -topic
<topicname> -json
```

**REST**

```
http[s]://<host>:<port>/rest/
kafkatopic/info?topic=<topicname>
```

Parameter	Description
-topic	The topic name . This is a mandatory parameter.

## Examples

View topic information for a topic by the name `day_temperature`.

```
$ maprcli kafkatopic info -topic day_temperature -json
{
  "timestamp":1681933868166,
  "timeofday":"2023-04-19 12:51:08.166 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "topic":"day_temperature",
      "owner":"root",
      "partitions":1,
      "ttl":604800,
      "compression":"off",
      "size":0,
      "ownvolume":false
    }
  ]
}
```

## kafkatopic connectionprops

Lists the connection properties of Kafka clients.

### Syntax

 **IMPORTANT:** Ensure that the `mapr-kafka` package is installed on the server node, before running the `kafkatopic connectionprops` command. When `mapr-kafka` package is not installed, the following error is encountered: Command execution failed! 'kafkatopic' commands requires 'mapr-kafka' package.

#### CLI

The command returns relevant connection properties for Kafka clients.

```
$ maprcli kafkatopic
connectionprops -json
```

#### REST

```
http[s]://<host>:<port>/rest/
kafkatopic/connectionprops
```

## Examples

List connection properties of Kafka clients.

```
$ maprcli kafkatopic connectionprops -json
{ "timestamp": 1678731806417,
  "timeofday": "2023-03-13 11:23:26.417 GMT-0700 AM",
  "status": "OK",
  "total":1,
  "data":[
    {
      "bootstrap.servers": "host1:9092,host2:9092",
      "security.protocol": "SASL_PLAINTEXT",
      "sasl.mechanism": "PLAIN"
    }
  ]
}
```

**kafkatopic delete**

Delete a Kafka topic.

**Syntax**

 **IMPORTANT:** Ensure that the `mapr-kafka` package is installed on the server node, before running the `kafkatopic delete` command. When `mapr-kafka` package is not installed, the following error is encountered: `Command execution failed! 'kafkatopic' commands requires 'mapr-kafka' package.`

**CLI**

The command deletes a Kafka topic.

```
$ maprcli kafkatopic delete -topic
<topicname>
```

**REST**

```
http[s]://<host>:<port>/rest/
kafkatopic/delete?topic=<topicname>
```

**Parameters**

Parameter	Description
<code>-topic</code>	The topic name. This is a mandatory parameter.

**Examples**Delete a topic by the name `day_temperature`.

```
$ maprcli kafkatopic delete -topic day_temperature
```

**kafkatopic listbrokers**

Lists the Apache Kafka Wire Protocol brokers in a multi-node Data Fabric cluster.

**Syntax**

 **IMPORTANT:** Ensure that the `mapr-kafka` package is installed on the server node, before running the `kafkatopic listbrokers` command. When `mapr-kafka` package is not installed, the following error is encountered: `Command execution failed! 'kafkatopic' commands requires 'mapr-kafka' package.`

**CLI**The `maprcli` command lists the Apache Kafka Wire Protocol brokers on the multi-node Kafka cluster.

```
$ maprcli kafkatopic listbrokers
```

**REST**

```
http[s]://<host>:<port>/rest/
kafkatopic/listbrokers
```

**Example**

Use the command `maprcli kafkatopic listbrokers` to list brokers along with the broker details in the Data Fabric cluster.

```
$ maprcli kafkatopic listbrokers -json
{
  "timestamp":1687251172651,
  "timeofday":"2023-06-20 01:52:52.651 GMT-0700 AM",
  "status":"OK",
  "total":3,
  "data":[
    {
      "id":0,
      "security.protocol":"SASL_PLAINTEXT",
      "sasl.mechanism":"PLAIN",
      "host":"m2-mapreng-dev10.mip.storage.hpccorp.net",
      "port":"9092",
      "starttime":"1687008286813"
    },
    {
      "id":1,
      "security.protocol":"SASL_PLAINTEXT",
      "sasl.mechanism":"PLAIN",
      "host":"m2-mapreng-dev09.mip.storage.hpccorp.net",
      "port":"9092",
      "starttime":"1687008287001"
    },
    {
      "id":2,
      "security.protocol":"SASL_PLAINTEXT",
      "sasl.mechanism":"PLAIN",
      "host":"m2-mapreng-dev11.mip.storage.hpccorp.net",
      "port":"9092",
      "starttime":"1687008285254"
    }
  ]
}
```

**kafkatopic getcontroller**

Fetches details of the controller node from the available Apache Kafka Wire Protocol brokers in the Data Fabric cluster.

**Syntax**

 **IMPORTANT:** Ensure that the `mapr-kafka` package is installed on the server node, before running the `kafkatopic getcontroller` command. When `mapr-kafka` package is not installed, the following error is encountered: Command execution failed! 'kafkatopic' commands requires 'mapr-kafka' package.

**CLI**

The `maprcli` command displays information about the Apache Kafka Wire Protocol controller on the Data Fabric cluster.

Use the command to understand which of the nodes in the cluster is the controller.

```
$ maprcli kafkatopic
getcontroller -json
```

**REST**

```
http[s]://<host>:<port>/rest/
kafkatopic/getcontroller
```

**Example**

Use the command `maprcli kafkatopic getcontroller` to display details of the Apache Kafka Wire Protocol broker

```
$ maprcli kafkatopic getcontroller -json
{
  "timestamp":1687176345951,
  "timeofday":"2023-06-19 05:05:45.951 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "id":0,
      "host":"m2-sm2027-14-n2.mip.storage.hpccorp.net",
      "port":"9092",
      "security.protocol":"SASL_PLAINTEXT",
      "sasl.mechanism":"PLAIN",
      "starttime":"1687008489078"
    }
  ]
}
```

**s3domain**

Commands for managing HPE Ezmeral Object Store domains.

**s3domain info**

Displays information about a HPE Ezmeral Object Store domain.

**Permissions Required**

None

**Syntax**

<b>CLI</b>	<pre>s3domain info   [ -cluster cluster_name ]   -name name</pre>
------------	-------------------------------------------------------------------

**Input Parameters**

Parameter	Description
cluster	The cluster on which to run the command. By default, the cluster is the one on which the command is being run.
name	The domain name for which to fetch information.

**Output Parameters**

Parameter	Description
userCount	The number of users in the domain.

Parameter	Description
usedSizeMB	The amount of disk space in MB used by the domain. Buckets and Objects for every account in the domain use disk space.
bucketCount	The number of buckets present in the accounts in the domain.
totalAccounts	The number of accounts that belong to the domain.
unavailableAccounts	The number of disabled accounts in the domain.

### Sample Output

Return information for the domain primary:

#### CLI

```
maprcli s3domain info -name
primary -json

{
  "timestamp":1637912276781,
  "timeofday":"2021-11-25
11:37:56.781 GMT-0800 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "totalAccounts":121,
      "unavailableAccounts":0,
      "userCount":128,
      "bucketCount":356,
      "usedSizeMB":261192
    }
  ]
}
```

#### s3domain list

List all HPE Ezmeral Object Store domains.

#### Permissions Required

None

#### Syntax

CLI	<pre>maprcli s3domain list [ -cluster cluster_name ]</pre>
-----	------------------------------------------------------------

### Sample Output

List all domains

**CLI**

```
maprcli s3domain list -json

{
  "timestamp":1636354490984,
  "timeofday":"2021-11-07
10:54:50.984 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[
    {
      "root":0,
      "totalAccounts":0,
      "unavailableAccounts":0,
      "userCount":0,
      "bucketCount":0,
      "usedSizeMB":0
    },
    {
      "name":"primary",
      "root":1002
    }
  ]
}
```

**s3user**

Creates user in the specified s3 account and domain for the specified cluster or refreshes LDAP user information.

**Permissions Required**

None

**Syntax**

```
maprcli s3user create
  [ -cluster cluster_name ]
  -domainname <domain_name>
  -accountname <account_name>
  -username <user_name>
refreshldap
  [ -cluster cluster_name ]
  [ -username <user_name> ]
  [ -all <true|false> ]
```

**s3user create**

The command creates a user in the given s3 account and domain in a Data Fabric cluster.

**Syntax**

The `s3user create` command can be used to create a user in the given S3 account, domain.

In a multi-cluster environment, you must specify the `cluster_name` parameter to create the user on the specified cluster.

```
maprcli s3user create
  [ -cluster cluster_name ]
  -domainname <domain_name>
```

```
-accountname <account_name>
-username <user_name>
```

### Input Parameters

Parameter	Description
cluster	The cluster on which to run the command. By default, the cluster is the one on which the command is being run. This is an optional parameter. If cluster name not specified, the user is created on the local cluster.
domainname	The s3 domain name in which the user is to be created.
accountname	The s3 account name in which the user is to be created.
username	The s3 username to be created.

### Output Parameters

Parameter	Description
accesskey	Access key for the user is generated when the user is created successfully.
secretkey	Secret key for the user is generated when the user is created successfully.

### Sample Output

#### CLI

```
maprcli s3user create -domainname
primary -accountname
default -username user1 -json
{
    "timestamp":1693200369351,
    "timeofday":"2023-08-27
10:26:09.351 GMT-0700 PM",
    "status":"OK",
    "total":1,
    "data":[
        {
            "accesskey":"67845HA2VTKNN6RR58U55G13K
G696SJXK2JU5P1MN80MZFQ1P9HYTGXN3GDF2XV
OBEKQQZANUN8J9WCQG9PGYRTIJP0Z",
            "secretkey":"8OXATTWV3HEG4VTFGHLE0VR09
DX1AO1XS2ZT93E2MR3T9W1A3W0918HMA8UEK7M
IZMQ013L2P4B1FS78VNDUOBAW05ALUFWBPERNN
K"
        }
    ]
}
```

#### *s3user refreshldap*

The command refreshes user information on the Data Fabric to match the user information on LDAP.

### Syntax

The `s3user refreshldap` subcommand is used to refresh the Data Fabric cluster user information, so as to be in sync with any change to the user information on the external LDAP server side.

For instance, a user could be moved from a privileged group (group1) to a less privileged group (group2) on the LDAP server. In such a scenario, the Data Fabric cluster would still have stale user information and might still allow privileged access to the user. Hence, a refresh of the LDAP permissions is essential to reflect the change on to Data Fabric.

**NOTE:** The LDAP refresh is auto-triggered periodically for an LDAP integrated Data Fabric cluster.

```
maprcli s3user refreshldap
    [ -cluster cluster_name ]
    [ -username <user_name> ]
    [ -all <true|false> ]
```

### Input Parameters

Parameter	Description
clustername	The cluster on which to run the command. By default, the cluster is the one on which the command is being run. This is an optional parameter. If cluster name not specified, default value is the local cluster.
username	The user name whose user information should be fetched or synced from LDAP server.
all	Use the value <code>true</code> if all LDAP users are to be refreshed. Default value is <code>false</code> .

### s3keys

Commands for managing HPE Ezmeral Object Store access and secret keys.

#### s3keys generate

Generates access and secret keys for IAM users to access the Object Store.

### Syntax

CLI	<pre>maprcli s3keys generate     [ -cluster cluster_name ]     -domainname &lt;domain_name&gt;     -accountname &lt;account_name&gt;     [ -username &lt;user_name&gt; ]</pre>
REST	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/s3keys/generate?&lt;parameters&gt;</code>

### Parameters

Parameter	Description
cluster	The cluster on which to create the access and secret keys. The default is the current cluster.
domainname	The domain to which the user belongs. This parameter is mandatory.
accountname	The account to which the domain belongs. This parameter is mandatory.
username	The user for which to generate the keys. If not specified, the logged-in user is taken as the user to generate the keys.

### Example

**TIP:** To work properly, the `maprcli s3keys generate` command requires a quorum of the CLDB `s3server` modules. If you run the command before the quorum is formed, the command can generate an error. To check the quorum status, use the `maprcli dump cldbstate --json` command. The dump output should indicate that the primary and secondary `s3server` modules are running.

Generate the access and secret keys for the `mapr` user in the `default` account and `primary` domain.

#### CLI

```
maprcli s3keys generate -domainname
primary -accountname
default -username mapr -json
{
  "timestamp":1633527639908,
  "timeofday":"2021-10-06
06:40:39.908 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "accesskey":"XJSV9SD99PET929AAJACUSB52
ABUMWG05WWCTYLGABPB48HA9NLL3UN1Y2X87OX
P3GO3SZU3LVVJOCAL9ZQ1DMCKVL1FNTABDSPGB
8P",
      "secretkey":"FFIL3OS5IL482GHPQE0LJD360
KJV56Y4ML75ZFMW9STYY24V7X36H3VTQX"
    }
  ]
}
```

#### s3keys delete

Deletes an access key and the associated secret key.

#### Syntax

<b>CLI</b>	<code>maprcli s3keys delete</code> [ <code>-cluster cluster_name</code> ] [ <code>-accesskey &lt;access key&gt;</code> ]
<b>REST</b>	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/s3keys/delete?&lt;parameters&gt;</code>

#### Parameters

Parameter	Description
<code>cluster</code>	The cluster on which the access and secret keys were created. The default is the current cluster.
<code>accesskey</code>	The key to delete.

### Example

Delete the access key

```
2ZYLIHQYR0DXPDX8RGN3ET96RJNSIG1T5CFPR0AXUAX0Y2ZCA5SK7RRU3RHJ2ZW52OVVAINOAO
5ONNFQCHVQIR2GS336OLUHKEE7KEY56GD.
```

**CLI**

```
maprcli s3keys delete -accesskey
"2ZYLIHQYR0DXPDX8RGN3ET96RJNSIG1T5CFPR
0AXUAX0Y2ZCA5SK7RRU3RHJ2ZW52OVVAINOA05
ONNFQCHVQIR2GS336OLUHKEE7KEY56GD"
```

Removed

```
2ZYLIHQYR0DXPDX8RGN3ET96RJNSIG1T5CFPR0
AXUAX0Y2ZCA5SK7RRU3RHJ2ZW52OVVAINOA050
NNFQCHVQIR2GS336OLUHKEE7KEY56GD

```

**s3keys list**

Lists all access keys in the HPE Ezmeral Object Store.

**Syntax**

<b>CLI</b>	maprcli s3keys list [ -cluster cluster_name ]
<b>REST</b>	http[s]://<host>:<port>/rest/s3keys/list?<parameters>

**Parameters**

Parameter	Description
cluster	The cluster on which the access and secret keys were created. The default is the current cluster.

**Example**

**CLI**

```
maprcli s3keys list

key

username

A58D30E9ZMQV0XELZT46346JWNIWJPEJ7XOZ3Q
5AOL1J9KZ5F3LGYLA9MMEVDKX4S24EM4NBI0EF

```

**REST**

```
https://abc.sj.us:8443/rest/s3keys/
list
```

**table**

Performs functions related to HPE Ezmeral Data Fabric Database tables.

**table create**

Creates a HPE Ezmeral Data Fabric Database binary or JSON table.

**Permissions Required**

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax**

CLI	<pre> /opt/mapr/bin/maprcli table create -path &lt;path&gt; [ -copymetafrom &lt;path to source table&gt; ] [ -copymetatype all cfs aces splits  attrs ] [ -regionsizeMB &lt;region size in MB&gt; ] [ -autosplit true false ] [ -bulkload true false ] [ -audit true false ] [ -tabletype &lt;Table Type - json or binary&gt; default: binary ] [ -packperm &lt;Pack Permission settings&gt; ] [ -bulkloadperm &lt;Bulk load Permission settings&gt; ] [ -splitmergeperm &lt;Split and Merge Permission settings&gt; ] [ -createrenamefamilyperm &lt;Add/Rename Family Permission settings&gt;] [ -deletefamilyperm &lt;Delete Family Permission settings&gt; ] [ -adminaccessperm &lt;ACE Admin Permission settings&gt; ] [ -replperm &lt;Replication Admin Permission settings&gt; ] [ -indexperm &lt;ACE Admin Permission settings&gt; ] [ -defaultversionperm &lt;CF Versions Default Permission setting&gt;] [ -defaultcompressionperm &lt;CF Compression Default Permission setting&gt; ] [ -defaultmemoryperm &lt;CF Memory Default Permission setting&gt;] [ -defaultreadperm &lt;CF Read Default Permission setting&gt; ] [ -defaultwriteperm &lt;CF Write Default Permission setting&gt; ] [ -defaulttraverseperm CF Traverse Default Permission ] [ -defaultappendperm &lt;CF Append Default Permission setting&gt;] [ -defaultunmaskedreadperm CF Unmasked Read Default Permission ] [ -metricsinterval &lt;metric interval setting&gt; ] [ -securitypolicy &lt;comma-delimited list of policies&gt; ] </pre>
REST	<pre> curl -k -X POST 'http[s]://&lt;host&gt;:&lt;port&gt;/rest/table/ create?path=&lt;path&gt;&amp;&lt;parameters&gt;' -u &lt;username&gt;:&lt;password&gt; </pre>

## Parameters

Parameter	Description
path	<p>The path to the new HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul> <p> <b>NOTE:</b> You cannot use the following characters in the table name:</p> <pre data-bbox="922 716 1455 774">&lt; &gt; ? % \</pre> <p>To use the following characters in the table name, enclose them either in single or double quotes:</p> <pre data-bbox="857 884 1463 942">;   ( ) /</pre> <p>For example:</p> <pre data-bbox="857 1010 1463 1152">maprcli table create -path "/^=#; {}&amp;()/\" (or) maprcli table create -path '/^=#; {}&amp;()/'</pre> <p>To use either the <code>'</code> or the <code>"</code> character in the table name, enclose:</p> <ul style="list-style-type: none"> <li>the <code>'</code> character within double quotes (<code>"</code>)</li> <li>the <code>"</code> character within single quote (<code>'</code>)</li> </ul> <p>For example:</p> <pre data-bbox="857 1398 1463 1541">maprcli table create -path "'^=#; {}&amp;()/\" (or) maprcli table create -path '/"^=#; {}&amp;()/'</pre>

Parameter	Description
copymetafrom	<p>The path to a table that contains the metadata that should be used to create the table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, if you want to copy metadata from a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test</li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, if you want to copy metadata from a table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer</li> </ul>
copymetatype	<p>The type of metadata to copy from the table identified in the copymetafrom parameter. You can specify one or more of the following options in a comma separated list:</p> <ul style="list-style-type: none"> <li>all. Copy all metadata. This is the default.</li> <li>cfs. Copy column family metadata.</li> <li>aces. Copy ACE permissions.</li> <li>splits. Copy split keys.</li> <li>attrs. Copy table attributes.</li> </ul>
regionsizeMB	<p>The average size of the regions into which HPE Ezmeral Data Fabric Database tries to split the table as the table grows. The default is 4096 MB. This value is ignored if autosplit is set to false.</p> <p>If autosplit is set to true, HPE Ezmeral Data Fabric Database splits a region when the size of the region exceeds 150% of the average value. For example, if the average value is 4096 MB, HPE Ezmeral Data Fabric Database splits a region that is larger than 6144 MB.</p> <p>Although splits are automatic, merges are not. For example, if the value of regionsizeMB is changed from 8 GB to 4 GB, all regions that are eligible are split automatically, if autosplit is set to true. However, if the value of regionsizeMB is changed from 2 GB to 4 GB, regions smaller than 4 GB are not automatically merged.</p> <p> <b>NOTE:</b> When a table has less than 4 regions, HPE Ezmeral Data Fabric Database ignores the regionsizeMB parameter and splits regions at a lower threshold.</p>
autosplit	<p>A Boolean value that specifies whether to split the table into regions automatically as the table grows. The average size of each region is determined by the regionsizeMB parameter.</p> <p>The default value is true. If you set the value to false, you can manually split tables into regions by using the table region split command.</p>

Parameter	Description
bulkload	A Boolean value that specifies whether to allow a full bulk load of the table. The default is <code>false</code> . For more information, see <a href="#">Loading Data into Binary Tables</a> on page 1381 and <a href="#">Loading Documents into JSON Tables</a> on page 1378.
audit	Specifies whether to turn auditing on for the table. If auditing is also enabled at the cluster level with the <code>maprcli audit data</code> command and enabled for the current volume, setting this value to <code>true</code> causes auditing to start for the table.
tabletype	Specifies whether the table will be a binary table or a JSON table. The values are <code>binary</code> and <code>json</code> . The default is <code>binary</code> .
packperm	The <a href="#">ACE</a> that controls who can pack table regions. By default, permission is given to the user ID that is used to create the table.
bulkloadperm	The <a href="#">ACE</a> that controls who can load this table with bulk loads if the table was created with bulk load support. By default, permission is given to the user ID that is used to create the table.
splitmergeperm	The <a href="#">ACE</a> that controls who can take the following actions: <ul style="list-style-type: none"> <li>Run the <code>table region split</code> and <code>table region merge</code> commands to split the table into regions or to merge regions of the table together.</li> <li>Change the value of <code>regionsizemb</code>.</li> </ul> By default, permission is given to the user ID that is used to create the table.
createrenamefamilyperm	The <a href="#">ACE</a> that controls who can create column families for this table or rename existing column families. By default, permission is given to the user ID that is used to create the table.
deletefamilyperm	The <a href="#">ACE</a> that defines access to delete column families for this table. Delimit the expression with single-quotation marks. By default, permission is given to the user ID that is used to create the table.
adminaccessperm	The <a href="#">ACE</a> that controls who can view and edit the permissions for this table. By default, permission is given to the user ID that is used to create the table.
replperm	The <a href="#">ACE</a> that controls who can set up replication either to or from a table. By default, permission is given to the user ID that is used to create the table.
indexperm	The secondary index Admin permissions setting that controls who can create an index associated with this table. By default, permission is given to the user ID that is used to create the table.

Parameter	Description
defaultversionperm	<p>The default <a href="#">ACE</a> for the version permission on new column families that are created in this table. If no value is specified, the default is u:&lt;username of the table creator&gt;. This value of the parameter <code>versionperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value.</p> <p> <b>NOTE:</b> This permission is not applicable to JSON tables. Versioning is not supported for JSON documents.</p>
defaultcompressionperm	<p><b>Applies to binary tables only:</b> The default <a href="#">ACE</a> for the compression permission on new column families that are created in this table. If no value is specified, the default is u:&lt;username of the table creator&gt;. This value of the parameter <code>compressionperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value.</p>
defaultmemoryperm	<p>The default <a href="#">ACE</a> for the memory permission on new column families that are created in this table. If no value is specified, the default is u:&lt;username of the table creator&gt;. This value of the parameter <code>memoryperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value.</p>
defaultreadperm	<p>The default <a href="#">ACE</a> for the read permission on new column families that are created in this table. If no value is specified, the default is u:&lt;username of the table creator&gt;. This value of the parameter <code>readperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. See <a href="#">table cf create</a> on page 2443 and <a href="#">table cf edit</a> on page 2449</p>
defaultwriteperm	<p>The default <a href="#">ACE</a> for the write permission on new column families that are created in this table. If no value is specified, the default is u:&lt;username of the table creator&gt;. This value of the parameter <code>writeperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. See <a href="#">table cf create</a> on page 2443 and <a href="#">table cf edit</a> on page 2449</p>
defaulttraverseperm	<p><b>Applies to JSON tables only:</b> The default Access Control Expression for the traverse permission on new column families. For more information about this permission, see <a href="#">Permission Types for Fields and Column Families in JSON Tables</a> on page 1393.</p>
defaultappendperm	<p><b>Applies to binary tables only:</b> The default <a href="#">ACE</a> for the append permission on new column families that are created in this table. If no value is specified, the default is u:&lt;username of the table creator&gt;. This value of the parameter <code>appendperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value.</p>

Parameter	Description
defaultunmaskedreadperm	The defaultunmaskedreadperm permission on table creation is set to the table creator. This setting takes effect for all new column families (and therefore also all columns/fields within all column families) unless otherwise overridden by the <code>maprcli table cf</code> or the <code>maprcli table cf colperm</code> command. This permission allows the user to read the data unmasked. Users without this permission have the masked data returned.
metricsinterval	The metrics collection interval, in seconds, for the table. Possible values: 10, 60, 600 Default: 60 seconds  When configured to 10 seconds, under normal workloads, the metrics are available in OpenTSDB in about 30 seconds. At an interval of 60 seconds, the metrics are available in about 90 seconds.   <b>NOTE:</b> You cannot disable metrics collection for a table by setting the interval to 0.
securitypolicy	The security policy or policies that apply to the table. If the parameter is not specified during table creation, the default value is uninitialized ("[-]"), and there is no security policy for the table.

### Example

Creates a HPE Ezmeral Data Fabric Database table named `newtable` in `volume1`:

CLI	<pre>/opt/mapr/bin/maprcli table create -path /volume1/newtable</pre>
REST	<pre>curl -k -X POST \ 'https://rln1.sj.us:8443/rest/table/ create?path=%2Fvolume1%2Fnewtable' \ -u mapr:mapr</pre>

### `table cf`

Manages column families for HPE Ezmeral Data Fabric Database tables.

`table cf colperm get`

Lists the Access Control Expressions (ACEs) for a specified column.

### Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the path
- `adminaccessperm` on the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Syntax

### CLI

```
maprcli table cf colperm get
  -path <path>
  -cfname <column-family name>
  [ -name <column name> ]
  [ -json | -long ]
```

### REST

```
curl -k -X GET
  'http[s]://<host>:<port>/rest/
  table/cf/colperm/get?
  path=<path>&cfname=<name>&name=<name>'

  -u <username>:<password>
```

## Parameters

Parameter	Description
path	<p>The path to the table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>test</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volumel/customer</code></li> </ul>
cfname	The name of the column family in which the column is located.
name	The name of the column that you want to list the ACEs for. If you do not specify the column name, the ACEs for all of the columns in the family are listed.
json	This command returns multiple levels of data. You must specify to display the output either in JSON or the "long" format to see the full set of information.
long	This command returns multiple levels of data. You must specify to display the output either in JSON or the "long" format to see the full set of information.

## Example

Lists ACEs for column `coll` in table `mytable` and column family `cf1`:

**CLI**

```
maprcli table cf colperm get -path /
mytable -cfname cfl -name coll -long
```

**REST**

```
curl -X GET \
'https://rln1.sj.us:8443/
rest/table/cf/colperm/get?
path=%2Fmytable&cfname=cfl&name=coll'
-u <username>:<password>
```

*table cf colperm set*

Sets access control expressions (ACEs) for a specified column.

**Permissions Required**

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- [adminaccessperm](#) on the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax****CLI**

```
/opt/mapr/bin/maprcli table cf
colperm set
  -path <path>
  -cfname <column-family name>
  -name <column name>
  [ -appendperm <Access Control
Expression for column appends> ]
  [ -readperm <Access Control
Expression for column reads> ]
  [ -writeperm <Access Control
Expression for column writes> ]
  [ -traverseperm <Access Control
Expression for column traversals in
JSON tables> ]
  [ -unmaskedreadperm <Unmasked read
column permission settings> ]
```

**REST**

```
curl -k -X POST
'http[s]://<host>:<port>/rest/
table/cf/colperm/set?
path=<path>&cfname=<name>&name=<name>&
<parameters>'
-u <username>:<password>
```

## Parameters

Parameter	Description
<b>path</b>	<p>The path to the table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>test</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
<b>cfname</b>	The name of the column family in which the column is located.
<b>name</b>	<p><b>For binary tables:</b> The name of the column for which you want to set the <a href="#">ACE</a>.</p> <p><b>For JSON tables:</b> The fieldpath of the field on which you want to set permissions. For example, if you wanted to grant <code>readperm</code> to a user on field <code>b</code> in the following document, the fieldpath would be <code>a.b</code>.</p> <pre>{   "a" : {     "b" : "value_b"   } }</pre>
<b>appendperm</b>	<p><b>Applies to binary tables only:</b> The <a href="#">ACE</a> for column appends. Use single quotation marks around the <a href="#">ACE</a>.</p> <p>Column appends require permission both at the column-family level and at the column level.</p>
<b>readperm</b>	<p>The <a href="#">ACE</a> for column reads. Use single quotation marks around the <a href="#">ACE</a>.</p> <p>Reads require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p>
<b>writeperm</b>	<p>The <a href="#">ACE</a> for column writes (puts and deletes). Use single quotation marks around the <a href="#">ACE</a>.</p> <p>Writes require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p>

Parameter	Description
traverseperm	<p><b>Applies to JSON tables only:</b> The Access Control Expressions that specifies who has permission to pass over fields in JSON documents. For example, suppose that a JSON table contains documents of this general structure:</p> <pre>{   "_id" : "ID",   "a" :     {       "b" : "value",       "c" : "value"     } }</pre> <p>Suppose further that the user <code>sjohnson</code> has read permission on <code>a.b</code>, but not on <code>a</code>. For <code>sjohnson</code> to read <code>a.b</code>, the user needs the traverse permission on <code>a</code>. The user can then pass over field <code>a</code> to <code>a.b</code>.</p> <p>This permission is inherited by fields within the column family. By default, this permission is given to the value of <code>defaulttraverseperm</code> for the JSON table.</p>
unmaskedreadperm	<p>The <code>unmaskedreadperm</code> permission, when applied to a column of a JSON table with a <a href="#">dynamic data mask</a> set, allows the user to read the data unmasked. Users without this permission have the masked data returned.</p>

### Example

Sets `readperm` ACE for column `coll` in table `mytable` and column family `cf1` :

#### CLI

```
/opt/mapr/bin/maprcli table cf
colperm set -path /mytable -cfname
cf1 -name coll -readperm 'g:group1'
```

#### REST

```
curl -X POST \
'https://r1n1.sj.us:8443/rest/
table/cf/colperm/set?
path=%2Fmytable&cfname=cf1&name=coll&r
eadperm="g:group1" ' \
-u <username>:<password>
```

*table cf colperm delete*

Deletes the Access Control Expressions (ACEs) for a specified column. Deletion cannot be undone.

 **NOTE:** When a user, group, or role requests to read data from, write data to, or append data to a column, HPE Ezmeral Data Fabric Database checks whether that user, group, or role has read or write permission for the column family AND read or write permission for the column. For example, suppose user `i_montoya` tries to write data to columns `col1` and `col2` in column family `cf1`. HPE Ezmeral Data Fabric Database checks whether `i_montoya` has write permission on `cf1` AND `col1` AND `col2`. If `i_montoya` does not have all three permissions, HPE Ezmeral Data Fabric Database returns an error that says access for the write is denied.

If this user were to try to read from the same two columns, HPE Ezmeral Data Fabric Database would simply not return the data. If the user tried to read from those two columns and additional columns on which he had read permissions, the results would contain the data for those additional columns but exclude the data for `col1` and `col2`.

### Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminaccessperm` on the table

 **NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Syntax

#### CLI

```
maprcli table cf colperm delete
-path <path>
-cfname <column-family name>
-name <column name>
```

#### REST

```
curl -k -X POST
'http[s]://<host>:<port>/
rest/table/cf/colperm/delete?
path=<path>&cfname=<name>&name=<name>'
-u <username>:<password>
```

 **NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Parameters

Parameter	Description
<b>path</b>	<p>The path to the table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>test</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
<b>cfname</b>	The name of the column family in which the column is located.
<b>name</b>	The name of the column that you want to delete the ACEs for.

### Example

Deletes ACEs for column `coll` in table `mytable` and column family `cf1`:

#### CLI

```
maprcli table cf
colperm delete -path /mytable -cfname
cf1 -name coll
```

#### REST

```
curl -X POST \
  'https://r1n1.sj.us:8443/
rest/table/cf/colperm/delete?
path=%2Fmytable&cfname=cf1&name=coll'
  \
  -u <username>:<password>
```

*table cf column securitypolicy add*

Adds one or more security policies to the existing list of policies associated with a field in a HPE Ezmeral Data Fabric Database JSON table.

### Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax**

CLI	<pre>maprcli table cf column securitypolicy add   -path &lt;path&gt;   -cfname &lt;column family name&gt;   -column &lt;JSON table field&gt;   -securitypolicy &lt;comma-delimited list of policies&gt;</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/table/cf/ column/securitypolicy/add? path=&lt;path&gt;&amp;cfname=&lt;column-family-name&gt;&amp; column=&lt;JSON-table-field&gt;&amp;securitypolicy =&lt;policies&gt;</pre>

**Parameters**

Parameter	Description
path	<p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
cfname	The name of the column family of the JSON table field to which the security policies will be added.
column	The JSON table field.
securitypolicy	The list of security policy tags to be added to the JSON table field.

**Example**

Adds the security policy named `newpolicy` to the `sales` field in the default column family of a Data Fabric table named `table1`:

CLI	<pre>maprcli table securitypolicy add   -path "/table1"   -cfname "default"   -column "sales"   -securitypolicy "newpolicy"</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/table/cf/ column/securitypolicy/add?path=/ table1&amp;cfname=default&amp;column=sales&amp;secur itypolicy=newpolicy</pre>

*table cf column datamask set*

Sets the data mask on one or more JSON table columns.

To set a [dynamic data mask](#) for a column within a column family (CF) of a JSON table, use the `maprcli table cf column datamask set` command. For columns with existing data, the dynamic data masks will apply to all future SCAN and GET queries for that table column without any client-side or application changes.

**Syntax****CLI**

```
maprcli table cf column datamask set
  -path <table-path>
  -cfname <column family name>
  -name <column-name>
  -datamask <mask-name>
```

**REST**

```
http[s]://<host>:<port>/rest/table/cf/
column/datamask/set?<parameters>
```

**Parameters**

Parameter	Description
path	<p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
cfname	The name of the column family of the JSON table field to which the data mask will be added.
name	The JSON table field.
datamask	<p>The name of the data mask. This must be one of the <a href="#">predefined data masks</a>. At most one dynamic data mask can be set for a specific column at a time. Obtain supported mask names using the <code>maprcli security datamask list</code> command.</p> <p> <b>NOTE:</b> Using an empty string for a datamask removes all datamasks from the column family. For example:</p> <pre>maprcli table cf column datamask set -path / mytable -cfname default -name a -datamask ""</pre>

## Example

### CLI

```
maprcli table cf column datamask
set -path /table1 -cfname default \
-name Creditcard -datamask
mrddm_last4
```

### REST

```
curl -X POST \
'https://r1n1.sj.us:8443/rest/
table/cf/column/datamask/set?path=/
table1 \

&cfname=default&name=Creditcard&datama
sk=mrddm_last4' -u
<username>:<password>
```

```
table cf column datamask get
```

Retrieves the data mask used by one or more JSON table columns.

**Syntax****CLI**

```
maprcli table cf column datamask get
-path <table-path>
-cfname <column family name>
[ -name <column-name>]
```

**REST**

```
http[s]://<host>:<port>/rest/table/cf/
column/datamask/get?<parameters>
```

**Parameters**

Parameter	Description
path	<p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
cfname	The name of the column family of the JSON table field from which the data mask will be retrieved.
name	The JSON table field. This parameter is optional. If omitted, the query returns all columns for the specified column family that have associated dynamic data masks.

**Example****CLI**

```
maprcli table cf column
datamask get -path /table1 -cfname
default -json

{
  "timestamp":1612303576139,
  "timeofday":"2021-02-02
02:06:16.139 GMT-0800 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "name":"Creditcard",
```

```

        "datamask": "mrddm_last4"
    }
]
}

```

## REST

```

curl -k -X POST 'https://
rln1.sj.us:8443/rest/table/cf/column/
datamask/get?path=/table1
&cfname=default' -u mapr:mapr

```

*table cf column datamask remove*

Removes the data mask used by one or more JSON table columns.

If the column does not currently have a [dynamic data mask](#) set, this command returns successfully with no changes.

## Syntax

### CLI

```
maprcli table cf column datamask
remove
  -path <table-path>
  -cfname <column family name>
  -name <column-name>
```

### REST

```
http[s]://<host>:<port>/rest/table/cf/
column/datamask/remove?<parameters>
```

## Parameters

Parameter	Description
path	<p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
cfname	The name of the column family of the JSON table field.
name	The JSON table field to check for a dynamic data mask

## Example

### CLI

```
maprcli table cf column
datamask remove -path /table1 -cfname
default -name CC
```

### REST

```
curl -X GET \
  'https://r1n1.sj.us:8443/rest/
table/cf/column/datamask/remove?path=
table1 \
  &cfname=default&name=CC' -u
<username>:<password>
```

*table cf column list*

Lists column-level attributes including any dynamic data masking properties set for JSON table columns.

## Syntax

### CLI

```
maprcli table cf column list -path
<table-path>
  -cfname <column family name>
  [ -name <column-name>
```

### REST

```
http[s]://<host>:<port>/rest/table/cf/
column/list?<parameters>
```

## Parameters

Parameter	Description
path	<p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
cfname	The name of the column family of the JSON table field.
name	The JSON column family field to list attributes. If omitted, all columns for the specified column family that have associated column-level attributes are returned.

### Example

In the following example, only user `mapr` can read column `Creditcard` from the default CF of table `/table1` unmasked. User `user1` can read the `Creditcard` column, but it will be masked:

#### CLI

```
maprcli table cf colperm set -path /
table1--cfname default \
-name Creditcard -readperm "u:user1|
u:mapr" -unmaskedreadperm "u:mapr" \
-writeperm "u:mapr"

maprcli table cf
column securitypolicy set -path /
table1 -cfname default \
-name Creditcard -securitypolicy pci

maprcli table cf column datamask set
-path /table1 -cfname default \
-name Creditcard -datamask
mrddm_last4

maprcli table cf column list -path /
table1 -cfname default -json

{
  "timestamp":1612303576139,
  "timeofday":"2021-02-02
02:06:16.139 GMT-0800 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
```

```

    "name": "Creditcard",
    "aces": {
      "readperm": "u:user1|u:mapr",
      "unmaskedreadperm": "u:mapr",
      "writeperm": "u:mapr"
    },
    "securitypolicy": "pci",
    "datamask": "mrddm_last4"
  }
]

```

*table cf column securitypolicy list*

Displays the list of security policies associated with a field in a HPE Ezmeral Data Fabric Database JSON table.

**Permissions Required**

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax****CLI**

```
maprcli table cf column
securitypolicy list
  -path <path>
  -cfname <column family name>
  -column <JSON table field>
```

**REST**

```
http[s]://<host>:<port>/rest/table/cf/
column/securitypolicy/list?
path=<path>&cfname=<name>&column=<JSON
N-table-field>
```

**Parameters**

Parameter	Description
path	<p>The path to the table.</p> <ul style="list-style-type: none"> <li>• For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>• For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>test</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
cfname	The name of the column family.
column	The JSON table field.

**Example**

This example lists the security policies associated with the `sales` field in the `default` column family of the JSON table `jtable`.

**CLI**

```
maprcli table cf
column securitypolicy list -path /
```

```
my.cluster.com/volume1/jtable -cfname
default -column sales
```

**REST**

```
https://r1n1.sj.us:8443/rest/table/cf/
securitypolicy/list?
path=%2Fmy.cluster.com%2Fvolume1%2Fjta
ble' &cfname=default &column=sales
```

**Example Output**

```
{
  "timestamp":1539674179277,
  "timeofday":"2018-10-16 12:16:19.277 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "securitypolicy":["Sales"]
    }
  ]
}
```

*table cf column securitypolicy remove*

Removes one or more security policies from the list of security policies associated with a field in a HPE Ezmeral Data Fabric Database JSON table.

**Permissions Required**

To run this command, your user ID must have the following permissions:

- adminaccessperm on the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax**

CLI	<pre>maprcli table cf column securitypolicy remove   -path &lt;path&gt;   -cfname &lt;column family name&gt;   -column &lt;JSON table field&gt;   -securitypolicy &lt;comma-delimited list of policies&gt;</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/table/cf/ column/securitypolicy/remove? path=&lt;path&gt;&amp;cfname=&lt;column-family-name&gt;&amp; column=&lt;JSON-table-field&gt;&amp;securitypolicy =&lt;policies&gt;</pre>

## Parameters

Parameter	Description
path	<p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
cfname	The name or names of the column families containing the security policies you want to remove.
column	The JSON table field.
securitypolicy	The security policy tags to be removed from the list of security policies for the specified JSON table field.

### Example

Removes the security policy named `newpolicy` from the `sales` field in the default column family of a JSON table named `table1`:

CLI	<pre>maprcli table cf column securitypolicy remove   -path "/table1"   -cfname "default"   -column "sales"   -securitypolicy "newpolicy"</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/table/cf/ securitypolicy/remove?path=/ table1&amp;cfname=default&amp;column=sales&amp;secu ritypolicy=newpolicy</pre>

*table cf column securitypolicy set*

Replaces the existing list of security policies associated with a field in a HPE Ezmeral Data Fabric Database JSON table with one or more new security policies.

### Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax**

CLI	<pre>maprcli table cf column securitypolicy set   -path &lt;path&gt;   -cfname &lt;column family name&gt;   -column &lt;JSON table field&gt;   -securitypolicy &lt;comma-delimited list of policies&gt;</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/table/cf/ column/securitypolicy/set? path=&lt;path&gt;&amp;cfname=&lt;column-family-name&gt;&amp; column=&lt;JSON-table-field&gt;&amp;securitypolicy =&lt;policies&gt;</pre>

**Parameters**

Parameter	Description
path	<p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
cfname	The name of the column family of the JSON table field for which the security policies will be replaced.
column	The JSON table field
securitypolicy	The list of security policy tags to be replaced in the JSON table field.

**Example**

Replaces the security policy for the `sales` field in the `default` column family of a Data Fabric table named `table1` with a new security policy named `newpolicy`:

CLI	<pre>maprcli table securitypolicy set   -path "/table1"   -cfname "default"   -column "sales"   -securitypolicy "newpolicy"</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/table/ securitypolicy/set?path=/ table1&amp;cfname=default&amp;column=sales&amp;secur itypolicy=newpolicy</pre>

*table cf create*

Creates a column family for a HPE Ezmeral Data Fabric binary or JSON table.

**Permissions Required**

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `createrenamefamilyperm` on the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax****CLI**

```
/opt/mapr/bin/maprcli table cf create
-path <Table path >
-cfname <Column family name >
[ -minversions <Min versions to
keep> Default: 0 ]
[ -maxversions <Max versions to
keep> Default: 1 ]
[ -ttl <Time to live> Enter 0 for
forever, otherwise, enter time in
seconds. Default: 0 ]
[ -inmemory <In-memory> Default:
false ]
[ -compression <off|lzf|lz4|zlib>
Default: table's compression setting
is applied. ]
[ -versionperm <Version
Permissions> ]
[ -compressionperm <Compression
Permissions> ]
[ -memoryperm <Memory Permissions> ]
[ -readperm <Read Permissions> ]
[ -writeperm <Write Permissions> ]
[ -appendperm <Append
Permissions> ]
[ -unmaskedreadperm <CF Unmasked
Read Permission> ]
[ -jsonpath Json <Family Path -
needed for JSON column family, like
a.b.c> ]
[ -securitypolicy <comma-delimited
list of policies> ]
[ -force <Force create non-default
column family for json tabletype>
Default: false ]
[ -traverseperm <Traverse
Permissions> ]
```

**REST**

```
curl -k -X POST
'http[s]://<host>:<port>/rest/
table/cf/create?
```

```
path=<path>&cfname=<name>&<parameters>
-u <username>:<password>
```

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Parameters

Parameter	Description
path	<p>The path to the table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>test</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
cfname	The name of the column family to create.
minversions	<b>Applies to binary tables only:</b> Minimum number of versions of column values to keep. The default is zero.
maxversions	<b>Applies to binary tables only:</b> Maximum number of versions of column values to keep. The default is one.
ttl	<p>Time to live in seconds. When the age of the data in this column family exceeds the value of the <code>ttl</code> parameter, the data is purged. Setting the value of <code>ttl</code> to 0 is equivalent to allowing data to remain indefinitely. Default: 0</p> <p> <b>NOTE:</b> If the value of <code>-ttl</code> for an existing column family in a JSON table is not 0, you cannot add another column family. You also cannot set the TTL for a JSON table if it has secondary indexes. See <a href="#">Setting TTL for Data</a>.</p>

Parameter	Description
inmemory	<p>Boolean. Determines whether preference is given to values of this column family for storage with row keys. Because row keys are cached in memory in preference to row data, column-family data that is stored inline with the row keys is also cached in memory.</p> <p>For all column families in a table together, up to 200 bytes of row data will be stored inline with each row key. Storing data inline with a row key might speed retrieval of the data from a column family because disk access can often be avoided. For each column family, up to 32 bytes can be stored inline with each row key even if its <code>inmemory</code> parameter is set to <code>false</code>, but preference will be given to column families where this parameter is set to <code>true</code>. A column family can have more than 32 bytes stored inline if its <code>inmemory</code> parameter is set to <code>true</code>.</p> <p>If the total number of bytes for all column families together exceeds 200 for a row, then preference for inclusion within the inline storage for that row is given to column families that have the <code>inmemory</code> parameter set to <code>true</code>.</p> <p> <b>NOTE:</b> All of the data for a column family are either stored in-line with the row key, or not stored at all. If the contents in a column family for a particular row are larger than the maximum number of bytes that are allowed to be stored for that column family, then data is not stored in-line for that column family.</p> <p>The default value for the <code>inmemory</code> parameter is <code>false</code>.</p>
compression	<p>The compression setting to use for the column family. Valid options are <code>off</code>, <code>lzf</code>, <code>lz4</code>, and <code>zlib</code>. The default setting is equal to the compression setting for the directory in which the table is located. To find out whether a directory is compressed and the type of compression, see <a href="#">Turning Compression On or Off on Directories Using the CLI</a> on page 1321.</p>
versionperm	<p><b>Applies to binary tables only:</b> <a href="#">ACE</a> for changing the value of the <code>maxversions</code> and <code>minversions</code> parameters. By default, permission is given to the value of <code>defaultversionperm</code> for the table.</p>
compressionperm	<p><b>Applies to binary tables only:</b> <a href="#">ACE</a> for changing the value of the <code>compression</code> parameter. By default, permission is given to the value of <code>defaultcompressionperm</code> for the table.</p>
memoryperm	<p>The <a href="#">ACE</a> for changing the value of the <code>inmemory</code> parameter. Use single quotation marks around the <a href="#">ACE</a>. By default, permission is given to the value of <code>defaultmemoryperm</code> for the table.</p>

Parameter	Description
readperm	<p>The <a href="#">ACE</a> for column reads. Use single quotation marks around the <a href="#">ACE</a>.</p> <p>Reads require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> <p>By default, permission is given to the value of <code>defaultreadperm</code> for the table.</p>
writeperm	<p>The <a href="#">ACE</a> for column writes (puts and deletes). Use single quotation marks around the <a href="#">ACE</a>.</p> <p>Writes require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> <p>By default, permission is given to the value of <code>defaultwriteperm</code> for the table.</p>
appendperm	<p><b>Applies to binary tables only:</b> The <a href="#">ACE</a> for column appends. Use single quotation marks around the <a href="#">ACE</a>.</p> <p>Column appends require permission both at the column-family level and at the column level. By default, permission is given to the value of <code>defaultappendperm</code> for the table.</p>
jsonpath	<p><b>Applies to JSON tables only:</b> Specifies the path to the column family. The path is in dotted notation. For example, suppose the table contained JSON documents that were of this general structure:</p> <pre data-bbox="820 1123 1453 1459"> {   "_id" : "ID",   "a" :     {       "b" :         {           "c" : "value",         },       "e" : "value"     } } </pre> <p>You want to create a column family at the field <code>d</code> in the new path <code>a.b.d</code> because you plan to store image files in fields in that column family.</p> <p> <b>IMPORTANT:</b> Ensure that the field at which you want to create the column family does not yet exist. Also ensure that there are no secondary indexes defined on the field. If the field does exist or is a field in an index, the data in the field could become inaccessible after you create the column family.</p> <p> <b>RESTRICTION:</b> As of release 6.0, a column family cannot be deleted from a JSON table.</p>

Parameter	Description
securitypolicy	The security policy or policies that apply to the column family. One or more tags can be assigned to a column family at the same time. If a security policy is not specified during column-family creation, the column family inherits the table <code>securitypolicy</code> value as its own security policy at runtime. If a security policy is specified during column-family creation, the table security policy is enforced followed by the column-family security policy.
force	<b>Applies to JSON tables only:</b> By default, every time you try to create a non-default column family in a JSON table, this command fails and returns a warning message that you should ensure there is no existing data at the specified path. Set this parameter to <code>true</code> if you want to override this warning mechanism and create a column family.
traverseperm	<p><b>Applies to JSON tables only:</b> The Access Control Expressions that specifies who has permission to pass over fields in JSON documents. For example, suppose that a JSON table contains documents of this general structure:</p> <pre data-bbox="824 848 1458 1104"> {   "_id" : "ID",   "a" :     {       "b" : "value",       "c" : "value"     } } </pre> <p>Suppose further that the user <code>sjohnson</code> has read permission on <code>a.b</code>, but not on <code>a</code>. For <code>sjohnson</code> to read <code>a.b</code>, the user needs the traverse permission on <code>a</code>. The user can then pass over field <code>a</code> to <code>a.b</code>.</p> <p>This permission is inherited by fields within the column family. By default, this permission is given to the value of <code>defaulttraverseperm</code> for the JSON table.</p>
unmaskedreadperm	<p>The <code>unmaskedreadperm</code> permission, when applied to a column of a JSON table with a <a href="#">dynamic data mask</a> set, allows the user to read the data unmasked. Users without this permission have the masked data returned.</p> <p>Default <code>unmaskedreadperm</code> permission on column family creation is set to the table-level <code>defaultunmaskedreadperm</code> permission set using the <code>maprcli table create</code> or the <code>maprcli table edit</code> command unless the <code>unmaskedreadperm</code> permission is specified when creating the column family. This setting will take effect for all new columns/fields within this CF) unless otherwise overridden by the <code>maprcli table cf colperm</code> command.</p>

**NOTE:** If a field is specified as a column family JSON path name, that field cannot be defined as either an indexed or included field when creating an index. For example, suppose you have the following JSON table:

```
{
  "_id" : "ID",
  "a" :
  {
    "b" :
    {
      "c" : "value",
      "d" : "value"
    },
    "e" : "value"
  }
}
```

If you created a column family at field `c` in the JSON path `a.b.c`, when creating an index, field `a.b.c` cannot be defined as an indexed or included field. However, you can define, as either an indexed or included field, fields `a`, `a.b`, `a.b.d`.

### Example

Creates a new column family `mynewcf` for table `mytable`, keeping four versions in memory:

#### CLI

```
/opt/mapr/bin/maprcli table cf
create -path /volume1/mytable -cfname
mynewcf \
  -maxversions 4 -inmemory true
```

#### REST

```
curl -X POST \
  'https://r1n1.sj.us:8443/rest/
table/cf/create?
path=%2Fvolume1%2Fmytable&cfname=mynew
cf&maxversions=4&inmemory=true' \
  -u <username>:<password>
```

*table cf delete*

Deletes a column family from a HPE Ezmeral Data Fabric Database binary table or JSON table. Deletion cannot be undone.

**IMPORTANT:** As of release 6.0, a column family cannot be deleted from a JSON table.

### Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `deletefamilyperm` on the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Syntax

### CLI

```
maprcli table cf delete
  -path <path>
  -cfname <name>
```

### REST

```
curl -k -X POST
  'http[s]://
  <host>:<port>/rest/table/cf/delete?
  path=<path>&cfname=<name>'
  -u <username>:<password>
```

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Parameters

Parameter	Description
path	<p>The path to the table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>test</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
cfname	<p>The name of the column family to delete.</p> <p> <b>NOTE:</b> In JSON tables, it is not possible to delete column families in addition to the default column family.</p>

## Example

Deletes a column family `mycf` from table `thetable`:

### CLI

```
maprcli table cf delete -path /
  volume1/thetable -cfname mycf
```

### REST

```
curl -X POST \
  'https://r1n1.sj.us:8443/rest/
  table/cf/delete?
  path=%2Fvolume1%2Fthetable&cfname=mycf' \
  -u <username>:<password>
```

*table cf edit*

Edits a column family in a binary table or JSON table.

## Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `createrenamefamilyperm` on the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Syntax

### CLI

```

/opt/mapr/bin/maprcli table cf edit
-path <Table path >
-cfname <Column family name>
 [ -newcfname <New column family
name> ]
 [ -minversions <Min versions to
keep> ]
 [ -maxversions <Max versions to
keep> ]
 [ -ttl <Time to live> Enter 0 for
forever, otherwise, enter time in
seconds. Default: 0 ]
 [ -inmemory <In-memory> ]
 [ -compression <off|lzf|lz4|zlib> ]
 [ -versionperm <Version
Permissions> ]
 [ -compressionperm <Compression
Permissions> ]
 [ -memoryperm <Memory Permissions> ]
 [ -readperm <Read Permissions> ]
 [ -writeperm <Write Permissions> ]
 [ -appendperm <Append Permissions> ]
 [ -traverseperm <Traverse
Permissions> ]
 [ -unmaskedreadperm <CF Unmasked
Read Permission> ]

```

### REST

```

curl -k -X POST
'http[s]://<host>:<port>/rest/
table/cf/edit?
path=<path>&cfname=<name>&<parameters>
'
-u <username>:<password>

```

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Parameters

Parameter	Description
path	<p>The path to the table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test</li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer</li> </ul>
cname	The name of the column family to edit.
newcname	The new name to give to the column family.
minversions	<b>Applies to binary tables only:</b> Minimum number of versions of column values to keep. The default is zero.
maxversions	<b>Applies to binary tables only:</b> Maximum number of versions of column values to keep. The default is one.
ttl	<p>Time to live in seconds. When the age of the data in this column family exceeds the value of the ttl parameter, the data is purged. Setting the value of ttl to 0 is equivalent to allowing data to remain indefinitely. Default: 0</p> <p> <b>NOTE:</b> If the value of -ttl for an existing column family in a JSON table is not 0, you cannot add another column family. You also cannot set the TTL for a JSON table if it has secondary indexes. See <a href="#">Setting TTL for Data</a>.</p>

Parameter	Description
inmemory	<p>Boolean. Determines whether preference is given to values of this column family for storage with row keys. Because row keys are cached in memory in preference to row data, column-family data that is stored inline with the row keys is also cached in memory.</p> <p>For all column families in a table together, up to 200 bytes of row data will be stored inline with each row key. Storing data inline with a row key might speed retrieval of the data from a column family because disk access can often be avoided. For each column family, up to 32 bytes can be stored inline with each row key even if its <code>inmemory</code> parameter is set to <code>false</code>, but preference will be given to column families where this parameter is set to <code>true</code>. A column family can have more than 32 bytes stored inline if its <code>inmemory</code> parameter is set to <code>true</code>.</p> <p>If the total number of bytes for all column families together exceeds 200 for a row, then preference for inclusion within the inline storage for that row is given to column families that have the <code>inmemory</code> parameter set to <code>true</code>.</p> <p> <b>NOTE:</b> All of the data for a column family will be stored in-line with the row key, or none will be. If the contents in a column family for a particular row are larger than the maximum number of bytes that are allowed to be stored for that column family, no data at all will be stored in-line for that column family.</p> <p>The default value for the <code>inmemory</code> parameter is <code>false</code>.</p>
compression	<p>The compression setting to use for the column family. Valid options are <code>off</code>, <code>lzf</code>, <code>lz4</code>, and <code>zlib</code>. The default setting is equal to the compression setting for the directory in which the table is located. To find out whether a directory is compressed and the type of compression, see <a href="#">Turning Compression On or Off on Directories Using the CLI</a> on page 1321.</p>
versionperm	<p><b>Applies to binary tables only:</b> <a href="#">ACE</a> for changing the value of the <code>maxversions</code> and <code>minversions</code> parameters. By default, permission is given to the value of <code>defaultversionperm</code> for the table.</p>
compressionperm	<p><b>Applies to binary tables only:</b> <a href="#">ACE</a> for changing the value of the <code>compression</code> parameter. By default, permission is given to the value of <code>defaultcompressionperm</code> for the table.</p>
memoryperm	<p><a href="#">ACE</a> for changing the value of the <code>inmemory</code> parameter. Use single quotation marks around the <a href="#">ACE</a>. By default, permission is given to the value of <code>defaultmemoryperm</code> for the table.</p>

Parameter	Description
readperm	<p>The <a href="#">ACE</a> for column reads. Use single quotation marks around the <a href="#">ACE</a>.</p> <p>Reads require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> <p>By default, permission is given to the value of <code>defaultreadperm</code> for the table.</p>
writeperm	<p>The <a href="#">ACE</a> for column writes (puts and deletes). Use single quotation marks around the <a href="#">ACE</a>.</p> <p>Writes require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> <p>By default, permission is given to the value of <code>defaultwriteperm</code> for the table.</p>
appendperm	<p><b>Applies to binary tables only:</b> <a href="#">ACE</a> for column appends. Use single quotation marks around the <a href="#">ACE</a>.</p> <p>Column appends require permission both at the column-family level and at the column level. By default, permission is given to the value of <code>defaultappendperm</code> for the table.</p>
traverseperm	<p><b>Applies to JSON tables only:</b> The Access Control Expressions that specifies who has permission to pass over fields in JSON documents. For example, suppose that a JSON table contains documents of this general structure:</p> <pre data-bbox="820 1150 1458 1402"> {   "_id" : "ID",   "a" :   {     "b" : "value",     "c" : "value"   } } </pre> <p>Suppose further that the user <code>sjohnson</code> has read permission on <code>a.b</code>, but not on <code>a</code>. For <code>sjohnson</code> to read <code>a.b</code>, the user needs the traverse permission on <code>a</code>. The user can then pass over field <code>a</code> to <code>a.b</code>.</p> <p>This permission is inherited by fields within the column family. By default, this permission is given to the value of <code>defaulttraverseperm</code> for the JSON table.</p>

Parameter	Description
unmaskedreadperm	<p>The <code>unmaskedreadperm</code> permission, when applied to a column of a JSON table with a <a href="#">dynamic data mask</a> set, allows the user to read the data unmasked. Users without this permission have the masked data returned.</p> <p>Default <code>unmaskedreadperm</code> permission on column family creation is set to the table-level <code>defaultunmaskedreadperm</code> permission set using the <code>maprcli table create</code> or the <code>maprcli table edit</code> command unless the <code>unmaskedreadperm</code> permission is specified when creating the column family. This setting will take effect for all new columns/fields within this CF) unless otherwise overridden by the <code>maprcli table cf colperm</code> command.</p>

**NOTE:** If a field is specified as a column family JSON path name, that field cannot be defined as either an indexed or included field when creating an index. For example, suppose you have the following JSON table:

```
{
  "_id" : "ID",
  "a" :
    {
      "b" :
        {
          "c" : "value",
          "d" : "value"
        },
      "e" : "value"
    }
}
```

If you created a column family at field `c` in the JSON path `a.b.c`, when creating an index, field `a.b.c` cannot be defined as an indexed or included field. However, you can define, as either an indexed or included field, fields `a`, `a.b`, `a.b.d`.

### Example

Changes the name of a column family in table `mytable` from `mycf` to `mynewcfname`. Also changes the time to live setting.

#### CLI

```
/opt/mapr/bin/maprcli table
cf edit -path /my.cluster.com/volume1/
mytable -cfname mycf \
-newcfname mynewcfname -ttl 86400
```

#### REST

```
curl -k -X POST \
'https://r1n1.sj.us:8443/rest/
table/cf/edit?
path=%2Fmy.cluster.com%2Fvolume1%2Fmyt
able&cfname=mycf&newcfname=mynewcfname
&ttl=86400' \
-u mapr:mapr
```

*table cf list*

Lists the column families for a HPE Ezmeral Data Fabric table.

## Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the path
- `adminaccessperm` on the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Syntax

### CLI

```
maprcli table cf list
  -path <path>
  [ -cfname <name>]
  [ -showcol [true|false]]
```

### REST

```
curl -k -X GET \
  'http[s]://<host>:<port>/rest/
  table/cf/list? \

  path=<path>&cfname=<name>&showcol=[tru
  e|false]' \
  -u <username>:<password>
```

## Parameters

Parameter	Description
path	<p>The path to the table.</p> <ul style="list-style-type: none"> <li>• For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>• For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>test</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
cfname	The name of the column family.
showcol	Set to <code>false</code> by default. If set to <code>true</code> , then all column-level attributes for this column family are displayed.

**Output Fields**

Verbose Field Name	Terse Field Name	Field Value
inmemory	inmem	Whether or not this column value resides in memory
cfname	n	The column family name
maxversions	vmax	Maximum number of versions for this column family
minversions	vmin	Minimum number of versions for this column family
compression	comp	Compression scheme used for this column family
ttl	ttl	Time to live for this column family
compressionperm	pcomp	<b>Applies to binary tables only:</b> <a href="#">ACE</a> for changing the value of the <code>compression</code> parameter. By default, permission is given to the value of <code>defaultcompressionperm</code> for the table.
memoryperm	pmem	<a href="#">ACE</a> for changing the value of the <code>inmemory</code> parameter. Use single quotation marks around the <a href="#">ACE</a> . By default, permission is given to the value of <code>defaultmemoryperm</code> for the table.
readperm	pread	The <a href="#">ACE</a> for column reads. Use single quotation marks around the <a href="#">ACE</a> .  Reads require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.  By default, permission is given to the value of <code>defaultreadperm</code> for the table.

Verbose Field Name	Terse Field Name	Field Value
traverseperm	ptraverse	<p><b>Applies to JSON tables only:</b> The Access Control Expressions that specifies who has permission to pass over fields in JSON documents. For example, suppose that a JSON table contains documents of this general structure:</p> <pre data-bbox="1040 432 1464 743"> {   "_id" : "ID",   "a" :     {       "b" :         "value",       "c" :         "value"     } } </pre> <p>Suppose further that the user <code>sjohnson</code> has read permission on <code>a.b</code>, but not on <code>a</code>. For <code>sjohnson</code> to read <code>a.b</code>, the user needs the traverse permission on <code>a</code>. The user can then pass over field <code>a</code> to <code>a.b</code>.</p> <p>This permission is inherited by fields within the column family. By default, this permission is given to the value of <code>defaulttraverseperm</code> for the JSON table.</p>
writeperm	pwrite	<p>The <a href="#">ACE</a> for column writes (puts and deletes). Use single quotation marks around the <a href="#">ACE</a>.</p> <p>Writes require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> <p>By default, permission is given to the value of <code>defaultwriteperm</code> for the table.</p>

Verbose Field Name	Terse Field Name	Field Value
unmaskedreadperm	punmasked	<p>The <code>unmaskedreadperm</code> permission, when applied to a column of a JSON table with a <a href="#">dynamic data mask</a> set, allows the user to read the data unmasked. Users without this permission have the masked data returned.</p> <p>Default <code>unmaskedreadperm</code> permission on column family creation is set to the table-level <code>defaultunmaskedreadperm</code> permission set using the <code>maprcli table create</code> or the <code>maprcli table edit</code> command unless the <code>unmaskedreadperm</code> permission is specified when creating the column family. This setting will take effect for all new columns/fields within this CF) unless otherwise overridden by the <code>maprcli table cf colperm</code> command.</p>

### Example

This example lists all column families for the table `newtable`.

#### CLI

```
maprcli table cf list -path /
my.cluster.com/volume1/newtable
```

#### REST

```
curl -X GET \
'https://r1n1.sj.us:8443/rest/
table/cf/list?
path=%2Fmy.cluster.com%2Fvolume1%2Fnew
table' \
-u <username>:<password>
```

### Example Output

```
[user@node]# maprcli table cf list -path /mapr/default/user/user/newtable
comp  inmem  vmax  n      ttl      vmin
lz4   false  3     dine   2147483647  0
lz4   false  3     nahashchid 2147483647  0
lz4   false  3     wollachee 2147483647  0
```

This example shows the security policies for the `default` column family of the JSON table, `jtable`.

#### CLI

```
maprcli table cf list -path /
my.cluster.com/volume1/jtable -cname
default -json
```

#### REST

```
curl -X GET \
'https://r1n1.sj.us:8443/rest/
table/cf/list?
path=%2Fmy.cluster.com%2Fvolume1%2Fjta
```

```
ble' &cfname=default \
-u <username>:<password>
```

### Example Output

```
{
  "timestamp":1539674179277,
  "timeofday":"2018-10-16 12:16:19.277 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cfname":"default",
      "maxversions":1,
      "minversions":0,
      "ttl":2147483647,
      "inmemory":false,
      "compression":"lz4",
      "securitypolicy":["Lab_Security_Policy,Sensitive_Data"],
      "compressionperm":"u:root",
      "memoryperm":"u:root",
      "readperm":"u:root",
      "traverseperm":"u:root",
      "writeperm":"u:root",
      "unmaskedreadperm":"u:mapr",
    }
  ]
}
```

In the following example, only user `mapr` can read column `Creditcard` from the default CF of table / `table1` **unmasked**. User `user1` can read the `Creditcard` column, but it will be masked: .

#### CLI

```
maprcli table cf list -path /
table1 -cfname default -json -showcol
true
```

#### REST

```
curl -X GET \
      'https://
rln1.sj.us:8443/rest/table/cf/list?
path=%2Ftable1&cfname=default \
      &showcol=true' -u
<username>:<password>
```

*table cf securitypolicy add*

Specifies new security policies to be associated with an existing column family for a HPE Ezmeral Data Fabric Database JSON table.

#### Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax**

CLI	<pre>maprcli table cf securitypolicy add -path &lt;path&gt; -cfname &lt;column family name&gt; -securitypolicy &lt;comma-delimited list of policies&gt;</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/table/cf/ securitypolicy/add? path=&lt;path&gt;&amp;cfname=&lt;col-family-name&gt;&amp;sec uritypolicy=&lt;policies&gt;</pre>

**Parameters**

Parameter	Description
path	<p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
cfname	The name of the column family to which security policies will be added.
securitypolicy	The security policy tags to be added to the list of security policies for the specified column family.

**Example**

Adds the security policy named `newpolicy` to the column family `mycf` for a Data Fabric table named `table1`:

CLI	<pre>maprcli table cf securitypolicy add -path "/table1" -cfname "mycf" -securitypolicy "newpolicy"</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/table/cf/ securitypolicy/add?path=/ table1&amp;cfname=mycf&amp;securitypolicy=newpol icy</pre>

*table cf securitypolicy remove*

Removes specified security policies associated with a column family within a HPE Ezmeral Data Fabric Database JSON table.

## Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Syntax

CLI	<pre>maprcli table cf securitypolicy remove -path &lt;path&gt; -cfname &lt;column family name&gt; -securitypolicy &lt;comma-delimited list of policies&gt;</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/ table/cf/securitypolicy/remove? path=&lt;path&gt;&amp;securitypolicy=&lt;policies&gt;</pre>

## Parameters

Parameter	Description
path	<p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> <li>• For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>• For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
cfname	The name or names of the column families containing the security policies you want to remove.
securitypolicy	The security policy tags to be removed from the list of security policies for the specified column family.

## Example

Removes the security policy named `newpolicy` from the default column family of a Data Fabric table named `table1`:

CLI	<pre>maprcli table cf securitypolicy remove -path "/table1" -cfname "default" -securitypolicy "newpolicy"</pre>
-----	-----------------------------------------------------------------------------------------------------------------

REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/table/cf/ securitypolicy/remove?path=/ table1&amp;cfname=default&amp;securitypolicy=new policy</pre>
------	----------------------------------------------------------------------------------------------------------------------------------------------------

*table cf securitypolicy set*

Replaces a security policy associated with a column family for a HPE Ezmeral Data Fabric Database JSON table with a new security policy.

### Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table.

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Syntax

CLI	<pre>maprcli table cf securitypolicy set -path &lt;path&gt; -cfname &lt;column family name&gt; -securitypolicy &lt;comma-delimited list of policies&gt;</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/table/cf/ securitypolicy/set? path=&lt;path&gt;&amp;cfname=&lt;column-family-name&gt;&amp; securitypolicy=&lt;policies&gt;</pre>

### Parameters

Parameter	Description
path	The path to the HPE Ezmeral Data Fabric Database table. <ul style="list-style-type: none"> <li>• For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>• For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
cfname	The name of the column family for which security policies will be replaced.
securitypolicy	The security policy tags to be replaced in the list of security policies for the specified column family.

**Example**

Replaces the security policy for the column family `mycf` for a Data Fabric table named `table1` with a new security policy named `newpolicy`:

CLI	<pre>maprcli table cf securitypolicy set -path "/table1" -cfname "mycf" -securitypolicy "newpolicy"</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/table/cf/ securitypolicy/set?path=/ table1&amp;cfname=mycf&amp;securitypolicy=newpol icy</pre>

**table changelog**

These `maprcli` commands are used to create and manage Change Data Capture (CDC) changelogs. A changelog is used to establish a relationship between a HPE Ezmeral Data Fabric Database source table (JSON or binary) and a HPE Ezmeral Data Fabric Streams stream topic and to manage the propagation process.

*table changelog add*

**Description**

Creates a changelog and creates a stream topic if one does not already exist. A changelog establishes a relationship between a HPE Ezmeral Data Fabric Database source table (JSON or binary) and a HPE Ezmeral Data Fabric Streams stream topic.

**Syntax****Table**

CLI	<pre>maprcli table changelog add -path &lt;source table path&gt; -changelog &lt;destination stream path&gt;:&lt;topic name&gt;</pre>
REST	<pre>http://&lt;ipaddress&gt;:8443/rest/table/changelog/add? path=&lt;source-table-path&gt;&amp;changelog=&lt;destination stream path&gt;:&lt;topic name&gt;</pre>

**Parameters****Table**

Parameter	Description
path	(Required) Path of the source table.

Table (Continued)

Parameter	Description
changelog	<p>(Required) Target of the change log, specified as <code>&lt;stream_path&gt;:&lt;topic_name&gt;</code>, to which all change data records will be published. The stream must exist, otherwise, the command fails. If the topic does not already exist, <code>maprcli table changelog add</code> creates it. To propagate to an existing topic, specify <code>-useexistingtopic</code>.</p> <p> <b>NOTE:</b> The <code>maprcli stream create</code> command is used to create the changelog stream.</p> <p> <b>IMPORTANT:</b> A CDC changelog stream's default partitions can impact how many partitions a stream topic can have. This is because once you create a stream topic for a changelog stream, the number of topic partitions is <i>locked</i>. The number of topic partitions cannot change.</p> <p>When using the <code>table changelog add</code> command to add a stream topic (as well as establish a relationship between the source table and the changelog stream), then the number of topic partitions is inherited from the changelog stream and is <i>locked</i>.</p>
useexistingtopic	If true, allows propagation to an existing topic. Default: false.
propagateexistingdata	If true, initiates propagation of the existing data to the stream topic, otherwise, only new changes are propagated. Default: true
columns	For HPE Ezmeral Data Fabric Database JSON, a comma separated list of field paths to be propagated. For HPE Ezmeral Data Fabric Database Binary, a comma separated list of column family names, for example, <code>&lt;family&gt;[:&lt;column&gt;]</code> to be propagated. Default: All fields are propagated.
throttle	If true, data transfers to the specified sink are throttled. Default: false
pause	If true, pauses propagation after the changelog is created. Default: false
synchronous	If true, acknowledges the client writes to the table before the internal CDC gateway receives the data. Default: false
networkencryption	Specifies whether the data transfer between Data Fabric file system and the internal gateway is encrypted. If true, data propagation is encrypted on-wire. Default: false
networkcompression	Specifies the compression scheme ( <code>off lz4 lz4 zlib</code> ) of the data transfer on-wire. Default: lz4

### Example

```
maprcli table changelog add -path /tableVolume/cdcTable -changelog /
streamVolume/changelogStream:cdcTopic1
```

```
https://ip.address:8443/rest/table/changelog/add?path=/tableVolume/
cdcTable&changelog=/streamVolume/changelogStream:cdcTopic1
```

*table changelog edit*

### Description

Changes changelog specifications.

## Syntax

### Table

CLI	<pre>maprcli table changelog edit -path &lt;source table path&gt; -changelog &lt;destination stream path&gt;:&lt;topic name&gt;</pre>
REST	<pre>http://&lt;ipaddress&gt;:8443/rest/table/changelog/edit?path=&lt;source-table-path&gt;&amp;changelog=&lt;destination-stream-path&gt;:&lt;topic-name&gt;</pre>

## Parameters

### Table

Parameters	Description
path	(Required) Path of the HPE Ezmeral Data Fabric Database source table
changelog	(Required) Target of this changelog.
throttle	If true, data propagation is throttled. Default: false
synchronous	If true, acknowledges the client writes to the table before the internal CDC gateway receives the data. Default: false
networkencryption	If true, data propagation is encrypted on-wire. Default: false
networkcompression	Specifies the compression scheme (off lz4 zlib) of the data propagation on-wire. Default: lz4

## Example

```
maprcli table changelog edit -path /tableVolume/cdcTable -changelog /streamVolume/changelogStream:cdcTopic1
```

```
https://10.10.100.17:8443/rest/table/changelog/edit?path=/tableVolume/cdcTable&changelog=/streamVolume/changelogStream:cdcTopic1
```

*table changelog info*

## Description

Displays changelog source table information.

## Syntax

### Table

CLI	<pre>maprcli table changelog info -path &lt;destination stream path&gt;:&lt;topic name&gt;</pre>
REST	<pre>http://&lt;ipaddress&gt;:8443/rest/table/changelog/info?path=&lt;destination stream path&gt;:&lt;topic name&gt;</pre>

## Parameters

### Table

Parameters	Description
path	(Required) Path to the stream with topic. Specified in the format: pathToStream:streamTopic

### Example

```
maprcli table changelog info -changelog /streamVolume/
changelogStream:cdcTopic1 -json
https://10.10.100.17:8443/rest/table/changelog/info?changelog=/streamVolume/
changelogStream:cdcTopic1
```

### Output

```
{
  "timestamp":1498526974087,
  "timeofday":"2017-06-26 06:29:34.087 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"clst185",
      "changelog":"/streamVolume/changelogStream/cdcTopic1",
      "idx":0,
      "uuid":"59bf0064-97a1-c417-b6d7-0a6681515900"
    }
  ]
}
```

*table changelog list*

### Description

Lists changelog information.

### Syntax

#### Table

CLI	maprcli table changelog list -path <source table path>
REST	http://<ipaddress>:8443/rest/table/changelog/list? path=<source-table-path>

## Parameters

### Table

Parameters	Description
path	(Required) Path of the source table in the HPE Ezmeral Data Fabric Database cluster.

Table (Continued)

Parameters	Description
refreshnow	Specifies if the user wants to trigger an immediate update of the sink statistics.

**Example**

```
// CLI example
maprcli table changelog list -path /tableVolume/cdcTable -json

// REST example
https://10.10.100.17:8443/rest/table/changelog/list?path=/tableVolume/
cdcTable
```

**Output**

```
{
  "timestamp":1505779365019,
  "timeofday":"2017-09-18 05:02:45.019 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"my.cluster.com",
      "changelog":"/streamVolume/changelogStream:cdcTopic1",
      "changelogStream":"/streamVolume/changelogStream",
      "replicaState":"REPLICA_STATE_REPLICATING",
      "paused":false,
      "throttle":false,
      "idx":1,
      "networkencryption":false,
      "synchronous":false,
      "networkcompression":"lz4",
      "propagateExistingData":true,
      "isUptodate":true,
      "minPendingTS":0,
      "maxPendingTS":0,
      "bytesPending":0,
      "putsPending":0,
      "bucketsPending":0,
      "uuid":"76a3efd3-6357-8cd6-092f-0fca5dc05900",
      "copyTableCompletionPercentage":100
    }
  ]
}
```

**Output Data Fields**

The following fields display for each replica.

Field	Description
cluster	The cluster on which the replica resides.
changelog	Identifies the destination stream topic for the changelog.
changelogstream	Identifies the destination stream for the changelog.

Field	Description
replicaState	The replication state. For information about the replication states, see <a href="#">Table Replication States</a> on page 756.
paused	A Boolean values that specifies if replication is paused.
throttle	A Boolean value that specifies if replication is throttled.
idx	The internal index value.
networkencryption	A Boolean value that specifies if replication is encrypted.
synchronous	A Boolean value that specifies whether replication is synchronous or asynchronous.
networkcompression	The type of on-wire compression.
propagateExistingData	Identifies whether existing data in the source table is propagated to the destination stream topic.
isUptodate	A Boolean value that specifies if the replica is up-to-date.
minPendingTS	The epoch time in milliseconds of the oldest operation that has yet to be replicated to the replica.
maxPendingTS	The epoch time in milliseconds of the newest operation that has yet to be replicated to the replica.
bytesPending	The number of bytes that have yet to be replicated to the replica.
putsPending	The number of puts that have yet to be replicated to the replica.
bucketsPending	The number of buckets that have yet to be replicated to the replica.
uuid	The table UUID.
copyTableCompletionPercentage	When propagation of existing data is in progress, this value is the percentage of data from the source table that has been propagated to the destination stream topic.   <b>NOTE:</b> When replicating HPE Ezmeral Data Fabric Database data, the copyTablePercentageCompletion data may re-adjust to a lower rate. This depends on table region (also referred to as tablets) splits and merges as well as the rate of incoming data to replicating data.
errors	If applicable, an error is displayed.

*table changelog pause*

### Description

Pauses the propagation of changed data records.

## Syntax

### Table

CLI	<pre>maprcli table changelog pause -path &lt;source table path&gt; -changelog &lt;destination stream path&gt;:&lt;topic name&gt;</pre>
REST	<pre>http://&lt;ipaddress&gt;:8443/rest/table/changelog/pause? path=&lt;source-table-path&gt;&amp;changelog=&lt;destination stream path&gt;:&lt;topic_name&gt;</pre>

## Parameters

### Table

Parameters	Description
path	(Required) Path of the HPE Ezmeral Data Fabric Database source table
changelog	(Required) Target of this change log.

## Example

```
maprcli table changelog pause -path /tableVolume/cdcTable -changelog /
streamVolume/changelogStream:cdcTopic1
```

```
https://10.10.100.17:8443/rest/table/changelog/pause?path=/tableVolume/
cdcTable&changelog=/streamVolume/changelogStream:cdcTopic1
```

*table changelog remove*

## Description

Removes the changelog connection.

## Syntax

### Table

CLI	<pre>maprcli table changelog remove -path &lt;source table path&gt; -changelog &lt;destination stream path&gt;:&lt;topic name&gt;</pre>
REST	<pre>http://&lt;ipaddress&gt;:8443/rest/table/changelog/remove? path=&lt;source-table-path&gt;&amp;changelog=&lt;destination stream path&gt;:&lt;topic_name&gt;</pre>

## Parameters

### Table

Parameters	Description
path	(Required) Path of the source table in the HPE Ezmeral Data Fabric Database cluster.

Table (Continued)

Parameters	Description
changelog	(Required) Target of the change log.

**Example**

```
maprcli table changelog remove -path /tableVolume/cdcTable -changelog /
streamVolume/changelogStream:cdcTopic1
```

```
https://10.10.100.17:8443/rest/table/changelog/remove?path=/tableVolume/
cdcTable&changelog=/streamVolume/changelogStream:cdcTopic1
```

*table changelog resume*

**Description**

Resumes the propagation of changed data records after a pause.

**Syntax****Table**

CLI	<pre>maprcli table changelog resume -path &lt;source table path&gt; -changelog &lt;destination stream path&gt;:&lt;topic name&gt;</pre>
REST	<pre>http://&lt;ipaddress&gt;:8443/rest/table/changelog/resume? path=&lt;source-table-path&gt;&amp;changelog=&lt;destination stream path&gt;:&lt;topic_name&gt;</pre>

**Parameters****Table**

Parameters	Description
path	(Required) Path of the HPE Ezmeral Data Fabric Database source table
changelog	(Required) Target of this change log.

**Example**

```
maprcli table changelog resume -path /tableVolume/cdcTable -changelog /
streamVolume/changelogStream:cdcTopic1
```

```
https://10.10.100.17:8443/rest/table/changelog/resume?path=/tableVolume/
cdcTable&changelog=/streamVolume/changelogStream:cdcTopic1
```

**table delete**

Deletes a HPE Ezmeral Data Fabric Database binary or JSON table.

**Permissions Required**

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminaccessperm` on the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Syntax

#### CLI

```
maprcli table delete -path <path>
```

#### REST

```
curl -X POST
'http[s]://<host>:<port>/rest/table/delete?path=<path>'
-u <username>:<password>
```

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Parameters

Parameter	Description
path	<p>Path to the Data Fabric table to delete.</p> <ul style="list-style-type: none"> <li>• For a path on the local cluster, start the path at the volume mount point. For example, if you want to delete a table named <code>test</code> under volume1 which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>• For a path on a remote cluster, you must also specify the cluster name in the path. For example, if you want to delete a table named <code>customer</code> under volume1 in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>

### Example

Deletes the table `table`:

#### CLI

```
maprcli table delete -path /mapr/mycluster/volume1/table
```

#### REST

```
curl -X POST \
'https://rln1.sj.us:8443/rest/table/delete?path=%2Fmapr%2Fmycluster%2Fvolume1%2Ftable' \
-u <username>:<password>
```

**table edit**

Edits the attributes of a HPE Ezmeral Data Fabric Database binary or JSON table.

**Permissions Required**

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminaccessperm` on the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax****CLI**

```
maprcli table edit
  -path <path >
  [ -audit true|false ]
  [ -autosplit <Auto Split table> ]
  [ -regionsizeMB <Region Size in
MB> ]
  [ -bulkload <Bulk load> ]
  [ -deletettl <delete TTL in secs> ]
  [ -packperm <Pack Permission
settings> ]
  [ -bulkloadperm <Bulk load
Permission settings> ]
  [ -splitmergeperm <Split and Merge
Permission settings>]
  [ -createrenamefamilyperm <Add/
Rename Family Permission settings> ]
  [ -deletefamilyperm <Delete Family
Permission settings> ]
  [ -adminaccessperm <Secondary Index
Admin Permission settings> ]
  [ -replperm <Replication Admin
Permission settings> ]
  [ -indexperm <Ace Admin Permission
settings> ]
  [ -defaultversionperm <CF Versions
Default Permission> ]
  [ -defaultcompressionperm <CF
Compression Default Permission> ]
  [ -defaultmemoryperm <CF Memory
Default Permission> ]
  [ -defaultreadperm <CF Read Default
Permission> ]
  [ -defaultwriteperm <CF Write
Default Permission> ]
  [ -defaulttraverseperm <CF Traverse
Default Permission> ]
  [ -defaultappendperm <CF Append
Default Permission> ]
  [ -defaultunmaskedreadperm <CF
Unmasked Read Default Permission> ]
```

```
[ -metricsinterval <Metrics
collection interval, in seconds> ]
```

**REST**

```
curl -k -X POST \
  'http[s]://<host>:<port>/rest/table/
edit?path=<path>&<parameters>'
-u <username>:<password>
```

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameter	Description
path	<p>The path to the table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test</li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer</li> </ul>
audit	<p>Specifies whether to turn auditing on for the table. If auditing is also enabled at the cluster level with the <code>maprcli audit data</code> command and enabled for the current volume, setting this value to true causes auditing to start for the table.</p> <p>The possible values are <code>true</code> and <code>false</code>. By default, the value is <code>false</code>.</p>
autosplit	<p>A Boolean value that specifies whether to split the table into regions automatically as the table grows. The average size of each region is determined by the <code>regionsizeemb</code> parameter.</p> <p>The default value is <code>true</code>. If you set the value to <code>false</code>, you can manually split tables into regions by using the <code>table region split</code> command.</p>

Parameter	Description
regionsizeMB	<p>The average size of the regions into which HPE Ezmeral Data Fabric Database tries to split the table as the table grows. The default is 4096 MB. This value is ignored if <code>autosplit</code> is set to <code>false</code>.</p> <p>If <code>autosplit</code> is set to <code>true</code>, HPE Ezmeral Data Fabric Database splits a region when the size of the region exceeds <b>150%</b> of the average value. For example, if the average value is 4096 MB, HPE Ezmeral Data Fabric Database splits a region that is larger than 6144 MB.</p> <p>Although splits are automatic, merges are not. For example, if the value of <code>regionsizeMB</code> is changed from 8 GB to 4 GB, all regions that are eligible are split automatically, if <code>autosplit</code> is set to <code>true</code>. However, if the value of <code>regionsizeMB</code> is changed from 2 GB to 4 GB, regions smaller than 4 GB are not automatically merged.</p> <p> <b>NOTE:</b> When a table has less than 4 regions, HPE Ezmeral Data Fabric Database ignores the <code>regionsizeMB</code> parameter and splits regions at a lower threshold.</p>
bulkload	A Boolean value that specifies whether to allow a full bulk load of the table. The default is <code>false</code> . For more information, see <a href="#">Loading Data into Binary Tables</a> on page 1381 and <a href="#">Loading Documents into JSON Tables</a> on page 1378.
deletettl	The number of seconds to wait before purging the delete operations. The time-to-live for deletes should be greater than the amount of time that it takes replicated operations to reach replicas. By default, the value is 24 hours for tables configured for replication. If the table is not configured for replication, the default is 0 hours.
packperm	The Access Control Expression that controls who can pack table regions. By default, permission is given to the user ID that was used to create the table.
bulkloadperm	The Access Control Expression that controls who can load this table with bulk loads if the table was created with bulk load support. By default, permission is given to the user ID that was used to create the table.
splitmergeperm	<p>The Access Control Expression that controls who can take the following actions:</p> <ul style="list-style-type: none"> <li>• Run the <code>table region split</code> and <code>table region merge</code> commands to split the table into regions or to merge regions of the table together.</li> <li>• Change the value of <code>regionsizeMB</code>.</li> </ul> <p>By default, permission is given to the user ID that was used to create the table.</p>
createfamilyperm	The Access Control Expression that controls who can create column families for this table or rename existing column families. By default, permission is given to the user ID that was used to create the table.

Parameter	Description
deletefamilyperm	The Access Control Expression that defines access to delete column families for this table. Delimit the expression with single-quotation marks. By default, permission is given to the user ID that was used to create the table.
adminaccessperm	The Access Control Expression that controls who can view and edit the permissions for this table. By default, permission is given to the user ID that was used to create the table.
replperm	The Access Control Expression that controls who can set up replication either to or from a table. By default, permission is given to the user ID that is used to create the table.
indexperm	The secondary index admin permission setting that controls who can create an index associated with this table. By default, permission is given to the user ID that is used to create the table.
defaultversionperm	<p>The default Access Control Expression for the version permission on new column families that are created in this table. If no value is specified, the default is <code>u:&lt;username of the table creator&gt;</code>. This value of the parameter <code>versionperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value.</p> <p> <b>NOTE:</b> This permission is not applicable to JSON tables. Versioning is not supported for JSON documents.</p>
defaultcompressionperm	<b>Applies to binary tables only:</b> The default Access Control Expression for the compression permission on new column families that are created in this table. If no value is specified, the default is <code>u:&lt;username of the table creator&gt;</code> . This value of the parameter <code>compressionperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value.
defaultmemoryperm	The default Access Control Expression for the memory permission on new column families that are created in this table. If no value is specified, the default is <code>u:&lt;username of the table creator&gt;</code> . This value of the parameter <code>memoryperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value.
defaultreadperm	The default Access Control Expression for the read permission on new column families that are created in this table. If no value is specified, the default is <code>u:&lt;username of the table creator&gt;</code> . This value of the parameter <code>readperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. See <a href="#">table cf create</a> on page 2443 and <a href="#">table cf edit</a> on page 2449

Parameter	Description
defaultwriteperm	The default Access Control Expression for the write permission on new column families that are created in this table. If no value is specified, the default is <code>u:&lt;username of the table creator&gt;</code> . This value of the parameter <code>writeperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. See <a href="#">table cf create</a> on page 2443 and <a href="#">table cf edit</a> on page 2449
defaulttraverseperm	<b>Applies to JSON tables only:</b> The default Access Control Expression for the traverse permission on new column families. For more information about this permission, see <a href="#">Permission Types for Fields and Column Families in JSON Tables</a> on page 1393.
defaultappendperm	<b>Applies to binary tables only:</b> The default Access Control Expression for the append permission on new column families that are created in this table. If no value is specified, the default is <code>u:&lt;username of the table creator&gt;</code> . This value of the parameter <code>appendperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value.
defaultunmaskedreadperm	The <code>defaultunmaskedreadperm</code> permission on table creation is set to the table creator. This setting takes effect for all new column families (and therefore also all columns/fields within all column families) unless otherwise overridden by the <code>maprcli table cf or</code> or the <code>maprcli table cf colperm</code> command. This permission allows the user to read the data unmasked. Users without this permission have the masked data returned.
metricsinterval	The metrics collection interval, in seconds, for the table. Possible values: 10, 60, 600 Default: 60 seconds When configured to 10 seconds, under normal workloads, the metrics are available in OpenTSDB in about 30 seconds. At an interval of 60 seconds, the metrics are available in about 90 seconds.  <b>NOTE:</b> You cannot disable metrics collection for a table by setting the interval to 0.

### Example

Changes the value of `regionsizemb` for the table `mytable`:

#### CLI

```
maprcli table edit -path /volume1/
mytable -regionsizemb 8192
```

## REST

**NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X POST \
  'https://server.sj.us:8443/rest/
  table/edit?
  path=%2Fvolume1%2Fmytable&regionsizemb
  =8192' \
  -u <username>:<password>
```

### table index

Manages indexes for HPE Ezmeral Data Fabric Database JSON tables.

#### Permissions Required

To run this command, your user ID must have the following permissions:

- readAce on the volume
- lookupdir on directories in the table path

**NOTE:** The mapr user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

#### *table index add*

This topic describes how to add secondary indexes on HPE Ezmeral Data Fabric Database JSON tables.

#### Permissions Required

To run this command, your user ID must have the following permissions:

- readAce on the volume
- lookupdir on directories in the table path
- indexperm permission on the table

If you created the table in version 6.0 or later, you automatically have `indexperm` permission. For tables created before 6.0, even if you are the owner of the table, you must explicitly add `indexperm` permission.

**NOTE:** The mapr user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Syntax

### CLI

```
maprcli table index add
  -path <path>
  -index <index name>
  -indexedfields < indexed field
  names >
  [ -includedfields < included field
  names > ]
  [ -hashed [ enable hashed index:
  true | false> ]
```

```
[ -numhashpartitions < number of
hash index partitions when hashed
index is enabled > ]
```

**REST**

```
curl -X POST \
'http[s]://<host>:<port>/rest/table/
index/add?path=<path>&index=<index
name>&indexedfields=<indexed field
names>&<parameters>' \
-u <username>:<password>
```

**Parameters**

Parameter	Description
<b>path</b>	(Required) Path to where the parent JSON table resides.
<b>index</b>	(Required) Name of the index.

Parameter	Description
indexedfields	<p>(Required) Names of the indexed fields. This is a comma separated list of the fields from the JSON table that are indexed and used for ordering the index. The sort ordering of each field can be specified separately. The syntax is as follows:</p> <pre data-bbox="834 373 1446 464">-indexedfields &lt;fieldname&gt;:&lt;sort_order&gt;,&lt;fieldname&gt;:&lt;sort_order&gt;,...</pre> <p> <b>IMPORTANT:</b> Do not place a space between the commas and the field names.</p> <p>A sort_order of <code>asc</code>, <code>ASC</code>, or <code>1</code> denotes an ascending sort order. This is the default.</p> <p>A sort_order of <code>desc</code>, <code>DESC</code>, or <code>-1</code> denotes a descending sort order.</p> <p>The following example specifies two indexed fields. <code>fieldName1</code> has an ascending sort, while <code>fieldName2</code> is descending.</p> <pre data-bbox="834 831 1292 888">-indexedfields fieldName1:asc,fieldName2:desc</pre> <p>If an indexed field contains a colon (<code>:</code>) in the name, you need to escape the last colon in the name. In the example below, the indexed field names are the following:</p> <ol data-bbox="821 1016 1081 1150" style="list-style-type: none"> <li>1. <code>field1</code></li> <li>2. <code>field2</code></li> <li>3. <code>colonField:X:Y</code></li> </ol> <p>The following shows how to escape the last colon in the third indexed field.</p> <pre data-bbox="834 1266 1292 1323">-indexedfields field1,field2,colonField:X\\:Y</pre> <p> <b>NOTE:</b> The <code>CAST</code> function can be applied on indexed fields. You must enclose each <code>CAST</code> function call in single quotes. See the next section for details.</p>
includedfields	<p>(Optional) Names of the included fields. This is a comma separated list of the fields from the JSON table that are part of the index, but not used for ordering. The syntax is as follows:</p> <pre data-bbox="834 1644 1243 1701">-includedfields &lt;fieldname&gt;,&lt;fieldname&gt;,...</pre> <p> <b>IMPORTANT:</b> Do not place a space between the commas and the included field names.</p>
hashed	(Optional) True   False. Default: false

Parameter	Description
numhashpartitions	(Optional) Number of <a href="#">hash index</a> partitions when the hashed index option is enabled. This parameter determines the number of logical partitions HPE Ezmeral Data Fabric Database distributes keys across. Incoming keys are hashed to 2 byte partition IDs. Default: 10

### Applying CAST on Indexed Fields

Indexes can be defined with the CAST function applied to an indexed field.

The following statement queries a table named `lineitem` and casts the `L_LINENUMBER` and `L_ORDERKEY` fields to the `int` data type.

```
SELECT L_LINESTATUS, L_QUANTITY FROM lineitem WHERE CAST(L_LINENUMBER as int) = 1 AND CAST(L_ORDERKEY as int) = 550;
```

To optimize the previous statement, you can create an index on the `L_LINENUMBER` and `L_ORDERKEY` fields, and use the CAST function to map each field to a specific data type, as shown below:

```
maprcli table index add \
  -path /drill/testdata/qa/sfl/maprdb/json/lineitem \
  -index l_cast_comp_1 -indexedfields
  '$CAST(L_LINENUMBER@INT)', '$CAST(L_ORDERKEY@INT)' \
  -includedfields L_LINESTATUS,L_QUANTITY
```

The index stores the values of the `L_LINENUMBER` and `L_ORDERKEY` fields as the `int` data type. HPE Ezmeral Data Fabric Database can use the index for any subsequent queries that cast these fields to `int` instead of accessing data in the primary table and converting the values to `int`.

See [Using Casts in Secondary Indexes](#) on page 687 for more information.

### Restrictions

The following restrictions apply to creating indexes.

#### Name Restrictions

You cannot use the following characters in the index name and in the indexed fields:

```
< > ? % \
```

To use the following characters in the index name and in the indexed fields, enclose them either in single or double quotes:

```
 ; | ( ) /
```

For example:

```
maprcli table index
add -path /volumel/MYTABLE -index
  "MYTABLE1_ANALYSIS_1 ^=#{ }&()/ " \
  -indexedfields "_timestamp":desc, "
  ", "LOTNo" -includedfields \
  " ", " ^=#{ }&()/ " (or)
```

```
maprcli table index
add -path /volumel/MYTABLE -index
  'MYTABLE1_ANALYSIS_1 ^=#{ }&()/' \
  -indexedfields "_timestamp":desc, "
```

```
" , "LOTNo" -includedfields \
  ' , '^=#; { } & ( ) / ' }
```

To use either the ' or the " character in the index name and in the indexed fields, enclose:

- the ' character within double quotes (")
- the " character within single quote (')

For example:

```
maprcli table index
add -path /volume1/MYTABLE -index
" 'MYTABLE1_ANALYSIS_1 '^=#; { } & ( ) / ' \
  -indexedfields "_timestamp":desc, " '
" , "LOTNo" -includedfields \
  " ' , '^=#; { } & ( ) / ' (or)

maprcli table index
add -path /volume1/MYTABLE -index
' "MYTABLE1_ANALYSIS_1 '^=#; { } & ( ) / ' \
  -indexedfields "'_timestamp":desc, "
" , "LOTNo" -includedfields \
  ' ' , '^=#; { } & ( ) / ' }
```

### Type Restrictions

- If a composite index includes the same subfield in multiple indexed fields, the implied types of the subfields must be consistent.

For example, you cannot create an index with the following indexed fields:

```
a.b[ ].c , a.b.d
```

Although subfield b appears in both indexed fields, in the first, it is an array and in the second, it is a nested document.

See [Composite Indexes and Container Field Paths](#) on page 684 for more details.

### Size Restrictions

- The maximum size of all indexed fields in an index is 32 KB.

If the collective size exceeds 32 KB, then an insert of the corresponding document results in an encoding error (INDEX\_ROW\_KEY\_ENCODER\_ERROR\_ENCODING\_IS\_TOO\_LONG).

- The maximum number of indexes that you can create on a JSON table is 32.

### Field Definition Restrictions

- You cannot specify individual array elements as indexed fields.
- You cannot specify a table's `_id` field as an indexed field.

- If a field contains an array of nested documents and you want to index on subfields in the nested documents, then you must define the indexed field using a container field path.
- You can include a specific field only once as either an indexed or included field, with the following two exceptions:

- The indexed field is a container field path:

```
maprcli table index add -path /
people \
  -index phoneNumberIdx \
  -indexedfields
Phones[ ].Number \
  -includedfields
Phones[ ].Number
```

- The field specifies a cast to another type.

You can create an index in which the `score` field is an indexed field cast as a double type, and `score` is also an included field. The included field retains the original data type of the `score` field:

```
maprcli table index add -path /
castTable \
  -index castIdx1 \
  -indexedfields
'$CAST(score@DOUBLE)' \
  -includedFields score
```

You can create an index in which the `score` field is an indexed field, cast as a double type, and the `score` field is also another indexed field, cast as a long type:

```
maprcli table index add -path /
castTable \
  -index castIdx2 \
  -indexedfields
'$CAST(score@DOUBLE)', '$CAST(score@LONG)'
```

- You cannot use casts with included fields.

- You cannot specify a field as either an indexed or included field if the field is also specified as a column family JSON path name.

For example, suppose you have the following JSON table:

```
{
  "_id" : "ID",
  "a" : {
    "b" : {
      "c" :
"value",
      "d" :
"value"
    },
    "e" : "value"
  }
}
```

If you create a column family at field `c` in the JSON path `a.b.c`, you cannot define field `a.b.c` as either an indexed or included field. You can define the fields `a`, `a.b`, and `a.b.d` as either indexed or included fields.

- You cannot specify an included field in which the data in the field spans more than one column family.

In the following example, the included field `s11.s12` spans column families, `cf2` and `cf3`:

```
maprcli table cf list -path /cftab
compressionperm readperm
traverseperm jsonfamilypath
writeperm minversions
maxversions compression
ttl          inmemory cfname
memoryperm
u:root          u:root
u:root
u:root          0
1              lz4
2147483647 false      default
u:root
u:root          u:root
u:root          s11
u:root          0
1              lz4
2147483647 false      cf1
u:root
u:root          u:root
u:root          s11.s12.s13
u:root          0
1              lz4
2147483647 false      cf2
u:root
u:root          u:root
u:root          s11.s12.s13.s14
u:root          0
1              lz4
2147483647 false      cf3
u:root

maprcli table index add -path /
cftab -index i1 -indexedfields
s11.s12.s13.s14.l4a,
s11.l1a -includedfields
s11.s12,s11.s12.s13.s14.s15.l5b -js
on
{
    "timestamp":1507419777919,
    "timeofday":"2017-10-07
04:42:57.919 GMT-0700 PM",
    "status":"ERROR",
    "errors":[
        {
            "id":22,

"desc":"Data for included field
s11.s12 may not span more than one
column family."
        }
    ]
}
```

- You cannot specify a composite index with more than one container field path as your indexed fields, unless the prefixes of the container field paths are the same.

See [Composite Indexes and Container Field Paths](#) on page 684 for more details.

- You cannot specify a composite index with an indexed field that is a subfield of another indexed field.

For example, you cannot create an index with the following indexed fields:

```
a, a.b
```

The indexed field `a.b` is a subfield of the indexed field `a`.

### Option Restrictions

- As indexes are automatically split, you cannot disable splits when you create your index.

### Index Use Restrictions

- Indexes do not optimize non-existence filter conditions.

## Example

### CLI

```
maprcli table index
add -path /demo/business -index
newIndex -indexedfields fieldName
```

### REST

```
curl -k -X POST \
'https://rln1.sj.us:8443/rest/table/
index/add?
path=%2Fdemo%2Fbusiness&index=newIndex
&indexedfields=fieldName' \
-u mapr:mapr
```

### *table index list*

This topic describes how to list information about the secondary indexes created on HPE Ezmeral Data Fabric Database JSON tables.

## Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the table path

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax****CLI**

```
maprcli table index list
  -path <path>
  [ -indexname <index name> ]
  [ -refreshnow < true | false > ]
```

**REST**

```
curl -k -X GET
  'http[s]://<host>:<port>/rest/table/
  index/list?path=<path>&<parameters>'
  -u <username>:<password>
```

**Parameters**

Parameter	Description
path	(Required) Path to where the parent JSON table resides
indexname	(Optional) Name of the index for which to display information. If omitted, the output includes all indexes created on the table.
refreshnow	(Optional) Whether to fetch the current status of the index Default: False

**Example****CLI**

```
maprcli table index list -path /
my.cluster.com/volume1/table1
```

```
maprcli table index list -path /demo/
business -json
```

**REST**

```
curl -X GET \
  'https://r1n1.sj.us:8443/rest/table/
  index/list?
  path=%my.cluster.com%2Fvolume1%2Ftable
  1' \
  -u <username>:<password>
```

```
curl -X GET \
  'https://r1n1.sj.us:8443/rest/table/
  index/list?path=%2Fdemo%2Fbusiness' \
  -u <username>:<password>
```

**Output Fields**

Output Field	Description
cluster	The cluster on which the index resides
type	For indexes, this is always maprdb.si

Output Field	Description
indexFid	A unique id used to identify the index in file system
indexName	Name of the index
hashed	A boolean value that specifies whether the index is hashed
indexState	The replication state of the index. For information about the replication states, see <a href="#">Table Replication States</a> on page 756.
idx	The index id. Unique per table.
indexedFields	The list of indexed fields with the sort order of each key
includedFields	The list of included fields in the index. Missing from output if there are no included fields.
isUptodate	A boolean value that specifies if the index is up-to-date
minPendingTS	The epoch time in milliseconds of the oldest operation that has yet to be replicated to the index
maxPendingTS	The epoch time in milliseconds of the newest operation that has yet to be replicated to the index
bytesPending	The number of bytes that have yet to be replicated to the index
putsPending	The number of puts that have yet to be replicated to the index
bucketsPending	The number of buckets that have yet to be replicated to the index
copyTableCompletionPercentage	<p>The percentage of data from the source that has been copied to the index during the setup phase of replication. After replication setup completes, the value remains at 100.</p> <p> <b>NOTE:</b> When replicating data to the index, the <code>copyTableCompletionPercentage</code> value may decrease. This happens when splits or merges occur in the JSON table's regions, or the table receives new data.</p>
numTablets	The number of tablets the index occupies
numRows	The number of rows in the index
totalSize	The total size of the index

### Example Output

```
maprcli table index list -path /demo/business -json -indexname il
{
  "timestamp":1506617667735,
  "timeofday":"2017-09-28 04:54:27.735 GMT+0000 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"my.cluster.com",
      "type":"maprdb.si",
      "indexFid":"2049.93.10257820",
      "indexName":"il",
```

```

        "hashed":false,
        "indexState":"REPLICA_STATE_REPLICATING",
        "idx":1,
        "indexedFields":"a.b:ASC",
        "isUptodate":true,
        "minPendingTS":0,
        "maxPendingTS":0,
        "bytesPending":0,
        "putsPending":0,
        "bucketsPending":0,
        "copyTableCompletionPercentage":100,
        "numTablets":1,
        "numRows":4,
        "totalSize":24576
    }
}
}

```

### Troubleshooting Use Cases

Situations where you can use this command include the following:

- Examine the properties of an index.
- Determine if there is a lag in updates in an index.

See [Troubleshooting Secondary Indexes](#) on page 1453 for more information on these use cases.

#### *table index remove*

This topic describe how to remove secondary indexes that are no longer needed.

### Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the table path
- `indexperm` permission on the table, if you did not create the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Syntax

#### CLI

```
maprcli table index remove
-path <path>
-index <index name>
```

#### REST

```
curl -k -X POST \
'http[s]://<host>:<port>/rest/table/
index/remove?path=<path>&index=<index
name>'
-u <username>:<password>
```

## Parameters

Parameter	Description
<b>path</b>	(Required) Path to where the parent JSON table resides
<b>index</b>	(Required) Name of the index

## Example

### CLI

```
maprcli table
index remove -path /my.cluster.com/
volumel/newtable -index testIndex
```

### REST

```
curl -X POST \
'https://r1n1.sj.us:8443/rest/table/
index/remove?
path=%2Fmy.cluster.com%2Fvolumel%2Fnew
table&index=testIndex' \
-u <username>:<password>
```

### table info

Displays information about a HPE Ezmeral Data Fabric Database binary or JSON table, or an index on a JSON table.

## Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) on the volume
- [lookupdir](#) on directories in the path

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Syntax

### CLI

```
maprcli table info
-path <path>
[ -index <index name> ]
```

### REST

```
curl -k -X GET \
'http[s]://<host>:<port>/rest/table/
info?path=<path>&index=<index name>'
-u <username>:<password>
```

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Parameters

Parameter	Description
path	<p>The path to the table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
index	The name of the index for which to display information.

### Example

Lists the information for a table named `mytable` in the JSON format, as described in [Common Options](#) on page 1989:

#### CLI

```
maprcli table info -path /mapr/
my.cluster.com/volume1/mytable -json
```

#### REST

```
curl -k -X GET \
'https://rln1.sj.us:8443/rest/table/
info?
path=%2Fmapr%2Fmy.cluster.com%2Fvolume
1%2Fmytable' \
-u mapr:mapr
```

## Sample Output

### Output Fields

```
maprcli table info -path /mapr/my.cluster.com/volume1/mytable -json
{
  "timestamp":1540362830403,
  "timeofday":"2018-10-23 11:33:50.403 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "path":"/mapr/my.cluster.com/volume1/mytable",
      "numregions":1,
      "totallogicalsize":0,
      "totalphysicalsize":0,
      "totalcopypendingsize":0,
      "totalrows":0,
      "totalnumberofspills":0,
      "totalnumberofsegments":0,
      "autosplit":true,
      "bulkload":false,
      "wireencryptionfrompolicies":false,
      "tabletype":"json",

    }
}
}

```

Output Field	Description
path	<p>The path to the HPE Ezmeral Data Fabric Database table</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
numregions	Number of regions in the table.
totallogicalsize	Estimated size (in bytes) of uncompressed data stored in table (excluding replication).
totalphysicalsize	<p>Estimated size (in bytes) of actual data stored in table (excluding replication).</p> <p>Includes internal metadata and reflects compressed data size when compression is enabled.</p>
totalcopypendingsize	Total size (in bytes) of pending data for replication.
totalrows	Estimated number of rows in a table. Values may not match the actual number of rows. This variance occurs because the counter, for performance reasons, is not updated on each row. Note that internal data management events trigger (in bulk) counter updates.

Output Field	Description
autosplit	<p>A Boolean value that specifies whether to split the table into regions automatically as the table grows. The average size of each region is determined by the <code>regionsizeMB</code> parameter.</p> <p>The default value is <code>true</code>. If value is set to <code>false</code>, you can manually split tables into regions by using the <code>table region split</code> command.</p>
bulkload	<p>A Boolean value that specifies whether to allow a full bulk load of the table. The default is <code>false</code>. For more information, see <a href="#">Loading Data into Binary Tables</a> on page 1381 and <a href="#">Loading Documents into JSON Tables</a> on page 1378.</p>
tabletype	<p>Specifies whether the table will be a binary table or a JSON table. The values are <code>binary</code> and <code>json</code>. The default is <code>binary</code>.</p>
regionsizeMB	<p>The average size of the regions into which HPE Ezmeral Data Fabric Database tries to split the table as the table grows. The default is 4096 MB. This value is ignored if <code>autosplit</code> is set to <code>false</code>.</p> <p>If <code>autosplit</code> is set to <code>true</code>, HPE Ezmeral Data Fabric Database splits a region when the size of the region exceeds 150% of the average value. For example, if the average value is 4096 MB, HPE Ezmeral Data Fabric Database splits a region that is larger than 6144 MB.</p> <p>Although splits are automatic, merges are not. For example, if the value of <code>regionsizeMB</code> is changed from 8 GB to 4 GB, all regions that are eligible are split automatically, if <code>autosplit</code> is set to <code>true</code>. However, if the value of <code>regionsizeMB</code> is changed from 2 GB to 4 GB, regions smaller than 4 GB are not automatically merged.</p> <p> <b>NOTE:</b> When a table has less than 4 regions, HPE Ezmeral Data Fabric Database ignores the <code>regionsizeMB</code> parameter and splits regions at a lower threshold.</p>
audit	<p>Specifies whether to turn auditing on for the table. If auditing is also enabled at the cluster level with the <code>maprcli audit data</code> command and enabled for the current volume, setting this value to <code>true</code> causes auditing to start for the table.</p>
metricsinterval	<p>The table metrics collection interval, in seconds.</p>
maxvaluesizeinmemindex	<p>The maximum value size to save in an in-memory index.</p>
adminaccessperm	<p>The Access Control Expression that controls who can view and edit the permissions for this table. By default, permission is given to the user ID that is used to create the table.</p>
createrenamefamilyperm	<p>The Access Control Expression that controls who can create column families for this table or rename existing column families. By default, permission is given to the user ID that is used to create the table.</p>

Output Field	Description
bulkloadperm	The Access Control Expression that controls who can load this table with bulk loads if the table was created with bulk load support. By default, permission is given to the user ID that is used to create the table.
indexperm	The secondary index Admin permissions setting that controls who can create an index associated with this table. By default, permission is given to the user ID that is used to create the table.
packperm	The Access Control Expression that controls who can pack table regions. By default, permission is given to the user ID that is used to create the table.
deletefamilyperm	The Access Control Expression that defines access to delete column families for this table. Delimit the expression with single-quotation marks. By default, permission is given to the user ID that is used to create the table.
replperm	The Access Control Expression that controls who can set up replication either to or from a table. By default, permission is given to the user ID that is used to create the table.
splitmergeperm	<p>The Access Control Expression that controls who can take the following actions:</p> <ul style="list-style-type: none"> <li>Run the <code>table region split</code> and <code>table region merge</code> commands to split the table into regions or to merge regions of the table together.</li> <li>Change the value of <code>regionsizemb</code>.</li> </ul> <p>By default, permission is given to the user ID that is used to create the table.</p>
defaultappendperm	<b>Applies to binary tables only:</b> The default Access Control Expression for the append permission on new column families that are created in this table. If no value is specified, the default is <code>u:&lt;username of the table creator&gt;</code> . This value of the parameter <code>appendperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value.
defaultcompressionperm	<b>Applies to binary tables only:</b> The default Access Control Expression for the compression permission on new column families that are created in this table. If no value is specified, the default is <code>u:&lt;username of the table creator&gt;</code> . This value of the parameter <code>compressionperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value.
defaultmemoryperm	The default Access Control Expression for the memory permission on new column families that are created in this table. If no value is specified, the default is <code>u:&lt;username of the table creator&gt;</code> . This value of the parameter <code>memoryperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value.

Output Field	Description
defaultreadperm	The default Access Control Expression for the read permission on new column families that are created in this table. If no value is specified, the default is <code>u:&lt;username of the table creator&gt;</code> . This value of the parameter <code>readperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. See <a href="#">table cf create</a> on page 2443 and <a href="#">table cf edit</a> on page 2449.
defaulttraverseperm	<b>Applies to JSON tables only:</b> The default Access Control Expression for the traverse permission on new column families. For more information about this permission, see <a href="#">Permission Types for Fields and Column Families in JSON Tables</a> on page 1393.
defaultwriteperm	The default Access Control Expression for the write permission on new column families that are created in this table. If no value is specified, the default is <code>u:&lt;username of the table creator&gt;</code> . This value of the parameter <code>writeperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. See <a href="#">table cf create</a> on page 2443 and <a href="#">table cf edit</a> on page 2449.
defaultunmaskedreadperm	The <code>defaultunmaskedreadperm</code> permission on table creation is set to the table creator. This setting takes effect for all new column families (and therefore also all columns/fields within all column families) unless otherwise overridden by the <code>maprcli table cf</code> or the <code>maprcli table cf colperm</code> command. This permission allows the user to read the data unmasked. Users without this permission have the masked data returned.
securitypolicy	The security policy or policies tagged to the table. If the parameter is not specified during table creation, the default value is uninitialized (" <code>[ - ]</code> "), and there is no security policy for the table.
uuid	The table UUID.
wireencryptionfrompolicies	The system automatically sets this field to true if at least one security policy has wire-level encryption enabled, false otherwise.

**table metadata update**

Updates table metadata and adds user table entries to the metadata list.

**REMEMBER:** This command is meant to be used by support engineers to debug issues.

**Syntax****CLI**

```
maprcli table metadata update
-path <path>
```

**REST**

```
curl -k -X GET \
'http[s]://<host>:<port>/rest/table/
metadata/update?path=<path>'
-u <username>:<password>
```

## Parameters

Parameter	Description
path	<p>The path to use to fetch the metadata recursively. Metadata entries under this path are updated.</p> <p> <b>NOTE:</b> This parameter is optional. If not specified, the root path / is used.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>ezmeral</code> under <code>volume1</code> that has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/ezmeral</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>

## Example

Updates the metadata for tables in a volume named `nysales` under the `/` path, in the JSON format:

### CLI

```
maprcli table metadata update -path /
nysales -json
```

### REST

```
curl -k -X POST \
  'https://rln1.sj.us:8443/rest/table/
  metadata/update?path=/nysales' \
  -u mapr:mapr
```

## Sample Output

```
maprcli table metadata update -path /nysales -json
{
  "timestamp":1699290019872,
  "timeofday":"2023-11-06 09:00:19.872 GMT-0800 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "1 entries were added or updated in table metadata."
  ]
}
```

### table metadata list

Lists table metadata

**REMEMBER:** This command is meant to be used by support engineers to debug issues.

## Syntax

### CLI

```
maprcli table metadata list
[-terse]
```

### REST

```
curl -X GET \
'http[s]://<host>:<port>/rest/table/
metadata/list?terse'
-u <username>:<password>
```

## Parameters

Parameter	Description
terse	Displays only table paths.

## Example

List table metadata.

### CLI

```
maprcli table metadata
list -terse -json
```

### REST

```
curl -X POST \
'https://rln1.sj.us:8443/rest/table/
metadata/list?terse' \
-u <username>:<password>
```

## Sample Output

```
maprcli table metadata list -json
{
  "timestamp":1700050001936,
  "timeofday":"2023-11-15 04:06:41.936 GMT-0800 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "path":"/nysales",
      "numregions":1,
      "totallogicalsize":0,
      "totalphysicalsize":0,
      "owner":"root"
    }
  ]
}
```

```
maprcli table metadata list -terse -json
{
  "timestamp":1700050025638,
  "timeofday":"2023-11-15 04:07:05.638 GMT-0800 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
```

```

        "path": "/nysales"
    }
]
}

```

### table region

Manages table regions for HPE Ezmeral Data Fabric Database binary and JSON tables.

*table region list*

Lists the regions that make up a specified table or index.

### Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) on the volume
- [lookupdir](#) on directories in the path

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Syntax

#### CLI

```

maprcli table region list
  -path <path>
  [ -start <offset from starting
region> ]
  [ -limit <number of regions to
return> ]
  [ -index <index name> ]
  [ -output terse | verbose ]

```

#### REST

**NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```

curl -X GET \
  'http[s]://<host>:<port>/rest/table/
region/list?path=<path>&<parameters>'
  -u <username>:<password>

```

**Parameters**

Parameter	Description
<b>path</b>	<p>Path to the table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, if you want to list regions for a table named <code>test</code> under volume1 which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, if you want to list regions for a table named <code>test</code> under volume1 in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
<b>start</b>	The offset from the starting region. The default value is 0.
<b>limit</b>	The number of regions to return, counting from the starting region. The default value is 2147483647.
<b>index</b>	The name of the index for which to list region information.
<b>output</b>	<p>Specifies whether the output should be <code>terse</code> or <code>verbose</code>.</p> <p>Default: <code>verbose</code></p>

**Output Fields**

Verbose Field Name	Terse Field Name	Field Value
<code>primarymfs</code>	<code>pn</code>	Host name and port of the primary node for this region.
<code>secondarymfs</code>	<code>sn</code>	Host names and ports of the secondary nodes where this region is replicated.
<code>startkey</code>	<code>sk</code>	Value of the start key for this region. For the first region in a table, this value is exclusive. For all other regions, it is inclusive. See the example output.
<code>endkey</code>	<code>ek</code>	Value of the end key for this region. This value is always exclusive. See the example output.
<code>lastheartbeat</code>	<code>lhb</code>	Time since last heartbeat from the region's primary node
<code>fid</code>	<code>fid</code>	The region's FID.
<code>logicalsize</code>	<code>ls</code>	The logical size (in bytes) of the region without data compression (excluding replication).
<code>physicalsize</code>	<code>ps</code>	The physical size (in bytes) of the region with data compression (excluding replication).

Verbose Field Name	Terse Field Name	Field Value
copypendingsize	cps	The size (in bytes) of the data residing on the original remote region after region split that remains to be copied onto the new region.
numberofrows	nr	Estimated number of rows in the region. Values may not match the actual number of rows. This variance occurs because the counter, for performance reasons, is not updated on each row. Note that internal data management events trigger (in bulk) counter updates.
numberofrowswithdelete	nrd	Number of rows in the region, counting deleted rows.
numberofspills	nsp	Number of spills for the region.
numberofsegments	nsg	Number of segments in the region.

## Examples

### Lists the Region Information for a Table

This example lists the region information for the table `newtable`.

#### CLI

```
maprcli table region list -path /
my.cluster.com/volume1/newtable
```

#### REST

**NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X GET \
'https://r1n1.sj.us:8443/rest/table/
region/list?
path=%2Fmy.cluster.com%2Fvolume1%2Fnew
table' \
-u <username>:<password>
```

### Example Output Using the -json Option

This example shows two table regions. The value of `endkey` for the first region is the value of `startkey` for the second region. The value of `endkey` is always exclusive. So, for the first region, `endkey` shows that the first region was split with the addition of the record with the key `5190414F2E44DB732547630A9A81452539749000`; for the second region, `startkey` shows that the region begins with that record.

```
{
  "timestamp":1452554659812,
  "timeofday":"2016-01-11 03:24:19.812 GMT-0800",
  "status":"OK",
  "total":2,
  "data":[
    {
      "primarymfs":"test150.qa.lab:5660",
      "secondarymfs":"test156.qa.lab:5661, test151.qa.lab:5660",
      "startkey":"-INFINITY",
```

```

        "endkey": "5190414F2E44DB732547630A9A81452539749000" ,
        "lastheartbeat": 0,
        "fid": "2068.100.131676" ,
        "logicalsize": 794624,
        "physicalsize": 794624,
        "copypendingsize": 0,
        "numberofrows": 0,
        "numberofrowswithdelete": 0,
        "numberofspills": 0,
        "numberofsegments": 0
    },
    {
        "primarymfs": "test161.qa.lab:5660" ,
        "secondarymfs": "test157.qa.lab:5661, test162.qa.lab:5660" ,
        "startkey": "5190414F2E44DB732547630A9A81452539749000" ,
        "endkey": "INFINITY" ,
        "lastheartbeat": 0,
        "fid": "2069.181.131578" ,
        "logicalsize": 745472,
        "physicalsize": 745472,
        "copypendingsize": 0,
        "numberofrows": 0,
        "numberofrowswithdelete": 0,
        "numberofspills": 0,
        "numberofsegments": 0
    }
]
}

```

#### *table region merge*

Merges regions of a table together to reduce the number of regions that a table occupies.

This command merges the region that you specify with the region that contains the row keys that immediately follow the row keys of the specified region.

**NOTE:** Consider the table configuration when you decide to merge regions because it is possible that HPE Ezmeral Data Fabric Database might immediately split the regions after they are merged. If `autosplit` is set to `true`, HPE Ezmeral Data Fabric Database splits a region when the size of the region exceeds 150% of the average value (`regionsizeemb`). For example, if the average value is 4096 MB, HPE Ezmeral Data Fabric Database splits a region that is larger than 6144 MB.

### Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `splitmergeperm` permission on the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Syntax

### CLI

```
maprcli table region merge
  -fid <regionFID>
  -path <table path>
```

### REST

```
curl -k -X POST
  'http[s]://<host>:<port>/rest/
  table/region/merge?fid=<region
  FID>&path=<path>'
  -u <username>:<password>
```

## Parameters

Parameter	Description
<b>fid</b>	The FID for the table region that you want to merge. The output of <code>maprcli table region list</code> lists the FIDs for the table.
<b>path</b>	The path to the table whose regions are being merged. <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, if you want to merge regions for table named <code>test</code> under volume1 which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote, you must also specify the cluster name in the path. For example, if you want to merge regions for table named <code>test</code> under volume1 in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>

## Example

Merges the specified region:

### CLI

```
maprcli table region merge -path /
user/test5 -fid 2086.32.131296
```

### REST

```
curl -X POST \
  'https://myhost:8443/rest/table/
  region/merge?
  path=%2Fuser%2Ftest5&fid=2086.32.13129
  6' \
  -u <username>:<password>
```

### *table region pack*

Manually triggers the packing of regions.

HPE Ezmeral Data Fabric Database automatically compacts or packs regions and reclaims space when 25% of the data contained in the partitions (max of 3 per tablet) has expired; however, for a time series table, you **must** run this command to reclaim space used by expired rows and to avoid read amplification, if the old rows are never accessed.

## Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `packperm` permission on the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Syntax

### CLI

```
maprcli table region pack
  -path <table path>
  -fid <fid>|all
  [ -nthreads <number of threads> ]
```

### REST

```
curl -X POST
  'http[s]://
  <host>:<port>/rest/table/region/pack?
  path=<path>&fid=<fid>&<parameters>'
  -u <username>:<password>
```

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Parameters

Parameter	Description
path	<p>Specifies the path to the table.</p> <ul style="list-style-type: none"> <li>• For a path on the local cluster, start the path at the volume mount point. For example, if you want to pack a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volumel/test</code></li> <li>• For a path on another cluster, you must also specify the cluster name in the path. For example, if you want to pack a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volumel/customer</code></li> </ul>
fid	<p>Specifies that you want to pack all table regions or a single table region that you identify with a FID. The output of <code>maprcli table region list</code> lists the FIDs for the table.</p>
nthreads	<p>Specifies the number of threads allocated to process the packing of table regions. Default: 16</p>

## Example

Packs the specified region:

**CLI**

```
maprcli table region pack -path /user/
test5 -fid 2086.32.131296
```

**REST**

```
curl -X POST \
'https://myhost:8443/rest/table/
region/pack?
path=%2Fuser%2Ftest5&fid=2086.32.13129
6' \
-u <username>:<password>
```

*table region split*  
Splits a region in a table.

**Permissions Required**

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- [splitmergeperm](#) permission on the table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax****CLI**

```
maprcli table region split
-path <path>
-fid <fid>
```

**REST**

**NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X POST
'http[s]://<host>:<port>/rest/table/
region/split?path=<path>&fid=<fid>'
-u <username>:<password>
```

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Parameters

Parameter	Description
<b>path</b>	<p>Path to the table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, if you want to split regions in a table named <code>test</code> under volume1 which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on another cluster, you must also specify the cluster name in the path. For example, if you want to split regions in a table named <code>customer</code> under volume1 in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
<b>fid</b>	The FID of the region to split. The output of <code>maprcli table region list</code> lists the FIDs for the table's regions.

### Example

This example splits a region in the table `newtable`.

#### CLI

```
maprcli table region split -path /
my.cluster.com/volume1/newtable -fid
2086.32.131296
```

#### REST

**NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X POST \
'https://r1n1.sj.us:8443/rest/table/
region/split?
path=%2Fmy.cluster.com%2Fvolume1%2Fnew
table&fid=2086.32.131296' \
-u <username>:<password>
```

### **table replica**

Performs functions related to replication of HPE Ezmeral Data Fabric Database binary and JSON tables. Replication occurs for binary-to-binary tables and JSON-to-JSON tables.

*table replica add*

Registers a table as a replica of another HPE Ezmeral Data Fabric Database binary or JSON table.

**NOTE:** You do not need to use this command if you use the `table replica autoseup` command.

### Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on both the source volume and the target volume
- `lookupdir` on directories in the paths of both tables

- readperm and replperm permissions on the source table

**NOTE:** The **mapr user** is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the **mapr user** to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Syntax

#### CLI

```
/opt/mapr/bin/maprcli table replica
add
  -path <table path>
  -replica <replica table path>
  [ -columns <comma separated list of
  <family>[:<column>]> ]
  [ -paused <is replication paused>
  default: false ]
  [ -throttle <throttle replication
  ops> default: false ]
  [ -networkencryption <enable
  on-wire encryption> default: false ]
  [ -synchronous <is synchronous
  replication> default: false ]
  [ -networkcompression <on-wire
  compression type: off|on|lzf|lz4|
  zlib> default: on ]
```

#### REST

```
curl -k -X POST
  'http[s]://<host>:<port>/rest/table/
  replica/add?
  path=<path>&replica=<name>&<parameters
  >
  -u <username>:<password>
```

**NOTE:** The **mapr user** is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the **mapr user** to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Parameters

Parameter	Description
path	<p>The path to the source table that you want to replicate.</p> <ul style="list-style-type: none"> <li>• For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code></li> <li>• For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code></li> </ul>

Parameter	Description
replica	<p>The path to the replica.</p> <ul style="list-style-type: none"><li>• For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code></li><li>• For a table on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code></li></ul> <p> <b>NOTE:</b> For replication to a table, the command will fail if the table in the replica path does not exist.</p>

Parameter	Description
columns	<p>By default, all columns in the source table are replicated.</p> <p>If you do not want to replicate all columns in the table, you can specify specific columns to replicate:</p> <p><b>For binary tables</b></p> <p>Provide a comma-separated list of column families or columns from a certain column family (column family:qualifier). For example, use the following syntax to replicate the column family purchases and the column stars in the reviews column family: <code>-columns purchases, reviews:stars</code></p> <p> <b>NOTE:</b> While the column families that you specify must already exist in the source table, the columns that you specify do not have to exist in the destination table for replication to succeed. If the column is added at a later date, replication for that column will start at that time.</p> <p><b>For JSON tables</b></p> <p>Provide a comma-delimited list of fields to replicate. Include the full field path for each field.</p> <p><b>Example</b></p> <p>Suppose your table contains documents that contain this general structure:</p> <pre data-bbox="1149 1478 1455 1982"> {   "_id" : "ID",   "a" :     {       "b" :         {           "c" :             "value",           },       "e" : "value"         }     } </pre> <p>To replicate fields a, c, and e, you would specify these field paths:</p>

Parameter	Description
paused	A Boolean value that specifies whether to pause the replication so that it does not start immediately. The replication can be resumed using the replica resume command at a later time. The values are <code>true</code> or <code>false</code> . Default: Not paused ( <code>false</code> )
throttle	A Boolean value that specifies whether to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The values are <code>true</code> or <code>false</code> . Default: No throttle ( <code>false</code> )
networkencryption	A Boolean value that specifies whether or not to enable on-wire encryption. The values are <code>true</code> or <code>false</code> . If you set this to <code>true</code> , the local cluster and any other cluster that is part of the replication process must be enabled for security. Default: No encryption ( <code>false</code> )
synchronous	A Boolean value that specifies whether replication is synchronous or asynchronous. The values are <code>true</code> or <code>false</code> . Default: Asynchronous ( <code>false</code> )
networkcompression	The type of on-wire compression. Default: on The types are: <ul style="list-style-type: none"> <li>• <code>off</code></li> <li>• <code>on</code> (default)</li> <li>• <code>lzf</code></li> <li>• <code>lz4</code></li> <li>• <code>zlib</code></li> </ul> The default compression is <code>lz4</code> , which can be set by specifying <code>on</code> or <code>lz4</code> as value.

### Example

Registers a table on the local cluster as a replica of another table on the local cluster:

#### CLI

```
/opt/mapr/bin/maprcli table
replica add -path /volume1/
custA -replica /volume2/custA
```

#### REST

```
curl -k -X POST \
  'https://rln1.sj.us:8443/rest/table/
  replica/add?
  path=%2Fvolume1%2FcustA&replica=%2Fvol
  ume2%2FcustA' \
  -u mapr:mapr
```

```
table replica autoseup
```

Sets up and starts replication between a *source* HPE Ezmeral Data Fabric Database binary or JSON table to a *replica* HPE Ezmeral Data Fabric Database binary or JSON table.

The `maprcli table replica autoseup` command performs the following steps to set up replication:

1. Creates a new table with metadata from the source table in the destination cluster.
2. Declares the new table to be a replica of the source table and ensures that replication does not begin immediately after the next step.
3. Declares the source table as an upstream source for the replica.
4. For multi-master replication, replica autoseup declares the source table to be a replica of the new table and then declares the new table to be an upstream source for the source table.
5. Loads a copy of the source data into the replica(s).
6. Clears the paused replication state to start the replication stream.

For more information about the automatic setup process, see [Replica Autoseup for HPE Ezmeral Data Fabric Database Tables](#) on page 755.

Before you set up replication for a table, verify that the cluster is setup for replication. For more information, see [Preparing Clusters for Table Replication](#) on page 1424.

### Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on both the source volume and the target volume
- [lookupdir](#) on directories in the paths of both tables
- [readperm](#) and [replperm](#) permissions on the source table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with [ACE](#).

### Syntax

#### CLI

```
/opt/mapr/bin/maprcli table replica
autoseup
  -path <table path>
  -replica <replica table path>
  [ -columns <comma separated list of
  <family>[:<column>]> ]
  [ -synchronous <is synchronous
  replication> default: false ]
  [ -multimaster <is multi master
  replication> default: false ]
  [ -throttle <throttle replication
  ops> default: false ]
  [ -networkencryption <enable
  on-wire encryption> default: false ]
  [ -networkcompression <on-wire
  compression type: off|on|lzf|lz4|
  zlib> default: on ]
  [ -directcopy <enable directcopy>
  default: true ]
  [ -useexistingreplica <use existing
  replica table if present> default:
  false ]
```

**REST**

```
curl -k -X POST
  'http[s]://<host>:<port>/rest/table/
  replica/autosetup?
  path=<path>&replica=<path>&<parameters
  >'
  -u <username>:<password>
```

**Parameters**

path	<p>The path to the source table that you want to replicate.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code></li> <li>For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code></li> </ul>
replica	<p>The path to the replica.</p> <ul style="list-style-type: none"> <li>For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code></li> <li>For a table on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code></li> </ul> <p> <b>NOTE:</b> For replication to a table, the command will fail if the replica path you specify points to table that already exists.</p>

columns

By default, all columns in the source table are replicated.

If you do not want to replicate all columns in the table, you can specify specific columns to replicate:

#### For binary tables

Provide a comma-separated list of column families or columns from a certain column family (column family:qualifier). For example, use the following syntax to replicate the column family purchases and the column stars in the reviews column family: `-columns purchases, reviews:stars`

**NOTE:** While the column families that you specify must already exist in the source table, the columns that you specify do not have to exist in the destination table for replication to succeed. If the column is added at a later date, replication for that column will start at that time.

#### For JSON tables

Provide a comma-delimited list of fields to replicate. Include the full field path for each field.

#### Example

Suppose your table contains documents that contain this general structure:

```
{
  "_id" : "ID",
  "a" :
    {
      "b" :
        {
          "c" :
            "value",
          },
      "e" : "value"
        }
    }
}
```

To replicate fields a, c, and e, you would specify these field paths:

```
a,a.b.c,a.e
```

2511

synchronous	A Boolean value that specifies whether replication is synchronous or asynchronous. The value is either <code>true</code> or <code>false</code> . Asynchronous ( <code>false</code> ) is the default.
multimaster	A Boolean value that specifies whether or not to set up a multi-master topology. The value is either <code>true</code> or <code>false</code> . Basic primary-secondary topology ( <code>false</code> ) is the default.
throttle	A Boolean value that specifies whether or not to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The value is either <code>true</code> or <code>false</code> . No throttle ( <code>false</code> ) is the default.
networkencryption	A Boolean value that specifies whether or not to enable on-wire encryption. The value is either <code>true</code> or <code>false</code> . No encryption ( <code>false</code> ) is the default. If you set this to <code>true</code> , the local cluster and any other cluster that is part of the replication process must be enabled for security.
networkcompression	<p>The type of on-wire compression.</p> <p>The types are:</p> <ul style="list-style-type: none"> <li>• off</li> <li>• on (default)</li> <li>• lzf</li> <li>• lz4</li> <li>• zlib</li> </ul> <p>lz4 is the default compression which it set by parameter values <code>on</code> or <code>lz4</code>.</p>
directcopy	<p>A Boolean value that specifies whether or not autoseup will use the directcopy option . The value is either <code>true</code> or <code>false</code>. Autoseup with direct copy (<code>true</code>) is the default. If you set this parameter to <code>false</code>, the cluster will run autoseup without the directcopy option. For more information, see <a href="#">Replica Autoseup for HPE Ezmeral Data Fabric Database Tables</a> on page 755.</p> <p> <b>NOTE:</b> If a table was originally created in MapR 5.x and the <code>maprcli table replica autoseup</code> command is specified with <code>directcopy=false</code>, then an error, "Copy Table failed for tables", occurs. This is due to the introduction of new table meta information in 6.0. It is recommended that replication be setup using <code>directcopy=true</code> (which is the default). If the default method is not desired, then replication should be setup manually.</p>
useexistingreplica	When the <code>directcopy</code> parameter is set to <code>true</code> (default), this Boolean value specifies whether or not an existing table can be used as the replica table. The value is either <code>true</code> or <code>false</code> . No reuse of existing tables ( <code>false</code> ) is the default. If a table exists with the specified name, and this parameter is set to <code>false</code> , the create table operation will fail.

## Example

### CLI

```
/opt/mapr/bin/maprcli table
replica autoseup -path /volume1/
custBsrc -replica /volume2/custBdst
```

### REST

```
curl -k -X POST \
  'https://r1n1.sj.us:8443/rest/table/
  replica/autoseup?
  path=%2Fvolume2%2FcustBsrc&replica=%2F
  volume2%2FcustBdst' \
  -u mapr:mapr
```

*table replica edit*

Edits the properties of a replica of a HPE Ezmeral Data Fabric Database binary or JSON table.

## Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on both the source volume and the target volume
- `lookupdir` on directories in the paths of both tables
- `readperm` and `replperm` permissions on the source table

**NOTE:** The **mapr user** is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the **mapr user** to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Syntax

### CLI

```
maprcli table replica edit
-path <table path>
-replica <replica table path>
[ -newreplica <renamed table path> ]
[ -columns <comma separated list of
<family>[:<column>]> ]
[ -throttle <throttle replication
ops> ]
[ -networkencryption <enable
on-wire encryption> ]
[ -synchronous <is synchronous
replication> ]
[ -networkcompression <on-wire
compression type: off|on|lzf|lz4|
zlib> ]
```

### REST

```
curl -k -X POST
  'http[s]://<host>:<port>/rest/table/
  replica/edit?
  path=<path>&replica=<path>&<parameters
  >'
  -u <username>:<password>
```

**NOTE:** The **mapr user** is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the **mapr user** to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Parameters

Parameter	Description
path	<p>The path to the source table that you want to replicate.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code></li> </ul>
replica	<p>The path to the replica.</p> <ul style="list-style-type: none"> <li>For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code></li> <li>For a table on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code></li> </ul>
newreplica	<p>The updated replica path due to a renamed replica table, renamed cluster, or changed table path. The table specified in the <code>replica</code> parameter and the table specified in the <code>newreplica</code> parameter must have the same UUID.</p>

Parameter	Description
columns	<p>By default, all columns in the source table are replicated.</p> <p>If you do not want to replicate all columns in the table, you can specify specific columns to replicate:</p> <p><b>For binary tables</b></p> <p>Provide a comma-separated list of column families or columns from a certain column family (column family:qualifier). For example, use the following syntax to replicate the column family purchases and the column stars in the reviews column family: <code>-columns purchases, reviews:stars</code></p> <p> <b>NOTE:</b> While the column families that you specify must already exist in the source table, the columns that you specify do not have to exist in the destination table for replication to succeed. If the column is added at a later date, replication for that column will start at that time.</p> <p><b>For JSON tables</b></p> <p>Provide a comma-delimited list of fields to replicate. Include the full field path for each field.</p> <p><b>Example</b></p> <p>Suppose your table contains documents that contain this general structure:</p> <pre data-bbox="1149 1478 1455 1982"> {   "_id" : "ID",   "a" :     {       "b" :         {           "c" :             "value",           },       "e" : "value"         }     } </pre> <p>To replicate fields a, c, and e, you would specify these field paths:</p>

Parameter	Description
throttle	A Boolean value that specifies whether or not to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The values are <code>true</code> or <code>false</code> . No throttle ( <code>false</code> ) is the default.
networkencryption	A Boolean value that specifies whether or not to enable on-wire encryption. The values are <code>true</code> or <code>false</code> . No encryption ( <code>false</code> ) is the default. If you set this to <code>true</code> , the local cluster and any other cluster that is part of the replication process must be enabled for security.
synchronous	A Boolean value that specifies whether replication is synchronous or asynchronous. The values are <code>true</code> or <code>false</code> . Asynchronous ( <code>false</code> ) is the default.
networkcompression	The type of on-wire compression. The types are: <ul style="list-style-type: none"> <li>• <code>off</code></li> <li>• <code>on</code> (default)</li> <li>• <code>lz4</code></li> <li>• <code>lz4</code>. This is the default</li> <li>• <code>zlib</code></li> </ul> <p><code>lz4</code> is the default compression which it set by parameter values <code>on</code> or <code>lz4</code>.</p>

### Examples

Changes the replica path to reflect that replica `t2dst` is renamed to `t2dst_new`:

#### CLI

```
maprcli table replica edit -path /
volumel/t1src -replica /volumel/t2dst
\
-newreplica /volumel/t2dst_new
```

#### REST

```
curl -k -X POST \
'https://rlnl.sj.us:8443/rest/table/
replica/edit?
path=%2Fvolumel%2Ft1&replica=%2Fvolumel
1%2Ft2&newreplica=%2Fvolumel%2Ft2_new'
\
-u mapr:mapr
```

Changes the column families to replicate:

#### CLI

```
maprcli table
replica edit -path /volumel/
custAsrc -replica /volume2/custAdst \
-columns purchases, reviews, returns
```

**REST**

```
curl -k -X POST \
  'https://r1n1.sj.us:8443/rest/table/
  replica/edit?
  path=%2Fvolume1%2FcustAsrc&replica=%2F
  volume2%2FcustAdst&columns=purchases,r
  eviews,returns' \
  -u mapr:mapr
```

*table replica list*

Lists replicas and the associated replica statistics for a specified HPE Ezmeral Data Fabric Database binary or JSON table. By default, replica statistics are updated every five minutes.

**Permissions Required**

To run this command, your user ID must have the following permissions:

- readAce on the volume
- lookupdir on directories in the path

**NOTE:** The **mapr user** is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the **mapr user** to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax**

**CLI**

```
/opt/mapr/bin/maprcli table replica
list
-path <table path>
[ -refreshnow true|false ]
```

**REST**

```
curl -X GET
'http[s]://
<host>:<port>/rest/table/replica/list?
path=<path>&refreshnow=false'
-u <username>:<password>
```

**Parameters**

Parameter	Description
path	<p>The path to the table that you want to list replicas for.</p> <ul style="list-style-type: none"> <li>• For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>• For a table on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfranciscocluster</code>, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>

Parameter	Description
refreshnow	A Boolean value that specifies if you want to trigger an immediate update of the replica statistics. The values are <code>true</code> or <code>false</code> . By default, the value is <code>false</code> ; the command lists the current version of the replica statistics, which could be a maximum of five minutes old.

### Output

Lists information about each replica for the specified table.

### Output Data Fields

The following fields display for each replica.

Field	Description
cluster	The cluster on which the replica resides.
table	The table name for the replica.
type	The table type.
paused	A Boolean values that specifies if replication is paused.
replicaPath	The table replica path.
replicaState	The replication state. For information about the replication states, see <a href="#">Table Replication States</a> on page 756.
throttle	A Boolean value that specifies if replication is throttled.
idx	The internal index value.
networkencryption	A Boolean value that specifies if replication is encrypted.
synchronous	A Boolean value that specifies whether replication is synchronous or asynchronous.
networkcompression	The type of on-wire compression.
isUptodate	A Boolean value that specifies if the replica is up-to-date.
minPendingTS	The epoch time in milliseconds of the oldest operation that has yet to be replicated to the replica.
maxPendingTS	The epoch time in milliseconds of the newest operation that has yet to be replicated to the replica.
bytesPending	The number of bytes that have yet to be replicated to the replica.
putsPending	The number of puts that have yet to be replicated to the replica.
bucketsPending	The number of buckets that have yet to be replicated to the replica.
uuid	The table UUID.

Field	Description
copyTableCompletionPercentage	<p>When replica autoseup with directcopy is in progress, this value is the percentage of data from the source that has been copied to the replica. After replication is setup, the value remains at 100.</p> <p> <b>NOTE:</b> When replicating HPE Ezmeral Data Fabric Database data, the copyTablePercentageCompletion data may re-adjust to a lower rate. This depends on table region (also referred to as tablets) splits and merges as well as the rate of incoming data to replicating data.</p>
errors	If applicable, an error is displayed.

### Sample Output

```
{
  "timestamp":1485555420019,
  "timeofday":"2017-01-27 10:17:00.019 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"cluster",
      "table":"/dst",
      "type":"MapRDB",
      "replicaPath":"/dst",
      "replicaState":"REPLICA_STATE_REPLICATING",
      "paused":false,
      "throttle":false,
      "idx":1,
      "networkencryption":false,
      "synchronous":false,
      "networkcompression":"lz4",
      "isUptodate":true,
      "minPendingTS":0,
      "maxPendingTS":0,
      "bytesPending":0,
      "putsPending":0,
      "bucketsPending":0,
      "uuid":"4164f38a-b4ed-0302-f929-0d8bc68b5800",
      "copyTableCompletionPercentage":100
    }
  ]
}
```

### Example

Lists replicas for the `custA` table:

#### CLI

```
/opt/mapr/bin/maprcli table replica
list -path /volume1/custA
```

#### REST

```
curl -k -X GET \
  'https://r1n1.sj.us:8443/rest/table/
  replica/list?path=%2Fvolume1%2FcustA'
```

```
\
-u mapr:mapr
```

### *table replica pause*

Pauses the replication of data from a *source* HPE Ezmeral Data Fabric Database binary or JSON table to a *replica* HPE Ezmeral Data Fabric Database binary or JSON table during autoseup and replication phases.

### Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on both the source volume and the target volume
- `lookupdir` on directories in the paths of both tables
- `replperm` permissions on the source table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Syntax

#### CLI

```
maprcli table replica pause
-path <table path>
-replica <replica table path>
```

#### REST

```
curl -X POST
'http[s]://
<host>:<port>/rest/table/replica/
pause?path=<path>&replica=<path>'
-u <username>:<password>
```

### Parameters

Parameter	Description
path	<p>The path to the source table.</p> <ul style="list-style-type: none"> <li>• For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code></li> <li>• For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code></li> </ul>

Parameter	Description
replica	<p>The path to the replica that will receive updates from the source.</p> <ul style="list-style-type: none"> <li>For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code></li> <li>For a table on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code></li> </ul>

### Example

Sets the replication state to paused:

#### CLI

```
maprcli table
replica pause -path /volume1/
custAsrc -replica /volume2/custAdst
```

#### REST

```
curl -X POST \
  'https://rln1.sj.us:8443/rest/table/
  replica/pause?
  path=%2Fvolume1%2FcustAsrc&replica=%2F
  volume2%2FcustAdst' \
  -u <username>:<password>
```

`table replica remove`

De-registers the specified HPE Ezmeral Data Fabric Database binary or JSON table as a replica.

### Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on both the source volume and the target volume
- `lookupdir` on directories in the paths of both tables
- `replperm` permissions on the source table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

After running this command, the specified table or index is no longer a replica of the source table and will no longer receive updates from the source table.

In addition, run the `table upstream remove` command to remove the association between the source table and the replica table.

## Syntax

### CLI

```
/opt/mapr/bin/maprcli table replica
remove
  -path <table path>
  -replica <replica table path>
```

### REST

```
curl -X POST
  'http[s]://
<host>:<port>/rest/table/replica/
remove?path=<path>&replica=<path>'
  -u <username>:<password>
```

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Parameters

Parameter	Description
path	<p>The path to the source table that is being replicated.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code></li> </ul>
replica	<p>The path to the replica.</p> <ul style="list-style-type: none"> <li>For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code></li> <li>For a table on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code></li> </ul>

## Example

De-registers table `custAdst` as a replica of table `custAsrc`:

### CLI

```
/opt/mapr/bin/maprcli table
replica remove -path /volume1/
custAsrc -replica /volume2/custAdst
```

**REST**

```
curl -X POST \
  'https://r1n1.sj.us:8443/rest/table/
  replica/remove?
  path=%2Fvolume1%2FcustAsrc&replica=%2F
  volume2%2FcustAdst' \
  -u <username>:<password>
```

*table replica resume*

Resumes replication between a *source* HPE Ezmeral Data Fabric Database binary or JSON table and a *replica* of that table. Replication can be paused during autoseup and replication phases. When replication resumes, it continues from where it left off.

**Permissions Required**

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on both the source volume and the target volume
- [lookupdir](#) on directories in the paths of both tables
- `replperm` permissions on the source table

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax****CLI**

```
maprcli table replica resume
  -path <table path>
  -replica <replica table path>
```

**REST**

```
curl -X POST
  'http[s]://
  <host>:<port>/rest/table/replica/
  resume?path=<path>&replica=<path>'
  -u <username>:<password>
```

**Parameters**

Parameter	Description
path	<p>The path to the table that will be replicated.</p> <ul style="list-style-type: none"> <li>• For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code></li> <li>• For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>mapr/sanfrancisco/volume1/customersrc</code></li> </ul>

Parameter	Description
replica	<p>The path to the replica.</p> <ul style="list-style-type: none"> <li>For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code></li> <li>For a table on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code></li> </ul>

### Example

#### CLI

```
maprcli table
replica resume -path /volume1/
custAsrc -replica /volume2/custAdst
```

#### REST

```
curl -X POST \
'https://r1n1.sj.us:8443/rest/table/
replica/resume?
path=%2Fvolume1%2FcustAsrc&replica=%2F
volume2%2FcustAdst' \
-u <username>:<password>
```

#### **table securitypolicy**

Manages security policies for HPE Ezmeral Data Fabric Database JSON tables.

*table securitypolicy add*

Adds a new security policy to a HPE Ezmeral Data Fabric Database JSON table without replacing existing security policies.

#### Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table.

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

#### Syntax

CLI	<pre>maprcli table securitypolicy add -path &lt;path&gt; -securitypolicy &lt;comma-delimited list of policies&gt;</pre>
-----	-------------------------------------------------------------------------------------------------------------------------

REST	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/ table/securitypolicy/add? path=&lt;path&gt;&amp;securitypolicy=&lt;policies&gt;</code>
------	------------------------------------------------------------------------------------------------------------------------------------------------

### Parameters

Parameter	Description
path	<p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
securitypolicy	The list of security policy tags to be added to this table.

### Example

Adds the security policy named `newpolicy` to a Data Fabric table named `table1`:

CLI	<pre>maprcli table securitypolicy add -path "/table1" -securitypolicy "newpolicy"</pre>
REST	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/ table/securitypolicy/add?path= table1&amp;securitypolicy=newpolicy</code>

*table securitypolicy remove*

Removes a security policy from a HPE Ezmeral Data Fabric Database JSON table.

### Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table.

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Syntax**

CLI	<pre>maprcli table securitypolicy remove -path &lt;path&gt; -securitypolicy &lt;comma-delimited list of policies&gt;</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/ table/securitypolicy/remove? path=&lt;path&gt;&amp;securitypolicy=&lt;policies&gt;</pre>

**Parameters**

Parameter	Description
path	<p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
securitypolicy	The list of security policy tags to be removed from this table.

**Example**

Removes the security policy named `newpolicy` from a Data Fabric table named `table1`:

CLI	<pre>maprcli table securitypolicy remove -path "/table1" -securitypolicy "newpolicy"</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/ table/securitypolicy/remove?path=/ table1&amp;securitypolicy=newpolicy</pre>

*table securitypolicy set*

Replaces a security policy on a HPE Ezmeral Data Fabric Database JSON table with a new security policy.

**Permissions Required**

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table.

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

### Syntax

CLI	<pre>maprcli table securitypolicy set -path &lt;path&gt; -securitypolicy &lt;comma-delimited list of policies&gt;</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/ table/securitypolicy/set? path=&lt;path&gt;&amp;securitypolicy=&lt;policies&gt;</pre>

### Parameters

Parameter	Description
path	<p>The path to the HPE Ezmeral Data Fabric Database table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code></li> </ul>
securitypolicy	The list of security policy tags to be associated with this table.

### Example

Replaces the security policy on a Data Fabric table named `table1` with a new security policy named `newpolicy`:

CLI	<pre>maprcli table securitypolicy set -path "/table1" -securitypolicy "newpolicy"</pre>
REST	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/rest/ table/securitypolicy/set?path=/ table1&amp;securitypolicy=newpolicy</pre>

### **table upstream**

Performs functions related to upstream sources for table replication.

*table upstream add*

Adds a binary table as upstream source for a replica.

 **NOTE:** You do not need to use this command if you use the `table replica autosetup` command.

## Syntax

### CLI

```
maprcli table upstream add
  -path <table path>
  -upstream <upstream table
  path>
```

### REST

```
curl -X POST
  'http[s]://
  <host>:<port>/rest/table/upstream/add?
  path=<path>&upstream=<name>'
  -u <username>:<password>
```

 **NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Parameters

Parameter	Description
path	<p>The path to the replica.</p> <ul style="list-style-type: none"> <li>For a path to a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code></li> <li>For a path to a table on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code></li> </ul>
upstream	<p>The path to the source table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code></li> <li>For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code></li> </ul>

## Example

Adds `company1src` as the upstream source for replica `company1dst`:

**CLI**

```
maprcli table
upstream add -path /volume2/
companyldst -upstream /volume1/
companylsrc
```

**REST**

```
curl -k -X POST \
  'https://r1n1.sj.us:8443/rest/table/
upstream/add?
path=%2Fvolume2%2Fcompanyldst&upstream
=%2Fvolume1%2Fcompanylsrc' \
  -u mapr:mapr
```

*table upstream list*

Lists the binary tables that replicate data to the specified replica binary table.

**Syntax****CLI**

```
maprcli table upstream list
-path <table path>
```

**REST**

```
curl -X GET
'http[s]://<server>:<port>/rest/
table/upstream/list?path=<path>'
-u <username>:<password>
```

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

**Parameters**

Parameter	Description
path	<p>The path to the replica.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code></li> <li>For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code></li> </ul>

**Sample Output**

```
maprcli table upstream list -path /volume2/company1 -json
{
  "timestamp":1423162601288,
  "timeofday":"2015-02-05 10:56:41.288 GMT-0800",
  "status":"OK",
  "total":1,
```

```

      "data": [
        {
          "cluster": "mycluster",
          "table": "/volume1/company1",
          "idx": 1,
          "uuid": "P?\x18\xCC\x17\xB1&\xA7i,\x04\xBB\xB8\xD3T\x00"
        }
      ]
    }
  }

```

## Example

Lists sources that replicate data to the replica `/volume2/company1`:

### CLI

```
maprcli table upstream list -path /
volume2/company1 -json
```

### REST

```
curl -X GET \
  'https://
  rln1.sj.us:8443/rest/table/upstream/
  list?path=%2Fvolume2%2Fcompany1' \
  -u <username>:<password>
```

*table upstream remove*

Un-registers a binary table as an upstream source for a replica.

**NOTE:** This step is separate from the `table replica remove` command, which stops replication updates to a replica.

## Syntax

### CLI

```
maprcli table upstream remove
-path <table path>
-upstream <upstream table path>
```

### REST

```
curl -X POST
  'http[s]://
  <host>:<port>/rest/table/upstream/
  remove?path=<path>&upstream=<path>'
  -u <username>:<password>
```

**NOTE:** The `mapr` user is not treated as a superuser. HPE Ezmeral Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

## Parameters

Parameter	Description
path	<p>The path to the replica.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code></li> <li>For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code></li> </ul>
upstream	<p>The path to the source table.</p> <ul style="list-style-type: none"> <li>For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code></li> <li>For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code></li> </ul>

## Example

Removes `company1src` as the upstream source for replica `company1dst`:

### CLI

```
maprcli table upstream remove -path /
volume2/company1dst -upstream /
volume1/company1src
```

### REST

```
curl -X POST \
'https://r1n1.sj.us:8443/rest/table/
upstream/remove?
path=%2Fvolume2%2Fcompany1dst&upstream
=%2Fvolume1%2Fcompany1src' \
-u <username>:<password>
```

## tier

Lets you create, modify, remove, and retrieve list of tiers and tiering rules.

### tier create

Creates a new tier.

## Syntax

### CLI

```
maprcli tier create
-name <tier_name>
-type cold|ectier
```

```

[ -url <tier_url> ]
[ -credential
<credentials_file_path> ]
[ -tag <object_store_type> ]
[ -credential_str
<tier_credentials> ]
[ -dbtopology
<metadata_volume_path> ]
[ -cluster <cluster_name> ]

```

**REST**

Request Type	POST
Request URL	http[s]://<host:port>/rest/tier/create?<parameters>

**Usage**

To create a warm tier:

```

maprcli tier create
  [ -cluster <cluster_name> ]
  -name <tier_name>
  -type ectier
  [ -dbtopology <path> ]

```

To create a cold tier:

```

maprcli tier create
  [ -cluster <cluster_name> ]
  -name <tier_name>
  -type cold -url <tier_URL>
  -credential|credential_str <credential>
  [ -dbtopology <path> ]
  [ -tag S3-AWS|S3-GCS|S3-HDS|S3-IBM|Azure-Blobs|S3-Others ]

```

**NOTE:** The `-tag` parameter is required for Azure.

**Parameters**

Parameter	Description
cluster	The name of the cluster on which to run the command.
credential	(For tier of type <code>cold</code> only) The path to the credentials file to use for accessing the tier. The credentials file must already exist on the node from where the tier is being created. For more information, see <a href="#">Setting up a Credentials File for Connecting to a Cold Tier Using the CLI or REST API</a> on page 1282.  <b>NOTE:</b> Either this or <code>-credential_str</code> is required for creating a cold tier.
credential_str	(For tier of type <code>cold</code> only) The credentials, access key and secret key, bucket name, and region in JSON format. Either this or <code>-credential</code> is required for creating a cold tier.

Parameter	Description
dbtopology	The rack path to the volume where metadata is stored in DB tables. The default value is <code>/data</code> .
name	The name of the tier.
tag	<p>(For tier of type <code>cold</code> only) The object store to connect to. Value can be one of the following:</p> <ul style="list-style-type: none"> <li>• S3-GCS (for Google Cloud Platform)</li> <li>• S3-HDS (for Hitachi HCP)</li> <li>• S3-IBM (for IBM Cloud Object Storage)</li> <li>• S3-AWS (for Amazon AWS)</li> <li>• Azure-Blobs (for Microsoft Azure)</li> <li>• S3-Others (for other all vendors)</li> </ul> <p>The MAST Gateway uses this to determine the connector library (such as <code>libcurl</code>, etc.) to use. See <a href="#">Specifying the Vendor/Object Store for a Cold Tier</a> on page 1285 for more information on the object store.</p> <p> <b>NOTE:</b> This parameter is required for Azure.</p>
type	<p>The type of tier to create. Value can be:</p> <ul style="list-style-type: none"> <li>• <code>cold</code> — to offload to low-cost storage alternative on the cloud</li> <li>• <code>ectier</code> — to offload to low-cost storage alternative on the Data Fabric cluster</li> </ul>
url	<p>(For tier of type <code>cold</code> only) The URL (or endpoint) of the tier in the following format: <code>&lt;protocol&gt;://&lt;IP hostname&gt;.&lt;domain&gt;</code>. For more information, see <a href="#">Specifying the Vendor/Object Store for a Cold Tier</a> on page 1285. When specifying the URL (for S3), use double quotes.</p> <p>If the protocol is <code>https</code>, the MAST Gateway uses HTTPS to upload data to the cold-tier. If the cold-tier storage does not support HTTPS, all tier related operations will fail. If the cold tier does not support HTTPS, set the protocol to <code>http</code>, which is the default.</p>

## Examples

### Create a cold tier for offloading to S3:

#### CLI

```
# /opt/mapr/bin/maprcli
tier create -name
ksTestCold -type cold -url
"s3.amazonaws.com" -credential
credentials.txt -json
{
  "timestamp":1519669953410,
  "timeofday":"2018-02-26
10:32:33.410 GMT-0800 AM",
  "status":"OK",
```

```

    "total":0,
    "data":[

    ],
    "messages":[
        "Successfully created tier:
'ksTestCold'"
    ]
}

```

**REST**

```

# curl -X POST 'https://
abc.sj.us:8443/rest/tier/create?
name=ksTestCold&type=cold&url=s3.amazo
naws.com&credential=/root/
credentials.txt' --user
<username>:<password>
{"timestamp":1519679457859,"timeofday"
:"2018-02-26 01:10:57.859 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
tier: 'ksTestCold'"]}

```

**Create a EC tier for offloading to a erasure coded volume on the Data Fabric cluster:****CLI**

```

# /opt/mapr/bin/maprcli tier
create -name ksTestEC -type
ectier -json
{
    "timestamp":1519664750448,
    "timeofday":"2018-02-26
09:05:50.448 GMT-0800 AM",
    "status":"OK",
    "total":0,
    "data":[

    ],
    "messages":["
        Successfully created tier:
'ksTestEC'"
    ]
}

```

**REST**

```

# curl -X POST 'https://
testserver.sj.us:8443/rest/tier/
create?
name=ksTestEC&type=ectier' --user
<username>:<password>
{"timestamp":1519679884411,"timeofday"
:"2018-02-26 01:18:04.411 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
tier: 'ksTestEC'"]}

```

**Create a cold tier by sending the credentials as a string:****CLI**

```

# maprcli tier create -name
testCold -type cold -url

```

```
"s3.amazon.com" -credential_str
'{"bucketName":"testbucket","credential
ls":
{"accessKey":"ABCDEFGHIJKLM","secretKe
y":"OPQRSTUVWXYZ"}}' -json
{
  "timestamp":1526406945863,
  "timeofday":"2018-05-15
10:55:45.863 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":[
    "Successfully created tier:
'testCold'"
  ]
}
```

**REST**

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/create?
name=testCold&type=cold&url=s3.amazon.
com&credential_str=%7B%22bucketName%22
%3A%22testbucket%22%2C%22credentials%2
2%3A%7B%22accessKey%22%3A%ABCDEFGHIJKL
%22%2C%22secretKey%22%3A%22OPQRSTUWXY
Z%22%7D%7D' --user mapr:mapr
{"timestamp":1526483636503,"timeofday"
:"2018-05-16 08:13:56.503 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully created
tier: 'testCold'"]}
```

**tier info**

Retrieves information about a tier.

**Syntax**

**CLI**

```
$ maprcli tier info
  -name <tier_name>
  [ -cluster <cluster_name> ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host:port>/rest/tier/info?<parameters>

**Parameters**

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the tier.

## Output

The command returns the following:

volume	The name of the volume associated with the tier.
tiertype	The type of tier. Value can be one of the following: <ul style="list-style-type: none"> <li>• cold</li> <li>• ectier</li> </ul>
tierid	The ID of the tier.
dbtopology	The topology of the volume associated with the tier.
dbvolumeid	The ID of the volume associated with the tier.
tiername	The name of the tier.
bucketname	The name of the bucket. The value is displayed for cold tiers only.
region	The region. The value is displayed for cold tiers only.
objectstoretype	The type of object store (for cold tiers only). Value can be one of the following: <ul style="list-style-type: none"> <li>• S3-GCS</li> <li>• S3-HDS</li> <li>• S3-IBM</li> <li>• S3-Others</li> <li>• Azure-Blobs</li> </ul>
url	The tier URL. The value is displayed for cold tiers only.

## Examples

Retrieve information about a warm tier:

### CLI

```
# maprcli tier info -name testWarm
volume
tiertype dbtopology dbvolumeid
tierid tiername
mapr.internal.tier.testWarm
ectier /data 201186661
74117928 testWarm
```

### REST

```
# curl -X GET 'https://
server.sj.us:8443/rest/tier/info?
name=testWarm' --user
<username>:<password>
{"timestamp":1530987914127,"timeofday"
:"2018-07-07 11:25:14.127 GMT-0700
AM","status":"OK","total":1,"data":
[{"tierid":"74117928","tiername":"test
Warm","tiertype":"ectier","volume":"ma
pr.internal.tier.testWarm","dbtopology
":"/data","dbvolumeid":201186661}]}
```

Retrieve information about a cold tier:

**CLI**

```
# maprcli tier info -name testCold
volume
tiertype dbtopology dbvolumeid
tierid tiername bucketname
region objectstoretype
url
mapr.internal.tier.testCold
cold /data 13372843
49971858 testCold testbucket
us-east-1 S3-AWS http://
s3.amazon.com
```

**REST**

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/tier/info?
name=testCold' --user mapr:mapr
{"timestamp":1530987683808,"timeofday"
:"2018-07-07 11:21:23.808 GMT-0700
AM","status":"OK","total":1,"data":
[{"tierid":"49971858","tiername":"test
Cold","tiertype":"cold","url":"http://
s3.amazon.com","bucketname":"testbucke
t","region":"us-east-1","volume":"mapr
.internal.tier.testCold","dbtopology":
"/
data","dbvolumeid":13372843,"objectsto
retype":"S3-AWS"}]}
```

**tier list**

Lists the tiers on the cluster.

**Syntax**

**CLI**

```
maprcli tier list
[ -cluster <cluster_name> ]
[ -sortby <attribute> ]
[ -sortorder asc|desc ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host:port>/rest/tier/list?<parameters>

**Parameters**

Parameter	Description
cluster	The name of the cluster on which to run the command.
sortby	Specifies one of the following attributes to sort the list of tiers by: tierid, tiername, tiertype, url, throttling, bucketname, region, objectstoretype, volume, topology

Parameter	Description
sortorder	The order to sort the results by. Value can be: <ul style="list-style-type: none"> <li>asc - for ascending order</li> <li>desc - for descending order</li> </ul>

## Output

The command returns the following:

volume	The name of the tiered volume.
tiertype	The type of tier. Value can be one of the following: <ul style="list-style-type: none"> <li>cold</li> <li>ectier</li> </ul>
dbtopology	The topology of the metadata volume associated with the tier.
dbvolumeid	The ID of the metadata volume associated with the tier.
tierid	The ID of the tier.
tiername	The name of the tier.
bucketname	The name of the bucket. The value is displayed for cold tiers only.
region	The region. The value is displayed for cold tiers only.
objectstoretype	The type of object store (for cold tiers only). Value can be one of the following: <ul style="list-style-type: none"> <li>S3-AWS</li> <li>S3-GCS</li> <li>S3-HDS</li> <li>S3-IBM</li> <li>S3-Others</li> <li>Azure-Blobs</li> </ul>
url	The tier URL. The value is displayed for cold tiers only.

## Example

**Get the list of tiers:**

CLI

```
# maprcli tier list
volume
tiertype dbtopology dbvolumeid
tierid tiername bucketname
region objectstoretype
url
mapr.internal.tier.ksTestCold
cold /data 135415553
30712925 ksTestCold ksekhar-test
us-east-1 S3-AWS http://
s3.amazonaws.com
```

```
mapr.internal.tier.testCold
cold /data 192997092
189158428 testCold testbucket
us-east-1 S3-AWS http://
s3.amazon.com
mapr.internal.tier.ksTestEC
ectier /data 87658196
198680137 ksTestEC
```

**REST**

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/tier/list' --user
mapr:mapr
{"timestamp":1533055528861,"timeofday"
:"2018-07-31 09:45:28.861 GMT-0700
AM","status":"OK","total":0,"data":
[{"tierid":"30712925","tiername":"ksTe

```

**tier modify**

Modifies the credentials used to access tier.

**Syntax**

**CLI**

```
maprcli tier modify
-name <tier_name>
[ -credential
<path_to_credentials_file> ]
[ -credential_str
<tier_credentials> ]
[ -cluster <cluster_name> ]
[ -force true|false ]
[ -tag <object_store_type> ]
[ -url <tier_url> ]
```

**REST**

Request Type	POST
--------------	------

Request URL

```
http[s]://<host:port>/
rest/tier/modify?
<parameters>
```

### Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
credential	<p>(For cold tier only) The path to the credentials file to use to access the tier.</p> <p> <b>NOTE:</b> You cannot modify the bucket name in the credentials file after the tier is created; only the accesskey and the secretkey can be modified.</p> <p>For more information, see <a href="#">Setting up a Credentials File for Connecting to a Cold Tier Using the CLI or REST API</a> on page 1282.</p>
credential_str	(For cold tier only) The region, bucket, and credentials, access key and secret key, specified in JSON format. Either this or <code>-credential</code> is required to connect to a cold tier.
force	<p>Required to force a change of any of the following:</p> <ul style="list-style-type: none"> <li>• Bucket on the tier where data is offloaded.</li> <li>• Region where the bucket resides.</li> <li>• URL (or endpoint) of the tier.</li> </ul> <p>Value can be one of the following:</p> <ul style="list-style-type: none"> <li>• <code>true</code> — to force a change</li> <li>• <code>false</code> — to not change</li> </ul> <p>The default value is <code>false</code>.</p>
name	The name of the tier.
tag	<p>(For cold tier only) The tier to connect to. Value can be one of the following:</p> <ul style="list-style-type: none"> <li>• S3-GCS</li> <li>• S3-HDS</li> <li>• S3-IBM</li> <li>• S3-AWS</li> <li>• S3-Others</li> <li>• Azure-Blobs</li> </ul> <p>The MAST Gateway uses this to determine the connector library (such as <code>libcurl</code>, etc.) to use.</p> <p> <b>NOTE:</b> You must specify this parameter to connect to Azure.</p>

Parameter	Description
url	<p>(For cold tier only) The URL (or endpoint) of the tier. This can be modified only with the <code>-force</code> option. See <a href="#">Specifying the Vendor/Object Store for a Cold Tier</a> on page 1285 for information on the tier endpoints and supported authentication protocols.</p> <p> <b>NOTE:</b> If the credentials for the new URL are different, specify the new credentials through the <a href="#">credentials</a> file or using the <code>credential_str</code> parameter.</p>

## Examples

### Modify the credentials (credential file) used to access the tier:

#### CLI

```
# /opt/mapr/bin/maprcli tier
modify -name testCold -credential
credentials.txt -json
{
  "timestamp":1519670281090,
  "timeofday":"2018-02-26
10:38:01.090 GMT-0800 AM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully updated tier:
'ksTestCold'"
  ]
}
```

#### REST

```
# curl -X POST 'https://
<clusterserverip>:8443/rest/tier/
modify?
name=testCold&credential=credentials.t
xt' --user <username>:<password>
{"timestamp":1526485277061,"timeofday"
:"2018-05-16 08:41:17.061 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully updated
tier: 'testCold'"]}
```

### Modify the tier by passing the credentials as a string:

#### CLI

```
# maprcli tier modify -name
testCold -credential_str
'{"bucketName":"testbucket","credentia
ls":
{"accessKey":"ABCDEFGHijkl","secretKey
":"MNOPQRSTUVWXYZ"}}' -json
{
  "timestamp":1526484682668,
  "timeofday":"2018-05-16
08:31:22.668 GMT-0700 AM",
  "status":"OK",
```

```

    "total":0,
    "data":[

    ],
    "messages":[
      "Successfully updated tier:
'testCold'"
    ]
  }

```

**REST**

```

# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/modify?
name=testCold&credential_str=%7B%22buc
k3A%22testbucket%22%2C%22credentials%2
2%3A%7B%22accessKey%22%3A%22ABCDEFGHUIJ
KLMN%22%2C%22secretKey%22%3A%22OPQRSTU
VWXYZ%22%7D%7D' --user mapr:mapr
{"timestamp":1526485116177,"timeofday"
:"2018-05-16 08:38:36.177 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully updated
tier: 'testCold'"]}

```

**tier move**

Moves a tier metadata volume to the specified topology. The command can be used to move a metadata volume to faster storage nodes for performance improvement of tier operations, or to move a metadata volume to less occupied nodes in the cluster.

**Syntax****CLI**

```

maprcli tier move
[ -cluster cluster_name ]
-name <tier name>
-dbtopology <db topology>

```

**REST**

```

curl -X POST 'https://<host>:<port>/
rest/tier/move?
name=<tier_name>&dbtopology=<rack_path
_of_destination_db_volume_topology>'

```

**Usage**

To move a tier metadata volume to the specified topology.

```

maprcli tier move
[ -cluster <cluster_name> ]
-name <tier_name>
-dbtopology <path>

```

**Parameters**

Parameter	Description
cluster	The name of the cluster on which to run the command.

Parameter	Description
name	The name of the tier to move to the specified topology.
dbtopology	The rack path of the volume to which the tier is to be moved. The default value of the volume rack path is /data.

### Output

There is no output when the command runs successfully.

### Examples

Move tier, 'ec\_tier' to the topology having topology rack path as '/rack\_a/mip.storage.abccorp.net'.

#### CLI

```
# maprcli tier
move -name ec_tier -dbtopology /
rack_a/mip.storage.abccorp.net
"timestamp":1662638774428
"timeofday":"2022-09-08 05:06:14.428
GMT-0700 AM"
"status":"OK"
"total":0
"data":[]
"messages":"moved tier successfully"
```

#### REST

```
# curl -X POST --user <username>
'https://
apiserver.mip.storage.abccorp.net:8443
/rest/tier/move?
name=ec_tier&dbtopology=/rack_a/
mip.storage.abccorp.net'
{"timestamp":1662638774428,"timeofday"
:"2022-09-08 05:06:14.428 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["moved tier
successfully"]}
```

### tier remove

Removes a tier.

**NOTE:** You cannot remove a tier currently associated with a volume.

### Syntax

#### CLI

```
$ maprcli tier remove
-name <tier_name>
[ -cluster <cluster_name> ]
```

#### REST

Request Type	POST
Request URL	http[s]://<host:port>/rest/tier/remove?<parameters>

## Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the tier to remove.

## Examples

### Remove a tier (specified by name):

#### CLI

```
# /opt/mapr/bin/maprcli tier
remove -name testCold -json
{
  "timestamp":1521064355911,
  "timeofday":"2018-03-14
02:52:35.911 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":["
    Successfully deleted tier:
'testCold'"]
}
```

#### REST

```
# curl -X POST 'https://
abc.sj.us:8443/rest/tier/remove?
name=testCold' --user
<username>:<password>
{"timestamp":1526485963448,"timeofday"
:"2018-05-16 08:52:43.448 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully deleted
tier: 'testCold'"]}
```

### tier rule create

Creates a rule for offloading data to a tier.

## Syntax

#### CLI

```
$ maprcli tier rule create
  -name <rule_name>
  -expr <regular_expression>
  [ -cluster <cluster_name> ]
```

#### REST

Request Type	POST
Request URL	http[s]://<host:port>/rest/tier/rule/create?<parameters>

**Parameters**

Parameter	Description
cluster	The name of the cluster on which to run the command.

Parameter	Description		
expr	The criteria for offloading data. The criteria can be defined using a combination of the following:		
	<table border="1"> <tr> <td data-bbox="808 281 1133 520">u</td> <td data-bbox="1133 281 1466 520">                             Username or user ID, as configured in the OS registry (such as <code>/etc/passwd</code> file, LDAP, etc.), of a specific user.   <b>Usage:</b> <code>u:&lt;username or user ID&gt;</code> </td> </tr> </table>	u	Username or user ID, as configured in the OS registry (such as <code>/etc/passwd</code> file, LDAP, etc.), of a specific user.  <b>Usage:</b> <code>u:&lt;username or user ID&gt;</code>
	u	Username or user ID, as configured in the OS registry (such as <code>/etc/passwd</code> file, LDAP, etc.), of a specific user.  <b>Usage:</b> <code>u:&lt;username or user ID&gt;</code>	
<table border="1"> <tr> <td data-bbox="808 520 1133 760">g</td> <td data-bbox="1133 520 1466 760">                             Group name or group ID, as configured in the OS registry (such as <code>/etc/group</code> file, LDAP, etc.), of a specific group.   <b>Usage:</b> <code>g:&lt;groupname or group ID&gt;</code> </td> </tr> </table>	g	Group name or group ID, as configured in the OS registry (such as <code>/etc/group</code> file, LDAP, etc.), of a specific group.  <b>Usage:</b> <code>g:&lt;groupname or group ID&gt;</code>	
g	Group name or group ID, as configured in the OS registry (such as <code>/etc/group</code> file, LDAP, etc.), of a specific group.  <b>Usage:</b> <code>g:&lt;groupname or group ID&gt;</code>		
<table border="1"> <tr> <td data-bbox="808 760 1133 2091">a</td> <td data-bbox="1133 760 1466 2091">                             (atime) Time (in seconds or days) since the files were last accessed. The number of seconds can be specified by appending <code>s</code> to value and the number of days can be specified by appending <code>d</code> to the value.   <b>Usage:</b> <ul style="list-style-type: none"> <li>"a:&lt;value&gt;s" — specifies atime in seconds</li> <li>"a:&lt;value&gt;d" — specifies atime in days</li> </ul> <div style="border: 1px solid black; padding: 5px; margin: 10px 0;">  <b>NOTE:</b> If the system time on CLDB and file server nodes are different, the atime rule for offloading data may not work as intended.                             </div> <p>This tier rule is matched and files are offloaded, when <b>all</b> of the following conditions are met:</p> <ol style="list-style-type: none"> <li>1. atime tracking is enabled at volume level</li> <li>2. Time since atime that is configured on the volume is more than the time specified in the rule</li> <li>3. Duration since the file was last accessed is more than the time specified in the rule</li> </ol> <p>Assume that the atime feature is enabled on the volume and that the time in the rule is set to <b>a:300s</b>.</p> </td> </tr> </table>	a	(atime) Time (in seconds or days) since the files were last accessed. The number of seconds can be specified by appending <code>s</code> to value and the number of days can be specified by appending <code>d</code> to the value.  <b>Usage:</b> <ul style="list-style-type: none"> <li>"a:&lt;value&gt;s" — specifies atime in seconds</li> <li>"a:&lt;value&gt;d" — specifies atime in days</li> </ul> <div style="border: 1px solid black; padding: 5px; margin: 10px 0;">  <b>NOTE:</b> If the system time on CLDB and file server nodes are different, the atime rule for offloading data may not work as intended.                             </div> <p>This tier rule is matched and files are offloaded, when <b>all</b> of the following conditions are met:</p> <ol style="list-style-type: none"> <li>1. atime tracking is enabled at volume level</li> <li>2. Time since atime that is configured on the volume is more than the time specified in the rule</li> <li>3. Duration since the file was last accessed is more than the time specified in the rule</li> </ol> <p>Assume that the atime feature is enabled on the volume and that the time in the rule is set to <b>a:300s</b>.</p>	
a	(atime) Time (in seconds or days) since the files were last accessed. The number of seconds can be specified by appending <code>s</code> to value and the number of days can be specified by appending <code>d</code> to the value.  <b>Usage:</b> <ul style="list-style-type: none"> <li>"a:&lt;value&gt;s" — specifies atime in seconds</li> <li>"a:&lt;value&gt;d" — specifies atime in days</li> </ul> <div style="border: 1px solid black; padding: 5px; margin: 10px 0;">  <b>NOTE:</b> If the system time on CLDB and file server nodes are different, the atime rule for offloading data may not work as intended.                             </div> <p>This tier rule is matched and files are offloaded, when <b>all</b> of the following conditions are met:</p> <ol style="list-style-type: none"> <li>1. atime tracking is enabled at volume level</li> <li>2. Time since atime that is configured on the volume is more than the time specified in the rule</li> <li>3. Duration since the file was last accessed is more than the time specified in the rule</li> </ol> <p>Assume that the atime feature is enabled on the volume and that the time in the rule is set to <b>a:300s</b>.</p>		

Parameter	Description
name	The name of the rule.

## Examples

Create a rule to offload files older than a year:

### CLI

```
/opt/mapr/bin/maprcli tier
rule create -name rule1 -expr
"m:365d" -json
{
  "timestamp":1519681290079,
  "timeofday":"2018-02-26
01:41:30.079 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully created rule:
'rule1'"
  ]
}
```

### REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/rule/create?
name=rule1&expr=m:365d' --user
mapr:mapr
{"timestamp":1519681475025,"timeofday":
"2018-02-26 01:44:35.025 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
rule: 'rule1'"]}
```

Create a rule to offload files larger than 5 GB:

### CLI

```
# /opt/mapr/bin/maprcli tier rule
create -name rule2 -expr "s:5g" -json
{
  "timestamp":1519681586774,
  "timeofday":"2018-02-26
01:46:26.774 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully created rule:
'rule2'"
  ]
}
```

### REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/rule/create?
```

```
name=rule2&expr=s:5g' --user mapr:mapr
{"timestamp":1519681667766,"timeofday"
:"2018-02-26 01:47:47.766 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
rule: 'rule2'"]}
```

Create rule to offload files whose owner is m7user1:

#### CLI

```
# /opt/mapr/bin/maprcli tier
rule create -name rule3 -expr
"u:m7user1" -json
{
  "timestamp":1519682014521,
  "timeofday":"2018-02-26
01:53:34.521 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":["
    Successfully created rule:
    'rule3'"]
  ]
}
```

#### REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/rule/create?
name=rule3&expr=u:m7user1' --user
mapr:mapr
{"timestamp":1519682095080,"timeofday"
:"2018-02-26 01:54:55.080 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
rule: 'rule3'"]}
```

Create rule to offload all files:

#### CLI

```
# /opt/mapr/bin/maprcli tier rule
create -name rule4 -expr "p" -json
{
  "timestamp":1519682694183,
  "timeofday":"2018-02-26
02:04:54.183 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":["
    Successfully created rule:
    'rule4'"]
  ]
}
```

**REST**

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/rule/create?
name=rule4&expr=p' --user mapr:mapr
{"timestamp":1519682828031,"timeofday"
:"2018-02-26 02:07:08.031 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
rule: 'rule4'"]}
```

Create rule to not offload any files:

```
# /opt/mapr/bin/maprcli tier rule create -name rule5 -expr "" -json
{
  "timestamp":1519682947271,
  "timeofday":"2018-02-26 02:09:07.271 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully created rule: 'rule5'"
  ]
}
```

Create a rule, called testRule, for offloading all files owned by user m7user1 or for offloading files owned by user mapr and whose size is greater than 5 GB or whose file modification timestamp is greater than 365 (days):

**CLI**

```
# /opt/mapr/bin/maprcli tier
rule create -name testRule -expr
"u:m7user1 | (u:mapr & (s:5g |
m:365d))" -json
{
  "timestamp":1519683138305,
  "timeofday":"2018-02-26
02:12:18.305 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully created rule:
'testRule'"
  ]
}
```

**REST**

```
# curl -k -X POST 'https://
10.10.82.24:8443/rest/tier/rule/
create?
name=testRule&expr=u%3Am7user1%7C%28u%
3Amapr%26%28s%3A5g%20%7C%20m%3A365d%29
%29' --user mapr:mapr
{"timestamp":1526488621687,"timeofday"
:"2018-05-16 09:37:01.687 GMT-0700
AM","status":"OK","total":0,"data":
```

```
[ ], "messages": ["Successfully created rule: 'testRule'"]}
```

**tier rule info**

Retrieves information on a rule (specified by name).

**Syntax****CLI**

```
maprcli tier rule info
  -name <rule_name>
  [ -output verbose ]
  [ -cluster <cluster_name> ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host:port>/rest/tier/rule/info?<parameters>

**Parameters**

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the rule.
output	The type of output. The default value is verbose.

**Output**

The command returns the following:

expression	The rules defined using a combination of expressions.
inuse	Whether (true) or not (false) the rule is associated with a volume.
rulename	The name of the rule.
ruleid	The ID of the rule.

**Example**

Retrieve information on the rule named testRule:

**CLI**

```
# maprcli tier rule info -name
testRule
expression
  inuse  rulename  ruleid
u:m7user1 | (u:mapr & (s:5g |
m:365d)) true  testRule  2
```

**REST**

```
# curl -X GET 'https://
server.sj.us:8443/rest/tier/rule/info?
```

```
name=testRule' --user
<username>:<password>
{"timestamp":1528147823598,"timeofday"
:"2018-06-04 02:30:23.598 GMT-0700
PM","status":"OK","total":1,"data":
[{"ruleid":"2","rulename":"testRule",
"expression":"u:m7user1 | (u:mapr &
(s:5g | m:365d))","inuse":"true"}]}
```

**tier rule list**

Retrieves the list of rules for offloading data.

**Syntax****CLI**

```
$ maprcli tier rule list
[ -output terse|verbose ]
[ -cluster cluster_name ]
[ -sortby <attribute> ]
[ -sortorder <asc|desc> ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host:port>/rest/tier/rule/list?<parameters>

**Parameters**

Parameter	Description
cluster	The name of the cluster on which to run the command.
output	Specifies whether the output should be terse or verbose. Default: verbose.
sortby	The attributes by which to sort the list of tiers. Value can be one of the following: ruleid, rulename, expression
sortorder	The order to sort the results by. Value can be: <ul style="list-style-type: none"> <li>asc - for ascending order</li> <li>desc - for descending order</li> </ul>

**Output**

The command returns the following:

expression	The rules defined using a combination of expressions.
rulename	The name of the rule.
ruleid	The ID of the rule.

**Example**

Retrieve the list of tier rules:

**CLI**

```
# /opt/mapr/bin/maprcli tier rule list
expression
  rulename  ruleid
m:365d
  rule1     1
s:5g
  rule2     2
u:m7user1
  rule3     3
p
  rule4     4

  rule5     5
u:m7user1 | (u:mapr & (s:5g |
m:365d)) testRule 6
```

**REST**

```
# curl -X GET 'https://abc.sj.us:8443/
rest/tier/rule/list' --user
<username>:<password>
{"timestamp":1519840839491,"timeofday"
:"2018-02-28 10:00:39.491 GMT-0800
AM","status":"OK","total":6,"data":
[{"ruleid":"1","rulename":"rule1","exp
ression":"m:365d"},
{"ruleid":"2","rulename":"rule2","expr
ession":"s:5g"},
{"ruleid":"3","rulename":"rule3","expr
ession":"u:m7user1"},
{"ruleid":"4","rulename":"rule4","expr
ession":"p"},
{"ruleid":"5","rulename":"rule5","expr
ession":""},
{"ruleid":"6","rulename":"testRule","e
xpression":"u:m7user1 | (u:mapr &
(s:5g | m:365d))"}]}
```

**tier rule modify**

Modifies the criteria in a tiering rule (specified by name).

**Syntax****CLI**

```
$ maprcli tier rule modify
  -name <rule_name>
  -expr <expression>
  [ -cluster <cluster_name> ]
```

**REST**

Request Type	POST
Request URL	http[s]://<host:port>/rest/tier/rule/modify?<parameters>

## Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
expr	<p>The criteria for offloading data. The criteria can be defined using a combination of the following:</p> <ul style="list-style-type: none"> <li>• <code>u</code> — the user who owns the file(s) to offload</li> <li>• <code>g</code> — the group that owns the file(s) to offload</li> <li>• <code>m</code> — the time since the file was modified</li> <li>• <code>s</code> — the size of the file to offload. Use <code>b</code> for bytes, <code>k</code> for kilobytes, <code>m</code> for megabytes, or <code>g</code> for gigabytes.</li> </ul> <p>Or, use:</p> <ul style="list-style-type: none"> <li>• <code>p</code> — to offload all the files</li> <li>• <code>"</code> — empty string to not offload any files</li> </ul> <p>Use the following to string multiple criteria for offload:</p> <ul style="list-style-type: none"> <li>• <code>&amp;</code> — to indicate all specified criteria must be met for offload</li> <li>• <code> </code> — to indicate any of the specified criteria is adequate for offload</li> <li>• <code>()</code> — to specify sub-expressions</li> </ul>
name	The name of the rule.

## Examples

Modify the criteria in the tiering rule, `ksTestRule`, to offload all files in the volume:

### CLI

```
# /opt/mapr/bin/maprcli tier rule
modify -name ksTestRule -expr
"p" -json
{
  "timestamp":1516225073780,
  "timeofday":"2018-01-17
09:37:53.780 GMT+0000",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully updated rule:
'ksTestRule'"
  ]
}
```

### REST

```
# curl -X POST 'https://
server.sj.us:8443/rest/tier/rule/
modify?name=ksTestRule&expr=p' --user
<username>:<password>
```

```
{ "timestamp":1526489124827,"timeofday"
:"2018-05-16 09:45:24.827 GMT-0700
AM", "status":"OK", "total":0, "data":
[], "messages":["Successfully updated
rule: 'ksTestRule'"] }
```

**tier rule remove**

Removes the rule for offloading data.

**NOTE:** You cannot remove a rule that is currently associated with a volume.**Syntax****CLI**

```
$ maprcli tier rule remove
  -name <rule_name>
  [ -cluster <cluster_name> ]
```

**REST**

Request Type	POST
Request URL	http[s]://<host:port>/rest/tier/rule/remove?<parameters>

**Parameters**

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the rule to remove.

**Examples**

Remove the rule named testRule:

**CLI**

```
# /opt/mapr/bin/maprcli tier rule
remove -name testRule -json
{
  "timestamp":1516225222172,
  "timeofday":"2018-01-17
09:40:22.172 GMT+0000",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":["
    Successfully deleted rule:
    'testRule'"]
}
```

**REST**

```
# curl -X POST 'https://
server.sj.us:8443/rest/tier/rule/
```

```
remove?name=testRule' --user
<username>:<password>
{"timestamp":1526488467571,"timeofday"
:"2018-05-16 09:34:27.571 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully deleted
rule: 'testRule'"]}
```

**trace**

Lets you view and modify the trace buffer, and the trace levels for the system modules.

The valid trace levels are:

- DEBUG
- INFO
- ERROR
- WARN
- FATAL

**trace dump**

Dumps the contents of the trace buffer into the Data Fabric file system log.

**Syntax****CLI**

```
maprcli trace dump
[ -host <host> ]
[ -port <port> ]
```

**REST**

None.

**Parameters**

Parameter	Description
host	The IP address of the node from which to dump the trace buffer. Default: localhost
port	The port to use when dumping the trace buffer. Default: 5660

**Examples****Dump the trace buffer to the Data Fabric file system log:****CLI**

```
maprcli trace dump
```

**trace info**

Displays the trace level of each module.

**Syntax****CLI**

```
maprcli trace info
  [ -host <host> ]
  [ -port <port> ]
```

**REST**

None.

**Parameters**

Parameter	Description
host	The IP address of the node on which to display the trace level of each module. Default: localhost
port	The port to use. Default: 5660

**Output**

A list of all modules and their trace levels.

**Sample Output**

```
RPC Client Initialize
**Trace is in DEFAULT mode.
**Allowed Trace Levels are:
FATAL
ERROR
WARN
INFO
DEBUG
**Trace buffer size: 2097152
**Modules and levels:

```

## Examples

### Display trace info:

CLI

```
maprcli trace info
```

### trace print

Manually dumps the trace buffer to stdout.

### Syntax

CLI

```

maprcli trace print
[ -host <host> ]
[ -port <port> ]
-size <size>

```

REST

None.

### Parameters

Parameter	Description
host	The IP address of the node from which to dump the trace buffer to stdout. Default: localhost
port	The port to use. Default: 5660
size	The number of kilobytes of the trace buffer to print. Maximum: 64

### Output

The most recent <size> bytes of the trace buffer.

```

-----
2010-10-04 13:59:31,0000 Program: mfs on Host: fakehost IP: 0.0.0.0, Port:
0, PID: 0
-----
DONE

```

## Examples

### Display the trace buffer:

**CLI**

```
maprcli trace print
```

**trace reset**

Resets the in-memory trace buffer.

**Syntax****CLI**

```
maprcli trace reset
[ -host <host> ]
[ -port <port> ]
```

**REST**

None.

**Parameters**

Parameter	Description
host	The IP address of the node on which to reset the trace parameters. Default: localhost
port	The port to use. Default: 5660

**Examples****Reset trace parameters:****CLI**

```
maprcli trace reset
```

**trace resize**

Resizes the trace buffer.

**Syntax****CLI**

```
maprcli trace resize
[ -host <host> ]
[ -port <port> ]
-size <size>
```

**REST**

None.

**Parameters**

Parameter	Description
host	The IP address of the node on which to resize the trace buffer. Default: localhost
port	The port to use. Default: 5660
size	The size of the trace buffer, in kilobytes. Default: 2097152 Minimum: 1

## Examples

### Resize the trace buffer to 1000

CLI

```
maprcli trace resize -size 1000
```

### trace setlevel

Sets the trace level on one or more modules.

### Syntax

CLI

```
/opt/mapr/bin/maprcli trace setlevel  
[ -host <host> ]  
-level <trace level>  
-module <module name>  
[ -port <port> ]
```

REST

None.

### Parameters

Parameter	Description
<b>host</b>	The node on which to set the trace level. Default: localhost
<b>module</b>	The module on which to set the trace level. If set to all, sets each module to the specified trace level.

Parameter	Description
<b>level</b>	<p>The new trace level. Set the level to <code>default</code>, to set the trace level of the specified module(s) to its default.</p> <p>If you do not set the level, then INFO is set as the level.</p> <p>You can find the existing trace level of each module, using the command: <code>/opt/mapr/bin/maprcli trace info</code></p> <p>The current modules along with their default trace level are:</p> <ul style="list-style-type: none"> <li>• Global : INFO</li> <li>• RPC : ERROR</li> <li>• MessageQueue : ERROR</li> <li>• CacheMgr : INFO</li> <li>• IOMgr : INFO</li> <li>• Transaction : ERROR</li> <li>• Log : ERROR</li> <li>• Cleaner : INFO</li> <li>• Allocator : ERROR</li> <li>• BTreeMgr : ERROR</li> <li>• BTree : ERROR</li> <li>• BTreeDelete : ERROR</li> <li>• BTreeOwnership : INFO</li> <li>• MapServerFile : ERROR</li> <li>• MapServerDir : INFO</li> <li>• MFSReadAhead : INFO</li> <li>• Container : INFO</li> <li>• Snapshot : INFO</li> <li>• Util : ERROR</li> <li>• Replication : INFO</li> <li>• PunchHole : INFO</li> <li>• KvStore : INFO</li> <li>• Truncate : ERROR</li> <li>• Orphanage : INFO</li> <li>• FileServer : INFO</li> <li>• Heartbeat : ERROR</li> <li>• Defer : ERROR</li> <li>• ServerCommand : INFO</li> <li>• Write : ERROR</li> <li>• DB : INFO</li> </ul>

Parameter	Description
port	The port to use. Default: 5660

### Examples

#### Set the trace level of the Log module to INFO:

CLI

```
/opt/mapr/bin/maprcli trace
setlevel -module Log -level info
```

#### Set the trace level of the BTreeMgr module to FATAL:

CLI

```
/opt/mapr/bin/maprcli trace
setlevel -module BTreeMgr -level FATAL
```

#### Set the trace levels of all modules to their defaults:

CLI

```
/opt/mapr/bin/maprcli trace
setlevel -module all -level default
```

#### Set the trace levels of all modules to INFO:

CLI

```
/opt/mapr/bin/maprcli trace
setlevel -module all -level INFO
```

or equivalently:

```
/opt/mapr/bin/maprcli trace
setlevel -module all
```

### trace setmode

Sets the trace mode.

There are two modes:

- Default
- Continuous

In default mode, all trace messages are saved in a memory buffer. If there is an error, the buffer is dumped to stdout. In continuous mode, every allowed trace message is dumped to stdout in real time.

### Syntax

CLI

```
maprcli trace setmode
[ -host <host> ]
-mode default|continuous
[ -port <port> ]
```

REST

None.

**Parameters**

Parameter	Description
host	The IP address of the host on which to set the trace mode
mode	The trace mode.
port	The port to use.

**Examples**

**Set the trace mode to continuous:**

CLI

```
maprcli trace setmode -mode continuous
```

**urls**

Displays the status page URL for the specified service.

**Syntax**

CLI

```
/opt/mapr/bin/maprcli urls
                        [ -cluster
<cluster name> ]
                        [ -zkconnect
<ZooKeeper Connect String:
'host:port,host:port,host:port,...'> ]
                        -name <name of
the service link is required for>
                        [ -validate
<Validate if URL is reachable or not.
default: true> ]
```

REST

Request Type	GET
Request URL	<pre>http[s]://&lt;host&gt;:&lt;port&gt;/ rest/urls/statuspage? &lt;parameters&gt;</pre> <p>If you submit the request without <code>statuspage</code> in the request URL, the return value contains a 404 error because the API requires a subcommand (empty or otherwise) to be present even though the subcommand is ignored.</p>

**Parameters**

Parameter	Description
cluster	The name of the cluster on which to save the configuration.

Parameter	Description
name	The name of the service for which to get the status page: <ul style="list-style-type: none"> <li>cldb</li> </ul>
validate	Enables ( <code>true</code> ) or disables ( <code>false</code> ) validating whether the URL is reachable.
zkconnect	<a href="#">ZooKeeper Connect String</a>

## Examples

### Display the URL of the status page for the CLDB service:

#### CLI

```
# /opt/mapr/bin/maprcli urls -name
cldb
url
https://server.sj.us:7443/cldb.jsp
```

#### REST

```
curl -X GET 'https://
server.sj.us:8443/rest/urls/
statuspage?name=cldb' --user
<username>:<password>
{"timestamp":1544561148186,"timeofday"
:"2018-12-11 12:45:48.186 GMT-0800
PM","status":"OK","total":1,"data":
[{"url":"https://abc.sj.us:7443/
cldb.jsp"}]}
```

## virtualip

Manages virtual IP addresses for NFS nodes.

### Table

Field	Description
macaddress	The MAC address of the virtual IP.
netmask	The netmask of the virtual IP.
virtualipend	The virtual IP range end.

### virtualip add

Adds a virtual IP address.

### Permissions Required

`fc` or `a` on the cluster.

### Syntax

#### CLI

```
maprcli virtualip add
[ -cluster <cluster> ]
[ -gateway <gateway> ]
[ -macs <MAC address> ]
-netmask <netmask>
```

```
-virtualip <virtualip>
[ -virtualipend <virtual IP range
end> ]
[ -preferredmac <MAC address> ]
[ -service nfs3|nfs4 ]
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/virtualip/add?<parameters>

**Parameters**

Parameter	Description
cluster	The cluster on which to run the command.
gateway	The NFS gateway IP or address
macs	A list of the MAC addresses that represent the NICs on the nodes that the VIPs in the VIP range can be associated with. Use this list to limit VIP assignment to NICs on a particular subnet when your NFS server is part of multiple subnets.   <b>NOTE:</b> When adding VIPs with the <code>-preferredmac</code> and <code>-macs</code> options, include the preferred MAC in the MAC pool. Otherwise, VIPs will be distributed among the MACs instead of being assigned to the preferred MAC node.
netmask	The netmask of the virtual IP.
preferredmac	The preferred MAC for this virtual IP. When an NFS server restarts, Data Fabric attempts to move all of the virtual IP addresses that list a MAC address on this node as a preferred MAC to this node. If the new value is null, this parameter resets the preferred MAC value.   <b>NOTE:</b> When adding VIPs with the <code>-preferredmac</code> and <code>-macs</code> options, include the preferred MAC in the MAC pool. Otherwise, VIPs will be distributed among the MACs instead of being assigned to the preferred MAC node.
service	The service to assign VIPs to. Value can be one of the following: <ul style="list-style-type: none"> <li>• <code>nfs3</code> — for NFSv3</li> <li>• <code>nfs4</code> — for NFSv4</li> </ul> The default value is <code>nfs3</code> , which is used if this option is not specified. You must specify the MAC addresses ( <code>macs</code> ) with this option.
virtualip	The virtual IP, or the start of the virtual IP range.
virtualipend	The end of the virtual IP range.

**Example**

Add VIP for NFSv3 node:

**CLI**

```
maprcli virtualip add
  -cluster
mycluster.402.source
  -macs "09:0C:29:3C:47:AB
03:3C:34:76:CF:21 02:0E:22:71:AD:34"
  -netmask 255.255.255.0
  -virtualip 10.1.1.5
  -preferredmac
"02:0E:22:71:AD:34"
```

**REST**

```
curl -X POST 'https://
server.sj.us:8443/rest/virtualid/add?
cluster=mycluster.402.source&macs=%220
9%3A0C%3A29%3A3C%3A47%3AAB%2003%3A3C%3
A34%3A76%3ACF%3A21%2002%3A0E%3A22%3A71
%3AAD%3A34%22&netmask=255.255.255.0&vi
rtualid=10.1.1.5&preferredmac=%2202%3A0E%
3A22%3A71%3AAD%3A34%22' --user
<username>:<password>
```

Add VIP range for NFSv3 nodes:

**CLI**

```
maprcli virtualip add
  -cluster
mycluster.402.source
  -service nfs3
  -macs "09:0C:29:3C:47:AB
03:3C:34:76:CF:21 02:0E:22:71:AD:34"
  -netmask 255.255.255.0
  -virtualip 10.1.1.5
  -virtualipend 10.1.1.7
  -preferredmac
"02:0E:22:71:AD:34"
```

**REST**

```
curl -X POST 'https://
server.sj.us:8443/rest/virtualid/add?
cluster=mycluster.402.source&service=n
fs3&macs=%2209%3A0C%3A29%3A3C%3A47%3AA

dmac=%2202%3A0E%3A22%3A71%3AAD%3A37%22
' --user <username>:<password>
```

**virtualip edit**

Edits a virtual IP (VIP) range. Permissions required: fc or a.

**Syntax**

**CLI**

```
maprcli virtualip edit
[ -cluster <cluster> ]
[ -macs <MAC addresses> ]
-netmask <netmask>
-virtualip <virtualip>
[ -virtualipend <virtual IP range
end> ]
[ -preferredmac <MAC address> ]
[ -service nfs3|nfs4 ]
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/virtualip/edit?<parameters>

**Parameters**

Parameter	Description
cluster	The cluster on which to run the command.
macs	A list of the MAC addresses that represent the NICs on the nodes to which the VIPs in the VIP range can be associated. Use this list to limit VIP assignment to NICs on a particular subnet when your NFS server is part of multiple subnets.
netmask	The netmask of the virtual IP.
preferredmac	The preferred MAC for this virtual IP. When a NFS server restarts, the Data Fabric system attempts to move all of the virtual IP addresses that list a MAC address on this node as a preferred MAC to this node. If the new value is null, this parameter resets the preferred MAC value.

Parameter	Description
service	The service to which the VIPs need to be assigned. The Value can be one of the following: <ul style="list-style-type: none"> <li>• <code>nfs3</code> — for NFSv3</li> <li>• <code>nfs4</code> — for NFSv4</li> </ul> The default value is <code>nfs3</code> . You must specify the MAC addresses ( <code>macs</code> ) with this option.
virtualip	The virtual IP, or the start of the virtual IP range.
virtualipend	The end of the virtual IP range.

## Examples

### Single virtual IP

#### CLI

```
maprcli virtualip edit
                        -cluster
mycluster.402.source
                        -macs
"09:0C:29:3C:47:AB
00:0c:29:9e:96:15"
                        -netmask 255.255.255.0
                        -virtualip 10.1.1.5
```

#### REST

```
curl -X POST 'https://
server.sj.us:8443/rest/virtualip/
remove?
cluster=mycluster.402.source&macs=%220
9%3A0C%3A29%3A3C%3A47%3AAB%2000%3A0c%3
A29%3A9e%3A96%3A15%22&netmask=255.255.
255.0&virtualip=10.1.1.5' --user
<username>:<password>
```

### Virtual IP range

#### CLI

```
maprcli virtualip edit
                        -cluster
mycluster.402.source
                        -macs
"09:0C:29:3C:47:AB
00:0c:29:9e:96:15"
                        -netmask
255.255.255.0
                        -virtualip
10.1.1.5
                        -virtualipend
10.1.1.8
```

#### REST

```
curl -X POST 'https://
server.sj.us:8443/rest/virtualip/
remove?
cluster=mycluster.402.source&macs=%220
9%3A0C%3A29%3A3C%3A47%3AAB%2000%3A0c%3
A29%3A9e%3A96%3A15%22&netmask=255.255.
255.0&virtualip=10.1.1.5&virtualipend=
10.1.1.8' --user <username>:<password>
```

**virtualip list**

Lists the virtual IP addresses in the cluster.

**Syntax****CLI**

```
maprcli virtualip list
[ -cluster <cluster> ]
[ -columns <columns> ]
[ -filter <filter> ]
[ -limit <limit> ]
[ -nfsmacs <NFS macs> ]
[ -output <output> ]
[ -range <range> ]
[ -sortby <attribute> ]
[ -start <start> ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/virtualip/list[?<parameters>]

**Parameters**

Parameter	Description
cluster	The cluster on which to run the command.
columns	The columns to display.  <b>NOTE:</b> <ul style="list-style-type: none"> <li>The <code>hostname</code> and <code>ip</code> fields are always returned in the query.</li> <li>The value(s) for <code>assignables</code> are not returned as a column.</li> </ul>
filter	A filter specifying VIPs to list. See <a href="#">Filters</a> for more information.
limit	The number of records to return.
nfsmacs	Specifies whether (1) or not (0) to return the MAC addresses of servers running NFS. If value is 1, the command returns the MAC addresses of the NFS servers.
output	Whether the output should be <code>terse</code> or <code>verbose</code> .

Parameter	Description
range	<p>Specifies whether (1) or not (0) to return the VIP ranges. The default value is 0, which returns all VIPs individually. If:</p> <ul style="list-style-type: none"> <li>The value is 0, the command returns the assignment of VIPs to hosts (specified by <code>hn</code>, <code>mac</code>, and <code>ip</code> in the output).</li> <li>The value is 1, the command returns the VIP ranges and the assignables, which is the group of nodes amongst which the VIP range (specified by <code>vip</code> and <code>vipe</code> in the output) must be distributed. If <code>assignables</code> is empty in the output, the range of VIPs (specified by <code>vip</code> and <code>vipe</code> in the output) can be assigned to any NFSv3 server.</li> </ul> <p> <b>NOTE:</b> The <code>assignables</code> contains the list of MAC addresses only if the VIP assignment is restricted to a group of nodes. You must specify <code>-json</code> with the command to view the <code>assignables</code>.</p>
sortby	<p>Specifies one of the following attributes to sort the list of virtual IP addresses by: <code>vipip</code>, <code>vipendip</code>, <code>vipnetmask</code>, <code>vipgateway</code>, <code>vipnumdevices</code>, <code>viphealth</code>, <code>vipassigneddevname</code>, <code>vipassigneddevip</code>, <code>vipassigneddevmac</code>, <code>vippreferredhostname</code>, <code>vippreferredip</code>, <code>vippreferredmac</code>.</p>
start	The index of the first record to return.

## Output

Field	Description
<code>assignables</code>	<p>The group of nodes to assign the VIP range to. If empty, the range of VIPs can be assigned to any NFSv3 server.</p> <p> <b>NOTE:</b> You must specify <code>-json</code> with the command to view the <code>assignables</code>.</p>
<code>hn</code>	The hostname.
<code>ip</code>	The IP address.
<code>mac</code>	The MAC address.
<code>nm</code>	The netmask.
<code>vip</code>	The virtual IP. If output contains VIP range, this is the start of the VIP range.
<code>vipe</code>	The end of the VIP range.

## Examples

### Return the list of VIPs:

**CLI**

```
# maprcli virtualip list
hn                ip
vip              mac
nm

**REST**

```
curl -X GET 'https://abc.sj.us:8443/
rest/virtualip/list' --user
<username>:<password>
```

**Return 2 virtual IPs:****CLI**

```
# maprcli virtualip list -limit 2
hn                ip
vip              mac
nm
atsqa4-164.nfs4ad.com 10.10.88.164
10.10.88.10 0c:c4:7a:1f:91:a5
255.255.255.0
atsqa4-161                10.10.88.161
10.10.88.11 0c:c4:7a:1f:91:0a
255.255.255.0
```

**REST**

```
curl -X
GET 'https://server.sj.us:8443/rest/
virtualip/list?limit=2' --user
<username>:<password>
```

**Return a list of VIP ranges:****CLI**

```
# maprcli virtualip list -range 1
assignables vip
vipec        nm
```

```
... 10.10.88.10
10.10.88.13 255.255.255.0
... 10.10.88.14
10.10.88.15 255.255.255.0
... 10.10.88.17
10.10.88.18 255.255.255.0
```

**REST**

```
curl -X
GET 'https://server.sj.us:8443/rest/
virtualip/list?range=1' --user
<username>:<password>
```

**virtualip move**

Reassigns a virtual IP or a range of virtual IP addresses to a specified Media Access Control (MAC) address.

**Syntax**

**CLI**

```
maprcli virtualip move
[ -cluster <cluster name> ]
-virtualip <virtualip>
[ -virtualipend <virtualip end
range>
-tomac <mac>
[ -service nfs3|nfs4 ]
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/virtualip/move?<parameters>

**Parameters**

Parameter	Description
cluster	The name of the cluster where the virtual IP addresses are being moved.
service	The service to assign the VIPs to. Value can be one of the following: <ul style="list-style-type: none"> <li>nfs3 — for NFSv3</li> <li>nfs4 — for NFSv4</li> </ul> The default value is <code>nfs3</code> , which is used if this option is not specified.
tomac	The MAC address that the virtual IP addresses are being assigned.
virtualip	A virtual IP address. If you provide a value for <code>-virtualipend</code> , this virtual IP address defines the beginning of the range.

Parameter	Description
virtualipend	A virtual IP address that defines the end of a virtual IP address range.

### Examples

**Move a range of three virtual IP addresses to a MAC address for the cluster my.cluster.com:**

#### CLI

```
maprcli virtualip move -cluster
my.cluster.com -virtualip
192.168.0.8 -virtualipend
192.168.0.10 -tomac 00:FE:ED:CA:FE:99
```

#### REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/virtualip/move?
cluster=my.cluster.com&virtualip=192.1
68.0.8&virtualipend=192.168.0.10&tomac
=00%3AFE%3AED%3ACA%3AFE%3A99' --user
<username>:<password>
```

### virtualip remove

Removes a virtual IP (VIP) or a VIP range. Permissions required: fc or a.

### Syntax

#### CLI

```
maprcli virtualip remove
[ -cluster <cluster> ]
-virtualip <virtual IP>
[ -virtualipend <Virtual IP Range
End> ]
```

#### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/virtualip/remove?<parameters>

### Parameters

Parameter	Description
cluster	The cluster on which to run the command.
virtualip	The virtual IP or the start of the VIP range to remove.
virtualipend	The end of the VIP range to remove.

## Examples

### CLI

```
maprcli virtualip remove -virtualip
10.1.1.5
```

### REST

```
https://abc.sj.us:8443/rest/virtualip/
remove?virtualip=10.1.1.5
```

## volume

Manages volumes, snapshots and mirrors.

## Fields

The following table lists the data fields that provide information about each volume. Each field has two names:

- Field name - displayed in the output of the `volume list` command and used to specify the columns displayed using the `columns` parameter
- Short name - used to specify the columns displayed using the `columns` parameter

The short name is also used when specifying rows with a filter, for example when specifying a set of volumes about which to get information.

Field Name	Short Name	Description
accesstime	va	A value that can be used to determine when this volume was accessed.
actualreplication	arf	The actual current replication factor by percentage of the volume, as a zero-based array of integers from 0 to 100. For each position in the array, the value is the percentage of the volume that is replicated index number of times. Example: arf=5,10,85 means that 5% is not replicated, 10% is replicated once, 85% is replicated twice.
advisoryquota	aqt	The advisory quota for the volume, in MB. A value of 0 indicates there are no soft or advisory quotas for this volume.
AdvisoryQuotaExceededAlarm	aqa	Alarm raised if the volume size is more than the value configured for the advisory quota.
aename	aen	The <i>accounting entity (AE)</i> name.
aetype	aet	The type of <i>accounting entity (AE)</i> . Value can be: <ul style="list-style-type: none"> <li>• 0 - user</li> <li>• 1 - group</li> </ul>

allowGrant	ag	Specifies whether a parent volume grants permission for a child volume to inherit its properties. Value can be true or false.
allowReadforExecute	re	When set to true(1), allows execution of SUID binaries with only their executable bit set, on a FUSE filesystem. This parameter works in conjunction with the fuse.mount.setuid FUSE option. For more information, see <a href="#">Configuring the HPE Ezmeral Data Fabric FUSE-Based POSIX Client</a> on page 1608
AlmostFullTopologyAlarm	afta	Timestamp when <a href="#">Topology Almost Full</a> on page 3034 alarm was raised.
atimeTrackingStartTime	atimeinterval	Indicates the time at which atimeUpdateInterval is enabled. aTimeTrackingStartTime is updated to the current time in the following cases: <ul style="list-style-type: none"> <li>• Just started tracking atime, which means that the atimeUpdate frequency was previously zero</li> <li>• If the value of atimeUpdate frequency is decreased</li> <li>• If the value of atimeUpdate frequency is increased and atime has not been tracked for the duration of the new frequency value</li> </ul> For more information, see <a href="#">Tuning Last Access Time</a> on page 523.
atimeUpdateInterval	atst	Defines the frequency at which the last file access time is updated. For more information, see <a href="#">Tuning Last Access Time</a> on page 523.
audited	ea	Indicates whether 1 or not (0) auditing is enabled for the volume. See <a href="#">Enabling Auditing</a> for the steps to enable auditing on a volume and on directories, files, and tables in that volume.
auditVolume	av	Indicates whether (1) or not volume accommodates audit logs.
BecomeMasterStuckAlarm	bms	Timestamp when the <a href="#">Volume Become Master Stuck</a> on page 3036 alarm has been raised for the volume.
CannotMirrorAlarm	cma	Timestamp when the "Cannot Mirror" alarm was raised.

coalesceInterval	ci	The interval of time in minutes during which only the first instance of an operation on a node is recorded in audit logs, if auditing is enabled. Subsequent identical operations performed on the same node are ignored during the interval. Setting this field to a larger number helps prevent audit logs from growing quickly.   <b>NOTE:</b> The default value is 60 minutes.
CompactionFailureAlarm	cfa	Timestamp when the <a href="#">Compaction Failed</a> on page 3029 alarm has been raised for the volume.
containerAllocationFactor	caf	Indicates the number of containers created for the volume.
ContainersNonLocalAlarm	cnla	Timestamp when the <a href="#">Local Volume containers non-local</a> alarm was raised.
creationTime	ct	The volume creation time (epoch time in seconds). This is only available on volumes created using MapR v6.0.0 or later. For volumes created using older MapR/Data Fabric versions, the <a href="#">volume info</a> on page 2632 and <a href="#">volume list</a> on page 2652 commands will return empty value for this field.
creator	on	Name of the user that created the volume.
creatorcontainerid	ccid	ID for the container.
creatorvolumeuuid	cvid	ID that supports the container chain identification for mirroring. The creatorcontainerid and creatorvolumeuuid fields combined form a unique identifier for the container chain.
CriticallyDegradedEcStripesAlarm	cea	Timestamp when the <a href="#">Data Under-Encoded</a> on page 3032 alarm has been raised for the volume.
criticalReReplTimeOutSec	crto	The timeout (in seconds) before re-replicating critically under-replicated containers only.
cvtotalused		The total space used by the associated cache volume.
dareEnabled	de	Indicates whether (1) or not (0) data-at-rest encryption is enabled for the volume.
data-size-mirrored-mb	dsm	Indicates the amount of data (in MB) that has been mirrored to the volume.
data-size-to-mirror-mb	dstm	Indicates the amount of data (in MB) that is yet to be mirrored to the volume.

DataUnavailableAlarm	dua	Timestamp when the <a href="#">Data Unavailable</a> on page 3030 alarm was raised.
DataUnderReplicatedAlarm	rfa	Timestamp when the <a href="#">Data Under-Replicated</a> on page 3031 alarm was raised.
dbindexlagsecalarmthresh	dilsat	Defines the lag time in seconds for updating secondary indexes after which the <a href="#">Secondary Index Encoding Error</a> on page 3029 alarm is raised.
dbrepllagsecalarmthresh	dlsat	Defines the lag time in seconds for replication after which the <a href="#">Table Replication Lag High</a> on page 3027 alarm is raised.
DegradedEcStripesAlarm	dea	Timestamp when the <a href="#">Warm-Tier Data Node Down</a> on page 3031 alarm has been raised for the volume.
disableddataauditoperations	ddao	The list of operations excluded from auditing. For more information, see <a href="#">Auditing Data Access Operations</a> on page 840 and <a href="#">Selective Auditing of File-System, Table, and Stream Operations Using the CLI</a> on page 1053.
ecscheme	ecs	The erasure coding scheme for the volume if the volume is enabled for warm tiering.
ecstorevolume	ecstore	The name of the backend volume or erasure coded volume associated with the tiering enabled front-end volume.
ecstripedepthmb	ecstripedepthmb	The stripe depth of the erasure coded volume. The default value is 4 MB.
ectopology	ectopo	The rack path to the erasure coded volume.
ectotalused	ecused	The total space, after compression, used by the erasure-coded volume. This includes the disk space used by the parity fragments.
enableddataauditoperations	edao	The list of operations selected for auditing. For more information, see <a href="#">Auditing Data Access Operations</a> on page 840 and <a href="#">Selective Auditing of File-System, Table, and Stream Operations Using the CLI</a> on page 1053.

enforcementmode	em	<p>The enforcement mode when evaluating authorization for data access. Permitted values are as follows:</p> <ul style="list-style-type: none"> <li><b>PolicyAceOnly:</b> Determines data access authorization based only on the security policy tags, for the file or directory. Ignores both mode bits and file or directory ACEs in determining access rights, when the resource is tagged with a security policy. Volume level ACEs still apply.</li> <li><b>PolicyAceAndDataAce:</b> Evaluates access rights based on the AND of the (file/directory ACEs OR mode bits), and security policy ACEs.</li> <li><b>DataAceOnly:</b> Evaluates access rights based on the AND of file/directory ACEs OR mode bits. Use this mode to switch off the policy-based security feature, on a per-volume basis, in an emergency situation.</li> </ul> <p>Default: PolicyAceAndDataAce</p>
enforceMinReplicationForIO	esmr	Indicates whether ( <i>true</i> ) or not ( <i>false</i> ) to enforce minimum number of replicas for the volume.
fixCreatorId	fcid	An internal flag for volumes to fix the creator container ID.
forceAudit	fa	Indicates whether (1) or not (0) to force audit of operations on all files, tables, and streams in the volume.
FullTopologyAlarm	fta	Timestamp when the <a href="#">Topology Full Alarm</a> on page 3035 was raised.
gateway	gwips	The hostname or IP address and port of the MAST Gateway associated with the volume.
InodesExceededAlarm	ia	Timestamp when the <a href="#">Inodes Exceeded</a> alarm was raised.
label	l	Label associated with the volume. See <a href="#">Using Storage Labels</a> on page 1306 for more information on labels.
LargeRowWarning	lrwarning	Timestamp when the <a href="#">Large Row</a> on page 3033 alarm was raised.
lastSuccessfulMirrorTime	lmt	Last time when the mirror completed successfully.

limitspread	ls	An internal flag for volumes to control the growth of volumes in terms of the number of containers. When this flag is set, CLDB tried to limit the number of new containers created depending on the present size of the volume. If the volume size (the data in the volume) is small, the CLDB tries to reuse space in existing containers thus avoiding the creation of new containers.
localpath	lp	Topology of the volume.
logicalUsed	dlu	Logical size of disk used by this volume in MB.
maxinodesalarmthreshold	miath	The threshold of inodes in use that set off the <a href="#">Inodes Limit Exceeded</a> on page 3032 alarm.
maxnssizembalarmthreshold	mnsszath	The namespace container size, which when exceeded raises the <a href="#">INODES_EXCEEDED</a> alarm.
metricsEnabled	me	Indicates whether (1) or not (0) metrics collection is enabled for the volume.
minreplicas	mrf	Minimum number of replicas before re-replication starts.
mirror-percent-complete	mpc	Percentage complete for the most recent or current mirror operation.
mirrorDataSrcCluster	mdc	Name of the cluster of the originator volume.
mirrorDataSrcVolume	mds	Name of the originator volume. This is used to identify the mirror family in cascaded mirroring.
mirrorDataSrcVolumeld	mdi	ID of the originator volume.
MirrorFailureAlarm	mfa	Timestamp when the <a href="#">Mirror Failure</a> on page 3033 alarm was raised.
mirrorId	mid	Current mirror ID of the volume.
mirrorscheduleid	msid	ID of the schedule that determines when the volume needs to be mirrored.
mirrorSrcCluster	msc	Name of the source cluster from which the current mirroring will happen.
mirrorSrcVolume	src	Name of the source volume from which the current mirroring will happen.
mirrorSrcVolumeld	msi	ID of the source volume from which the current mirroring will happen.
mirrorstatus	mst	Status of the last mirror attempt.

mirrorthrottle	dt	Flag to determine if the throttling need to be done on mirroring. Value can be: <ul style="list-style-type: none"> <li>0 - disabled</li> <li>1 - enabled</li> </ul>
mirrortype	mrt	Determines the type of volume: <ul style="list-style-type: none"> <li>0 - Read-write Volume</li> <li>1 - Mirror Volume</li> <li>2 - Mirror than can be converted to read-write</li> <li>3 - Read-write volume that can be converted to mirror</li> </ul>
mountdir	p	The path the volume is mounted on.
mounted	mt	A value of 1 indicates the volume is mounted
nameContainerDataThresholdMB	ncdt	Maximum amount of data allowed in the name container.
nameContainerSizeMB	ncsmb	Size of the name container for this volume in MB.
nsMinReplicas	nsmr	Minimum replication level for the namespace container.
nsNumReplicas	nsnr	Replication level for the namespace container.
needsGfsck	nfscck	Indicates whether ( <code>true</code> ) or not ( <code>false</code> ) this volume requires a filesystem check.
nextMirrorId	nmid	Mirror ID that is assigned if the mirroring successfully completes the next time.
NoNodesInTopologyAlarm	nna	Timestamp when the <a href="#">No Nodes in Topology</a> on page 3033 alarm was raised.
nslabel	nsl	The name container label. See <a href="#">Using Storage Labels</a> on page 1306 for more information on labels.
nsMinReplicas	nsmr	Indicates the minimum number of name space replicas configured for the volume.
nsNumRelicas	nsnr	Indicates the desired number of name space replicas configured for the volume.
numactivecgcontainers	numactivecgcntrs	The number of active CG containers for the volume.
numcontainers	nc	Number of containers that the volume has.

numreplicas	drf	Desired number of replicas. Containers with this amount of replicas are not re-replicated.
OffloadRecallFailureAlarm	ora	Timestamp when the <a href="#">Offload/Recall Failed</a> on page 3032 alarm has been raised for the volume.
partlyOutOfTopology	poot	A value of 1 indicates this volume is partly out of its topology
quota	qta	Quota for limiting disk size in MB. A value of 0 indicates there are no hard quotas for this volume
QuotaExceededAlarm	qa	Timestamp when the <a href="#">Volume Quota Alarm</a> on page 3037 was raised.
rackpath	rp	The rack path for this volume.
readonly	ro	A value of 1 indicates the volume is read-only.
replicatedlogicalused	replused	Replicated logical used data of this volume
replicatedtotalused	replusedtotal	Replicated total used data of this volume
replicationtype	dcr	Replication type. Value can be <code>low_latency</code> (star replication) or <code>high_throughput</code> (chain replication).
ReplTypeConversionInProgress	rtip	Indicates whether (1) replication type conversion is currently happening.
reReplTimeOutSec	rto	Timeout (in seconds) before attempting re-replication of replica containers. This volume property defines the timeout period until CLDB starts re-replicating the containers on the node of the volume when CLDB stops receiving a heartbeat from the node.
scheduleid	sid	The ID of the schedule, if any, used by this volume.
schedulename	sn	The name of the schedule, if any, used by this volume.
skipWireSecurityForTierInternalOps	swsfti	Indicates whether the skip wire security tier internal ops got enabled for this volume.
SnaprestoreMaxretriesExceededAlarm	sra	Timestamp when the <a href="#">Snapshot Restore Failure</a> on page 3034 alarm was raised.
snapshotcount	sc	The number of snapshots for this volume.
SnapshotFailureAlarm	sfa	Timestamp when the <a href="#">Snapshot Failure</a> on page 3034 alarm was raised.

snapshotused	ssu	Total space used (in MB) by the data owned only by the snapshot and not present in the RW volume. Data shared between the snapshot and RW volume is not counted in this field.
TableIndexEncodingErrorAlarm	vatinee	Timestamp when the the <a href="#">VOLUME_ALARM_TABLE_INDEX_ENCODING_ERROR</a> alarm has been raised for the volume.
TableIndexErrorAlarm	vatinde	Timestamp when the <a href="#">VOLUME_ALARM_TABLE_INDEX_ERROR</a> alarm has been raised for the volume.
TableIndexLagHighAlarm	vatindlh	Timestamp when the <a href="#">VOLUME_ALARM_TABLE_INDEX_LAG_HIGH</a> alarm has been raised for the volume.
TableReplicationAsyncAlarm	vatrepa	Timestamp when the <a href="#">Table Replication Asynchronous</a> on page 3028 alarm was raised.
TableReplicationErrorAlarm	vatrepe	Timestamp when the <a href="#">Table Replication Errors</a> on page 3026 alarm was raised.
TableReplicationLagHighAlarm	vatreplh	Timestamp when the <a href="#">Table Replication Lag High</a> on page 3027 alarm was raised.
tiercompactionoverheadthreshold	tcover	The percentage of offloaded data that must have been deleted on the cluster to qualify the data for compaction (or deletion from the tier).
tiercompactionscheduleid	tcsid	The ID of the schedule to use for running the compactor.
tierenable	tenb	Indicates whether (1) or not (0) storage efficiency through tiering is enabled for the volume.
tierencryption	tenc	Indicates whether ( <code>true</code> ) or not ( <code>false</code> ) encryption of data on the tier is enabled.
tierid	tid	The ID of the tier.
tierjobendtime	tjetime	The date and time when the last tiering operation was completed.
tierjoboffloadavgthroughputmbps	tjospeed	The average throughput (MB per second) for offloaded data.
tierjobrecallavgthroughputmbps	tjrspeed	The average throughput (MB per second) for recalled data.
tierjobprogress	tjprog	The completion percentage of the currently running or last tiering operation.
tierjobstarttime	tjstime	The date and time when the currently running or last tiering operation was started.

tierjobstate	tjstatus	<p>The status of the currently running or last tiering operation. Value can be one of the following:</p> <ul style="list-style-type: none"> <li>• Scheduled</li> <li>• Running</li> <li>• FailureFatal</li> <li>• FailureRetriable</li> <li>• Success</li> <li>• Aborted</li> <li>• AbortInProgress</li> <li>• AbortedInternal</li> </ul> <p>For more information on these, see <a href="#">Statuses</a> on page 2718.</p>
tierjobtotaloffloadsize	tjsize	The total amount of data offloaded to the tier during the last offload operation.
tierjobtype	tjtype	The type of tiering operation currently running or last performed on the volume.
tierLocal	tloc	The amount of (in MB) physical user data (including recalled data) on the volume in the cluster.
tiername	tname	The name of the tier.
tieroffloadscheduleid	tsid	The ID of the schedule for offloading data to the tier.
tierPurged	tpur	The amount (in MB) of physical user data that is offloaded to the tier.
tierRecall	trec	The amount of (in MB) physical user data that is recalled to the cluster.
tierrecallexpirytime	ret	The amount of time to keep recalled data on the cluster before offloading (if there are changes) or purging (if there are no changes) the data.
tierruleid	rid	The ID of the rule or storage policy.
tiertype	ttype	<p>The type of tier. Value can be either:</p> <ul style="list-style-type: none"> <li>• cold</li> <li>• ectier</li> </ul>
totalused	tsu	Total space used for volume and snapshots, in MB.
used	dsu	Disk space used (in MB), not including snapshots.
volumeAces	vace	Displays the ACE values set for this volume.
volumeid	id	The volume ID.

volumename	n	The name of the volume.
volumetype	t	The volume type (for backward-compatibility): <ul style="list-style-type: none"> <li>• 0 - Read-write Volume</li> <li>• 1 - Mirror Volume</li> </ul>
wireSecurity	ws	Indicates whether (1) or not (0) wire-level security is enabled.

**Related concepts**

[node](#) on page 2260

Manages nodes in the cluster

**Related reference**

[disk add](#) on page 2124

Adds one or more disks to the specified node. Permissions required: `fc` or `a`.

[disk setlabel](#) on page 2126

Adds a label to disks or a storage pool. Permissions required: `fc` or `a`.

[label add](#) on page 2251

Registers a label. Permissions required: `fc` or `a`.

[volume create](#) on page 2592

Creates a volume.

[volume move](#) on page 2701

Moves the specified volume or mirror to a different topology. Permissions required: `m` or `fc` on the volume.

[label list](#) on page 2255

Lists registered labels. Permissions required: `fc` or `a`.

[node list](#) on page 2270

Lists nodes in the cluster.

[dump volumeinfo](#) on page 2171

Returns information about volumes and the associated containers. For JSON formatted output, use the `-json` option from the command line.

[configure.sh](#) on page 2826

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Ezmeral Data Fabric client nodes, and configuring services for a node.

**volume audit**

Enables or disables auditing on the specified volume.

You must have the `fc` permission on the cluster to use this command. See [acl](#) for details about this permission.

To learn how to determine whether auditing is enabled for a volume, see [Checking Whether Auditing is Enabled for a Directory, File, or HPE Ezmeral Data Fabric Database Table](#).

**Syntax****CLI**

```
maprcli volume audit
[ -cluster <cluster name> ]
-name <volume name>
[-dataauditops <+|-operations>]
[ -enabled <true|false> ]
```

```
[ -forceenable true|false ]
[ -coalesce <interval in
minutes> ]
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/audit?<parameters>

**Parameters**

Parameter	Description
cluster	The cluster on which the volume is located. This parameter is required if the volume is on a remote cluster. The remote cluster must be listed in the <code>mapr-clusters.conf</code> file for the cluster where you run the command.
<i>coalesce</i>	<p>The interval of time during which READ, WRITE, or GETATTR operations on one file from one IP address or UID are logged only once for a particular operation, if auditing is enabled.</p> <p>For example, suppose that a client application reads a single file three times in 6 minutes, so that there is one read at 0 minutes, another at 3 minutes, and a final read at 6 minutes. If the coalesce interval is at least 6 minutes, then only the first read operation is logged. However, if the interval is between 4 minutes, then only the first and third read operations are logged. If the interval is 2 minutes, all three read operations are logged.</p> <p>Now however, if the client was also writing to the file, irrespective of the coalesce interval for the read operation in the example stated previously, the write operation is logged, as it is a different operation from reading.</p> <p>The default value is 60 minutes. Setting this field to a larger number helps prevent audit logs from growing quickly.</p>

Parameter	Description
dataauditops	<p>The comma separated list of filesystem operations to include (specified with a preceding plus sign (+)) and/or exclude (specified with a preceding minus sign (-)) from auditing.</p> <p> <b>NOTE:</b> If the first operation in the list is to be excluded from auditing, it must be preceded by two minus (--) signs. Subsequent operations to exclude must be preceded by only a single minus (-) sign, whether or not the first operation was included (using a plus (+) sign) or excluded (using two minus (--) signs). If neither sign is specified, the given operation is included for auditing.</p> <p>The operations that can be included (+) and/or excluded (-) from auditing are listed <a href="#">here</a>. You can, alternatively, group all the filesystem and table operations using the keyword <code>all</code>, which:</p> <ul style="list-style-type: none"> <li>• If included (+), cannot be specified with a list of other included operations.</li> <li>• If excluded (-), cannot be specified with a list of other excluded operations.</li> </ul> <p> <b>NOTE:</b> You can specify a mixed list of included and excluded operations. There are no changes to operations that are not specified with the command.</p>
enabled	<p>Enables or disables the auditing of operations within the volume. You must use either this parameter, the <code>-coalesce</code> parameter, or both.</p> <p>See <a href="#">Enabling Auditing</a> for the steps to enable auditing on directories, files, and tables in a volume.</p> <p>When you set the value to false, auditing of operations within the volume ceases. None of the auditing settings are changed on the directories, files, and HPE Ezmeral Data Fabric Database tables within the volume. If you later run the <code>maprcli volume audit</code> command with <code>-enabled</code> set to <code>true</code>, auditing begins again on the objects that were already enabled for auditing.</p>
forceenable	<p>Enables or disables auditing of all directories, files, tables, and streams in the volume whether or not auditing is enabled at the individual file, table, and/or stream level.</p>
name	<p>The name of the volume.</p>

## Examples

### Enable Auditing for a volume

The following example shows how to enable auditing for the volume “auditVolume”:

#### CLI

```
maprcli volume audit -name
auditVolume -enabled true
```

**REST**

```
curl -X POST 'https://
abc.sj.us:8443/rest/volume/audit?
name=auditVolume&enabled=true' --user
<username>:<password>
```

**Modify the list of operations to audit**

The following example shows how to specify the operations to audit. Here, `create` operation is included for auditing and `lookup` operation is excluded from auditing. There are no changes to operations that are not specified.

**CLI**

```
maprcli volume audit -name
sampleAuditVolume -dataauditops
+create,-lookup
```

**REST**

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/audit?
name=sampleAuditVolume&dataauditops=%2
Bcreate%2C%2Dlookup' --user
<username>:<password>
```

**volume balancecontainers**

Balances the containers, or stops the balancing of containers associated with the volume.

**Syntax****CLI**

```
maprcli volume balancecontainers
[ -cluster cluster_name ]
-name <volume name>
[ -cancel <true|false>. default:
false ]
```

**REST API**

N/A

**Parameters**

Parameter	Description
cancel	Stop the balancing of containers associated with the volume. Set this parameter to <code>true</code> to cancel balancing a volume.
cluster	The name of the cluster on which to run the command.
name	The name of the volume.

**Examples****Start balancing the containers associated with a volume:**

```
maprcli volume balancecontainers -name sampleVol
```

**Stop balancing the containers associated with a volume:**

```
maprcli volume balancecontainers -name sampleVol -cancel true
```

**volume balancinginfo**

Fetch currently running or scheduled balancer information for one or more volumes.

**NOTE:** For best results, use the `-json` option when running the command.

**Syntax****CLI**

```
maprcli volume balancinginfo
[ -cluster cluster_name ]
[ -name <volume name> ]
```

**REST API**

N/A

**Parameters**

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the volume.

**Output**

The command returns the following fields:

Field	Description
spId	The ID of the storage pool.
capacity	The capacity/size of the storage pool in MB.
usedSize	The size of the storage pool that is consumed.
desiredSize	The total size of the containers of a volume that should be allocated on this storage pool.
isUnderweight	Value is <code>true</code> if the storage pool contains less than 50% of the <code>desiredSize</code> for this volume.
isOverweight	Value is <code>true</code> if the storage pool contains more than 1.5 times the <code>desiredSize</code> for this volume.

**Examples**

**Fetch the list of volumes whose balancing is currently in progress or scheduled:**

```
maprcli volume balancinginfo -json
```

**Fetch the balancing information for a volume:**

```
maprcli volume balancinginfo -name snapshotVolume1 -json
```

Output:

```
{
  "timestamp":1502529117881,
  "timeofday":"2017-08-12 09:11:57.881 GMT+0000",
  "status":"OK",
  "total":5,
  "data":[
    {
```

```

    "volumeName": "snapshotVolume1"
  },
  {
    "isBalancingInProgress": false
  },
  {
    "numContainers": 15
  },
  {
    "volumeSize": 384
  },
  {
    "spInfo": [
      {
        "spId": "f891ae9e6663fa2000598ec48808155c",
        "capacity": 152969,
        "usedSize": 96,
        "desiredSize": 95,
        "isUnderweight": false,
        "isOverweight": false
      },
      {
        "spId": "bed92c0ecfaefc8b00598ec48b01cdfe",
        "capacity": 152969,
        "usedSize": 96,
        "desiredSize": 95,
        "isUnderweight": false,
        "isOverweight": false
      },
      {
        "spId": "b61aa1b814fd8bbc00598ec48d0af1d2",
        "capacity": 157065,
        "usedSize": 96,
        "desiredSize": 97,
        "isUnderweight": false,
        "isOverweight": false
      },
      {
        "spId": "7af11d5b9d223baa00598ec4850efb57",
        "capacity": 152969,
        "usedSize": 96,
        "desiredSize": 95,
        "isUnderweight": false,
        "isOverweight": false
      }
    ]
  }
]
}

```

**volume compact**

Runs the compactor to remove recalled data on the Data Fabric cluster or stale data on the tier.

**Permissions Required**

The user running the command must have one of the following:

- Full control (fc) on the cluster or volume
- Volume edit permissions

## Syntax

### CLI

```
maprcli volume compact
  [ -cluster <cluster_name> ]
  -name <vol_name>
  [ -forcerecallexpiry true|false ]
```

### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/compact?<parameters>

## Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
forcerecallexpiry	Specifies whether (true) or not (false) to purge recalled data on the Data Fabric cluster. If the command is run with the value for this set to true, the compactor purges recalled data on the Data Fabric cluster whether or not the expiry time for recalled data has been reached. If this is not specified or if the value for this is false, the compactor purges stale data on the tier and recalled data on the Data Fabric cluster if the expiry time for recalled data has been reached or has passed. The default value is false.
name	The name of the volume.

## Examples

### Remove stale data on the tier for the volume named sampleVol:

#### CLI

```
# maprcli volume compact -name
sampleVol -json
{
  "timestamp":1528299575917,
  "timeofday":"2018-06-06
08:39:35.917 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully started
compaction."
  ]
}
```

#### REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/compact?
name=sampleVol' --user mapr:mapr
```

```
{ "timestamp":1528299575917,"timeofday"
:"2018-06-06 08:39:35.917 GMT-0700
AM", "status":"OK", "total":0, "data":
[], "messages":["Successfully started
compaction." ] }
```

### Remove recalled data immediately on the volume named `sampleVol`:

#### CLI

```
# maprcli volume compact -name
sampleVol -forcerecallexpiry
true -json
{
  "timestamp":1528299765110,
  "timeofday":"2018-06-06
08:42:45.110 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":["
    Successfully started
    compaction."
  ]
}
```

#### REST

```
# curl -X POST 'https://
abc.sj.us:8443/rest/volume/compact?
name=sampleVol&forcerecallexpiry=true'
--user <username>:<password>
{ "timestamp":1528299765110,"timeofday"
:"2018-06-06 08:42:45.110 GMT-0700
AM", "status":"OK", "total":0, "data":
[], "messages":["Successfully started
compaction." ] }
```

### volume container move

Moves a container. Permissions required: `fc` or `m` on the volume.

The volume container move command moves a specified container (`cid`) from a source file server (`fromfileserver`) to a destination file server (`tofileserver`). If the `tofileserver` parameter is not specified, a destination file server is chosen by the CLDB. If the `tofileserver` is specified but does not exist, the command fails with an error. If the `fromfileserver` does not exist or is down, the container move occurs once the source file server comes back up.

#### Syntax

##### CLI

```
volume container move
  -cid <cid>
  -fromfileserverid
<fromfileserverid>
  [ -tofileserverid
<tofileserverid> ]
```

##### REST

Request Type	POST
--------------	------

Request URL	http[s]://<host>:<port>/rest/volume/container/move?<parameters>
-------------	-----------------------------------------------------------------

### Parameters

Parameter	Description
cid	The container ID.
fromfileserverid	The ID of the file server on which the container to be moved currently resides. The ID is available from the <code>maprcli node list</code> command.
tofileserverid	The ID of the file server to which to move the container. If not specified, a file server is chosen by the CLDB. The ID is available from the <code>maprcli node list</code> command.

### Examples

#### CLI

```
maprcli volume container
move -cid 2316 -fromfileserverid
5227152973904547710 -tofileserverid
875290643748357753
```

#### REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/container/move?
cid=2316&fromfileserverid=52271529739045
47710&tofileservicerid=87529064374835775
3' --user <username>:<password>
```

#### volume container switchprimary

Switches the primary replica for a specified container to another replica in the replica chain.

This command fails if there is only one up-to-date replica for the container.

**NOTE:** Only the `root` and the `MAPR_USER` (user name under which HPE Ezmeral Data Fabric services run) user have permissions to run this command.

### Syntax

#### CLI

```
maprcli volume container
switchprimary
[ -cluster <cluster_name> ]
-cid <cid>
```

#### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/container/switchprimary?<parameters>

## Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
cid	The unique ID number for the container that you want to run the command on.

## Example

Switches the primary container for a specified container:

### CLI

```
maprcli volume container
switchprimary -cid 2049
```

### REST

```
https://abc.sj.us:8443/rest/volume/
container/switchprimary?cid=2049
```

## volume create

Creates a volume.

## Permissions Required

cv or fc on the cluster.

**NOTE:** See [acl](#) on page 1993 for more information.

## Syntax

### CLI

```
/opt/mapr/bin/maprcli volume create
-name <volume name>
[ -advisoryquota <advisory quota> ]
[ -ae <accounting entity> ]
[ -aetype <accounting entity
type> ]

```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/create?<parameters>

**Parameters**

**Parameter: advisoryquota**

*Default Value:* No default value

*Possible Values:* 0 or any other integer value.

*Description:* The advisory quota for the volume as integer plus unit. Example: quota=500G;

*Units:* B, K, M, G, T, P

Setting a quota allows you to configure an alarm when the volume usage exceeds a specific limit. There are two kind of quotas, the advisory quota and the quota, also referred to as a "hard" quota (see the *quota* parameter later on this page). You can choose to set either or both types of quotas. If both quotas are set, the advisory quota must be less than or equal to the hard quota.

Volume usage that exceeds the advisory quota raises a VOLUME\_ALARM\_ADVISORY\_QUOTA\_EXCEEDED alarm. Volume usage that exceeds the hard quota raises a VOLUME\_ALARM\_QUOTA\_EXCEEDED alarm and prevents new writes until space is freed up

<b>Parameter: ae</b>	<p>on the volume. Setting an advisory quota can alert you to take action before a hard quota is reached and new writes to the volume are stopped.</p>
	<i>Default Value:</i> No default value
	Possible Values: Name of the entity that owns the volume.
	Description: The accounting entity that owns the volume.
<b>Parameter: aetype</b>	<i>Default Value:</i> No default value
	Possible Values:
	<ul style="list-style-type: none"> <li>• 0=user</li> </ul>
	<ul style="list-style-type: none"> <li>• 1=group</li> </ul>
	Description: Type of accounting entity.
<b>Parameter: allowgrant</b>	<i>Default Value:</i> false
	Possible Values:
	<ul style="list-style-type: none"> <li>• true</li> </ul>
	<ul style="list-style-type: none"> <li>• false</li> </ul>
	Description: Specifies whether the volume as a parent, grants permission for a child volume to inherit its properties.
<b>Parameter: allowinherit</b>	<i>Default Value:</i> true
	Possible Values:
	<ul style="list-style-type: none"> <li>• true</li> </ul>
	<ul style="list-style-type: none"> <li>• false</li> </ul>
	Description: Specifies whether a new volume inherits properties from the parent mount point volume.
<b>Parameter: allowreadforexecute</b>	<i>Default Value:</i> false
	Possible Values:
	<ul style="list-style-type: none"> <li>• true</li> </ul>
	<ul style="list-style-type: none"> <li>• false</li> </ul>
	Description: Allows execution of SUID binaries with only their executable bit set, on a FUSE filesystem. This parameter works in conjunction with the <code>fuse.mount.setuid</code> FUSE option. For more information, see <a href="#">Configuring the HPE Ezmeral Data Fabric FUSE-Based POSIX Client</a> on page 1608.
<b>Parameter: auditenabled</b>	<i>Default Value:</i> true
	Possible Values:
	<ul style="list-style-type: none"> <li>• true</li> </ul>
	<ul style="list-style-type: none"> <li>• false</li> </ul>
	Description: Specifies whether to turn on auditing for the volume. If you enable auditing at the cluster level with the <code>audit data</code> on page 2030 command, setting this value to <code>true</code> causes auditing to start for any directories, files, tables, or streams that are

already enabled for auditing. If none are yet enabled, enabling auditing on any of them causes auditing of them to start.

Set `auditenabled` to `true` to enable auditing on directories, files, tables, and streams in the volume.

You must have the `fc` permission on the cluster to use this parameter. See [acl](#) for details about this permission.

**Parameter:** `autooffloadthresholdgb`

*Default Value:* 1024 GB

*Possible Values:* Any positive integer.

*Description:* The size of the volume in GB (threshold). When this threshold is reached or exceeded, volume data is automatically offloaded by the Automatic Tiering Scheduler. To use the global size threshold (of 1024 GB), set the value to 0.

**Parameter:** `cluster`

*Default Value:* No default value

*Possible Values:* Any valid cluster.

*Description:* The cluster on which to create the volume.

**Parameter:** `coalesce`

*Default Value:* 60 minutes

*Possible Values:* Set this parameter to a large number of minutes to prevent audit logs from growing quickly.

*Description:* The interval of time (in minutes) during which READ, WRITE, or GETATTR operations on one file from one IP address or UID are logged only once for a particular operation, if auditing is enabled.

For example, suppose that a client application reads a single file three times in 6 minutes, so that there is one read at 0 minutes, another at 3 minutes, and a final read at 6 minutes. If the coalesce interval is at least 6 minutes, then only the first read operation is logged. However, if the interval is 4 minutes, then only the first and third read operations are logged. If the interval is 2 minutes, all three read operations are logged.

Now however, if the client was also writing to the file, irrespective of the coalesce interval for the read operation in the example stated previously, the write operation is logged, as it is a different operation from reading.

**Parameter:** `compactionoverheadthreshold`

*Default Value:* 30%

*Possible Values:* 0-100%

*Description:* Specifies the percentage of offloaded data that must have been deleted on the cluster to qualify the data for compaction (or deletion from the tier).

**Parameter:** `compactionschedule`

*Default Value:* Automatic Internal Schedule

*Possible Values:* Any valid schedule ID.

Set this parameter to 0 to disable the compactor.

*Description:* Specifies the schedule to use for running the compactor.

**Parameter:** `containerallocationfactor`

*Default Value:* 5

*Recommended Value:* 2\* SP count in the volume topology.

<b>Parameter: createparent</b>	<p>Description: Specifies the number of containers to create when the first write from a remote client is sent to the volume. The pre-created containers are distributed equally across topologies, servers, file system instances, and storage pools. CLDB also takes into consideration the load (IO/Space) when selecting target storage pools for containers. The value must be a positive integer.</p> <p><i>Default Value:</i> 1</p> <p>Possible Values:</p> <ul style="list-style-type: none"> <li>• 0 - Do not create a parent directory</li> <li>• 1 - Create a parent directory</li> </ul>
<b>Parameter: criticalrereplicationtimeoutsec</b>	<p>Description: Specifies whether or not to create a parent directory to hold the volume link.</p> <p><i>Default Value:</i> 0 (No timeout)</p> <p>Possible Values: Any integer between 300 and 3600 (seconds)</p> <p>Description: Timeout (in seconds) before re-replicating only the critically under-replicated containers . If you set both <code>rereplicationtimeoutsec</code> and <code>criticalrereplicationtimeoutsec</code>, and if the value of:</p> <ul style="list-style-type: none"> <li>• <code>rereplicationtimeoutsec</code> is less than <code>criticalrereplicationtimeoutsec</code>, <code>rereplicationtimeoutsec</code> overrides the <code>criticalrereplicationtimeoutsec</code> setting for both under-replicated and critically under-replicated containers.</li> <li>• <code>rereplicationtimeoutsec</code> is greater than <code>criticalrereplicationtimeoutsec</code>, <code>criticalrereplicationtimeoutsec</code> overrides the <code>rereplicationtimeoutsec</code> setting only for critically under-replicated containers; <code>rereplicationtimeoutsec</code> setting is still applicable for under-replicated containers.</li> </ul>
<b>Parameter: dare</b>	<p><i>Default Value:</i> false</p> <p>Possible Values:</p> <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul> <p>Description: Specifies whether or not to enable data-at-rest encryption for volume. This setting takes effect only if the data-at-rest encryption feature is also enabled at the cluster level. Once enabled, this feature cannot be disabled.</p>
<b>Parameter: dataauditops</b>	<p><i>Default Value:</i> Default enabled audit ops: <code>setattr, chown, chperm, chgrp, getxattr, listxattr, setxattr, removexattr, read, write, create, delete, mkdir, readdir, rmdir, createsym, lookup, rename, createdev, truncate, tablecfcreate, tablecfdelete, tablecfmodify, tablecfScan, tableget, tableput, tablescan, tablecreate, tableinfo, tablemodify, getperm,</code></p>

`getpathforfid,hardlink,filesca,filerecall,filetierjobstatus,filetierjobabort`

**Possible Values:** Any audit operations that you want to enable.

**Description:** The comma separated list of filesystem operations to include (specified with a preceding plus sign (+)) or exclude (specified with a preceding minus sign (-)) from auditing.

To exclude the first operation in the list (of operations) from auditing, precede it by two minus (--) signs. To exclude subsequent operations, precede them by only a single minus (-) sign, irrespective of whether the first operation was included (using a plus (+) sign) or excluded (using two minus (--) signs). If neither sign is specified, the given operation is included for auditing.

The operations that can be included (+) or excluded (-) from auditing are listed [here](#). You can, alternatively, group all the operations using the keyword `all`, which:

- If included (+), cannot be specified with a list of other included operations.
- If excluded (-), cannot be specified with a list of other excluded operations.

You can specify a mixed list of included and excluded operations. There is no change to operations that are not specified with the command.

**NOTE:** Enabling `setattr` automatically enables the following operations:

- `chown`
- `chgrp`
- `chperm`

If you disable `setattr`, these operations are automatically disabled. If you do nothing with `setattr` (neither enable nor disable), you can enable or disable `chown`, `chgrp`, and `chperm` in any combination and they will not affect `setattr`.

For more information, see [Selective Auditing of Filesystem and Table Operations](#).

**Parameter:** `dbindexlagsecalarmthresh`

*Default Value:* 300 seconds

**Possible Values:** Any integer value.

**Description:** Specifies the threshold (in seconds) to raise an alarm for index update lag.

**Parameter:** `dbrepllagsecalarmthresh`

*Default Value:* 900 seconds

**Possible Values:** Any integer value.

**Description:** Specifies the threshold (in seconds) to raise an alarm for DB replication lag.

**Parameter:** `ecenable`

*Default Value:* false

**Possible Values:**

- true
- false

Description: Enable (`true`) or disable (`false`) warm tiering for the volume. Either this parameter or `tieringenable` is required to enable warm tiering. If you specify this parameter, you cannot specify `tiername`; when the command runs, a new tier is created for the volume. If you do not specify any rule, the default rule, which is all files (`p`), is associated with the volume.

*Default Value:* HDD

Possible Values: Any label.

Description: The label to use for the erasure-coded volume. See [Using Storage Labels](#) on page 1306 for more information on labels.

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

#### Parameter: eclabel

*Default Value:* 4+2

Possible Values: Any valid EC scheme.

Description:

**NOTE:** This parameter is applicable only for EC volumes, and only when you set the `ecenable` parameter to `true`.

The number of data chunks and the number of parity chunks separated by a plus (+) sign.

For schemes with local parity, the scheme is of the form  $x+y+z$ , where  $x$  is the number of data chunks,  $y$  is the number of local parity chunks, and  $z$  is the number of global parity chunks.

For information on the supported schemes, see [Erasure Coding Scheme for Data Protection and Recovery](#) on page 1236.

#### Parameter: ecscheme

*Default Value:* /data/default-rack

Possible Values: Any topology that exists in your environment.

Description: Sets the topology to store the erasure coded volume. Once set, you cannot change the topology of an erasure coded volume using this command. To change the topology of an erasure coded volume, use [volume move](#) on page 2701.

#### Parameter: ectopology

**NOTE:**

1. This parameter is applicable only for EC volumes.
2. The specified EC topology needs to have sufficient nodes for the selected EC Scheme. For example, 6 nodes for 4+2, 5 nodes for 3+2 etc.

**Parameter: enforcementmode***Default Value:* No default value

Possible Values:

- PolicyAceOnly
- PolicyAceAndDataAce
- DataAceOnly
- PolicyAceAuditAndDataAce

Description: The enforcement mode when evaluating authorization for data access. Permitted values are as follows:

- **PolicyAceOnly:** Determines data access authorization based only on the ACEs set in security policies. Ignores POSIX mode bits and ACEs directly defined on data objects when determining access rights, if a data object is tagged with at least one security policy. If a data object is not associated with at least one security policy, the system will enforce POSIX mode bits and ACEs directly defined on the data object. Volume-level ACEs are always enforced.
- **PolicyAceAndDataAce:** Determines data access authorization based on the ACEs set in security policies AND ACEs or POSIX mode bits directly set on data objects.
- **DataAceOnly:** Determines data access authorization based on the ACEs or POSIX mode bits directly set on data objects. You can use this mode to switch off the policy-based security feature, on a per-volume basis, in an emergency situation.
- **PolicyAceAuditAndDataAce:** Use this mode when testing security policies. In this mode:
  - ACEs defined directly on data objects are enforced.
  - Data objects associated with security policies are checked for access, and any access denied events are audited, but access itself is allowed.

See the section on [Volume-Level Security Policy Enforcement Mode](#) on page 853 for a discussion on how to determine permission to access a resource, when this flag is set.

**Parameter: enforceminreplicationforio***Default Value:* false

Possible Values:

- true
- false

Description: Specifies whether (*true*) or not (*false*) to enforce minimum number of replicas for the (read-write) volume during IO. This flag ensures that further updates (writes) to volume are successful only when the minimum number of copies of the container are available. Setting this parameter to *true* ensures

that if writes succeed, then it has been applied to at least the minimum number of copies; if writes fail, it may have been applied to zero or more copies.

Enabling this parameter, may stall `volume dump` and `volume snapshot create` operations, if the minimum number of copies of the container are not available.

If you do not set this parameter on a volume, or if you modified this parameter from `false` to `true`, then you need to restart all the nodes where the containers associated with the volume exist, for the changes to take effect.

This flag is ignored on mirror volumes. If there are more than five cluster nodes, this flag is set to `true`, by default, on the tier volume. If the number of cluster nodes is less than five, this flag is set to `false`, by default, on the tier volume.

**Parameter: filefilter**

Possible Values: Any file filter.

Description: Specifies the file filter to use to prevent specific types of files from being stored on the volume. For more information, see [Prevent Storage of Specified Types of Files](#) on page 833. You can associate only one filter for each volume.

**Parameter: forceauditenable**

*Default Value:* false

Possible Values:

- `true` - force audit of all content
- `false` - do not force audit

Description: Specifies whether (`true`) or not (`false`) to force audit of operations on all files, tables, and streams in the volume if auditing is enabled at the cluster and volume levels, irrespective of the audit setting on the individual directory, file, table, and stream.

**Parameter: group**

*Default Value:* No default value

Possible Values: Any user with `Create Volume` privileges.

Description: Space-separated list of `group:permission` pairs. Use commas to separate permissions. For example:  
`group:permission,permission,...`

**Parameter: honorrackreliability**  
`<ec-rack-reliability : true | false>`

*Default Value:* false

**NOTE:** The `honorrackreliability` parameter considers each rack as a site.

Allocates CGs for maximized resiliency during a site failure. CG containers are spread across multiple sites so that a site does not host more parity containers for a given CG (EC scheme: D+P). Container allocations for a CG with previous software use one container per site for a CG. Managing new allocations in this manner (where `honorrackreliability` is set to `true`) ensures that CG data is available for reads, even in cases where an entire site goes down. For a given EC D+P scheme, CG allocation requires, at

least, Math.ceil (D+P)/P site for CG creation, and if enough sites are unavailable, CG allocation fails.

**NOTE:** To use `-honorrackreliability` in a cluster with geographically-dispersed nodes, you must configure a topology with multiple racks having enough nodes in each rack. Specifying the configured topology as `-ectopology` ensures that `RackReliabilitySelector` allocates, at most, P containers in each rack during CG allocations.

**NOTE:** If a container needs to be reallocated for rebuild, an attempt is made to allocate a new container in the same rack in which the old container resided. If this allocation cannot be done, a new container is allocated into a different rack, such that the selected rack will not have more, than P containers. Otherwise, container allocation fails.

**Parameter:** `inherit`

*Default Value:* No default value

*Possible Values:* Any existing volume name

*Description:* Specifies the name of the volume from which the new volume inherits properties. When you specify `inherit`, you do not need to specify `allowgrant`. See the following section on Inheritance for more information.

**Parameter:** `label`

*Default Value:* default

*Possible Values:* Any label.

*Description:* The label to use for the storage pool. See [Using Storage Labels](#) on page 1306 for more information on labels.

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

**TIP:** Use the special label named `anywhere` to let a volume reside on any storage pool. Not setting a label, causes a volume to reside only on a storage pool without a label.

**Parameter:** `localvolumehost`

*Default Value:* No default value

*Possible Values:* Any existing volume name

*Description:* Specifies the name of the local volume host.

**Parameter:** `localvolumeport`

*Default Value:* 5660

*Possible Values:* Any valid port number

*Description:* Specifies the port number of the local volume host.

**Parameter:** `maxinodesalarmthreshold`

*Default Value:* 50000000

*Possible Values:* Any positive integer.

*Description:* The number of inodes, which when exceeded raises the `INODES_EXCEEDED` alarm.

**Parameter:** `maxnssizembalarmthreshold`

*Default Value:* 500 GB

	<p>Possible Values: Any positive integer.</p> <p>Description: The namespace container size, which when exceeded raises the <a href="#">INODES_EXCEEDED</a> alarm.</p> <p><i>Default Value:</i> false</p> <p>Possible Values:</p> <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul> <p>Description: Specifies whether (<i>true</i>) or not (<i>false</i>) to enable metrics collection for a volume.</p>
<p><b>Parameter:</b> <code>metricsenabled</code></p>	<p><i>Default Value:</i> 2</p> <p>Possible Values: Can be any value that you desire based on the replication you need.</p> <p>Description: The minimum replication level. When the replication factor falls below this minimum, re-replication occurs as aggressively as possible to restore the replication level. If any containers in the CLDB volume fall below the minimum replication factor, writes are disabled until aggressive re-replication restores the minimum level of replication.</p> <p><b>TIP:</b> For more information, see <a href="#">Understanding Replication</a> on page 484.</p>
<p><b>Parameter:</b> <code>minreplication</code></p>	<p><i>Default Value:</i> 0</p> <p>Possible Values: Any valid schedule ID.</p> <p>Description: The schedule ID corresponding to the schedule to be used for mirroring. If you specify a mirror schedule ID, then the mirror volume automatically syncs with its source volume on the specified schedule. Pre-assigned IDs include 1 for critical data, 2 for important data, and 3 for normal data. Custom schedules are assigned ID numbers in sequence. To determine the ID number, use the <code>schedule list</code> command.</p>
<p><b>Parameter:</b> <code>mirrorschedule</code></p>	<p><i>Default Value:</i> true</p> <p>Possible Values:</p> <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul> <p>Description: Specifies whether mirror throttling is enabled (<i>true</i>) or disabled (<i>false</i>). Throttling is set on the source volume and applies to all its mirrors.</p>
<p><b>Parameter:</b> <code>mirrorthrottle</code></p>	<p><i>Default Value:</i> true</p> <p>Possible Values:</p> <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul> <p>Description: Specifies whether to mount the volume (<i>true</i>) or not (<i>false</i>) after creating the volume.</p>
<p><b>Parameter:</b> <code>mount</code></p>	<p><i>Default Value:</i> No default value</p> <p>Possible Values: Any valid name</p>
<p><b>Parameter:</b> <code>name</code></p>	

**Parameter: namecontainerdatathreshold**

Description: Specifies the name for the volume.

The name should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

For tiering-enabled volumes, the volume name cannot exceed 98 characters. For regular volumes, the volume name should be a maximum of 128 characters.

*Default Value:* 524288 MB

*Possible Values:* Any integer value. The value is interpreted as being in MB.

If you set this parameter to 0, there is no limit on the size of user data that can be stored in the name container.

If chunk size is 0, by default, all data is stored in the name container. However, if this property is set, all data is stored in a second container and only the meta data is stored in the name container once the threshold is reached. The size of the second container is not limited by this setting; you must ensure that the size does not grow too large, by limiting the amount of data in the volume.

Description: Limits the size of user data that can be placed in the name container. The value is interpreted as being in MB. If the user data size limit:

- Has not yet been reached, the first 64 KB of data is stored in name container, and the rest of the data is stored in data containers.
- Has already been reached, only meta data is stored in the name container, and the data is stored in data containers. For example, if you set the current name container size to 200GB and the limit to 100GB, then all new user data is stored in data containers.

*Default Value:* default

*Possible Values:* Any value.

Description: The label to use for the namespace container. See [Using Storage Labels](#) on page 1306 for more information on labels.

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

**Parameter: nslabel****Parameter: nsminreplication**

*Default Value:* 2

*Possible Values:* Any integer value.

Description: A replication factor of the namespace container. When the replication factor falls below this value, re-replication occurs as aggressively as possible to restore the replication level. If any containers in the CLDB volume fall below the minimum replication factor, writes are disabled until aggressive re-replication restores the minimum level of replication.

When enabled, the CLDB manages the namespace container replication separate from the data container

**Parameter: nsreplication**

replication. You use this capability when you have low volume replication but want to have higher namespace replication.

Set the value to be the same or larger than the value of the equivalent data replication parameter, `minreplication`.

See also: [Understanding Replication](#) on page 484.

*Default Value:* 3

*Possible Values:* Any integer value.

*Description:* A replication factor of the namespace container. When the number of copies fall below the desired replication factor, but remains equal to or above the minimum replication factor, re-replication occurs after the timeout specified in the `cldb.fs.mark.rereplicate.sec` parameter. This timeout is the time given for a node that is offline to come back online. After this timeout period, the CLDB takes action to restore the replication factor. When enabled, the CLDB manages the namespace container replication separate from the data container replication. This capability is used when you have low volume replication but want to have higher namespace replication. By default, the value of this parameter is the same or larger than the value of the equivalent data replication parameter. However, to set the value of this parameter lower than the replication value, first set `engg.manual.override` to true in `cldb.conf`. See also: [Understanding Replication](#) on page 484.

**Parameter: numactivecgcontainers**

*Default Value:* 0

*Possible Values:* Any integer between 1 and 100.

*Description:* Number of containers to be assigned for a CG assign request.

**Parameter: offloadschedule**

*Default Value:* No default value

*Possible Values:* Any valid schedule ID. To disable schedule-based offload, set this value to 0.

*Description:* The ID of the schedule to associate with the volume for offloading volume data to the tier.

**NOTE:** This parameter is required only for Cold/EC tiered volumes.

**Parameter: path**

*Default Value:* No default value

*Possible Values:* Any valid path.

*Description:* The path at which to mount the volume. The path must be relative to / and cannot be in the form of a global namespace path (for example, /mapr/<cluster-name>/).

**Parameter: quota**

*Default Value:* 0

*Possible Values:* Any integer value along with a unit.

*Description:* The quota for the volume as integer plus unit. Example: `quota=500G; Units: B, K, M, G, T, P`

Do not use two-letter abbreviations for quota units, such as GB and MB.

Setting a quota allows you to configure an alarm when the volume usage exceeds a specific limit. There are two kind of quotas: the quota, also referred to as a "hard" quota, and the advisory quota (see the advisory quota parameter earlier on this page). You can choose to set either or both types of quotas. If both quotas are set, the advisory quota must be less than or equal to the hard quota.

Volume usage that exceeds the hard quota raises a `VOLUME_ALARM_QUOTA_EXCEEDED` alarm and prevents new writes until space is freed up on the volume. Volume usage that exceeds the advisory quota raises a `VOLUME_ALARM_ADVISORY_QUOTA_EXCEEDED` alarm. Setting an advisory quota can alert you to take action before a hard quota is reached and new writes to the volume are stopped.

When you set a quota for a tiering-enabled volume, the quota is the total space allocated for the volume irrespective of the location (cluster or tier) where the volume data is stored. For example, if you allocate 1GB of hard quota for a tiering-enabled volume, writes fail after you write 1GB of data whether or not the volume data is local (on the cluster) or offloaded (to the tier).

Note that quotas for source and mirror volumes must match.

**Parameter: readAce**

*Default Value:* `p` (grant access to all users)

Possible Values: Any valid permissions.

Description: Specifies [Access Control Expressions](#)(ACEs) that grant permissions at the volume level to read files and tables in the volume. The default value is `p`, which grants access to all users.

See [ACEs](#).

**Parameter: readonly**

*Default Value:* No default value

Possible Values:

- 0
- 1

Description: Specifies whether the volume is read-only.

- 0 - read/write
- 1 - read-only

**Parameter: recallexpirytime**

*Default Value:* 1 day

Possible Values: Any integer between 1 and 7500.

Description: The amount of time (in days) to keep the recalled data before purging or offloading it.

**Parameter: replication**

*Default Value:* 3

Possible Values: Any integer starting at 0.

Description: The desired replication level. When the number of copies falls below the desired replication factor, but remains equal to or above the minimum replication factor, re-replication

occurs after the timeout specified in the `cldb.fs.mark.rereplicate.sec` parameter. Note that this timeout is the time given for a node that is offline to come back online. After this timeout period, the CLDB takes action to restore the replication factor.

**TIP:** For more information, see [Understanding Replication](#) on page 484.

**Parameter:** `replicationtype`

*Default Value:* `high_throughput`

Possible Values:

- `low_latency` (star replication)
- `high_throughput` (chain replication)

Description: The desired replication type. The default setting is `high_throughput`.

**Parameter:** `rereplicationtimeoutsec`

*Default Value:* 3600 seconds (1 hour)

Possible Values: Any positive integer.

Description: Timeout (in seconds) before attempting re-replication of replica containers. This volume property defines the timeout period until CLDB starts re-replicating the containers on the node of the volume after CLDB stops receiving a heartbeat from the node.

When a node is down, CLDB gives the node an hour to come back online before it takes any action for the containers on this node. You can set this parameter on volumes to reduce the default value to a shorter time period. This option is provided mainly for local volumes, so that when the file system is down, CLDB can give up quickly and decide that the container has no master. This forces the TT to give up on local containers, and take the appropriate recovery action of deleting the mapped volume and creating another one.

**Parameter:** `rootdirgroup`

*Default Value:* User who is running the command

Possible Values: Any valid group

Description: Group that owns the root directory

**Parameter:** `rootdirperms`

*Default Value:* `rwxr-xr-x`

Possible Values: Any valid permission

Description: Permissions on the volume root directory.

**Parameter:** `rootdiruser`

*Default Value:* User who is running the command

Possible Values: Any valid user

Description: User that owns the root directory.

**Parameter:** `rootdirsecuritypolicy`

*Default Value:* None

Possible Values: An empty string, or a list of security policy tags.

Description: A comma-delimited list of security policy tags to be associated with the volume root directory. This parameter is not mandatory.

If you do not specify a security policy, the volume is created without initial security policy tags.

**Parameter:** `schedule`

*Default Value:* 0

**Parameter: skipinherit**

Possible Values: 0 or a valid schedule ID.

Description: The ID of a schedule. Use the [schedule list](#) command to find the ID of the named schedule that you want to apply to the volume.

To disable the schedule, set this parameter to 0.

*Default Value:* No default value

Possible Values:

- schedule
- tiername

Description: Specifies not to inherit given properties associated with the:

- Parent volume (for other volumes)
- Source volume (for mirror volumes)

Value must be either or both:

- schedule to not inherit snapshot schedule settings
- tiername to not:
  - Inherit tiering properties like tierid, tieroffloadscheduleid, ecshceme, ectopology
  - Set default values for compactionscheduleid and compactionoverheadthreshold

Use comma to separate multiple values.

*Default Value:* No default value

Possible Values: Any volume.

Description: The source volume from which a mirror volume receives updates, specified in the format <volume>@<cluster>.

**Parameter: source****Parameter: tenant**

*Default Value:* No default value

Possible Values: Any valid tenant user.

Description: The tenant is the entity for which resources such as volumes are created. The tenant can be an organization, a department within an organization, or an individual.

This parameter indicates the tenant for whom the volume is being created. All resources within the created volume are owned by the specified tenant.

**Parameter: tierencryption**

*Default Value:* false

Possible Values:

- true
- false

Description: Specifies whether to enable (*true*) or disable (*false*) encryption of data on the object store. This parameter is applicable only for cold-tier volumes.

If you enable this parameter, user data is encrypted before being written to the object, and the HTTPS protocol is used for communication with the object store to ensure that data is encrypted both on the wire and on the tier.

You can set this parameter only if you specify a tier name (see the `tiername` parameter) as well. You cannot modify this parameter after you set it.

If you set the value to `true`, you can also specify a custom key using the `tierkey` parameter. Once set to `true`, the MAST Gateway uses HTTPS to upload data to the cold-tier. If the cold tier does not support HTTPS, all tier related operations fail. If the cold-tier does not support HTTPS, you must explicitly set the value for this to `false` at the time of associating a tier with the volume because the default value for this parameter is `true`.

**TIP:** For warm tier, use `-dare` option on the front-end volume to enable or disable encryption of data-at-rest.

**Parameter: `tieringenable`**

*Default Value:* No default value

Possible Values:

- `true`
- `false`

Description: Enable (`true`) or disable (`false`) tiering for the volume. When you specify this parameter, you must also specify the `tiername`. For creating a tiering-enabled mirror volume, specify this parameter if the source volume is enabled for cold-tier; specify either this parameter or `ecenable`, if the source volume is enabled for warm-tier.

**Parameter: `tieringrule`**

*Default Value:* `p` (all files)

Possible Values: Name of any valid rule

Description: The name of the rule (referred to as storage policy in the Control System) to use for offloading data to the tier. If you do not specify a rule, the default rule, which is all files (`p`), is associated with the volume. See [Creating a Rule in Creating a Storage Tier Policy](#) on page 1295 for more information.

**Parameter: `tierkey`**

*Default Value:* Auto generated

Possible Values: Any 32-character HEX string, or let CLDB auto-generate this string

Description: The 32-character HEX string to use for encryption only for cold tier volumes. If you do not specify a string, CLDB generates a 32 character HEX string to use for encrypting the data to offload to the tier.

**Parameter: `tiername`**

*Default Value:* No default value

Possible Values: Any

Description: The name of the tier to use for offloading data. You can set this name only once and cannot modify it.

**Parameter: topology**

For warm tiering, you cannot specify this parameter if `ecenable` is set to `true`.

*Default Value:* /data

Possible Values: Any

Description: The rack path to the volume.

To create a volume in a specific topology, you must have the [Converged Enterprise Edition](#) installed on your system. Without the Converged Enterprise Edition, when you run the `maprcli volume create` command with the `-topology` option, the following error message is returned:

```
ERROR (10010) - Volume Creation
Failed: Setting topology on
           a volume
requires data placement feature.
License not found for data placement.
```

**Parameter: type**

*Default Value:* 0

Possible Values:

- mirror
- rw
- 0
- 1

Description: The type of volume to create.

The following values are accepted:

- `mirror` - standard mirror (read-only) volume (promotable to standard read-write volume)
- `rw` - standard (read-write) volume (convertible to standard mirror volume)
- `0` - standard (read-write) volume (for backward compatibility)
- `1` - non-convertible mirror (read-only) volume (for backward compatibility)

**Parameter: user**

*Default Value:* All permissions (`dump`, `restore`, `m`, `a`, `d`, `fc`) for the administrator who created the volume

Possible Values: Any valid permissions

Description: Space-separated list of `user:permission` pairs.

Use comma to separate permissions. For example: `user:permission,permission,...`

**Parameter: wiresecurityenabled**

*Default Value:* true

Possible Values:

- true

- false

Description: Enables (`true`) or disables (`false`) on-wire encryption for all files, tables, and streams in the volume for secure clusters.

If `true`, this setting overrides all file, table, and stream level encryption settings (set using the `hadoop mfs` command) and enables on-wire encryption for all files, tables, and streams. If you disable (`false`) this parameter at the volume level, but enable it at the file, table, or stream level, the file, table, or stream level encryption setting overrides this setting on those files, tables, and streams where it is enabled; for all other files, tables, and streams where encryption is not enabled at the file, table, or stream level, the on-wire encryption is disabled.

**Parameter: writeAce**

*Default Value:* `p` (grants access to all users)

*Possible Values:* Any valid permissions

Description: Specifies [Access Control Expressions \(ACEs\)](#) that grant permission at the volume level to write to files and tables in the volume. The default value is `p`, which grants access to all users.

See [ACEs](#).

**Inheritance**

The following table shows the list of inheritable parameters that are (Yes) and are not (No) inherited by a:

- Mirror volume from the source volume on the same cluster
- Mirror volume from the source volume on a different cluster

**NOTE:** All (non-mirror) volumes inherit all the inheritable properties from the parent volume. For more information on the properties, refer to `volume create` [parameters](#).

Inheritable Properties (which are inherited by non-mirror volumes by default)	Inherited by Mirror Volume on the same cluster as the source volume?	Inherited by Mirror Volume on a different cluster from the source volume?
<code>advisoryquota</code>	Yes	Yes
<code>ae</code>	Yes	No
<code>aetype</code>	Yes	No
<code>allowgrant</code>	Yes	Yes
<code>allowinherit</code>	Yes	Yes
<code>auditenabled</code>	Yes	Yes
<code>coalesce</code>	Yes	Yes
<code>dare</code>	Yes	Yes <sup>1</sup> , No <sup>2</sup>
<code>dataauditops</code>	Yes	Yes
<code>dbindexlagsecalarmthresh</code>	Yes	Yes
<code>dbrepllagsecalarmthresh</code>	Yes	Yes
<code>enforcementMode</code>	Yes	Yes

Inheritable Properties (which are inherited by non-mirror volumes by default)	Inherited by Mirror Volume on the same cluster as the source volume?	Inherited by Mirror Volume on a different cluster from the source volume?
ecscheme	Yes	No
ectopology	Yes	No
group	Yes	Yes
inherit	Yes	Yes
localvolumehost	No	No
localvolumeport	No	No
maxinodesalarmthreshold	Yes	Yes
minreplication	Yes	Yes
mirrorschedule	Yes	No
mirrorthrottle	Yes	Yes
nsminreplication	Yes	Yes
nsreplication	Yes	Yes
ofloadschedule	Yes	No
quota	Yes	Yes
readonly	Yes	Yes
recallexpirytime	Yes	No
replication	Yes	Yes
replicationtype	Yes	Yes
rereplicationtimeoutsec	Yes	Yes
rootdirperms	Yes	Yes
schedule	Yes <sup>3</sup>	No
securitypolicy	Yes	Yes
source	Yes	Yes
tierencryption	Yes	No
tieringenable	Yes	No
tieringrule	Yes	No
tierkey	Yes	No
tiername <sup>4</sup>	Yes	No
topology	Yes	No
type	Yes	Yes
user	Yes	Yes
wiresecurityenabled	Yes	Yes

- <sup>1</sup> If destination cluster is also enabled for data-at-rest encryption, dare setting is inherited by the mirror volume on the destination cluster.

- <sup>2</sup> If destination cluster is not enabled for data-at-rest encryption, `dare` setting is not inherited by the mirror volume on the destination cluster.
- <sup>3</sup> If `schedule` keyword is specified with the `skipinherit` parameter, `schedule(s)` are not inherited while inheriting volume properties from the source volume.
- <sup>4</sup> If `tiername` keyword is specified with the `skipinherit` parameter:
  - The tiering properties are not inherited by the mirror volume while inheriting volume properties from the tiering-enabled source volume.
  - For volumes enabled for warm-tier, the backend erasure-coded volume is not created.

## Examples

**NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

### Create the volume "test-volume" mounted at "/test/test-volume" with a time of 2 days

#### CLI

```
/opt/mapr/bin/maprcli volume
create -name test-volume -path /
test/test-volume -type rw
-atimeUpdateInterval 2 -json
{
  "timestamp":1526522204072,
  "timeofday":"2020-05-16
06:56:44.072 GMT-0700 PM",

```

## Create Volume with a Quota and an Advisory Quota

This example creates a volume with the following parameters:

- advisoryquota: 100M
- name: volumename
- path: /volumepath
- quota: 500M
- replication: 3
- schedule: 2
- topology: /East Coast
- type: rw

## CLI

```

/opt/mapr/bin/maprcli volume
create -name volumename -path /
volumepath -advisoryquota 100M -quota
500M -replication 3 -schedule
2 -topology "/East Coast" -type
rw -json
{
    "timestamp":1526522474660,
    "timeofday":"2018-05-16
07:01:14.660 GMT-0700 PM",
    "status":"OK",
    "total":0,

```

```

    "data":[
      ],
      "messages":[
        "Successfully created volume:
        'volumename'"
      ]
    ]
  }

```

**REST**

```

curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=volumename&path=/
volumepath&advisoryquota=100M&quota=50
0M&replication=3&schedule=2&type=rw'
--user <username>:<password>
{"timestamp":1526522622494,"timeofday":

PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'test-volume.mirror'"]}

```

**Create volumes that inherit from a parent volume**

When creating and mounting a volume, the location of the mount path is specified by the `path` parameter. Volumes can be mounted via the web console, the `maprcli` commands, or the REST commands. The `maprcli` commands include `volume create -path` command and the `maprcli volume mount -path` command if the volume was previously created. Sub-volumes (children) can inherit properties from their parent volume.

In the following example, a parent volume and two (2) child volumes are create where the child volume inherit properties from the parent. When the `inherit` flag is explicitly used, the `allowgrant` parameter for the parent volume is not required.

- For child volumes, `c1` and `c2`, inheritance is explicit because the `inherit` option is specified. Thus, `p1.c1` and `p1.c2` volumes will inherit all properties from volume `p1` (note that `p1` is not a parent of `p1.c1`) regardless of whether the `allowgrant` option is set on `p1` or not. In this case, there is an explicit inheritance ant the `allowgrant` flag is ignored and volume properties are inherited.
- For the child volume, `c3`, inheritance is implicit. Meaning, the child volume, `p1.c3`, inherits all properties from the parent volume, `p1`, only if the `allowgrant` option is set on `p1`.

#### CLI

```
/opt/mapr/bin/maprcli volume
create -name p1 -path /p1
/opt/mapr/bin/maprcli volume
create -name p1.c1 -inherit p1
/opt/mapr/bin/maprcli
volume create -name
p1.c2 -path /p1/c2 -inherit p1
/opt/mapr/bin/maprcli volume
create -name p1.c3 -path /p1/c3
```

#### REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=p1&path=%2Fp1' --user
<username>:<password>
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=p1.c1&inherit=p1' --user
<username>:<password>
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=p1.c2&path=%2Fp1%2Fc2&inherit=p1'
--user <username>:<password>
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=p1.c3&path=%2Fp1%2Fc3' --user
<username>:<password>
```

In the following example, the `p1.child` volume normally inherits from the `p1` parent volume properties because `p1.child` is mounted under `p1` and `allowgrant` option is set to `true` on the parent volume. However, if the child volume doesn't want to inherit properties, then set the `allowinherit` option to `false` (default: `true`).

#### CLI

```
/opt/mapr/bin/maprcli volume
create -name p1 -path /p1 -allowgrant
true
/opt/mapr/bin/maprcli volume
create -name p1.child -path /p1/
p1.child -allowinherit false
```

**REST**

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=p1&path=%2Fp1&allowgrant=true'
--user <username>:<password>
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=p1.child&path=%2Fp1%2Fp1.child&a
lowinherit=false' --user
<username>:<password>
```

**Create a volume with namespace container replicas****CLI**

```
/opt/mapr/bin/maprcli
volume create -name
testVol -nsminreplication
2 -nsreplication 3 -json
{
  "timestamp":1526525132522,
  "timeofday":"2018-05-16

```

**Create a volume and grant user permissions on the volume:****CLI Example 1**

```
/opt/mapr/bin/maprcli volume
create -name testVoll -path /
testVoll -user user1:dump
user2:fc -json
{
  "timestamp":1521162402826,
```

```

    "timeofday":"2018-03-15
06:06:42.826 GMT-0700 PM",
    "status":"OK",
    "total":0,
    "data":[
    ],
    "messages":[
        "Successfully created volume:
'testVol1'"
    ]
}

```

**REST**

```

curl -X POST 'https://
10.10.82.24:8443/rest/volume/create?
name=testVol&path=/
testVol&user=user1%3Adump%20user2%3Afc
' --user <username>:<password>
{"timestamp":1526526072608,"timeofday"
:"2018-05-16 08:01:12.608 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'testVol'"]}

```

**CLI Example 2**

```

/opt/mapr/bin/maprcli volume
create -name testVol -path /
testVol2 -user user1:dump,restore
user2:a,fc -json
{
    "timestamp":1521162467485,
    "timeofday":"2018-03-15
06:07:47.485 GMT-0700 PM",
    "status":"OK",
    "total":0,
    "data":[
    ],
    "messages":[
        "Successfully created volume:
'testVol2'"
    ]
}

```

**REST**

```

curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=testVol2&path=/
testVol2&user=user1%3Adump%2Crestore%2
0user2%3Aa%2Cfc' --user
<username>:<password>
{"timestamp":1526526256845,"timeofday"

PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'testVol2'"]}

```

**Create a volume for a tenant**

This example creates a volume for a tenant with the following parameters:

- name: volumename

- path: /volume/path
- advisoryquota: 500MB
- quota: 1GB
- replication: 3

**CLI**

```
/opt/mapr/bin/maprcli volume
create -name tenantVol -cluster
ksTest -path /egTenant -tenantuser
egTenant -advisoryquota 500M -quota
1G -replication 3 -json
{
  "timestamp":1526526462865,
  "timeofday":"2018-05-16
08:07:42.865 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully created volume:
'tenantVol'"
  ]
}
```

**REST**

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=tenantVol&cluster=ksTest&path=/
egTenant&advisoryquota=500M&quota=1G&r
eplication=3' --user
<username>:<password>
{"timestamp":1526526615167,"timeofday"
:"2018-05-16 08:10:15.167 GMT-0700

[label add](#) on page 2251

Registers a label. Permissions required: `fc` or `a`.

[volume move](#) on page 2701

Moves the specified volume or mirror to a different topology. Permissions required: `m` or `fc` on the volume.

[label list](#) on page 2255

Lists registered labels. Permissions required: `fc` or `a`.

[node list](#) on page 2270

Lists nodes in the cluster.

[configure.sh](#) on page 2826

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Ezmeral Data Fabric client nodes, and configuring services for a node.

### volume dump create

Creates a volume *dump file* containing data from a volume for distribution or restoration.

### Permissions Required

`dump` or `fc` on the volume.

 **NOTE:** In a secure cluster, you must use the HPE Ezmeral Data Fabric user ID. Using `root` or any other user ID results in the system hanging.

## Syntax

### CLI

```
/opt/mapr/bin/maprcli volume dump
create
  [ -cluster cluster_name
  [-s startvolumepointname]
  [-e endvolumepointname]
  [-o (for dumpfile on stdout)]
  [-dumpfile dumpfilename (ignored
  if -o is used)]
  -name volumename
```

### REST

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/volume/dump/create?&lt;parameters&gt;</code>

## Parameters

Parameter	Description
<code>cluster</code>	The cluster on which to run the command.
<code>dumpfile</code>	The name of the dump file (ignored if <code>-o</code> is used).
<code>e</code>	The name of the state file to create for the end point of the dump.
<b>name</b>	A volume name.
<code>o</code>	This option dumps the volume to stdout instead of to a file.
<code>s</code>	The start point for an incremental dump.

 **NOTE:** The data is not encrypted in the dump file created for a volume enabled for data at rest encryption.

## Examples

### Create a full dump:

#### CLI

```
/opt/mapr/bin/maprcli volume dump
create -e statefile1 -dumpfile
fulldump1 -name volume
```

#### REST

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/dump/
create?'
```

```
e=statefile1&dumpfile=fulldump1&name=volume' --user <username>:<password>
```

### Create an incremental dump:

#### CLI

```
/opt/mapr/bin/maprcli volume
dump create -s statefile1 -e
statefile2 -name volume -dumpfile
incrdump1
```

#### REST

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/dump/
create?
s=statefile1&e=statefile2&name=volume&
dumpfile=incrdump1' --user
<username>:<password>
```

### Create and Maintain Volume Dump File

Describes how to create full dump files and add incremental volume dump files.

#### About this task

You can use `volume dump create` to create two types of files:

- *full* dump files containing all data in a volume
- *incremental* dump files that contain changes to a volume between two points in time

A full dump file is useful for restoring a volume from scratch. An incremental dump file contains the changes necessary to take an existing (or restored) volume from one point in time to another. Along with the dump file, a full or incremental dump operation can produce a *state* file (specified by the `?-e` parameter) that contains a table of the version number of every container in the volume at the time the dump file was created. This represents the *end point* of the dump file, which is used as the *start point* of the next incremental dump. The main difference between creating a full dump and creating an incremental dump is whether the `-s` parameter is specified; if `-s` is not specified, the volume create command includes all volume data and creates a full dump file. If you create a full dump followed by a series of incremental dumps, the result is a sequence of dump files and their accompanying state files:

```
dumpfile1 statefile1
```

```
dumpfile2 statefile2
```

```
dumpfile3 statefile3
```

**NOTE:** You can restore the volume from scratch, using the [volume dump restore](#) command with the full dump file, followed by each dump file in sequence.

When you create a dump file for a volume enabled for data at rest encryption, data in the dump file is not encrypted.

**NOTE:** In a secure cluster, you must use the MapR user ID. Using root or any other user ID results in the system hanging.

#### To create and maintain an up-to-date dump of a volume:

## Procedure

1. Create a full dump file.

Example:

```
maprcli volume dump create -name cli-created -dumpfile fulldump1 -e
statefile1
```

2. Periodically, add an incremental dump file.

Examples:

```
maprcli volume dump create -s statefile1 -e statefile2 -name
cli-created -dumpfile incrdump1
maprcli volume dump create -s statefile2 -e statefile3 -name
cli-created -dumpfile incrdump2
maprcli volume dump create -s statefile3 -e statefile4 -name
cli-created -dumpfile incrdump3
```

...and so on.

## volume dump show

Evaluates the validity of a dump file. The command can be run before restoring a dump file to ensure that a valid dump file is being restored.

## Syntax

### CLI

```
maprcli volume dump show
-dumpfile dumpfilename
[-dumpCid cid_num]
```

**NOTE:** The `maprcli volume dump show` command output contains the dump file details. Check the end of the output to verify if the dump file is valid or corrupted.

A valid dump file contains the following text at the end of the `maprcli volume dump show` command output.

```
Dump Successful cids: {<cid1>,
<cid2>,...<cidn>}
Dump Failed Cids: {}
```

A corrupted dump file contains the following text at the end of the `maprcli volume dump show` command output.

```
Dump Cids(having corrupted
records): {<cid1>,
<cid2>,...<cidn>} ***** InValid
DumpFile *****
```

You can use a valid dump file to restore a volume. You cannot restore a corrupted dump file. `InValid DumpFile` in the `maprcli volume dump show` command output indicates that the dump file is corrupted.

**Parameters**

Parameter	Description
dumpfile	The name of the dump file
dumpCid	The Container ID or cid for which details are to be printed from the dump file

**Examples****CLI****Check validity of dump file**

```
maprcli volume dump show -dumpfile
<dump file name>
```

**Show specified CID details from dump file**

```
maprcli volume dump show -dumpfile
<dump filename> -dumpCid <dumpCid>
```

**volume dump restore**

Restores or updates a volume from a dump file. Permissions required: `fc` or `restore` on the volume.

**Syntax****CLI**

```
maprcli volume dump restore
  [ -cluster cluster_name ]
  [-i (read dump from stdin)]
  [-n (create new volume if it
doesn't exist)]
  [-dumpfile dumpfilename (ignored
if -i is used)]
  [-full <true|false> (perform
full volume restore, default:false ]
  -name volumename
```

**REST**

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/volume/dump/restore?&lt;parameters&gt;</code>

**Parameters**

Parameter	Description
cluster	The cluster on which to run the command.
dumpfile	The name of the dumpfile (ignored if <code>-i</code> is used).
i	This option reads the dump file from <code>stdin</code> .
n	This option creates a new volume if it doesn't exist.
full	Perform either a full volume restore or an incremental volume restore. The default restore is incremental.
name	A volume name, in the form <code>volumename</code>

 **NOTE:** In a secure cluster, you must use the HPE Ezmeral Data Fabric user ID. Using `root` or any other user ID results in the system hanging.

## Examples

### Restore a volume from a full dump file:

#### CLI

```
maprcli volume dump restore -name
volume -dumpfile fulldump1 -full true
```

#### REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/dump/restore?
name=volume&dumpfile=fulldump1&full=tr
ue' --user <username>:<password>
```

Apply an incremental dump file to a volume:

#### CLI

```
maprcli volume dump restore -name
volume -dumpfile incrdump1
```

#### REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/dump/restore?
name=volume&dumpfile=incrdump1' --user
<username>:<password>
```

### *Restore Volume From a Dump*

Describes how to restore from full and incremental dump files.

## About this task

There are two ways to use `volume dump restore`:

- With a full dump file, `volume dump restore` recreates a volume from scratch from volume data stored in the dump file.
- With an incremental dump file, `volume dump restore` updates a volume using incremental changes stored in the dump file.

The volume that results from a `volume dump restore` operation is a mirror volume whose source is the volume from which the dump was created. After the operation, this volume can perform mirroring from the source volume.

When you are updating a volume from an incremental dump file, you must specify an existing volume and an incremental dump file. To restore from a sequence of previous dump files would involve first restoring from the volume's full dump file, then applying each subsequent incremental dump file.

 **NOTE:** In a secure cluster, you must use the Data Fabric user ID. Using `root` or any other user ID results in the system hanging.

A restored volume may contain mount points that represent volumes that were mounted under the original source volume from which the dump was created. In the restored volume, these mount points have no meaning and do not provide access to any volumes that were mounted under the source volume. If the source volume still exists, then the mount points in the restored volume will work if the restored volume is associated with the source volume as a mirror.

To restore from a full dump plus a sequence of incremental dumps:

## Procedure

1. Restore from the full dump file, using the `-n` option to create a new mirror volume and the `-name` option to specify the name.

```
maprcli volume dump restore -dumpfile fulldump1 -name restore1 -n
```

2. Restore from each incremental dump file in order, specifying the same volume name.

```
maprcli volume dump restore -dumpfile incrdump1 -name restore1 maprcli
                                volume dump restore -dumpfile incrdump2 -name
restore1 maprcli volume dump restore
                                -dumpfile incrdump3 -name restore1
```

## volume fixmountpath

Corrects the mount path of a volume. Permissions required: `fc` or `m` on the volume.

The CLDB maintains information about the mount path of every volume. If a directory in a volume's path is renamed (by a `hadoop fs` command, for example) the information in the CLDB will be out of date. The `volume fixmountpath` command does a reverse path walk from the volume and corrects the mount path information in the CLDB.

## Syntax

### CLI

```
maprcli volume fixmountpath
-name <name>
[ -cluster <clustername> ]
```

### REST

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/volume/fixmountpath?&lt;parameters&gt;</code>

## Parameters

Parameter	Description
<code>name</code>	The volume name.
<code>cluster</code>	The cluster name

## Examples

### Fix the mount path of volume v1:

#### CLI

```
maprcli volume fixmountpath -name v1
```

#### REST

```
https://abc.sj.us:8443/rest/volume/fixmountpath?name=v1
```

**volume info**

Displays information about the specified volume. For JSON formatted output, use the `-json` option when running the command.

**Syntax****CLI**

```
maprcli volume info
  [ -cluster <cluster name> ]
  [ -output verbose. default:
  verbose ]
  [ -path <mount directory> ]
  [ -name <volume name> ]
  [ -columns comma separated list
  of column names. default: all ]
```

**REST**

Request Type	GET
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/volume/info?&lt;parameters&gt;</code>

**Parameters**

You must specify either name or path, but not both.

Parameter	Description
cluster	The cluster on which to run the command.
columns	A comma-separated list of fields to return in the query. See the Fields table on the <code>volume</code> command page. Default: all
name	The volume name for which to retrieve information. When issuing the <code>maprcli volume info -columns</code> and <code>marcli volume list -columns</code> commands, the column for the volume name is <code>volumename</code> .
output	Indicates whether the output should be terse or verbose. Default: verbose
path	The mount path of the volume for which to retrieve information.

**Output**

For definitions of the output fields, and short names for use with filters, see the [Fields](#) table on the `volume` command [page](#).

**Examples**

**Return information on standard volume named `test_vol`:**

## CLI

```

/opt/mapr/bin/maprcli volume
info -name test_vol -json

### Return information on volume named `volt_warm` enabled for warm-tier:

#### CLI

```

/opt/mapr/bin/maprcli volume
info -name volt_warm -json
{
  "timestamp": 1666960195475,

### Return security policy related information for a volume:

In the following example, the volume named `my_volume` is tagged with two security policies, `Lab_Security_Policy` and `Sensitive_Data`. The enforcement mode was not specified during volume creation, and is set to the default value of `PolicyAceAndDataAce`.

**CLI**

```

/opt/mapr/bin/maprcli volume
info -name my_volume -json
{
  "timestamp":143018287317,
  "timeofday":"2019-02-05
15:45:22.130 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    "volumename":"my_volume",
    "volumeAces":{
      "writeAce":"p",
      "readAce":"p",

"securitypolicy":"Lab_Security_Policy,
Sensitive_Data",

"enforcementmode":"PolicyAceAndDataAce
"
    },
    ... other properties ...
  ]
}

```

**REST**

```

curl -k -X GET 'https://
abc.sj.us:8443/rest/volume/info?
name=my_volume' --user mapr:mapr

{"timestamp":143018287317,"timeofday":
"2019-02-05 15:45:22.130 GMT-0700 PM",
  "status":"OK","total":1,"data":
[{"volumename":"my_volume",
  "volumeAces":
{"writeAce":"p","readAce":"p",

"securitypolicy":"Lab_Security_Policy,
Sensitive_Data",

"enforcementmode":"PolicyAceAndDataAc
e"}]}]}

```

**Return snapshot information for a volume when a snapshot restore operation is in progress:**

In the following example, the volume named `my_volume` has a snapshot restore operation in progress, and the snapshot is named `s1`.

**CLI**

```

/opt/mapr/bin/maprcli volume
info -name my_volume -json
{
  "timestamp":143018287317,
  "timeofday":"2019-02-05
15:45:22.130 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    "volumename":"my_volume",
    "snapshotRestore":{

"snapshotname":"s1",

```

```

"snapshotid":256000049,
"inprogress":true,
"seqnum":602446,
"numcontainerstotal":6,
"numcontainersinprogress":2
    },
    ... other properties ...
  ]
}

```

## REST

```

curl -X GET --user <username>
'https://abc.sj.us:8443/rest/volume/
info?name=my_volume'

{"timestamp":143018287317,"timeofday":
"2019-02-05 15:45:22.130 GMT-0700 PM",

00049,

"inprogress":true,"seqnum":602446,"num
containerstotal":6,

"numcontainersinprogress":2}}]}

```

### Return snapshot information for a volume when the snapshot restore operation is NOT in progress:

In the following example, the volume named `my_volume` does not have a snapshot restore operation in progress.

## CLI

```

/opt/mapr/bin/maprcli volume
info -name my_volume -json
{

"timestamp":143018287317,

"timeofday":"2019-02-05 15:45:22.130
GMT-0700",

"status":"OK",

"total":1,
"data":[

"volumename":"my_volume",

"snapshotRestore":{

"snapshotname":"s1",

"snapshotid":256000049,

"inprogress":false,

```

```

"seqnum":602446,
    },
    ... other
properties ...
    }
}

```

## REST

```

curl -X GET --user <username>
'https://abc.sj.us:8443/rest/volume/
info?name=my_volume'

{"timestamp":143018287317,"timeofday":
"2019-02-05 15:45:22.130 GMT-0700 PM",

### Related concepts

[node](#) on page 2260

Manages nodes in the cluster

[Restoring a Volume From a Snapshot](#) on page 517

Provides a synopsis of restoring a volume from a snapshot. Describes the implications, and the prerequisites.

### Related reference

[disk add](#) on page 2124

Adds one or more disks to the specified node. Permissions required: `fc` or `a`.

[disk setlabel](#) on page 2126

Adds a label to disks or a storage pool. Permissions required: `fc` or `a`.

[label add](#) on page 2251

Registers a label. Permissions required: `fc` or `a`.

[volume create](#) on page 2592

Creates a volume.

[volume move](#) on page 2701

Moves the specified volume or mirror to a different topology. Permissions required: `m` or `fc` on the volume.

[label list](#) on page 2255

Lists registered labels. Permissions required: `fc` or `a`.

[node list](#) on page 2270

Lists nodes in the cluster.

[dump volumeinfo](#) on page 2171

Returns information about volumes and the associated containers. For JSON formatted output, use the `-json` option from the command line.

[configure.sh](#) on page 2826

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Ezmeral Data Fabric client nodes, and configuring services for a node.

### volume link create

Creates a link to a volume. Permissions required: `fc` or `m` on the volume.

## Syntax

### CLI

```
maprcli volume link create
[ -cluster <clustername> ]
-path <link path>
-type <type>
-volume <volume>
```

### REST

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/volume/link/create?&lt;parameters&gt;</code>

## Parameters

Parameter	Description
<code>path</code>	The <code>-path</code> parameter specifies the link path: <code>/link</code> Example: <code>/home/abc/.rw</code>
<code>type</code>	The volume type: <code>writable</code> or <code>mirror</code> .
<code>volume</code>	The volume name.
<code>cluster</code>	The cluster name.

## Examples

**Create a link to v1 at the path v1. mirror:**

### CLI

```
maprcli volume link create -volume
v1 -type mirror -path /v1.mirror
```

**REST**

```
https://abc.sj.us:8443/rest/
volume/link/create?path=
vl.mirror&type=mirror&volume=v1
```

**volume link remove**

Removes the specified symbolic link. Permissions required: `fc` or `m` on the volume.

**Syntax**

**CLI**

```
maprcli volume link remove
-path <path>
[ -cluster <clustername> ]
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/link/remove?<parameters>

**Parameters**

Parameter	Description
path	<p>The symbolic link to remove. The path parameter specifies the link path and other information about the symbolic link, using the following syntax: <code>/link/[maprfs::][volume::]&lt;volume type&gt;::&lt;volume name&gt;</code></p> <ul style="list-style-type: none"> <li>link - the symbolic link path</li> <li>maprfs - a keyword to indicate a special MapR filesystem link</li> <li>volume - a keyword to indicate a link to a volume</li> <li>volume type - writeable or mirror</li> <li>volume name - the name of the volume</li> </ul> <p>Example: <code>/abc/maprfs::mirror::abc</code></p>
cluster	The cluster name.

**Examples**

**Remove the link /abc:**

**CLI**

```
maprcli volume link remove -path /abc/
maprfs::mirror::abc
```

**REST**

```
https://abc.sj.us:8443/rest/
volume/link/remove?path=/abc/
maprfs::mirror::abc
```

**volume list**

Lists information about volumes specified by name, path, or filter.

See the Fields table on the [volume](#) on page 2573 page for the fields available to filter. See the [Filters](#) on page 1990 for more information.

**Syntax****CLI**

```

/opt/mapr/bin/maprcli volume
    list
    [ -cluster
cluster_name ]
    [ -output verbose.
default: verbose ]
    [ -start start.
default: 0 ]
    [ -limit limit.
default: 2147483647 ]
    [ -filter none.
default: none ]
    [ -nodes nodes ]
    [ -columns comma
separated list of column names.
default: all ]
    [ -alarmedvolumes
alarmsonly. default: false ]

[ -sortby <volumeowner|
volumenumreplicas|volumeminreplicas|
volumerackpath|volumemountdir|
volumename|volumequota|volumeused|
volumequotaadvisory|volumeaename|
volumeaetype|volumeschedule|
volumetype|volumemirror|
volumemirrorpercentcomplete|
volumesnapshotcount|volumeid|
volumenamecontainersize|
volumelocalpath|volumesnapshotused|
volumetotalused|volumelogicalused|
volumecontainercount|
volumemirrorschedule|volumeaccesstime|
volumenamespacecontainernumreplicas|
volumenamespacecontainerminreplicas|
volumerereplicationtimeoutsec|
volumecriticalrereplicationtimeoutsec|
volumecreatetime|volumedareenabled|
volumeallowreadforexecute|
volumedatacntrl|
volumenamecntrl>, column
names of supported fields. ]
    [ -sortorder
<asc|desc> ]
    [ -honoraces
honoraces. default: false ]

```

**NOTE:** For JSON formatted output, use the `-json` option when running `volume list` from the command line.

## REST

Request Type	GET
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/volume/list[?&lt;parameters&gt;]</code>

## Parameters

Parameter	Description
<code>cluster</code>	The cluster name on which to run the command.
<code>output</code>	Specifies whether the output should be <code>terse</code> or <code>verbose</code> . Default: <code>verbose</code>
<code>start</code>	The offset from the starting row according to sort. Default: <code>0</code>
<code>limit</code>	The number of rows to return, beginning at <code>start</code> . Default: <code>2147483647</code>
<code>filter</code>	A filter specifying volumes to list. See <a href="#">Filters</a> on page 1990 for more information. Default: <code>none</code>
<code>nodes</code>	A list of nodes. If specified, <code>volume list</code> only lists volumes on the specified nodes.
<code>columns</code>	A comma-separated list of fields to return in the query. See the <a href="#">volume</a> on page 2573 table on the volume page.  When issuing the <code>maprcli volume info -columns</code> and <code>marcli volume list -columns</code> commands, the column for the volume name is <code>volumename</code> .
<code>alarmedvolumes</code>	Specifies whether (1) or not (0) to list alarmed volumes only. Default: <code>0</code>
<code>sortby</code>	Specifies one of the following attributes to sort the list of volumes by: <code>volumeowner</code> , <code>volumenumreplicas</code> , <code>volumeminreplicas</code> , <code>volumerackpath</code> , <code>volumemountdir</code> , <code>volumename</code> , <code>volumequota</code> , <code>volumeused</code> , <code>volumequotaadvisory</code> , <code>volumeaename</code> , <code>volumeaetype</code> , <code>volumeschedule</code> , <code>volumetype</code> , <code>volumemirrorpercentcomplete</code> , <code>volumesnapshotcount</code> , <code>volumeid</code> , <code>volumenamecontainersize</code> , <code>volumelocalpath</code> , <code>volumesnapshotused</code> , <code>volumetotalused</code> , <code>volumelogicalused</code> , <code>volumecontainercount</code> , <code>volumemirrorschedule</code> , <code>volumeaccessstime</code> , <code>volumenamespacecontainernumreplicas</code> , <code>volumenamespacecontainerminreplicas</code> , <code>volumerereplicationtimeoutsec</code> , <code>volumecriticalrereplicationtimeoutsec</code> , <code>volumecreatetime</code> , <code>volumedareenabled</code>
<code>sortorder</code>	Specifies whether the list of volumes is sorted in an ascending or a descending order. Sorting of records is based on the value specified for the <code>sortby</code> parameter.
<code>honoraces</code>	The parameter facilitates the filtering of volumes for listing purpose, based on the volume-level permissions of the currently logged in user. When you set the values as <code>true</code> , volume information for the volumes on which the current user has read/write permissions, is displayed. The default value for the <code>honoraces</code> parameter is <code>false</code> .

## Output

Information about the specified volumes.

For standard and mirror volumes (not enabled for tiering), the output looks similar to the following:

```
{
  "timestamp":1435363624712,
  "timeofday":"2015-06-26 05:07:04.712 GMT-0700",

## Fields

For definitions of the output fields, and short names for use with filters, see the [Fields](#) table on the `volume` command [page](#).

## Examples

### List all volumes

#### CLI

```

/opt/mapr/bin/maprcli volume
list -json

```

#### REST

```

https://10.10.82.23:8443/rest/volume/
list

```

### List the first ten volumes

The `start` and `limit` parameters are useful for windowing the results. You can list the first ten volumes, then the next ten, and so on.

#### CLI

```

/opt/mapr/bin/maprcli volume
list -start 0 -limit 10 -json

```

#### REST

```

curl -X
GET 'https://server.sj.us:8443/rest/
node/list?start=0&limit=10' --user
<username>:<password>

```

### Filter by aename

#### CLI

```

maprcli volume list -filter
'[aename==mapr]' -columns volumeid
volumeid
243256560
139026416
192452723
1
237238261
185847104
83335307

```

```

97256251
248672744
206179696
59269298
23746740
155195506
204064014
243050615
175781739
109532950

```

### Filter the list of volumes that the logged in user has permissions on

#### CLI

```
# maprcli volume list -honoraces
true -json
```

#### REST

```
curl -X
GET 'https://server.sj.us:8443/rest/
volume/list?honoraces=true --user
<username>:<password>
```

### volume mirror push

Pushes the changes in a volume to all of its mirror volumes in the same cluster, and waits for each mirroring operation to complete.

Use this command when you need to push recent changes.

### Syntax

#### CLI

```
maprcli volume mirror push
[ -cluster <cluster> ]
-name <volume name>
[ -verbose true|false ]
```

#### REST

None.

### Parameters

Parameter	Description
cluster	The cluster on which to run the command.
name	The volume to push.
verbose	Specifies whether the command output should be verbose. Default: true

### Output

#### Sample Output

```
Starting mirroring of volume mirror1
Mirroring complete for volume mirror1
Successfully completed mirror push to all local mirrors of volume volume1
```

### Examples

Push changes from the volume "volume1" to its local mirror volumes:

**CLI**

```
maprcli volume mirror push -name
volumel -cluster mycluster
```

**volume mirror start**

Starts mirroring on the specified volume from its source volume.

- License required: Enterprise Edition
- Permissions required: `fc` or `restore` on the volume

When a mirror is started, the mirror volume is synchronized from a hidden internal snapshot so that the mirroring process is not affected by any concurrent changes to the source volume. The `volume mirror start` command does not wait for mirror completion, but returns immediately. The changes to the mirror volume occur atomically at the end of the mirroring process; deltas transmitted from the source volume do not appear until mirroring is complete.

To provide rollback capability for the mirror volume, the mirroring process creates a snapshot of the mirror volume before starting the mirror, with the following naming format:  
`<volume>.mirrorsnap.<date>.<time>`.

Normally, the mirroring operation transfers only deltas from the last successful mirror. Under certain conditions (mirroring a volume repaired by `fsck`, for example), the source and mirror volumes can become out of sync. In such cases, it is impossible to transfer deltas, because the state is not the same for both volumes. Use the `-full` option to force the mirroring operation to transfer all data to bring the volumes back in sync.

**NOTE:** If you are creating a local mirror of the root volume, `root(/)` points to the mirror volume, hence `root` is read-only. For read-write copy of `root (/)`, you must use the special path, `/.rw`

**Syntax****CLI**

```
maprcli volume mirror start
[ -cluster <cluster> ]
[ -full true|false ]
-name <volume name>
```

**REST**

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/volume/mirror/start?&lt;parameters&gt;</code>

**Parameters**

Parameter	Description
<code>cluster</code>	The cluster on which to run the command.
<code>full</code>	Specifies whether to perform a full copy of all data. If false, only the deltas are copied.
<code>name</code>	The volume for which to start the mirror.

## Output

### Sample Output

```
messages
Started mirror operation for volumes 'testMirror'
```

## Examples

### Start mirroring the mirror volume "testMirror":

#### CLI

```
maprcli volume mirror start -name
testMirror
```

#### REST

```
https://abc.sj.us:8443/rest/volume/
mirror/start?name=testMirror
```

### volume mirror status

Displays the status of the mirroring operation in progress. Use this command to examine the progress of mirroring.

- License required: Enterprise Edition
- Permissions required: `fc` or `restore` on the volume

The `status` command displays the statistics of the mirroring operation including the total number of container IDs to resync, the current status of the mirroring, the number of indoes in use for the mirror, the container ID information for the source and destination volumes, and the error code if any, to name a few.

## Syntax

#### CLI

```
maprcli volume mirror status
[ -cluster cluster_name ]
-name name
[ -start start. default: 1 ]
[ -limit limit. default:
2147483647 ]
[ -verbose <true/false> if true,
will displayed detailed container
information. default: true ]
```

#### REST

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/volume/mirror/status?&lt;parameters&gt;</code>

## Parameters

Parameter	Description
<code>cluster</code>	The cluster on which to run the command.
<code>name</code>	The volume for which to determine the mirror status.

Parameter	Description
start	The container to start with.
limit	The number of containers for which to display status.
verbose	Whether to display a terse output or display full statistics.

## Examples

Check the status of the mirroring on mirror volume "testvol":

### CLI

```
maprcli volume mirror status -name
testvol -json

**** Displays mirroring statistics.
****
*** Here, it is resyncing
destination containers ****

**REST**

```
https://abc.sj.us:8443/rest/volume/
mirror/status?name=testvol
```

**volume mirror stop**

Stops mirroring on the specified volume.

- License required: Enterprise Edition
- Permissions required: `fc` or `restore` on the volume

The `volume mirror stop` command lets you stop mirroring (for example, during a network outage). You can use the `volume mirror start` command to resume mirroring.

**Syntax**

**CLI**

```
maprcli volume mirror stop
[ -cluster <cluster> ]
-name <volume name>
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/mirror/stop?<parameters>

**Parameters**

Parameter	Description
<code>cluster</code>	The cluster on which to run the command.
<code>name</code>	The volume for which to stop the mirror.

**Output**

**Sample Output**

```
messages
Stopped mirror operation for volumes 'testMirror'
```

## Examples

### Stop mirroring the mirror volume "testMirror":

#### CLI

```
maprcli volume mirror stop -name
testMirror
```

#### REST

```
https://abc.sj.us:8443/rest/volume/
mirror/stop?name=testMirror
```

### volume modify

Modifies an existing volume. Permissions required: `m` or `fc` on the volume.

An error occurs if the name or path refers to a non-existent volume, or cannot be resolved.

### Syntax

#### CLI

```
/opt/mapr/bin/maprcli volume modify
[ -cluster <cluster name> ]
-name <volume name>

REST

Request Type	POST
--------------	------

Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/volume/modify?&lt;parameters&gt;</code>
-------------	----------------------------------------------------------------------------------------

## Parameters

### Parameter: `advisoryquota`

Possible Values: 0 or any other integer value.

Description: The advisory quota for the volume as integer plus unit. Example: `quota=500G`; Units: B, K, M, G, T, P

### Parameter: `ae`

Possible Values: Name of the entity that owns the volume.

Description: The accounting entity that owns the volume.

### Parameter: `aetype`

Possible Values:

- 0=user
- 1=group

Description: Type of accounting entity.

### Parameter: `allowgrant`

Possible Values:

- true
- false

Description: Specifies whether the volume as a parent, grants permission for a child volume to inherit its properties.

### Parameter: `allowreadforexecute`

Possible Values:

- true
- false

Description: Allows execution of SUID binaries with only their executable bit set, on a FUSE filesystem. This parameter works in conjunction with the `fuse.mount.setuid` FUSE option. For more information, see [Configuring the HPE Ezmeral Data Fabric FUSE-Based POSIX Client](#) on page 1608.

### Parameter: `auditenabled`

Possible Values:

- true
- false

Description: Specifies whether to turn on auditing for the volume. If you enable auditing at the cluster level with the `audit data` on page 2030 command, setting this value to `true` causes auditing to start for any directories, files, tables, or streams that are already enabled for auditing. If none are yet enabled, enabling auditing on any of them causes auditing of them to start.

	<p>Set <code>auditenabled</code> to <code>true</code> to enable auditing on directories, files, tables, and streams in the volume.</p> <p>You must have the <code>fc</code> permission on the cluster to use this parameter. See <a href="#">acl</a> for details about this permission.</p>
<b>Parameter:</b> <code>autooffloadthresholdgb</code>	<p>Possible Values: Any positive integer.</p> <p>Description: The size of the volume in GB (threshold). When this threshold is reached or exceeded, volume data is automatically offloaded by the Automatic Tiering Scheduler. To use the global size threshold (of 1024 GB), set the value to 0.</p>
<b>Parameter:</b> <code>cluster</code>	<p>Possible Values: Any valid cluster.</p> <p>Description: The cluster on which to run the command.</p>
<b>Parameter:</b> <code>coalesce</code>	<p>Possible Values: Set this parameter to a large number of minutes to prevent audit logs from growing quickly.</p> <p>Description: The interval of time (in minutes) during which READ, WRITE, or GETATTR operations on one file from one IP address or UID are logged only once for a particular operation, if auditing is enabled.</p> <p>For example, suppose that a client application reads a single file three times in 6 minutes, so that there is one read at 0 minutes, another at 3 minutes, and a final read at 6 minutes. If the coalesce interval is at least 6 minutes, then only the first read operation is logged. However, if the interval is 4 minutes, then only the first and third read operations are logged. If the interval is 2 minutes, all three read operations are logged.</p> <p>Now however, if the client was also writing to the file, irrespective of the coalesce interval for the read operation in the example stated previously, the write operation is logged, as it is a different operation from reading.</p>
<b>Parameter:</b> <code>compactionoverheadthreshold</code>	<p>Possible Values: 0-100%</p> <p>Description: Specifies the percentage of offloaded data that must have been deleted on the cluster to qualify the data for compaction (or deletion from the tier).</p>
<b>Parameter:</b> <code>compactionschedule</code>	<p>Possible Values: Any valid schedule ID.</p> <p>Set this parameter to 0 to disable the compactor.</p> <p>Description: Specifies the schedule to use for running the compactor. By default, the compactor runs on an automatic internal schedule.</p>
<b>Parameter:</b> <code>containerallocationfactor</code>	<p>Recommended value: 2* SP count in the volume topology.</p> <p>Description: Specifies the number of containers to create when the first write from a remote client is sent to the volume. The pre-created containers are distributed equally across topologies, servers, file system instances, and storage pools. CLDB also takes into consideration the load (IO/Space) when selecting target storage pools for containers. The value must be a positive integer.</p>
<b>Parameter:</b> <code>criticalrereplicationtimeoutsec</code>	<p>Possible Values: Any integer between 300 and 3600 (seconds)</p>

Description: Timeout (in seconds) before re-replicating only the critically under-replicated containers . If you set both `rereplicationtimeoutsec` and `criticalrereplicationtimeoutsec`, and if the value of:

- `rereplicationtimeoutsec` is less than `criticalrereplicationtimeoutsec`, `rereplicationtimeoutsec` overrides the `criticalrereplicationtimeoutsec` setting for both under-replicated and critically under-replicated containers.
- `rereplicationtimeoutsec` is greater than `criticalrereplicationtimeoutsec`, `criticalrereplicationtimeoutsec` overrides the `rereplicationtimeoutsec` setting only for critically under-replicated containers; `rereplicationtimeoutsec` setting is still applicable for under-replicated containers.

**Parameter: dataauditops**

Possible Values: Any audit operations that you want to enable.

Description: The comma separated list of filesystem operations to include (specified with a preceding plus sign (+)) or exclude (specified with a preceding minus sign (-)) from auditing.

To exclude the first operation in the list (of operations) from auditing, precede it by two minus (--) signs. To exclude subsequent operations, precede them by only a single minus (-) sign, irrespective of whether the first operation was included (using a plus (+) sign) or excluded (using two minus (--) signs). If neither sign is specified, the given operation is included for auditing.

The operations that can be included (+) or excluded (-) from auditing are listed [here](#). You can, alternatively, group all the operations using the keyword `all`, which:

- If included (+), cannot be specified with a list of other included operations.
- If excluded (-), cannot be specified with a list of other excluded operations.

You can specify a mixed list of included and excluded operations. There is no change to operations that are not specified with the command.

**NOTE:** Enabling `setattr` automatically enables the following operations:

- `chown`
- `chgrp`
- `chperm`

If you disable `setattr`, these operations are automatically disabled. If you do nothing with `setattr` (neither enable nor disable), you can enable or disable `chown`, `chgrp`, and `chperm` in any combination and they will not affect `setattr`.

**TIP:** For more information, see [Selective Auditing of Filesystem and Table Operations](#).

**Parameter: `disableddataauditops`**

Possible Values: Any audit operations that you want to disable.

Description: The comma-separated list of disabled filesystem audit operations to set. This parameter is an alternate way of setting audit operations as compared to the `dataauditops` option. Plus (+) or minus signs (-) are not allowed for this option. Any audit operation that is specified with this option replaces any existing disabled audit operations configured for this security policy, while any audit operations that are not specified, are enabled.

Merging of the specified audit operations with existing audit operations is not performed, as with the `dataauditops` option.

**Parameter: `dbindexlagsecalarmthresh`**

Possible Values: Any integer value.

Description: Specifies the threshold (in seconds) to raise an alarm for index update lag.

**Parameter: `dbrepllagsecalarmthresh`**

Possible Values: Any integer value.

Description: Specifies the threshold (in seconds) to raise an alarm for DB replication lag.

**Parameter: `ecenable`**

Possible Values:

- `true`
- `false`

Description: Enable (`true`) warm tiering for the volume only if it is already not enabled. When specified, you cannot specify `tiername` to use an existing warm-tier; when the command runs, a new tier and rule are automatically created for the volume.

`ecenable` works only if you have set `tieringenable` to `true` at the time of volume creation.

When modifying volumes, `ecenable` does not automatically set `tieringenable` to `true` as in the case of volume creation.

Setting this parameter to `false` is the same as not specifying this parameter, and does nothing.

**Parameter: ecscheme**

Possible Values: Any valid EC scheme.

Description: The number of data chunks and the number of parity chunks separated by a plus (+) sign. The default scheme is 4+2. For information on the supported schemes, see [Erasure Coding Scheme for Data Protection and Recovery](#) on page 1236.

**NOTE:** This parameter is applicable only for EC volumes, and only when you set the `ecenable` parameter to `true`.

**Parameter: ectopology**

Possible Values: Any topology that exists in your environment.

Description: Sets the topology of the erasure coded volume if it is not set.

**NOTE:** This parameter is applicable only for EC volumes.

Once set, you cannot change the topology of an erasure coded volume using this command. To change the topology of an erasure coded volume, use [volume move](#) on page 2701

**Parameter: enforcementmode**

Possible Values:

- `PolicyAceOnly`
- `PolicyAceAndDataAce`
- `DataAceOnly`
- `PolicyAceAuditAndDataAce`

Description: The enforcement mode when evaluating authorization for data access. Permitted values are as follows:

- `PolicyAceOnly`: Determines data access authorization based only on the ACEs set in security policies. Ignores POSIX mode bits and ACEs directly defined on data objects when determining access rights, if a data object is tagged with at least one security policy. If a data object is not associated with at least one security policy, the system will enforce POSIX mode bits and ACEs directly defined on the data object. Volume-level ACEs are always enforced.
- `PolicyAceAndDataAce`: Determines data access authorization based on the ACEs set in security policies AND ACEs or POSIX mode bits directly set on data objects.
- `DataAceOnly`: Determines data access authorization based on the ACEs or POSIX mode bits directly set on data objects. You can use this mode to switch off the policy-based security feature, on a per-volume basis, in an emergency situation.
- `PolicyAceAuditAndDataAce`: Use this mode when testing security policies. In this mode:

- ACEs defined directly on data objects are enforced.
- Data objects associated with security policies are checked for access, and any access denied events are audited, but access itself is allowed.

See the section on [Volume-Level Security Policy Enforcement Mode](#) on page 853 for a discussion on how to determine permission to access a resource, when this flag is set.

**Parameter: `enforceminreplicationforio`**

Possible Values:

- `true`
- `false`

Description: Specifies whether (`true`) or not (`false`) to enforce minimum number of replicas for the (read-write) volume during IO. This flag ensures that further updates (writes) to volume are successful only when the minimum number of copies of the container are available. Setting this parameter to `true` ensures that if writes succeed, then it has been applied to at least the minimum number of copies; if writes fail, it may have been applied to zero or more copies.

Enabling this parameter, may stall `volume dump` and `volume snapshot create` operations, if the minimum number of copies of the container are not available.

If you do not set this parameter on a volume, or if you modified this parameter from `false` to `true`, then you need to restart all the nodes where the containers associated with the volume exist, for the changes to take effect.

This flag is ignored on mirror volumes.

**Parameter: `filefilter`**

Possible Values: Any file filter.

Description: Specifies the file filter to use to prevent specific types of files from being stored on the volume. For more information, see [Prevent Storage of Specified Types of Files](#) on page 833. You can associate only one filter for each volume.

**NOTE:** To remove the filter from a volume, use the special filter `" "`.

**Parameter: `forceauditenable`**

Possible Values:

- `true`
- `false`

Description: Specifies whether (`true`) or not (`false`) to force audit of operations on all files, tables, and streams in the volume if auditing is enabled at the cluster and volume levels, irrespective of the audit setting on the individual directory, file, table, and stream.

**Parameter: `group`**

Possible Values: Any user with `Create Volume` privileges.

**Parameter: honorrackreliability**  
`<ec-rack-reliability : true | false>`

Description: Space-separated list of `group:permission` pairs.

**NOTE:** The `honorrackreliability` parameter considers each rack as a site.

Description: Allocates CGs for maximized resiliency during a site failure. CG containers are spread across multiple sites so that a site does not host more parity containers for a given CG (EC scheme: D+P). Container allocations for a CG with previous software use one container per site for a CG. Managing new allocation in this manner (where `honorrackreliability` is set to `true`) ensures that CG data is available for reads, even in cases where an entire site goes down. For a given EC D+P scheme, CG allocation requires, at least, `Math.ceil((D+P)/P)` site for CG creation, and if enough sites are unavailable, CG allocation fails.

**NOTE:** To use `-honorrackreliability` in a cluster with geographically-dispersed nodes, you must configure a topology with multiple racks having enough nodes in each rack. Specifying the configured topology as `-ectopology` ensures that `RackReliabilitySelector` allocates the most P containers per rack during CG allocations.

**NOTE:** If a container needs to be reallocated for rebuild, the new container is allocated in the same rack in which the old container resided. If this allocation cannot be done, a new container can be allocated from a different rack so that the number of containers for the CG in the new rack is less than or equal to the number of P containers. Otherwise, container allocation fails.

**Parameter: maxinodesalarmthreshold**

Possible Values: Any positive integer.

Description: The number of inodes, which when exceeded raises the [INODES\\_EXCEEDED](#) alarm.

**Parameter: maxnssizebalarmthreshold**

Possible Values: Any positive integer.

Description: The namespace container size, which when exceeded raises the [INODES\\_EXCEEDED](#) alarm.

**Parameter: metricsenabled**

Possible Values:

- `true`
- `false`

Description: Specifies whether (`true`) or not (`false`) to enable metrics collection for a volume.

**Parameter: minreplication**

Possible Values: Can be any value that you desire based on the replication you need.

Description: The minimum replication level. When the replication factor falls below this minimum, re-replication occurs as aggressively as possible to restore the replication level. If any containers in the CLDB volume fall below the minimum replication factor, writes are disabled until aggressive re-replication restores the minimum level of replication.

**TIP:** For more information, see [Understanding Replication](#) on page 484.

**Parameter: mirrorschedule**

Possible Values: 0 or a valid schedule ID.

Description: The schedule ID corresponding to the schedule to be used for mirroring. If you specify a mirror schedule ID, the mirror volume automatically syncs with its source volume on the specified schedule. Pre-assigned IDs include 1 for critical data, 2 for important data, and 3 for normal data. Custom schedules are assigned ID numbers in sequence. To determine the ID number, use the `schedule list` command. To disable the schedule, set this parameter to 0.

**Parameter: mirrorthrottle**

Possible Values:

- true
- false

Description: Specifies whether mirror throttling is enabled (`true`) or disabled (`false`). Throttling is set on the source volume and applies to all its mirrors.

**Parameter: namecontainerdatathreshold**

Possible Values: Any integer value.

If you set this parameter to 0, there is no limit on the size of user data that can be stored in the name container.

Description: Limits the size of user data that can be placed in the name container. The value is interpreted as being in MB. If the user data size limit:

- Has not yet been reached, the first 64 KB of data is stored in name container, and the rest of the data is stored in data containers.
- Has already been reached, only meta data is stored in the name container, and the data is stored in data containers. For example, if you set the current name container size to 200GB and the limit to 100GB, then all new user data is stored in data containers.

**Parameter: nsminreplication**

Possible Values: Any integer value.

Description: When the replication factor falls below this value, re-replication occurs as aggressively as possible to restore the replication level. If any containers in the CLDB volume fall below the minimum replication factor, writes are disabled until aggressive re-replication restores the minimum level of replication.

When enabled, the CLDB manages the namespace container replication separate from the data container replication. You use this capability when you have low volume replication but want to have higher namespace replication.

Set the value to be the same or larger than the value of the equivalent data replication parameter, `minreplication`.

See also: [Understanding Replication](#) on page 484.

**Parameter: nsreplication**

Possible Values: Any integer value.

Description: The desired namespace container replication level.

When the number of copies falls below the desired replication factor, but remains equal to or above the minimum replication factor, re-replication occurs after the timeout specified in the `cldb.fs.mark.rereplicate.sec` parameter. This timeout is the time given for a node that is down to come back online. After this timeout period, the CLDB takes the action required to restore the replication factor.

When enabled, the CLDB manages the namespace container replication separate from the data container replication. Use this capability when you have low volume replication but want to have higher namespace replication.

By default, the value of this parameter is the same or larger than the value of the equivalent data replication parameter, `replication`. However, to set the value of this parameter lower than the `replication` value, first set `engg.manual.override` to `true` in `cldb.conf`.

See also: [Understanding Replication](#) on page 484.

**Parameter: name**

Possible Values: Not Applicable.

Description: The name of the volume to modify.

**Parameter: numactivecgcontainers**

Possible Values: Any integer between 1 and 100.

Description: Number of containers to be assigned for a CG assign request.

**Parameter: offloadschedule**

Possible Values: Any valid schedule ID. To disable schedule-based offload, set this value to 0.

Description: The ID of the schedule to associate with the volume for offloading volume data to the tier.

**NOTE:** This parameter is required only for Cold/EC tiered volumes.

**Parameter: quota**

Possible Values: Any integer value along with a unit.

Description: The quota for the volume as `integer plus unit`. Example: `quota=500G; Units: B, K, M, G, T, P`

Do not use two-letter abbreviations for quota units, such as `GB` and `MB`.

When you set a quota for a tiering-enabled volume, the quota is the total space allocated for the volume irrespective of the location (cluster or tier) where the volume data is stored. For example, if you allocate 1GB of hard quota for a tiering-enabled volume, writes fail after you write 1GB of data whether or not the volume data is local (on the cluster) or offloaded (to the tier).

Note that quotas for source and mirror volumes must match.

**Parameter: readAce**

Possible Values: Any valid permissions.

Description: Specifies [Access Control Expressions](#)(ACEs) that grant permissions at the

volume level to read files and tables in the volume. The default value is `p`, which grants access to all users.

See [ACEs](#).

**Parameter: readonly**

Possible Values:

- 0
- 1

Description: Specifies whether the volume is read-only.

- 0 - read/write
- 1 - read-only

**Parameter: recallexpirytime**

Possible Values: Any integer between 1 and 7500.

Description: The amount of time (in days) to keep the recalled data before purging or offloading it.

**Parameter: replication**

Possible Values: Any integer starting at 0.

Description: The desired replication level. When the number of copies falls below the desired replication factor, but remains equal to or above the minimum replication factor, re-replication occurs after the timeout specified in the `cldb.fs.mark.rereplicate.sec` parameter. Note that this timeout is the time given for a node that is offline to come back online. After this timeout period, the CLDB takes action to restore the replication factor.

**TIP:** For more information, see [Understanding Replication](#) on page 484.

**Parameter: rereplicationtimeoutsec**

Possible Values: Any positive integer.

Description: Timeout (in seconds) before attempting re-replication of replica containers. This volume property defines the timeout period until CLDB starts re-replicating the containers on the node of the volume after CLDB stops receiving a heartbeat from the node.

When a node is down, CLDB gives the node an hour to come back online before it takes any action for the containers on this node. You can set this parameter on volumes to reduce the default 1 hour to a shorter time period. This option is provided mainly for local volumes, so that when the file system is down, CLDB can give up quickly and decide that the container has no master. This forces the TT to give up on local containers, and take the appropriate recovery action of deleting the mapped volume and creating another one.

**Parameter: schedule**

Possible Values: 0 or a valid schedule ID.

Description: The ID of a schedule. Use the [schedule list](#) command to find the ID of the named schedule that you want to apply to the volume.

To disable the schedule, set this parameter to 0.

**Parameter: skipwiresecurityfortierinternalops**

Possible Values:

- true

**Parameter: source**

- false

Description: Skips wire security for internal operations.

Possible Values: Any volume.

Description: The source volume from which a mirror volume receives updates, specified in the format <volume>@<cluster>.

**Parameter: tierencryption**

Possible Values:

- true
- false

Description: Specifies whether to enable (*true*) or disable (*false*) encryption of data on the object store. This parameter is applicable only for cold-tier volumes. If you enable this parameter, user data is encrypted before being written to the object, and the HTTPS protocol is used for communication with the object store to ensure that data is encrypted both on the wire and on the tier.

You can set this parameter only if you specify a tier name (see the *tiername* parameter) as well. You cannot modify this parameter after you set it.

If you set the value to *true*, you can also specify a custom key using the *tierkey* parameter. Once set to *true*, the MAST Gateway uses HTTPS to upload data to the cold-tier. If the cold tier does not support HTTPS, all tier related operations fail. If the cold-tier does not support HTTPS, you must explicitly set the value for this to *false* at the time of associating a tier with the volume because the default value for this parameter is *true*.

**TIP:** For warm tier, use *-dare* option on the front-end volume to enable or disable encryption of data-at-rest.

**Parameter: tieringrule**

Possible Values: Name of any valid rule

Description: The name of the rule (referred to as storage policy in the Control System) to use for offloading data to the tier. If you do not specify a rule, the default rule, which is all files (*p*), is associated with the volume. See [Creating a Rule in Creating a Storage Tier Policy](#) on page 1295 for more information.

**Parameter: tierkey**

Possible Values: Any 32-character HEX string, or let CLDB auto-generate this string

Description: The 32-character HEX string to use for encryption only for cold tier volumes. If you do not specify a string, CLDB generates a 32 character HEX string to use for encrypting the data to offload to the tier.

 **RESTRICTION:** You cannot modify the tierkey that is already associated with the volume.

**Parameter: tiername**

Possible Values: Not Applicable

Description: The name of the tier to use for offloading data. You can set this name only once and cannot modify it.

**Parameter: type**

For warm tiering, you cannot specify this parameter if `ecenable` is set to `true`.

Possible Values:

- `mirror`
- `rw`
- `0`
- `1`

Description: The type of volume to create.

The following values are accepted:

- `mirror` - standard mirror (read-only) volume (promotable to standard read-write volume)
- `rw` - standard (read-write) volume (convertible to standard mirror volume)
- `0` - standard (read-write) volume (for backward compatibility)
- `1` - non-convertible mirror (read-only) volume (for backward compatibility)

**Parameter: user**

Possible Values: Any valid permissions

Description: Space-separated list of `user:permission` pairs.

Use comma to separate permissions. For example: `user:permission,permission,...`

**Parameter: wiresecurityenabled**

*Default Value:* `true`

Possible Values:

- `true`
- `false`

Description: Enables (`true`) or disables (`false`) on-wire encryption for all files, tables, and streams in the volume for secure clusters. This parameter is not supported on insecure clusters.

If `true`, this setting overrides all file, table, and stream level encryption settings (set using the `hadoop mfs` command) and enables on-wire encryption for all files, tables, and streams. If you disable (`false`) this parameter at the volume level, but enable it at the file, table, or stream level, the file, table, or stream level encryption setting overrides this setting on those files, tables, and streams where it is enabled; for all other files, tables, and streams where encryption is not enabled at the file, table, or stream level, the on-wire encryption is disabled.

**Parameter: writeAce**

Possible Values: Any valid permissions

Description: Specifies [Access Control Expressions](#) (ACEs) that grant permission at the volume level to write to files and tables in the volume. The default value is `p`, which grants access to all users.

See [ACEs](#).

## Examples

### Change the source volume of the mirror "test-mirror" and update the atime value to 2 days:

#### CLI

```
/opt/mapr/bin/maprcli volume
modify -name test-mirror -source
volume-2@my-cluster
-atimeUpdateInterval 2
```

#### REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=test-mirror&source=volume-2@my-cl
uster&atimeUpdateInterval=2' --user
mapr:mapr
```

### Create a volume with namespace container replicas

#### CLI

```
/opt/mapr/bin/maprcli
volume modify -name
testVol -nsminreplication
2 -nsreplication 4 -json
{
  "timestamp":1526528489360,
  "timeofday":"2018-05-16
08:41:29.360 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
  ]
}
```

#### REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=testVol&nsminreplication=2&nsrepl
ication=4' --user mapr:mapr
{"timestamp":1526528556748,"timeofday"
:"2018-05-16 08:42:36.748 GMT-0700
PM","status":"OK","total":0,"data":[]}
```

### Modify a volume to allow inheritance by a child volume

Sub-volumes (children) can inherit properties from their parent volume. The `maprcli volume create` and `volume modify` commands provide parameters for setting the inheritance feature. For a child volume to inherit from a parent volume, the parent volume must grant permission, and the child volume must be created specifying the volume name of the parent. In the following example, the parent volume, `parentVol`, grants inheritance to child volumes.

#### CLI

```
/opt/mapr/bin/maprcli volume
modify -name parentVol -allowgrant
true
```

**REST**

```
curl -k -X
POST 'https://abc.sj.us:8443/
rest/volume/modify?name=parentVol?
allowgrant=true' --user mapr:mapr
```

**Set and modify ACEs on a volume**

In the following example, the command sets and modifies access (defined using ACEs) to the volume data. When the command runs, new values:

- Overwrite existing values for access types that were previously set.
- Are set for access types that were not set.

**NOTE:** There is no change to the readAce access type, which is not specified with the command, irrespective of whether it is set or not.

**CLI**

```
/opt/mapr/bin/maprcli volume
modify -name testVol -writeAce
'g:group1&(!u:user1|!r:role1)'
```

**REST**

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=testVol&writeAce=g%3Agroup1%26%28
%2lu%3Auser1%7C%2lr%3Arole1%29' --user
mapr:mapr
```

**Modify the list of operations that are audited**

In the following example, the `create` operation is included for auditing and the `lookup` operation is excluded from auditing. There are no changes to operations that are not specified.

**CLI**

```
/opt/mapr/bin/maprcli volume
modify -name parentVol -dataauditops
+create,-lookup
```

**REST**

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=pl&dataauditops=%2Bcreate%2C-look
up' --user mapr:mapr
```

**Modify an existing volume to enable on-wire encryption:****CLI**

```
/opt/mapr/bin/maprcli
volume modify -name
local2 -wiresecurityenabled true -json
{
    "timestamp":1505205889697,
    "timeofday":"2017-09-12
01:44:49.697 GMT-0700",
    "status":"OK",
    "total":0,
    "data":[
```

```
]
}
```

**REST**

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=pl&wiresecurityenabled=true' --us
er mapr:mapr
{"timestamp":1526569299139,"timeofday"
:"2018-05-17 08:01:39.139 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

**Associate an offload rule with a tiering-enabled volume:****CLI**

```
/opt/mapr/bin/maprcli volume
modify -name sampleVol -tieringrule
ksTestRule -json
{
  "timestamp":1526569498559,
  "timeofday":"2018-05-17
08:04:58.559 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ]
}
```

**REST**

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=sampleVol&tieringrule=ksTestRule'
--user mapr:mapr
{"timestamp":1526569554743,"timeofday"
:"2018-05-17 08:05:54.743 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

**Modify a volume to set a schedule for data offload and set number of days to three days to keep recalled data:****CLI**

```
/opt/mapr/bin/maprcli
volume modify -name
sampleVol -offloadschedule
3 -recallexpirytime 3 -json
{
  "timestamp":1526569615285,
  "timeofday":"2018-05-17
08:06:55.285 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ]
}
```

**REST**

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
```

```
name=sampleVol&offloadschedule=3&recal
lexpirytime=3' --user mapr:mapr
{"timestamp":1526569653267,"timeofday"
:"2018-05-17 08:07:33.267 GMT-0700
AM", "status":"OK", "total":0, "data":[]}
```

## Tag a volume with a security policy

### CLI

```
/opt/mapr/bin/maprcli volume
modify -securitypolicy
Lab_Security_Policy -name
my_volume -json
{
  "timestamp":1526569615285,
  "timeofday":"2019-02-15
08:06:55.285 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ]
}
```

### REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=my_volume& \
securitypolicy=Lab_Security_Policy'
--user mapr:mapr
{"timestamp":1526569653267,"timeofday"
:"2019-02-15 08:07:33.267 GMT-0700
AM", "status":"OK", "total":0, "data":[]}
```

The `-securitypolicy` option in the `maprcli volume modify` command sets the volume to be tagged with the specified policies, replacing any security policies that existed before the command was run. This command works as follows, depending on the security policies that are associated with this volume prior to invoking this command.

- If the volume initially has no security policy tags before invoking this command, then it is tagged with the specified security policy (`Lab_Security_Policy` in our example).
- If the volume initially has two security policy tags before invoking this command, say `Lab_Security_Policy` and `Sensitive_Data`, then the `Sensitive_Data` Policy security policy is disassociated from this volume, and the volume now has only the `Lab_Security_Policy` tag.
- If the volume initially has one security policy tag, say `Sensitive_Data`, then the `Sensitive_Data` security policy is removed and replaced with the security policy `Lab_Security_Policy`.
- If the volume has one security policy tag, say `Lab_Security_Policy`, which is the same as the security policy specified in the command, then modifications are not made.

### Remove all security policies that are tagged to a volume

To remove all security policy tags from a volume, pass in an empty string as the value of the `securitypolicy` parameter.

For example:

**CLI**

```
/opt/mapr/bin/maprcli volume
modify -securitypolicy "" -name
my_volume
```

This code removes all security policy tags from the volume named `my_volume`.

**REST**

```
curl -u mapr:mapr -k 'https://
abc.sj.us:8443/rest/volume/modify?
name=my_volume<securitypolicy=' |
python -m json.tool
  % Total % Received % Xferd
Average Speed Time Time Time Current
  Dload Upload Total Spent Left Speed
100 111 100 111 0 0
184 0 --:--:-- --:--:-- --:--:-- 190
{
  "data": [],
  "status": "OK",
  "timeofday": "2018-09-03
11:20:13.282 GMT-0700 PM",
  "timestamp": 1536042013282,
  "total": 0
}
```

**Disable scheduled snapshot creation**

To disable a schedule, set the `schedule` parameter to 0.

For example:

**CLI**

```
/opt/mapr/bin/maprcli volume
modify -name mapr.apps -schedule 0
/opt/mapr/bin/maprcli volume
info -name mapr.apps -json | grep
schedule

"scheduleid": "0",

"schedulename": "",

"mirrorscheduleid": "0"
```

**Remove file filter from a volume**

To remove a file filter use the special `filefilter ""`.

For example:

**CLI**

```
/opt/mapr/bin/maprcli volume
modify -name noexec -filefilter ""
```

**Related reference**

[disk add](#) on page 2124

Adds one or more disks to the specified node. Permissions required: `fc` or `a`.

[volume create](#) on page 2592

Creates a volume.

**volume mount**

Mounts one or more specified volumes. Permissions required: `fc` or `m` on the volume.

**Syntax****CLI**

```
maprcli volume mount
[ -cluster <cluster> ]
-name <volume list>
-path <path list>
[ -createparent 0|1 ]
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/mount?<parameters>

**Parameters**

Parameter	Description
<code>cluster</code>	The cluster on which to run the command.
<code>name</code>	The name of the volume to mount.
<code>path</code>	The path at which to mount the volume. The path must be relative to <code>/</code> and cannot be in the form of a global namespace path (for example, <code>/mapr/&lt;cluster-name&gt;/</code> ).
<code>createparent</code>	Specifies whether or not to create a parent volume: <ul style="list-style-type: none"> <li>0 = Do not create a parent volume.</li> <li>1 = Create a parent volume.</li> </ul>

**Examples**

**Mount the volume "test-volume" at the path "/test":**

**CLI**

```
maprcli volume mount -name
test-volume -path /test
{
  "timestamp":1537804971391,
  "timeofday":"2018-09-24
09:02:51.391 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ]
}
```

**REST**

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/mount?
```

```
name=test-volume&path=/test' --user
<username>:<password>
{"timestamp":1537804971391,"timeofday"
:"2018-09-24 09:02:51.391 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

### volume move

Moves the specified volume or mirror to a different topology. Permissions required: `m` or `fc` on the volume.

### Syntax

#### CLI

```
/opt/mapr/bin/maprcli volume move
-name volumeName
[ -cluster cluster_name ]
[ -eclabel new label for ec-store
volume ]
[ -ectopology <topology> ]
[ -label new label for volume data ]
[ -nslabel new label for volume name
container ]
[ -topology topology ]
```

#### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/move?<parameters>

### Parameters

#### Parameter: cluster

Possible Values: Any valid cluster.

Description: The cluster on which to create the volume.

#### Parameter: eclabel

Possible Values: Any label.

Description: The label to use for the erasure-coded volume. See [Using Storage Labels](#) on page 1306 for more information on labels.

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

#### Parameter: ectopology

Possible Values: Any topology that exists in your environment.

Description: The new rack path for the erasure-coded volume if you are moving an erasure-coded volume.

**NOTE:** This parameter is applicable only for EC volumes.

#### Parameter: label

Possible Values: Any label.

Description: The label to use for the storage pool. See [Using Storage Labels](#) on page 1306 for more information on labels.

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

**TIP:** Use the special label named *anywhere* to let a volume reside on any storage pool. Not setting a label, causes a volume to reside only on a storage pool without a label.

**Parameter: name**

Possible Values: Any valid name

Description: The name of the volume to move. For moving:

- An erasure coded volume, specify the name of the front-end volume.
- The metadata volume associated with a tier, specify the name of the metadata volume.

The name should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

For tiering-enabled volumes, the volume name cannot exceed ninety-eight characters.

Possible Values: Any value.

Description: The label to use for the namespace container. See [Using Storage Labels](#) on page 1306 for more information on labels.

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

**Parameter: nslabel**

**Parameter: topology**

Possible Values: Any

Description: The new rack path for the:

- Regular or tiered standard volume, if you are moving a regular or tiered standard volume.
- Regular or tiered mirror volume, if you are moving a regular or tiered mirror volume.
- Metadata volume, if you are moving a metadata volume associated with a tier.

This parameter is not required, if you are moving an erasure-coded volume.

### Advisory Note on Storage Labels

When the volume of a label is changed, replicas cannot be migrated within the file server, from one SP with the old label to another SP with the desired label. If there no other SPs, all old copies will not be fully migrated to the new desired label.

## Examples

### CLI

```
maprcli volume move -name
testVolume -topology /newPath
```

### REST

```
curl -k -X 'https://abc.sj.us:8443/
rest/volume/move?
name=testVolume&topology=%2FnewPath'
--user mapr:mapr
```

## volume offload

Offloads data in the volume to the tier.

## Permissions Required

The user running the command must have one of the following:

- Full control (`fc`) on the cluster or volume
- Volume edit permissions

## Syntax

### CLI

```
maprcli volume offload
[ -cluster cluster_name ]
[ -ignorerule <true|false> ]
-name <volume_name>
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/offload?<parameters>

**Parameters**

Parameter	Description
cluster	The name of the cluster on which to run the command.
ignorerule	Specify whether ( <i>true</i> ) or not ( <i>false</i> ) to ignore existing rules associated with the volume for offloading data. If value is: <ul style="list-style-type: none"> <li><i>true</i>, all data in the volume is offloaded and rules associated with the volume for offload are ignored.</li> <li><i>false</i>, data is offloaded based on the rules set up for offloading data.</li> </ul> Default value is <i>false</i> .
name	The name of the volume.

**Example****Offload a volume:****CLI**

```
# /opt/mapr/bin/maprcli volume
offload -name sampleVol -json
{
  "timestamp":1501104289006,
  "timeofday":"2017-07-26
02:24:49.006 GMT-0700",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":[
    "Successfully started
offload."
  ]
}
```

**REST**

```
# curl -X POST 'https://
abc.sj.us:8443/rest/volume/offload?
name=sampleVol' --user
<username>:<password>
{"timestamp":1519947659597,"timeofday"
:"2018-03-01 03:40:59.597 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully started
offload."]}
```

**volume recall**

Recalls the offloaded data for the specified volume.

**Permissions Required**

The user running the command must have one of the following:

- Full control (fc) on the cluster or volume
- Volume edit permissions

**Syntax****CLI**

```
maprcli volume recall
  [ -cluster cluster_name ]
  -name <volume_name>
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/recall?<parameters>

**Parameters**

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the volume.

**Example**

Recall a volume:

**CLI**

```
# /opt/mapr/bin/maprcli volume
recall -name sampleVol -json
{
  "timestamp":1520007453541,
  "timeofday":"2018-03-02
08:17:33.541 GMT-0800 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully started recall."
  ]
}
```

**REST**

```
# curl -X POST 'https://
abc.sj.us:8443/rest/volume/recall?
name=sampleVol' --user
<username>:<password>
```

```
{ "timestamp":1520007538784,"timeofday"
:"2018-03-02 08:18:58.784 GMT-0800
AM","status":"OK","total":0,"data":
[],"messages":["Successfully started
recall."]}
```

**volume remove**

Removes the specified volume or mirror. Permissions required: `d` or `fc` on the volume.

**Syntax****CLI**

```
maprcli volume remove
  [ -cluster <cluster> ]
  [ -force true|false ]
  [ -filter <filter> ]

  -name <volume name>
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/remove?<parameters>

**Parameters**

Parameter	Description
cluster	The cluster on which to run the command.
force	Forces the removal of the volume, even if there are dependencies.
name	The volume name.
filter	All volumes with names that match the filter are removed.

**Examples**

The following command removes the volume by the name, `testVolume`.

**CLI**

```
maprcli volume remove -name testVolume
```

**REST**

```
https://abcdcorp.sj.us:8443/rest/volume/remove?name=testVolume
```

**volume rename**

Renames the specified volume or mirror. Permissions required: `fc` or `d` on the volume.

**NOTE:** If you rename a volume, you must [unmount](#) and [re-mount](#) the volume to allow applications and/or users to continue accessing the volume.

## Syntax

### CLI

```
maprcli volume rename
[ -cluster <cluster> ]
-name <volume name>
-newname <new volume name>
```

### REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/rename?<parameters>

## Parameters

Parameter	Description
cluster	The cluster on which to run the command.
name	The volume name.
newname	The new volume name. For tiering-enabled volumes, volume name cannot exceed ninety-eight characters.

## Examples

### Rename a standard volume:

#### CLI

```
# maprcli volume
rename -name testVolume -newname
newVolumeName -json
{
  "timestamp":1537994815889,
  "timeofday":"2018-09-26
01:46:55.889 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
  ]
}
```

#### REST

```
# curl -X POST 'https://
server.sj.us:8443/rest/volume/rename?
name=testVolume&newname=newVolumeName'
--user <username>:<password>
{"timestamp":1537994918599,"timeofday"
:"2018-09-26 01:48:38.599 GMT-0700
PM","status":"OK","total":0,"data":[]}
```

### volume showmounts

Returns a list of mount points for the specified volume.

**NOTE:** The three dots in the output indicate hierarchical mounts within a volume. Use `-json` to format the output.

**Syntax****CLI**

```
maprcli volume showmounts
[ -cluster <cluster name> ]
-name <volume name>
-json
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/volume/showmounts?<parameters>

**Parameters**

Parameter	Description
cluster	The name of the cluster hosting the volume.
json	(Required) Returns the output in JSON format.
name	The name of the volume to return a list of mount points for.

**Examples**

**Return the mount points for volume mapr.user.volume for the cluster my.cluster.com:**

**CLI**

```
maprcli volume showmounts -cluster
my.cluster.com -name
mapr.user.volume -json
```

**REST**

```
curl -X GET 'https://abc.sj.us:8443/
rest/volume/showmounts?
cluster=my.cluster.com&name=mapr.user.
volume' --user <username>:<password>
```

**volume snapshot create**

Creates a snapshot of the specified volume, using the specified snapshot name.

- License required: Enterprise Edition
- Permissions required: `fc` or `m` on the volume

**Syntax****CLI**

```
maprcli volume snapshot create
[ -cluster <cluster> ]
[ -retain <positive_integer>mi|h|
d|w|m|y ]
-snapshotname <snapshot>
-volume <volume>
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/snapshot/create?<parameters>

**Parameters**

Parameter	Description
cluster	The cluster on which to run the command.
retain	<p>Specifies how long to retain the snapshot data. Value can be specified in:</p> <ul style="list-style-type: none"> <li>Minutes by appending <code>mi</code> to the integer. For example, <code>30mi</code> can be specified as the value for this parameter to retain snapshot data for 30 minutes.</li> <li>Hours by appending <code>h</code> to the integer. For example, <code>1h</code> can be specified as the value for this parameter to retain snapshot data for 1 hour.</li> <li>Days by appending <code>d</code> to the integer. For example, <code>2d</code> can be specified as the value for this parameter to retain snapshot data for 2 days.</li> <li>Weeks by appending <code>w</code> to the integer. For example, <code>4w</code> can be specified as the value for this parameter to retain snapshot data for 4 weeks.</li> <li>Months by appending <code>m</code> to the integer. For example, <code>10m</code> can be specified as the value for this parameter to retain snapshot data for 10 months.</li> <li>Years by appending <code>y</code> to the integer. For example, <code>7y</code> can be specified as the value for this parameter to retain snapshot data for 7 years.</li> </ul> <p>If this is not specified, snapshot data will never expire.</p>
snapshotname	The name of the snapshot to create.
volume	The volume for which to create a snapshot.

**Examples**

**Create a snapshot called "test-snapshot" for volume "test-volume":**

**CLI**

```
maprcli volume
snapshot create -snapshotname
test-snapshot -volume test-volume
{
  "timestamp":1537805380237,
  "timeofday":"2018-09-24
09:09:40.237 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
```

```
    ]
  }
```

**REST**

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/
snapshot/create?
volume=test-volume&snapshotname=test-s
napshot' --user <username>:<password>
{"timestamp":1537805548885,"timeofday"
:"2018-09-24 09:12:28.885 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

**volume snapshot list**

Displays info about a set of snapshots.

You can specify the snapshots by volumes or paths, or by specifying a filter to select volumes with certain characteristics.

**Syntax****CLI**

```
/opt/mapr/bin/maprcli volume snapshot
list
[ -cluster <cluster name> ]
[ -columns <fields> ]
( -filter <filter> ]
[ -path <volume path list> ]
[ -volume <volume list> ]
[ -limit <rows> ]
[ -output (terse|verbose) ]
[ -start <offset> ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/volume/snapshot/list[?<parameters>]

**Parameters**

Either `volume` or `path` can be used if you wish to specify the snapshots. In addition, `filter` can be used with `volume` and `path`, or independently.

Parameter	Description
cluster	The cluster on which to run the command.
columns	A comma-separated list of fields to return in the query. See the <a href="#">Fields</a> on page 2711 table below. Default: none
filter	A filter specifying snapshots to list. See <a href="#">Filters</a> on page 1990 for more information.
limit	The number of rows to return, beginning at start. Default: 2147483647
output	Specifies whether the output should be <code>terse</code> or <code>verbose</code> . Default: <code>verbose</code>

Parameter	Description
path	A comma-separated list of paths for which to list snapshots.
start	The offset from the starting row. Default: 0
volume	A comma-separated list of volumes for which to list snapshots.

## Fields

The following table lists the fields used in the `columns` parameter, and returned as output.

Field Name	Short Name	Description
snapshotid	id	Unique snapshot ID.
sharedSize	shSz	Size of data (in MB) that the snapshot shares with previous snapshots.
volumename	vn	Name of the read-write volume associated with the snapshot.
ownername	on	Owner (user or group) associated with the volume.
cumulativeReclaimSizeMB	cs	Disk space (in MB) used/owned by the snapshot
snapshotname	n	Snapshot name.
ownedsize	owSz	Size of data (in MB) owned by a snapshot, as opposed to sharedSize (owned by previous snapshots).
ownertype	ot	Owner type for the owner of the volume: <ul style="list-style-type: none"> <li>0=user</li> <li>1=group</li> </ul>
volumeid	vid	ID of the volume associated with the snapshot.
creationtime	ct	Snapshot creation time. Date time string (verbose output) or milliseconds since 1970 (terse output).
volumePath	vp	Path to the volume associated with the snapshot.
expirytime	et	The time until which the snapshot should be maintained. Expired snapshots are purged (deleted) periodically. Date time string (verbose output), or milliseconds since 1970 (terse output); 0 = never expires.
volumeSnapshotAces	N/A	<a href="#">ACE</a> permissions for read and write on the volume snapshot. Use <code>-json</code> to view the <a href="#">ACE</a> permissions.

## Output

This sample output is based on using the following code to create a snapshot called `uservolume` for the volume named `users`.

```
/opt/mapr/bin/maprcli volume snapshot create -snapshotname
uservolsnap -volume users
```

## Sample Output

### Examples

#### List all snapshots:

##### CLI

```
maprcli volume snapshot list
```

##### REST

```
curl -X GET 'https://abc.sj.us:8443/
rest/volume/snapshot/list' --user
<username>:<password>
{"timestamp":1537984492448,"timeofday"
:"2018-09-26 10:54:52.448 GMT-0700
AM","status":"OK","total":3,"data":
[{"ownername":"mapr","ownertype":"1",

```

#### List all snapshots and format the output:

```
maprcli volume snapshot list -json
```

#### volume snapshot preserve

Preserves one or more snapshots from expiration.

Specify the snapshots by volumes, paths, filter, or IDs.

- License required: Enterprise Edition
- Permissions required: `fc` or `m` on the volume

## Syntax

### CLI

```
maprcli volume snapshot preserve
  [ -cluster <cluster> ]
  ( -filter <filter> | -path
  <volume path list> | -snapshots
  <snapshot list> | -volume <volume
  list> )
```

### REST

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/volume/snapshot/preserve[?&lt;parameters&gt;]</code>

## Parameters

Specify exactly one of the following parameters: volume, path, filter, or snapshots.

Parameter	Description
cluster	The cluster on which to run the command.
filter	A filter specifying snapshots to preserve. See <a href="#">Filters</a> on page 1990 for more information.
path	A comma-separated list of paths for which to preserve snapshots.
snapshots	A comma-separated list of snapshot IDs to preserve.
volume	A comma-separated list of volumes for which to preserve snapshots.

## Examples

### Preserve two snapshots by ID:

First, use `volume snapshot list` to get the IDs of the snapshots you wish to preserve. Example:

```
# maprcli volume snapshot list
snapshotid ownedsize sharedSize volumename ownertype
256000049 0 0 egVol mapr 1
0 29379677 egVol-snapshot Wed Sep 26 10:42:52 PDT
2018 /egVol ...
256000051 0 0 users mapr 1
0 212450174 uservolsnap Wed Sep 26 10:45:27 PDT
2018 /user ...
256000050 0 0 egVol mapr 1
```

```
0          29379677  egVolSnapshot  Wed Sep 26 10:43:12 PDT
2018 /egVol      ...
```

Use the IDs in the `volume snapshot preserve` command. For example, to preserve the first two snapshots in the above list, run the commands as follows:

### CLI

```
maprcli volume
snapshot preserve -snapshots
256000049,256000051 -json
{
  "timestamp":1537986060505,
  "timeofday":"2018-09-26
11:21:00.505 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ]
}
```

### REST

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/
snapshot/preserve?
snapshots=256000049,256000051' --user
<username>:<password>
{"timestamp":1537986132998,"timeofday"
:"2018-09-26 11:22:12.998 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

### volume snapshot remove

Removes one or more snapshots.

- License required: Enterprise Edition
- Permissions required: `fc` or `m` on the volume

### Syntax

#### CLI

```
maprcli volume snapshot remove
[ -cluster <cluster> ]
( -snapshotname <snapshot name> ]
[ -snapshots <snapshots> ]
[ -volume <volume name> ]
```

#### REST

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/volume/snapshot/remove[?&lt;parameters&gt;]</code>

### Parameters

Specify both snapshot name and volume, or just snapshot ID.

Parameter	Description
cluster	The cluster on which to run the command.
snapshotname	The name of the snapshot to remove. You must also specify the volume name using the <code>volume</code> parameter.
snapshots	A comma-separated list of IDs of snapshots to remove.
volume	The name of the volume from which to remove the snapshot. This is required if you are removing snapshot by specifying the snapshot name (using <code>snapshotname</code> parameter).

## Examples

**Remove the snapshot named "test-snapshot" associated with volume named "test-volume":**

### CLI

```
maprcli volume
snapshot remove -snapshotname
test-snapshot -volume test-volume
```

### REST

```
curl -X POST 'https://
abc.sj.us:8443/api/volume/snapshot/
remove?
snapshotname=test-snapshot&volume=tes
t-volume' --user <username>:<password>
```

**Remove two snapshots by ID:**

First, use `volume snapshot list` to get the IDs of the snapshots you wish to remove. Example:

```
# maprcli volume snapshot list
snapshotid ownedsize sharedSize volumename ownertype
cumulativeReclaimSizeMB volumeid snapshotname
creationtime volumepath volumeSnapshotAces
256000049 0 0 egVol mapr 1
0 29379677 egVol-snapshot Wed Sep 26 10:42:52 PDT
2018 /egVol ...
256000051 0 0 users mapr 1
0 212450174 uservolsnap Wed Sep 26 10:45:27 PDT
2018 /user ...
256000050 0 0 egVol mapr 1
0 29379677 egVolSnapshot Wed Sep 26 10:43:12 PDT
2018 /egVol ...
```

Use the IDs in the `volume snapshot remove` command. For example, to remove the first two snapshots in the above list, run the commands as follows:

### CLI

```
maprcli volume snapshot
remove -snapshots 256000049,256000051
{
  "timestamp":1537986405764,
  "timeofday":"2018-09-26
11:26:45.764 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
```

```
    ]
}
```

**REST**

```
# curl -X POST 'https://
server.sj.us:8443/rest/volume/
snapshot/remove?
snapshots=256000049,256000051' --user
<username>:<password>
{"timestamp":1537987406574,"timeofday"
:"2018-09-26 11:43:26.574 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

**volume tierjobterminate**

Terminates an ongoing offload or recall operation for a volume (specified by name).

**Permissions Required**

The user running the command must have one of the following:

- Full control (fc) on the cluster or volume
- Volume edit permissions

**Syntax****CLI**

```
maprcli volume tierjobterminate
[ -cluster cluster_name ]
-name name
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/ rest/volume/ tierjobterminate? <parameters>

**Parameters**

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the volume.

**Example****Stop offloading data to the tier:****CLI**

```
/opt/mapr/bin/maprcli volume
tierjobterminate -name sampleVol -json
{
    "timestamp":1503504450211,
    "timeofday":"2017-08-23
```

```
04:07:30.211 GMT+0000",
  "status": "OK",
  "total": 0,
  "data": [
    ],
    "messages": [
      "Successfully started
to terminate."
    ]
  }
}
```

**REST**

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/
tierjobterminate?
name=sampleVol' --user
<username>:<password>
{"timestamp":1503504450211,"timeofday"
:"2017-08-23 04:07:30.211
GMT+0000","status":"OK","total":0,"dat
a":[],"messages":["Successfully
started to terminate."]}
```

**volume tierjobstatus**

Retrieves the status of the currently running operation (such as offload, recall, or terminate) for a volume.

**Permissions Required**

The user running the command must have one of the following:

- Full control (fc) on the cluster or volume
- Volume edit permissions

**Syntax**

**CLI**

```
maprcli volume tierjobstatus
[ -cluster <cluster_name> ]
-name <volume_name>
[ -verbose true|false ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/volume/tierjobstatus?<parameters>

**Parameters**

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the volume.

Parameter	Description
verbose	Specifies whether the command output should be verbose. The value for this must be <code>true</code> to retrieve the status of a compaction operation. The default value is <code>false</code> .

### Output

The command returns the following:

state	The status of the offload, recall, or terminate operation. See <a href="#">Statuses</a> on page 2718 below for more information.
offloadedDataSize	The amount of data offloaded. This is returned only when returning the status of an offload operation.
progress	The percentage of containers that have been processed so far.
recalledDataSize	The amount of data recalled. This is returned only when returning the status of a recall operation.
reclaimedDataSize	The amount of data purged. This is returned only when returning the status of a compaction job.
startTime	The date and timestamp for when the offload operation started.
endTime	The date and timestamp for when the offload operation completed.
gateway	The IP address of the MAST Gateway used for the tiering operation.

### Statuses

The value for the `state` field (statuses) can be one of the following:

State	Description
Scheduled	<p>Indicates the job request has reached CLDB, but has not yet been forwarded to any MAST Gateway service. For example:</p> <p><b>CLI</b></p> <pre data-bbox="1149 321 1455 1192"> {   "timestamp":1532093619983,   "timeofday":"2018-07-20 06:33:39.983 GMT-0700 AM",   "status":"OK",   "total":1,   "data":[     {       "compaction":{         "state":"Scheduled",         "scheduleTime":"2018-07-20 06:33:38.953 GMT-0700",         "gateway":"10.10.108.116:8660"       }     }   ] } </pre> <p><b>REST</b></p> <pre data-bbox="1149 1230 1455 1675"> {"timestamp":1532093619983,"timeofday":"2018-07-20 06:33:39.983 GMT-0700 AM","status":"OK", "total":1,"data":[{"compaction":{"state":"Scheduled","scheduleTime":"2018-07-20 06:33:38.953 GMT-0700","gateway":"10.10.108.116:8660"}}]} </pre>

State	Description
Running	<p>Indicates the offload or recall job has been forwarded to MAST Gateway service. The MAST Gateway service can either still be waiting for resources to run the job or is actually performing the requested job. For example:</p> <p><b>CLI</b></p> <pre data-bbox="1149 348 1455 1835"> {   "timestamp":1532095481297,   "timeofday":"2018-07-20 07:04:41.297 GMT-0700 AM",   "status":"OK",   "total":1,   "data":[     {       "offload":{         "state":"Running",         "progress":"61%",         "startTime":"2018-07-20 07:00:02.277 GMT-0700",         "gateway":"10.10.108.115:8660",         "compaction":{           "state":"Success",           "progress":"100%",           "startTime":"2018-07-20 06:34:06.628 GMT-0700",           "endTime":"2018-07-20 06:40:25.334 GMT-0700",           "reclaimedDataSize":"0 MB",           "gateway":"10.10.108.115:8660"         }       }     }   ] } </pre> <p><b>REST</b></p> <pre data-bbox="1149 1873 1455 2095"> {"timestamp":1532095481297,"timeofday":"2018-07-20 07:04:41.297 GMT-0700 AM","status":"OK", "total":1,"data": [{"offload": </pre>

State	Description
<p>FailureFatal</p>	<p>Indicates the job has failed with non-retriable error. You must resolve the issue and retry the operation. For example:</p> <p><b>CLI</b></p> <pre data-bbox="1153 321 1455 1419"> {   "timestamp":1531778057385,   "timeofday":"2018-07-16 09:54:17.385 GMT+0000 PM",   "status":"OK",   "total":1,   "data":[     {       "offload":{         "state":"FailureFatal",         "progress":"50%",         "startTime":"2018-07-16 21:54:01.779 GMT+0000",         "endTime":"2018-07-16 21:54:05.339 GMT+0000",         "offloadedDataSize":"0 MB",         "gateway":"10.10.88.198:8660"       }     }   ] } </pre> <p><b>REST</b></p> <pre data-bbox="1153 1455 1455 2064"> {"timestamp":1531778057385,"timeofday":"2018-07-16 09:54:17.385 GMT+0000 PM","status":"OK","total":1,"data":[{"offload":{"state":"FailureFatal","progress":"50%","startTime":"2018-07-16 21:54:01.779 GMT+0000","endTime":"2018-07-16 21:54:05.339 GMT+0000","offloadedDataSize":"0 MB","gateway":"10.10.88.198:8660"}}]} </pre>

State	Description
FailureRetriable	<p>Indicates the job has failed with an error for which CLDB will retry the job based on the configuration parameters, <code>cldb.gateway.retry.count</code> and <code>cldb.gateway.retry.waittime</code>. But if the job is restarted manually or terminated, CLDB will not retry. For example:</p> <p><b>CLI</b></p> <pre data-bbox="1149 407 1455 1528"> {   "timestamp":1532624516372,   "timeofday":"2018-07-26 10:01:56.372 GMT-0700 AM",   "status":"OK",   "total":1,   "data":[     {       "offload":{         "state":"FailureRetry, RetryCount:5",         "progress":"50%",         "startTime":"2018-07-25 17:43:27.924 GMT-0700",         "endTime":"2018-07-25 17:43:59.108 GMT-0700",         "offloadedDataSize":"0 MB",         "gateway":"10.10.25.29:8660"       }     }   ] }                 </pre> <p><b>REST</b></p> <pre data-bbox="1149 1570 1455 2095"> {"timestamp":1532624656640,"timeofday":"2018-07-26 10:04:16.640 GMT-0700 AM","status":"OK", "total":1,"data": [{"offload": {"state":"FailureRetry, RetryCount:5", "progress":"50%", "startTime":"2018-07-25 17:43:27.924 GMT-0700", "endTime":"2018-07-25 17:43:59.108 GMT-0700", "offload                 </pre>

State	Description
<p>Success</p>	<p>Indicates the job has been successfully completed. For example:</p> <p><b>CLI</b></p> <pre data-bbox="1149 296 1455 1978"> {   "timestamp":1531311128469,   "timeofday":"2018-07-11 12:12:08.469 GMT+0000 PM",   "status":"OK",   "total":1,   "data":[     {       "offload":{         "state":"Success",         "progress":"100%",         "startTime":"2018-07-11 12:10:26.290 GMT+0000",         "endTime":"2018-07-11 12:10:35.521 GMT+0000",         "offloadedDataSize":"353.16 MB",         "gateway":"10.10.20.12:8660",         "compaction":{           "state":"Success",           "progress":"100%",           "startTime":"2018-07-11 12:12:01.335 GMT+0000",           "endTime":"2018-07-11 12:12:02.264 GMT+0000",           "reclaimedDataSize":"353.097 MB",           "gateway":"10.10.20.12:8660"         }       }     }   ] } </pre>

State	Description
Terminated	<p data-bbox="818 212 1403 241">Indicates the job has been terminated. For example:</p> <p data-bbox="818 264 873 294"><b>CLI</b></p> <pre data-bbox="1162 281 1442 1150"> {   "timestamp":1503504464179,   "timeofday":"2017-08-23 04:07:44.179 GMT+0000",   "status":"OK",   "total":1,   "data":[{"offload":{     "state":"Terminated",     "startTime":"2017-08-23 04:06:06.867 GMT+0000",     "endTime":"2017-08-23 04:06:38.910 GMT+0000",     "gateway":"10.10.88.199:8660"   }}] } </pre> <p data-bbox="818 1199 894 1228"><b>REST</b></p> <pre data-bbox="1162 1220 1442 1696"> {"timestamp":1503504464179,"timeofday":"2017-08-23 04:07:44.179 GMT+0000","status":"OK","total":1,"data":[{"offload":{"state":"Terminated","startTime":"2017-08-23 04:06:06.867 GMT+0000","endTime":"2017-08-23 04:06:38.910 GMT+0000","gateway":"10.10.88.199:8660"}}]} </pre>

State	Description
TerminateInProgress	<p data-bbox="818 212 1446 268">Indicates that the terminate operation is in progress. For example:</p> <p data-bbox="818 289 878 321"><b>CLI</b></p> <pre data-bbox="1166 310 1446 1213"> {   "timestamp":1533005375001,   "timeofday":"2018-07-30 07:49:35.001 GMT-0700 PM",   "status":"OK",   "total":1,   "data":[     {       "offload":{         "state":"TerminateInProgress",         "progress":"98%",         "startTime":"2018-07-30 19:02:37.108 GMT-0700",         "gateway":"10.10.101.121:8660"       }     }   ] } </pre> <p data-bbox="818 1255 894 1287"><b>REST</b></p> <pre data-bbox="1166 1276 1446 1738"> {"timestamp":1533005375001,"timeofday":"2018-07-30 07:49:35.001 GMT-0700 PM","status":"OK", "total":1,"data":[{"offload":{"state":"TerminateInProgress","progress":"98%","startTime":"2018-07-30 19:02:37.108 GMT-0700","gateway":"10.10.101.121:8660"}}]} </pre>

State	Description
TerminatedInternal	<p data-bbox="816 216 1468 321">Indicates the offload operation was terminated by another internal process, such as when promoting a mirror volume to a read-write volume when offload is in progress. For example:</p> <p data-bbox="816 342 876 373"><b>CLI</b></p> <pre data-bbox="1166 363 1442 1287"> {   "timestamp":1515488569411,   "timeofday":"2018-01-09 01:02:49.411 GMT-0800",   "status":"OK",   "total":1,   "data":[{"recall":{     "state":"TerminatedInternal",     "progress":"36%",     "startTime":"2018-01-09 01:01:57.824 GMT-0800",     "endTime":"2018-01-09 01:02:43.329 GMT-0800",     "gateway":"10.10.108.150:8660"   }}] } </pre> <p data-bbox="816 1329 893 1360"><b>REST</b></p> <pre data-bbox="1166 1350 1442 1854"> {"timestamp":1515488569411,"timeofday":"2018-01-09 01:02:49.411 GMT-0800","status":"OK","total":1,"data":[{"recall":{"state":"TerminatedInternal","progress":"36%","startTime":"2018-01-09 01:01:57.824 GMT-0800","endTime":"2018-01-09 01:02:43.329 GMT-0800","gateway":"10.10.108.150:8660"}}]} </pre>

**Example****CLI**

```
# maprcli volume tierjobstatus -name
testVol -json -verbose true
{
  "timestamp":1533005419522,

```

**volume tierstats**

Retrieves statistics on the offload and recall operation.

**Permissions Required**

The user running the command must have one of the following:

- Full control (fc) on the cluster or volume
- Volume edit permissions

**Syntax****CLI**

```
maprcli volume tierstats
  [ -cluster cluster_name ]
  -name <volume_name>
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/volume/tierstats?<parameters>

**Parameters**

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the volume.

**Output**

The command returns the following:

offloadThroughput	The amount of data (in MB) offloaded per second.
totalTierDataSize	The total size of tiered data (in MB).
totalTierReclaimableSize	The size of deleted data (in MB) that is under the compaction operation threshold.
recallThroughput	The amount of data (in MB) recalled per second.

**Example**

**Retrieve statistics for a volume specified by name:**

**CLI**

```
# /opt/mapr/bin/maprcli volume
tierstats -name sampleVol -json
{
  "timestamp":1520275614872,
  "timeofday":"2018-03-05
06:46:54.872 GMT+0000",
  "status":"OK",
  "total":1,
```

```

    "data":[
      {
        "totalTierDataSize": "404.323 MB",
        "offloadThroughput": "17.063 MB/s",
        "recallThroughput": "14.071 MB/s"
      }
    ]
  }
}

```

**REST**

```

curl -X GET 'https://
server.sj.us:8443/rest/volume/
tierstats?name=sampleVol' --user
<username>:<password>
{"timestamp":1520275614872,"timeofday"
:"2018-03-05 06:46:54.872
GMT+0000","status":"OK","total":1,"dat
a":[{"totalTierDataSize":"404.323
MB","offloadThroughput":"17.063 MB/
s","recallThroughput":"14.071 MB/s"}]}

```

**Retrieve statistics for a volume after a compaction operation:****CLI**

```

# maprcli volume tierstats -name
test1 -json
{
  "timestamp":1527048672887,
  "timeofday":"2018-05-23
04:11:12.887 GMT+0000 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "totalTierDataSize":"3001.926 MB",
      "totalTierReclaimableSize":"100 MB",
      "offloadThroughput":"31.064 MB/s"
    }
  ]
}

```

**REST**

```

curl -X GET 'https://
server.sj.us:8443/rest/volume/
tierstatus?name=test1' --user
<username>:<password>
{"timestamp":1527048672887,"timeofday"
:"2018-05-23 04:11:12.887 GMT+0000
AM","status":"OK","total":1,"data":
[{"totalTierDataSize":"3001.926
MB","totalTierReclaimableSize":"100
MB","offloadThroughput":"31.064 MB/
s"}]}

```

**volume unmount**

Unmounts one or more mounted volumes. Permissions required: `fc` or `m` on the volume.

**Syntax****CLI**

```
maprcli volume unmount
[ -cluster <cluster> ]
[ -force 0|1 ]
-name <volume name>
```

**REST**

Request Type	POST
Request URL	<code>http[s]://&lt;host&gt;:&lt;port&gt;/rest/volume/unmount?&lt;parameters&gt;</code>

**Parameters**

Parameter	Description
<code>cluster</code>	The cluster on which to run the command.
<code>force</code>	Specifies whether (1) or not (0) to force the volume to unmount.
<code>name</code>	The name of the volume to unmount.

**Examples****Unmount the volume "test-volume":****CLI**

```
maprcli volume unmount -name
test-volume
{
  "timestamp":1537804903335,
  "timeofday":"2018-09-24
09:01:43.335 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ]
}
```

**REST**

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/unmount?
name=test-volume' --user
<username>:<password>
{"timestamp":1537805053854,"timeofday"
:"2018-09-24 09:01:43.335 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

**volume upgradeformat**

Upgrades and old-type volume to a new-type volume, which can in turn be used as a promotable mirror volume. Permissions required: `m` or `fc` on the volume.

**Syntax****CLI**

```
maprcli volume upgradeformat
[ -cluster <cluster> ]
-name <volume name>
```

**REST**

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/upgradeformat?<parameters>

**Parameters**

Parameter	Description
cluster	The cluster on which to run the command.
name	The volume name.

**Examples****CLI**

```
maprcli volume upgradeformat -name
vol999 -json
```

**REST**

```
https://abc.sj.us:8443/rest/volume/
upgradeformat?name=vol999
```

**volume snapshot restore**

Restores a volume from a snapshot using the CLI.

For an overview on the Snapshot Restore functionality, refer to [Restoring a Volume From a Snapshot](#) on page 517.

To restore a snapshot using the Control System, refer to [Restoring Volume Snapshots Using the Control System](#) on page 1268.

To check the progress of a snapshot restore operation, use the [volume snapshot restorestatus](#) on page 2733 command.

**Syntax****CLI**

```
/opt/mapr/bin/maprcli volume snapshot
restore
[ -cluster <cluster> ]
( -snapshotname <snapshot name> ]
[ -volume <volume name> ]
```

**REST**

Request Type	POST
--------------	------

## Request URL

```
http[s]://<host>:<port>/
rest/volume/snapshot/
restore[?<parameters>]
```

## Parameters

Parameter	Description
cluster	The cluster on which to run the command. This parameter is not mandatory. If not specified, the current cluster is used by default.
snapshotname	The name of the snapshot to use for restoring a volume. You must also specify the volume name using the <code>volume</code> parameter.
volume	The name of the volume to restore from a snapshot.

## Example

## CLI

The following example command restores a snapshot named `s3` to a volume named `vol2`:

```
/opt/mapr/bin/maprcli volume snapshot
restore -volume vol2 -snapshotname
s3 -json
{
  "timestamp":1549970648390,
  "timeofday":"2019-02-12
11:24:08.390 GMT+0000 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":["
    "Snapshot Restore
    queued for volume vol2, snapshot name
    s3"
  ]
}
```

## REST

```
curl -X
POST 'https://server.sj.us:8443/
rest/volume/snapshot/restore?
snapshotname=s3&volume=vol2' --user
<username>:<password>
```

## Related concepts

[Restoring a Volume From a Snapshot](#) on page 517

Provides a synopsis of restoring a volume from a snapshot. Describes the implications, and the prerequisites.

## Related tasks

[Restoring Volume Snapshots Using the Control System](#) on page 1268

Describes how to restore snapshots of volumes using the Control System.

**Related reference**

[volume snapshot restorestatus](#) on page 2733

Displays the progress of the snapshot restore operation, in terms of percentage.

**volume snapshot restorestatus**

Displays the progress of the snapshot restore operation, in terms of percentage.

For an overview on the Snapshot Restore functionality, refer to [Restoring a Volume From a Snapshot](#) on page 517.

To restore a snapshot using the Control System, refer to [Restoring Volume Snapshots Using the Control System](#) on page 1268.

To restore a snapshot, use the [volume snapshot restore](#) on page 2731 command.

**Syntax****CLI**

```
/opt/mapr/bin/maprcli volume snapshot
restorestatus
  [ -cluster <cluster> ]
  [ -volume <volume name> ]
  [ -verbose <true/false> ]
```

**REST**

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/volume/snapshot/restorestatus[?<parameters>]

**Parameters**

Parameter	Description
cluster	The cluster on which to run the command. This parameter is not mandatory. If not specified, the current cluster is used by default.
volume	The name of the volume that is being restored from a snapshot.
verbose	Displays container statistics in addition to percentage.

**Examples****CLI**

The following example command displays the status of the snapshot restore operation on a volume named vol2. See the example in [volume snapshot restore](#) on page 2731 for the command that triggered the snapshot restore operation.

```
/opt/mapr/bin/maprcli volume snapshot
restorestatus -volume vol2 -json
{
  "timestamp":1549970683260,
  "timeofday":"2019-02-12
```

```
11:24:43.260 GMT+0000 AM",
  "status": "OK",
  "total": 1,
  "data": [
    {
      "targetsnapshot": "s3",
      "progress": "100%"
    }
  ]
}
```

**REST**

```
curl -X
GET 'https://server.sj.us:8443/
rest/volume/snapshot/restorestatus?
volume=vol2' --user
<username>:<password>
```

The following command displays the container statistics of volume `vol2` using the `verbose` flag.

**CLI**

```
/opt/mapr/bin/maprcli volume snapshot
restorestatus -volume vol2 -verbose
true -json
{
  "timestamp": 1549970690705,
  "timeofday": "2019-02-12
11:24:50.705 GMT+0000 AM",
  "status": "OK",
  "total": 1,
  "data": [
    {
      "targetsnapshot": "s3",
      "progress": "100%",
      "numcontainerstotal": 6,

      "numcontainersinprogress": 0,
      "numcontainerssuccess": 6,

      "numcontainersinretrywait": 0
    }
  ]
}
```

**REST**

```
# curl -X GET 'https://abc.sj.us:8443/
rest/volume/snapshot/restorestatus?
volume=vol2&verbose=true' --user
<username>:<password>
```

**Related tasks**

[Restoring Volume Snapshots Using the Control System](#) on page 1268

Describes how to restore snapshots of volumes using the Control System.

**Related reference**

[volume snapshot restore](#) on page 2731

Restores a volume from a snapshot using the CLI.

**insight**

Describes the `maprcli insight` command to enable insights and get information related to insights.

**Syntax**

The `insight` command is used to manage the retrieval and pushing of audit log data by the insight service. The insight service retrieves and pushes audit log data related to MFS, CLDB, auth, and S3 services to Apache Iceberg tables. The data in the Apache Iceberg tables can be used for analysis related to anomalies in user behavior, such as authentication, authorization, file operations. Audit log data related to the individual services, MFS, CLDB, auth and S3, can be selectively pushed to Apache Iceberg tables.

Other operations related to insight data such as listing and specifying the retention period can be performed by using the `insight` command.

```
maprcli insight
cluster
  [ -enable set true/false ]
  [ -nodes node names space separated ]
  [ -type audit type [mfs, s3, auth, cldb] ]

info
  [ -nodes node names space separated ]
  [ -type audit type [mfs, s3, auth, cldb] ],
  [ -purge true/false ]

purge
  [ -retentionDays set retention days ]
```

See the individual subcommand help for details related to each subcommand.

**MinIO Client (mc) Commands**

Lists `mc` commands that you can use to perform operations, such as creating and editing buckets and accounts in HPE Ezmeral Data Fabric Object Store.

HPE Ezmeral Data Fabric Object Store provides MinIO client commands that you run from `/opt/mapr/bin/`, as shown in the following example:

```
/opt/mapr/bin/mc ls --recursive salesobject -json

//Lists all buckets recursively from the Object Store deployment with alias
salesobject.
```

**TIP:**

- A user cannot run the `mc` commands until the user's access to the `mc` commands is enabled, as described in [Enabling the HPE Ezmeral Data Fabric Object Store](#) on page 209.
- The following `mc` commands operate on delete markers or versioned objects when used with the `--versions` or `--version-id` option:
  - [mc cp](#) on page 2802
  - [mc ls](#) on page 2789
  - [mc rm](#) on page 2800

Use the following `mc` commands to manage accounts and resources in HPE Ezmeral Data Fabric Object Store:

**mc alias**

Creates and manages user and service aliases.

**mc alias set**

Sets a user or service alias.

**NOTE:** By default, the API server uses `https://` for URLs. To make `https://` work, run:

```
cp /opt/mapr/conf/ca/chain-ca.pem to the user's ~/.mc/certs/CAs/
directory
```

**Syntax****CLI**

```
mc alias set ALIAS URL ACCESSKEY
SECRETKEY

FLAGS:
  --path value
  bucket path lookup supported by the
  server. Valid options are '[auto, on,
  off]' (default: "auto")
  --api value
  API
  signature. Valid options are '[S3v4,
  S3v2]'
```

--config-dir value, -C value path
 to configuration folder (default: "/"
 root/.mc")
 --quiet, -q
 disable progress bar display
 --no-color
 disable color theme
 --json
 enable JSON lines formatted output
 --debug
 enable debug output
 --insecure
 disable SSL certificate verification
 --help, -h
 show
 help

**Parameters**

Parameters	Description
ALIAS	<p>The name to associate to the user or service.</p> <p>The specified string cannot match any existing host aliases. Use the alias list command to view the current host aliases before adding a new host.</p> <p>This parameter is mandatory.</p>
URL	<p>The URL for the Object Store endpoint.</p> <p>This parameter is mandatory.</p>
ACCESSKEY	<p>The access key for authenticating to the Object Store service. The ACCESSKEY must correspond to a user or role on the Object Store service.</p> <p>This parameter is mandatory.</p>

Parameters	Description
SECRETKEY	The corresponding secret for the specified ACCESSKEY.
path	Use DNS or path style URL for bucket lookups. The valid value is one of: <ul style="list-style-type: none"> <li>on: use path style URL for bucket lookup</li> <li>off: Use DNS for bucket lookup</li> <li>auto: Allow the command to automatically determine the appropriate style to use.</li> </ul> Default: auto
api	The Amazon S3 signature version to use when connecting to the Object Store service. The valid value is one of: <ul style="list-style-type: none"> <li>s3v2: use path style URL for bucket lookup</li> <li>s3v4</li> </ul> Default: s3v4
config-dir	The path to the configuration folder. Default: /root/.mc
quiet	Disables progress bar display.
no-color	Disables color in the output.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

### Examples

1. Alias a user with access key A7363534 and secret key S42525252 to the finance service endpoint:

CLI

```
/opt/mapr/bin/mc alias
set finuser https://
findept.storage.beamraft.com:9000
A7363534 S42525252 -json
```

2. Add the Object Store service under the salesobject alias, to use DNS style bucket lookup:

CLI

```
mc alias set salesobject https://
localhost:9000 minio minio123 --api
"s3v4" --path "off" -json
```

### mc alias list

Lists all aliases.

**CLI**

```
mc alias list [ALIAS]

FLAGS:
  --config-dir value, -C value path
to configuration folder (default: "/
root/.mc")
  --quiet, -q
disable progress bar display
  --no-color
disable color theme
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h show
help
```

**Parameters**

Parameters	Description
ALIAS	The alias to list. Without this parameter, the command lists all aliases.
config-dir	The path to the configuration folder. Default: /root/.mc
quiet	Disables progress bar display
no-color	Disables color in the output
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

**Examples**

1. List all aliases:

**CLI**

```
/opt/mapr/bin/mc alias list
```

2. List a specific alias called financedept:

**CLI**

```
/opt/mapr/bin/mc alias list
financedept
```

**mc alias remove**  
Removes an alias.

**CLI**

```
mc alias remove ALIAS

FLAGS:
  --config-dir value, -C value path
to configuration folder (default: "/
root/.mc")
  --quiet, -q
disable progress bar display
  --no-color
disable color theme
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h show
help
```

**Parameters**

Parameters	Description
ALIAS	The alias to remove. This parameter is Mandatory.
config-dir	The path to the configuration folder. Default: /root/.mc
quiet	Disables progress bar display
no-color	Disables color in the output
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

**Examples**

Remove an alias `financedept`.

**CLI**

```
/opt/mapr/bin/mc alias remove
financedept
```

**mc admin account**

Creates and manages accounts.

**mc admin account create**

Creates an account.

The mc administrator runs this command to create accounts.

**NOTE:** Any account other than `default` account is disallowed in case of a global namespace.

**Syntax****CLI**

```
mc admin account create TARGET
account_name [ domain=<domain_name> ]
[ admin=<user_name> ] \
  [ storage_class="key1:
  val1,key2: val2" ]
[ default_bucket_policy=<json_file> ]
\
  [ access_controls=<json_file> ]

account_name:
  Name of the account to be created

domain:
  The domain in which the account
  needs to be created

admin:
  The LDAP username to be designated
  as the account root. Default: cluster
  admin (mapr)

storage_class keys:
  quota      : <x> (in MB)
  advisory_quota : <y> (in MB)
  label      : <storage_label>
  metaLabel  : <storage_label>
for megta data containers>
  ecLabel    : <storage label
for ec volume>
  ec_scheme  : <data_parity +
global_parity [+local_parity]
  min_repl   : <minimum repl
factor>
  desired_repl : <desired repl
factor>
  topology   : <topology>
  ecTopology : <topology for ec
volume>
  dareEnabled : <Data at Rest
Encryption>

FLAGS:
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h          show
help
```

**Parameters**

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command creates the account. This parameter is mandatory.

Parameter	Description
account_name	The name of the account to create. This parameter is mandatory.
domain	The name of the domain under which the account must be created.
admin	The name of the LDAP user to designate as the account administrator. By default, the <code>mapr</code> user is the administrator, till you create your own admin user.
storage_class	Optional storage parameters to be specified as key-value pairs for the account. HPE Ezmeral Data Fabric creates bucket volumes using these parameters.
default_bucket_policy	The bucket policy to set as default for the account.
access_control	Specifies who can manage users/groups/policies/keys in this account.   <b>NOTE:</b> For in-depth information on access controls, read <a href="#">Administering Account Resources</a> on page 570.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

## Examples

1. Create an account `sales` in the Object Store deployment with alias `salesobject`:

CLI

```
/opt/mapr/bin/mc admin account
create salesobject sales
```

2. Create an account `sales` in the Object Store deployment with alias `salesobject`, with specific storage class values:

CLI

```
/opt/mapr/bin/mc admin account
create salesobject sales
storage_class="label=hdd,quota=42894
1,ec_scheme=6+2+2"
```

### mc admin account delete

Deletes an account.

The Object Store administrator runs this command to delete accounts. An account is deleted only if there are no users, buckets or buckets under it.

### Syntax

CLI

```
mc admin account delete - delete
account
```

USAGE:

```
mc admin account delete TARGET
account_name [ domain=<domain_name> ]

account_name:
  Name of the account that needs to
  be deleted

domain:
  The domain to which the account
  belongs.

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help
```

### Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store deployment from which the command deletes the account. This parameter is mandatory.
account_name	The name of the account to delete. This parameter is mandatory.
domain	The name of the domain to which the account being deleted belongs.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

### Examples

1. Delete an account `sales` from the Object Store deployment with alias `salesobject`:

CLI

```
mc admin account delete
salesobject 'sales'
```

2. Delete an account `sales` in the Object Store deployment with alias `salesobject`, from the domain `north_america`:

CLI

```
mc admin account
delete salesobject sales
domain=north-america
```

### mc admin account modify

Modifies an account for a domain.

The Object Store administrator runs this command to modify accounts.

**NOTE:** You cannot modify storage class options with this command. Use the [mc admin account modify-storageclass](#) command to modify the storage class options.

After you modify the default bucket policy for the account, then all the new buckets that get created from that moment will inherit the modified policy. Existing buckets will continue to use the old bucket policy.

## Syntax

### CLI

```
mc admin account modify TARGET
account_name [ domain=<domain_name> ]
[ admin=<user_name> ] \

[ default_bucket_policy=<json_file> ]
[ access_controls=<json_file> ]

account_name:
    The account whose meta data needs
    to be modified

FLAGS:
    --json
    enable JSON lines formatted output
    --debug
    enable debug output
    --insecure
    disable SSL certificate verification
    --help, -h          show
    help
```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store deployment on which the command modifies an account. This parameter is mandatory.
account_name	The name of the account to modify. This parameter is mandatory.
domain	The name of the domain under which the account must be modified.
admin	The name of the LDAP user to designate as the new account administrator. By default, the <code>mapr</code> user is the cluster administrator and the administrator of all accounts.
default_bucket_policy	The bucket policy to set as default for all buckets in the account.
access_control	The access control list to set for all resources in the account.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification

Parameter	Description
help	Shows this help

**Example**

Set the root/admin of the account *sales* in the Object Store deployment with alias *salesobject* to LDAP user *joe*:

**CLI**

```
mc admin account modify salesobject
sales admin=joe
```

**mc admin account modify-storageclass**

Modifies storage class parameters for an account.

The Object Store administrator runs this command to modify storage class parameters for an account.

**NOTE:** To modify all other account parameters, see the [mc admin account modify](#) on page 2742 command.

**Syntax****CLI**

```
mc admin account
modify-storageclass TARGET
account "key1:value1,key2:value2"
[ domain=<domain_name> ]

account:
  The account whose storage class
  arguments need to be modified.

keys:
  quota           : <x> (in MB)
  advisory_quota  : <y> (in MB)
  label           : <storage_label>
  metaLabel       : <storage_label
for megta data containers>
  ecLabel         : <storage label
for ec volume>
  ec_scheme       : <data_parity +
global_parity [+local_parity]
  min_repl        : <minimum repl
factor>
  desired_repl    : <desired repl
factor>
  topology        : <topology>
  ecTopology      : <topology for ec
volume>
  dareEnabled     : <Data at Rest
Encryption>

FLAGS:
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h          show
help
```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store deployment on which the command modifies the storage class. This parameter is mandatory.
account_name	The name of the account to modify. This parameter is mandatory.
storage_class	The storage parameters to be specified as key-value pairs for the account. See <a href="#">quota</a> , <a href="#">advisory quota</a> , <a href="#">label</a> , <a href="#">EC scheme</a> , <a href="#">minimum replication factor</a> , and the <a href="#">desired replication factor</a> for explanations.
domain	The name of the domain under which the account must be modified.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

### Example

Modify desired replication factor to 5 for the account *sales* in the Object Store deployment with alias *salesobject*.

#### CLI

```
mc admin account modify-storageclass
salesobject sales "desired_repl:5"
```

### mc admin account list

Lists all accounts for a domain.

### Syntax

#### CLI

```
mc admin account list TARGET
[ domain=<domain_name> ]

domain:
  The domain whose accounts need to
  be listed

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help
```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store for which the command lists accounts. This parameter is mandatory.
domain	The name of the domain for which the accounts must be listed. Without this parameter, only accounts in the primary domain are listed.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

## Examples

- List all accounts in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin account list
salesobject
```

- List all accounts in the Object Store deployment with alias *salesobject* for the domain *sales*:

CLI

```
/opt/mapr/bin/mc admin account list
salesobject domain='sales'
```

### mc admin account info

Lists account information for a specified account.

## Syntax

CLI

```
mc admin account info - list the info
of an account
```

USAGE:

```
mc admin account info TARGET
account [ domain=<domain_name> ]
```

account:

The account whose info needs to be fetched and displayed

FLAGS:

```
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h          show
help
```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the account exists. This parameter is mandatory.
account	The account for which to retrieve the information. This parameter is mandatory.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

## Examples

Display information for the account *sales* under the domain *north\_america* in the Object Store deployment with alias *salesobject*.

### CLI

```
/opt/mapr/bin/mc admin account
info salesobject sales
domain=north_america -json
```

## mc admin audit

Describes how S3 auditing works in HPE Ezmeral Data Fabric Object Store. Provides the command for bucket and account operations auditing. Also provides the command to view the audit status of bucket and account operations.

Starting in HPE Ezmeral Data Fabric 7.3.0, Object Store supports auditing of S3 operations at the global, account, and bucket levels. You can run the `mc admin audit set alias` command to set auditing flags at each level. Flags are disabled by default.

The following table lists the flag levels with descriptions:

Flag Level	Description	Operations Audited	Supported Flags
Global	Controls all levels of auditing. When enabled, this flag audits operations on the MOSS server, accounts, and buckets. When disabled, no operations are audited.	<ul style="list-style-type: none"> <li>Create account</li> <li>Delete account</li> <li>Changes to account properties</li> </ul>	auditable
Account	Controls auditing of operations at the account level. When enabled, operations on accounts are audited.  Use <code>forceauditable</code> to override the global audit setting for accounts.  When the <code>forceauditable</code> flag is enabled at the account level, all operations at the account and bucket levels are audited regardless of the bucket level audit setting. For example, if the <code>auditable</code> flag is disabled at the bucket level, all account-level and bucket-level operations are audited.	<ul style="list-style-type: none"> <li>IAM operations: <ul style="list-style-type: none"> <li>Create users/groups/policies</li> <li>Delete users/groups/policies</li> <li>Edit users/groups/policies</li> </ul> </li> </ul>	auditable, forceauditable

Flag Level	Description	Operations Audited	Supported Flags
Bucket	Controls auditing at the bucket level. When enabled, operations on buckets are audited.	<ul style="list-style-type: none"> <li>• Create object</li> <li>• Delete object</li> <li>• Changes to object properties</li> </ul>	auditenable

You can also run the `mc admin audit info alias` command to get the audit status of buckets and accounts.

### Audit Logs

The CLDB creates a volume for audit records when the first MOSS server registers with the cluster. When the MOSS server starts, it creates a folder in the audit volume that stores audit logs for each node:

```
/var/mapr/local/mapr.s3.audit/
```

For example:

```
# hadoop fs -ls /var/mapr/local/mapr.s3.audit/
drw-r--r--  - mapr mapr          1 2023-04-11 07:25 /var/mapr/local/
mapr.s3.audit/<FQDN-1>
drw-r--r--  - mapr mapr          0 2023-04-11 07:22 /var/mapr/local/
mapr.s3.audit/<FQDN-2>
drw-r--r--  - mapr mapr          0 2023-04-11 07:22 /var/mapr/local/
mapr.s3.audit/<FQDN-3>
drw-r--r--  - mapr mapr          0 2023-04-11 07:22 /var/mapr/local/
mapr.s3.audit/<FQDN-4>
```

### Audit Commands

The following topics provide the commands to enable auditing of account and bucket operations in HPE Ezmeral Data Fabric Object Store:

#### mc admin audit

Enables and disables auditing for HPE Ezmeral Data Fabric Object Store operations.

#### Syntax

##### CLI

```
mc admin audit set alias \
  [ bucket=<bucket name> ]
  [ account=<account name> ] \
  [ auditenable=<true/false> ]
  [ forceauditenable=<true/false> ] \
  [ retentionPeriod=<days> ]
  [ alaramingAuditVolumeSize=<size in
mb> ]

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help
```

## Parameters

Parameter	Description
bucket	Bucket on which to set the <code>auditenable</code> flag.
account	Account on which to set the <code>auditenable</code> or <code>forceauditenable</code> flag.
global	If both the account and bucket are not specified, auditing is applied globally.
auditenable	Sets auditing at the global, account, or bucket level.
forceauditenable	Forces auditing at the account level only. Overrides the global audit setting.
retentionPeriod	Specifies the number of days to retain the audit logs.
alarmingAuditVolumeSize	Specifies the size (MB) limit for the audit volume. When the limit is reached, the system raises an alarm.

## Examples

CLI

Enable auditing of operations at the global level (to audit account and bucket operations):

```
mc admin audit set alias
auditenable=true retentionPeriod=10
```

CLI

Disable auditing on account operations only:

```
mc admin audit set alias
account='sales' forceauditenable=false
```

CLI

Enable auditing on bucket operations:

```
mc admin audit set alias
bucket='mybucket' auditenable=true
retentionPeriod=20
```

### mc admin audit info

Lists the audit status for global, bucket, and account level.

## Syntax

CLI

```
mc admin audit info
alias [ bucket=<bucket name> ]
[ account=<account name> ]

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help
```

## Parameters

Parameter	Description
bucket	Displays the <code>auditenable</code> flag status for the bucket specified.
account	Displays the <code>auditenable</code> and <code>forceauditenable</code> flag status for the account specified.
None.	If no parameter is specified, displays the status of global level auditing.

## Examples

### CLI

Shows the `auditenable` flag status for a bucket named `mybucket`:

```
mc admin audit info
alias --bucket='mybucket'
```

### CLI

Shows the `auditenable` and `forceauditenable` flag status for an account named `myaccount`:

```
mc admin audit info
alias --account='myaccount'
```

## **mc admin policy**

Creates and manages user and group policies .

### **mc admin policy add**

Creates accounts, domains, and user policies.

The Object Store administrator runs this command to create a policy. The command throws an error if the policy already exists.

## Syntax

### CLI

```
mc admin policy add TARGET POLICYNAME
POLICYFILE account=<account_name>

                        domain=<domain_name>
POLICYNAME:
    Name of the canned policy on the
    HPE Object Store server.

POLICYFILE:
    Name of the policy file associated
    with the policy name.

FLAGS:
    --json
    enable JSON lines formatted output
    --debug
    enable debug output
    --insecure
    disable SSL certificate verification
    --help, -h          show
    help
```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command creates or updates a policy. This parameter is mandatory.
POLICYNAME	The name of the policy to create or update. This parameter is mandatory.
POLICYFILE	The file in JSON format containing the policy. This parameter is mandatory.
account	The account to which this policy applies.
domain	The domain to which this policy applies.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

## Examples

1. Create the *listbuckets* policy that is in the file */tmp/listbuckets.json* in the Object Store deployment with alias *salesobject*.

### CLI

```
mc admin policy add salesobject
listbuckets /tmp/listbuckets.json
```

2. Create the *listbuckets* policy that is in the file */tmp/listbuckets.json* in the Object Store deployment with alias *salesobject*, and applicable to the domain *primary*:

### CLI

```
mc admin policy add salesobject
listbuckets /tmp/listbuckets.json
domain=primary -json
```

## mc admin policy update

Updates accounts, domains, and user policies.

The Object Store administrator runs this command to update a policy. The command throws an error if the policy does not exist.

## Syntax

### CLI

```
mc admin policy update TARGET
POLICYNAME POLICYFILE
account=<account_name>

                domain=<domain_name>
POLICYNAME:
    Name of the canned policy on the
    HPE Object Store server.
POLICYFILE:
    Name of the policy file associated
```

with the policy name.

```

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help

```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command updates a policy. This parameter is mandatory.
POLICYNAME	The name of the policy to update. This parameter is mandatory.
POLICYFILE	The file in JSON format containing the policy. This parameter is mandatory.
account	The account to which this policy applies.
domain	The domain to which this policy applies.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

## Examples

1. Updates the *listbuckets* policy that is in the file */tmp/listbuckets.json* in the Object Store deployment with alias *salesobject*.

### CLI

```
mc admin policy update salesobject
listbuckets /tmp/listbuckets.json
```

2. Update the *listbuckets* policy that is in the file */tmp/listbuckets.json* in the Object Store deployment with alias *salesobject*, and applicable to the domain *primary*:

### CLI

```
mc admin policy update salesobject
listbuckets /tmp/listbuckets.json
domain=primary -json
```

## mc admin policy remove

Removes a policy.

The Object Store administrator runs this command to remove a policy. A policy can only be removed if it is not attached to any user or group.

## Syntax

### CLI

```
mc admin policy remove TARGET
POLICYNAME [ account=<account_name> ]
[ domain=<domain_name> ]

POLICYNAME:
  Name of the policy to be removed.

account:
  Name of the account to which
  the policy belongs. Default Value:
  'default'

domain:
  Name of the domain to which the
  policy and account belong. Default
  Value: 'primary'

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help
```

### Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store from which the command removes a policy. This parameter is mandatory.
POLICYNAME	The name of the policy to remove. This parameter is mandatory.
account	The account in which this policy was created.
domain	The domain to which this policy account belongs.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

### Examples

1. Remove the *listbuckets* policy from the Object Store deployment with alias *salesobject*:

#### CLI

```
mc admin policy remove salesobject
listbuckets
```

2. Remove the *listbuckets* policy from the Object Store deployment with alias *salesobject*, which is applicable to the domain *primary* and account *northamerica*:

**CLI**

```
mc admin policy remove salesobject
listbuckets domain='primary'
account='northamerica' -json
```

**mc admin policy list**

List all policies.

**Syntax****CLI**

```
mc admin policy list - list all
policies

USAGE:
  mc admin policy list
TARGET [ account=<account_name> ]
[ domain=<domain_name> ]

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help
```

**Parameters**

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store from which to retrieve the policies. This parameter is mandatory.
account	The account from which to retrieve the list of policies. Omitting this parameter, lists only IAM policies present in the default account.
domain	The domain from which to retrieve the list of policies.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

**Examples**

1. List all IAM policies on the Object Store deployment with alias *salesobject*. The policies are listed from the *primary* domain for the *default* account:

**CLI**

```
mc admin policy list salesobject
```

2. List all IAM policies for the domain *primary* from the Object Store deployment with alias *salesobject* for the *default* account:

**CLI**

```
mc admin policy list salesobject
domain='primary'
```

- List all policies for the domain *primary* from the Object Store deployment with alias *salesobject* for the *northamerica* account:

**CLI**

```
mc admin policy list
salesobject domain='primary'
account='northamerica'
```

**mc admin policy info**

Returns information for a specified policy, along with the users and groups to which the policy is attached.

**Syntax****CLI**

```
mc admin policy info - show info on a
policy
```

**USAGE:**

```
mc admin policy info TARGET
POLICYNAME [ account=<account_name> ]
[ domain=<domain_name> ]
```

**POLICYNAME:**

Name of the policy on the Object Store server.

**FLAGS:**

```
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h          show
help
```

**Parameters**

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store from which the command retrieves policy information. This parameter is mandatory.
POLICYNAME	The name of the policy for which to retrieve the information. This parameter is mandatory.
account	The account to which this policy belongs.
domain	The domain to which this policy account belongs.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

## Examples

1. Display the information for the *listbuckets* policy from the Object Store deployment with alias *salesobject*.

CLI

```
mc admin policy info salesobject
listbuckets
```

2. Display the information for the *listbuckets* policy from the Object Store deployment with alias *salesobject*, which is applicable to the domain *primary*:

CLI

```
mc admin policy info salesobject
listbuckets domain='primary' -json
```

## mc admin policy set

Sets a policy for a user or a group.

## Syntax

CLI

```
mc admin policy set - set IAM policy
on a user or group
```

### USAGE:

```
mc admin policy set TARGET
POLICYNAME [ users=user1,user2 ]
[ groups=group1,
group2 ] [ account=<account_name> ]
[ domain=<domain_name> ]
[ principalsaccount=<user/group
account> ]
```

### POLICYNAME:

Name of the policy on the MinIO server.

### users:

List of users to which the policy must be attached.

### groups:

List of Groups to which the policy must be attached.

### account:

Name of the account whose policy is being attached.

### domain:

Name of the domain to which the account belongs.

### principalsaccount:

Name of the account of the users or groups, if it is different from the policy's account.

Currently, the allowed value for this is 'default'.

```

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help

```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command sets the policy. This parameter is mandatory.
POLICYNAME	The name of the policy to set. This parameter is mandatory.
users	Comma separated list of users to which the policy must be set. Specify either a user or a group (using the <code>groups</code> parameter), or both.
groups	Comma separated list of groups to which the policy must be set. Specify either a user (using the <code>users</code> parameter) or a group or both.
account	Name of the account where the policy is created.
domain	Name of the domain to which account belongs.
principalsaccount	Name of the account of the users or groups, if different from the policy's account. Currently, the allowed value for this is default.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

## Examples

1. Set the `listbuckets` policy for users `james` and `daniel` on the Object Store deployment with alias `salesobject`.

### CLI

```

/opt/mapr/bin/mc admin policy
set salesobject listbuckets
users='james,daniel' -json

```

2. Set the `listbuckets` policy for users `james` and `daniel` in account `naphthara` on the Object Store deployment with alias `salesobject`.

### CLI

```

/opt/mapr/bin/mc admin
policy set salesobject
listbuckets users='james,daniel'
account='naphthara' -json

```

**mc admin policy unset**

Detaches a policy from a user or a group.

**Syntax****CLI**

```
mc admin policy unset TARGET
POLICYNAME [ users=user1,user2 ]
[ groups=group1,
group2 ] [ account=<account_name> ]
[ domain=<domain_name> ]
[ principalsaccount=<user/group
account> ]
```

**POLICYNAME:**

Name of the policy to be detached.

**users:**

List of users from which the policy must be detached.

**groups:**

List of groups from which the policy must be detached.

**account:**

Name of the account to which the policy belongs.

**domain:**

Name of the domain to which the account belongs.

**principalsaccount:**

Name of the account of the users or groups, if it is different from the policy's account.

Currently, the only allowed value is 'default'.

**FLAGS:**

```
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h          show
help
```

**Parameters**

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store from which the command detaches the policy. This parameter is mandatory.
POLICYNAME	The name of the policy to detach. This parameter is mandatory.

Parameter	Description
users	Comma separated list of users from which the policy must be detached. Specify either a user or a group (using the <code>groups</code> parameter), or both.
groups	Comma separated list of groups from which the policy must be detached. Specify either a user (using the <code>users</code> parameter) or a group or both.
account	Name of the account whose policy is being detached.
domain	Name of the domain to which account belongs.
principalsaccount	Name of the account of the users or groups, if different from the policy's account. Currently, the allowed value for this is <code>default</code> .
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

### Examples

1. Detaches the `listbuckets` policy from users `james` and `daniel` on the Object Store deployment with alias `salesobject`:

CLI

```
/opt/mapr/bin/mc admin policy
unset salesobject listbuckets
users='james,daniel'
```

2. Detaches the `listbuckets` policy from users `james` and `daniel` in account `naphthara` on the Object Store deployment with alias `salesobject`:

CLI

```
/opt/mapr/bin/mc admin
policy unset salesobject
listbuckets users='james,daniel'
account='naphthara'
```

### mc version

Manages bucket versioning.

### mc version enable

Enables versioning for a bucket.

### Syntax

CLI

```
mc version enable TARGET

FLAGS:
--json          enable JSON lines
                formatted output
--debug         enable debug output
--insecure      disable SSL certificate
                verification
--help, -h     show help
```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command enables versioning. This parameter is mandatory.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

## Examples

1. Enable versioning on bucket *northamerica* in the Object Store deployment with alias *salesobject*:

### CLI

```
/opt/mapr/bin/mc version enable
salesobject/northamerica
```

### mc version suspend

Suspends versioning for a bucket.

## Syntax

### CLI

```
mc version suspend TARGET

FLAGS:
  --json      enable JSON lines
              formatted output
  --debug     enable debug output
  --insecure  disable SSL certificate
              verification
  --help, -h  show help
```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command suspends versioning. This parameter is mandatory.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

## Examples

1. Suspend versioning on bucket *northamerica* in the Object Store deployment with alias *salesobject*:

**CLI**

```
/opt/mapr/bin/mc version suspend
salesobject/northamerica
```

**mc version info**

Query the status of versioning for a bucket.

**Syntax****CLI**

```
mc version info TARGET

FLAGS:
  --json          enable JSON lines
                  formatted output
  --debug         enable debug output
  --insecure      disable SSL certificate
                  verification
  --help, -h     show help
```

**Parameters**

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command queries versioning. This parameter is mandatory.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

**Examples**

1. Query versioning on bucket *northamerica* in the Object Store deployment with alias *salesobject*:

**CLI**

```
/opt/mapr/bin/mc version info
salesobject/northamerica
```

**mc admin user**

Creates and manages users for each account.

**mc admin user add**

Adds a user to an account.

The Object Store administrator runs this command to add both IAM users to accounts and domain users to the `default` account.

**NOTE:** IAM users cannot be added to the `default` account.

**Syntax****CLI**

```
mc admin user add - add a new user
```

```

USAGE:
  mc admin user add TARGET
  USERNAME [ account=<account_name> ]
  [ domain=<domain_name> ]

USERNAME:
  Name of the user to be created.

account:
  Name of the account in which the
  user needs to be created

domain:
  Name of the domain in which the
  said account is present.

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help

```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command adds the user. This parameter is mandatory.
USERNAME	The user name to add. This parameter is mandatory.
account	The name of the account to which to add the user.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

### Example

Add a user *joe* to the *northamerica* account in the Object Store deployment with alias *salesobject*.

#### CLI

```

/opt/mapr/bin/mc admin user
add salesobject joe
account='northamerica' -json

```

### **mc admin user addgroups**

Adds IAM groups to a IAM user.

The Object Store administrator runs this command to add IAM groups to IAM users.

## Syntax

### CLI

```
mc admin user
addgroups TARGET USERNAME
GROUPS [ account=<account_name> ]
[ domain=<domain_name> ]

USERNAME:
  The user to whom new groups need to
  be added.

GROUPS:
  List of comma separated groups to
  be added to the user.

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help
```

### Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command adds the groups. This parameter is mandatory.
USERNAME	The user name to which the groups must be added. This parameter is mandatory.
GROUPS	The comma separated list of groups to add. This parameter is mandatory.
account	The name of the account to which to the user belongs.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

### Example

Add groups *firestorm* and *freezone* to a user *joe* in the *northamerica* account in the Object Store deployment with alias *salesobject*.

### CLI

```
/opt/mapr/bin/mc admin user addgroups
salesobject joe 'firestorm,freezone'
account='northamerica'
```

### mc admin user removegroups

Removes IAM groups from IAM users.

The Object Store administrator runs this command to remove IAM groups from IAM users.

## Syntax

### CLI

```
mc admin user removegroups - remove
group of a user

USAGE:
  mc admin user
  removegroups TARGET USERNAME
  GROUPS [ account=<account_name> ]
  [ domain=<domain_name> ]

USERNAME:
  The user whose groups need to be
  removed.

GROUPS:
  List of comma separated groups to
  be removed from the user.

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help
```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command removes the groups. This parameter is mandatory.
USERNAME	The user name from which the groups must be removed. This parameter is mandatory.
GROUPS	The comma separated list of groups to remove. This parameter is mandatory.
account	The name of the account to which the user belongs.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

## Example

Remove groups *firestorm* and *freezone* from a user *joe* in the *northamerica* account in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc admin user
removegroups salesobject
joe 'firestorm,freezezone'
account='northamerica'
```

**mc admin user disable**

Disables an IAM user account.

The Object Store administrator runs this command to disable an IAM user. Disabled users cannot manage their keys nor can they login to the Object Store.

**Syntax****CLI**

```
mc admin user disable TARGET USERNAME
account=<account name> domain=<domain
name>

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help
```

**Parameters**

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command disables the user. This parameter is mandatory.
USERNAME	The user name to disable. This parameter is mandatory.
account	The name of the account in which the user exists. This parameter is mandatory.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

**Example**

Disable a user *joe* in the *northamerica* account in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc admin user disable
salesobject joe account='northamerica'
```

**mc admin user enable**

Enables an IAM user account.

The Object Store administrator runs this command to enable a user.

## Syntax

### CLI

```
mc admin user enable TARGET
USERNAME [account=<account name>
domain=<domain name>]

FLAGS:
  --json
    enable JSON lines formatted output
  --debug
    enable debug output
  --insecure
    disable SSL certificate verification
  --help, -h
    show help
```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command enables the user. This parameter is mandatory.
USERNAME	The user name to enable. This parameter is mandatory.
account	The name of the account in which the user exists.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

## Example

Enable a user *joe* in the *northamerica* account in the Object Store deployment with alias *salesobject*.

### CLI

```
/opt/mapr/bin/mc admin user enable
salesobject joe account='northamerica'
```

## mc admin user remove

Removes an IAM user account.

The Object Store administrator runs this command to remove an IAM user. On removal, the ownership of the resources belonging to the user is transferred to the administrator of the account to which the user belongs.

## Syntax

### CLI

```
mc admin user remove TARGET
USERNAME [account=<account name>
domain=<domain name>]
```

```

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help

```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command removes the user. This parameter is mandatory.
USERNAME	The user name to remove. This parameter is mandatory.
account	The name of the account in which the user exists.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

## Example

1. Removes a user *joe* from the *northamerica* account in the Object Store deployment with alias *salesobject*.

### CLI

```

/opt/mapr/bin/mc admin user
remove salesobject joe
account='northamerica'

```

## mc admin user list

Lists all users belonging to an account.

## Syntax

### CLI

```

mc admin user list - list all users

USAGE:
  mc admin user list
  TARGET [account=<account name>
  domain=<domain name>]

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure

```

```

disable SSL certificate verification
--help, -h                               show
help

```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store from which the command lists the user. This parameter is mandatory.
account	The name of the account from which to list users. The account is assumed to be the <code>default</code> account, if you do not specify this parameter.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

## Examples

1. List all users from the `default` account in the Object Store deployment with alias `salesobject`.

### CLI

```

/opt/mapr/bin/mc admin user list
salesobject

```

2. List all users from the `northamerica` account in the Object Store deployment with alias `salesobject`.

### CLI

```

/opt/mapr/bin/mc admin user list
salesobject account='northamerica'

```

## mc admin user info

Displays information for a specified user.

## Syntax

### CLI

```

mc admin user info TARGET
USERNAME [account=<account name>
domain=<domain name>]

FLAGS:
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h                               show
help

```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store from which the command retrieves the user information. This parameter is mandatory.
USERNAME	The user name for which to retrieve the information. This parameter is mandatory.
account	The name of the account to which the user belongs. The account is assumed to be the <code>default</code> account, if you do not specify this parameter.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

## Examples

- List user information for user *joe* from the `default` account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin user info
salesobject joe
```

- List user information for user *joe* from the `northamerica` account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin user
info salesobject joe
account='northamerica'
```

### mc admin creds

Creates and manages access keys for users

#### mc admin creds add-access-key

Creates the access key for a user.

The Object Store administrator runs this command to create the access key for a user. Every user can have a maximum of two keys at any time.

## Syntax

CLI

```
mc admin creds add-access-key - add a
new access key for user
```

USAGE:

```
mc admin creds add-access-key
TARGET user=<user_name>
[ account=<account_name> ]
[ domain=<domain_name> ]
```

```

user:
  User whose access key needs to be
  added

account:
  The account to which the user
  belongs.

FLAGS:
  --config-dir value, -C value path
  to configuration folder (default: "/
  root/.mc")
  --quiet, -q
  disable progress bar display
  --no-color
  disable color theme
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help

```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command creates the access key. This parameter is mandatory.
user	The user name for which the access key needs to be created. This parameter is mandatory.
account	The name of the account to which the user belongs. The account is assumed to be the <code>default</code> account, if you do not specify this parameter.
domain	The name of the domain under which the account exists.
config-dir	Path to the configuration directory ( <code>/root/.mc</code> by default)
quiet	Disables progress bar display
no-color	Disables color in the output
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

## Examples

1. Create the access key for user *joe* from the `default` account in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc admin creds
add-access-key salesobject joe -json
```

2. Create the access key for user *joe* from the *northamerica* account in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc admin creds
add-access-key salesobject joe
account='northamerica' -json
```

**mc admin creds delete-access-key**

Delete the access key for a user.

The Object Store administrator runs this command to delete the access key for a user.

**Syntax****CLI**

```
mc admin creds delete-access-key
TARGET access-key

user:
  Access key that needs to be deleted

FLAGS:
  --config-dir value, -C value path
to configuration folder (default: "/
root/.mc")
  --quiet, -q
disable progress bar display
  --no-color
disable color theme
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h show
help
```

**Parameters**

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command deletes the access key. This parameter is mandatory.
access-key	The access key to delete. This parameter is mandatory.
config-dir	Path to the configuration directory ( <i>/root/.mc</i> by default)
quiet	Disables progress bar display
no-color	Disables color in the output
json	Enables JSON formatted output

Parameter	Description
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

### Example

Delete the access key *XyAbZpo123tuY* in the Object Store deployment with alias *salesobject*.

#### CLI

```
/opt/mapr/bin/mc admin creds
delete-access-key salesobject
XyAbZpo123tuY
```

### mc admin creds list-access-key

Lists the access keys belonging to a specified user.

Users can run this command to list their access keys.

### Syntax

#### CLI

```
mc admin creds list-access-key - list
the access keys of a user
```

#### USAGE:

```
mc admin creds
list-access-key TARGET
user [ account=<account_name> ]
[ domain=<domain_name> ]
```

#### user:

User whose access key needs to be listed

#### account:

The account to which the user belongs.

#### FLAGS:

```
--config-dir value, -C value path
to configuration folder (default: "/
root/.mc")
--quiet, -q
disable progress bar display
--no-color
disable color theme
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h show
help
```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store from which the command lists the access key. This parameter is mandatory.
user	The user name for which the access key needs to be listed. This parameter is mandatory.
account	The name of the account to which the user belongs. The account is assumed to be the <code>default</code> account, if you do not specify this parameter.
domain	The name of the domain under which the account exists.
config-dir	Path to the configuration directory ( <code>/root/.mc</code> by default).
quiet	Disables progress bar display.
no-color	Disables color in the output.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

## Examples

- List the access key for user *joe* from the `default` account in the Object Store deployment with alias *salesobject*.

### CLI

```
/opt/mapr/bin/mc admin creds
list-access-key salesobject
joe -json
```

- List the access key for user *joe* from the `northamerica` account in the Object Store deployment with alias *salesobject*.

### CLI

```
/opt/mapr/bin/mc admin creds
list-access-key salesobject joe
account='northamerica' -json
```

## mc admin creds enable-access-key

Enables an access key.

Users can run this command to enable their access keys.

## Syntax

### CLI

```
mc admin creds enable-access-key -
enable an access key
```

#### USAGE:

```
mc admin creds enable-access-key
TARGET access-key
```

```

user:
  Access key that needs to be enabled

FLAGS:
  --config-dir value, -C value path
  to configuration folder (default: "/
  root/.mc")
  --quiet, -q
  disable progress bar display
  --no-color
  disable color theme
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help

```

### Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command enables the access key. This parameter is mandatory.
access-key	The access key to enable. This parameter is mandatory.
config-dir	Path to the configuration directory (/root/.mc by default)
quiet	Disables progress bar display
no-color	Disables color in the output
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

### Example

Enable the access key *XyAbZpo123tuY* in the Object Store deployment with alias *salesobject*.

#### CLI

```

/opt/mapr/bin/mc admin creds
enable-access-key salesobject
XyAbZpo123tuY

```

#### **mc admin creds disable-access-key**

Disables an access key.

Users can run this command to disable their access keys.

## Syntax

### CLI

```
mc admin creds disable-access-key -
disable an access key

USAGE:
  mc admin creds disable-access-key
TARGET access-key

user:
  Access key that needs to be disabled

FLAGS:
  --config-dir value, -C value path
to configuration folder (default: "/
root/.mc")
  --quiet, -q
disable progress bar display
  --no-color
disable color theme
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h show
help
```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command disables the access key. This parameter is mandatory.
access-key	The access key to disable. This parameter is mandatory.
config-dir	Path to the configuration directory (/root/.mc by default)
quiet	Disables progress bar display
no-color	Disables color in the output
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

## Example

Disable the access key *XyAbZpo123tuY* in the Object Store deployment with alias *salesobject*.

### CLI

```
/opt/mapr/bin/mc admin creds
disable-access-key salesobject
XyAbZpo123tuY
```

**mc admin group**

Creates and manages user groups.

**mc admin group create**

Creates an IAM group under an account.

**Syntax****CLI**

```
mc admin group create - create a new
group under an account
```

**USAGE:**

```
mc admin group create TARGET
GROUPNAME [account=<account_name>]
[domain=<domain_name>]
```

**FLAGS:**

```
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h          show
help
```

**Parameters**

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which the command creates a group. This parameter is mandatory.
GROUPNAME	The name of the group to create. This parameter is mandatory.
account	The name of the account to which the group belongs. This parameter is mandatory.  <b>NOTE:</b> You cannot create IAM groups under the default account.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

**Example**Create a group *hydsales* in the *asiapac* account in the Object Store deployment with alias *salesobject*.**CLI**

```
/opt/mapr/bin/mc admin group create
salesobject hydsales account=asiapac
```

**mc admin group info**

Displays IAM group information.

## Syntax

### CLI

```
mc admin group info TARGET
GROUPNAME [account=<account_name>]
[domain=<domain_name>]

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help
```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store from which the command fetches group information. This parameter is mandatory.
GROUPNAME	The name of the group to fetch information. This parameter is mandatory.
account	The name of the account to which the group belongs. This parameter is mandatory.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

## Example

Get information on group *hydsales* in the *asiapac* account in the Object Store deployment with alias *salesobject*.

### CLI

```
/opt/mapr/bin/mc admin group info
salesobject hydsales account=asiapac
```

## mc admin group list

Lists all IAM groups.

## Syntax

### CLI

```
mc admin group list - display list of
groups

USAGE:
  mc admin group list
  TARGET [account=<account_name>]
  [domain=<domain_name>]
```

```

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help

```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store from which the command lists groups. This parameter is mandatory.
account	The name of the account from which to list groups. This parameter is mandatory.
domain	By default groups are listed from the <code>primary</code> domain. To list only the groups applicable to another specific domain, enter the domain name for which the groups should be listed.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

### Example

List all groups under the *northamerica* account in the *primary* domain in the Object Store deployment with alias *salesobject*

#### CLI

```

/opt/mapr/bin/mc admin group list
salesobject account=northamerica
domain=primary

```

### mc admin group remove

Removes an IAM group.

### Syntax

#### CLI

```

mc admin group remove TARGET
GROUPNAME [account=<account_name>]
[domain=<domain_name>]

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification

```

```
--help, -h          show
help
```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store from which the command removes a group. This parameter is mandatory.
GROUPNAME	The name of the group to remove. This parameter is mandatory.  <b>NOTE:</b> The group is removed only if there are no users in it.
account	The name of the account to which the group belongs.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

### Example

Remove a group *hydsales* from the *asiapac* account in the Object Store deployment with alias *salesobject*.

#### CLI

```
/opt/mapr/bin/mc admin group
remove salesobject hydsales
account=asiapac -json
```

### mc admin recovery

Manages bucket recovery.

#### mc admin recovery start

Starts the bucket recovery.

### Syntax

#### CLI

```
mc admin recovery start - start
bucket recovery

USAGE:
  mc admin recovery start TYPE TARGET

TYPE
  type accepts value as either "full"
  or "mini"

FLAGS:
  --json          enable JSON lines
formatted output
  --debug         enable debug output
```

```
--insecure  disable SSL certificate
verification
--help, -h  show help
```

## Parameters

Parameter	Description
TYPE	<p>Either start a <i>full</i> recovery or a <i>mini</i> recovery.</p> <p>In a mini recovery, the system scans for buckets to recover every hour. The system picks up buckets that were created or modified in the last hour and examines them for any recovery to perform. The recovery deletes dangling delete markers.</p> <p>In a full recovery, the system scans ALL buckets every week and examines them for any recovery to perform. Similar to the mini recovery, the system deletes all incomplete multipart uploads and dangling delete markers.</p>
TARGET	The alias of a configured HPE Ezmeral Object Store on which bucket to recover exists. This parameter is mandatory.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

## Example

1. Start *full* recovery for a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

### CLI

```
/opt/mapr/bin/mc admin recovery
start full salesobject/northamerica
```

2. Start *mini* recovery for a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

### CLI

```
/opt/mapr/bin/mc admin recovery
start mini salesobject/northamerica
```

## mc admin recovery stop

Stops the bucket recovery.

## Syntax

### CLI

```
mc admin recovery stop - stop bucket
recovery
```

### USAGE:

```
mc admin recovery stop TARGET
```

```

FLAGS:
  --json      enable JSON lines
              formatted output
  --debug     enable debug output
  --insecure  disable SSL certificate
              verification
  --help, -h  show help

```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store on which bucket that is under recovery exists. This parameter is mandatory.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

## Example

Stop recovery for a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

### CLI

```

/opt/mapr/bin/mc admin recovery stop
salesobject/northamerica

```

## mc retention

Sets and manages the retention lock for buckets and objects.

### mc retention set

Sets a retention lock for a bucket or object.

## Syntax

### CLI

```

mc retention set [FLAGS] [governance
| compliance] VALIDITY TARGET

FLAGS:
  --recursive, -r
  apply retention recursively
  --bypass
  bypass governance
  --version-id value, --vid value
  apply retention to a specific object
  version
  --rewind value
  roll back object(s) to current
  version at specified time
  --versions
  apply retention object(s) and all its
  versions
  --default
  set bucket default retention mode
  --json

```

```
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h
show help

VALIDITY:
  This argument must be formatted
  like Nd or Ny where 'd' denotes days
  and 'y'
  denotes years e.g. 10d, 3y.
```

**Parameters**

Parameter	Description
recursive	Apply the retention lock recursively to all objects.
bypass	Allows a user with the <code>s3:BypassGovernanceRetention</code> permission to modify the object. Requires the Governance Retention mode.
version-id	Apply retention only to the specified version of the object.
rewind	Rollback objects to the version that was present in the specified point of time.
versions	Apply retention to all versions of the object.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

**Examples**

1. Set governance mode to 1 day as the default for all objects in a bucket named finance:

**CLI**

```
/opt/mapr/bin/mc retention
set governance 1d newmooss/
finance --default

GOVERNANCE mode is enabled for
1DAYS.
```

2. Set retention for a specific version of an object:

**CLI**

```
/opt/mapr/bin/mc retention
set governance 30d
newmooss/worml/f2 --version-id
00000000000000000000000000000000

Object retention successfully
```

```
set for newmoss/worm1/f2
(version-id=00000000000000000002).
```

**mc retention clear**

Clears a retention lock from a bucket or object.

**Syntax****CLI**

```
mc retention clear [FLAGS] TARGET

FLAGS:
  --recursive, -r
  clear retention recursively
  --version-id value, --vid value
  clear retention of a specific object
  version
  --rewind value
  roll back object(s) to current
  version at specified time
  --versions
  clear retention of object(s) and all
  its versions
  --default
  set default bucket locking
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h
  show help
```

**Parameters**

Parameter	Description
recursive	Clear the retention lock recursively from all objects.
version-id	Clear retention only from the specified version of the object.
rewind	Rollback objects to the version that was present in the specified point of time.
versions	Clear retention from all versions of the object.
default	Clear default bucket lock.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

**Examples**

1. Clear the default retention mode from a bucket named finance:

**CLI**

```
/opt/mapr/bin/mc retention clear
newmooss/finance --default
```

Object lock configuration cleared successfully.

**2. Clears retention from a specific version of an object:**

**CLI**

```
/opt/mapr/bin/mc retention
clear newmooss/worm2/f2 --version-id
00000000000000000003
```

Object retention successfully cleared for newmooss/worm2/f2 (version-id=00000000000000000003).

**mc retention info**

Displays retention information for a bucket or object.

**Syntax**

**CLI**

```
mc retention info [FLAGS] [governance
| compliance] VALIDITY TARGET
```

**FLAGS:**

```
--recursive, -r
show retention info recursively
--version-id value, --vid value
show retention info of specific
object version
--rewind value
roll back object(s) to current
version at specified time
--versions
show retention info on object(s) and
all its versions
--default
show bucket default retention mode
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h
show help
```

**Parameters**

Parameter	Description
recursive	Displays retention information recursively for all objects
version-id	Displays retention information only for the specified version of the object

Parameter	Description
rewind	Rollback objects to the version that was present in the specified point of time
versions	Displays retention information for all versions of the object
default	Show the default retention mode for the bucket
json	Enable JSON formatted output
debug	Enable output for debugging
insecure	Disable SSL verification
help	Show this help

## Examples

1. Display the default retention mode for a bucket named *finance*:

### CLI

```
/opt/mapr/bin/mc retention info
newmooss/finance --default

GOVERNANCE mode is enabled for
1DAYS.
```

2. Display retention info for a specific version of an object:

### CLI

```
/opt/mapr/bin/mc retention
info newmooss/worm2/f2 --version-id
00000000000000000004

Name : newmooss/worm2/f2
Version : 00000000000000000004
Mode : GOVERNANCE, expiring in
19 days
```

## mc legalhold

Sets and manages the legal hold for buckets and objects.

A legal hold prevents an object version from being deleted or overwritten. There is no retention period associated with a legal hold. The legal hold remains in effect until removed.

### mc legalhold set

Sets a legal hold for an object.

## Syntax

### CLI

```
mc legalhold set [FLAGS] TARGET

FLAGS:
  --recursive, -r
  apply legal hold recursively
  --version-id value, --vid value
  apply legal hold to a specific object
  version
  --rewind value
```

```

apply legal hold on an object version
at specified time
--versions
apply legal hold on multiple versions
of an object
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h
show help

```

## Parameters

Parameter	Description
recursive	Apply the legal hold recursively to all objects.
version-id	Apply the legal hold to the specified version of the object.
rewind	Rollback objects to the version that was present in the specified point of time.
versions	Apply the legal hold to all versions of the object.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

## Examples

1. Set legal hold on a specific object.

### CLI

```

/opt/mapr/bin/mc legalhold set
newmoss/worm2/f2

```

```

Object legal hold successfully
set for f2.

```

2. Set legal hold for a specific version of an object:

### CLI

```

/opt/mapr/bin/mc legalhold
set newmoss/worm2/f2 --version-id
00000000000000000005

```

```

Object legal hold
successfully set for f2
(version-id=00000000000000000005).

```

### **mc legalhold clear**

Clears the legal hold from an object.

## Syntax

### CLI

```
mc legalhold clear [FLAGS] TARGET

FLAGS:
  --recursive, -r
clear legal hold recursively
  --version-id value, --vid value
clear legal hold of a specific object
version
  --rewind value
clear legal hold on an object version
at specified time
  --versions
clear legal hold on multiple versions
of object(s)
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h
show help
```

## Parameters

Parameter	Description
recursive	Clears the legal hold recursively from all objects.
version-id	Clears legal hold only from the specified version of the object.
rewind	Rolls back objects to the version that was present in the specified point of time.
versions	Clears legal hold from all versions of the object.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Show this help.

## Examples

1. Clear the legal hold from a specific object:

### CLI

```
/opt/mapr/bin/mc legalhold clear
newmoss/worm2/f2

Object legal hold successfully
cleared for f2.
```

2. Clear the legal hold from a specific version of an object:

**CLI**

```
/opt/mapr/bin/mc legalhold
clear newmoss/worm2/f2 --version-id
00000000000000000005
```

```
Object legal hold
successfully cleared for f2
(version-id=00000000000000000005).
```

**mc legalhold info**

Displays legal hold information for an object.

**Syntax****CLI**

```
/opt/mapr/bin/mc legalhold info
[FLAGS] TARGET

FLAGS:
  --recursive, -r
  show legal hold status recursively
  --version-id value, --vid value
  show legal hold status of a specific
  object version
  --rewind value
  show legal hold status of an object
  version
  specified time
  --versions
  show legal hold status of multiple
  versions of object(s)
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h
  show help
```

**Parameters**

Parameter	Description
recursive	Displays legal hold information recursively for all objects.
version-id	Displays legal hold information only for the specified version of the object.
rewind	Rolls back objects to the version that was present in the specified point of time.
versions	Displays legal hold information for all versions of the object.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

## Examples

1. Display the legal hold information for a specific object:

CLI

```
/opt/mapr/bin/mc legalhold info
newmoss/worm2/f2

[ OFF ] f2
```

2. Display the legal hold information for a specific version of an object:

CLI

```
/opt/mapr/bin/mc legalhold
info newmoss/worm2/f2 --version-id
00000000000000000007

[ ON ] 00000000000000000007 f2
```

## mc ls

Lists buckets and objects on a local cluster or a remote fabric of the global namespace (GNS).

## Syntax

Use the command to list buckets and objects from the local cluster or a cluster/fabric from a cluster group/global namespace.

**NOTE:** To list the fabrics/clusters and the external S3 servers that have been imported into the global namespace, use `gns` as the bucket name.

CLI

```
mc ls [FLAGS] TARGET [TARGET ...]

FLAGS:
  --account value          list
  buckets of the account
  --versions               list
  all versions
  --recursive, -r         list
  recursively
  --summarize
  display summary information (number
  of objects, total size)
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h              show
  help
```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store deployment from which the command lists buckets and objects. This parameter is mandatory. To list buckets and objects from a remote cluster/fabric in the global namespace use the format <fabricname>-<bucketname> instead of only the <bucketname> after the alias, that is <alias>/<fabricname>-<clustername>. When bucketname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified bucketname.
account	The account from which buckets and objects are listed. If not specified, buckets and objects from all accounts are listed.
versions	List all versions of an object, including those with delete markers.
recursive	Recursively lists objects from all folders and not just the top level folder.
summarize	Display the total size and number of objects in the target.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

## Examples

1. List buckets in the object store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc ls
salesobject -json
```

2. List all buckets in the account *asia* in the object store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc ls --account asia
salesobject -json
```

3. List all buckets recursively from the object store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc ls --recursive
salesobject -json
```

4. List all buckets recursively from the object store deployment with alias *salesobject* and display the total number of objects and the total size:

CLI

```
/opt/mapr/bin/mc
ls --recursive --summarize
salesobject -json
```

- List all objects from the object store deployment with alias *salesobject* containing the bucket *bucket1* from the cluster */fabric cluster1* and display the total number of objects and the total size:

CLI

```
/opt/mapr/bin/mc ls salesobject/  
cluster1-bucket1/ -json
```

- List all buckets from the object store deployment with the alias named *clalias* on the cluster named *securecluster*

CLI

```
/opt/mapr/bin/mc ls clalias/  
securecluster/
```

- List all objects, that is, the list of fabrics and external S3 servers on the global namespace (*gns*) on the object store deployment with alias named *clalias*

CLI

```
/opt/mapr/bin/mc ls clalias/gns/
```

### mc stat

Displays object meta data for a bucket or object on local cluster or remote fabric in the global namespace.

### Syntax

CLI

```
mc stat [FLAGS] TARGET [TARGET ...]  
  
FLAGS:  
  --versions  
  stat all versions  
  --version-id value, --vid value  
  stat a specific object version  
  --recursive, -r  
  stat all objects recursively  
  --json  
  enable JSON lines formatted output  
  --debug  
  enable debug output  
  --insecure  
  disable SSL certificate verification  
  --help, -h  
  show help
```

### Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store deployment from which the command displays object meta data. This parameter is mandatory. To display metadata for objects from a remote cluster/fabric in the global namespace use the format <i>&lt;fabricname&gt;-&lt;bucketname&gt;</i> instead of only the <i>&lt;bucketname&gt;</i> after the alias, that is <i>&lt;alias&gt;/&lt;fabricname&gt;-&lt;clustername&gt;</i> . When bucketname and objectname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified bucketname and objectname.

Parameter	Description
versions	Display meta data for all versions of objects.
version-id	Display meta data for the specified version of the object.
recursive	Display meta data for all objects from all folders and not just the top level folder.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

### Examples

1. Display object meta data for top level objects in bucket *mybucket* in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc stat salesobject/  
mybucket
```

2. Display object meta data for an object with specific version *CL3sWgdSN2pNntSf6UnZAuh2kcu8E8si* in bucket *mybucket* in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc stat --version-id  
"CL3sWgdSN2pNntSf6UnZAuh2kcu8E8si"  
salesobject/mybucket
```

3. Display object meta data for all objects recursively in bucket *mybucket* in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc stat --recursive  
salesobject/mybucket
```

4. Display object meta data for all objects recursively in bucket *mybucket* from remote fabric *sales* in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc stat --recursive  
salesobject/sales-mybucket
```

5. Display object meta data for the bucket *mybucket* from remote fabric *sales* in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc stat salesobject/  
sales-mybucket
```

6. Display object meta data for the object *myobject* contained in the bucket *mybucket* from remote fabric *sales* in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc stat salesobject/
sales-mybucket/myobject
```

**mc mb**

Creates buckets on local cluster/fabric or on remote fabrics present on the global namespace.

**Syntax****CLI**

```
mc mb [FLAGS] TARGET

FLAGS:
  --account value
  specify account that bucket should be
  created in
  --ignore-existing, -p
  ignore if bucket/directory already
  exists
  --with-lock, -l
  enable object lock
  --disable-versioning, -d
  disable object versioning
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help
```

**Parameters**

Parameter	Description
TARGET	The target string that includes the alias of a configured HPE Ezmeral Object Store deployment on which the command creates buckets. This is a mandatory parameter. To create buckets from a remote cluster/fabric in the global namespace use the format <fabricname>-<bucketname> instead of only the <bucketname> after the alias, that is <alias>/<fabricname>-<bucketname>. When bucketname is mentioned without the fabric name, Data Fabric creates a bucket with the specified name on the local cluster.
account	The account on which the bucket is to be created. If not specified, buckets are created in the default account.
ignore-existing	Ignores creation if the bucket already exists.
with-lock	Enables Object Locking for the bucket.
disable-versioning	Disables bucket versions. By default, bucket versions are enabled.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.

Parameter	Description
help	Show this help.

 **ATTENTION:** When you name a bucket, do not include `mapr.` as a prefix for the bucket name. For example, `mapr.bucket1` is not supported.

### Examples

 **NOTE:** For the following examples, the object store deployment is identified by the alias `salesalias`.

1. Create a bucket named `northamerica` in the Object Store deployment with alias `salesalias`:

CLI

```
/opt/mapr/bin/mc mb salesalias/
northamerica
```

2. Create a folder called `brickfire` inside the bucket named `northamerica` in the Object Store deployment that is identified by the alias `salesalias`:

CLI

```
/opt/mapr/bin/mc mb salesalias/
northamerica/brickfire
```

3. Create a bucket named `northamerica` on the remote fabric `sales` on the default account in the Object Store deployment with alias `salesalias`:

CLI

```
/opt/mapr/bin/mc
mb --account=default salesalias/
northamerica --cluster sales
```

4. Create a bucket named `northamerica` with its versions disabled, on the remote fabric `sales` on the default account in the Object Store deployment with alias `salesalias`:

CLI

```
/opt/mapr/bin/mc
mb --disable-versioning --account=de
fault salesalias/sales-northamerica
```

### mc ub

Updates the properties of buckets on a local cluster/fabric or on a remote fabric present on the global namespace.

### Syntax

CLI

```
mc ub [FLAGS] TARGET [TARGET...]

FLAGS:
  --enable-versioning, -v
                        enable object version
  --suspend-versioning, -s
                        suspend object version
  --set-compression value, -z
value                  set MapR fs
compression type, off/on/lz4/zlib
```

```

--set-object-chunk-size value, -c
value      set object chunk size
(default: 256 MB)
--set-max-inline-object-size
value, -i value  set max inline
object size (default: 0)
--set-max-in-db-object-size
value, -d value  set max in DB
object size (default: 0)
--json
           enable JSON lines formatted
output
--debug
           enable debug output
--insecure
           disable SSL certificate
verification
--help, -h
           show help

```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store deployment on which the command updates the properties of buckets. This parameter is mandatory. To update properties of buckets from a remote cluster/fabric in the global namespace use the format <fabricname>-<bucketname> instead of only the <bucketname> after the alias, that is <alias>/<fabricname>-<clustername>. When bucketname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified bucketname.
enable-versioning	Enables versioning on the given bucket.
suspend-versioning	Suspends versioning on the given bucket.
set-compression	Compression to use when saving objects in the bucket. Either lz4 or zlib or off (no compression). The default compression is lz4.
set-object-chunk-size	Chunk size is used when saving objects to disk. For example, if chunk size is set to 256MB, an object of size 512MB is written to disk in parallel in two 256MB chunks. The default chunk size is 256MB for jumbo objects. For large objects, chunks size is always set to zero. Zero indicates no chunking. After you change the chunk size, all new uploads will use the updated value; existing objects will continue to use the previously set chunk size. Updating the chunk size only affects jumbo objects uploaded with multi-part upload disabled (mc cp --disable-multipart).
set-max-inline-object-size	The maximum size of tiny objects to be stored in the database instead of in the bucket. Default value is 128 bytes. The value can be set up to maximum of 1 MB. The value of 0 indicates that objects are not stored in the database.

Parameter	Description
set-max-in-db-object-size	The maximum size of small objects to be stored in the database instead of in the bucket. Default value is 16KB. The value can be set up to maximum of 8 MB. The default of 0 indicates that objects are not stored in the database.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

**NOTE:** Changing the `set-max-inline-object-size` and the `set-max-in-db-object-size` values is typically only required if there are performance issues with small objects (1KB - 16KB). Consult with HPE before you change these parameters. Note that the values of the parameters should follow the condition:

`max-inline-object-size < max-in-db-object-size < chunk size`

For example:

```
/opt/mapr/bin/mc ub alias <bucketName> --set-max-inline-object-size
16384 --set-max-in-db-object-size 16385
```

## Examples

1. Suspend versions for a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc
ub --suspend-versioning salesobject/
northamerica
```

2. Set *zlib* compression for objects in a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc
ub --set-compression zlib
salesobject/northamerica
```

3. Set chunk size to 512 MB for objects in a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc
ub --set-object-chunk-size
536870912 salesobject/northamerica
```

4. Set chunk size to 512 MB for objects in a bucket named *northamerica* on a remote fabric named *sales*, in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc
ub --set-object-chunk-size
```

```
536870912 salesobject/
sales-northamerica
```

**mc rb**

Removes buckets from a local cluster or a remote fabric in the global namespace..

**Syntax****CLI**

```
mc rb [FLAGS] TARGET [TARGET...]

FLAGS:
  --force
  forcefully deletes a non-empty bucket
  --dangerous allow
  site-wide removal of objects
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h show
  help
```

**Parameters**

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store deployment from which the command removes buckets. This parameter is mandatory. To remove buckets from a remote cluster/fabric in the global namespace use the format <fabricname>-<bucketname> instead of only the <bucketname> after the alias, that is <alias>/<fabricname>-<clustername>. When bucketname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified bucketname.
force	Deletes a non-empty bucket forcefully. This option first empties the bucket and then deletes it.  <b>CAUTION:</b> With this option, a bucket may or may not be deleted if object uploads are in-progress to the same bucket.
dangerous	Removes all buckets from the target.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

**Examples**

1. Remove a bucket named *northamerica* and its contents from the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc rb --force
salesobject/northamerica
```

- Remove all buckets from all accounts in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc
rb --dangerous --force salesobject
```

- Refer to [Delete Bucket to Reclaim Space](#) on page 610 to delete a non-WORM on page 6357 bucket in a volume.
- Remove a bucket named *northamerica* and its contents on the remote fabric *sales* from the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc rb --force
salesobject/sales-northamerica
```

**mc policy**

Manages anonymous access to buckets and objects.

**Syntax****CLI**

```
USAGE:
  mc policy [FLAGS] set PERMISSION
TARGET
  mc policy [FLAGS] set-json FILE
TARGET
  mc policy [FLAGS] get TARGET
  mc policy [FLAGS] get-json TARGET
  mc policy [FLAGS] list TARGET

FLAGS:
  --recursive, -r  list recursively
  --json          enable JSON lines
                  formatted output
  --debug         enable debug output
  --insecure      disable SSL
                  certificate verification
  --help, -h      show help

PERMISSION:
  Allowed policies are: [none,
download, upload, public].

FILE:
  A valid HPE Object Store policy
JSON filepath.
```

## Parameters

Parameter	Description
PERMISSION	The canned policy to set. One of: <ul style="list-style-type: none"> <li>• none</li> <li>• download</li> <li>• upload</li> <li>• public</li> </ul>
FILE	The path to a file containing a valid JSON Object Store policy.  <b>NOTE:</b> You can either set the canned policy directly using the PERMISSION parameter or use a custom policy file with the FILE parameter.
TARGET	The alias of a configured HPE Ezmeral Object Store deployment from or on which the command retrieves or sets policies. This parameter is mandatory.
recursive	List all folders recursively instead of just the top-level folder.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

## Examples

1. Set the `download` policy for a bucket named `northamerica` in the Object Store deployment with alias `salesobject`.

CLI

```
/opt/mapr/bin/mc policy set
download salesobject/northamerica/
```

2. Set a custom policy contained in the file `/sales/policies/confidential.json` for a bucket named `northamerica` in the Object Store deployment with alias `salesobject`.

CLI

```
/opt/mapr/bin/mc policy set-json /
sales/policies/confidential.json
salesobject/northamerica/
```

3. Get the policy for a bucket named `northamerica` in the Object Store deployment with alias `salesobject`.

CLI

```
/opt/mapr/bin/mc policy get
salesobject/northamerica/
```

4. Get the policy in JSON format for a bucket named `northamerica` in the Object Store deployment with alias `salesobject`.

**CLI**

```
/opt/mapr/bin/mc policy get-json
salesobject/northamerica/
```

5. List policies for a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc policy list
salesobject/northamerica/
```

6. List public object URLs recursively for a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc policy
list --recursive links salesobject/
northamerica/
```

**mc rm**

Removes objects from a bucket. Operates on versioned objects in buckets on a local cluster or a remote fabric in the global namespace.

**Syntax****CLI**

```
mc rm [FLAGS] TARGET [TARGET ...]

FLAGS:
  --versions
  remove all versions of an object
  --version-id value, --vid value
  delete a specific version of an object
  --recursive, -r
  remove recursively
  --force
  allow a recursive remove operation
  --dangerous
  allow site-wide removal of objects
  --fake
  perform a fake remove operation
  --stdin
  read object names from STDIN
  --bypass
  bypass governance
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h
  show help
```

## Parameters

**ATTENTION:** In Object Store, versioning and delete markers work the same as they do in S3 – If you remove a directory or object from a versioned bucket using the `mc rm` command, a delete marker is placed against that directory or object while all previous versions of the directory or object are retained. These retained versions occupy space that jobs cannot reclaim when they run against the versioned bucket. If you want jobs to reclaim space, you must use the `--versions` option to remove all versions of a directory or object when you run the `mc rm` command, for example:

```
/opt/mapr/bin/mc rm --recursive --force --versions <alias>/
<versionedbuck>/<directory>
```

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store deployment from which the command removes objects. This parameter is mandatory. To remove objects from a remote cluster/fabric in the global namespace use the format <code>&lt;fabricname&gt;-&lt;bucketname&gt;/&lt;objectname&gt;</code> instead of only the <code>&lt;bucketname&gt;/&lt;objectname&gt;</code> after the alias, that is <code>&lt;alias&gt;/&lt;fabricname&gt;-&lt;bucketname&gt;/&lt;objectname&gt;</code> . When the bucketname and objectname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified bucketname and objectname.
versions	Removes all versions of an object that exist in the bucket.
recursive	Removes objects recursively. When using <code>--recursive</code> , you must also use <code>--force</code> . For versioned buckets, <code>--recursive</code> produces a delete marker for each object removed. If you want to recursively remove all objects and all versions of the objects from the bucket, you must also include the <code>--versions</code> option.
force	Force a recursive remove operation.
dangerous	Removes all objects from the target.
fake	Simulate a remove operation but do not actually remove them.
stdin	Read objects from STDIN.
bypass	Bypass governance settings and delete the object.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

## Examples

1. Remove objects recursively from the bucket `songs` matching the prefix `Jim` from the Object Store deployment with alias `classmusic`:

**CLI**

```
/opt/mapr/bin/mc
rm --recursive --force classmusic/
songs/Jim/
```

- Remove all objects from all accounts in the Object Store deployment with alias *classmusic*:

**CLI**

```
/opt/mapr/bin/mc
rm --recursive --force --dangerous
classmusic
```

- Remove object *salesspeech.mp4* with governance mode set from the Object Store deployment with alias *northamerica*:

**CLI**

```
/opt/mapr/bin/mc rm --bypass
northamerica/salesspeech.mp4
```

- Remove object *salesspeech.mp4* with version ID *f20f3792-4bd4-4288-8d3c-b9d05b3b62f6* set from the Object Store deployment with alias *northamerica*:

**CLI**

```
/opt/mapr/bin/mc rm northamerica/
salesspeech.mp4 --version-id
"f20f3792-4bd4-4288-8d3c-b9d05b3b62f
6"
```

- Remove object *salesspeech.mp4* with governance mode set in bucket *qfoursales* of remote cluster *sales* from the Object Store deployment with alias *northamerica*:

**CLI**

```
/opt/mapr/bin/mc
rm --bypass northamerica/
sales-qfoursales/salesspeech.mp4
```

**mc cp**

Copies objects to and from buckets on local cluster or remote fabric in the global namespace.

**Syntax**

**NOTE:** The size limits for an object to upload are as follows.

Single object put : 5 GiB

Single part size : 5 GiB

Multi part complete object size : 5 TiB

**CLI**

```
mc cp [FLAGS] SOURCE [SOURCE...]
TARGET

FLAGS:
  --version-id value, --vid value
  select an object version to copy
  --recursive, -r
  copy recursively
```

```

--attr value
add custom metadata for the object
--preserve, -a
preserve filesystem attributes (mode,
ownership, timestamps)
--disable-multipart
disable multipart upload feature
--md5
force all upload(s) to calculate
md5sum checksum
--retention-mode value
retention mode to be applied on the
object (governance, compliance)
--retention-duration value
retention duration for the object in
d days or y years
--legal-hold value
apply legal hold to the copied object
(on, off)
--tags value
add tags for the object
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h
show help
    
```

### Parameters

Parameter	Description
SOURCE	The source from which an object is copied. This can be the filesystem or the alias of a configured HPE Ezmeral Object Store deployment. This parameter is mandatory. To copy objects from a remote cluster/fabric in the global namespace, use the format <fabricname>-<bucketname>/<objectname> instead of only the <bucketname>/<objectname> after the alias, that is <alias>/<fabricname>-<bucketname>/<objectname>. When bucketname and objectname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified bucketname and objectname.
TARGET	The destination to which an object is copied. This can be the filesystem or the alias of a configured HPE Ezmeral Object Store deployment. This parameter is mandatory. To copy objects from a remote cluster/fabric in the global namespace use the format <fabricname>-<bucketname>/<objectname> instead of only the <bucketname>/<objectname> after the alias, that is <alias>/<fabricname>-<clustername>/<objectname>. When bucketname and objectname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified bucketname and objectname.
version-id	The object version to copy.

Parameter	Description
recursive	Copy objects recursively and not just the top-level folder.
attr	Add custom metadata for the object.
preserve	Preserve filesystem attributes such as mode, timestamps and ownership when copying.
disable-multipart	Disable the multipart upload feature.
md5	Calculate the md5 checksum when uploading.
retention-mode	The retention mode - either governance or compliance - to apply to the object.
retention-duration	Set the duration of the retention mode in days (d) or years (y).
legal-hold	Set legal hold for the object.
tags	Add tags for the object.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

### Examples

1. Copy local folders *fin1* and *fin2* recursively to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc cp --recursive
fin1/ fin2/ salesobject/
northamerica/
```

2. Copy a list of Excel files (*.xls*) with specified metadata, separated by ";" from the *profit* folder to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*

CLI

```
/opt/mapr/bin/mc cp --attr
"key1=value1;key2=value2" profit/
*.xls salesobject/northamerica/
```

3. Copy the file *secret.txt* with object lock mode set to *governance* with retention duration 1 day, from the *profit* folder to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc
cp --retention-mode
governance --retention-duration
1d profit/secret.txt salesobject/
northamerica/
```

4. Copy the file *secret.txt* with legal hold enabled, from the *profit* folder to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc cp --legal-hold
on profit/secret.txt salesobject/
northamerica/
```

5. Copy the file *secret.txt* with legal hold enabled, from the *profit* folder to a bucket named *northamerica* on a remote cluster named *sales*, in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc cp --legal-hold
on profit/secret.txt salesobject/
sales-northamerica/
```

6. Copy the object *testobject* from the *usa* bucket on the remote fabric *sales* to a bucket named *northamerica* on the same remote fabric *sales*, in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc cp salesobject/
sales-usa/testobject salesobject/
sales-northamerica/
```

**mc mv**

Move objects between buckets.

**Syntax****CLI**

```
mc mv [FLAGS] SOURCE [SOURCE...]
TARGET

FLAGS:
  --recursive, -r      move
recursively
  --attr value        add custom
metadata for the object
  --preserve, -a      preserve
filesystem attributes (mode,
ownership, timestamps)
  --disable-multipart  disable
multipart upload feature
  --json              enable JSON
lines formatted output
  --debug              enable debug
output
  --insecure           disable SSL
certificate verification
  --help, -h          show help
```

## Parameters

Parameter	Description
SOURCE	The source from which an object is moved. This can be the filesystem or the alias of a configured HPE Ezmeral Object Store deployment. This parameter is mandatory. To move objects from a remote cluster/fabric in the global namespace, use the format <fabricname>-<bucketname>/<objectname> instead of only the <bucketname>/<objectname>. When bucketname and objectname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified objectname.
TARGET	The destination to which an object is moved. This can be the filesystem or the alias of a configured HPE Ezmeral Object Store deployment. This parameter is mandatory. To move objects from a remote cluster/fabric in the global namespace, use the format <fabricname>-<bucketname>/<objectname> instead of only the <bucketname>/<objectname> after the alias, that is <alias>/<fabricname>-<bucketname>/<objectname>. When bucketname and objectname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified bucketname and objectname.
recursive	Move objects recursively and not just the top-level folder.
attr	Add custom metadata for the object.
preserve	Preserve filesystem attributes such as mode, timestamps and ownership when moving.
disable-multipart	Disable the multipart upload feature.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

## Examples

1. Move local folders *fin1* and *fin2* recursively to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc mv --recursive
fin1/ fin2/ salesobject/
northamerica/
```

2. Move a list of Excel files (*.xls*) with specified metadata, separated by ";" from the *profit* folder to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*

CLI

```
/opt/mapr/bin/mc mv --attr
"key1=value1;key2=value2" profit/
*.xls salesobject/northamerica/
```

3. Move a file named *secret.txt* with attributes preserved from the *profit* folder to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc mv --preserve
profit/secret.txt salesobject/
northamerica/
```

4. Move a file named *secret.txt* with attributes preserved from the *profit* folder to a bucket named *northamerica* in a remote cluster named *sales* in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc mv --preserve
profit/secret.txt salesobject/
sales-northamerica/
```

### mc head

Displays the first n lines of an object.

The `mc head` command automatically decompresses *gzip* and *bzip2* compressed objects.

### Syntax

CLI

```
mc head - display first 'n' lines of
an object

USAGE:
  mc head [FLAGS] SOURCE [SOURCE...]

FLAGS:
  -n value, --lines value
print the first 'n' lines (default:
10)
  --version-id value, --vid value
select an object version to display
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h
show help
```

### Parameters

Parameter	Description
SOURCE	The alias of a configured HPE Ezmeral Object Store deployment from which the command reads objects. This parameter is mandatory.
lines	The number of lines to read from the object. The default value is 10.
version-id	The object version to read.
json	Enable JSON formatted output.
debug	Enable output for debugging.

Parameter	Description
insecure	Disable SSL verification.
help	Show this help.

### Examples

1. Display the first seven lines from a *gzip* compressed object named *secret.csv.gz* that is present in a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

#### CLI

```
/opt/mapr/bin/mc head --lines
7 salesobject/northamerica/
secret.csv.gz
```

2. Display the first twelve lines from a *gzip* compressed object named *secret.csv.gz* with version ID *3ddac055-89a7-40fa-8cd3-530a5581b6b8* that is present in a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

#### CLI

```
/opt/mapr/bin/mc head --lines
12 --version-id="3ddac055-89a7-40f
a-8cd3-530a5581b6b8" salesobject/
northamerica/secret.csv.gz
```

### mc cat

Displays the contents of an object.

### Syntax

#### CLI

```
mc cat [FLAGS] SOURCE [SOURCE...]

FLAGS:
  --version-id value, --vid value
display a specific version of an
object
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h
show help
```

### Parameters

Parameter	Description
SOURCE	The alias of a configured HPE Ezmeral Object Store deployment from which the command reads objects. This parameter is mandatory.
version-id	The object version to display.
json	Enable JSON formatted output.
debug	Enable output for debugging.

Parameter	Description
<code>insecure</code>	Disable SSL verification.
<code>help</code>	Show this help.

### Examples

1. Stream an object `kubectl-pres.mp4` present in a bucket named `cloudarch` in the Object Store deployment with alias `firebrick` to mplayer standard input. :

CLI

```
/opt/mapr/bin/mc cat firebrick/
cloudarch/kubectl-pres.mp4 |
mplayer -
```

2. Display the contents of an object `secret.csv` with version ID `3ddac055-89a7-40fa-8cd3-530a5581b6b8` that is present in a bucket named `northamerica` in the Object Store deployment with alias `salesobject`.

CLI

```
/opt/mapr/bin/mc
cat --version-id="3ddac055-89a7-40f
a-8cd3-530a5581b6b8" salesobject/
northamerica/secret.csv
```

3. Concatenate files `eng1.img`, `eng2.img`, and `eng3.img`, and save the concatenated file as `complete.img` on a bucket named `northamerica` in the Object Store deployment with alias `salesobject`.

CLI

```
/opt/mapr/bin/mc cat
eng*.img > salesobject/northamerica/
complete.img
```

### mc pipe

Stream standard input (STDIN) to an object.

### Syntax

CLI

```
mc pipe [FLAGS] [TARGET]

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h
  show help
```

### Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store deployment to which the target is copied. This parameter is mandatory.

Parameter	Description
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

### Examples

1. Write contents of STDIN to an object named *notes.txt* that is in a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc pipe salesobject/
northamerica/notes.txt
```

2. Stream MySQL database dump to the file *accounts.sql* that is in a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

CLI

```
mysqldump -u root -p *****
accountsdb | /opt/mapr/bin/mc
pipe salesobject/northamerica/
accounts.sql
```

3. Copy an iso file *deb.iso* from the local filesystem to a bucket named *northamerica* in the Object Store deployment with alias *enrg*.

CLI

```
cat deb.iso | /opt/mapr/bin/mc pipe
enrg/northamerica/deb.iso
```

### mc find

Find objects meeting the specified criteria.

### Syntax

CLI

```
USAGE:
  mc find PATH [FLAGS]

FLAGS:
  --exec value                spawn
                              an external process for each matching
                              object (see FORMAT)
  --ignore value              exclude objects matching the wildcard
                              pattern
  --name value                 find
                              object names matching wildcard pattern
  --newer-than value          match
                              all objects newer than L days, M
                              hours and N minutes
  --older-than value          match
                              all objects older than L days, M
                              hours and N minutes
  --path value                 match
```

```

directory names matching wildcard
pattern
  --print value                print
in custom format to STDOUT (see
FORMAT)
  --regex value                match
directory and object name with PCRE
regex pattern
  --larger value               match
all objects larger than specified
size in units (see UNITS)
  --smaller value              match
all objects smaller than specified
size in units (see UNITS)
  --maxdepth value             limit
directory navigation to specified
depth (default: 0)
  --json                       enable JSON lines formatted output
  --debug                       enable debug output
  --insecure                    disable SSL certificate verification
  --help, -h                    show
help

```

#### UNITS

--smaller, --larger flags accept human-readable case-insensitive number suffixes such as "k", "m", "g" and "t" referring to the metric units KB, MB, GB and TB respectively. Adding an "i" to these prefixes, uses the IEC units, so that "gi" refers to "gibibyte" or "GiB". A "b" at the end is also accepted. Without suffixes the unit is bytes.

--older-than, --newer-than flags accept the string for days, hours and minutes  
i.e. 1d2h30m states 1 day, 2 hours and 30 minutes.

#### FORMAT

Support string substitutions with special interpretations for following keywords.

Keywords supported if target is filesystem or object storage:

```

{}      --> Substitutes to full
path.
{base} --> Substitutes to
basename of path.
{dir}  --> Substitutes to
dirname of the path.
{size} --> Substitutes to object
size of the path.
{time} --> Substitutes to object
modified time of the path.

```

Keywords supported if target is object storage:

{url} --> Substitutes to a shareable URL of the path.

## Parameters

Parameter	Description
PATH	The path to search for objects. This path can be on the local filesystem or be the alias of a configured HPE Ezmeral Object Store deployment. This parameter is mandatory.
exec	Spawn an external process for each matching object.
ignore	Ignore objects matching this wild card specification.
name	Find objects matching this wild card specification. This parameter is mandatory.
newer-than	Find all objects that are newer than the specified days, hours or minutes.
older-than	Find all objects that are older than the specified days, hours or minutes.
path	Find directory names that match the wildcard pattern.
print	Print the search results in a custom format.
regex	Find objects and directories that match the specified regular expression.
larger	Find objects that are larger than the specified size.
smaller	Find objects that are smaller than the specified size.
maxdepth	Restrain directory navigation to the specified depth. For example, the value 3 limits the searching to 3 levels deep from the top-level directory. The default value of 0 indicates no limit.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

## Examples

1. Find all occurrences of the object *foo.jpg* in all buckets in the Object Store deployment with alias *salesobject*.

### CLI

```
/opt/mapr/bin/mc find
salesobject --name foo.jpg
```

2. Find all objects in the Object Store deployment with alias *salesobject* that are older than 2 days, 5 hours and 10 minutes and exclude the ones with the *.jpg* extension:

**CLI**

```
/opt/mapr/bin/mc find
salesobject --older-than
2d5h10m --ignore "*.jpg"
```

- Find only the object names without the directory component in the bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc find salesobject/
northamerica --name "*" -print
{base}
```

- Find all images with the *.jpg* extension in the bucket named *northamerica* in the Object Store deployment with alias *salesobject* and simultaneously copy the images to the bucket named *philo* in the Object Store deployment with alias *asia*:

**CLI**

```
/opt/mapr/bin/mc find
salesobject/northamerica --name
"*.jpg" --watch --exec "mc cp {}
philo/asia"
```

**mc share**

Generates URLs for temporary access to objects.

**mc share download**

Generates URLs for download access.

**Syntax****CLI**

```
mc share download [FLAGS] TARGET
[TARGET...]
```

FLAGS:

- recursive, -r  
share all objects recursively
- version-id value, --vid value  
share a particular object version
- expire value, -E value  
set expiry in NN[h|m|s] (default:  
"168h")
- json  
enable JSON lines formatted output
- debug  
enable debug output
- insecure  
disable SSL certificate verification
- help, -h  
show help

**Parameters**

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store deployment from which to download the object. This parameter is mandatory.

Parameter	Description
recursive	Share all objects recursively.
version-id	Share a specific version of an object.
expire	Set the time in hours, minutes and seconds when the URL expires. The default expiry time is 168 hours (7 days).
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

### Examples

1. Share all objects in a top level bucket named *northamerica* in the Object Store deployment with alias *salesobject* with *20 minutes* expiry:

CLI

```
/opt/mapr/bin/mc share
download --expire=20m salesobject/
northamerica/
```

2. Share all objects in recursively in all folders from a bucket named *northamerica* in the Object Store deployment with alias *salesobject* with *120 minutes* expiry:

CLI

```
/opt/mapr/bin/mc share
download --expire=20m --recursive
salesobject/northamerica/
```

### mc share upload

Generate the **curl** command to upload objects without requiring access/secret keys.

### Syntax

CLI

```
mc share upload [FLAGS] TARGET
[TARGET...]
```

FLAGS:

- recursive, -r  
recursively upload any object matching the prefix
- expire value, -E value set expiry in NN[h|m|s] (default: "168h")
- content-type value, -T value specify a content-type to allow
- json  
enable JSON lines formatted output
- debug  
enable debug output
- insecure  
disable SSL certificate verification
- help, -h  
show help

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store deployment to which to upload the object. This parameter is mandatory.
recursive	Recurively upload all objects that match the prefix.
expire	Set the time in hours, minutes and seconds when the <i>curl</i> command expires. The default expiry time is 168 hours (7 days).
content-type	The content type that is permitted to be uploaded.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

## Examples

1. Generate a *curl* command to allow upload access for a single object named *secret.gz* to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*, with *10 days* expiry time:

CLI

```
/opt/mapr/bin/mc share
upload --expire=10d salesobject/
northamerica/secret.gz
```

2. Generate a *curl* command to allow upload access of only *.png* images to a folder called *images* in a bucket named *northamerica* in the Object Store deployment with alias *salesobject*, with *10 days* expiry time :

CLI

```
/opt/mapr/bin/mc share
upload --content-type=image/png --ex
pire=10d salesobject/northamerica/
secret.gz
```

3. Generate a *curl* command to allow uploading objects that match the key prefix **'backup/** to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*. The command expires in *2 hours*:

CLI

```
mc share
upload --recursive --expire=2h
salesobject/northamerica/backup/
```

### mc share list

List shared objects.

### Syntax

CLI

```
mc share list COMMAND
```

```
COMMAND:
  upload:  list previously shared
           access to uploads.
  download: list previously shared
           access to downloads.
```

### Parameters

Parameter	Description
upload	List previously shared uploads.
download	List previously shared downloads.

### Examples

1. List previously shared downloads, that have not expired yet.

CLI

```
/opt/mapr/bin/mc share list download
```

2. List previously shared uploads, that have not expired yet.

CLI

```
/opt/mapr/bin/mc share list upload
```

### mc sql

Runs SQL queries on objects.

### Syntax

CLI

```
mc sql [FLAGS] TARGET [TARGET...]

FLAGS:
  --query value, -e value      sql
  query expression (default: "select *
  from s3object")
  --recursive, -r              sql
  query recursively
  --csv-input value            csv
  input serialization option
  --json-input value           json
  input serialization option
  --compression value         input
  compression type
  --csv-output value           csv
  output serialization option
  --csv-output-header value   optional csv output header
  --json-output value          json
  output serialization option
  --json                       enable JSON lines formatted output
  --debug                      enable debug output
  --insecure                   disable SSL certificate verification
  --help, -h                   show
```

```
help
```

**SERIALIZATION OPTIONS:**

For query serialization options, refer to <https://docs.min.io/docs/minio-client-complete-guide#sql>

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store deployment on which the command runs SQL queries. This parameter is mandatory.
query	The query to run. The default query is <code>select * from s3object</code>
recursive	Query all folders recursively instead of just the top-level folder.
csv-input	The CSV input format.
json-input	The JSON input format. Required when querying JSON documents.
compression	Specifies if the queried object is compressed. Valid values are NONE   GZIP   BZIP2. Default value is NONE.
csv-output	The format for CSV output.
csv-output-header	The CSV output header. If not specified, the first row of the CSV is used as the header.
json-output	The format for JSON output.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

## Usage Notes

Review the following notes related to the use of the `mc sql` command before you run any queries:

### Parquet files

Before you run any queries against Parquet files, set `export MINIO_API_SELECT_PARQUET=on` in the `/opt/mapr/conf/env.sh` file and restart the Object Store server. You can restart the Object Store server from the Services page in the Control System or from the CLI by running the following command:

```
/opt/mapr/bin/maprcli node
services -nodes <space-delimited list
of node names> -s3server restart
```

**JSON documents**

When you query a JSON document, you must include the `--json-input` parameter and `type=document`, as shown in the following example:

```
/opt/mapr/bin/mc sql --json-input
type=document --query "select *
from S3Object" alias0/mybucket/
example5.json
```

**Examples**

1. Query a set of objects recursively that are in a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

**CLI**

```
/opt/mapr/bin/mc
sql --recursive --query "select
* from S3Object" salesobject/
northamerica/
```

2. Query a compressed object *books1.json.bz2* that is in *bzip2* format present in the bucket named *comics* in the Object Store deployment with alias *royallibrary*.

```
/opt/mapr/bin/mc sql --compression bzip2 --query "select id, cat from
s3object" royallibrary/comics/books1.json.bz2
```

3. Query the *data.csv* object in the *lpd* bucket for the alias *powerconsumption*. For the input, specify a semicolon (;) as the delimiter (fd), newline as the record delimiter (rd), and use file header (fh) in the query.

**CLI**

```
/opt/mapr/bin/mc sql --csv-input
"rd=\n,fh=USE,fd=;" \
--json-output "rd=\n\n" --query
"select * from S3Object"
powerconsumption/lpd/data.csv
```

4. Query the *data.csv* object in the *lpd* bucket for the alias *powerconsumption*. For the input, specify a semicolon (;) as the delimiter (fd), newline as the record delimiter (rd), and use file header (fh) in the query. For the output, specify the CSV output header. When you specify the CSV output headers as "col1,col2,col3", the first row of the CSV file is interpreted as the header.

**CLI**

```
/opt/mapr/bin/mc sql --csv-input
"rd=\n,fh=USE,fd=;" \
--csv-output
"rd=\n" --csv-output-header
"device_id,uptime,lat,lon" \
--query "select * from S3Object"
powerconsumption/lpd/data.csv
```

5. Query a JSON document type.

**CLI**

```
/opt/mapr/bin/mc sql --json-input
type=document --query \
"select * from S3Object" alias0/
```

```
mybucket/example3.json
```

```
{ "owner": null, "brand": "BMW", "year": 2020, "status": false, "color": [ "red", "white", "yellow" ],
  "Model": { "name": "BMW M4", "Fuel Type": "Petrol", "TransmissionType": "Automatic",
    "Turbo Charger": "true", "Number of Cylinder": 4 } }
```

```
cat /tmp/example3.json
```

```
{
  "owner": null,
  "brand": "BMW",
  "year": 2020,
  "status": false,
  "color": [
    "red",
    "white",
    "yellow"
  ],
  "Model": {
    "name": "BMW M4",
    "Fuel Type": "Petrol",
    "TransmissionType": "Automatic",
    "Turbo Charger": "true",
    "Number of Cylinder": 4
  }
}
```

### mc tag

Manages tags assigned to buckets and objects.

Run the `/opt/mapr/bin/mc tag -h` command on the command line to view the list of `mc tag` commands.

### Related reference

[mc tag set](#) on page 2819

Assigns a tag to a bucket or an object on a local cluster or a remote fabric in the global namespace.

[mc tag list](#) on page 2821

Lists tags assigned to a bucket or an object on a local cluster or a remote cluster in the global namespace.

[mc tag remove](#) on page 2823

Remove tags assigned to objects and buckets on local or remote fabric/cluster on the global namespace.

### mc tag set

Assigns a tag to a bucket or an object on a local cluster or a remote fabric in the global namespace.

### Syntax

#### CLI

USAGE:

```
/opt/mapr/bin/mc tag set [FLAGS]
TARGET TAGS
```

```

FLAGS:
  --versionid value, --vid value  set
tags on a specific object version
  -- rewind value                 set
tags on a specific object version at
specific time
  --versions                       set
tags on multiple versions for an
object
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h
show help

```

### Parameters

Parameter	Description
versionid or vid	The object version ID.
rewind	Use the rewind flag to set tags on a specific object version at specific time.
versions	Use versions to specify multiple version numbers.
target tags	the tag or tags to assign to the bucket or the object. Upto 10 tags can be assigned. Multiple tags can be separated using an ampersand. For target, use the format <alias>/<bucketname> for a local cluster and <alias>/<clustername>-<bucketname> for a remote cluster on the global namespace.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show command help.

### Examples

1. Assign tags to an object.

#### CLI

```

/opt/mapr/bin/mc tag set play/
testbucket/testobject
"key1=value1&key2=value2&key3=value3
"

```

2. Assign tags to a particular version of an object.

#### CLI

```

/opt/mapr/bin/mc tag
set --version-id
"ieQq7aXsyhlhDt47YURGlrucYY3GxWHa"
play/testbucket/testobject

```

```
"key1=value1&key2=value2&key3=value3"
"
```

3. Assign tags to a object versions older than one week.

**CLI**

```
/opt/mapr/bin/mc tag
set --versions --rewind 7d play/
testbucket/testobject
"key1=value1&key2=value2&key3=value3"
"
```

4. Assign tags to a bucket.

**CLI**

```
/opt/mapr/bin/mc tag set myminio/
testbucket
"key1=value1&key2=value2&key3=value3"
"
```

5. Assign tags to a bucket.

**CLI**

```
/opt/mapr/bin/mc tag set myminio/
testbucket
"key1=value1&key2=value2&key3=value3"
"
```

6. Assign tags to a bucket named *testbucket* on remote cluster *sales* with object store alias named *myminio*.

**CLI**

```
/opt/mapr/bin/mc tag set myminio/
sales-testbucket
"key1=value1&key2=value2&key3=value3"
"
```

7. Assign tags to the object *testobject* with version id *ieWHA* contained in the bucket named *testbucket* on remote cluster *sales* with object store alias named *myminio*.

**CLI**

```
/opt/mapr/bin/mc tag
set --version-id "ieWHa" myminio/
sales-testbucket/testobject
"key1=value1&key2=value2&key3=value3"
"
```

### mc tag list

Lists tags assigned to a bucket or an object on a local cluster or a remote cluster in the global namespace.

### Syntax

**CLI**

USAGE:

```
/opt/mapr/bin/mc tag list [COMMAND
```

```

FLAGS] TARGET

FLAGS:
  --versionid value, --vid value
list tags of a specific object version
  --rewind value
list tags of a specific object
version at specific time
  --versions
list tags on all versions for an
object
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h
show command help

```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store deployment for which the tags are to be listed. This parameter is mandatory. For target, use the format <alias>/<bucketname> for a local cluster and <alias>/<clustername>-<bucketname> for a remote cluster on the global namespace.
versionid or vid	The object version ID for which tags are to be listed
rewind	Use the rewind flag to list tags on a specific object version at specific time
versions	Use versions to specify multiple versions
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show command help.

## Examples

- Lists tags assigned to an object.

### CLI

```
/opt/mapr/bin/ mc tag list myminio/
testbucket/testobject
```

- List the tags assigned to particular version of an object.

### CLI

```
/opt/mapr/bin/mc tag
list --version-id
"ieQq7aXsyhlhDt47YURGlrucYY3GxWHa"
myminio/testbucket/testobject
```

- List the tags assigned to an object versions that are older than one week.

**CLI**

```
/opt/mapr/bin/mc tag
list --versions --rewind 7d myminio/
testbucket/testobject
```

- List the tags assigned to an object in JSON format.

**CLI**

```
/opt/mapr/bin/ mc tag list --json
myminio/testbucket/testobject
```

- List the tags assigned to a bucket in JSON format.

**CLI**

```
/opt/mapr/bin/ mc tag list --json
s3/testbucket
```

- List the tags assigned to a bucket in a cluster named *sales* in JSON format.

**CLI**

```
/opt/mapr/bin/ mc tag list --json
s3/testbucket
```

- List the tags assigned to a bucket named *testbucket* on a fabric named *sales* associated with object store alias *myobjstore*

**CLI**

```
/opt/mapr/bin/ mc
tag list myobjstore/
sales-testbucket
```

- List the tags assigned to the object *testobject* from the bucket named *testbucket* on the fabric named *sales* associated with the object store alias *myobjstore*

**CLI**

```
/opt/mapr/bin/ mc tag
list myobjstore/sales-testbucket/
testobject
```

**mc tag remove**

Remove tags assigned to objects and buckets on local or remote fabric/cluster on the global namespace.

**Syntax****CLI**

```
USAGE:
/opt/mapr/bin/mc tag remove [FLAGS]
TARGET

FLAGS:
--versionid value, --vid value
remove tags of a specific object
version
--rewind value
remove tags of a specific object
version at specific time
--versions
```

```

remove tags on all versions for an
object
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h          show
command help

```

## Parameters

Parameter	Description
TARGET	The alias of a configured HPE Ezmeral Object Store deployment for which the tags are to be removed. This parameter is mandatory. For target, use the format <alias>/<bucketname> for a local cluster and <alias>/<clustername>-<bucketname> for a remote cluster on the global namespace.
versionid or vid	The object version ID for which to tags are to be listed
rewind	Use the rewind flag to list tags on a specific object version at specific time
versions	Use versions to specify multiple version numbers
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show command help.

## Examples

1. Remove the tags assigned to an object named *testobject* in a local cluster bucket named *testbucket*, on an object store with alias *myobjstore*.

### CLI

```

/opt/mapr/bin/ mc tag remove
myobjstore/testbucket/testobject

```

2. Remove the tags assigned to a particular version of an object.

### CLI

```

/opt/mapr/bin/mc tag
remove --version-id
"ieQq7aXsyhlhDt47YURGlrucYY3GxWHa"
myminio/testbucket/testobject

```

3. Remove the tags assigned to an object named *testobject* on bucket named *testbucket* for object versions that are older than one week on an object store with alias *myobjstore*.

### CLI

```

/opt/mapr/bin/mc tag
remove --versions --rewind 7d
myobjstore/testbucket/testobject

```

- Remove the tags assigned to a bucket named *testbucket* on the local cluster on an object store with alias *myobjstore*.

CLI

```
/opt/mapr/bin/mc tag remove
myobjstore/testbucket
```

- Remove the tags assigned to a bucket named *testbucket* on the remote fabric named *sales* on an object store with alias *myobjstore*.

CLI

```
/opt/mapr/bin/mc tag
remove myobjstore/
sales-testbucket
```

- Remove the tags assigned to the object *testobject* for object version *ieQa* in the bucket named *testbucket* on the remote fabric named *sales* on an object store with alias *myobjstore*.

CLI

```
/opt/mapr/bin/mc tag
remove --version-id
"ieQa" myobjstore/sales-testbucket/
testobject
```

## Utilities

Contains information about various scripts and utilities, that help setup, maintain, and monitor clusters.

The following scripts and utilities help you configure clusters, setup cross cluster security, setup storage pools, monitor CLDB activity, perform consistency checks and repair errors on volumes and snapshots, and maintain clusters with ease.

Script or Utility	Description
<b>Cluster Configuration</b>	
<a href="#">configure.sh</a> on page 2826	Describes the syntax and parameters of the <code>configure.sh</code> script that you run for a number of tasks, including setting up Data Fabric client nodes, and configuring services for a node.
<a href="#">configure-crosscluster.sh</a> on page 2841	Sets up cross-cluster security between two clusters.
<a href="#">disksetup</a> on page 2870	Formats specified disks for use by Data Fabric storage, and adds those disks to the <code>disktab</code> file.
<a href="#">mrconfig</a> on page 2925	Lets you create, remove, and manage storage pools, disk groups, and disks; and provides information about containers.
<a href="#">fcdebug</a> on page 2877	Dynamically sets the loglevel to debug a library.
<b>Auditing and Monitoring</b>	
<a href="#">cldbguts</a> on page 2858	Monitors CLDB activity. This utility prints information about the CLDB service that is running on the node from which you run the utility.
<a href="#">ectool</a> on page 2873	Dumps or checks the validity of the stripelets in the backend volume that is associated with the volume configured for warm tiering.

Script or Utility	Description
<a href="#">expandaudit</a> on page 2874	Expands IDs captured in the audit logs to their corresponding names.
<a href="#">fsck</a> on page 2879	Detects and fixes inconsistencies in the filesystem.
<a href="#">gfsck</a> on page 2881	Performs consistency checks and appropriate repairs on a volume, or a volume snapshot.
<a href="#">mapr-support-collect.sh</a> on page 2909	Collects information about a cluster's recent activity, to help sHPE support diagnose problems.
<a href="#">mapr-support-dump.sh</a> on page 2914	Collects node and cluster-level information for the node on which you invoke the script.
<a href="#">mrdirectorystats</a> on page 2971	Prints the space usage for each directory, for a container.
<a href="#">mrfscmd</a> on page 2974	Returns the path to the file specified by ID (fid).
<a href="#">stubfuse</a> on page 2975	Determines the read and write performance of a FUSE mount point.
<b>Authentication</b>	
<a href="#">maprlogin</a> on page 2918	Authenticates logins to secure Data Fabric clusters.

**configure.sh**

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Ezmeral Data Fabric client nodes, and configuring services for a node.

**NOTE:** The `configure.sh` script must always be run as `root`.

You run `configure.sh` to [set up a HPE Ezmeral Data Fabric cluster node](#), or to [set up a HPE Ezmeral Data Fabric client node for communication with one or more clusters](#). You can also run `configure.sh` to update the configuration of a node. For example, you can use `configure.sh` to [change the services running on a node](#), or specify the [user that runs HPE Ezmeral Data Fabric services](#).

**ATTENTION:** On a Windows client, the `configure.sh` script is named `configure.bat`. The script requires the `-c` parameter and does not accept the `-z` parameter, but otherwise works similarly as on a Linux client.

**Steps Performed by configure.sh**

`configure.sh` performs the following steps, each time you run it:

- **Updates `/opt/mapr/conf/mapr-clusters.conf` with the cluster name.** It creates or modifies a line in `/opt/mapr/conf/mapr-clusters.conf` containing a cluster name followed by a list of CLDB nodes. New entries are added to `mapr-clusters.conf` when the cluster name passed to the `-N` parameter is different from the existing cluster name in that file.
- **Checks that the node has at least 4GB of RAM, and that the `/tmp` and `/opt` partitions each have at least 1 GB of free space.** If these conditions are not met, the script asks for confirmation before continuing.
- **Disables standard NFS daemons.** If the node has the `mapr-nfs` role, the script disables the standard Linux NFS daemon, since both NFS processes cannot run on the same node.
- **Updates additional `*.conf` and `*.xml` files related to the cluster and the services running on the node.** For example, `yarn-site.xml`, `warden.conf`, and `cldb.conf` may be updated based on input to `configure.sh`.

- **On cluster nodes, it creates a group named *shadow*, adds the HPE Ezmeral Data Fabric user to this group, and then enables members of the *shadow* group to view the */etc/shadow* file.** Read access to the */etc/shadow* file enables HPE Ezmeral Data Fabric users to authenticate with the HPE Ezmeral Data Fabric cluster.
- **Starts newly installed services.** Automatically starts new services, if Warden is running at the time you run `configure.sh`.
- **All changes to configuration options or system files are logged to */opt/mapr/logs/configure.log*.** You can use the `-L` parameter to specify a different log file name.

When you include disk-setup options (`-D` or `-F`) on nodes with the `mapr-fileserver` role, the script performs the following additional steps:

- **Runs disksetup to create the disktab file.** `configure.sh` takes the values that you specify in the `-disk-opts` option, and passes the value to `disksetup`. For example, if you include `-disk-opts FW5` when you run `configure.sh`, `configure.sh` runs `disksteup -F -W5`. If `disksetup` fails, `configure.sh` exits with an error.
- **Starts Zookeeper and Warden.** When the `configure.sh` script starts services, the message `starting <servicename>` is echoed to the standard output to enable the user to see which services are starting. When Warden starts, the Warden and ZooKeeper services are added to the `inittab` file as the first available `inittab` IDs, enabling these services to restart automatically on failure.

You can specify the `-no-autostart` option to prevent the script from starting Zookeeper or Warden when you run `configure.sh` with the `-F` or `-D` options.

## Syntax

```
/opt/mapr/server/configure.sh
-C <cldb_list>
-Z <zookeeper_list>
-EZ <ext_zookeeper_list>
[<parameters>]
```

```
/opt/mapr/server/configure.sh
-C <cldb_list>
[ -M <cldb_mh_list ...> ]
-Z <zookeeper_list>
[<parameters>]
```

```
/opt/mapr/server/configure.sh
-c
[ -R ]
[<parameters>]
```

```
/opt/mapr/server/configure.sh
-R
[ -c ]
[<parameters>]
```

## Options

**-C**

Use the `-C` option for CLDB servers that only have a single IP address. This option takes a comma-separated list of the CLDB nodes that this

machine uses to connect to the HPE Ezmeral Data Fabric cluster. The list is in the following format:

```
hostname[:port_no]
[,hostname[:port_no]...]
```

**-c**

Specifies client setup. The `-c` option is required, while the `-z` option is optional. See [set up a HPE Ezmeral Data Fabric client node for communication with one or more clusters](#).

**-EZ**

The `-EZ` option is optional when configuring the cluster, and is not applicable when configuring a client. This option takes a comma-separated list of the external IP addresses of the ZooKeeper nodes in the cluster. The list is in the following format:

```
hostname[:port_no]
[,hostname[:port_no] ...]
```

**-M**

Use the `-M` option only for multihomed CLDB servers that have more than one IP address. This option takes a comma-separated list of the multihomed CLDB nodes that this machine uses to connect to the HPE Ezmeral Data Fabric cluster. The list is in the following format:

```
hostname[:port_no][,
hostname[:port_no]...]
```

**-R**

After initial node configuration, specifies that `configure.sh` should use the previously configured ZooKeeper and CLDB nodes. The `-c` and `-z` parameters are not required when you specify `-R`. When `-R` is specified, the CLDB credentials are read from `mapr-clusters.conf`, while the ZooKeeper credentials are read from `warden.conf`. Use the `-R` option when you make changes to the services configured on a node without changing the CLDB and ZooKeeper nodes. Specify the `--noRecalcMem` parameter to skip recalculating memory settings when refreshing roles.

**NOTE:** This parameter impacts the JMX parameters in `/opt/mapr/conf/env_override.sh` in the following ways:

- When you set `MAPR_JMXLOCALBINDING` to `true`, running `/opt/mapr/server/configure.sh -R` sets `MAPR_JMXAUTH` to `false`, since JMX is only accessible from the local machine and does not require authentication.
- When you set `MAPR_JMXLOCALBINDING` to `false` but set `MAPR_JMXLOCALHOST` to `true`, running `/opt/mapr/server/configure.sh -R` sets `MAPR_JMXAUTH` to `true` and `MAPR_JMXSSL` to `false`, since JMX is only accessible from the local network and does not require secure authentication.
- When you set `MAPR_JMXLOCALBINDING` to `false` but set `MAPR_JMXREMOTEHOST` to `true`, running `/opt/mapr/server/configure.sh -R` sets `MAPR_JMXAUTH` to `true` and `MAPR_JMXSSL` to `true`, since JMX is now accessible remotely and requires secure authentication.

**-z**

The `-z` option is required unless you specify the `-c` (lowercase), or the `-R` option. The `-z` option takes a comma-separated list of the ZooKeeper nodes in the cluster. The list is in the following format:

```
hostname[:port_no]
[,hostname[:port_no]...]
```

## Parameters

**-certdomain**

Specifies a DNS domain for generated SSL wildcard certificates. This domain overrides the default DNS domain.

**--create-user | -a**

Creates a local user to run HPE Ezmeral Data Fabric services, using the user specified either with the `-u` parameter, or from the environment variable `$MAPR_USER`.

**-D**

Specifies a comma-delimited [list of disks](#) to use with the HPE Ezmeral Data Fabric filesystem. With the `-D` option, you cannot specify partitions. By default, the `configure.sh` script automatically starts cluster services, after the configuration finishes successfully. If you do not want cluster services to be restarted, include the `-no-autostart` option along with the `-D` option.

**-d**

The host and port of the MySQL database to use for storing HPE Ezmeral Data Fabric Metrics data.

**-dare**

Enables on-disk encryption at the cluster-level. When run on the first CLDB node with the `-genkeys` option, the utility generates the data-at-rest encryption master key file at `/opt/mapr/conf/dare.master.key`.

<b>-defaultdb</b>	<p>Sets the default database (HBase or HPE Ezmeral Data Fabric Database) to which the HBase clients connect. If you do not explicitly configure this option, it defaults to <code>hbase</code> (HBase) when you have <code>mapr-hbase-regionserver</code> or <code>mapr-hbase-master</code> installed on the node. Otherwise, it defaults to <code>maprdb</code> (HPE Ezmeral Data Fabric Database). You can also change the database setting using <code>hbase-site.xml</code> or the HBase client connection. For more information, see <a href="#">Configure the Default Database for HBase Clients</a> on page 4143.</p>
<b>-disk-opts</b>	<p>Denotes <a href="#">disksetup</a> formatting options. Do not include spaces or commas between the disksetup options. For example, you can specify <code>-disk-opts FW5</code> to format the disks (F), and configure five disks per storage pool (W5).</p>
<b>-disablessl</b>	<p>Disables SSL for ZooKeeper nodes on <b>secure clusters</b>.</p> <p>The new ZooKeeper (ZK version 3.8.3) supports SSL encryption for server-to-server communication. When you install a new clean 6.2 secure cluster, SSL between ZooKeeper servers is enabled automatically.</p> <p>However when you perform a rolling upgrade, few nodes are upgraded to data-fabric 6.2 (with the new ZooKeeper server), while other nodes still run the old data-fabric 6.1, where the ZooKeeper is at version 3.4.11 and is incapable of using SSL.</p> <p>You must disable SSL using this option, to get this hybrid cluster to work. You must enable SSL for ZooKeeper only AFTER you upgrade all nodes to data-fabric 6.2.</p> <p>You can use this option even when refreshing roles. For example: <code>configure.sh -R -disablessl</code>.</p> <p><b>Running <code>configure.sh</code> without this option enables SSL.</b> To turn on SSL:</p> <ol style="list-style-type: none"> <li>1. Shutdown the cluster.</li> <li>2. On every ZooKeeper node, run <code>configure.sh -R</code> (without this <code>disablessl</code> parameter).</li> <li>3. Start the cluster.</li> </ol> <p>The <code>sslQuorum</code> parameter in <a href="#">zoo.cfg</a> on page 3008 controls whether or not the ZooKeeper nodes can use SSL for communication.</p> <p>To verify that ZooKeeper nodes are communicating over SSL, check the ZooKeeper log for messages such as <i>SSL handshake complete with ...</i> and/or <i>Accepted TLS connection from...</i></p>
<b>-dp</b>	<p>Specifies the password for logging into the MySQL database used for storing HPE Ezmeral Data Fabric Metrics data.</p>
<b>-ds</b>	<p>Specifies the name of the database schema to use for the MySQL database used for storing HPE Ezmeral Data Fabric Metrics data. The default schema name is <i>metrics</i>.</p>

<b>-du</b>	Specifies the username for logging into the MySQL database used for storing HPE Ezmeral Data Fabric Metrics data.
<b>-EP</b>	<p>Specifies an option that is passed directly to an ecosystem <code>configure.sh</code> script. These commands follow the form <code>-EP&lt;ecosystem component name&gt; &lt;option&gt;</code>. In general, <code>-EP</code> options are not documented, and should be used only if the documentation specifically instructs you to use them.</p> <p>In HPE Ezmeral Data Fabric 6.0 and later, some ecosystem components have their own <code>configure.sh</code> scripts. The server <code>configure.sh</code> script or a user, can pass options directly to the ecosystem component by using the <code>-EP</code> syntax. For example, in the following command:</p> <pre style="background-color: #f0f0f0; padding: 5px;">/opt/mapr/server/ configure.sh -R -EPkibana '-kibanaPort 5610'</pre> <p><code>-EPkibana '-kibanaPort 5610'</code> changes the default port for Kibana to 5610.</p> <p>As ecosystem components are updated more frequently than HPE Ezmeral Data Fabric Core (which contains the server <code>configure.sh</code> script), implementing some <code>configure.sh</code> functions through an ecosystem <code>configure.sh</code> script can accelerate the introduction of new features.</p>
<b>-ES</b>	<p>Specifies a comma-separated list of host names or IP addresses that identify the Elasticsearch nodes. The Elasticsearch nodes can either be part of the current HPE Ezmeral Data Fabric cluster, or part of a different HPE Ezmeral Data Fabric cluster. Do not use this option when you configure a node for the first time. Use this option along with the <code>-R</code> parameter.</p> <p>The list is in the following format:</p> <pre style="background-color: #f0f0f0; padding: 5px;">hostname/IPaddress[:port_no] [,hostname/IPaddress[:port_no]...]</pre> <p> <b>NOTE:</b> The default Elasticsearch port is 9200. If you want to use a different port, specify the port number when you list the Elasticsearch nodes.</p>
<b>-ESDB</b>	<p>Specifies a non-default location for writing index data on Elasticsearch nodes. To configure an index location, you only need to include this parameter on Elasticsearch nodes.</p> <p>Elasticsearch requires a lot of disk space. Therefore, a separate filesystem for the index is recommended. It is not recommended to store index data under the <code>/</code> or the <code>/var</code> file system.</p> <p>For more information, see <a href="#">Log Aggregation and Storage</a> on page 1754.</p>
<b>-F</b>	Specifies a path to a text file that <a href="#">lists the disks and partitions to use with the HPE Ezmeral Data Fabric filesystem</a> . By default, the <code>configure.sh</code>

	script automatically starts cluster services after the configuration finishes successfully. If you do not want cluster services to be restarted, include the <code>-no-autostart</code> option along with the <code>-F</code> option.
<code>-f</code>	Specifies that the node should be configured without performing the system prerequisite check.
<code>-forceSecurityDefaults</code>	Instructs <code>configure.sh</code> to undo any custom security settings for a cluster, and reconfigure security to the default HPE Ezmeral Data Fabric value <code>-secure</code> . You must specify the <code>-secure</code> option. Using the <code>-forceSecurityDefaults</code> option removes the <code>/opt/mapr/conf/.customSecure</code> file. Use the following syntax:
	<pre> /opt/mapr/server/ configure.sh -forceSecurityDefaults [ -secure ] -C &lt;CLDB_node&gt; -Z &lt;ZK_node&gt; </pre>
	For more information, see <a href="#">Customizing Security in HPE Ezmeral Data Fabric</a> on page 1933.
	 <b>IMPORTANT:</b> It is possible that the <code>-forceSecurityDefaults</code> operation might not undo all custom security settings since <code>configure.sh</code> cannot know all of the custom settings that were implemented. Therefore, you might have to edit some configuration files and settings to restore the cluster to full functionality.
<code>-G</code>	The group ID to use when creating <code>\$MAPR_USER</code> with the <code>-create-user</code> or <code>-a</code> option; corresponds to the <code>-g</code> or <code>-gid</code> option of the <code>useradd</code> command in Linux.
<code>-g</code>	The group name under which HPE Ezmeral Data Fabric services run.
<code>-genkeys</code>	Generates needed keys and certificates for the initial CLDB node in a secure cluster. If specified with the <code>-dare</code> option, the <code>-genkeys</code> option generates a master key at <code>/opt/mapr/conf/dare.master.key</code> on the first CLDB node. Without the master key, you cannot start the cluster, nor can you access the data.
<code>-H</code>	Specifies the HTTPS port number for connecting to the CLDB node. The default port is 7443.
<code>-HS</code>	Specifies the IP or hostname of the node in the cluster that performs the HistoryServer role. This parameter is required only when a node in the cluster performs the HistoryServer role. In HPE Ezmeral Data Fabric 5.1 and later, this parameter is expanded to support the Mesos DNS-style name with format for Job History. The format is <code>&lt;myriad-fwk-name&gt;.mesos</code> . For example, if the <code>-MF</code> parameter is <code>myriadA</code> , the name is: <code>jobhistory.myriadA.mesos</code> . Myriad is not supported in HPE Ezmeral Data Fabric 6.2.0 and later.
<code>--isvm</code>	Specifies the virtual machine setup. Required when <code>configure.sh</code> is run on a cluster node, that is on a virtual machine. This option configures the script to use less memory.

<code>-J</code>	Specifies the <a href="#">JMX</a> port for the CLDB. Default: 7220
<code>-JMXEnable</code>	Globally enables JMX support for services on the node. JMX is enabled by default.
<code>-JMXDisable</code>	Globally disables JMX support for services on the node.
<code>-JMXLocalBindingEnable</code>	Enables local binding for JMX connections.
<code>-JMXLocalBindingDisable</code>	Disables local binding for JMX connections.
<code>-JMXLocalHostEnable</code>	Enables the local-host TCP port for JMX. This setting is mutually exclusive with <code>JMXRemoteHostEnable</code> .
<code>-JMXLocalHostDisable</code>	Disables the local-host TCP port for JMX.
<code>-JMXRemoteHostEnable</code>	Enables the remote TCP port for JMX. This setting is mutually exclusive with <code>JMXLocalHostEnable</code> .
<code>-JMXRemoteHostDisable</code>	Disables the remote TCP port for JMX.
<code>-K   -kerberosEnable</code>	Indicates that <a href="#">Kerberos security has been enabled</a> . Kerberos security is disabled by default.
<code>-keycloak</code>	<p>Installs the Keycloak identity and access management (IAM) solution. Installing Keycloak is optional. Keycloak provides single-sign-on (SSO) support for the Data Fabric. Using the <code>-keycloak</code> parameter installs a preconfigured version of Keycloak on all nodes in the cluster. However, the Keycloak server is started on only one node.</p> <p>Keycloak is preconfigured with a single user (the <code>admin</code> user) and the following roles:</p> <ul style="list-style-type: none"> <li>• Fabric manager</li> <li>• Infrastructure Administrator</li> <li>• Developer user</li> </ul> <p>You can add new users or integrate your LDAP directory with Keycloak. See <a href="#">Adding New Users to Keycloak</a> on page 1026 and <a href="#">Integrating Your LDAP Directory with Keycloak</a> on page 1033.</p> <p>Keycloak installation creates a single client, the <code>edf-client</code>, which is the dedicated client for the Data Fabric. In Keycloak, a <i>client</i> is an application or service that can request authentication for a user. Keycloak installation also gives you access to the Keycloak admin portal. For more information, see <a href="#">Accessing the Keycloak Administration Console</a> on page 1022.</p>
<code>-L</code>	Specifies a log file. If not specified, <code>configure.sh</code> logs errors to <code>/opt/mapr/logs/configure.log</code> .
<code>-label</code>	<p><i>Default Value:</i> default</p> <p>Possible Values: Any registered label</p> <p>Description: The label to use for the storage pool. See <a href="#">Using Storage Labels</a> on page 1306 for more information on labels.</p> <p>The label should contain only the following characters:</p> <pre>A-Z a-z 0-9 _ - .</pre>

**ATTENTION:** This option is meant to be run **ONLY** on CLDB nodes. However, if you intend to use this option on data nodes, ensure that you first [register the label](#) on the data node before using this option.

<code>--logHTTPFS</code>	Specifies the hostname to enable centralized logging using <code>fluentd</code> .
<code>-MCL</code>	Specifies the top-level directory where all the staging data as well as shuffle data is written for a specific Myriad framework. Used when multiple clusters are implementing Myriad. Myriad is not supported in HPE Ezmeral Data Fabric 6.2.0 and later.
<code>-MP</code>	Specifies the name of the Myriad framework that is displayed in the Mesos UI. Myriad is not supported in HPE Ezmeral Data Fabric 6.2.0 and later.
<code>-MHA</code>	Enables Myriad high availability. Myriad is not supported in HPE Ezmeral Data Fabric 6.2.0 and later.
<code>-M7</code>	Deprecated as of HPE Ezmeral Data Fabric 4.0.1.
<code>-maprpam</code>	When specified, the <code>configure.sh</code> script installs the HPE Ezmeral Data Fabric version of Pluggable Authentication Modules (PAM). This option is ignored if <code>-S</code> is not set.
<code>-N</code>	<p>Specifies the cluster name. If you do not specify a name, <code>configure.sh</code> applies a default name (<code>my.cluster.com</code>) to the cluster. Whenever you run <code>configure.sh</code>, be aware of the existing cluster name or names in <code>mapr-clusters.conf</code> and specify the <code>-N</code> parameter accordingly. If you specify a name that does not exist, a new line is created in <code>mapr-clusters.conf</code> and is treated as a configuration for a separate cluster.</p> <p>Subsequent runs of <code>configure.sh</code> without the <code>-N</code> parameter operate on this default cluster. If you specify a name when you first run <code>configure.sh</code>, you can modify the CLDB and ZooKeeper settings corresponding to the named cluster by specifying the same name and running <code>configure.sh</code> again. Whenever you need to re-run <code>configure.sh</code> on a given cluster (to add or rename nodes, for example), be sure to specify the same cluster name that you used when you ran <code>configure.sh</code> for the first time.</p>
<code>-no-autostart</code>	Specifies that the script should not start Zookeeper or Warden when you run <code>configure.sh</code> .
<code>-no-auto-permission-update</code>	Pass this option to prevent HPE Ezmeral Data Fabric from silently altering permissions in <code>/etc/shadow</code> .
<code>-nocerts</code>	When specified, the <code>configure.sh</code> script does not generate SSL certificates even when the <code>-genkeys</code> option is specified.
<code>-noDB</code>	Specifies that HPE Ezmeral Data Fabric Database is not in use.
<code>--noRecalcMem</code>	Skips recalculating memory settings when refreshing roles. Can be used only with the <code>-R</code> option.
<code>-OT</code>	Specifies a comma-separated list of host names or IP addresses that identify the OpenTSDB nodes. The

OpenTSDB nodes can be part of the current HPE Ezmeral Data Fabric cluster or part of a different HPE Ezmeral Data Fabric cluster. Do not use this option when you configure a node for the first time. Use this option along with the `-R` parameter. The Warden service must be running when you use `configure.sh -R -OT`.

Use the following format to list the hostnames:

```
hostname/IP address[:port_no]
[,hostname/IP address[:port_no]...]
```

**NOTE:** The default OpenTSDB port is 4242. If you want to use a different port, specify the port number when you list the OpenTSDB nodes.

`-on-prompt-cont`

Specify:

- `y` to automatically respond Yes to all prompts.
- `n` to automatically respond No to all prompts.

`-P`

Specifies the Kerberos instance that is used to form a CLDB Kerberos principal in the form of `mapr/<instance-name>@<realm-name>`. Enclose this value in quotes (""). This value is ignored if Kerberos security is not enabled.

`-QS`

Use the `-QS` option to configure the OJAI Distributed Query Service. See [Configure the OJAI Distributed Query Service](#) on page 233.

`-removePasswordsInXML`

Can be used during an upgrade as part of the `configure.sh -R` command to remove the clear-text passwords stored in the Hadoop configuration files (`ssl-client.xml` and `ssl-server.xml`). During an upgrade, the passwords are retained for backward compatibility with some ecosystem services. To make the cluster more secure, you can use `-removePasswordsInXML` to remove the passwords from the `.xml` files on a node. See [Removing Clear-Text Passwords After Upgrade](#) on page 1809.

`-RM`

In HPE Ezmeral Data Fabric 5.1, this parameter is expanded to support the Mesos DNS-style hostname for Myriad configuration. The Mesos-style hostname is `<application name>.marathon.mesos`. When starting ResourceManager from Marathon, the `.<application name> rm`, for example, is `rm.marathon.mesos`.

In HPE Ezmeral Data Fabric 4.0.2, this parameter is not required unless you want to configure manual or automatic failover; zero configuration failover is enabled by default. In HPE Ezmeral Data Fabric 4.0.1, this parameter specifies the nodes in the cluster with the ResourceManager role.

List the nodes in the following format:  
hostname[,hostname]...]

For more information, see [ResourceManager High Availability](#) on page 1971. Myriad is not supported in HPE Ezmeral Data Fabric 6.2.0 and later.

<b>-s   -secure</b>	Specifies that this cluster is a secure cluster, and configures security on the platform and on all ecosystem components that support security. Default: <code>secure</code> .
<b>-storepasswd &lt;keypass&gt;:&lt;trustpass&gt;</b>	<p>Generates credential stores, like the <code>-genkeys</code> parameter, but uses the given key or trust store passwords (or files containing passwords) to create the certificates. After configuring the primary (<code>-genkeys</code>) server, you can use this parameter to configure additional servers. See <a href="#">Enabling Security</a> on page 1770. The <code>-storepasswd</code> parameter does not create the CLDB, DARE, or master keys, which must be copied from the primary CLDB node.</p> <p>The <code>-storepasswd</code> parameter is not needed for homogenous clusters (where all nodes are FIPS enabled or all nodes are non-FIPS-enabled). In homogenous clusters, the credential files can be copied and do not need to be regenerated. However, in operations on a non-homogenous cluster – for example, when adding a FIPS-enabled node to a non-FIPS cluster – you must use the <code>-storepasswd</code> parameter. There is no other way for the FIPS-enabled node to obtain the credential files.</p> <p>Note that for client operations (for example, when adding a FIPS client to a non-FIPS cluster), the <code>&lt;keypass&gt;</code> value is not needed, and the command can be issued as</p> <pre>configure.sh -c -storepasswd :MyTrustPassword</pre> <p>For more information, see <a href="#">Configuring a FIPS Client for a Secure Non-FIPS Server</a> on page 417.</p>
<b>-syschk</b>	Configures the system checks to be enabled or disabled. Value: Y/N.
<b>-TL</b>	Specifies the single node on which the timeline server is installed for the Hive-on-Tez user interface. When you install Tez manually, you must also install the timeline server and run <code>configure.sh -TL &lt;timeline_server_node&gt;</code> on all nodes to indicate where the timeline server resides.
<b>-U</b>	The user ID to use when creating <code>\$MAPR_USER</code> with either the <code>--create-user</code> or <code>-a</code> option; corresponds to the <code>-u</code> or <code>--uid</code> option of the <code>useradd</code> command in Linux.
<b>-u</b>	The user name under which HPE Ezmeral Data Fabric services run.
<b>-v</b>	In addition to logging information, also prints to <code>stdout</code> .
<b>HSM Parameters - For more information, see <a href="#">Setting Up the External KMIP Keystore</a> on page 892</b>	
<b>-hsm</b>	<p>Performs HSM configuration. This will always run the <a href="#">mrhsm init</a> on page 909 command to initialize the HSM if not already initialized. The <code>-hsmlabel</code> option is required if the <code>-hsm</code> option is specified for the first time.</p> <p>When used with the <code>-genkeys</code> option, <code>-hsm</code> invokes the <a href="#">mrhsm enable</a> on page 899 command to generate the CLDB and also the DARE keys if the <code>-dare</code> option is specified.</p>

	Otherwise, <code>-hsm</code> configures the settings specified by the <code>-hsmip</code> , <code>-hsmport</code> , <code>-hsmcacert</code> , <code>-hsmclientcert</code> , <code>-hsmclientkey</code> and <code>-hsmkmipversion</code> options, but does not enable the HSM feature or generate any keys.
<code>-hsmip &lt;ip-address&gt;</code>	The comma-separated list of host names or IP addresses of the external HSM. This parameter is required only when no IP addresses have been configured, or when you need to modify the IP addresses of the external HSM.
<code>-hsmport &lt;port&gt;</code>	The KMIP port of the external HSM. This parameter is optional. If omitted, this defaults to the standard KMIP port of 5696.
<code>-hsmcacert &lt;/path/to/cert&gt;</code>	The full path name of the file containing the HSM CA certificate downloaded from the HSM. This parameter is required only when no CA certificate has been configured, or when we need to modify the CA certificate.
<code>-hsmclientcert &lt;/path/to/cert&gt;</code>	The full path name of the file containing the KMIP-enabled client certificate. This parameter is required only when no client certificate has been configured, or when you need to modify the client certificate.
<code>-hsmclientkey &lt;/path/to/key&gt;</code>	The full path name of the file containing the KMIP-enabled client key. This parameter is required only when no client key has been configured, or when you need to modify the client key.
<code>-hsmlabel &lt;label&gt;</code>	The KMIP token label. This is an ASCII string which is used to describe the KMIP token and can range from 1 to 32 characters, e.g. Utimaco ESKM. This parameter is only needed when initializing the KMIP token for the first time. It is ignored for subsequent invocations.
<code>-hsmsopin &lt;so-pin&gt;</code>	PIN for the Security Officer (SO). This should be between 4 to 255 characters inclusive. The SO PIN is set in the KMIP token during the initial invocation. In subsequent invocations, the SO PIN entered into this utility must match the configured SO PIN. If this argument is not specified, you will be prompted to enter it. For more information about the SO PIN, see <a href="#">About the SO PIN</a> on page 920.
<code>-hsmkmipversion &lt;version&gt;</code>	The KMIP version number to use for all communication with the external KMIP-enabled key store. Supported values are 1.0, 1.1, 1.2, 1.3 and 1.4. The default value is 1.1.

At the end of the `configure.sh` script, the HSM should be up and running, when you use the HSM parameters. Use the [mrhsm info](#) on page 903 command to check the HSM status.

Protection of Java key stores is NOT supported in the HSM for HPE Ezmeral Data Fabric 6.2. In later releases, `configure.sh` will generate PKCS#12 key stores instead of JCEKS key stores.

**NOTE:** The `--ipv6-support` and the `-6` parameter to enable IPv6 on a fabric in Ezmeral Data Fabric v7.6 has been deprecated. Use the [cluster feature enable](#) on page 2036 command to enable IPv6.

## Examples

1. **Add a node (not CLDB or ZooKeeper) to a cluster that is running the CLDB and ZooKeeper on three nodes:**

On the new node, run the following command:

```
/opt/mapr/server/configure.sh -C nodeA,nodeB,nodeC -Z nodeA,nodeB,nodeC
```

2. **Configure a client to work with cluster `my.cluster.com`, which has one CLDB at nodeA:**

On a Linux client, run the following command:

```
/opt/mapr/server/configure.sh -N my.cluster.com -c -C nodeA
```

On a Windows 7 client, run the following command:

```
C:\opt\mapr\server\configure.bat -N my.cluster.com -c -C nodeA
```

3. **Add a second cluster to the configuration:**

On a node in the second cluster `your.cluster.com`, run the following command:

```
/opt/mapr/server/configure.sh -C nodeZ -N your.cluster.com -Z  
<zKNodeA,zKNodeB,zKNodeC>
```

4. **Add CLDB servers with multiple IP addresses to a cluster:**

In this example, the cluster `my.cluster.com` has CLDB servers at nodeA, nodeB, nodeC, and nodeD. The CLDB servers nodeB and nodeD have two NICs each at `eth0` and `eth1`.

On a node in the cluster `my.cluster.com`, run the following command:

```
/opt/mapr/server/configure.sh -N my.cluster.com -C  
nodeAeth0,nodeCeth0 -M \  
nodeBeth0,nodeBeth1 -M nodeDeth0,nodeDeth1 -Z zknodeA
```

## 5. Start a cluster in secure mode using `configure.sh`

In this example, the cluster `my.cluster.com` has two CLDB servers at `nodeA` and `nodeB`. The ZooKeeper node for this cluster is at `nodeC`. To start the cluster in secure mode, run the following command on `nodeA`:

```
/opt/mapr/server/configure.sh -N my.cluster.com -C nodeA,nodeB -Z  
nodeC -secure \  
    -genkeys -F <disklist file>
```

This command creates the `ssl_truststore`, `ssl_keystore`, and `maprserverticket` files. Copy these files from `nodeA`'s `/opt/mapr/conf` directory to `nodeB`'s `/opt/mapr/conf` directory.

On `nodeB`, change the permissions on the `ssl_keystore` and `maprserverticket` files to 600 (the `mapr` user) by using the following command:

```
chmod 600 ssl_keystore maprserverticket
```

On the `ssl_truststore` file, change the permissions to 644 (world readable):

```
chmod 644 ssl_truststore
```

On `nodeB`, run the following command:

```
/opt/mapr/server/configure.sh -N mycluster.com -C nodeA,nodeB -Z  
nodeC -secure -F \  
    <disklist file>
```

## 6. Configure HSM:

A sample session transcript using the `/opt/mapr/server/configure.sh` script with DARE enabled is as follows. The portions in **bold** relate to the common HSM features, while the portions in *italics* relate to the DARE-specific features:

```
# /opt/mapr/server/configure.sh -secure -genkeys -N
test96.cluster.com -C perfnode96.lab:7222 -Z perfnode96.lab:5181 -F
disks.txt -dare -hsm -hsmip 10.10.30.129 -hsmlabel "SafeNet
KeySecure" -hsmopin 12345678 -hsmclientcert /root/safenet-keysecure/
client.pem -hsmcacert /root/safenet-keysecure/CA.pem -hsmclientkey /root/
safenet-keysecure/key.pem
create /opt/mapr/conf/conf.old
CLDB node list: perfnode96.lab:7222

To stop and start this node, use "systemctl start/stop mapr-warden "
No need to set label returning from SetDiskLabel
```

### Troubleshooting configure.sh

When you run `configure.sh` with the `-OT` option for the first time, you might encounter an error message such as **directory /opt/mapr/conf/proxy is not owned by root**. You must ignore this transient error

message. If you repeatedly see this error during client operations, then re-run `configure.sh` with the `-R` option.

### configure-crosscluster.sh

Use the `configure-crosscluster.sh` utility to set up cross-cluster security between two clusters.

You can use the [configure-crosscluster.sh](#) on page 2841 utility to set up cross-cluster security between two clusters. When you run this utility with the `create` subcommand, it establishes security between the local cluster and a remote cluster. After the setup, communication between the two clusters is bi-directional. You can run this utility on any node in the source cluster to grant secure access to users and servers (for replication, or mirroring) on the destination cluster.

The utility prompts for the passwords for both the local and remote clusters. All hosts on a cluster must have the same password. Alternatively, you can use `ssh` public key authentication between the current node and the other nodes in the local and remote clusters.

### Prerequisites

Before running this utility, you must:

- Enable wire-level security for both the local and remote clusters.  
Set `secure=true` in your cluster entry for `/opt/mapr/conf/mapr-clusters.conf`, for both the local and remote clusters.
- Ensure that the local and remote cluster are either all non-FIPS-enabled nodes or all FIPS-enabled nodes. See [FIPS Support](#) on page 2845 later on this page.
- Install the `pssh` (Parallel SSH) package from EPEL.
- Install the `expect` package.

If you plan to use a user other than the `mapr` administrative user for mirroring or gateway/streams replication, that user must already exist on both the local and remote clusters.

### Permissions

In release 7.0.0 and later, the `configure-crosscluster.sh` script returns an error if it is run by a user other than the cluster owner (as configured in `/${MAPR_HOME}/conf/daemon.conf`). For example, an error is generated if you run the script as the `root` superuser:

```
# /opt/mapr/server/configure-crosscluster.sh create all \
  -remoteip my_ip_addr.mycorp.net \
  -localtruststorepassword QHj9NmFyZ_j9_BUnyooEWa898a_xNvQY \
  -remotetruststorepassword 0KH3gbF05XTYOTjLQPGXCibtGDpI_Di
User is root. This script must be run as the cluster owner mapr
```

### Syntax

```
/opt/mapr/server/configure-crosscluster.sh create <cross-cluster-type>
[ -localcrossclusteruser <user> ]
[ -localhosts <path_to_file> ]
[ -localport <port_number> ]
[ -localtruststorepassword <password> ]
[ -remotetruststorepassword <password> ]
[ -localuser <user> ]
[ -recover <id> ]
[ -remotecrossclusteruser <user> ]
[ -remotehosts <port_number> ]
-remoteip <ip_address>
[ -remoteport <port_number> ]
[ -remoteuser <user> ]
```

### Required Parameters

In release 7.0.0 and later, the trust store passwords are no longer in plain text, and the `configure-crosscluster.sh` script cannot automatically retrieve them. Therefore, you must provide the passwords:

#### **localtruststorepassword**

Password for the local trust store. Beginning with release 7.0.0, this parameter is required if the `ssl-server.xml` file does not contain the plain-text password.

#### **remotetruststorepassword**

Password for the remote trust store. Beginning with release 7.0.0, this parameter is required.

### Type Parameters

The `<cross-cluster-type>` parameter specifies the type of entity for which cross-cluster access must be established. The value can be one of the following:

#### **user**

Used for direct data access for the given user. When you run the utility with the `user` parameter, it performs the following tasks on both the clusters:

1. Updates the `/opt/mapr/conf/mapr-clusters.conf` file to include the first entry from the `/opt/mapr/conf/mapr-clusters.conf` file on the other cluster.

- Imports the certificate of the other cluster in the `/opt/mapr/conf/ssl_truststore` file, and copies the updated `/opt/mapr/conf/ssl_truststore` file to all the other nodes on the cluster.

**server**

Used for data-fabric server access such as mirroring and replication. When you run the utility with the `server` parameter, it performs the following tasks on both the clusters:

- Generates a cross-cluster ticket on this cluster for the other cluster, and copies the ticket to the CLDB node on the other cluster.
- Merges the ticket with the `/opt/mapr/conf/maprserverticket` file on the node on the other cluster, and copies the updated `/opt/mapr/conf/maprserverticket` file to all the other CLDB nodes on the other cluster.

**all**

Used for both user and server access. When you run the utility with the `all` parameter, it performs the following actions on both the clusters:

- Updates the `/opt/mapr/conf/mapr-clusters.conf` file to include the first entry from the `/opt/mapr/conf/mapr-clusters.conf` file on the other cluster.
- Imports the certificate of the other cluster in the `/opt/mapr/conf/ssl_truststore` file, and copies the updated `/opt/mapr/conf/ssl_truststore` file to all the other nodes on the cluster.
- Generates a cross-cluster ticket for the other cluster, copies the ticket to the CLDB node on the other cluster, merges the ticket with the `/opt/mapr/conf/maprserverticket` file on the node in the other cluster, and copies the updated `/opt/mapr/conf/maprserverticket` file to all other CLDB nodes on the other cluster.

**Options**

The `configure-crosscluster.sh` on page 2841 utility supports the following options:

**localcrossclusteruser**

*Default value:* local user

This option applies only to the `server` parameter. Specifies the name of the local cross-cluster user if different from the local user, for mirroring and replication of tables, and streams.

**localhosts**

*Default value:* No Default Value

Contains the full or relative path to the file containing the list of IP addresses or host names of the hosts to update in the local cluster. Specify one host per line in the file, excluding the current host. If you specify this option, the utility updates the configuration, both on the host on which you are running the utility, and on the

other nodes specified in the file. If you do not specify this option, the utility copies both the:

- Updated server security configuration in the `/opt/mapr/conf/maprserverticket` file to only the CLDB nodes in the local cluster.
- Updated user security configuration in the `/opt/mapr/conf/mapr-clusters.conf` file, and the `/opt/mapr/conf/ssl_truststore` file, to all the nodes in the local cluster.

**localport**

*Default value:* 22

Indicates the port to use to connect (using `ssh` or `scp`) to local cluster hosts.

**localuser**

*Default value:* `mapr`

Specifies the name of the user for the local cluster.

**recover**

*Default value:* No Default Value

Defines the option to recover from the failure to copy files to nodes in the local or remote cluster, due to failed cluster nodes. Use the special ID keyword `latest` to run with the contents of the most recent run. See [Troubleshooting and Recovery](#) on page 2849 for more information.

**remotecrossclusteruser**

*Default value:* `remote user`

This option applies only to the server parameter. Specifies the name of the remote cross-cluster user, if different from the remote user.

**remotehosts**

*Default value:* No Default Value

Contains the full or relative path to the file containing the list of IP addresses or host names of the hosts to update in the remote cluster. Specify one host per line in the file. If you do not specify this option, the utility copies both the:

- Updated server security configuration in the `/opt/mapr/conf/maprserverticket` file to only the CLDB nodes in the remote cluster.
- Updated user security configuration in the `/opt/mapr/conf/mapr-clusters.conf` file, and the `/opt/mapr/conf/ssl_truststore` file, to all the nodes in the remote cluster.

For example, if you have a file `myhosts.txt` in the current directory with the following contents:

```
10.10.20.100
10.10.20.101
10.10.20.102
```

then, specify `-remotehosts myhosts.txt` for this parameter.

**ATTENTION:** All hosts specified in this file must be directly reachable from the local hosts from which you run the [configure-crosscluster.sh](#) on page 2841 utility.

<b>remoteip</b>	<i>Default value:</i> No Default Value This option is mandatory. Specifies the host name or IP address of a host in the remote cluster.
<b>remoteport</b>	<i>Default value:</i> 22 Indicates the port to use to connect (using <code>ssh</code> or <code>scp</code> ) to remote cluster hosts.
<b>remoteuser</b>	<i>Default value:</i> local user Designates the name of the user for the remote cluster.

## FIPS Support

In release 7.0.0 and later, the `configure-crosscluster.sh` script supports FIPS clusters subject to the following limitations:

- Both the local and remote cluster must have nodes with the same FIPS setting. This means that one of the following statements is true:
  - All nodes in the local and remote cluster are secure non-FIPS nodes.
  - All nodes in the local and remote cluster are FIPS-enabled nodes.
- `configure-crosscluster.sh` with the basic options does not support mixed configurations consisting of combinations of FIPS and non-FIPS nodes. However, mixed configurations can be supported using manual steps. See [Configuring Cross-Cluster Security for a Mixed \(FIPS and Non-FIPS\) Configuration](#) on page 1952.

## Verification

To verify that cross-cluster security is correctly set up, perform one of the following actions:

- If you ran the utility using the cross-cluster type `user` or `all`, and the utility completed successfully, you should be able to run remote commands from the local node after obtaining a user ticket using the `maprlogin` on page 2918 utility. See [Configuring Secure Clusters for Running Commands Remotely](#) on page 1943 for more information.
- If you ran the utility using the cross-cluster type `server` or `all`, and the utility completed successfully, you should be able to perform various service operations from the local to the remote cluster and vice versa, including mounting volumes over NFS, mirroring volumes, and replicating tables and streams. See [Configuring Secure Clusters for Cross-Cluster Mirroring and Replication](#) on page 1946 for more information.

## Sample Session

To configure cross-cluster security, run the utility on a CLDB host with wire-level security enabled, :

```
# /opt/mapr/server/configure-crosscluster.sh create all -remoteip
10.10.30.96
Remote IP is 10.10.30.96
WARNING: Strict host key checking will be disabled for this script.
Local user unset, defaulting to mapr
Remote user unset, defaulting to local user mapr
Enter password for mapr user (mapr) for local cluster:
Enter password for mapr user (mapr) for remote cluster:
Local cross-cluster user unset, defaulting to local user mapr
Remote cross-cluster user unset, defaulting to remote user mapr
Verifying connectivity to 10.10.30.96 and presence of mapr-clusters.conf
MapR credentials of user 'mapr' for cluster 'myCluster.cluster.com' are
written to '/tmp/maprticket_0'
```

```

Local host is running the CLDB
chyelinl01.cluster.com secure=true qa-cnode101.lab:7222
Configuring cross-cluster communication for users
Certificate stored in file </tmp/mapr-xcs/29668/local_mapcert>
Certificate stored in file </tmp/mapr-xcs/29668/remote_mapcert>

Certificate was added to keystore
Configuring cross-cluster communication for server-side operations
Generating cross-cluster ticket for user mapr on remote node
Generating cross-cluster ticket for mirroring for user mapr
MapR credentials of user 'mapr' for cluster 'myCluster.cluster.com' are
written to '/tmp/mapr-xcs/29668/local_crosscluster_ticket'
SUCCESS
This script has logged in to both the local and remote clusters. Please log
out of
the clusters if needed.

```

## Cleanup

After running the utility, you must perform two cleanup actions:

1. Log out of the local and remote clusters if needed, using the `maprlogin logout` command.
2. Delete the `/tmp/mapr-xcs` directory, if it is present, after verifying that the cross-cluster setup is correct.

If you run this utility without the `-recover` option, the utility creates temporary files in the `/tmp/mapr-xcs` directory under the current process ID. These directories contain sensitive information such as server tickets that are protected by Unix permissions. The utility preserves these tickets, so that you can perform troubleshooting and recovery actions, as needed. You must delete this directory after verifying that the cross-cluster setup is correct:

```
$ /bin/rm -rf /tmp/mapr-xcs
```

## Post-Configuration Tasks

After you run this utility, cross-cluster security should be successfully set up between the local and the remote cluster. If you specified either the `user` or `all` cross-cluster type when running the utility, to perform any operations on the remote cluster from the local node, login to the remote cluster to obtain a user ticket using the `maprlogin` on page 2918 command.

```
$ maprlogin password -cluster <remote-cluster-name>
```

**NOTE:** You must obtain a new ticket when your current ticket expires.

## Examples of Using the Cross-Cluster Utility

For examples on how to run the `configure-crosscluster.sh` on page 2841 utility, see [Configure-crosscluster.sh Examples](#) on page 2847.

### More information

[Configure-crosscluster.sh Examples](#) on page 2847

Demonstrates how to use the `configure-crosscluster.sh` utility.

[Troubleshooting and Recovery](#) on page 2849

## Configure-crosscluster.sh Examples

Demonstrates how to use the `configure-crosscluster.sh` utility.

This section contains some examples to show how to run the `configure-crosscluster.sh` utility.

These examples are valid only for installations in which:

- Both the local and remote clusters consist of all FIPS-enabled nodes.
- Both the local and remote clusters consist of all non-FIPS-enabled nodes.

The examples are not valid for installations in which a local or remote cluster has a mix of FIPS and non-FIPS-enabled nodes. To configure cross-cluster security where local and/or remote clusters consist of a combination of FIPS and secure non-FIPS nodes, see [Configuring Cross-Cluster Security for a Mixed \(FIPS and Non-FIPS\) Configuration](#) on page 1952.

### Example 1

Release 7.0.0 and later require specifying passwords for the local and remote trust stores:

```
$ /opt/mapr/server/configure-crosscluster.sh create all \
  -localtruststorepassword kfSLfzJSIkv_DH7EK \
  -remotetruststorepassword m83SymAwcRXD1MndJFXXpha1008HD0eC \
  -remoteip 10.163.166.251
```

### Example 2

Suppose both the local and remote cluster administrator usernames are `mapr`, and both the local and remote cross-cluster users for mirroring and gateway/streams replication are also `mapr`, specify only the `-remoteip` argument for a fresh run:

```
$ /opt/mapr/server/configure-crosscluster.sh create server \
  -localtruststorepassword kfSLfzJSIkv_DH7EK \
  -remotetruststorepassword m83SymAwcRXD1MndJFXXpha1008HD0eC \
  -remoteip 10.10.1.1
```

### Example 3

Assume that the local cluster administrator username defaults to `mapr`, and the remote cluster administrator username defaults to the local cluster administrator username. Specify different user names for the local and remote cluster administrator using the `-localuser` and `-remoteuser` arguments. For example, if the local cluster administrator username is `admin` and the remote cluster administrator username is `mapr`:

```
$ /opt/mapr/server/configure-crosscluster.sh create server \
  -localtruststorepassword kfSLfzJSIkv_DH7EK \
  -remotetruststorepassword m83SymAwcRXD1MndJFXXpha1008HD0eC \
  -remoteip 10.10.1.1 \
  -localuser admin \
  -remoteuser mapr
```

### Example 4

Assume that the local cross-cluster user defaults to the local cluster administrative user, and the remote cross-cluster user defaults to the remote cluster administrative user. To use a different cross-cluster user for mirroring or gateway/streams replication, specify the `-localcrossclusteruser`

and/or `-remotecrossclusteruser` parameters. For example, if the local cross-cluster username is `crosscluster`, run the utility as follows:

```
$ /opt/mapr/server/configure-crosscluster.sh create server \
  -localtruststorepassword kfSLfzJSIkv_DH7EK \
  -remotetruststorepassword m83SymAwcRXD1MndJFXXpha1008HD0eC \
  -remoteip 10.10.1.1 \
  -localcrossclusteruser crosscluster
```

### Example 5

By default, the utility performs `ssh` and `scp` operations between the node where the utility is running and the other nodes in the local and remote clusters, using the default SSH port 22. To use a non-default SSH port, either for the local or remote clusters, specify the port number using the `-localport` or the `-remoteport` option. For example, if the SSH port for the local cluster is 10022, run the utility as follows. The remote SSH port is the default value of 22 if the `-remoteport` argument is not specified:

```
$ /opt/mapr/server/configure-crosscluster.sh create server \
  -localtruststorepassword kfSLfzJSIkv_DH7EK \
  -remotetruststorepassword m83SymAwcRXD1MndJFXXpha1008HD0eC \
  -remoteip 10.10.1.1 \
  -localport 10022
```

### Example 6

By default, the utility runs the `maprcli node list` command on both the local and remote nodes to determine the list of hosts in the local and remote clusters, and updates the configuration for all the nodes in the local and remote clusters. To update the configuration only for a subset of nodes in either the local or remote cluster, such as when you want to update only the CLDB nodes, specify the path to the file containing the list of hosts, one per line, using the `-localhosts` and `-remotehosts` options respectively. For example, to update the configuration for only the local nodes specified in the file `/tmp/local` and the remote nodes specified in the file `/tmp/remote`, run:

```
$ /opt/mapr/server/configure-crosscluster.sh create server \
  -localtruststorepassword kfSLfzJSIkv_DH7EK \
  -remotetruststorepassword m83SymAwcRXD1MndJFXXpha1008HD0eC \
  -remoteip 10.10.1.1 \
  -localhosts /tmp/local \
  -remotehosts /tmp/remote
```

### Example 7

To configure cross-cluster functionality for a user without setting up server cross-cluster functionality, specify `user` as the parameter. This parameter allows users to run commands such as `maprcli node list` using the `-cluster` parameter, and the remote cluster name:

```
$ /opt/mapr/server/configure-crosscluster.sh create user \
  -localtruststorepassword kfSLfzJSIkv_DH7EK \
  -remotetruststorepassword m83SymAwcRXD1MndJFXXpha1008HD0eC \
  -remoteip 10.10.1.1
```

**Example 8**

To configure both user and server cross-cluster functionality, specify `all` as the parameter, instead of `user` or `server`:

```
$ /opt/mapr/server/configure-crosscluster.sh create all \
  -localtruststorepassword kfSLfzJSIkv_DH7EK \
  -remotetruststorepassword m83SymAwcRXD1MndJFXXpha1008HD0eC \
  -remoteip 10.10.1.1
```

**Example 9**

To copy the configuration files from the most recently failed run, use the `-recover` option. To update the configuration for a specified list of local or remote hosts, use the `-recover` option together with the `-localhosts` and `-remotehosts` options.

```
$ /opt/mapr/server/configure-crosscluster.sh create server \
  -localtruststorepassword kfSLfzJSIkv_DH7EK \
  -remotetruststorepassword m83SymAwcRXD1MndJFXXpha1008HD0eC \
  -remoteip 10.10.1.103 \
  -localuser admin \
  -remoteuser mapr \
  -recover latest \
  -localhosts local \
  -remotehosts remote
```

See [Sample Failure, Troubleshooting, and Recovery Session](#) on page 2853 for more information.

**Troubleshooting and Recovery**

Typically, the utility succeeds and if the utility fails partially or completely, try the troubleshooting and recovery steps described here.

**Completely Failed Runs**

A completely failed run indicates that the utility did not set up cross-cluster communication between any of the local or remote nodes. Typical reasons for complete failure include:

- The prerequisites for running this utility were not met.  
Refer to [Prerequisites](#) on page 2841 for running this utility.
- The utility was not run as `mapr` or administrative user.  
The user running the utility must be able to run commands like `maprlogin password`, `maprlogin generateticket`, and `maprcli node list`.
- The `-localuser` option was not specified when there was a non-default username (like `admin`) for the `mapr` user on the local node.
- The `-remoteuser` option was not specified when there was a non-default username (like `admin`) for the `mapr` user on the remote node.

- The username specified in the `-localcrosscluster` option does not exist in the local cluster.  
This utility requires that the username specified in the `-localcrossclusteruser` option to exist before running the utility.
- The username specified in the `-remotecrosscluster` option does not exist in the remote cluster.  
This utility requires that the username specified in the `-remotecrossclusteruser` option to exist before running the utility.
- The wrong password was specified for the local `mapr` user for the local cluster.  
This utility uses commands like `ssh` and `scp` to access other nodes in the local cluster. So, if the public key authentication between the local node and the other nodes in the local cluster is not setup, you must have set a password for the `mapr` administrative user specified in the `-localuser` argument.
- The wrong password was specified for the remote `mapr` user for the remote cluster.  
This utility uses commands like `ssh` and `scp` to access other nodes in the local cluster. So, if the public key authentication between the local node and the node specified in the `-remoteip` option is not setup, there must be a password for the `mapr` administrative user specified in the `-remoteuser` option.

For completely failed runs, examine the log file in `/opt/mapr/logs/crosscluster.log` and the output of the latest run in `/tmp/mapr-xcs` directory. The `crosscluster.log` looks something like the following:

```
Script started at Fri Sep 29 15:56:33
PDT 2017
Entering recovery mode. Using
cross-cluster directory /tmp/mapr-xcs/
13194

ls /
opt/mapr/conf/mapr-clusters.conf
Logging in to local cluster
...

```

## Partially Failed Runs

The utility may also report partial success. The utility does not fail due to inability to copy the updated files to the nodes in the local or remote clusters, so the most likely cause of partial failure is improperly configured or failed cluster nodes.

For partially failed runs, examine the contents of the latest run in `/tmp/mapr-xcs` directory in addition to the contents of the `/opt/mapr/logs/crosscluster.log` file.

In the following example, the latest run of the utility is in `/tmp/mapr-xcs/13194`, since this directory has the most recent modification date:

```

[admin@node95 ~]# ls -lt /tmp/mapr-xcs
total 8
drwx----- 14 mapr mapr 4096 Sep 29
15:49 13194
drwx----- 30 mapr mapr 4096 Sep 29
14:44 23802

```

The following is the sample content in `/tmp/mapr-xcs/13194`:

```

[admin@node95 mapr-xcs]# ls -l 13194
total 52
-rw-r--r-- 1 mapr mapr 59 Sep 29
15:49 local_clusterentry

15:56 STATUS

```

## Troubleshooting

1. Look at `/tmp/mapr-xcs/<latest>/STATUS`. A non-zero value indicates an overall error.
2. If you encounter a non-zero overall status, look at the `STATUS` files in each of the subdirectories.
3. For the subdirectories reporting a non-zero status, look at the contents of the files in that subdirectory.
4. If there is an error in updating the local cluster hosts, and you did not use the `-localhosts` option when running the script, also look at `/tmp/mapr-xcs/<latest>/localclusterhosts.txt` file.

The `/tmp/mapr-xcs/<latest>/localclusterhosts.txt` file contains the list of IP addresses of the local cluster hosts, which is the first IP address of each node if there are multiple IP addresses, obtained from the following command:

```
maprcli node list -cluster <local-cluster-name> -columns hostname
```

Verify the contents of the file to ensure that the list of local cluster hosts is correct. The original output of the above command is in `/tmp/mapr-xcs/<latest>/localclusterhosts_full.txt`, and you should also check the output to ensure that the list is correct. Otherwise, fix the errors and re-run the script with the `-localhosts` option.

5. If there is an error in updating the remote cluster hosts, and you did not use the `-remotehosts` option when running the script, you should also look at `/tmp/mapr-xcs/<latest>/remoteclusterhosts.txt` file.

The `/tmp/mapr-xcs/<latest>/remoteclusterhosts.txt` file contains the list of IP addresses of remote cluster hosts, which is the first IP address of each node if there are multiple IP addresses, obtained from the following command:

```
ssh <remoteuser>@<remote-ip> maprcli node list -cluster  
<remote-cluster-name> -columns hostname
```

Verify the contents of the file to ensure that the list of remote cluster hosts is correct. The original output of the above command is in `/tmp/mapr-xcs/<latest>/remoteclusterhosts_full.txt`, and you should also check the output to ensure that the list is correct. Otherwise, fix the errors and re-run the script with the `-remotehosts` option.

6. If you have an error copying to some or all of the local or remote cluster hosts, try doing an `ssh` to the local or remote cluster host (respectively) to ensure that it is accessible using the supplied username and password. If this fails, the copy operation in the script will also fail, since it relies on either public key authentication or username/password authentication to access the nodes. Specify the correct username and/or password and then re-run the script.

### Sample Failure, Troubleshooting, and Recovery Session

Suppose the utility is run where one of the nodes in the local cluster (10.10.30.96) has a password that is different from other local cluster nodes, causing the `ssh` and `scp` commands to this node to fail.

1. Run the utility on the local node (10.10.30.95).

The highlighted text below are the warning messages. The utility continues to run, despite the warnings, to update the cross-cluster configuration on as many nodes as possible:

```
[admin@node95 cross-cluster]$ /opt/mapr/server/configure-crosscluster.sh

An error has been encountered in configuring cross-cluster communication.
For more information, refer to the log file at /opt/mapr/logs/
crosscluster.log.
If the error is caused by non-functioning local and remote cluster
nodes, more information on the precise errors can be found in /tmp/
mapr-xcs/14043. The list of local cluster hosts is in /tmp/mapr-xcs/
14043/localclusterhosts.txt, and the list of remote cluster hosts is
in /tmp/mapr-xcs/14043/remotecusterhosts.txt.
In such cases, you can normally fix the error by editing the list
of local and/or remote cluster hosts file and then re-run the script
using the -r option, specifying the local or remote hosts file in
the -localhosts or -remotehosts option respectively.
This script has logged in to both the local and remote clusters. Please
log out of the clusters if needed.
```

2. Look at the specified directory, /tmp/mapr-xcs/14043, because the utility resulted in an error.

The overall status is 1 (indicating an error) as shown in bold below:

```
$ cat /tmp/mapr-xcs/14043/STATUS
1
```

3. Look at the STATUS files in each of the subdirectories to determine the content reporting error.

Content has non-zero status as shown in bold below:

```
[admin@node95 14043]$ find /tmp/mapr-xcs/14043 -print | grep STATUS |
xargs more
::::::::::::
./rpscp_clusterhosts_edir/STATUS
::::::::::::
0
::::::::::::
./lpscp_clusterhosts_edir/STATUS
::::::::::::
1 FAIL
::::::::::::
./lpssh_server_edir/STATUS
::::::::::::
1 FAIL
::::::::::::
./lpscp_server_edir/STATUS
::::::::::::
1 FAIL
::::::::::::
./rpssh_server_edir/STATUS
::::::::::::
0
::::::::::::
./rpscp_server_edir/STATUS
::::::::::::
0
::::::::::::
./STATUS
::::::::::::
1 Overall status is FAIL
```

4. Look at each of the files in the subdirectories reporting a non-zero status, for example, lpscp\_clusterhosts\_edir.

The error “lost connection” for 10.10.30.96 indicates that the local node 10.10.30.95 could not run the scp command to that node:

```
[admin@node95 14043]$ more lpscp_clusterhosts_edir/*
::::::::::::
lpscp_clusterhosts_edir/10.10.30.95
::::::::::::
lpscp_clusterhosts_edir/10.10.30.96
::::::::::::
lost connection
::::::::::::
lpscp_clusterhosts_edir/STATUS
::::::::::::
1
```

5. Try to `ssh` to that node (10.10.30.96), using the same local password used for running the utility.

The `ssh` (and therefore also `scp`) command fails:

```
[admin@node95 14043]$ ssh admin@10.10.30.96 ls
Password:
Password:
Password:
admin@10.10.30.96's password:
Permission denied, please try again.
admin@10.10.30.96's password:
Received disconnect from 10.10.30.96: 2: Too many authentication
failures for admin
```

6. Run the utility again.

The utility detects that the previous run did not complete successfully and prompts you to run the utility with the recovery option. It also detects the directories that contain the detailed error information as shown below:

```
[admin@node95 cross-cluster]$ /opt/mapr/server/configure-crosscluster.sh
create server -remoteip 10.10.1.103 -localuser admin -remoteuser mapr
Remote IP is 10.10.1.103
WARNING: Strict host key checking will be disabled for this script.
The previous run of this script with ID 14043 did not complete
successfully. Examine the error directories in /tmp/mapr-xcs/14043
for details of the error:
/tmp/mapr-xcs/14043/lpscp_clusterhosts_edir
/tmp/mapr-xcs/14043/lpscp_server_edir
/tmp/mapr-xcs/14043/lpssh_server_edir
If the failure is down to partially failed nodes, you should exit now,
and re-run this script in recovery mode using the -recover option to
copy the configured tickets and files to the remaining nodes, instead of
continuing and generating new tickets.
Exit now? Enter y to exit, or n to continue: y

Exiting. Re-run this script with the -recover option.
```

- Fix the error (in this example, by setting/changing the password for 10.10.30.96), and run the utility again with the `-recover` option to update the configuration for the previously failed operation for the local cluster node.

To copy the configuration again to all the nodes in the local and remote clusters, run the utility without the `-localhosts` and `-remotehosts` option. To rerun the utility to update the configuration for the failed nodes only, specify the IP addresses of the failed nodes only.

**NOTE:** Specify at least one node in the `-localhosts` and `-remotehosts` option. You can use hostnames instead of IP addresses, as long as you ensure that DNS is working properly between the local node you are running the utility on, and the nodes you specify in the `-localhosts` and `-remotehosts` options.

The output of the recovery session is shown below. Note that the utility returned a SUCCESS result:

```
[admin@node95 cross-cluster]$ cat local
10.10.30.96
[admin@node95 cross-cluster]$ cat remote
10.10.1.101
[admin@node95 cross-cluster]$ /opt/mapr/server/configure-crosscluster.sh
create server -remoteip 10.10.1.103 -localuser admin -remoteuser
mapr -recover latest -localhosts local -remotehosts remote
Remote IP is 10.10.1.103
WARNING: Strict host key checking will be disabled for this script.

mapr-xcs/14043/remote_maprserverticket
SUCCESS
This script has logged in to both the local and remote clusters. Please
log out of the clusters if needed.
```

### Multiple Runs of the Utility

When running the utility with the `all` or `user` argument, you may see the following error if you run the utility multiple times:

```
keytool error: java.lang.Exception: Certificate not imported, alias
<remote.cluster.com> already exists
ERROR: Unable to import remote cluster certificate from /tmp/mapr-xcs/17056/
remote_mapcert into local SSL trust store
Please delete the certificate with the same alias remote.cluster.com from
the truststore first
```

Certificates with the same alias should be imported to the trust store only once. If you are able to run commands like `maprcli volume mount` on the remote cluster from the local cluster, you can ignore this error. If you really want to re-import the remote cluster certificate into the trust store, contact HPE support.

Also, note that when you run the utility multiple times, there are at least 2 entries with the same alias in `/opt/mapr/conf/maprserverticket` file. The utility generates a new cross-cluster ticket (useful for volume mirroring and table and streams replication) every time it is run, and does not delete any tickets in `/opt/mapr/conf/maprserverticket` file. Service tickets have a long lifetime, so this can be ignored if you are able to successfully perform volume mirroring, and table and streams replication operations. However, if you want to clean up the tickets, you can do the following:

1. Delete all the tickets with the remote cluster alias in the `/opt/mapr/conf/maprserverticket` file on the local node.
2. Delete all the tickets with the local cluster alias in the `/opt/mapr/conf/maprserverticket` file on the remote node referenced in the `-remoteip` parameter.
3. Re-run the utility with the `server` argument to set up the service tickets again.

### cldbputs

Monitors the activity of the Container Location Database (CLDB). This utility prints information about the CLDB service that is running on the node from which you run the utility.

Monitoring the progress of the [container location database \(CLDB\)](#) may be useful when troubleshooting cluster issues.

The `cldbputs` utility prints information about active container reports, full container reports, registration requests, MapRHPE Ezmeral Data Fabric file system heartbeats, NFS server heartbeats, and containers. You can run `cldbputs` from any [container location database \(CLDB\)](#) node; however, running this command from the [container location database \(CLDB\)](#) master node provides the most relevant information.

**NOTE:** After you run `cldbputs`, it continues to print the output until you kill the process. To prevent `cldbputs` from printing indefinitely, specify the `-n` parameter that denotes the number of times `cldbputs` should print the output.

### Syntax:

```
/opt/mapr/bin/cldbputs [[acr | rpc | heartbeat | containers | alarms |
table | all] [-n iterations-count]
```

### Output Fields:

**NOTE:** When you run `cldbputs` without any parameters, only the `acr`, `clrpc`, `regn`, `mfs hb`, `nfs hb`, `assigns`, `roles`, `progress`, and the `con-chain` fields are displayed.

**acr**

Represents active container requests (ACR).

This column includes the following information:

- `nr`: Number of ACRs completed in the previous second. The first entry displays the total number of ACRs completed since the start of the CLDB service on the node.

- `pt`: Processing time (in milliseconds) for the ACRs completed in the previous second. The first entry displays the total time (in milliseconds) spent processing the ACRs since the start of the CLDB service on the node.
- `to`: Number of ACRs that took longer than expected in the previous second. The first entry displays the total number of ACRs that took longer than expected since the start of the CLDB service on the node.
- `d`: Number of duplicate ACRs received in the previous second. The first entry displays the total number of duplicate ACRs since the start of the CLDB service on the node.
- `dp`: Number of duplicate ACRs that required additional work in the previous second. The first entry displays the total number of duplicate ACRs that required additional work since the start of the CLDB service on the node.

**fcr**

Represents full container report (FCR).

This column includes the following information:

- `nr`: Number of FCRs completed in the previous second. The first entry displays the total number of FCRs completed since the start of the CLDB service on the node.
- `pt`: Processing time (in milliseconds) for the FCRs completed in the previous second. The first entry displays the total time (in milliseconds) spent processing the FCRs since the start of the CLDB service on the node.
- `to`: Number of FCRs that took longer than expected in the previous second. The first entry displays the total number of FCRs that took longer than expected since the start of the CLDB service on the node.

**regn**

Represents registration requests.

This column includes the following information:

- `nr`: Number of registration requests completed in the previous second. The first entry displays the total number of registration requests completed since the start of the CLDB service on the node.
- `pt`: Processing time (in milliseconds) for the registration requests completed in the previous second. The first entry displays the total time (in milliseconds) spent processing the registration requests since the start of the CLDB service on the node.

- `to`: Number of registration requests that took longer than expected in the previous second. The first entry displays the total number of registration requests that took longer than expected since the start of the CLDB service on the node.
- `d`: Number of duplicate registration requests received in the previous second. The first entry displays the total number of duplicate registration requests since the start of the CLDB service on the node.
- `dp`: Number of duplicate registration requests that required additional work in the previous second. The first entry displays the total number of duplicate registration requests that required additional work since the start of the CLDB service on the node.

**mfs hb**

Information about HPE Ezmeral Data Fabric file system heartbeats.

This column includes the following information:

- `nr`: Number of HPE Ezmeral Data Fabric file system heartbeats completed in the previous second. The first entry displays total number of HPE Ezmeral Data Fabric file system heartbeats completed since the start of the CLDB service on the node.
- `pt`: Processing time (in microseconds) for the HPE Ezmeral Data Fabric file system heartbeats completed in the previous second. The first entry displays total time (in microseconds) spent processing HPE Ezmeral Data Fabric file system heartbeats since the start of the CLDB service on the node.
- `to`: Number of HPE Ezmeral Data Fabric file system heartbeats that took longer than expected in the previous second. The first entry displays total number of HPE Ezmeral Data Fabric file system heartbeats that took longer than expected since the start of the CLDB service on the node.
- `bmc`: Number of times the Become Master Command (`bmc`) has been sent to this MFS.
- `otc`: Number of times the other commands (apart from `bmc`) has been sent to this MFS.

**nfs hb**

Information about NFS server heartbeats.

This column includes the following information:

- `nr`: Number of NFS server heartbeats completed in the previous second. The first entry displays total number of NFS server heartbeats completed since the start of the CLDB service on the node.

**assigns**

- **pt**: Processing time (in microseconds) for the NFS server heartbeats completed in the previous second. The first entry displays the total time (in microseconds) spent processing HPE Ezmeral Data Fabric file system heartbeats since the start of the CLDB service on the node.

This column includes the following information:

- **nr**: Number of container assign requests in the previous second. The first entry displays the total number of container assign requests since the start of the CLDB service on the node.
- **nc**: Number of containers created as part of the above container assign requests in the previous second. The first entry displays the total number of containers created since the start of the CLDB service on the node.
- **nrt**: Number of container assign requests for tablets in the previous second. The first entry displays the total number of container assign requests for tablets since the start of the CLDB service on the node.
- **nct**: Number of containers created as part of the above container assign requests for tablets in the previous second. The first entry displays the total number of container created in tablets since the start of the CLDB service on the node.
- **pt**: Time taken by container assignment RPC in milliseconds
- **tpt**: Time taken by container assignment tablet RPC in milliseconds
- **cas**: Number of storage pools scanned for container assignment requests

**roles**

Represents the roles of the various replica containers.

This column includes the following information:

- **bm**: Number of replica containers that are in the process of becoming master
- **ms**: Number of replica containers that the CLDB thinks have valid masters
- **wr**: Number of replica containers that are waiting for CLDB to assign a role to them
- **rs**: Number of replica containers that are re-syncing
- **vr**: Number of non-master replica containers that have finished resynchronization

- `uu`: Number of replica containers that are unused. For example, the number of replica containers that are on nodes or storage pools which have been offline or unavailable for more than an hour.

 **ATTENTION:** It may take some time for the CLDB to be aware of role changes.

### progress

This column includes the following information:

- `m%`: Percentage of containers that have valid masters
- `uc`: Number of unique containers
- `v%`: Percentage of replica containers that are valid (that is, have completed resynchronization)
- `tr`: Total number of replica containers

### con-chain

This column includes the following information:

- `ms`: Number of unique containers that have a master
- `1r`: Number of unique containers that have 2 valid copies of the data
- `2r`: Number of unique containers that have 3 valid copies of the data

### location

This column includes the following information:

- `1u`: Number of container location lookups
- `up`: Number of container location updates
- `d1`: Number of container location deletes
- `sc`: Number of container location scans

### size

This column includes the following information:

- `1u`: Number of container size lookups
- `up`: Number of container size updates
- `d1`: Number of container size deletes
- `sc`: Number of container size scans

### sptable

This column includes the following information:

- `1u`: Number of lookups on the SP-Container-Vol table
- `up`: Number of updates on the SP-Container-Vol table

- `dl`: Number of deletes on the SP-Container-Vol table
- `sc`: Number of scans on the SP-Container-Vol table

**nodes**

This column includes the following information:

- `nn`: Number of nodes in the cluster
- `of`: Number of offline nodes
- `nsp`: Number of storage pools
- `of`: Number of offline storage pools

**Example Output:**

```

/opt/mapr/bin/cldbguts all -n 3
                2019-09-15 22:08:39,981

**Related reference**

[Retrieving Tiering Statistics Using guts](#) on page 1258

Explains how to use the `guts` utility to retrieve tiering statistics.

[guts](#) on page 2892

`guts` is a tool to measure/analyse performance. In the default mode, it prints one line every second, and counts the number of operations or bytes-processed in one second intervals. `guts` is an internal utility, and is subject to change without notice.

**cldbguts acr**

The `acr` option displays active container requests (ACR).

**Syntax**

```

/opt/mapr/bin/cldbguts acr
    
```

**Output Fields**

Field	Description
nr	Number of ACRs completed in the previous 1 second. The first entry displays the total number of ACRs completed since the start of the CLDB service on the node.
pt	Processing time (in milliseconds) for the ACRs completed in the previous 1 second. The first entry displays the total time (in milliseconds) spent processing the ACRs since the start of the CLDB service on the node.
to	Number of ACRs that took longer than expected in the previous 1 second. The first entry displays the total number of ACRs that took longer than expected since start of the CLDB service on the node.
d	Number of duplicate ACRs received in the previous 1 second. The first entry displays the total number of duplicate ACRs since start of the CLDB service on the node.
dp	Number of duplicate ACRs that required additional work in the previous 1 second. The first entry displays the total number of duplicate ACRs that required additional work since start of the CLDB service on the node.

**Example Output**

```
# /opt/mapr/bin/cldbguts acr
2017-09-01 15:15:25,034
      acr
nr      pt      to      d      dp
269644  63338      0      0      0
      1      0      0      0      0
      0      0      0      0      0
```

**cldbguts containers**

The `containers` option displays information on the containers.

**Syntax**

```
/opt/mapr/bin/cldbguts containers
```

**Output Fields**

`assigns`

This column includes the following information:

Field	Description
nr	Number of ContainerAssign requests in the previous 1 second. The first entry displays the total number of ContainerAssign requests since the start of the CLDB service on the node.

Field	Description
nc	Number of containers created as part of the above ContainerAssign requests in the previous 1 second. The first entry displays the total number of containers created since the start of the CLDB service on the node.
nrt	Number of ContainerAssign requests for tablets in the previous 1 second. The first entry displays total number of ContainerAssign requests for tablets since the start of the CLDB service on the node.
nct	Number of containers created as part of the above ContainerAssign requests for tablets in previous 1 second. The first entry displays the total number of container created in tablets since the start of the CLDB service on the node.

**roles**

Represents the roles of the various replica containers. This column includes the following information:

Field	Description
bm	Number of replica containers that are in the process of becoming master
ms	Number of replica containers that the CLDB thinks have valid masters
wr	Number of replica containers that are waiting for CLDB to assign a role to them
rs	Number of replica containers that are re-syncing
vr	Number of non-master replica containers that have finished resynchronization

Field	Description
uu	Number of replica containers that are unused. For example, the number of replica containers that are on nodes or storage pools which have been offline or unavailable for more than an hour.

 **ATTENTION:** It may take some time for the CLDB to be aware of any role changes.

**progress**

This column includes the following information:

Field	Description
m%	Percentage of containers that have valid masters
uc	Number of unique containers
v%	Percentage of master + replica containers that are valid container copies
tr	Total number of replica containers

**con-chain**

This column includes the following information:

Field	Description
ms	Number of unique containers that have a master
1r	Number of unique containers that have 2 valid copies of the data
2r	Number of unique containers that have 3 valid copies of the data

**Example Output**

```
# /opt/mapr/bin/cldbguts containers
2019-10-03 03:05:15,846

```

**cldbputs heartbeat**

The `heartbeat` option displays information on the heartbeat sent by the file system and NFS.

**Syntax**

```
/opt/mapr/bin/cldbputs heartbeat
```

**Output Fields****mfs hb**

Information about Data Fabric file system heartbeats. This column includes the following information:

Field	Description
nr	Number of Data Fabric file system heartbeats completed in the previous 1 second. The first entry displays the total number of Data Fabric file system heartbeats completed since the start of the CLDB service on the node.
pt	Processing time (in microseconds) for the Data Fabric file system heartbeats completed in the previous 1 second. The first entry displays total time (in microseconds) spent processing Data Fabric file system heartbeats since the start of the CLDB service on the node.
to	Number of Data Fabric file system heartbeats that took longer than expected in the previous 1 second. The first entry displays total number of Data Fabric file system heartbeats that took longer than expected since the start of the CLDB service on the node.
bmc	Number of Become Master commands (such as <code>resync</code> , <code>reconnect</code> , etc.) sent by CLDB since the start of CLDB.

**nfs hb**

Information about NFS server heartbeats. This column includes the following information:

Field	Description
nr	Number of NFS server heartbeats completed in the previous 1 second. The first entry displays total number of NFS server heartbeats completed since the start of the CLDB service on the node.
pt	Processing time (in microseconds) for the NFS server heartbeats completed in the previous 1 second. The first entry displays the total time (in microseconds) spent processing Data Fabric file system heartbeats since the start of the CLDB service on the node.

### Example Output

```
# /opt/mapr/bin/cldbguts heartbeat
2019-10-03 03:14:56,811
      mfs hb      nfs hb
nr  pt  to  bmc  otc  nr  pt
0   0   0   0   0   0   0
0   0   0   0   0   0   0
0   0   0   0   0   0   0
```

### cldbguts rpc

The `rpc` option returns a count of the RPCs that CLDB is processing from clients.

### Syntax

```
/opt/mapr/bin/cldbguts rpc
```

### Output Fields

#### clrpc

Represents a count of the client RPCs per second. This count includes:

1. ClusterInfoProc
2. ContainerLookupProc
3. ContainerRootLookupProc

This column includes the following information:

Field	Description
nr	Number of Client RPC's completed in the previous 1 second. The first entry displays total number of client RPCs completed since the start of the CLDB service on the node.
pt	Processing time (in milliseconds) for the Client RPCs completed in the previous 1 second. The first entry displays total time (in milliseconds) spent processing the client RPCs since the start of the CLDB service on the node.
to	Number of Client RPCs that took longer than expected in the previous 1 second. The first entry displays the total number of client RPCs that took longer than expected since the start of the CLDB service on the node.

**fcr**

Represents full container report (FCR). This column includes the following information:

Field	Description
nr	Number of FCRs completed in the previous 1 second. The first entry displays total number of FCRs completed since the start of the CLDB service on the node.
pt	Processing time (in milliseconds) for the FCRs completed in the previous 1 second. The first entry displays total time (in milliseconds) spent processing the FCRs since the start of the CLDB service on the node.

Field	Description
to	Number of FCRs that took longer than expected in the previous 1 second. The first entry displays the total number of FCRs that took longer than expected since the start of the CLDB service on the node.

**regn**

Represents registration requests. This column includes the following information:

Field	Description
nr	Number of registration requests completed in the previous 1 second. The first entry displays total number of registration requests completed since the start of the CLDB service on the node.
pt	Processing time (in milliseconds) for the registration requests completed in the previous 1 second. The first entry displays the total time (in milliseconds) spent processing the registration requests since the start of the CLDB service on the node.
to	Number of registration requests that took longer than expected in the previous 1 second. The first entry displays total number of registration requests that took longer than expected since the start of the CLDB service on the node.

**Example Output**

```
# /opt/mapr/bin/cldbguts rpc
2019-10-03 03:17:48,863
      fcr          clrpc          regn
nr  pt  to      nr  pt  to  nr  pt  to
0   0   0      16116  74239  0   0   0   0
0   0   0        0    0    0   0   0   0
0   0   0        0    0    0   0   0   0
```

**disksetup**

Describes the `disksetup` command that formats disks for use by HPE Ezmeral Data Fabric storage.

## Description

 **NOTE:** The `disksetup` command must be run as `root`.

The `disksetup` command formats specified disks for use by HPE Ezmeral Data Fabric storage, and adds those disks to the `disktab` file.

You do not need to set up Redundant Array of Independent Disks (RAID) on disks used by the file system. HPE Ezmeral Data Fabric uses `disksetup` to set up storage pools. In most cases, you should let HPE Ezmeral Data Fabric calculate storage pools using the default *stripe width* of two or three disks. If you anticipate a high volume of random-access I/O, you can use the `-w` option to specify larger storage pools of up to 8 disks each.

See [Setting Up Disks for MapR](#) for more information about when and how to use `disksetup`.

 **IMPORTANT:** On RHEL 8.1, run the following command to symlink `/usr/bin/python` to `/usr/bin/python3`. The `disksetup` command fails if `/usr/bin/python` is not found.

```
sudo alternatives --set python /usr/bin/python3
```

## Syntax

```
/opt/mapr/server/disksetup
[-F]
[-G]
[-X]
[-M]
[-W <stripe_width>]
<disk list file>
```

## Options

Option	Description
-F	Forces formatting of all specified disks. Disks that are already formatted for HPE Ezmeral Data Fabric are not reformatted by <code>disksetup</code> unless you specify this option. The <code>-F</code> option fails when a filesystem has an entry in the <code>disktab</code> file, is mounted, or is in use. Call <code>maprcli disk remove</code> to remove a disk entry from the <code>disktab</code> file.
-G	Generates the <code>disktab</code> file contents from input disk list, but does not format disks. Use this option if the <code>disktab</code> file is completely lost, and you need to regenerate it based on an input list of disks assigned to MapR-FS. This option reads the GUID from the provided disks, and generates the <code>disktab</code> output to stdout. You can redirect the output to a file.
-X	Fixes <code>disktab</code> contents from <code>/proc/partitions</code> , but does not format disks. Use this option if there is a change in the names of the disk devices referenced by <code>disktab</code> , but the disks themselves are still usable. For example, if <code>/dev/sdb</code> has been renamed to <code>/dev/sdf</code> but the device itself has the same GUID, only the <code>disktab</code> contents need to be updated to point to <code>/dev/sdf</code> .

Option	Description
-M	Uses the maximum available number of disks per storage pool.
-W	Specifies the number of disks per storage pool.

## Examples

### Setting up disks specified in the file `/tmp/disks.txt`:

```
/opt/mapr/server/disksetup -F /tmp/disks.txt
```

### Reformatting all disks

To reformat all disks, remove the `disktab` file and issue the `disksetup -F` command to format the disk:

```
/opt/mapr/server/disksetup -F
```

To reformat a particular disk from the `disktab`, use the `maprcli disk remove` on page 2135 and `maprcli disk add` on page 2124 commands. For more information, see [Setting Up Disks for HPE Ezmeral Data Fabric](#) on page 1139.

### Specifying disks

To specify the disks to be formatted for use by the HPE Ezmeral Data Fabric cluster, create a text file `/tmp/disks.txt` listing the disks and partitions for use by HPE Ezmeral Data Fabric on the node. Each line lists either a single disk, or all applicable partitions on a single disk. When listing multiple partitions on a line, separate each partition by spaces. For example:

```
/dev/sdb
/dev/sdc1 /dev/sdc2 /dev/sdc4
/dev/sdd
```

Later, when you run `disksetup` to format the disks, specify the `disks.txt` file. For example:

```
/opt/mapr/server/disksetup -F /tmp/disks.txt
```

### **IMPORTANT:**

The `disksetup` command removes all data from the specified disks. Ensure that you specify the disks correctly, and that you have backed up any data that you wish to keep.

If you are re-using a node that was used previously in another cluster, be sure to format the disks to remove any traces of data from the old cluster.

### **WARNING:** Run `disksetup` on page 2870 only after you run the `configure.sh` on page 2826 .

### Test Purposes Only: Using a Flat File for Storage

When setting up a small cluster for evaluation purposes, if a particular node does not have physical disks or partitions available to dedicate to the cluster, you can use a flat file on an existing disk partition as the node's storage. Create at least a 16GB file, and include a path to the file in the disk list file for the `disksetup` on page 2870 script.

The following example creates a 20 GB flat file (bs=1G specifies 1 gigabyte blocks, multiplied by count=20) at /root/storagefile:

```
dd if=/dev/zero of=/root/storagefile bs=1G count=20
```

Next, add the following entry to the disk list file /tmp/disks.txt to be used by disksetup:

```
/root/storagefile
```

### ectool

Dumps or checks the validity of the stripelets in the backend volume that is associated with the volume configured for warm tiering.

You can use the /opt/mapr/server/tools/ectool utility to dump or check the validity of the stripelets in the backend volume that is associated with the volume configured for warm tiering.

### Syntax

```
/opt/mapr/server/tools/ectool <cmd> <params>
```

### Commands

Command	Description
dumpStripelet	Dumps the content of a stripelet to the given file.
listStripes	Lists all the stripes in a given container.
validateStripe	Validates if the given parity stripelet is valid and matches with other stripelets of the stripe.
validateCG	Iterates over all the stripes of the Container Group and checks the validity using the rebuild operation.
getFid	Returns the fid for a Virtual Cluster Descriptor (VCD) ID.

### Parameters

Parameter	Description
cid	The ID of the container.
fid	The ID of the file.
file	The path to the file.
volid	The ID of the (backend) volume, referred to as ecstorevolume in the CLI output, associated with the tier. The ID can be retrieved using the <a href="#">volume info</a> on page 2632 command. For example: <pre> /opt/mapr/bin/maprcli volume info -name a4 -json   grep ecstorevolume "ecstorevolume": "mapr.internal.ec.a4.873 79483", /opt/mapr/bin/maprcli volume info -name mapr.internal.ec.a4.87379483 -json   grep volumeid "volumeid": 105118862, </pre>
vcdid	The ID of the Virtual Cluster Descriptor (VCD).

## Usage

```
/opt/mapr/server/tools/ectool dumpStripelet volid fid file
/opt/mapr/server/tools/ectool listStripes volid cid
/opt/mapr/server/tools/ectool validateStripe volid fid
/opt/mapr/server/tools/ectool validateCG volid cid
/opt/mapr/server/tools/ectool getFid cid vcid
```

## Examples

**Dump the stripelet content to the file `/tmp/t` for the file specified by ID `2271.160.131606` in the volume specified by ID `116581327`:**

```
# /opt/mapr/server/tools/ectool dump 116581327 2271.160.131606 /tmp/t
Stripelet Read done!
```

**List all the stripes in the container specified by ID `2271` for the volume specified by ID `116581327`:**

```
# /opt/mapr/server/tools/ectool list 116581327 2271
Inum:160 Uniq:131606 Size:4194304
Inum:161 Uniq:131608 Size:4194304
Inum:162 Uniq:131610 Size:4194304
```

**Validates if the given stripelet matches with other stripelets of the stripe for the file specified by ID `2271.160.131606` in the volume specified by ID `116581327`**

```
# /opt/mapr/server/tools/ectool validateStripe 116581327 2271.160.131606
Valid Stripe
```

**For the container specified by ID `2271`, validate if all stripelets match with other stripelets of the corresponding stripe:**

```
# /opt/mapr/server/tools/ectool validateCG 116581327 2271
Inum:160 Valid Stripe
Inum:161 Valid Stripe
Inum:162 Valid Stripe
```

## expandaudit

Describes how to use the `expandaudit` utility to expand IDs captured in the audit logs to their corresponding names.

As you perform operations on the directories, files, and tables that you are auditing, the audit logs capture records of those operations. Those records identify the affected directories, files, and tables by means of file IDs, the volumes on which the operations took place by means of volume identifiers, and the users who performed the operations by means of user IDs. These IDs are used instead of names in the audit records because fetching the actual names of these objects and users in real-time is costly in terms of performance.

You can use the `expandaudit` utility to create copies of your logs files in which the IDs are resolved into names and inserted into the audit records.

This utility acts on audit logs that exist in the current data-fabric cluster at the time that the utility is run.

## Restrictions

This utility operates on audit logs for file system operations and HPE Ezmeral Data Fabric Database operations, which are logged in a local data-fabric volume on each node where the operations are performed. These operations are logged in `FSAudit` and `DBAudit` log files.

File identifiers are converted to names only when either of the following conditions is met:

- The file exists at the time that `expandaudit` is run.
- The file has been deleted but the deletion of the file was logged and the log files being processed by `expandaudit` include the record of the file deletion.

If a volume is deleted, `expandaudit` does not convert identifiers for files that were in the volume unless the creation of the volume and files were logged.

If the creation of a file is audited and the file is later renamed, the file ID is converted to the current name.

## Permissions

Although the permissions on the tool are 755, the tool generates output only when run by `root` or the user `mapr`.

## Syntax

```
/opt/mapr/bin/expandaudit
expandaudit

[-volumename volume name]
[-volumeid volume ids. Either volume name or id must be specified]
-o output directory
[-i input directory]
[-d Specify for deleted volumes only]
[-cluster cluster name]
[-t number of threads used for parallel expansion across cluster
nod
es. default 10]
For deleted volumes, user specified volume name will be used during
expansion
```

## Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
d	Required for deleted volumes as it indicates that the volume is deleted. If you specify this parameter, you must specify a volume ID to be used during expansion. The deleted volume is tracked by the specified volume ID. You can optionally specify a volume name. This specified volume name is used for the expanded output.

Parameter	Description
o	<p>The directory in the data-fabric file system in which to create the copies of the audit logs. The directory must already exist.</p> <p>The directory structure is:</p> <pre>&lt;output directory&gt;/&lt;volume id&gt;/&lt;node&gt;/ &lt;day&gt;/&lt;expanded audit log files&gt;</pre> <p>The file names are the same as the names of the input files, though you might see the following extensions:</p> <ul style="list-style-type: none"> <li><code>.part</code>: If present, this extension is on the log file with the most recent date. The input log file that corresponds to this output file might still have been receiving new audit records at the time that the <code>expandaudit</code> utility was run. If the utility is run again with the same output directory, the utility will update the <code>.part</code> file by including the most recent records and converting the identifiers in those records.</li> <li><code>.pending</code>: This extension indicates files that contain one or more identifiers that the utility could not convert.</li> </ul> <p> <b>NOTE:</b> Sometimes, you might see a combination of these two types of files, <code>part.pending</code>, which indicates that there is a problem converting identifiers in the most recent audit file.</p>
i	The input directory for location of cluster audit logs. The default value is <code>/var/mapr/local/</code> .
t	The number of threads to use for parallel expansion across cluster nodes. The default value is 10.
volumename	The name of the volume being audited. You must specify either the <code>volumename</code> or the <code>volumeid</code> parameter.
volumeid	The ID of the volume being audited. You must specify either the <code>volumename</code> or the <code>volumeid</code> parameter.

### Sample Expansion of a Record for File System Operations

#### Original record

```
{ "timestamp" :
  { "$date" : "2015-06-06T13:02:23.746Z" }, "operation" : "GETATTR", "uid" : "1", "ipAddress" :
  "10.10.104.53", "srcFid" : "2049.652.263696", "volumeId" : 68048396, "status" : 0 }
```

#### Record processed by the `expandaudit` utility

```
{ "timestamp" :
  { "$date" : "2015-06-06T13:02:23.746Z" }, "operation" : "GETATTR", "user" :
  "userA", "uid" : "1", "ipAddress" : "10.10.104.53", "srcPath" : "/customers/
  US_Western_Region.json",
  "srcFid" : "2049.3296.268968", "volumeName" : "data_analysis", "volumeId" : 68048396,
  "status" : 0 }
```

**! ATTENTION:** Here, `uid` expands to `user`, `srcFid` expands to `srcPath`, and `volumeID` expands to `volumeName`. The original fields are also preserved in the output.

## Sample Expansion of a Record for HPE Ezmeral Data Fabric Database Table Operations

### Original record

```
{ "timestamp" :
  { "$date" : "2015-06-06T13:08:54.474Z" }, "operation" : "DB_PUT", "uid" : "1", "ipAddress" :
  "10.10.104.51", "volumeId" : 68048396, "columnFamily" : "fam63", "columnQualifier" :
  "col_96", "tableFid" :
  "2049.56.262518", "status" : 0 }
```

### Record processed by the expandaudit utility

```
{ "timestamp" : { "$date=2015-06-06T13:08:54.474Z" }, "operation" : "DB_PUT", "user" :
  "userA", "uid" :
  "1", "ipAddress" : "10.10.104.51", "volumeName" : "mapr.cluster.root", "volumeId" : "
  68048396",
  "columnFamily" : "fam63", "columnQualifier" : "col_96", "tablePath" : "/
  mytable", "tableFid" : "2049.56.262518",
  "status" : "0" }
```

**! ATTENTION:** Here, `uid` expands to `user`, `volumeID` expands to `volumeName`, and `tableFid` expands to `tablePath`. The original fields are also preserved in the output.

### fcdebug

Dynamically sets the log level to debug a library.

You can modify the `core-site.xml` file to set the log level of all modules using the `fs.mapr.trace` property. However, you must restart FUSE for the change to take effect. As an alternative, you can use the `fcdebug` utility to debug a specific library (at runtime) without restarting FUSE.

**NOTE:** You may have to run this command once per library (to debug).

### Syntax

```
/opt/mapr/server/tools/fcdebug [-i] [-p <process ID>] [-s <shm ID>] [-m
  <module>] [-l <level>] [-o <slowOpsTraceThreshold>]
```

### Parameters

Parameter	Description
-i	Lists the current debug level of all modules.
-l	Specifies the log level. Value can be one of the following: FATAL, ERROR, WARN, INFO, DEBUG.  <b>NOTE:</b> If you do not specify the log level, the default level is applied for the module.

Parameter	Description
-m	Specifies the module for which the log level is to be set. You can retrieve the list of modules with the <code>fcdebug -i -p &lt;process ID&gt;</code> or the <code>fcdebug -i -s &lt;shmid&gt;</code> command.   <b>NOTE:</b> If you do not specify the module, the log level is set on all modules.
-o	For RPCs, we use the <code>-o</code> parameter to rate limit error messages.  Default value: 0 milliseconds (no error messages are printed)  Value of <code>x</code> milliseconds indicates that error messages are printed every <code>x</code> milliseconds. There is no limit to the maximum value.
-p	Specifies the process ID of either the file client, or the FUSE-based POSIX client.
-s	Specifies the shared memory ID (shmid) of either the file client, or the FUSE-based POSIX client.

 **ATTENTION:** Specify either the `process ID` (`-p`) or the `shmid` (`-s`) option. If you specify both the options, only the `shmid` (`-s`) option is used.

### Examples

The following command retrieves the list of modules:

Note: Use either the `-p` or the `-s` option.

```
/opt/mapr/server/tools/fcdebug -i -p 196614 (OR)
/opt/mapr/server/tools/fcdebug -i -s 335020032
```

 **NOTE:** You can run this command after dynamically setting the log level to verify the setting.

The following command dynamically sets the log level to `DEBUG` on the given module:

Note: Use either the `-p` or the `-s` option.

```
/opt/mapr/server/tools/fcdebug -p 196614 -m FuseOps -l DEBUG (OR)
/opt/mapr/server/tools/fcdebug -s 335020032 -m FuseOps -l DEBUG
```

 **NOTE:** It may take up to 30 seconds for the changes to take effect.

The following command sets the log level to `DEBUG` on all the modules:

Note: Use either the `-p` or the `-s` option.

```
/opt/mapr/server/tools/fcdebug -p 196614 -l DEBUG (OR)
/opt/mapr/server/tools/fcdebug -s 335020032 -l DEBUG
```

The following command resets the log level to the default value on all the modules:

Note: Use either the `-p` or the `-s` option.

```
/opt/mapr/server/tools/fcdebug -p 196614 (OR)
/opt/mapr/server/tools/fcdebug -s 335020032
```

**fsck**

Detects and fixes inconsistencies in the filesystem.

Use the filesystem check (fsck) utility to detect and fix inconsistencies in the filesystem.

Every storage pool has its own log to journal updates to the storage pool. The system performs all operations to a storage pool transactionally by journaling all operations to the log, before applying them to storage pool metadata. If file system is not shutdown cleanly, some metadata blocks may not persist. However, on the next load of the storage pool, log recovery takes care of these metadata blocks by replaying the records in the log. The fsck utility also replays the log before it checks the metadata consistency in a storage pool. The fsck utility walks the storage pool in question to verify all MapR filesystem metadata (and data correctness if specified on the command line), and reports all potentially lost or corrupt containers, directories, tables, files, filelets, and blocks in the storage pool. The fsck utility:

- Checks whether all files and directories are reachable and all directory entries are valid.
- Checks whether BTrees are consistent for various inode types (such as files and directories).
- Walks the container file and visits every inode in the container to check that no block is owned by two inodes. Also, verifies the consistency of bitmaps of inodes and blocks.
- Checks consistency of snapshots.
- Visits every allocated block in the storage pool and recovers any blocks that are part of corrupted inodes.
- Checks consistency of HPE Ezmeral Data Fabric Database metadata.
- Checks consistency of tabletmap, tablets, buckets, and spill files.

The fsck utility can be used on an offline storage pool after a node failure, after a disk failure, or after a MapR filesystem process crash, or simply to verify the consistency of data for suspected software bugs.

**Typical process flow:**

- Take the affected storage pools offline with the [mrconfig sp offline](#) on page 2966 command.
- Execute the fsck command on the storage pools (or disks) as specified in the following discussion.
- Bring the storage pools back online with the [mrconfig sp online](#) on page 2967 command.
- Execute the [gfsck](#) on page 2881 command on the cluster, volumes, or snapshots that were affected.

You can run the fsck command in two modes:

- Verification mode - fsck only reports errors; it does not attempt to fix or modify any data on disk. You can run fsck in verification mode on an offline storage pool at any time, and it will report errors if there is inconsistency. If it does not report any errors, you can bring up the storage pool online without any risk of data loss. To run the fsck utility in verification mode, use any parameter *except* the -r parameter.
- Repair mode - fsck attempts to repair a bad storage pool. When you run the fsck utility in repair mode on a storage pool, some volumes might need a global fsck ([gfsck](#) on page 2881) after bringing the storage pool online. There is potential for loss of data in this case. To run the fsck utility in repair mode, use the -r parameter.

Using the `/opt/mapr/server/fsck` utility with the `-r` option produces different results depending on the scenario. The `fsck` utility does not interpret the scenario nor does it have a safe mode.

- If a disk is offline because of an imbalanced b-tree, using `fsck -r` may result in data loss from bad containers, and data loss if additional replicas are unavailable.
- If a disk is offline because of an I/O error, using `fsck -r` produces indeterminate results. A disk that is returning I/O errors is questionable in terms of data content and reliability. For example, an operation that completed on the disk but was never returned, may have partial data remaining on the disk. Using `fsck -r` retains any partial data.
- If a disk is offline because of slow I/O, using `fsck -r` does not produce data loss.

The most conservative usage of `fsck` is to first run `fsck` without the `-r` option (verification mode) and check the output. If the output returns errors, then run `fsck` with the `-r` option.

### Syntax

```
/opt/mapr/server/fsck [{<device-paths>}] or [-n <sp name>]
-l <log filename> ; default /opt/mapr/logs/fsck.log.<ts>.<pid>
-p <mfs port> ; default 5660
-N to disable status bar
-P to purge deleted containers in repair
-h for help
-j to skip log replay
-m <memory in MB> to set cache size for blocks
-d to check data blocks crc
-b to check db consistency
-C to specify the container-id when using -d
-I to specify inode-number when using -d and -C
-r to repair ; USE WITH CAUTION AS IT CAN LEAD TO LOSS OF DATA
```

### Parameters

Parameter	Description
-b	Checks database consistency.
-C	Optional with the <code>-d</code> option. Specifies the read-write container ID on which CRC (cyclic redundancy check) must be performed. If this option is not specified with the <code>-d</code> option, the CRC is performed on all the containers on the storage pool.
-d	Performs a CRC on data blocks. By default, <code>fsck</code> will not validate the CRC of user data pages. Enabling this check causes the check to take a while to complete.
<device-paths>	Paths to the disks that make up the storage pool.   <b>NOTE:</b> Before running <code>fsck</code> , use the <a href="#">mrconfig disk remove</a> on page 2939 command to remove all the disks from file system. For example:  <pre>/opt/mapr/server/mrconfig disk remove /dev/sdb /opt/mapr/server/fsck /dev/sdb</pre>
-h	Help

Parameter	Description
-l	Optional with the <code>-C</code> option. Specifies the inode number on which CRC (cyclic redundancy check) must be performed on the container specified by the <code>-C</code> option. If this option is not specified with the <code>-C</code> option, the CRC is performed on all the inodes.
-j	Skips log replay. Should be set only when log recovery fails. Log recovery can fail if the damaged blocks of a disk belong to the log, or if log recovery finds some CRC errors in the metadata blocks. *Using this parameter will typically lead to larger data loss.*
-l	The log filename. Default: <code>/opt/mapr/logs/fsck.log.&lt;ts&gt;.&lt;pid&gt;</code>
-m	Sets the cache size for blocks (MB).
-n	Storage pool name. This option works only if all the disks are in <code>disktab</code> . Otherwise, you must individually specify all the disks that make up the storage pool, using the <code>&lt;device-paths&gt;</code> parameter.
-N	Disables the status bar.
-p	The file system port. Default: 5660
-P	Purges deleted containers in repair.
-r	Runs in repair mode. <b>USE WITH CAUTION AS THIS CAN LEAD TO LOSS OF DATA.</b>

### gfsck

Describes how you can use the `gfsck` command, under the supervision of HPE Ezmeral Data Fabric Support or Engineering, to perform consistency checks and appropriate repairs on a volume, or a volume snapshot.

You can use the `gfsck` command when the local `fsck` either repairs or loses some containers at the highest epoch.

For an overview of using the GFSCK command, see [Using Global File System Checking](#) on page 1310.

### Permissions Required

Although you need to be the `root` user to run this command, checking tiering-enabled volumes requires you to be the `mapr` user.

### Syntax

```
/opt/mapr/bin/gfsck
[-h] [--help]
[-c] [--clear]
[-d] [--debug]
[-b] [--dbcheck]
[-r] [--repair]
[-y] [--assume-yes]
[-Gquick] [--check-tiermetadata-only]
[-Gfull] [--check-tiermetadata-full]
[-Dquick] [--check-tierdata-presence]
[-Dfull] [--check-tierdata-crc]
```

```

[-J] [--skip-tier-log-replay]
[-D] [--crc]
[-S3] [--only-object-store]
[cluster=cluster-name (default=default)]
[rwvolume=volume-name (default=null)]
[snapshot=snapshot-name (default=null)]
[snapshotid=snapshot-id (default=0)]
[fid=fid (default=null)]
[cid=cid (default=0)]
[startCid=cid (default=0)]
[rIdx=<repl index>] (replication index, only enabled with [-D] [--crc])
[fidThreads=<check crc thread count for fid>] (default:16, max:128)
[cidThread=<check crc thread count for cid>] (default:16, max:128)

```

## Parameters

<b>-h --help</b>	<p><i>Description:</i> Prints usage text</p> <p><i>User who must use this option:</i> Either root or mapr.</p>
<b>-c --clear</b>	<p><i>Description:</i> Clears previous warnings before performing the global filesystem check.</p> <p><i>User who must use this option:</i> Either root or mapr.</p>
<b>-d --debug</b>	<p><i>Description:</i> Provides information for debugging.</p> <p><i>User who must use this option:</i> Either root or mapr.</p>
<b>-b --dbcheck</b>	<p><i>Description:</i> Checks that every key in a tablet is within that tablet's startKey and endKey range. This option is I/O intensive, so use this option only if you suspect database inconsistency.</p> <p><i>User who must use this option:</i> root</p> <p>When used with S3 volumes, this option validates that <i>versionIds</i> of objects in a given partition are less than <i>maxVersionId</i> stored in Partition Map Entry.</p> <p><i>User who must use this option:</i> mapr.</p>
<b>-r --repair</b>	<p><i>Description:</i> Indicates and repairs the inconsistencies detected by -GQuick, -GFull, -DQuick, and -DFull. Repair is not supported for snapshots and mirrors.</p> <p><i>User who must use this option:</i> root</p>
<b>-y --assume-yes</b>	<p><i>Description:</i> If specified, assumes that containers without valid copies (as reported by CLDB) are deleted automatically. If not specified, <i>gfsck</i> pauses for user input: <b>yes</b> to delete, <b>no</b> to exit <i>gfsck</i>, or <b>ctrl-C</b> to quit.</p> <p><i>User who must use this option:</i> Either root or mapr.</p>
<b>-D --crc</b>	<p><i>Description:</i> Provides validation of the CRC of the data present in the volume. The data can either be local or offloaded.</p> <p>You can use this option at the volume, container, snapshot, and the filelet levels. <i>gfsck</i> reports corruption found at each level.</p> <p><i>User who must use this option:</i> root</p>
<b>-S3 --only-object-store</b>	<p><i>Description:</i> Check objects in each bucket of a given Object Store volume and Object Store mirror volume for metadata inconsistencies.</p>

	<i>User who must use this option:</i> <code>mapr</code> .
<b>cluster</b>	<p><i>Description:</i> Specifies the name of the cluster (default: default cluster)</p> <p><i>User who must use this option:</i> Either <code>root</code> or <code>mapr</code>.</p>
<b>rwvolume</b>	<p><i>Description:</i> Specifies the name of the volume (default: default cluster)</p> <p><i>User who must use this option:</i> Either <code>root</code> or <code>mapr</code>.</p>
<b>fid</b>	<p><i>Description:</i> Checks data CRC for the master copy of the specified fid. To check any other copy, use the <code>rIdx</code> option. You must use <b>fid</b> only with the <code>--crc</code> option.</p> <p><i>User who must use this option:</i> <code>mapr</code></p>
<b>cid</b>	<p><i>Description:</i> Checks data CRC for the master copy of the specified container ID. To check any other copy, use the <code>rIdx</code> option. The default value of 0 denotes that all containers are checked. You must use <b>cid</b> only with the <code>--crc</code> option.</p> <p><i>User who must use this option:</i> <code>mapr</code></p>
<b>startCid</b>	<p><i>Description:</i> <b>startCid</b> is only applicable with the option <code>--crc rwvolume=&lt;volumename&gt;</code>.</p> <p>Use this option to start verification from the specific container instead of starting from the first container of that volume. If not provided, the <code>--crc</code> option checks the data CRC of all the containers.</p> <p>For example, assume that one particular volume has containers such as 205...2055...2900... .. 3000 .. .. . 5000.. .. . 9999.</p> <p>You can use the <b>startCid</b> option to start verification from container 3000, and all containers prior to 3000 will be skipped.</p> <p><i>User who must use this option:</i> <code>mapr</code></p>
<b>rIdx</b>	<p><i>Description:</i> Specifies the index (either <code>fid</code> or <code>cid</code>) of the copy of the data to check for errors.</p> <p>Use only with <code>-D</code> or <code>--crc</code> and either <code>fid</code> or <code>cid</code>.</p> <p>For example, <code>-D fid:2510.32.131204 rIdx=0</code> only checks the data for copy 1 of the specified fid.</p> <p><i>User who must use this option:</i> <code>mapr</code></p>
<b>fidThreads</b>	<p><i>Description:</i> Specifies the number of threads for scanning fids (default:16, max:128). You must use <b>fidThreads</b> only with the <code>--crc</code> option.</p> <p><i>User who must use this option:</i> <code>mapr</code></p>
<b>cidThreads</b>	<p><i>Description:</i> Specifies the number of threads for scanning container IDs (default:16, max:128). You must use <b>cidThreads</b> only with the <code>--crc</code> option.</p> <p><i>User who must use this option:</i> <code>mapr</code></p>
<b>scanthreads</b>	<p><i>Description:</i> Specifies the number of threads for scanning inodes (default:10, max:1000)</p> <p><i>User who must use this option:</i> Either <code>root</code> or <code>mapr</code>.</p>
<b>snapshot</b>	<p><i>Description:</i> Specifies the name of the snapshot (default: null)</p>

<code>snapshotid</code>	<p><i>User who must use this option:</i> Either <code>root</code> or <code>mapr</code>.</p> <p><i>Description:</i> Specifies the snapshot ID (default: 0)</p> <p><i>User who must use this option:</i> Either <code>root</code> or <code>mapr</code>.</p>
<b>Tier Options</b>	
<code>-Gquick --check-tiermetadata-only</code>	<p><i>Description:</i> Checks if the entries in the meta data tables maintained internally for objects and tiers (the mapping between the Virtual Cluster Descriptor (VCD) map and object map) , are consistent, and reports an error if not.</p> <p><i>User who must use this option:</i> <code>mapr</code></p>
<code>-Gfull --check-tiermetadata-full</code>	<p><i>Description:</i> Checks if the entries in the meta data tables maintained internally for objects and containers (the mapping between the VCD map and object map, along with the mapping between the VCD map and the MFS meta data), are consistent and reports an error if not.</p> <p><i>User who must use this option:</i> <code>mapr</code></p>
<code>-Dquick --check-tierdata-presence</code>	<p><i>Description:</i> Specified with either <code>-Gquick</code> or <code>-Gfull</code>. Checks and reports if the object in the meta data tables exists in the tier or not.</p> <p><i>User who must use this option:</i> <code>mapr</code></p>
<code>-Dfull --check-tierdata-crc</code>	<p><i>Description:</i> Specified with either <code>-Gquick</code> or <code>-Gfull</code>. Validates the data CRC for the object in the meta data tables.</p> <p><i>User who must use this option:</i> <code>mapr</code></p>
<code>-J --skip-tier-log-replay</code>	<p><i>Description:</i> Skips replaying transactions from internal dot files if a tier operation ends abruptly. Data Fabric recommends that you use this option when running the GFSCK utility on tiered volumes.</p> <p><i>User who must use this option:</i> Either <code>root</code> or <code>mapr</code>.</p>

## Examples

### 1. Debug Mode

In debug mode, run the `gfsck` command on the read/write volume named `mapr.cluster.root`:

```
/opt/mapr/bin/gfsck rwvolume=mapr.cluster.root -d
```

Sample output is as follows:

```
Starting GlobalFsck:
  clear-mode           = false
  debug-mode          = true
  dbcheck-mode        = false
  repair-mode         = false
  assume-yes-mode     = false
  cluster             = my.cluster.com
  rw-volume-name      = mapr.cluster.root
  snapshot-name       = null
  snapshot-id         = 0
  user-id             = 0
  group-id            = 0

  get volume properties ...
    rwVolumeName = mapr.cluster.root (volumeId = 205374230,
rootContainerId = 2049, isMirror = false)

  put volume mapr.cluster.root in global-fsck mode ...

  get snapshot list for volume mapr.cluster.root ...

  starting phase one (get containers) for volume
mapr.cluster.root(205374230) ...
    container 2049 (latestEpoch=3, fixedByFsck=false)
    got volume containers map
  done phase one

  starting phase two (get inodes) for volume
mapr.cluster.root(205374230) ...
    get container inode list for cid 2049
    +inodelist: fid=2049.32.131224 pfid=-1.16.2 typ=4 styp=0 nch=0

remove volume mapr.cluster.root from global-fsck mode (ret = 0) ...

```

```
GlobalFsck completed successfully (7142 ms); Result: verify succeeded
```

To verify if the object is present on the tier, run the `gfscck` command on the tiering-enabled read/write volume named `for_test5`:

**NOTE:** This example is valid for `-Dfull` as well. Replace `-Dquick` with `-Dfull`.

```
/opt/mapr/bin/gfscck rwvolume=for_test5 -Gfull -Dquick
```

Sample output is as follows:

```
Starting GlobalFsck:
  clear-mode           = false

```

## 2. Verifying CRC of Filelet

```

# /opt/mapr/bin/gfsck -D fid=2085.32.131412 --debug
verifying data crc
  mode          =      fid
  fid           =      2085.32.131412
  debug-mode    =      true
  repair-mode   =      false
  cluster       =      default
  replication index =      -1
  user-id       =      0
  group-id      =      0

crc validate result for fid : 2085.32.131412
  total local cluster/vcfs verified : 51
  total local cluster/vcfs corrupted : 0
  total local cluster/vcfs skipped: 0
  total purged cluster/vcfs verified : 0
  total purged cluster/vcfs corrupted : 0
  total purged cluster/vcfs skipped: 0

```

### 3. Verifying CRC at a Container Level

For CRC checks at the container level, the output is not displayed on the terminal. Instead it is written to the `/opt/mapr/log/gfsck.log` file. Sample output is as follows:

```
/opt/mapr/bin/gfsck -D rwvolume=rocky
verifying data crc
mode = volume
rwVolumeName = rocky
fid thread count = 16
cid thread count = 16
debug-mode = false
repair-mode = false
cluster = default
replication index = -1
user-id = 0
group-id = 0
total containers : 6
total container skipped : 0
data crc verification completed with no errors
```

### 4. Check a HPE Object Store volume without corruption

**Step 1:** Extract the volume ID of a given bucket:

```
/opt/mapr/server/mrconfig s3 bucketinfo kbuckl
bucketdirfid 2503.43.131380
oltFid 2503.44.131382
odtFid 2503.48.131390
f2oFid 2503.51.131396
valid 96531604
creationTime 1642581709849
accountName default
```

**Step 2:** Obtain the volume name using the volume ID.

```
/opt/mapr/bin/maprcli volume list -columns volumename,volumeid | grep
96531604
mapr.s3bucketVol.00000003 96531604
```

**Step 3:** Run `gfsck` on the volume.

```
su mapr -c "/opt/mapr/bin/gfsck -S3
rwvolume=mapr.s3bucketVol.00000003 -d"
Starting GlobalFsck:
clear-mode = false
debug-mode = true
dbcheck-mode = false
repair-mode = false
assume-yes-mode = false
verify-only-object-store = true
cluster = ec-cluster
rw-volume-name = mapr.s3bucketVol.00000003
snapshot-name = null
snapshot-id = 0
cid = 0
fid = null
user-id = 5000
group-id = 5000

file-fidmap-filelet union --
256001024.54.131402:P --> primary (nchunks=2) -->
```

```

numObjectsStatusUnknown:0, numTinyObjects:1, numSmallObjects:1,
numFSObjects:2, numUnreachableSmallObjects:0
    total unreachable jumbo/large objects:0

```

The fields in the bucket verification report are as follows:

- numTinyObjects: Number of tiny objects per bucket in the volume.
- numSmallObjects: Number of small objects per bucket in the volume.
- numFSObjects: Number of large/jumbo objects per bucket in the volume.
- numObjectsNeedsRepair: Number of objects that need to be repaired.
- numUnreachableSmallObjects: Number of small objects that have an entry in ODT with no corresponding entry in OLT table.

## 5. Check a HPE Object Store volume with corruption

**Step 1:** Extract the volume ID of a given bucket:

```
/opt/mapr/server/mrconfig s3 bucketinfo kbuck2
bucketdirfid 2503.43.131380
oltFid 2503.44.131382
odtFid 2503.48.131390
f2oFid 2503.51.131396
valid 96531653
creationTime 1642581709849
accountName defaul
```

**Step 2:** Obtain the volume name using the volume ID.

```
/opt/mapr/bin/maprcli volume list -columns volumename,volumeid | grep
96531653
mapr.s3bucketVol.00000006 96531653
```

**Step 3:** Run `gfsck` on the volume.

```
su mapr -c "/opt/mapr/bin/gfsck -S3
rwvolume=mapr.s3bucketVol.00000006 -d"
Starting GlobalFsk:
clear-mode           = false
debug-mode           = true
dbcheck-mode         = false
repair-mode          = false
assume-yes-mode      = false
verify-only-object-store = true
cluster              = ec-cluster
rw-volume-name       = mapr.s3bucketVol.00000006
snapshot-name        = null
snapshot-id          = 0
cid                  = 0
fid                  = null
user-id              = 5000
group-id             = 5000

[Using Global File System Checking](#) on page 1310

Describes how to use the `gfsck` command to check and repair file system errors.

### guts

`guts` is a tool to measure/analyse performance. In the default mode, it prints one line every second, and counts the number of operations or bytes-processed in one second intervals. `guts` is an internal utility, and is subject to change without notice.

`guts` provides information on entities such as:

<b>CPU</b>	Indicates whether the CPU is idle or busy
<b>RPCs</b>	Number of RPCs, RPCs-in, RPCs-out, bytes-in, and bytes-out
<b>MFS</b>	Number of local-writes, local-reads, and other operations (such as lookup, create and remove)
<b>Log</b>	Number of log writes, log flushes, and log force-flushes
<b>IO</b>	Number of disk-operations/second (read/write), and the disk-io/second in MB (read/write)

## Syntax

```

/opt/mapr/bin/guts
  guts
  -help
  instance:<id>  time:unix time:all time:none (add timestamp to output)
  key:5660 (is server port)
  shmid:<shared memory id> (client's shared memory id, check ipcs)
  threadcpu:core threadcpu:all
  cpu:none  cpu:all
  net:sum  net:msum  net:ksum  net:all  net:none
  disk:none  disk:ops  disk:mb  disk:all
  diskMajor:major# of disk
  ssd:none  ssd:all
  cache:none  cache:small  cache:med  cache:all
  cleaner:small  cleaner:all  cleaner:none
  fs:rw  fs:all  fs:none

```

## Interpreting Output

The prefix *c* identifies client metrics. The suffix *P* refers to the number of pending RPCs. The suffix *C* denotes the number of completed RPCs.

The pending metrics are a snapshot of pending RPCs when the output is printed. The completed metrics are the increase that happened in the last print interval.

## Parameters and Output

### CPU

cpu:all — Percentage of idle time of each CPU on the system in the last second.

**IO**

The metrics are `ior` and `iow`, which are displayed by default.

- `ior` — The first number reports the number of I/O reads for a machine in the last second. The second number reports the amount of I/O reads in MB in the last second.
- `iow` — The first number reports the number of I/O writes for a machine in the last second. The second number reports the amount of I/O writes in MB in the last second.

**Disk**

- `disk:ops` — Number of I/O requests (read+write) for each disk in the last second.
- `disk:mb` — Amount of I/O in MB (read+write) for each disk in the last second.
- `disk:all` — The preceding two numbers for each disk in the last second. The first number is from `disk:ops`, the second number is from `disk:mb`.

**Filesystem**

`fs:rw` — Reports MFS file system activities. Reported metrics are:

- `read` — The first number reports the number of remote reads in the last second. The second number reports the amount of data read in MB in the last second.
- `write` — The first number reports the number of remote writes in the last second. The second number reports the amount of data written in MB in the last second.
- `lread/lwrite` — are similar to the `read` and `write` metrics, but are applicable for local reads/writes.

In addition, `guts` displays the following *filesystem* metrics:

- `crP` — Total pending *read* RPCs in the last second.
- `crC` — Total completed *read* RPCs in the last second.
- `cwP` — Total pending *write* RPCs in the last second.
- `cwC` — Total completed *write* RPCs in the last second.
- `ccP` — Total pending *create* RPCs in the last second.
- `ccC` — Total completed *create* RPCs in the last second.
- `cuP` — Total pending *unlink* RPCs in the last second.

**RPC**

- `cuC` — Total completed *unlink* RPCs in the last second.

Reports the following metrics:

- `rpc:none` — Does not display any RPC related metrics.
- `rpc:op` — *rpc* metric
- `rpc:all` — *rpc*, *im*, and *om* metrics.
- `rpc` — Number of RPC calls received in the last second.
- `im` — Amount of RPC calls received in MB in the last second.
- `om` — Amount of RPC calls sent in MB in the last second.

**Cache**

`cache:small` — Metrics on *inode* and *dentry* cache, which are displayed by default. The metrics reported are:

- `icache` (inode cache) — The first number reports the number of inode cache lookups in the last second. The second number reports the number of inode cache lookup misses in the last second.
- `dcache` (dentry cache) — The first and second numbers report dcache lookups and lookup misses in the last second, respectively.

**MOSS (Multithreaded Object Store Server)**

Reports the following metrics:

- `moSS:none` — Does not display any MOSS-related metrics.
- `moSS:basic` — Displays only MOSS metrics related to the number of gets and puts.
- `moSS:all` — Displays all MOSS-related metrics.

Metrics returned are:

- `s3bc` — Number of buckets created in the last second.
- `s3bcd` — Number of buckets deleted in the last second.
- `s3bi` — Number of bucket infos in the last second.
- `s3bl` — Number of buckets lists in the last second.
- `tp` — Number of tiny puts in the last second.
- `sp` — Number of small puts in the last second.
- `lp` — Number of large puts in the last second.

- `jp` — Number of jumbo puts in the last second.
- `tg` — Number of tiny gets in the last second.
- `sg` — Number of small gets in the last second.
- `lg` — Number of large gets in the last second.
- `jg` — Number of jumbo gets in the last second.
- `oi` — Number of object infos in the last second.
- `ols` — Number of object lists in the last second.
- `otag` — Number of object tags that are modified in the last second.
- `oput` — Number of total object puts (sum of tiny, small, large, and jumbo) in the last second.
- `opm` — Total size of data puts in MB in the last second.
- `oget` — Number of total object gets (the sum of tiny, small, large, and jumbo) in the last second.
- `ogm` — Total size of data gets in MB in the last second.

## Network

- `net:sum` — Total network traffic in bytes received and transmitted from all network interfaces for a machine.
- `net:msum` — Total network traffic in megabytes.
- `net:ksum` — Total network traffic in kilobytes.
- `net:all` — Not yet implemented.
- `net:none` — Does not display any network related metrics.

Metrics returned are:

- `nI` — Total amount of network traffic *received* in bytes in the last second. This is a summation of network traffic from all network interfaces for a machine.
- `nO` — Total amount of network traffic *sent* in bytes in the last second. This is a summation of network traffic from all network interfaces in a machine.

## Database

`db:get` — Metrics related to `gets`. The output columns are as follows:

- `rOP` — Number of RPCs completed for type OP in the last second.
- `rOPR` — Number of rows processed from all RPCs of type OP in the last second.

- `tOPR` — Number of rows processed from all RPCs in the last second.
- `cOP` — Number of in-progress RPCs for the OP (not differential).

### Cleaner Metrics

`guts` displays the following *cleaner* metrics:

- `di` — Number of inodes dirtied by update operations in the last second.
- `ic` — Number of inodes cleaned by the drainer in the last second.
- `dd` — Number of data blocks dirtied by update operations in the last second.
- `dc` — Number of data blocks cleaned by the drainer in the last second.

### Operational Metrics

`guts` displays the following *operational* metrics:

- `rput` — Number of *put* RPCs completed in the last second.
- `rputR` — Sum of *put* rows completed in the last second, from all *put* rpcs.
- `tputR` — Sum of *put* rows completed in the last second, from **all** rpcs (*put*, *increment*, *checkAndPut*, *Append ..*)
- `cput` — Number of *put* RPCs in progress currently. This is not a differential, but displays the number of outstanding *put* RPCs at that particular instant.
- `rget` — Number of *get* RPCs completed in the last second.
- `rgetR` — Sum of *get* rows completed in the last second, from all *get* RPCs.
- `tgetR` — Sum of *get* rows completed in the last second, from **all** rpcs (*get*, *increment*, *checkAndPut*, *Append ..*)
- `cget` — Number of *get* RPCs in progress currently. This is not a differential, but displays the number of outstanding *get* RPCs at that particular instant.
- `rsc` — Number of scan RPCs completed in the last second.
- `rscR` — Sum of scan rows returned in the last second, from **all** scan RPCs.
- `csc` — Number of scan RPCs currently in progress. This is not a differential, but shows the number of outstanding scan RPCs at that particular instant.

- `rinc` — Number of increment RPCs completed in the last second.
- `cinc` — Number of increment RPCs currently in progress. This is not a differential, but shows the number of outstanding increment RPCs at that particular instant.
- `rchk` — Number of *checkAndPut/checkAndDelete* RPCs completed in the last second.
- `rapp` — Number of append RPCs completed in the last second.
- `rtlk` — Number of tablet lookup RPCs completed in the last second.
- `ctlk` — Number of tablet lookup RPCs currently in progress. This is not a differential, but shows the number of outstanding lookup RPCs at that particular instant.
- `rbulkb` — Number of bulk-import-bucket RPCs completed in the last second.
- `rbulks` — Number of bulk-import-segment RPCs completed in the last second.

### Put Metrics

`guts` displays the following *put* metrics:

- `rput` — Number of *put* RPCs completed in the last second.
- `rputR` — Sum of *put* rows completed in the last second, from all *put* rpcs.
- `tputR` — Sum of *put* rows completed in the last second, from all rpcs (*put, increment, checkAndPut, Append ..*)
- `cput` — Number of *put* RPCs in progress currently. This value is not a differential, but displays the number of outstanding *put* RPCs at that particular instant.
- `rsf` — Reserved free memory in MemIndex in MB. If this value falls very low, *put* RPCs can get throttled. This value is not a differential.
- `bucketWR`:
  - Column1 : Number of bucket writes (calls to MFS) in the last second.
  - Column2 : Amount of bucket writes in MB in the last second.
- `f1` — Number of bucket flushes fired in the last second.

- `ffl` — Number of force-flushes of buckets in the last second. If the bucket was flushed before it reached its optimal size, then the flush is counted as a force-flush.
- `sfl` — Number of segments touched by the bucket-flushes in the last second.
- `mcom` — Number of segments mini-packed in the last second.
- `fcom` — Number of segments packed fully in the last second.
- `ccom` — Number of segment packs running currently. This value is not a differential.
- `scr` — Number of segment creates in the last second.
- `sPCR` — Number of spill creates in the last second.

## Get Metrics

`guts` displays the following *get* metrics:

- `rget` — Number of *get* RPCs completed in the last second.
- `rgetR` — Sum of *get* rows completed in the last second, from all *get* RPCs.
- `tgetR` — Sum of *get* rows completed in the last second, from **all** rpcs (*get*, *increment*, *checkAndPut*, *Append ..*)
- `cget` — Number of *get* RPCs currently in progress. This is not a differential, but displays the number of outstanding *get* RPCs at that particular instant.
- `vcM` — Size of the value-cache in MB. This value is not differential.
- `cL` — Number of value-cache lookups in the last second.
- `vcH` — Number of value-cache hits in the last second.
- `bget` — Number of bucket *gets* in the last second. Will be 0 if there are no active buckets.
- `sg` — Number of segment *gets* in the last second. Will normally be equal to `tgetR` minus the number of value-cache hits.
- `spg` — Number of spill *gets* in the last second. This value is calculated as `sigma(segments * spill-per-segment) - bloomFilterSkips`
- `bskp` — Number of spill *gets* that were avoided/saved by the bloom filter in the last second.

## Scan Metrics

`guts` displays the following *scan* metrics:

- `rsc` — Number of scan RPCs completed in the last second.
- `rscR` — Sum of scan rows returned in the last second, from **all** scan RPCs.
- `csc` — Number of scan RPCs currently in progress. This is not a differential, but shows the number of outstanding scan RPCs at that particular instant.
- `bsc` — Number of buckets scanned in the last second.
- `ssc` — Number of segments scanned in the last second.
- `spsc` — Number of spills scanned in the last second.
- `spscR` — Number of rows scanned from spills in the last second.
- `ldbr` — Number of *ldb* blocks read in the last second.
- `blkR` — Number of data blocks read in the last second (over *spills, buckets* ..)
- `raSg` — Number of segments for which read-ahead was done in the last second.
- `raSp` — Number of spills for which read-ahead was done in the last second.
- `nAdv` — Number of *advise* calls made to MFS for scan read-ahead in the last second.
- `raBl` — Sum of blocks in the *advise* calls made to MFS for scan read-ahead in the last second.

### Cumulative Metrics

`guts` displays the following *cumulative* metrics:

- `cmP` — Total pending RPCs from the client in the last second.
- `cmC` — Total completed RPCs from the client in the last second.

### DB Metrics

`guts` displays the following *database* metrics:

- `cgP` — Total pending *get* RPCs.
- `cgC` — Total completed *get* RPCs.
- `cpP` — Total pending *put* RPCs.
- `cpC` — Total completed *put* RPCs.
- `csP` — Total pending *scan* RPCs.
- `csC` — Total completed *scan* RPCs.

- *ciP* — Total pending *increment* RPCs.
- *ciC* — Total completed *increment* RPCs.
- *caP* — Total pending *append* RPCs.
- *caC* — Total completed *append* RPCs.
- *cgR* — Total client *get* rows.
- *cpR* — Total client *put* rows.
- *csR* — Total client *scan* rows.
- *ciR* — Total client *increment* rows.
- *caR* — Total client *append* rows.

### Example Usage

The following example demonstrates viewing client metrics. Perform the following steps:

1. Find the process ID of the client program.
2. Find all the shared memory segments (*shmem*) for this program:

```
ipcs -mp | grep <pid>
998080521 root      30030      21850
998113290 root      30030      30030
^^^^^^^^^^
shmem ID
```

Here, there are two shared memory segments — one between the client and MFS, and the other between the client and *guts*.

3. Identify the correct *shmem* segment for *guts*:

```
ipcs | grep 998113290
0x00000000 998113290 root      666      2288      1      dest
ipcs | grep 998080521
0x00000000 998080521 root      660      20971520 1      dest
^^^^^^^^^^
size
```

The *shmem* with size 20M is between client and MFS. Here, we select *shmem* with ID 998113290.

4. Run *guts*:

```
/opt/mapr/bin/guts client:all shmid:998113290
Printing only client statistics
cmP  cmC  cgP  cgC  cpP  cpC  csP  csC  ciP  ciC
caP  caC  crP  crC  cwP  cwC  ccP  ccC  cuP  cuC
0    0    0    0    0    0    0    0    0    0
0    0    0    0    0    0    0    0    0    0
0    0    0    0    0    0    0    0    0    0
```

Pass the *shmem* ID and one of the client options. Client options are one of:

- *none* — Used when printing MFS/dbserver statistics

- `db` — Prints client statistics for DB operations
- `fs` — Prints client statistics for filesystem operations
- `all` — Prints all client statistics

### CLDB Guts

The `cldbguts` utility prints information about active container reports, full container reports, registration requests, MapR-FS heartbeats, NFS server heartbeats, and containers. For more information, see [cldbguts](#) on page 2858.

### NFS Guts

`guts` displays the following NFS metrics:

- `req` — Number of requests received from all the NFS clients to this NFS server in the last second.
- `dpC` — Number of dropped calls from NFS client due to running out of ONC handles (probably cluster is responding slow OR [NFS client is bombarding the NFS server](#) ).
- `inReadReq` — Number of incoming read requests from NFS clients.
- `outReadResp` — Number of outgoing read request responses to NFS Clients.
- `inReadDataReq` — Size/Length of incoming read requests (buffer size) from NFS Clients.
- `outReadDataResp` — Size/Length of outgoing read request response (buffer size) to NFS Clients.
- `inWriteReq` — Number of incoming write requests from NFS clients.
- `outWriteResp` — Number of outgoing read request responses to NFS clients.
- `inWriteDataReq` — Size/Length of incoming write request (buffer size) from NFS clients.
- `outWriteDataResp` — Size/Length of outgoing write request response (buffer size) to NFS Clients.

### Running Guts

Start `guts` on the node for which you need to collect metrics.

```
/opt/mapr/bin/guts
00 01 02 03 04 05 06 07  rpc  lpc  write  lwrite  bwrite
read  lread  icache  dcache  di  ic  dd  dc  ior
iow  rput  rputR  cput  tputR  rget  rgetR  cget  tgetR  rsc  rscR  csc
86 90 84 84 87 93 81 84  5  6  0  0  1  0  0  0  0
0  3  0  8  0  163  1  337  22  13  16  1  0  73
4  0  0  0  0  1  0  0  0  0  0  0  0  0
62 77 70 82 93 61 50 84  12  20  0  0  3  0  0  0  0
0  10 0  27  0  41  0  6  0  3  0  0  0  0
0  0  0  0  0  3  0  0  0  0  0  0  0  0
63 78 59 56 84 64 32 86  4  5  0  0  5  0  0  0  0
0  0  0  5  0  27  0  8  0  22  0  0  0  0
0  3  1506  0  1506  0  0  0  0  0  0  0  0  0
83 76 77 82 68 69 82 67  1  0  0  0  0  0  0  0  0
0  0  0  0  0  0  0  0  0  0  0  0  0  0
0  0  0  0  0  0  0  0  0  0  0  0  0  0
94 49 91 56 75 48 57 92  1  0  0  0  0  0  0  0
0  0  0  0  0  0  0  0  0  0  0  0  0  0
0  0  0  0  0  0  0  0  0  0  0  0  0  0
```

```

 97 96 99 89 93 94 82 95      2      0      0      0      1      0      0      0      0
0   0   0      1      0      0      8      0      0      2      0      1      0      0      0      0
0   0      0      0      0      0      0      0      0      0      0      0      0      0      0      0
 99 99 96 97 99 98 99 82     19      6      0      0      1      0      0      0      0
0   3   0     186      0     18      0      0      0      0      0      0      0      0      0      0
0   0      0      0      1      0      0      0      0      0      0      0      0      0      0      0

```

To stop collecting metrics, press ^C.

### Related reference

[cldbguts](#) on page 2858

Monitors the activity of the Container Location Database (CLDB). This utility prints information about the CLDB service that is running on the node from which you run the utility.

[Retrieving Tiering Statistics Using guts](#) on page 1258

Explains how to use the `guts` utility to retrieve tiering statistics.

### manageSSLKeys.sh

Use the `manageSSLKeys.sh` utility to create and manage SSL certificates.

### Syntax

```

# /opt/mapr/server/manageSSLKeys.sh
manageSSLKeys.sh is a tool to create and manage the SSL certificates.
it is run once on the first node from configure.sh
Usage: manageSSLKeys and one of
    create [-d DNSDOMAIN] [-N clustername] [-k keypass] [-t
trustpass] -ug <maprUserGroup>
        creates the SSL key and trust stores needed for HTTPS traffic
        -d specifies DNS domain used in wildcard certificate. Default
            is detected from Local OS
        -N clustername
        -k password for key store or file containing the key store
password
        -t password for trust store or file containing the trust
store password
        -ug MapR user/group, e.g., mapr:mapr
    createcreds [-k keypass] -t trustpass -ug <maprUserGroup>
        creates the key and trust store credential files maprkeycreds
and maprtrustcreds. This
        is normally used in mixed FIPS and non-FIPS configurations in
addition to the convert utility.
        -k key store password. If not specified, the key credential
file will not be created
        -t trust store password for creating the trust credential
file. This is required
        -ug MapR user/group, e.g., mapr:mapr. This is required
    secureconfig [-N clustername] [-ug <maprUserGroup>] [-clientonly
true|false] [-k keypass] [-t trustpass]
        Completes the secure configuration process. For internal use
only
        -N clustername
        -ug MapR user/group, e.g., mapr:mapr
        -clientonly <true or false>
        -keypass Key store password. If specified, this overrides the
key store password in the XML files
        -trustpass Trust store password. If specified, this overrides
the trust store password in the XML files
    merge <in trust store> <out trust store> <inPassword> <outPassword>
        merges the certificates from the in trust store into the
existing out trust store
        All arguments are required

```

```

copytruststore <outputFile> <password for local trust store>
[password for output (if different from local)]
copywithconfiguredpassword (deprecated in 7.0, use changepassword
instead) <srcStore> <destStore> <srcPassword>
createrandompassword (deprecated in 7.0, use changepassword instead)
[oldPassword (needed to override default password)]
changepassword [-k <oldKeyPassword>] [-kp <newKeyPassword>] [-t
<oldTrustPassword>] [-tp <newTrustPassword>]
change key password or trust password or both
-k password for key store or file containing the key store
password
-kp new password for key store, can only be used with -k
option. If -k is used without -kp,
a new random password will be generated for key store
-t password for trust store or file containing the trust
store password
-tp new password for trust store, can only be used with -t
option. If -t is used without -tp,
a new random password will be generated for trust store
(For a client node - must use both -t old -tp new and
no -k )
createusercert -u <user> -ug <maprUserGroup> [ -p <truststorepw> ]
[ -k <keystorepw> ] [ -a <alias> ] [ -s <sanInfo> ] [ -ips <comma separated
IPs>] [ -w ]
add a cert for specified user to the existing ssl_user[key|
trust]stores.
-a alias name for certificate
password
-p password for trust store or file containing trust store
password
-k password for key store or file containing key store
password
-s SAN info to add to certificate - like 'DNS.1 = *.mydomain'
-u user name to create certificate for
-ug MapR user/group, e.g., mapr:mapr
-ips comma separated IPs, in case the node is having NATed
external IPs which is common in cloud deployment
-w overwrite the alias name, else fails if exist. Used in
regenerating the cert with external IPs
createusercerts [-p password] [-N <clustername> ] [-d
DNSDOMAIN ] -ug <maprUserGroup>
-N <clustername>
-d specifies DNS domain used in wildcard certificate. Default
is detected from Local OS
password
-p password for trust store or file containing trust store
password
-ug MapR user/group, e.g., mapr:mapr
convert [-N <clustername> ] [-k] [-n] -p <passwd> [-srcType JKS|
bcfks|pkcs12] [-dstType JKS|bcfks|pkcs12] <in key/trust store> <out key/
trust store>
converts an existing key/trust store from one store type to
another. If
the destination store type is pkcs12, this creates a new PEM
type key/trust store
if srcType and dstType are not specified, it is assumed that
you are
converting from JKS to PEM via pkcs12
-N <clustername>
-a denotes the certificate alias you want to convert
-k denotes you are converting a keystore
-n do not create a PEM type key/trust store
-p <passwd> store password. This is required
-srcType JKS|bcfks|pkcs12 denotes the source format of the
store

```

```
-dstType JKS|bcfks|pkcs12 denotes the destination format of
the store
```

## Operations

manageSSLKeys . sh performs the following operations:

### create

*Description:* Creates the SSL key and trust stores needed for HTTPS traffic.

*Format:* create [-d DNSDOMAIN] [-N clustertype] [-k keypass] [-t trustpass] -ug <maprUserGroup>

*Parameters:*

- d: (*Optional*) DNS domain used for the wildcard certificate. The default domain is detected from the Local OS.
- N: (*Optional*) Name of the cluster.
- k: (*Optional*) Password for key store or file containing the key store password.
- t: (*Optional*) Password for trust store or file containing the trust store password.
- ug: (*Required*) User:Group to use for the key. For example: `mapr:mapr`.

### createcreds

*Description:* Creates the key and trust store credential files `maprkeycreds` and `maprtrustcreds`. This command is usually used in mixed FIPS and non-FIPS configurations in addition to the `convert` utility.

*Format:* createcreds [-k keypass] -t trustpass -ug <maprUserGroup>

*Parameters:*

- -k: (*Optional*) Key store password. If not specified, the key credential file is not created.
- -t: (*Required*) Trust store password for creating the trust store credential file.
- -ug: (*Required*) Cluster administrator user and group (for example, `mapr:mapr`).

### secureconfig

*Description:* Completes the secure configuration process. **For internal use only.**

*Format:* secureconfig [-N clustertype] [-ug <maprUserGroup>] [-clientonly true|false] [-k keypass] [-t trustpass]

*Parameters:*

- -N: (*Optional*) Cluster name.. The default is the cluster on which this command is run.
- -ug: (*Optional*) Cluster administrator user and group (for example, `mapr:mapr`). The default is `mapr:mapr`.

- `-clientonly`: (*Optional*) true or false. This flag ensures that the script does not fail on the client only nodes where the keystores are not present. The default is false.
- `-keypass`: (*Optional*) Key store password. If specified, this value overrides the key store password in the XML files.
- `-trustpass`: (*Optional*) Trust store password. If specified, this value overrides the trust store password in the XML files.

**merge**

*Description:* Merges the SSL certificates from the *in trust* store into the existing *out trust* store.

*Format:* `merge <in trust store> <out trust store> <inPassword> <outPassword>`

*Parameters:*

- `in trust store`: (*Required*) Source trust store from which to obtain the SSL certificates.
- `out trust store`: (*Required*) Destination trust store to merge the SSL certificates.
- `inPassword`: (*Required*) Password for the source trust store.
- `outPassword`: (*Required*) Password to set for the destination trust store.

**copytruststore**

*Description:* Makes a copy of the existing trust store on the node on which you run this command.

*Format:* `copytruststore <outputFile> <password for local trust store> [password for output (if different from local)]`

*Parameters:*

- `outputFile`: (*Required*) The file in which to store the copy of the trust store.
- `password for local trust store`: (*Required*) The password of the trust store being copied.
- `password for output`: (*Optional*) The password to set for the output file. By default, this is the same as the password for the local trust store.

**copywithconfiguredpassword**

 **ATTENTION:** This command is deprecated in version 7.0. Use `changepassword` instead.

*Description:* Copies the source trust store to the destination trust store and secures the destination with the existing source trust store password..

*Format:* `copywithconfiguredpassword <srcStore> <destStore> <srcPassword>`

*Parameters:*

- `srcStore`: (*Required*) Source trust store to copy.
- `destStore`: (*Required*) Destination trust store.
- `srcPassword`: (*Required*) The password for the source trust store.

### createrandompassword

 **ATTENTION:** This command is deprecated in version 7.0. Use `changepassword` instead.

*Description:* Creates a random trust store password.

*Format:* `createrandompassword [oldPassword (needed to override default password)]`

*Parameters:*

- `oldPassword`: (*Optional*) The password to overwrite the default one (`mapr123`).

### changepassword

*Description:* Changes either the key password, the trust password, or both.

*Format:* `changepassword [-k <oldKeyPassword>] [-kp <newKeyPassword>] [-t <oldTrustPassword>] [-tp <newTrustPassword>]`

*Parameters:*

- `-k`: (*Optional*) Password for the key store or file containing the key store password.
- `-kp`: (*Optional*) New password for the key store (can only be used with the `-k` option). If `-k` is used without `-kp`, a new random password is generated for the key store.
- `-t`: (*Optional*) Password for the trust store or a file containing the trust store password.
- `-tp`: (*Optional*) New password for the trust store (can only be used with the `-t` option). If `-t` is used without `-tp`, a new random password is generated for the trust store.

For a client node, you must use both `-t` (old) and `-tp` (new) and not `-k`. For more information about using `changepassword`, see [Changing Key and Trust Store Passwords](#) on page 1816.

### createusercert

*Description:* Adds a certificate for the specified user to the existing SSL user key or trust store.

*Format:* `createusercert -u <user> -ug <maprUserGroup> [ -p <truststorepw> ] [ -k <keystorepw> ] [ -a <alias> ] [ -s <sanInfo> ] [ -ips <comma separated IPs> ] [ -w ]`

*Parameters:*

- `-u`: (*Required*) User name for which to create the certificate.
- `-ug`: (*Required*) Cluster administrator user and group (for example, `mapr:mapr`).

- `-p`: (*Optional*) Password for the trust store or a file containing the trust store password. If you omit this parameter, the command creates the trust store without password protection.
- `-k`: (*Optional*) Password for the key store or a file containing the key store password. If you omit this parameter, the command creates the key store without password protection.
- `-a`: (*Optional*) Alias name for the certificate.
- `-s`: (*Optional*) SAN information to add to the certificate (for example: `DNS.1=*mydomain`).
- `-ips`: (*Optional*) Comma separated NATed external IPs, if any.
- `-w`: (*Optional*) Overwrite the alias name, else fails if it exists. Used in regenerating the certificate with external IPs .

**createusercerts**

*Description:* Creates SSL user certificates.

*Format:* `createusercerts [-p password] [-N <clustername> ] [-d DNSDOMAIN ] -ug <maprUserGroup>`

*Parameters:*

- `p`: (*Optional*) Password to use for the SSL user certificate.
- `N`: (*Optional*) Name of the cluster. The default is the cluster on which this command is run.
- `d`: (*Optional*) DNS domain used for the wildcard certificate. The default domain is detected from the Local OS.
- `ug`: (*Required*) *User:Group* to use for the certificate. For example: `mapr:mapr`.

**convert**

*Description:* Converts an existing key/trust store into a new PEM type key/trust store. If you do not specify the type of the source and the destination key/trust store, it is assumed that you are converting from JKS to PEM (via `pkcs12`).

*Format:* `convert [-N <clustername> ] [-k] [-n] -p <passwd> [-srcType JKS|bcfks|pkcs12] [-dstType JKS|bcfks|pkcs12] <in key/trust store> <out key/trust store>`

*Parameters:*

- `N`: (*Optional*) Cluster name. The default is the cluster on which this command is run.
- `k`: (*Optional*) Indicates that a keystore is being converted.
- `n`: (*Optional*) Do not create a PEM type key/trust store.

- `p`: (*Required*) Password of the existing key/trust store.
- `srcType`: (*Optional*) Format of the source key/trust store - one of `JKS` or `bcfks` or `pkcs12`. The default keystore for a non-FIPS cluster is `JKS`, while the default for a FIPS cluster is `bcfks`.
- `dstType`: (*Optional*) Format of the destination key/trust store - either `JKS` or `bcfks` or `pkcs12`. The default keystore for a non-FIPS cluster is `JKS`, while the default for a FIPS cluster is `bcfks`.
- `in key/trust store`: (*Required*) The existing key/trust store to convert.
- `out key/trust store`: (*Required*) The name to use for the converted key/trust store.

## Examples

The following links demonstrate using the `manageSSLKeys.sh` utility.

- Change password: [Changing Key and Trust Store Passwords](#) on page 1816
- Copy trust store: [Enabling Security](#) on page 1770
- Create user cert: [Step 1: Restart and Check Cluster Services](#) on page 324
- Regenerate trust store password: [Enabling Security](#) on page 1770
- Merge trust store: [Configuring Secure Clusters for Running Commands Remotely](#) on page 1943
- Generate trust store and key store files: [Step 1: Restart and Check Cluster Services](#) on page 324 and [Configuring Encryption for ODBC Connection](#) on page 4303
- Convert type of keystore file: [Upgrading the Data Access Gateway](#) on page 369

## mapr-support-collect.sh

Collects information about a cluster's recent activity, to help Data Fabric Support diagnose problems.

The "mini-dump" option limits the size of the support output. When the `-m` or `--mini-dump` option is specified along with a size, `mapr-support-collect.sh` collects only a head and tail, each limited to the specified size, from any log file that is larger than twice the specified size. The total size of the output is therefore limited to approximately  $2 * \text{size} * \text{number of logs}$ . The size can be specified in bytes, or using the following suffixes:

- `b` - bytes
- `k` - kilobytes (1024 bytes)
- `m` - megabytes (1024 kilobytes)

## Syntax

```
/opt/mapr/support/tools/mapr-support-collect.sh
-h, --hosts HOST_FILE
    hosts file, each line has entries [user@]host[:port]
-H, --host HOST_ENTRY
    additional host entry of the form [user@]host[:port], multiple
can be specified
```

```

-Q, --no-cldb
    do not query CLDB for list of nodes
-n, --name NAME
    name of output file
-d, --output-dir DIR_PATH
    absolute path of output directory
-l, --no-logs
    do not include log files
--no-hadoop-logs
    do not include hadoop log files
--hbase-logs
    include hbase log files
--sqoop-logs
    include sqoop log files
--eco-logs
    include all ecosystem log files
--oozie-logs
    include oozie log files
--spark-logs
    include spark log files
--pig-logs
    include pig log files
--impala-logs
    include impala log files
--hue-logs
    include hue log files
--hive-logs
    include hive log files
--flume-logs
    include flume log files
--drill-logs
    include drill log files
--no-kibana-logs
    do not include kibana log files
--no-grafana-logs
    do not include grafana log files
--no-elasticsearch-logs
    do not include elasticsearch log files
--no-opentsdb-logs
    do not include opentsdb log files
--no-collectd-logs
    do not include collectd log files
--no-fluentd-logs
    do not include fluentd log files
--no-vol-info
    do not collect volume information
-L, --libraries
    include libraries
-s, --no-statistics
    do not include statistics
-c, --no-conf
    do not include configurations
-i, --no-sysinfo
    do not include system information
-x, --exclude-cluster
    do not collect cluster diagnostics
-u, --user USER
    username for ssh connections
-K, --strict-hostkey
    check for strict host key in ssh connection
-p, --par PAR
    maximum number of nodes from which support dumps will be gathered
    concurrently (default: 10)
-t, --dump-timeout DUMPTIMEOUT

```

```

        timeout for execution of mapr-support-dump command on a node
        (default: 3600 seconds, 0 = no limit)
        -T, --scp-timeout SCPTIMEOUT
            timeout for copy of support dump output from a remote node to
            local filesystem (default: no limit)
        -y, --yes
            do not require acknowledgement of the number of nodes that will
            be affected
        -O, --online
            Leverage MapR APIs to gather support dumps. When not specified,
            SSH and SCP will be used.
        -S, --scp-port SCPPORT
            the local port to which remote nodes will establish an SCP session
        --collect-cores
            Collect cores of running mfs processes from all nodes (off by
            default)
        --move-cores
            Move mfs and nfs cores from coresDir from all nodes (off by
            default)
        --use-hostname
            Use hostname to ssh instead of IP addresses (off by default)
        --cldb CLDBNODE
            Use this option when the CLDB Service is down to point to a CLDB
            node
        --port PORT
            port number used by FileServer (default: 5660)
        --nfsport NFS_MGMT_PORT
            port number used by NFS Server (default: 9998)
        -m, --mini-dump SIZE
            Collects only first and last number of bytes of each log file if
            file is greater than 2*SIZE.
            SIZE may have a multiplier suffix: b 512, k 1024, m 1024*1024
        -A, --logs-age DAYS
            Use this option to collect logs newer than specified DAYS
            (default: 7, nolimit: 0)
        -f, --filter FILTER_STRING
            Use this option to filter nodes for which support dump should be
            collected
        -?, --help
            display usage

```

## Parameters

Parameter	Description
-h or --hosts	A file containing a list of hosts. Each line contains one host entry, in the format [user@]host[:port].
-H or --host	One or more hosts in the format [user@]host[:port].
-Q or --no-cldb	If specified, the command does not query the CLDB for list of nodes.
-n or --name	Specifies the name of the output file. If not specified, the default is a date-named file in the format YYYY-MM-DD-hh-mm-ss.tar.
-d or --output-dir	The absolute path to the output directory. The default path is /opt/mapr/support/collect/.

Parameter	Description
-l or --no-logs	If specified, the command output does not include any log files.
--no-hadoop-logs	If specified, the command output does not include Hadoop log files.
--hbase-logs	If specified, the command output includes HBase log files.
--sqoop-logs	If specified, the command output includes Sqoop log files.
--eco-logs	If specified, the command output includes the log files for all MapR ecosystem components.
--oozie-logs	If specified, the command output includes Oozie log files.
--spark-logs	If specified, the command output includes Spark log files.
--pig-logs	If specified, the command output includes Apache Pig log files.
--impala-logs	If specified, the command output includes Apache Impala log files.
--hue-logs	If specified, the command output includes Apache Hue log files.
--hive-logs	If specified, the command output includes Apache Hive log files.
--flume-logs	If specified, the command output includes Apache Flume log files.
--drill-logs	If specified, the command output includes Apache Drill log files.
--no-kibana-logs	If specified, the command output does not include Kibana log files.
--no-grafana-logs	If specified, the command output does not include Grafana log files.
--no-elasticsearch-logs	If specified, the command output does not include Elasticsearch log files.
--no-opentsdb-logs	If specified, the command output does not include OpenTSDB log files.
--no-collectd-logs	If specified, the command output does not include Collectd log files.
--no-fluentd-logs	If specified, the command output does not include Fluentd log files.
--no-vol-info	If specified, the command output does not include any volume information.
-L or --no-libraries	If specified, the command output does not include libraries.
-c or --no-conf	If specified, the command output does not include configurations.
-i or --no-sysinfo	If specified, the command output does not include system information.

Parameter	Description
-x or --exclude-cluster	If specified, the command does not collect cluster diagnostics. Even if cluster diagnostics are excluded, the script still collects local logs and local system diagnostic information.
-u or --user	The username for ssh connections.
-K or --strict-hostkey	If specified, checks for strict host key in the SSH connection. When specified, ssh never automatically adds host keys to the <code>~/.ssh/known_hosts</code> file, and refuses to connect to a host whose host key has changed. This provides maximum protection against trojan horse attacks, but can be troublesome when the <code>/etc/ssh/ssh_known_hosts</code> file is poorly maintained or connections to new hosts are frequently made. This option forces the user to manually add all new hosts.
-p or --par	The maximum number of nodes from which support dumps are gathered concurrently (default: 10).
-t or --dump-timeout	The timeout in seconds for execution of the <code>mapr-support-dump</code> command on a node (default: 3600 seconds or 0 = no limit).
-T or --scp-timeout	The timeout in seconds for copy of support dump output from a remote node to the local filesystem (default: no limit).
-y or --yes	If specified, the command does not require acknowledgement of the number of nodes that are affected.
-O or --online	Specifies a space-separated list of nodes from which to gather support output, and uses the MapR APIs instead of ssh for transmitting the support data.
-S or --scp-port	The local port to which remote nodes establish a SCP session. The default port is 22.
--collect-cores	If specified, the command collects cores of running MFS processes from all nodes (default: off).
--move-cores	If specified, the command moves MFS and NFS cores from <code>/opt/cores</code> to <code>/opt/mapr/logs/cores/</code> on all nodes (default: off).
--use-hostname	If specified, uses hostnames instead of IP address for SSH (default: off).
--cldb <clbdbnode>	Use this option when the CLDB Service is down to point to a CLDB node.
--port	The port number used by FileServer (default: 5660).
--nfsport	The port number used by NFS Server (default: 9998).

Parameter	Description
-m or --mini-dump <size>	For any log file greater than 2 * <size>, collects only a head and tail each of the specified size. The <size> may have a suffix specifying units: <ul style="list-style-type: none"> <li>• b - blocks (512 bytes)</li> <li>• k - kilobytes (1024 bytes)</li> <li>• m - megabytes (1024 kilobytes)</li> </ul>
-A or --logs-ag	Use this option to collect logs newer than specified days (default: 7, nolimit: 0)
-f or --filter <filter string>	Use this option to specify a filter string. Support information is only collected for nodes with names that match the filter string.
-? or --help	Displays usage help text

### Examples

**Collect support information and dump it to the file /opt/mapr/support/collect/mysupport-output.tar:**

```
/opt/mapr/support/tools/mapr-support-collect.sh -n mysupport-output
2019-09-16 21:37:28.884 INFO Creating nodes file
2019-09-16 21:37:28.907 INFO Querying CLDB for nodes in the cluster
2019-09-16 21:37:31.883 INFO Created nodes file
Diagnostics will be collected from 1 nodes. Press enter to continue:
2019-09-16 21:37:35.650 INFO Collecting cluster information
2019-09-16 21:38:35.282 INFO Collecting dump on <ip>
Password:
2019-09-16 21:41:12.917 INFO Copying dump from <ip>
Password:
2019-09-16 21:44:25.137 INFO Making a tarball of all the dumps
```

```
-----
----- Finished collecting diagnostics
information -----
-----
```

Successfully collected support information on cluster from CLDB.

```
Total no. of nodes from which dump collection was attempted: 1
Nodes from which support information gathering succeeded:      1
Number of nodes from which dump collection failed:            0
Number of nodes from which dump file could not be copied:     0
```

The tar ball of the dumps is available at: /opt/mapr/support/collect/mysupport-output.tar

### mapr-support-dump.sh

Collects node and cluster-level information for the node on which you invoke the script.

The information collected is used to help HPE Support diagnose problems. Use [mapr-support-collect.sh](#) on page 2909 to collect diagnostic information from all nodes in the cluster.

The "mini-dump" option limits the size of the support output. When you specify the `-m` or `--mini-dump` option along with a size, `mapr-support-dump.sh` collects only a head and tail, each limited to the specified size, from any log file that is larger than twice the specified size. The total size of the output is

therefore limited to approximately 2 \* size \* number of logs. You can specify the size using the following suffixes:

- b - bytes
- k - kilobytes (1024 bytes)
- m - megabytes (1024 kilobytes)

## Syntax

```
/opt/mapr/support/tools/mapr-support-dump.sh
[ -n | --name <name> ]
[ -l | --no-logs ]
[ --no-hadoop-logs ]
[ --hbase-logs ]
[ --sqoop-logs ]
[ --eco-logs ]
[ --oozie-logs ]
[ --spark-logs ]
[ --pig-logs ]
[ --impala-logs ]
[ --hue-logs ]
[ --hive-logs ]
[ --flume-logs ]
[ --drill-logs ]
[ -L | --libraries ]
[ -d | --output-dir <path> ]
[ -s | --no-statistics ]
[ -c | --no-conf ]
[ -i | --no-sysinfo ]
[ -o | --exclude-cluster ]
[ -O | --online ]
[ -z | --only-cluster ]
[ --collect-cores ]
[ --move-cores ]
[ --port <port> ]
[ --nfsport <port> ]
[ -m | --mini-dump <size> ]
[ -A | --logs-age <days> ]
[ -? | --help ]
```

## Parameters

Parameter	Description
-n or --name	Specifies the name of the output file. If not specified, the default is a date-named file in the format YYYY-MM-DD-hh-mm-ss.tar
-l or --no-logs	Does not include log files.
--no-hadoop-logs	Does not include Hadoop log files
--hbase-logs	Includes Hbase log files.
--sqoop-logs	Includes Sqoop log files
--eco-logs	Includes all ecosystem log files.
--oozie-logs	Includes Oozie log files.
--spark-logs	Includes Spark log files.

Parameter	Description
--pig-logs	Includes Pig log files.
--impala-logs	Includes Impala log files.
--hue-logs	Includes Hue log files.
--hive-logs	Includes Hive log files.
--flume-logs	Includes Flume log files.
--drill-logs	Includes Drill log files.
-L or --libraries	Includes libraries.
-d or --output-dir	The absolute path to the output directory. If not specified, the default is <code>/opt/mapr/support/collect/</code>
-s or --no-statistics	Does not include statistics.
-c or --no-conf	Does not include configurations.
-i or --no-sysinfo	Does not include system information.
-o or --exclude-cluster	Does not collect cluster diagnostics.
-O or --online	Saves the support dump output file to the <code>/var/mapr/cluster/support</code> directory in maprfs. When not specified, the output file is stored at <code>/opt/mapr/support/dump</code> on the local machine filesystem.  Specifies a space-separated list of nodes from which to gather support output, and uses the warden instead of ssh for transmitting the support data.
-z or --only-cluster	Collects diagnostic information at the cluster level only.
--collect-cores	Collects cores of running mfs processes from all nodes (off by default)
--move-cores	Moves mfs and nfs cores from <code>/opt/cores</code> from all nodes (off by default)
--port	The port number used by the FileServer. Default: 5660
--nfs-port	The port used by the NFS server. Default: 9998
-m, --mini-dump <size>	For any log file greater than $2 * \text{<size>}$ , collects only a head and tail each of the specified size. The <size> may have a suffix specifying units: <ul style="list-style-type: none"> <li>• b - blocks (512 bytes)</li> <li>• k - kilobytes (1024 bytes)</li> <li>• m - megabytes (1024 kilobytes)</li> </ul>
-A or --logs-age <days>	Collects logs newer than the specified number of days. The default value for this parameter is 7. Specify a value of 0 to have the <code>mapr-support-dump.sh</code> script collect logs of any age.

Parameter	Description
-? or --help	Displays usage help text

## Output

The example produces a tar file at `/opt/mapr/support/dump/mysupport-output.tar`. To extract the tar file, use `tar -xf mysupport-output.tar`. The directory structure is as follows:

```
$ ls
mysupport-output      mysupport-output.tar

$ ls mysupport-output
MapRBuildVersion      hostid                mfsstate_commands
cluster               hostname              roles
cluster_summary.txt  linux-release        support_dump.log
conf                  logs                  system_info
conf_file_metadata   mapr-clusters.conf
```

- **mfsstate\_commands** - Contains all information collected about the state of the filesystem are stored the the `mfsstate_commands` directory.
- **cluster** - Contains information associated with `maprccli_commands`, `resourcemanager`, and `volume_dumps`.
- **system\_info** - Contains all information related to the system state and configuration.
- **support\_dump.log** - Contains console output of the individual commands launched by the support dump script.
- Commonly required files - `cluster_summary.txt`, `conf_file_metadata`, `hostid`, `hostname`, `linux-release`, `MapRBuildVersion`, `mapr-clusters.conf`, and `support_dump.log` are place in the dump root for easier access.

## Example

Collect support information and dump it to the file `/opt/mapr/support/collect/mysupport-output.tar`:

```
/opt/mapr/support/tools/mapr-support-dump.sh -n mysupport-output
```

## Example Output

```
/opt/mapr/support/tools/mapr-support-dump.sh -n mysupport-output
2015-06-25 11:51:38.397 INFO Starting Support dump collection. For
diagnostics, refer to support@dump.log inside the dump

```

**maprlogin**

Authenticates logins to secure HPE Ezmeral Data Fabric clusters.

The `/opt/mapr/bin/maprlogin` command line tool enables users to log into secure MapR clusters. Users authenticate themselves to the cluster with a `maprticket` that can be generated in the following ways:

- Run `maprlogin password` to authenticate with username and password.
- Run `maprlogin generateticket` to request a service, tenant, or cross-cluster ticket for use by an external application or user account (based on the current user's ticket).
- Run `maprlogin kerberos` after generating a Kerberos ticket with the `kinit` command.

**NOTE:** Tickets contain keys, and are used to authenticate users and MapR servers. Every user who wants to access a cluster must have a MapR user ticket (`maprticket_<uid>`) and every node in the cluster must have a MapR server ticket (`maprserverticket`).

For more details about different ways to generate tickets, see [Tickets](#).

**Syntax**

```
/opt/mapr/bin/maprlogin <argument> <option>
```

**Arguments**

Argument	Description
authtest	<p>Simulates runtime behavior during authentication. The following is the syntax for running the <code>maprlogin</code> command with this argument:</p> <pre>/opt/mapr/bin/maprlogin authtest   [ -cluster mapr cluster name ]</pre> <p>For more information, see <a href="#">Options</a> on page 2919.</p>
end logout	<p>Logs out of the cluster. The following is the syntax for running the <code>maprlogin</code> command with this argument:</p> <pre>/opt/mapr/bin/maprlogin end logout   [ -cluster mapr cluster name ]</pre> <p>For more information, see <a href="#">Options</a> on page 2919.</p>
generateticket	<p>Generates a ticket for another user or application. The user who runs the <code>maprlogin</code> command with this option must already have a user ticket and must have <code>fc</code> (full control) ACL authorization on the cluster. See <a href="#">acl set</a>.</p> <p>The following is the syntax for running the <code>maprlogin</code> command with this argument:</p> <pre>/opt/mapr/bin/maprlogin generateticket   -type service crosscluster servicewithimpersonation tenant   -user &lt;UNIX user name&gt;   [ -cluster &lt;cluster name&gt; ]   -out &lt;ticket location&gt;   [ -duration &lt;[Days:]Hours:Minutes OR -duration Seconds&gt; ]   [ -renewal &lt;[Days:]Hours:Minutes OR -duration Seconds&gt; ]   [ -impersonateduids &lt;uids to impersonate&gt; ]   [ -impersonatedgids &lt;gids to impersonate&gt; ]</pre> <p>For more information, see <a href="#">Options</a> on page 2919.</p>

Argument	Description
kerberos	<p>Indicates the presence of a Kerberos ticket. The following is the syntax for running the <code>maprlogin</code> command with this argument:</p> <pre>/opt/mapr/bin/maprlogin kerberos [ -cluster &lt;cluster name&gt; ] [ -duration &lt;ticket duration&gt; ]</pre> <p>For more information, see <a href="#">Options</a> on page 2919.</p>
password	<p>The user's UNIX password. The following is the syntax for running the <code>maprlogin</code> command with this argument:</p> <pre>/opt/mapr/bin/maprlogin password [ -cluster &lt;cluster name&gt; ] [ -user &lt;user name&gt; ] [ -duration &lt;ticket duration&gt; ] [ -out &lt;ticket location&gt; ]</pre> <p>For more information, see <a href="#">Options</a> on page 2919.</p>
print	<p>Prints ticket of any type and contains information including the cluster name, the user ID, the date when the ticket was created, the ticket expiration date, and whether user can impersonate other users, and whether the ticket is for a tenant.</p> <p>In the service tickets, the value for <code>CanImpersonate</code> is <code>true</code> if impersonation is enabled for user and <code>false</code> if impersonation is disabled for the user. In the regular cluster ticket for the user, the value of <code>CanImpersonate</code> is always <code>false</code>. In the tenant ticket, the value for <code>CanImpersonate</code> is always <code>true</code>.</p> <p>The following is the syntax for running the <code>maprlogin</code> command with this argument:</p> <pre>/opt/mapr/bin/maprlogin print [ -ticketfile &lt;location of ticket file&gt; ]</pre> <p>For more information, see <a href="#">Options</a> on page 2919.</p>
renew	<p>Renews the ticket, given a duration that does not cause the ticket to exceed its maximum lifetime. The original <code>-renewal</code> value for the ticket determines its maximum lifetime. The following is the syntax for running the <code>maprlogin</code> command with this argument:</p> <pre>/opt/mapr/bin/maprlogin renew [ -cluster &lt;cluster name&gt; ] [ -duration &lt;ticket renew duration&gt; ] [ -ticketfile &lt;input ticket file&gt; ] [ -out &lt;ticket location&gt; ]</pre> <p>For more information, see <a href="#">Options</a> on page 2919.</p>

### Options

Option	Description	Default
<code>-cluster</code>	Name of the cluster to log into.	First cluster name in the <code>/opt/mapr/conf/mapr-clusters.conf</code> file.

Option	Description	Default
-duration	<p>Length of time before the ticket expires, specified in one of the following formats:</p> <p>-duration [Days:]Hours:Minutes</p> <p>- duration Seconds</p> <p>Password-generated tickets are bounded by the CLDB duration and renewal properties that are set for the cluster:</p> <ul style="list-style-type: none"> <li>• <code>cldb.security.user.ticket.duration.seconds</code> (default=1209600) is used if duration is not specified while generating the ticket.</li> <li>• <code>cldb.security.user.ticket.max.duration.seconds</code> (default=2592000) is the maximum duration allowed for a ticket.</li> </ul> <p>For password-generated tickets, if -duration is not set with the <code>maprlogin</code> command, the CLDB duration property is used by default.</p> <p>See <a href="#">config</a>.</p> <p> <b>NOTE:</b> The <code>service</code>, <code>servicewithimpersonation</code>, <code>tenant</code>, and <code>crosscluster</code> tickets may have a very long lifetime; their duration is not bounded by these properties. For <code>service</code> and <code>crosscluster</code> tickets, the default value is LIFETIME.</p>	<ul style="list-style-type: none"> <li>• 1209600 seconds (14 days) for user tickets</li> <li>• LIFETIME for service and cross-cluster tickets</li> </ul>
-impersonatedgids	<p>The comma-separated list of GIDs to impersonate. This can only be specified when generating a <code>servicewithimpersonation</code> ticket. If this is specified, the ticket owner can only impersonate the specified groups or users belonging to the specified groups.</p> <p>If <code>impersonatedgids</code> and <code>impersonareduids</code> are not specified, the ticket holder can impersonate all users on the cluster except the root user or the <code>mapr</code> user.</p>	No default
-impersonateduids	<p>The comma-separated list of UIDs to impersonate. This can only be specified when generating a <code>servicewithimpersonation</code> ticket. If this is specified, the ticket owner can only impersonate the specified users.</p> <p>If <code>impersonatedgids</code> and <code>impersonareduids</code> are not specified, the ticket holder can impersonate all users on the cluster except the root user or the <code>mapr</code> user.</p>	No default
-out	<p>A safe directory location where the ticket will be stored. Can be used with <code>generateticket</code>, <code>password</code>, and <code>renew</code> commands.</p> <p>You must specify a location when generating service and tenant tickets. (This requirement ensures that other tickets are not overwritten.)</p>	<p><code>/tmp/maprticket_&lt;uid&gt;</code></p> <p>(default applies to non-service tickets only)</p>

Option	Description	Default
-renewal	<p>Total lifetime of the ticket, specified in one of the following formats:</p> <pre>-renewal [Days:]Hours:Minutes</pre> <pre>-renewal Seconds</pre> <p>If <code>-renewal</code> is not set with the <code>maprlogin</code> command, the CLDB renewal property is set by default (<code>cldb.security.user.ticket.renew.duration.seconds</code>). You can also set the <code>cldb.security.user.ticket.renew.max.duration.seconds</code> property, which is the maximum duration (7776000, by default) allowed for a ticket renewal.</p> <p> <b>NOTE:</b> Service, tenant, and crosscluster tickets are not bounded by these properties.</p> <p>For example, assume that the <code>maprlogin</code> command passes the following options for a service ticket:</p> <pre>-duration 30:0:0 -renewal 90:0:0</pre> <p>The ticket will expire after 30 days unless it is renewed. If a <code>maprlogin renew</code> command is submitted for the ticket before the initial 30 days pass, the ticket's lifetime may be extended up to a total maximum lifetime of 90 days. Tickets do not renew automatically; administrators must renew them with the <code>maprlogin renew</code> command, specifying a valid renewal period, and they must do this before the duration period ends. The renewal period must be less than or equal to the remaining amount of time allowed on the ticket.</p> <p>Using the same example, if you renew a ticket on the 29th day of its life, you can renew it for up to 61 days. You can renew a ticket incrementally, for some number of days at a time, as long as you do not exceed the original renewal value.</p>	2592000 seconds (30 days)
-ticketfile	<p>Optional with <code>print</code> and <code>renew</code> commands. Specifies the path to ticket file, if different from default. If this is not specified, the command looks for the ticketfile (<code>maprticket_&lt;uid&gt;</code>) in the default location, which is <code>/tmp</code> on Linux and <code>%TEMP%</code> on Windows systems or in the location specified by the environment variable, <code>\$MAPR_TICKETFILE_LOCATION</code>.</p>	<ul style="list-style-type: none"> <li>• Linux: <code>/tmp</code></li> <li>• Windows: <code>%TEMP%</code></li> </ul>

Option	Description	Default
-type	<p>Required ticket type for the <code>generateticket</code> command; value must be <code>service</code>, <code>servicewithimpersonation</code>, <code>tenant</code>, or <code>crosscluster</code>:</p> <ul style="list-style-type: none"> <li><code>service</code> is used to generate service tickets for regular cluster operations.</li> <li><code>servicewithimpersonation</code> is used to generate tickets for regular cluster operations, including allowing user to impersonate other users.</li> <li><code>tenant</code> is used to generate tickets for tenant users/hosts.</li> <li><code>crosscluster</code> is used to generate tickets for inter-cluster operations, such as remote mirroring. The <code>crosscluster</code> option only works with the <code>mapr</code> user.</li> </ul>	No default; <code>-type</code> must be set in the <code>maprlogin generateticket</code> command.
-user	<p>Required with the <code>generateticket</code> command. The UNIX user name of the user on the MapR cluster.</p> <p>For <code>crosscluster</code> tickets, the user must be <code>mapr</code>.</p>	No default

### maprlogin Command Examples

Describes common scenarios associated with `maprlogin` usage.

#### Generating and Displaying User Ticket

**Generate** a user ticket:

```
$ maprlogin password
[Password for user 'juser' at cluster 'my.cluster.com': ]
MapR credentials of user 'juser' for cluster 'my.cluster.com'
are written to '/tmp/maprticket_1000'
```

**Display** the ticket for the current user. Sample output is shown below.

```
$ maprlogin print
Opening keyfile /tmp/maprticket_1000
my.cluster.com: user = juser,
created = 'Mon Sep 17 08:30:26 PDT 2018', expires = 'Mon Oct 01 08:30:26
PDT 2018',
RenewalTill = 'Wed Oct 17 08:30:26 PDT 2018', uid = 20001, gids = 54261,
CanImpersonate = false
```

#### Generating and Displaying mapr User Ticket

**Generate** a ticket for the `mapr` user:

```
# su mapr
$ maprlogin password
[Password for user 'mapr' at cluster 'test.cluster.com': ]
MapR credentials of user 'mapr' for cluster 'test.cluster.com'
are written to '/tmp/maprticket_5000'
```

**Display** the ticket for the current user. Sample output is as follows.

```
$ maprlogin print
Opening keyfile /tmp/maprticket_5000
test.cluster.com: user = mapr, created = 'Mon Sep 17 09:18:19 PDT 2018',
expires = 'Mon Oct 01 09:18:19 PDT 2018', RenewalTill = 'Wed Oct 17
09:18:19 PDT 2018',
uid = 5000, gids = 5000, 0, 5001, CanImpersonate = true
```

## Generating and Displaying Service Ticket

**Generate** a service ticket, *longlived\_ticket*, in */tmp* for *maprUser1*:

```
$ maprlogin generateticket -type service -out /tmp/longlived_ticket
-duration 30:0:0 -renewal 90:0:0 -user maprUser1
MapR credentials of user 'maprUser1' for cluster 'JSKCluster129_secure'
are written to '/tmp/longlived_ticket'
```

**Display** the service ticket in a specified location:

```
$ maprlogin print -ticketfile /tmp/ticketwithduration
Opening keyfile /tmp/ticketwithduration
JSKCluster129_secure: user = maprUser1,
created = 'Tue Jun 14 11:12:01 PDT 2017', expires = 'Thu Jul 14 11:12:01
PDT 2017',
RenewalTill = 'Mon Sep 12 11:12:01 PDT 2017',
uid = 0, gids = 0, CanImpersonate = false
```

## Generating and Printing Service with Impersonation Ticket

**Generate** a service with impersonation ticket (in */var/tmp*) for *maprUser1*:

```
$ maprlogin generateticket -type servicewithimpersonation -user maprUser1
-out /var/tmp/impersonationTicketMapRuser1
```

After generating the ticket, ensure that *maprUser1* has read permissions on the ticket. If you move the ticketfile to a different location, set the `$MAPR_TICKETFILE_LOCATION` environment variable.

**Display** the service with impersonation ticket in the specified location:

```
$ maprlogin print -ticketfile /var/tmp/impersonationTicketMaprUser1
Opening keyfile /var/tmp/impersonationTicketMaprUser1
JSKCluster129_secure: user = maprUser1,
created = 'Mon Apr 18 13:46:38 PDT 2017', expires = 'Mon May 02 13:46:38
PDT 2017',
RenewalTill = 'Wed May 18 13:46:38 PDT 2017',
uid = 501, gids = 502, CanImpersonate = true
```

To allow a user to impersonate only specific users and/or groups, use the `impersonateduids` and/or `impersonatedgids` options with the `maprlogin` command. For example:

```
$ maprlogin generateticket -type servicewithimpersonation -user
mapruser1 -out /var/tmp/impersonation_ticket -duration
30:0:0 -impersonateduids 1002,1003 -impersonatedgids 1005,1006 -renewal
90:0:0
```

The command generates a service with impersonation ticket. The ticket holder can impersonate users whose UIDs are 1002 and 1003, and users in the groups with GIDs 1005 and 1006. The ticket expires after 30 days and is stored in `/var/tmp/impersonation_ticket`. The ticket may be renewed at any time

within 30 days and can be extended up to a maximum of 90 days. The ticket must be renewed explicitly before its expiration date; it does not renew automatically when it expires.

### Generating a Tenant Ticket that is Valid for Specific IPs

**Generate** a tenant ticket (in /tmp) for user *test* that is valid for specific IPs:

```
$ maprlogin generateticket -type tenant -out /tmp/ticketip -ips
10.9.0.1,10.9.0.2 -user test
MapR credentials of user 'test' for cluster 'my.cluster.com' are written to
'/tmp/ticketip'
```

**NOTE:** The `-ips` argument is only valid for the `tenant` ticket type.

**Display** the generated tenant ticket:

```
$ maprlogin print -ticketfile /tmp/ticketip
Opening keyfile /tmp/ticketip
my.cluster.com: user = test, created = 'Tue Aug 25 00:34:14 PDT 2020',
expires = 'Tue Aug 25 00:34:14
PDT 12020', RenewalTill = 'Tue Aug 25 00:34:14 PDT 12020', uid = 5001, gids
= 7001,
CanImpersonate = true, isExternal = true, ips = 10.9.0.1,10.9.0.2,,
IsTenant = true
```

### Generating and Displaying Cross-Cluster Ticket

**Generate** a cross-cluster ticket (in /tmp) for *maprUser1*:

```
$ maprlogin generateticket -type crosscluster -out /tmp/
crossclusterTicket -user maprUser1
MapR credentials of user 'maprUser1' for cluster 'JSKCluster128_secure'
are written to '/tmp/crossclusterTicket'
```

**Display** the contents of a cross-cluster ticket in the specified location:

```
$ maprlogin print -ticketfile /tmp/crossclusterTicket
Opening keyfile /tmp/crossclusterTicket
ClusterSecure: user = root,
created = 'Fri May 27 14:29:40 PDT 2017', expires = 'Fri May 27 14:29:40
PDT 12017',
RenewalTill = 'Fri May 27 14:29:40 PDT 12017',
uid = 0, gids = 0, CanImpersonate = false
```

### Running an Authentication Test

`authtest`: This troubleshooting option simulates the behavior of the runtime during authentication, going through the [authentication flow](#).

Options: [ `-cluster` ] Specifies the name of the cluster.

### Ending a Session Before the Ticket Expires

`end` or `logout`: Destroys tickets and logs out.

Options: [ `-cluster` ] Specifies the name of the cluster. By default, deletes all tickets for all clusters.

## Renewing a Ticket Before It Expires

`renew`: Renews an existing ticket for a specified time period.

Options:

- [ `-cluster` ] - Specifies the name of the cluster.
- [ `-duration` ] - Specifies the ticket duration.

The duration you specify must be valid for the ticket in question, given the original `-renewal` value for the ticket and the life of the ticket when the `renew` command is run:

- You cannot renew a ticket that has already expired.
- You can renew the same ticket multiple times.
- The renewal period (or periods) cannot exceed the available time left for the ticket.

For example, assume that a ticket is created with a duration of 10 days and a renewal of 30 days:

```
maprlogin password -duration 10:0:0 -renewal 30:0:0
```

- On the 11th day, the ticket expires and cannot be renewed at all.
- On the 9th day, you can renew the ticket for any number of days up to a maximum of 21.
- On the 23rd day, you can renew the ticket for any number of days up to a maximum of 7.

**Example:** Renew a ticket and display the renewed ticket in the specified location:

```
$ maprlogin renew -out /tmp/RenewedsecureClusterTicket
-ticketfile /tmp/secureClusterTicket -duration 1:0:0

$ maprlogin print -ticketfile /tmp/RenewedsecureClusterTicket
Opening keyfile /tmp/RenewedsecureClusterTicket
JSKCluster129_secure: user = root,
created = 'Tue Jun 07 11:53:29 PDT 2017',
expires = 'Wed Jun 08 11:56:56 PDT 2017',
RenewalTill = 'Thu Jul 07 11:53:29 PDT 2017',
uid = 0, gids = 0, CanImpersonate = false
```

## Troubleshooting maprlogin Failures

While the root causes of most failure cases with `maprlogin` can be quickly diagnosed, the following cases can prove challenging:

- When security is enabled for a cluster, the cluster's CLDB listens for connections on port 7443. If security for the cluster is disabled, the `maprlogin` utility is unable to reach the CLDB.
- The utility's connection uses HTTPS, which requires the file `conf/ssl_truststore` to exist on the client. If the file is not present, a secure connection cannot be negotiated.

Detailed error logs for `maprlogin` connection attempts are kept at `logs/maprlogin-<USERID>-nnnn.log`.

## mrconfig

The `mrconfig` commands let you create, remove, and manage storage pools, disk groups, and disks; and provide information about containers.

 **WARNING:** The `mrconfig` commands provide direct control and low-level access to the HPE Ezmeral Data Fabric file system. If you are not careful, or do not know what you are doing, you can irrevocably destroy valuable data.

### mrconfig cntr

Discusses the `mrconfig cntr` commands that allow you to manage containers and container replicas.

#### *mrconfig cntr disablethrottle*

Permits disabling throttling for resync of a container.

The `mrconfig cntr disablethrottle` command allows you to disable throttling for resync of a container (specified by ID). Run this command on the node that is the source for the resync.

 **NOTE:** By default, throttling is disabled if resync is not complete after 30 minutes, or when there is only one replica container.

### Syntax

```
/opt/mapr/server/mrconfig cntr disablethrottle <cid>
```

### Parameters

Parameter	Description
cid	The ID of the container.

### Example

#### Command

```
/opt/mapr/server/mrconfig cntr disablethrottle 2049
```

#### Output

```
-----
|From Instance 5660::|
-----
Changing throttling on container 2049 throttle flag disable
```

#### *mrconfig cntr resetthrottle*

Permits resetting the throttle setting for resync of a container.

The `mrconfig cntr resetthrottle` command allows you to reset the throttle setting for resync of a container (specified by ID).

 **NOTE:** Run this command only after the resync operation (on the specified container) is complete.

### Syntax

```
/opt/mapr/server/mrconfig cntr resetthrottle <cid>
```

### Parameters

Parameter	Description
cid	The ID of the container.

## Example

### Command

```
# /opt/mapr/server/mrconfig ctr resetthrottle 2049
```

### Output

```
-----
|From Instance 5660::|
-----
Changing throttling on container 2049 throttle flag reset
```

### *mrconfig ctr resyncprogress*

Retrieves the status of a resync operation for containers or volumes.

The `mrconfig ctr resyncprogress` command allows you to get the status of a resync operation for containers or volumes (specified by IDs).

### Syntax

```
/opt/mapr/server/mrconfig ctr resyncprogress --cids|--volid <id,...>
```

### Parameters

Parameter	Description
--cids	The comma-separated list of container IDs.
--volid	The comma-separated list of volume IDs.

## Example

### Command

```
# /opt/mapr/server/mrconfig ctr resyncprogress --cids 2104
```

### Output

```
-----
|From Instance 5660::|
-----
List of Source Container Ids: 2104
List of Volume Ids:
Resync Progress Info
-----
Cid: 2104, Snapshot Cid: 4069905785, Vol Id: 233969254, Location: Source,
Peer Addr: 10.20.30.40:5660
ResyncType: Container Resync, Status: Resync In Progress, Total Inodes:
4095, Resync Complete: 4095
```

### **mrconfig dbinfo**

Each instance of the file server on a node is responsible for processing and tracking activities that result from running database commands. The `mrconfig dbinfo` command displays information about the activities, including information related to containers, tablets, storage pools, tags, and threads processing operations on tables.

See [mrconfig](#) for instructions about running `mrconfig` commands.

### *mrconfig dbinfo arena*

The `mrconfig dbinfo arena` command displays all the database related arenas (contiguous piece of memory), including the arena count and byte allocated.

See [mrconfig](#) for instructions about running `mrconfig` commands.

### Syntax

```
/opt/mapr/server/mrconfig dbinfo arena
```

### Example

Display arena information.

```
/opt/mapr/server/mrconfig dbinfo arena
-----
Time: 2020-08-17 11:36:40,7368 Instance 5660
-----

### *mrconfig dbinfo autosetup*

The `mrconfig dbinfo autosetup` command displays information about replica autosetup for database tables.

See [mrconfig](#) for instructions about running `mrconfig` commands.

## Syntax

```
/opt/mapr/server/mrconfig dbinfo autosetup
```

## Example

Display replica autosetup information for database tables.

```
/opt/mapr/server/mrconfig dbinfo autosetup
-----
Time: 2020-08-18 14:49:10,4851 Instance 5660
-----
table 2049.557.263820 replicaIdx 1 replicaState 4 event 0 schedState 0
createScheduled 0
copyScheduled 1 doneRegionCount 3 retryRegionCount 1 recoveredProgressPct 0
copyProgressPct 100
backoff 0 reschedAt 0 inQuickDelayList 0 inLateDelayList 0 error 0
extendedError
```

### *mrconfig dbinfo cidmapcache*

The `mrconfig dbinfo cidmapcache` command displays the number of entries in the container ID cache and the number of successful and unsuccessful lookups performed by each instance of the file server on the cache.

See [mrconfig](#) for instructions about running `mrconfig` commands.

## Syntax

```
/opt/mapr/server/mrconfig dbinfo cidmapcache
```

## Example

Display container ID information.

```
/opt/mapr/server/mrconfig dbinfo cidmapcache
-----
Time: 2020-08-17 11:58:27,2761 Instance 5660

numMisses 0
```

### *mrconfig dbinfo copyregiontrackers*

The `mrconfig dbinfo copyregiontrackers` command displays information about copy region progress for tables upon a replica autosetup.

See [mrconfig](#) for instructions about running `mrconfig` commands.

## Syntax

```
/opt/mapr/server/mrconfig dbinfo copyregiontrackers
```

## Example

Display the copy region progress for tables upon replica autosetup.

```

/opt/mapr/server/mrconfig dbinfo copyregiontrackers
-----
Time: 2020-08-18 14:50:32,0558 Instance 5660

### *mrconfig dbinfo copyregionworkers*

The `mrconfig dbinfo copyregionworkers` command displays information about the worker threads for parallel copy regions.

See [mrconfig](#) for instructions about running `mrconfig` commands.

## Syntax

```

/opt/mapr/server/mrconfig dbinfo copyregionworkers

```

## Example

Display the

```

/opt/mapr/server/mrconfig dbinfo copyregionworkers
-----

```

### *mrconfig dbinfo mem*

The `mrconfig dbinfo mem` command displays memory information related to storage pools and buckets.

See [mrconfig](#) for instructions about running `mrconfig` commands.

## Syntax

```

/opt/mapr/server/mrconfig dbinfo mem

```

## Example

Display memory information.

```

/opt/mapr/server/mrconfig dbinfo mem
-----

```

### *mrconfig dbinfo replbuckets*

The `mrconfig dbinfo replbuckets` command displays the replication progress information for the data in each bucket for each replica of a table.

See [mrconfig](#) for instructions about running `mrconfig` commands.

## Syntax

```

/opt/mapr/server/mrconfig dbinfo replbuckets

```

## Example

Display replication progress.

```

/opt/mapr/server/mrconfig dbinfo replbuckets
-----
Time: 2020-08-18 15:01:00,5833 Instance 5660

```

*mrconfig dbinfo repltable*

The `mrconfig dbinfo repltable` command displays information about all the replicas setup on a table.

See [mrconfig](#) for instructions about running `mrconfig` commands.

**Syntax**

```
/opt/mapr/server/mrconfig dbinfo [-v] repltable <tableFid>
```

**Parameters**

Parameter	Description
-V	Sets the verbose option.
tableFid	The file identifier for the table.

**Example**

Display the information about all the replicas setup on a table.

```
/opt/mapr/server/mrconfig dbinfo repltable 2049.557.263820
-----
Time: 2020-08-18 15:05:43,2650 Instance 5660

maxPendingTS 0 bucketsPending 0 bytesPending 0 putsPending 0
```

*mrconfig dbinfo tablets*

The `mrconfig dbinfo tablets` command displays information about tablets (table regions).

See [mrconfig](#) for instructions about running `mrconfig` commands.

**Syntax**

```
/opt/mapr/server/mrconfig dbinfo tablets
```

**Example**

Display information about tablets.

```
/opt/mapr/server/mrconfig dbinfo tablets
-----
Time: 2020-08-17 10:26:05,5505 Instance 5660

```

***mrconfig dbinfo tabletsplits***

The `mrconfig dbinfo tabletsplits` command displays information about the tablets (table regions) being split.

See [mrconfig](#) for instructions about running `mrconfig` commands.

**Syntax**

```
/opt/mapr/server/mrconfig dbinfo tabletsplits
```

**Example**

Display information about the tablets currently being split.

```
/opt/mapr/server/mrconfig dbinfo tabletsplits
-----
Time: 2020-08-18 15:09:34,9493 Instance 5660
-----

SplitSrcInProgress splitStart (nil) splitEnd \x0fuser5085983665551623158
stabilizeState PAUSE_PARTITION_SPLITS
```

***mrconfig dbinfo threads***

The `mrconfig dbinfo threads` command displays information about the throttling queue for each thread processing BatchGet operations, such as the number of free and maximum slots. The command also displays the work areas (WA) for the RPCs being processed by the file server.

You can configure the number of operations that run in parallel in `mfs.conf` through the `mfs.db.max.concurrent.internal.ops` option. See [mrconfig](#) for instructions about running `mrconfig` commands.

**Syntax**

```
/opt/mapr/server/mrconfig dbinfo threads
```

**Example**

Display the throttling queue information for BatchGet operations and work areas (WA) for the RPCs currently being processed by the file server.

```
/opt/mapr/server/mrconfig dbinfo threads

### mrconfig dg

This section discusses the `mrconfig dg` commands that allow you to configure disk groups.

#### *mrconfig dg create*

Facilitates creation of disk groups.

The `mrconfig dg create` commands let you create disk groups (after you initialize disks with the `mrconfig disk init` command and add them to the node with the `mrconfig disk load` command).

You can create a disk group with one of two formats:

- Use the `mrconfig dg create raid0` command to create a striped disk group with a **RAID 0** format.
- Use the `mrconfig dg create concat` command to create a **concatenated** disk group (one disk after another).

After you create disk groups you will be ready to [create storage pools](#) on the disk groups.

See [mrconfig](#) for instructions about running `mrconfig` commands.

#### mrconfig dg create concat

The `mrconfig dg create concat` command creates a concatenated disk group. When a disk group is created Data Fabric assigns one of the disks as the device path of the disk group. After you create a disk group you will be ready to [create a storage pool](#) on the disk group.

See [mrconfig](#) for instructions about running `mrconfig` commands.

### Syntax

```
/opt/mapr/server/mrconfig dg create concat <path>
```

**Parameters**

Parameter	Description
path	The device path of each of the disks to add to the disk group; example /dev/sdc /dev/sdd /dev/sde

**Examples**

Create a concatenated disk group on a local node

```
/opt/mapr/server/mrconfig dg create concat /dev/sdc /dev/sdd /dev/sde
```

`mrconfig dg create raid0`

Creates a disk group striped for RAID 0.

The `mrconfig dg create raid0` command creates a disk group striped for RAID 0. When you create a disk group, MapR assigns one of the disks as the device path of the disk group. After you create a disk group, you are ready to [create a storage pool](#) on the disk group.

See [mrconfig](#) for instructions about running `mrconfig` commands.

**Syntax**

```
/opt/mapr/server/mrconfig dg create raid0 [-d <stripeDepth>] <path>
```

**Parameters**

Parameter	Description
-h	host IP address; default 127.0.0.1
-p	The file system port; default 5660
-d	The stripe depth in 8K blocs; default 128 (1 MB)
path	The device path of each of the disks to add to the disk group; example /dev/sdc /dev/sdd /dev/sde

**Examples**

Create a disk group striped for RAID 0 with a stripe depth of 24 on a local node

```
/opt/mapr/server/mrconfig dg create raid0 -d 24 /dev/sdc /dev/sdd /dev/sde
```

`mrconfig dg help`

The `mrconfig dg help` command displays online help for disk group commands.

See [mrconfig](#) for instructions about running `mrconfig` commands.

**Syntax**

```
/opt/mapr/server/mrconfig dg help
```

## Examples

Display online help for `mrconfig dg` commands on a local node

```
/opt/mapr/server/mrconfig dg help
```

### *mrconfig dg list*

The `mrconfig dg list` command lists the disk groups on all the file system disks on a node.

See [mrconfig](#) for instructions about running `mrconfig` commands.

## Syntax

```
/opt/mapr/server/mrconfig dg list
```

## Examples

List the disk groups on all the file system disks on localhost

```
/opt/mapr/server/mrconfig disk list
```

### **mrconfig disk**

This section discusses the `mrconfig disk` commands.

#### *mrconfig disk help*

The `mrconfig disk help` command displays the help text for `mrconfig disk` commands.

See [mrconfig](#) for instructions about running `mrconfig` commands.

## Syntax

```
/opt/mapr/server/mrconfig disk help
```

## Example

Display the help text for `mrconfig disk` commands on a local node

```
/opt/mapr/server/mrconfig disk help
```

### *mrconfig disk init*

The `mrconfig disk init` command initializes a disk and formats it for the Data Fabric file system.

#### **NOTE:**

Warning: Initializing a Disk Causes Data Loss

Initializing a disk destroys the data on the disk, so be sure that all data on a disk is backed up and replicated before initializing the disk.

After executing the `mrconfig disk init` command, add the disk to the node with the [mrconfig disk load](#) command.

See [mrconfig](#) for instructions about running `mrconfig` commands. **Tip:**

To initialize, format, and load one or more disks in one step using:

- The MapR Control System, see [Adding Disks to file system](#) on page 1141.
- The CLI, see [disk add](#) on page 2124 command.

## Syntax

```
/opt/mapr/server/mrconfig disk init <path>
[-F]
<path>
```

## Parameters

Parameter	Description
-F	Forces formatting of the disk for file system, regardless of prior formatting or existing data.
path	The device path of the disk; example /dev/sdc

## Examples

Initialize a disk for file system on a local node

```
/opt/mapr/server/mrconfig disk init /dev/sdc
```

Initialize and format a disk for file system on a local node

```
/opt/mapr/server/mrconfig disk init -F /dev/sdc
```

Initialize and format a disk for file system on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx disk init -F /dev/sdc
```

### *mrconfig disk list*

The `mrconfig disk list` command lists all of the disks on a node that have a Data Fabric file system.

It also shows information about the disk groups and storage pools on the node including whether or not the storage pools are online.

See [mrconfig](#) for instructions about running `mrconfig` commands.

### Tip:

To list system disks and other available disks on a node in addition to file system disks using:

- The MapR Control System, see [Viewing the List of Disks](#) on page 1138.
- The CLI, see [disk list](#) on page 2128 command.

## Syntax

```
/opt/mapr/server/mrconfig disk list [<path>]
```

## Parameters

Parameter	Description
path	The path of the disk; if not included shows information about all disks on the node, if included only shows information about the specified disk; example: /dev/sdc

## Examples

List information about all file system disks on a local node

```
/opt/mapr/server/mrconfig disk list
```

List information about file system disk `/dev/sdc` on a local node

```
/opt/mapr/server/mrconfig disk list /dev/sdc
```

### *mrconfig disk load*

After initializing a disk with the `mrconfig disk init` command, load the disk into memory with the `mrconfig disk load` command.

See [mrconfig](#) for instructions about running `mrconfig` commands.

## Syntax

```
/opt/mapr/server/mrconfig disk load <path>
<path>
```

## Parameters

Parameter	Description
path	The device path of the disk; example <code>/dev/sdc</code>

## Examples

Load a disk on a local node

```
/opt/mapr/server/mrconfig disk load /dev/sdc
```

### *mrconfig disk remove*

The `mrconfig disk remove` command removes a disk from file system. A disk cannot be removed unless its storage pool is offline.

#### **NOTE: Warning: Removing a Disk Causes Data Loss**

Removing a disk destroys the data on the disk, so be sure that all data on a disk is backed up and replicated before removing a disk.

The `mrconfig disk remove` command is typically used when replacing a failed disk on a node.

## Syntax

```
/opt/mapr/server/mrconfig disk remove [<path>]
```

## Parameters

Parameter	Description
path	The device path of the disk; example <code>/dev/sdc</code>

**Examples**

Remove a disk from a local node

```
/opt/mapr/server/mrconfig disk remove /dev/sdc
```

## Removing Disks Using mrconfig

**About this task**

Suppose one of three disks in a storage pool has failed, and the storage pool has gone offline.

To remove a disk with `mrconfig disk remove`:

**Procedure**

1. Ensure that the data on the surviving disks is backed up/replicated.
2. Remove the failed disk from the node's disktab with the `mrconfig disk remove` command.
3. Physically remove the failed disk.
4. Physically attach the replacement disk.
5. Run the `mrconfig disk init` command on the replacement disk and on the other two disks that were in the disk group.
6. Run the `mrconfig disk load` command on each of the three disks.
7. Use the `mrconfig dg create` command to create a new disk group with the three disks.
8. Use the `mrconfig sp make` command to create a storage pool on the new disk group.

**mrconfig info**

The `mrconfig info` commands provide information about memory, threads, volumes, containers and other information about the Data Fabric file system.

See [mrconfig](#) for instructions about running `mrconfig` commands.

*mrconfig info containerchain*

The `mrconfig info containerchain` command displays the containerchain for a given container.

Example:

```
$ /opt/mapr/server/mrconfig info containerchain 2050
Container 2050 prev 256000049 next 0.
Container 256000049 prev 0 next 2050.
```

See [mrconfig](#) for instructions on running `mrconfig` commands.

**Syntax**

```
mrconfig [-h <host>] [-p <port>] info containerchain <cid>
<cid>
```

## Parameters

Parameter	Description
-h	host IP address; default 127.0.0.1
-p	The file system port; default 5660
cid	The container identifier

### Tip:

Use the `mrconfig info dumpcontainers` command to find the container identifiers on a node.

### Examples

Find the containerchain for a container with a cid of 2049 on a local node

```
/opt/mapr/server/mrconfig info containerchain 2049
```

Find the containerchain for a container with a cid of 2049 on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info containerchain 2049
```

### *mrconfig info containerlist*

The `mrconfig info containerlist` command lists read/write container IDs for a specified volume.

Example:

```
$ /opt/mapr/server/mrconfig info containerlist volume1
Volume containers
2050
```

See `mrconfig` for instructions about running `mrconfig` commands.

### Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info containerlist
<volName>
```

## Parameters

Parameter	Description
-h	host IP address; default 127.0.0.1
-p	The file system port; default 5660
volName	The name of the volume

### Tips:

You can see the names of volumes using:

- The **Volumes** view in the in the Control System.
- The `maprcli volume list` command.

## Examples

Display information about the containers in a volume named `marketing` on a local node

```
/opt/mapr/server/mrconfig info containerlist marketing
```

Display information about the containers on a volume named `marketing` on a remote node with an IP address of `xx.xx.xx.xx`

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info containerlist marketing
```

### *mrconfig info containers*

The `mrconfig info containers` command displays information about containers.

Example:

```
$ /opt/mapr/server/mrconfig info containers rw
RW containers: 1 2049 2050
$ /opt/mapr/server/mrconfig info containers resync
$ /opt/mapr/server/mrconfig info containers snapshot
Snapshot containers: 256000049
```

See [mrconfig](#) for instructions about running `mrconfig` commands.

## Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info containers
<container-type> [path]

    <container-type>
    [path]
```

## Parameters

Parameter	Description
-h	host IP address; default 127.0.0.1
-p	The file system port; default 5660
container-type	When specified, lists only containers of the specified type. Possible values: <ul style="list-style-type: none"> <li>rw</li> <li>resync</li> <li>snapshot</li> </ul>
path	The path to a service pool (obtained with <a href="#">mrconfig sp list</a> ). When specified, lists only containers on the specified service pool.

## Examples

Display a list of read/write containers on a local node

```
/opt/mapr/server/mrconfig info containers rw
```

Display a list of read/write containers on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info containers rw
```

### *mrconfig info dumpcontainers*

The `mrconfig info dumpcontainers` command displays information about containers including container identifiers, volume identifiers, storage pools, total and free inodes per container.

### Example:

```
$ /opt/mapr/server/mrconfig info dumpcontainers
cid:2352 valid:165226505 sp:SP2:/dev/sde

```

See [mrconfig](#) for instructions about running `mrconfig` commands.

### Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info dumpcontainers
```

**Input Parameters**

Parameter	Description
-h	host IP address; default 127.0.0.1
-p	The file system port; default 5660

**Output Fields**

Field	Description
cid	Container ID
volid	Volume ID of the volume to which this container belongs.
sp	Storage pool to which this container belongs. For example: SP2:/dev/sde Here, SP2 is the name of the storage pool. /dev/sde is the disk on which the container resides.
spid	Storage pool ID
prev	Pointer to the previous snapshot cid or rw cid (for a clone container), in a snapshot chain.
next	Pointer to the next snapshot cid or rw cid (for a clone container), in a snapshot chain.
issnap	Indicates whether container is a snapshot or not, in a snapshot chain. <ul style="list-style-type: none"> <li>• 0 - rw container (Not a snapshot container)</li> <li>• 1 - Snapshot</li> </ul>
isclone	Indicates whether this container is a clone container created as part of the resync operation. <ul style="list-style-type: none"> <li>• 0 - Not a clone</li> <li>• 1 - Is a clone</li> </ul>
deleteinprog	Indicates whether this container is marked for deletion. <ul style="list-style-type: none"> <li>• 0 - Not marked for deletion</li> <li>• 1 - Marked for deletion</li> </ul>
fixedbyfsck	Indicates whether fsck was run on this container to fix any data or metadata errors. <ul style="list-style-type: none"> <li>• 0 - fsck was not run on the container</li> <li>• 1 - fsck was run on the container</li> </ul>

Field	Description
stale	Indicates whether the current cid is a stale cid or not. Container is marked as stale when it is yet to be processed for cleanup. <ul style="list-style-type: none"> <li>• 0 - Not stale</li> <li>• 1 - Stale</li> </ul>
querycldb	Indicates whether the container is awaiting its role from CLDB at the time of bringing up a cluster. <ul style="list-style-type: none"> <li>• 0 - Not waiting as CLDB has already defined the role for the container</li> <li>• 1 - Waiting for CLDB to specify the role for the container</li> </ul>
resyncinprog	Indicates if the container is resyncing from another container in the container chain. <ul style="list-style-type: none"> <li>• 0 - Resyncing in progress</li> <li>• 1 - No resyncing</li> </ul>
shared	Indicates whether the container is hosting any shared data. The value is the number of shared data blocks (each of size 8K).
owned	Indicates the number of data blocks (each of size 8K) that the container owns.
logical	Indicates the number of logical data blocks (each of size 8K) that are present in the container.
snapusage	Indicates the number of container blocks (each of size 8K) that are used for storing snapshot data.
snapusageupdated	Internal field.
ismirror	Indicates if this container is of a mirror volume or not. 0 - Is not of a mirror volume 1- Is of a mirror volume
isrwmirrorcapable	Indicates if the container belongs to a mirror volume, and if the volume can be converted to a rw volume, in case the primary volume goes down. <ul style="list-style-type: none"> <li>• 0 - Volume cannot be converted</li> <li>• 1 - Volume can be converted</li> </ul>
role	Role of the container, in the container chain. <ul style="list-style-type: none"> <li>• 0 - Master</li> <li>• 1 - Not the master</li> </ul>
totalnodes	Indicates the total number of inodes that can be created on the container.

Field	Description
freelnodes	Indicated the number of inodes that are still available to be used.
dare	Indicates whether the container belongs to a volume that is dare-enabled or not. <ul style="list-style-type: none"> <li>0 - Volume is not dare-enabled</li> <li>1 - Volume is dare-enabled</li> </ul>
istiered	Indicates whether the container belongs to a tiered (either cold-tiered or EC enabled) volume. <ul style="list-style-type: none"> <li>0 - Container belongs to a tiered volume</li> <li>1 - Container does not belong to a tiered volume</li> </ul>
numtotalblocks	Applicable only for tiered volumes, this parameter indicates the total number of data blocks present in the container.
numpurgedblocks	Applicable only for tiered volumes, this parameter indicates the number of data blocks that are offloaded and not locally present. This value decreases in case of recalls.
numoffloadedblocks	Applicable only for tiered volumes, this parameter indicates the number of data blocks that are off-loaded to the tier.
maxUniq	Internal field.
isResyncSnapshot	Indicates whether the container belongs to the resync snapshot. <ul style="list-style-type: none"> <li>0 - Container does not belong to the resync snapshot</li> <li>1 - Container belongs to the resync snapshot</li> </ul>
snapId	Indicates the snapshot ID to which this container belongs, if the ID is a snap cid.
port	Indicates the MFS port number used by the container.

### Examples

Display information about containers on a local node

```
/opt/mapr/server/mrconfig info dumpcontainers
```

Display information about containers on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info dumpcontainers
```

*mrconfig info fsstate*

The `mrconfig info fsstate` command displays information about the status of the Data Fabric file system, for example whether or not storage pools are loaded. See [mrconfig](#) for instructions about running `mrconfig` commands.

## Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info fsstate
```

## Parameters

Parameter	Description
-h	host IP address; default 127.0.0.1
-p	The file system port; default 5660

## Examples

Display information about the state of the Data Fabric file system on a local node

```
/opt/mapr/server/mrconfig info fsstate
```

Display information about the state of the Data Fabric file system on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info fsstate
```

*mrconfig info fsthreads*

The `mrconfig info fsthreads` command displays information about threads running on file system disks on a node. See [mrconfig](#) for instructions about running `mrconfig` commands.

## Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info fsthreads
```

## Parameters

Parameter	Description
-h	host IP address; default 127.0.0.1
-p	The file system port; default 5660

## Examples

Display information about MapR filesystem threads on a local node

```
/opt/mapr/server/mrconfig info fsthreads
```

Display information about MapR filesystem threads on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info fsthreads
```

*mrconfig info mastgateway*

The `mrconfig info mastgateway` command must be run on a CLDB node. The command displays the status of the MAST Gateways, the total number of volumes assigned to them, and the number of active, inflight, and pending volumes.

See [mrconfig](#) on page 2925 for instructions about running `mrconfig` commands.

## Syntax

```
/opt/mapr/server/mrconfig info mastgateway [<gwid>]
```

## Parameters

Parameter	Description
gwid	The ID of the MAST Gateway for which to display information.

## Examples

Display information about MAST Gateways on the cluster:

```
# /opt/mapr/server/mrconfig -h 10.20.30.400 info mastgateway
Num MastGateways: 2

Gateway : atsq8c46.qa.lab ( 6322920922584906487 )
Active : Yes
Active Vn : 101, Inflight Vn : 101
Num Active Vols : 4
Num Inflight Vols, Adds : 0, Removes : 0
Num Pending Vols, Adds : 0, Removes : 0

Active Vols :
153675213
97789611
23539482
45553484

Gateway : atsq8c48.qa.lab ( 8723754106996643487 )
Active : Yes
Active Vn : 100, Inflight Vn : 100
Num Active Vols : 0
Num Inflight Vols, Adds : 0, Removes : 0
Num Pending Vols, Adds : 0, Removes : 0
No vols assigned to gateway.
```

### *mrconfig info nfsthreads*

The `mrconfig info nfsthreads` command displays information about in-progress NFS operations.

## Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info nfsthreads
```

## Parameters

Parameter	Description
-h	host IP address; default 127.0.0.1
-p	The NFS port; default 2049

## Output

The output shows the NFS operations currently running (in progress) including the IP address of the client and the type of operation. For example:

```
# /opt/mapr/server/mrconfig info nfsthreads
NFS Threads in progress = 15

Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
Client IP:127.0.0.1:0, Op Type: NFSPROC3_WRITE
```

## Examples

**Display information about the NFS processes currently running:**

```
/opt/mapr/server/mrconfig info nfsthreads
```

**Display information about NFS operations in-progress on a remote node with an IP address of `xx.xx.xx.xx`:**

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info nfsthreads
```

*mrconfig info orphanagecount*

The `mrconfig info orphanagecount` command displays orphan entries for a given container (specified by ID).

## Syntax

```
/opt/mapr/server/mrconfig info orphanagecount <cid>
```

## Parameters

Parameter	Description
cid	The ID of the container.

## Examples

Display the number of orphan entries for container 2067:

```
~# /opt/mapr/server/mrconfig info orphanagecount 2067
-----
Time: 2017-03-31 18:00:49,1085 Instance 5660
-----
orphanagecount cid 2067 count 812
```

*mrconfig info orphanlist*

The `mrconfig info orphanlist` command displays information about a container's orphans. See [mrconfig](#) for instructions about running `mrconfig` commands.

**Syntax**

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info orphanlist <cid>
<cid>
```

**Parameters**

Parameter	Description
-h	host IP address; default 127.0.0.1
-p	The file system port; default 5660
cid	The container identifier

**Tip:**

Use the `mrconfig info dumpcontainers` command to find the container identifiers on a node.

**Examples**

Display information about the orphans of a container with an identifier of 2049 on a local node

```
/opt/mapr/server/mrconfig info orphanlist 2049
```

Display information about the orphans of a container with an identifier of 2049 on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info orphanlist 2049
```

*mrconfig info replication*

The `mrconfig info replication` command displays information about container replication. See [mrconfig](#) for instructions about running `mrconfig` commands.

**Syntax**

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info replication
```

**Parameters**

Parameter	Description
-h	host IP address; default 127.0.0.1
-p	The file system port; default 5660

**Examples**

Display information about container replication on a local node

```
/opt/mapr/server/mrconfig info replication
```

Display information about container replication on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info replication
```

*mrconfig info slabs*

The `mrconfig info slabs` command displays a report about memory usage.

This report is sometimes used for troubleshooting by HPE customer support and is typically not used by customers.

See [mrconfig](#) for instructions about running `mrconfig` commands.

**Syntax**

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info slabs
```

**Parameters**

Parameter	Description
-h	host IP address; default 127.0.0.1
-p	The file system port; default 5660

**Examples**

Display information about memory usage on a local node

```
/opt/mapr/server/mrconfig info slabs
```

Display information about memory usage on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info slabs
```

*mrconfig info threads*

The `mrconfig info threads` command displays information about threads running on file system. See [mrconfig](#) for instructions about running `mrconfig` commands.

**Syntax**

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info threads
```

**Parameters**

Parameter	Description
-h	host IP address; default 127.0.0.1
-p	The file system port; default 5660

## Examples

Display information about data-fabric filesystem threads on a local node

```
/opt/mapr/server/mrconfig info threads
```

Display information about data-fabric filesystem threads on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info threads
```

### *mrconfig info volume snapshot*

The `mrconfig info volume snapshot` command displays information about volume snapshots.

Snapshot and this command require an upgrade to a HPE Ezmeral Data Fabric Enterprise Edition license if you don't already have it. See [mrconfig](#) for instructions about running `mrconfig` commands.

## Syntax

```
/opt/mapr/server/mrconfig [-h <host>] [-p <port>] info volume snapshot
<volName> <snapName>

    <volName>
    <snapName>
```

## Parameters

Parameter	Description
-h	host IP address; default 127.0.0.1
-p	The file system port; default 5660
volName	The name of the volume
snapName	The name of the snapshot

### Tips:

To find volume and snapshot names:

- Navigate to the **Volume** view and the **Snapshot** view respectively in the Data Fabric Control System, or
- Execute the `maprcli volume snapshot list` command, which creates a report that displays volume names and snapshot names.

## Examples

Display information about snapshot "snap-2012-01-01" of volume "myVolume" on a local node

```
/opt/mapr/server/mrconfig info volume snapshot myVolume snap-2012-01-01
```

Display information about snapshot "snap-2012-01-01" of volume "myVolume" on a remote node with an IP address of xx.xx.xx.xx

```
/opt/mapr/server/mrconfig -h xx.xx.xx.xx info volume snapshot myVolume
snap-2012-01-01
```

### *mrconfig info volume mastgateway*

The `mrconfig info volume mastgateway` command displays the volume assignment information. This command must be run on a CLDB node.

See [mrconfig](#) on page 2925 for instructions about running `mrconfig` commands.

## Syntax

```
/opt/mapr/server/mrconfig info volume mastgateway [<volName>]
```

## Parameters

Parameter	Description
volName	The name of the volume for which to retrieve the volume assignment information.

## Examples

Display the volume assignment information:

```
# ./mrconfig -h 10.20.30.400 info volume mastgateway
Num volumes : 4

Volume : vol2 ( 153675213 )
State: ASSIGNED
Curr: atsq8c46.qa.lab ( 6322920922584906487 ), Active: Yes
Prop: **No Gw** ( -1 ), Active: No
Assign Suspended : No

Volume : vol1 ( 45553484 )
State: ASSIGNED
Curr: atsq8c46.qa.lab ( 6322920922584906487 ), Active: Yes
Prop: **No Gw** ( -1 ), Active: No
Assign Suspended : No

Volume : vol4 ( 97789611 )
State: ASSIGNED
Curr: atsq8c46.qa.lab ( 6322920922584906487 ), Active: Yes
Prop: **No Gw** ( -1 ), Active: No
Assign Suspended : No

Volume : vol3 ( 23539482 )
State: ASSIGNED
Curr: atsq8c46.qa.lab ( 6322920922584906487 ), Active: Yes
Prop: **No Gw** ( -1 ), Active: No
Assign Suspended : No
```

## mrconfig mastgateway

This section describes the `mrconfig mastgateway` commands that allow you to test PUT, GET, and DELETE operations on the corresponding tier.

### *mastgateway ecgstats*

Returns the list of containers under rebuild from CGManager.

## Syntax

```
mrconfig mastgateway ecgstats <cgid>
```

## Parameters

Parameter	Description
cgid	The Container Gateway ID from which the containers under rebuild must be retrieved.

## Output

For a given EC scheme  $k+m$ , where  $k$  is number of data stripelets and  $m$  is number of parity stripelets, the output fields are as follows:

ContainerGroupId	Container Gateway (CG) ID from which the containers under rebuild are retrieved.
numStripes	Total number of valid (v), invalid (i), and pre-allocated (pa) stripes minus the number of deleted (d) stripes. Calculated as: $(v+i+pa)-d$ .
numValidStripes	Stripe that have at least $k$ number of full stripelets.
numStripesToRecover	Stripes that have unelected stripelet(s), or number of full or partial stripelets less than $k$ .
numStripesInRebuild	Stripes that are being rebuilt.
numDegradedStripes[0]	Stripes that can have no more failures.
numDegradedStripes[1]	Stripes that can suffer at most $m-1$ failures.
numMaxStripes	Maximum number of stripes in the CG. This value is calculated from the container size and the stripe size.
numActivePreallocStripes	Number of actual pre-allocated stripes.
numActiveAllocStripes	Number of allocated stripes in the CG. This value is taken from the pre-allocated list.
numActiveDeleteStripes	Number of valid stripes for which stripelets have been deleted by an operation such as compaction, for example.
numPreallocStripes	Maximum number of stripes that can be pre-allocated. Default Value: 32
activeBitmap	Number of containers that are up in the CG.
pendingUpBitmap	Number of containers that are in the process of being brought up in the CG.
containersInRebuild	Number of containers that are being rebuilt.

## Example

```
# /opt/mapr/server/mrconfig mastgateway ecgstats 2351

MASTGateway service is alive on 127.0.0.1:8660
ContainerGroupId : 2351
numStripes : 189
numValidStripes : 173
numStripesToRecover : 0
numStripesInRebuild : 64
numDegradedStripes[0]: 0
numDegradedStripes[1]: 120
numMaxStripes : 8192
```

```

numActivePreallocStripes : 0
numActiveAllocStripes : 0
numActiveDeleteStripes : 0
numPreallocStripes : 32
activeBitmap : 1f
pendingUpBitmap : 0
containersInRebuild : 2353

```

### Related reference

[dump ecginfo](#) on page 2155

Indicates whether rebuild is in progress for a container from CLDB.

*mastgateway infomem*

Returns memory information on the MAST Gateway node.

### Syntax

```
mrconfig mastgateway infomem
```

### Parameters

None

### Output

Name	The name of the memory pool in the gateway. Each pool has a number of memory objects (not S3 objects) that are used by the MAST Gateway as needed.
Max Free	The maximum number of objects from this pool that can be free.
Active	The number of memory objects from this pool that are allocated and used by the MAST Gateway.
Avail	The number of memory objects that are free, and can be reused when needed.
Obj Size	The size of the object.
Num Objs	The number of objects on the tier.
TierType	The type of tier. Value can be: <ul style="list-style-type: none"> <li>• Cold</li> <li>• Ec</li> </ul>

### Example

```

# /opt/mapr/server/mrconfig mastgateway infomem
MASTGw mem info on 127.0.0.1:8660
  Name           Max Free  Active    Avail    Obj Size
  WriteFragBufsS3      128      0         0      8388616
  FullReadFragBufs     64       0         0      8388616
  FragReadFragBufs    1024     0         0     1048576

  Name           Num Objs    Obj Size    TierType
  ColdTiering, Recall Frag      0      8388608      Cold
  ColdTiering, Recall Full      0      8388608      Cold
  ColdTiering, Offload          0      8388608      Cold

```

```
ErasureCoding, Recall Frag    0      25165824    Ec
ErasureCoding, Recall Full    0      25165824    Ec
ErasureCoding, Offload        0      25165824    Ec
```

**mastgateway infothreads**

Returns information on the threads processing the offload or recall operation.

**Syntax**

```
mrconfig mastgateway infothreads
```

**Parameters**

None

**Output**

The command returns the following if it is run during an ongoing offload or recall operation.

threadId	The ID of the thread processing the operation.
volId	The ID of the volume being offloaded.
cid	The ID of the container associated with the volume.
cgid	The gateway ID of the container associated with the volume.
op	The operation being processed. Value can be: <ul style="list-style-type: none"> <li>• VolumeOffload</li> <li>• VolumeRecall</li> </ul>

**Example****Retrieve information on the threads processing the offload:**

```
~# /opt/mapr/server/mrconfig -p 8660 mastgateway infothreads
InfoThreads on 127.0.0.1:8660
threadId: 0
volId: 23315726
cid: 2128
cgid: 2078
op: VolumeOffload

threadId: 1
volId: 23315726
cid: 2130
cgid: 2054
op: VolumeOffload

threadId: 10
volId: 23315726
cid: 2127
cgid: 2096
op: VolumeOffload

threadId: 11
volId: 23315726
cid: 2129
cgid: 2082
```

```
op: VolumeOffload
threadId: 12
volId: 23315726
cid: 2131
cgid: 2091
op: VolumeOffload
```

### *mastgateway refreshvolassignment*

Triggers CLDB to re-assign specified volume to the least utilized MAST Gateway to rebalance tiering operations.

This can be used when new MAST Gateways are added or when MAST Gateways are removed from the cluster.

**NOTE:** You must run this command once for each volume to reassign. Run this command for all volumes if MAST Gateway is either newly added to the cluster or permanently removed from the cluster.

### Syntax

```
mrconfig mastgateway refreshvolassignment <volname>
```

### Parameters

Parameter	Description
volname	The name of the volume to reassign.

### Result

If the volume is successfully re-assigned, a success message (similar to the one shown in the [Examples](#) on page 2957 below) is printed on the console where the command was triggered.

In case of an error, the volume might or might not be assigned to the newly added MAST Gateway. However, the volume would either continue to be assigned to the same MAST Gateway or would be assigned to a different gateway. You can re-run the command in case of a failure.

### Examples

Refresh the assignment of the containers associated with volume named vold23:

```
# /opt/mapr/server/mrconfig mastgateway refreshvolassignment vold23
volume assignment refreshed successfully.
```

### *mastgateway resumevolume*

Resume tiering activities and allow reads and writes on the volume data.

### Syntax

```
mrconfig mastgateway resumevolume <volname> [forceresume] [forcereset]
```

### Parameters

Parameter	Description
volname	The name of the volume.

Parameter	Description
forceresume	This parameter is internal-only.
forcereset	This parameter is internal-only.

### Examples

```
# /opt/mapr/server/mrconfig mastgateway resumevolume volTSECNEW9_3
2018-08-06 02:47:14,8585 ERROR Global mrconfig.cc:2120 ResumeVolume succeed
for volume : volTSECNEW9_3
```

#### *mastgateway suspendvolume*

Revoke and suspend a volume assigned to a MAST Gateway.

When the command is run:

1. The volume assignment to the MAST Gateway is revoked.
2. All tiering activities and client reads and overwrites on the volume are suspended.
3. The volume is reassigned to another MAST Gateway.

You must manually run the `mastgateway resumevolume` on page 2957 command to resume tiering activities, including reads and overwrites, on the volume data.

### Syntax

```
/opt/mapr/server/mrconfig mastgateway suspendvolume <volname>
[ignoreflusherr deletcpfiles]
```

### Parameters

Parameter	Description
volname	The name of the volume to reassign.
ignoreflusherr	This parameter is internal-only.
deletcpfiles	This parameter is internal-only.

### Examples

Revoke volume assignment to MAST Gateway and suspend tiering activities on the volume:

```
# /opt/mapr/server/mrconfig mastgateway suspendvolume volTSECNEW9_3
2018-08-06 02:38:15,9360 INFO Global mrconfig.cc:2085 SuspendVolume :
success for volume volTSECNEW9_3
```

#### *mastgateway tierget*

Test retrieving an object from the storage tier.

### Syntax

```
mrconfig mastgateway tierget
    <tierName>
    <objectID>
```

```
<isSecure>
[ <objectSize> ]
```

### Parameters

Parameter	Description
isSecure	Specifies whether to use HTTPS or HTTP protocol. Value can be one of the following: <ul style="list-style-type: none"> <li>• true - for HTTPS protocol</li> <li>• false - for HTTP protocol</li> </ul>
objectID	The ID of the object to get from the storage tier. The ID must be the same ID (in string format) specified when offloading the object (using tierput command).
objectSize	The size of the object to get from the storage tier. The default value is 64KB.
tierName	The name of the storage tier. If necessary, run the <a href="#">tier list</a> on page 2537 command to retrieve the names of the tiers.

### Example

Retrieve the object named sampleamazonobj of size 20971520 on the tier named amazonTier:

```
# /opt/mapr/server/mrconfig mastgateway tierget amazonTier sampleamazonobj
true 20971520
time take for the operation: 8.748000 seconds
tierget successful
```

*mastgateway tierdelete*

Test deleting an object on the storage tier.

### Syntax

```
mrconfig mastgateway tierdelete
  <tierName>
  <objectID>
  <isSecure>
```

### Parameters

Parameter	Description
isSecure	Specifies whether to use HTTPS or HTTP protocol. Value can be one of the following: <ul style="list-style-type: none"> <li>• true - for HTTPS protocol</li> <li>• false - for HTTP protocol</li> </ul>
objectID	The ID of the object to get from the storage tier. The ID must be the same ID (in string format) specified when offloading the object (using tierput command).

Parameter	Description
tierName	The name of the storage tier. If necessary, run the <a href="#">tier list</a> on page 2537 command to retrieve the names of the tiers.

### Example

Delete the object named `sampleamazonobj` of size `20971520` KB in the tier named `amazonTier`:

```
# /opt/mapr/server/mrconfig mastgateway tierdelete amazonTier
sampleamazonobj true 20971520
time take for the operation: 0.339000 seconds
tierdelete successful
```

#### *mastgateway tierput*

Test offloading an object to the storage tier.

### Syntax

```
mrconfig mastgateway tierput
  <tierName>
  <objectID>
  <isSecure>
  [ <objectSize> ]
```

### Parameters

Parameter	Description
isSecure	Specifies whether to use HTTPS or HTTP protocol. Value can be one of the following: <ul style="list-style-type: none"> <li>• <code>true</code> - for HTTPS protocol</li> <li>• <code>false</code> - for HTTP protocol</li> </ul>
objectID	The ID of the object to put on the storage tier. Value must be a string.
objectSize	The size of the object to put on the storage tier. The default value is 64KB.
tierName	The name of the storage tier. If necessary, run the <a href="#">tier list</a> on page 2537 command to retrieve the names of the tiers.

### Example

Test offload of an object, whose ID is `sapleamazonobj` and size is `20971520`, to the tier named `amazonTier`:

```
# /opt/mapr/server/mrconfig mastgateway tierput amazonTier sampleamazonobj
true 20971520
time take for the operation: 4.291000 seconds
tierput successful
```

#### **mrconfig rdma**

Dumps RDMA server and connection information.

For an introduction to RDMA, see [Remote Direct Memory Access](#) on page 817.

*mrconfig rdma dumpServerInfo*

Displays information about the enabled RDMA servers, if any.

**Syntax**

```
mrconfig -p <RDMA port> rdma dumpServerInfo
```

**Parameters**

p	<p>The optional RDMA port for which the information needs to be fetched. For example:</p> <ul style="list-style-type: none"> <li>• <code>mrconfig -p 5660 rdma dumpServerInfo</code> - for the first instance of the file system</li> <li>• <code>mrconfig -p 5661 rdma dumpServerInfo</code> - for the second instance of the file system.</li> <li>• <code>mrconfig -p 9998 rdma dumpServerInfo</code> - for the management RPC port of the NFS server</li> </ul> <p>Omitting this parameter fetches server information for the first instance of the file system.</p>
---	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Example**

```
mrconfig rdma dumpServerInfo
rdma server: port 5660 , epoch 1, sessionid 16, issERVER True
rdma memory: start 0x55df46d62000 size 58656284672
id 0 ip 10.163.160.69:5660
```

**Related concepts**

**Related reference**

[mrconfig rdma listEndPoints](#) on page 2961

Displays RDMA connection information.

*mrconfig rdma listEndPoints*

Displays RDMA connection information.

**Syntax**

```
mrconfig -p <RDMA port> rdma listEndPoints
```

## Parameters

p	<p>The optional RDMA port for which the connection information needs to be fetched. For example:</p> <ul style="list-style-type: none"> <li>• <code>mrconfig -p 5660 rdma listEndPoints</code> - for the first instance of the file system</li> <li>• <code>mrconfig -p 5661 rdma listEndPoints</code> - for the second instance of the file system</li> <li>• <code>mrconfig -p 9998 rdma listEndPoints</code> - for the management RPC port of the NFS server</li> </ul> <p>Omitting this parameter fetches connection information for the first instance of the file system.</p>
---	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Example

```
mrconfig rdma listEndPoints
  binding 0x55a003056400 conn 0x55a003056470 endpoint 0x55a00320a000
10.163.160.215:5660 -> 10.163.160.212:5660 state 4 sessionId 20 epoch 0
waiters 0
  binding 0x5583773da900 conn 0x5583773da970 endpoint 0x55a00316a000
10.163.160.216:5660 -> 10.163.160.212:5660 state 2 sessionId 12 epoch 0
waiters 1
  binding 0x5583773db200 conn 0x5583773db270 endpoint 0x55a003168000
10.163.160.215:5661 -> 10.163.160.212:5660 state 2 sessionId 8 epoch 0
waiters 1
  binding 0x55a001ef0d00 conn 0x55a001ef0d70 endpoint 0x55a00315c000
10.163.160.216:5661 -> 10.163.160.212:5660 state 4 sessionId 4 epoch 0
waiters 0
  binding 0x55a003009b00 conn 0x55a003009b70 endpoint 0x55a003072000
10.163.160.214:5661 -> 10.163.160.212:5660 state 2 sessionId 16 epoch 0
waiters 1
```

## mrconfig sp

The `mrconfig sp` commands create and control storage pools.

Storage pools are created on [disk groups](#), so disk groups must be [created](#) before storage pools can be created.

file system reads and writes data (and metadata) to and from logical storage units called volumes. Volumes store data in containers in storage pools.

Initially storage pools don't have any containers, the containers are automatically created for a volume as needed. When a container is created it is assigned a container identifier (cid).

Storage pools aren't associated with any particular volume – storage pools may hold containers for multiple volumes. Large files may be distributed across multiple containers, and therefore across multiple storage pools. Data replication happens at the container level.

Data cannot be written directly to containers, a volume is required.

You can create volumes in one of two ways:

- Click the **Create Volume** button in the **Data > Volumes** page in the MapR Control System, or
- Execute the `maprcli volume create` command.

See [mrconfig](#) for instructions about running `mrconfig` commands.

*mrconfig sp help*

The `mrconfig sp help` command displays the online help for storage pool commands.

See [mrconfig](#) for instructions on running `mrconfig` commands.

## Syntax

```
mrconfig sp help
```

## Examples

Display the online help for storage pools on a local node

```
/opt/mapr/server/mrconfig sp help
```

*mrconfig sp list*

Displays information about configured storage pools.

The `mrconfig sp list` command displays information about storage pools including the name, size, free space and path of each [storage pool](#), whether or not each [storage pool](#) is online or offline, and the total number of [storage pools](#). See [mrconfig](#) for instructions on running `mrconfig` commands.

## Syntax

```
/opt/mapr/server/mrconfig sp list [-v] [sp path]
```

## Parameters

Parameter	Description
path	The device path of the <a href="#">storage pool</a> . If you do not specify the path, information about all <a href="#">storage pools</a> is displayed. If you specify the path, only information about the specified <a href="#">storage pool</a> is displayed; example <code>/dev/sdc</code>
-v	Print <a href="#">storage pool</a> and cluster GUID information including whether or not the <a href="#">storage pool</a> is enabled for data-at-rest encryption (DARE), and service pool log (journal) size.

## Examples

Display information about all [storage pools](#) on a local node:

```
/opt/mapr/server/mrconfig sp list
```

Display information about a [storage pool](#) with a path `/dev/sdc` on a local node:

```
/opt/mapr/server/mrconfig sp list /dev/sdc
```

Display [storage pool](#) information including whether or not the [storage pool](#) is DARE-enabled:

```
# /opt/mapr/server/mrconfig sp list -v
ListSPs resp: status 0:2
No. of SPs (2), totalsize 3518339 MB, totalfree 691937 MB

SP 0: name SP1, Online, size 1761217 MB, free 377127 MB, path /dev/
sdb, log 200 MB, port 5660, guid 9dd586829e179476005b0ce23f0dae3c,
clusterUuid -7600986066553737256-4524271553806028052, disks /dev/sdb /dev/
sdd, dare 1
SP 1: name SP2, Online, size 1757121 MB, free 314809 MB, path /dev/
sde, log 200 MB, port 5660, guid daa5916af8909118005b0ce2430d6d54,
clusterUuid -7600986066553737256-4524271553806028052, disks /dev/sde /dev/
sdf, dare 1
```

Display [storage pool](#) information including the labels associated with the [storage pool](#):

```
# /opt/mapr/server/mrconfig sp list -v
ListSPs resp: status 0:1
No. of SPs (1), totalsize 294465 MB, totalfree 293940 MB
SP 0: name SP1, Online, size 294465 MB, free 293940 MB, path /dev/
sdb, log 200 MB, port 5660, guid 7d71f3739cd771cd005f910d2803b865,
clusterUuid -6879590211771954706-6360117451062264043,

disks /dev/sdb /dev/sdc /dev/sdd, dare 1, label default:0
```

*mrconfig sp load*

The `mrconfig sp load` command loads all of the disks associated with a storage pool.

See [mrconfig](#) for instructions on running `mrconfig` commands.

## Syntax

```
mrconfig sp load <sp name>
```

## Parameters

Parameter	Description
sp name	The name of the storage pool; example SP2

## Tips:

- Use the `mrconfig sp list` command to see storage pool names (examples SP1, SP2) and the device paths of the storage pools (example `/dev/sdc`).
- Use the `mrconfig disk list` command to see storage pool names (examples SP1, SP2), the device paths of the storage pools (example `/dev/sdc`), and the disks associated with each storage pool (examples `/dev/sdc`, `/dev/sdd`, `/dev/sde`).

## Examples

Load the disks associated with the storage pool named SP2 on the local node

```
/opt/mapr/server/mrconfig sp load SP2
```

*mrconfig sp make*

The `mrconfig sp make` command creates a storage pool on a concat disk group.

**! WARNING: Creating a Storage Pool Causes Data Loss**

Creating a storage pool on a disk group destroys the data on the disks in the disk group, so be sure that all data on the disks in the disk group is backed up and replicated before creating a storage pool.

See [mrconfig](#) for instructions on running `mrconfig` commands.

**Syntax**

```
mrconfig sp make <dg path>

  [ -P <yes/no> ]
  [ -l <LogSize> ]
  [ -s <deviceSize> ]
  [ -L <Label> ]
  [ -F ]
  [ -I <cid> ]
  <dg path>
```

**Parameters**

Parameter	Description
-P	Primary partition or not; yes/no
-l	Log size in number of blocks; Note that this is a lowercase letter "l" (ell), not the number "1".
-s	Disk size in GB
-L	Label for this storage pool
-F	Force the overwrite of any existing storage pool
-I	Initialize the storage pool with one container with the specified container identifier, one directory, and one file. Note that this is an uppercase letter "I" (eye), not the letter "l" (ell) or the number "1".
dg path	The device path of the disk group; example <code>/dev/sdc</code>

**Examples**

Create a storage pool on a disk group with a path of `/dev/sdc` on a local node

```
/opt/mapr/server/mrconfig sp make /dev/sdc
```

**Creating a Storage Pool Using mrconfig****About this task**

To create a storage pool using `mrconfig`:

## Procedure

1. Assume the disks `/dev/sdb`, `/dev/sdc`, and `/dev/sdd` are available; initialize them with `mrconfig disk init`:

```
/opt/mapr/server/mrconfig disk init /dev/sdb
/opt/mapr/server/mrconfig disk init /dev/sdc
/opt/mapr/server/mrconfig disk init /dev/sdd
```

2. Create a disk group with `mrconfig dg create`:

```
/opt/mapr/server/mrconfig dg create raid0 -d
128 /dev/sdb /dev/sdc /dev/sdd
```

3. Create a concatenated disk group with `mrconfig dg create concat` by specifying the primary drive.

```
/opt/mapr/server/mrconfig dg create concat /dev/sdb
```

4. At this point, you can use `mrconfig dg list` to see the layout of the disk group, and which disk is the primary disk. The primary disk can be used in other commands to refer to the disk group as a whole. Example:

```
/opt/mapr/server/mrconfig dg list
```

5. From the disk group, create a storage pool with `mrconfig sp make`:

```
/opt/mapr/server/mrconfig sp make /dev/sdb
```

### *mrconfig sp offline*

The `mrconfig sp offline` command takes a loaded storage pool offline. When a storage pool is offline it remains loaded into memory but it is not available to Data Fabric file system for reads and writes.

The main use of the `mrconfig sp offline` command is to take a storage pool offline so the `fsck` (file system check) command can be run on one or more disks or storage pools if there are lost or corrupt containers, directories, tables, files, filelets, or blocks.

After running `fsck` the storage pool is brought back online with the `mrconfig sp online` command, and then typically the `gfsc` (global file system check) command would be run on the affected cluster, volumes, or snapshots.

See [mrconfig](#) for instructions on running `mrconfig` commands.

## Syntax

```
mrconfig sp offline <sp path>
```

## Parameters

Parameter	Description
sp path	The device path of the storage pool; example <code>/dev/sdc</code>

## Examples

Offline a loaded storage pool with a path of `/dev/sdc` on localhost

```
/opt/mapr/server/mrconfig sp offline /dev/sdc
```

`mrconfig sp offline all`

The `mrconfig sp offline all` command takes all of a node's loaded storage pools offline. When a storage pool is offline it remains loaded into memory, but it is not available to Data Fabric file system for reads and writes.

The main use of the `mrconfig sp offline all` command is to take all storage pools on a node offline so the `fsck` (file system check) command can be run on disks or storage pools if there are lost or corrupt containers, directories, tables, files, filelets, or blocks.

After running `fsck` the storage pools are brought back online with the `mrconfig sp online` command, and then typically the `gfsck` (global file system check) command would be run on the affected cluster, volumes, or snapshots.

See [mrconfig](#) for instructions on running `mrconfig` commands.

## Syntax

```
mrconfig sp offline all
```

## Examples

Offline all storage pools on a local node

```
/opt/mapr/server/mrconfig sp offline all
```

*mrconfig sp online*

The `mrconfig sp online` command makes an offline storage pool online.

When a storage pool is taken offline with the `mrconfig sp offline` command, the storage pool is not available for reads and writes. Typically this is done so the `fsck` (filesystem check) command can be run to check for or repair filesystem inconsistencies.

After the storage pool is put back online with the `mrconfig sp online` command, the storage pool is once again available for reads and writes, and the `gfsck` (global filesystem check) command can be run on the affected cluster, volumes or snapshots.

See [mrconfig](#) for instructions on running `mrconfig` commands.

## Syntax

```
mrconfig sp online <sp path>
```

## Parameters

Parameter	Description
sp path	The device path of the storage pool; example <code>/dev/sdc</code>

**Examples**

Online a storage pool with a path of `/dev/sdc` on a local node

```
/opt/mapr/server/mrconfig sp online /dev/sdc
```

*mrconfig sp refresh*

The `mrconfig sp refresh` command reloads the `disktab` file and adds any new disks to file system.

See [mrconfig](#) for instructions on running `mrconfig` commands.

**Syntax**

```
mrconfig sp refresh
```

**Examples**

Refresh the storage pools on the local node

```
/opt/mapr/server/mrconfig sp refresh
```

*mrconfig sp shutdown*

The `mrconfig sp shutdown` command offlines all storage pools and stops the Data Fabric file system on their disks.

See [mrconfig](#) for instructions on running `mrconfig` commands.

**Syntax**

```
mrconfig sp shutdown
```

**Examples**

Offline all storage pools on the local node and stop Data Fabric file system on their disks

```
/opt/mapr/server/mrconfig sp shutdown
```

*mrconfig sp unload*

The `mrconfig sp unload` command unloads all of the disks associated with a storage pool.

See [mrconfig](#) for instructions on running `mrconfig` commands.

**Syntax**

```
mrconfig sp unload <sp name>
```

**Parameters**

Parameter	Description
sp name	The name of the storage pool; example <code>SP2</code>

**Tips:**

- Use the `mrconfig sp list` command to see storage pool names (examples `SP1`, `SP2`) and the device paths of the storage pools (example `/dev/sdc`).

- Use the `mrconfig disk list` command to see storage pool names (examples `SP1`, `SP2`), the device paths of the storage pools (example `/dev/sdc`), and the disks associated with each storage pool (examples `/dev/sdc`, `/dev/sdd`).

### Examples

Unload the disks associated with the storage pool named `SP2` on a local node

```
/opt/mapr/server/mrconfig sp unload SP2
```

### mrconfig s3

The `mrconfig s3` commands display bucket statistics.

The [HPE Ezmeral Data Fabric Object Store](#) on page 533 uses buckets as the containers to store objects (be it text, movie or music files, for example).

The `mrconfig s3` commands display bucket statistics such as the account to which the bucket belongs, the time when the bucket was created, the internal ID of the bucket, the number of objects in the bucket, the size of the objects, the number of objects with compliance and legalhold enabled, and more.

See [mrconfig](#) for instructions about running `mrconfig` commands.

*mrconfig s3 bucketinfo*

Displays information about the bucket.

### Syntax

```
mrconfig s3 bucketinfo <bucket name>
```

### Parameters

Parameter	Description
bucket name	The name of the bucket; example <code>finbucket</code>

### Example

View information for a bucket `finbucket`:

```
/opt/mapr/server/mrconfig s3 bucketinfo finbucket
bucketdirfid 2085.66.131352
oltFid 2085.67.131354
odtFid 2085.71.131362
f2oFid 2085.74.131368
volid 123999978
creationTime 1637640659057
accountName default
```

*mrconfig s3 bucketstats*

Displays comprehensive statistics about the objects inside the bucket.

### Syntax

```
mrconfig s3 bucketstats <bucket name>
```

## Parameters

Parameter	Description
bucket name	The name of the bucket; example <code>finbucket</code>

## Example

View statistics for objects in a bucket `finbucket`:

```
/opt/mapr/server/mrconfig s3 bucketstats finbucket
oltfid 2085.67.131354
statsVN 10
numInProgress 2
numDeleteMarkers 0
numObjects 10
numMarkedForPurge 0
numLegalHoldEnabled 1
numRetentionEnabled 3
numComplianceEnabled 2
numObjectParts 0
numMPPendingStitching 0
totalSzInProgress 20
totalSzObjects 210
totalSzMarkedForPurge 0
totalSzObjectParts 0
SizeHisto size < 256 num 0
SizeHisto 256 <= size < 4096 num 4
SizeHisto 4096 <= size < 65536 num 3
SizeHisto 65536 <= size < 1048576 num 0
SizeHisto 1048576 <= size < 16777216 num 1
SizeHisto 16777216 <= size < 268435456 num 1
SizeHisto 268435456 <= size < 4294967296 num 1
SizeHisto 4294967296 <= size < 68719476736 num 1
SizeHisto 68719476736 <= size < 1099511627776 num 0
SizeHisto size >= 1099511627776 num 0
```

*mrconfig s3 refreshstats*

Refreshes statistics about the objects inside the bucket.

**NOTE:** You have to run this command as the `mapr` user whenever bucket stats are not correctly displayed, and then check the stats again.

## Syntax

```
mrconfig s3 refreshstats <bucket name>
```

## Parameters

Parameter	Description
bucket name	The name of the bucket; example <code>finbucket</code>

## Example

Refresh statistics for objects in a bucket `finbucket`:

```

/opt/mapr/server/mrconfig s3 refreshstats finbucket
  oltfid 2085.67.131354
  statsVN 10
  numInProgress 2
  numDeleteMarkers 0
  numObjects 10
  numMarkedForPurge 0
  numLegalHoldEnabled 1
  numRetentionEnabled 3
  numComplianceEnabled 2
  numObjectParts 0
  numMPPendingStitching 0
  totalSzInProgress 20
  totalSzObjects 210
  totalSzMarkedForPurge 0
  totalSzObjectParts 0
  SizeHisto size < 256 num 0
  SizeHisto 256 <= size < 4096 num 4
  SizeHisto 4096 <= size < 65536 num 3
  SizeHisto 65536 <= size < 1048576 num 0
  SizeHisto 1048576 <= size < 16777216 num 1
  SizeHisto 16777216 <= size < 268435456 num 1
  SizeHisto 268435456 <= size < 4294967296 num 1
  SizeHisto 4294967296 <= size < 68719476736 num 1
  SizeHisto 68719476736 <= size < 1099511627776 num 0
  SizeHisto size >= 1099511627776 num 0

```

## mrdirectorystats

Prints the space usage for each directory, for a container.

The `mrdirectorystats` utility, when run for a container, prints the space usage information for all directories, starting from the root of the container. This utility is considerably faster than running `ls -R` command on the root of the container and is useful, for example, in identifying directories which need to be moved out to a different volume while trying to reduce the size of the current namespace container.

## Syntax

```

/opt/mapr/server/mrdirectorystats
  -c <container_id>
  [ -p ]
  [ -h ]

```

## Parameters

Parameter	Description
<code>c</code>	The ID of the container.
<code>h</code>	Prints help for running the command.
<code>p</code>	Prints only parent file ID (PFid) and other information about the file IDs (fids) in the container.

## Output

When you specify the `-c` option, the utility prints the following information per directory to the console:

DirFid	The directory inode number.
files	The number of regular files under the directory.
subdir	The number of sub-directories inside the directory.
others	The number of other types of files (except directories and regular files), such as device, symlinks, kvstores, tables, etc., inside the directory.
tfiles	The total number of regular files stored in the entire directory tree.
tsubdir	The total number of sub-directories stored in the entire directory tree.
tothers	The total number of other type of files stored in the entire directory tree.
cntrBlocks	The space occupied in block size (8k) by the direct blocks of the total regular files (tfiles) in the directory tree, for the current container.
fieletBlocks	A rough estimation of the sum of all the data blocks of all the filelets of regular files spread across different data containers.

**NOTE:** The utility also shows volume links if any volume exists in the container.

The utility prints the following if `-p` is specified with `-c`:

Inode	The inode of the file.
PFid	The parent file ID.
Type	The type of entity in the container. Value can be one of the following: <ul style="list-style-type: none"> <li>• Directory — indicates the entity is a directory.</li> <li>• VolLink — indicates entity is a volume link.</li> <li>• KvStore — indicates entity is KvStore.</li> </ul>
SubType	The sub-type of the entity in the container. Value can be one of the following: <ul style="list-style-type: none"> <li>• Directory — indicates entity is directory.</li> <li>• VolLink — indicates entity is a volume link.</li> <li>• Table — indicates entity is a table. Entity can be table only if type is KvStore.</li> <li>• Tabletmap — indicates entity is a tabletmap. Entity can be tabletmap only if type is KvStore.</li> <li>• Schema — indicates entity is a schema. Entity can be schema only if type is KvStore.</li> </ul>

### Example

Retrieve the disk space usage information for a container by running the utility with the `-c` option:

```
# ./mrdirectorystats -c 2245
DirFid      files      subdir    others    tfiles    tsubdir    tothers
```

```

cntrBlocks  fileletBlocks
2245.16.2    5          3          3          6          4          3
0          65536
2245.39.131308 1          0          0          1          0          0
0          0
2245.40.131310 0          1          0          0          1          0
0          0
2245.41.131312 0          0          0          0          0          0
0          0
2245.45.131320 0          0          0          0          0          0
0          0
symlinks 2 fidmaps 1 tables 1 schemas 1 tabletmaps 1

```

Retrieve information about the file IDs in the container by running the utility with the `-c` and `-p` option:

```

# ./mrdirectorystats -p -c 2049
Inode :32      PFid: 2049.16.2      Type: VolLink      SubType: VolLink
Inode :33      PFid: 2049.16.2      Type: VolLink      SubType: VolLink
Inode :34      PFid: 2049.16.2      Type: Directory    SubType: Directory
Inode :35      PFid: 2049.34.131372 Type: VolLink      SubType: VolLink
Inode :36      PFid: 2049.16.2      Type: VolLink      SubType: VolLink
Inode :37      PFid: 2049.16.2      Type: VolLink      SubType: VolLink
Inode :38      PFid: 2049.16.2      Type: VolLink      SubType: VolLink
Inode :39      PFid: 2049.16.2      Type: KvStore      SubType: Table
Inode :40      PFid: 2049.16.2      Type: VolLink      SubType: VolLink
Inode :41      PFid: 2049.39.262468 Type: KvStore      SubType: Tabletmap
Inode :42      PFid: 2049.39.262468 Type: KvStore      SubType: Schema

```

### mr diagnostics

Gathers node metrics.

The `mr diagnostics` utility [collects metrics on the node](#) on which it is run. Metrics include IO statistics, network throughput, CPU performance, memory consumption, swap space usage, disk usage, disk latency, and MFS throughput for the node.

### Syntax

```
/opt/mapr/server/mrdiagnostics start (or) stop (or) restart
```

### Parameters

Parameter	Description
start	Starts the utility
stop	Stops the utility
restart	Restarts the utility

### Output

The `mr diagnostics` utility logs the collected metrics as a set of log files in the `/opt/mapr/logs/stats/` directory. A sample collection is as follows:

```

ls /opt/mapr/logs/stats/
guts.m2-mapreng-vm167212.out          sar.dev.m2-mapreng-vm167212.out
gutsmfs.m2-mapreng-vm167212.out
sar.error.dev.m2-mapreng-vm167212.out
iostat.m2-mapreng-vm167212.out
topmfsparent.m2-mapreng-vm167212.out
mpstat.m2-mapreng-vm167212.out

```

```
topmfsthreads.m2-mapreng-vm167212.out
mrconfig_dbinfo.m2-mapreng-vm167212.out
top.processes.m2-mapreng-vm167212.out
mrconfig_info.m2-mapreng-vm167212.out
netstat.pan.m2-mapreng-vm167212.out
psOutput.m2-mapreng-vm167212.out
top.threads.m2-mapreng-vm167212.out
vmstat.m2-mapreng-vm167212.out
```

## Configuration Parameters

The `/opt/mapr/conf/mrdiagnostics.conf` file contains the configuration for the `mrdiagnostics` utility. The parameters are as follows:

<b>stats.log.path</b>	Path in which the output files ( <code>*.out</code> ) files are placed. The default path is <code>/opt/mapr/logs/stats</code> .
<b>stats.log.interval</b>	Frequency at which the metrics are collected. The value is in seconds. The default value is 1 second.
<b>stats.log.size</b>	The size at which the output files are rotated. The value is in KB. The default value is 1000000 KB (1 GB). If the total size of all the output files inside the <code>/opt/mapr/logs/stats</code> folder exceeds this value, the output files are compressed to a single tar file and stored in the <code>/opt/mapr/logs</code> folder.

## mrfs cmd

Returns the path to the file specified by ID (fid).

Before running the utility, ensure that the `LD_LIBRARY_PATH` environment variable is set for the path to the `libjvm.so` file. If necessary, run the following command to set the `LD_LIBRARY_PATH`:

```
export LD_LIBRARY_PATH=/usr/lib/jvm/java/jre/lib/amd64/server/
```

## Syntax

```
/opt/mapr/server/mrfs cmd fid path -fid <file-ID>
```

## Parameters

Parameter	Description
fid	The ID of the file.

## Output

On success, returns path to the file specified by ID (fid).

On failure, returns error.

## Examples

The following examples show file path (on success) and errors returned by the utility.

```
# ./mrfscmd fid path -fid 2115.33.131412
/var/mapr/file1
```

```
# ./mrfscmd fid path -fid 2071.33.1313445
Error: Getting Path for Fid 2071.33.1313445 Failed - Stale file handle
(116).
```

```
# ./mrfscmd fid path -fid 2071.33.
Error: Invalid Fid 2071.33.
```

## stubfuse

Simulates a FUSE mount point to determine its read and write performance.

Simulates a FUSE mount point and creates a large test file named `hello`. Use the `dd` command to print the maximum read and write performance of this mount point. The values give you a fair idea of the performance to expect from a Data Fabric POSIX FUSE client. For more information, see [HPE Ezmeral Data Fabric FUSE-Based POSIX Client](#) on page 1606

**NOTE:** Use an empty directory for the test, as the contents of this directory are emptied during the test. The files that are created during the test are not present after the test.

**ATTENTION:** Export the path to `libfuse.so` before running this command. Run:

```
export LD_LIBRARY_PATH="/opt/mapr/lib"
```

## Syntax

```
/opt/mapr/bin/stubfuse <mountpoint> [<options>] [-h|--help]
```

## Parameters

Parameter	Description
<code>-h --help</code>	Prints syntax and all supported options.
mountpoint	The simulated FUSE mount point. This parameter is required.
options	The options that can be specified with the command. Use <code>-h</code> or <code>--help</code> to retrieve the list of supported options.

## Example

Retrieve the read and write performance for the mount point, `/tmp/egmnt`:

- For a write test: `dd if=/dev/zero of=/tmp/egmnt/hello count=100k bs=128k oflag=direct`

**NOTE:** The name of the output file has to be `hello`. Else, the command will fail.

- For a read test: `dd if=/tmp/egmnt/hello of=/dev/null count=100k bs=128k`

**NOTE:** The name of the input file has to be `hello`. Else, the command will fail.

The output will look similar to the following results:

```
100+0 records in
100+0 records out
5120 bytes (5.1 kB) copied, 0.000233249 s, 22.0 MB/s
```

## Configuration Files

This section contains reference information about various configuration files.

### Configuration File Permissions

Files located in `/opt/mapr/hadoop-2.x.x/etc/hadoop` are owned by the `root` user account. To edit these files, you must be logged in as `root` user.

### Automatic Rolloff of Old Configuration Files

Whenever you run `configure.sh`, the current `warden.conf`, `mapr-clusters.conf`, `hibernate.cfg.xml`, and `db.conf` configuration files are saved with the current timestamp appended to the name. They are saved to the following directory:

```
/opt/mapr/conf/conf.old
```

These configuration files are saved for backup purposes.

#### **cldb.conf**

Contains the configuration for CLDB nodes.

The file `/opt/mapr/conf/cldb.conf` specifies the configuration parameters for the CLDB nodes and the cluster topology.

**cldb.containers.cache.entries**

*Default Value:* 1000000

*Description:* The maximum number of read/write containers available in the CLDB cache.

**cldb.default.topologyfileserver**

*Default Value:* `/data`

*Description:* The default topology for newly-created volumes.

**cldb.detect.dup.hostid.enabled**

*Default Value:* `false`

*Description:* When `true`, CLDB disables *all* nodes with duplicate `hostid`, including *new* nodes that try to register with duplicate `hostid` *and* the existing node. Alarm `NODE_ALARM_DUPLICATE_HOSTID` is raised. This case requires administrator intervention to correct the `hostid` confusion. If duplicate `hostid` occurs on nodes running CLDB, the cluster may fail to start. Therefore, the alarm is not raised, but the `cldb.log` file in `/opt/mapr/logs/` contains an error message.

**cldb.enable.memory.tracker**

*Default Value:* `false`

*Description:* Utility that monitors CLDB for memory usage and deadlocks. If `true`, memory allocations in CLDB are tracked. If memory usage of CLDB goes

above certain limits, the utility generates core and shuts down the CLDB. Memory limit is configured as:

```
Xmx+non heap memory
constant (default: 3072MB)
```

You can change the non-heap memory usage by setting `cldb.memory.max.nonheap.mb` to any custom value.

If CLDB memory usage goes beyond 130% of this limit, the utility dumps and shuts down CLDB. The default value is `false`.

#### `cldb.memory.mirror.factor`

*Default Value:* 70

*Description:* The parameter represents the percentage of CLDB memory that has been allocated for mirroring. The value for this parameter can be set using the [config save](#) on page 2105 command. Check out the example in the [config save](#) command for details on setting the value of the `cldb.memory.mirror.factor` parameter. For example, if you wish to allocate 50% of the total CLDB memory for the mirroring operation, specify the value of the `cldb.memory.mirror.factor` parameter as 50, while using the [config save](#) on page 2105 command to set the value.

#### `cldb.ignore.posix.only.hb.alarm`

*Default Value:* 1

*Description:* By default, this parameter is set to 1 to consider all nodes except edge nodes (nodes that have only POSIX clients and loopback NFS installed) for the [No Heartbeat alarm](#).

Set this parameter to 0 to include both edge as well as cluster nodes for the [No Heartbeat alarm](#).

**NOTE:** The edge nodes that went down before changing this parameter are not visible in alarms. However, edge nodes that go down after changing this parameter to 0 will be visible in alarms.

See the `-nfsnodes` option of the [node list](#) on page 2270 command to view edge nodes.

#### `cldb.ignore.stale.zk`

*Default Value:* `false`

*Description:* When this setting is `true`, the CLDB ignores the ZooKeeper's information regarding the most recent copy of CLDB data. Change this setting to `true` when the ZooKeeper information is stale. Restart the CLDB with this setting. After the CLDB starts, change the setting back to `false` then restart the CLDB again.

Only change this setting on CLDB nodes that are known to have the most recent copy of the CLDB data. Shut down all CLDB processes before changing this variable.

#### `cldb.jmxremote.port`

*Default Value:* 7220

*Description:* The CLDB JMX remote port

#### `cldb.max.security.policies`

*Default Value:* 10000

<b>cldb.min.fileservers</b>	<p><i>Description:</i> Defines the maximum number of configured security policies. To prevent users from arbitrarily creating numerous security policies and draining CLDB performance, the maximum number of security policies is limited to 10000 by default.</p> <p><i>Default Value:</i> 1</p> <p><i>Description:</i> Number of file servers that must register with the CLDB before the root volume is created.</p>
<b>cldb.numthreads</b>	<p><i>Default Value:</i> 10</p> <p><i>Description:</i> The number of threads reserved for use by the CLDB.</p>
<b>cldb.pbs.global.master</b>	<p><i>Default Value:</i> 0</p> <p><i>Description:</i> Indicates the global primary cluster for the global namespace. Only the global primary security policy cluster can create/modify security policies. All other secondary security policy clusters can only view or import security policies.</p>
<b>cldb.port</b>	<p><i>Default Value:</i> 7222</p> <p><i>Description:</i> The port on which the CLDB listens.</p>
<b>cldb.security.blacklist.cleanup.duration.seconds</b>	<p><i>Default Value:</i> 36000</p> <p><i>Description:</i> Ticket blacklist cleanup interval.</p>
<b>cldb.security.resolve.user</b>	<p><i>Default Value:</i> 0</p> <p><i>Description:</i> Resolve UID:GID on client OS or on CLDB.</p>
<b>cldb.security.user.ticket.duration.seconds</b>	<p><i>Default Value:</i> 1209600</p> <p><i>Description:</i> Default ticket duration</p>
<b>cldb.security.user.ticket.max.duration.seconds</b>	<p><i>Default Value:</i> 2592000</p> <p><i>Description:</i> Maximum ticket duration</p>
<b>cldb.security.user.ticket.renew.duration.seconds</b>	<p><i>Default Value:</i> 2592000</p> <p><i>Description:</i> Default ticket renew duration</p>
<b>cldb.security.user.ticket.renew.max.duration.seconds</b>	<p><i>Default Value:</i> 7776000</p> <p><i>Description:</i> Maximum ticket renew duration</p>
<b>cldb.snap.cntr.count.alarm.threshold</b>	<p><i>Default Value:</i> 100000000</p> <p><i>Description:</i> The threshold (in minutes) for raising the CLUSTER_ALARM_TOO_MANY_SNAPSHOT_CONTAINERS alarm.</p>
<b>cldb.snap.cntr.count.disable.threshold</b>	<p><i>Default Value:</i> 128000000</p> <p><i>Description:</i> The maximum number of snapshots to allow before disabling snapshot creation.</p>
<b>cldb.snap.cntr.count.monitor.interval.minutes</b>	<p><i>Default Value:</i> 60</p> <p><i>Description:</i> The interval of time (in minutes) to elapse between checking the number of snapshots on the cluster.</p>
<b>cldb.sso.temp.ticket.expiry.time</b>	<p><i>Default Value:</i> 20</p> <p><i>Description:</i> The number of minutes for which the temporary ticket is valid. In installations where single-sign on is configured, the CLDB issues the temporary ticket, as described in <a href="#">Configuring SSO</a> on page 1021.</p>

<b>cldb.v2.features.enabled</b>	<p><i>Default Value:</i> 1</p> <p><i>Description:</i> Enables new features added in data-fabric version 2.0. Used only during the upgrade process from v1.x to 2.x to control when new features become active. Once enabled, cannot be disabled.</p>
<b>cldb.v3.features.enabled</b>	<p><i>Default Value:</i> 1</p> <p><i>Description:</i> Enables new features added in data-fabric version 3.0. Used only during the upgrade process from a pre-3.0 version to control when new features become active. Once enabled, cannot be disabled.</p>
<b>cldb.web.port</b>	<p><i>Default Value:</i> 7221</p> <p><i>Description:</i> The port that the CLDB uses for the webserver.</p>
<b>cldb.zookeeper.servers</b>	<p><i>Default Value:</i> Not Applicable</p> <p><i>Description:</i> The nodes that are running ZooKeeper, in the format <code>\&lt;host:port\&gt;</code>.</p>
<b>hadoop.version</b>	<p><i>Default Value:</i> Not Applicable</p> <p><i>Description:</i> The version of Hadoop supported by the cluster.</p>
<b>net.topology.script.file.name</b>	<p><i>Default Value:</i> Not Applicable</p> <p><i>Description:</i> The path to a script that associates IP addresses with physical topology paths. The script takes the IP address of a single node as input and returns the physical topology that should be associated with the specified node. This association is used only at the time a node is initially added to the cluster. To change topology for nodes already in the cluster, use the <code>maprcli node move</code> command.</p>
<b>net.topology.table.file.name</b>	<p><i>Default Value:</i> Not Applicable</p> <p><i>Description:</i> The path to a text file that associates IP addresses with physical topology paths. Each line of the text file is of format <code>&lt;hostname/ip&gt; &lt;rack&gt;</code>, with the IP address or hostname of one node, followed by the topology to associate with the node. This association is used only at the time a node is initially added to the cluster. To change topology for nodes already in the cluster, use the <code>maprcli node move</code> command.</p>
<b>num.volmirror.threads</b>	<p><i>Default Value:</i> 1</p> <p><i>Description:</i> The number of (volume mirror) threads to create to process mirroring requests. The specified number of threads will be created to process requests in parallel; the remaining requests will be in the queue till they are picked up by volume mirror thread.</p>

### Example cldb.conf file

```
#
# CLDB Config file.
# Properties defined in this file are loaded during startup
# and are valid for only CLDB which loaded the config.
# These parameters are not persisted anywhere else.
#
# Wait until minimum number of fileserver register with
# CLDB before creating Root Volume
cldb.min.fileserver=1
# CLDB listening port
```

```

cldb.port=7222
# Number of worker threads
cldb.numthreads=10
# CLDB webport
cldb.web.port=7221
# CLDB https port
cldb.web.https.port=7443
# Disable duplicate hostid detection
cldb.detect.dup.hostid.enabled=false
# Deprecated: This param is no longer supported. To configure
# the container cache, use the param cldb.containers.cache.percent
# Number of RW containers in cache
#cldb.containers.cache.entries=1000000
#
# Percentage (integer) of Xmx setting to be used for container cache
#cldb.containers.cache.percent=20
#
#Frequency of the heartbeat interval

# Topology script to be used to determine
# Rack topology of node
# Script should take an IP address as input and print rack path
# on STDOUT. eg
# $>/home/mapr/topo.pl 10.10.10.10
# $>/mapr-rack1
# $>/home/mapr/topo.pl 10.10.10.20
# $>/mapr-rack2
#net.topology.script.file.name=/home/mapr/topo.pl
#
# Topology mapping file used to determine
# Rack topology of node
# File is of a 2 column format (space separated)
# 1st column is an IP address or hostname
# 2nd column is the rack path
# Line starting with '#' is a comment
# Example file contents
# 10.10.10.10 /mapr-rack1
# 10.10.10.20 /mapr-rack2
# host.foo.com /mapr-rack3
#net.topology.table.file.name=/home/mapr/topo.txt
#
# ZooKeeper address
cldb.zookeeper.servers=10.10.82.22:5181
# Hadoop metrics jar version
hadoop.version=2.7.0
# CLDB JMX remote port
cldb.jmxremote.port=7220
num.volmirror.threads=1
# Set this to set the default topology for all volumes and nodes
# The default for all volumes is /data by default
# UNCOMMENT the below to change the default topology.
# For e.g., set cldb.default.topology=/mydata to create volumes
# in /mydata topology and to place all nodes in /mydata topology
# by default
#cldb.default.topology=/mydata
enable.replicas.invariant.check=false

```

**Related concepts**

[Security Certificate Expiry Alarm](#) on page 3023

Describes the NODE\_ALARM\_CERTIFICATE\_NEAR\_EXPIRATION alarm.

**core-site.xml**

Describes the `core-site.xml` file that contains the configuration that overrides the default core parameters.

The `/opt/mapr/hadoop/hadoop-2.x.x/etc/hadoop/core-site.xml` file contains configuration that override the [default core parameters](#).

**NOTE:** `/opt/mapr/hadoop/hadoop-0.20.2/conf/core-site.xml` is a symlink to `/opt/mapr/hadoop/hadoop-2.x/etc/hadoop/core-site.xml`.

To override a default value, specify the new value within the `<configuration>` tags, using the following format:

```
<property>
  <name> </name>
  <value> </value>
  <description> </description>
</property>
```

[Default core Parameters](#) describes the possible entries to place in the `<name>` and `<value>` tags. The `<description>` tag is optional but recommended for maintainability.

**WARNING:** You can examine the current configuration information for this node by using the [hadoop conf -dump](#) command from a command line.

**Default core-site.xml file**

```
<?xml version="1.0"?>
<?xml-stylesheet type="text/xsl" href="configuration.xsl"?>

<!-- Put site-specific property overrides in this file. -->

<configuration>

</configuration>
```

**Core Parameters**

See [Default core Parameters](#).

**daemon.conf**

The file `/opt/mapr/conf/daemon.conf` specifies the user and group under which MapR services run, and whether all Data Fabric services run as the specified user/group, or only ZooKeeper and FileServer. The configuration parameters operate as follows:

- If `mapr.daemon.user` and `mapr.daemon.group` are set, the ZooKeeper and FileServer run as the specified user/group. Otherwise, they run as `root`.
- If `mapr.daemon.runuser.warden=1`, all services started by the warden run as the specified user. Otherwise, they run as `root`.

**Sample daemon.conf file**

```
mapr.daemon.user=mapr
mapr.daemon.group=mapr
mapr.daemon.runuser.warden=1
```

**db.conf**

The file `/opt/mapr/conf/db.conf` specifies configuration parameters for the Metrics database.

**WARNING:** Any time you make changes to the `db.conf` file, you must restart the `hoststats` service and Warden for those changes to take effect.

Field	Default	Description
<code>db.url</code>	<code>localhost:3306</code>	The URL and port for the MySQL server that stores Metrics data. This machine does not need to be a node in the cluster.
<code>db.user</code>	<code>root</code>	The MySQL user name.
<code>db.passwd</code>	<code>mapr</code>	The MySQL password. If the password contains the <code>&amp;</code> character, it is replaced with the <code>&amp;amp;</code> string in the <code>hibernate.cfg.xml</code> file (following XML parsing standards).
<code>db.schema</code>	<code>metrics</code>	The name of the MySQL schema.
<code>db.mode</code>	<code>mysql</code>	Reserved for future use.
<code>db.driverclass</code>	<code>com.mysql.jdbc.Driver</code>	Reserved for future use.
<code>db.joblastaccessed.limit.hours</code>	48	Task and task attempt data for a job are purged for jobs that have not been accessed in a number of hours equal to this parameter's value.   <b>NOTE:</b> Note that there is an error in this parameter's name. Instead of <code>db.joblastaccessed.limit.hours</code> , spelled as the English word <i>accessed</i> , the parameter is written <code>db.joblastaccessed.limit.hours</code> .
<code>db.partition.finest.count.days</code>	3	Integer number of days for which the finest data granularity is kept. Finest granularity is a ten-second resolution.
<code>db.partition.fine.count.days</code>	15	Integer number of days for which fine data granularity is kept. Fine granularity is a five-minute average of the finest resolution.
<code>db.partition.coarse.count.years</code>	100	Integer number of years for which the coarse data granularity is kept. Coarse granularity is a 24-hour average of the fine resolution.
<code>metric.file.rotate</code>	365	Integer number of days for which metrics files are kept in the local volume for each node.

Field	Default	Description
metric.file.cleanupthreshold	512	Specifies a size in GB. When the total size of the metrics files exceeds the value of this parameter, all data over 30 days old is cleaned up.

#### Example db.conf file

```
db.url=localhost:3306
db.user=root
db.passwd=mapr
db.schema=metrics
db.mode=mysql
db.driverclass=com.mysql.jdbc.Driver
db.joblastaccessed.limit.hours=48
db.partition.finest.count.days=3
db.partition.fine.count.days=15
db.partition.coarse.count.years=100
### How many files with raw node metrics data to keep
metric.file.rotate=365
```

#### .dfs\_attributes

Each directory in Data Fabric storage contains a hidden file called `.dfs_attributes` that controls compression and chunk size. To change these attributes, change the corresponding values in the file.

Example:

```
# lines beginning with # are treated as comments
Compression=lz4
ChunkSize=268435456
```

Valid values:

- Compression: `lz4`, `lz4`, `zlib`, or `false`
- Chunk size (in bytes): a multiple of 65535 (64 K) or zero (no chunks). Example: `131072`

You can also set compression and chunksize using the [hadoop mfs](#) command.

#### disktab

Describes the use of the `disktab` file.

On each node, the file `/opt/mapr/conf/disktab` lists all of the physical drives and partitions that have been added to the file system. The `disktab` file is created by the [disksetup](#) command, and automatically updated when disks are added or removed (either using the MapR Control System, or with the [disk add](#) and [disk remove](#) commands).

#### Sample disktab file

```
# MapR Disks Mon Nov 28 11:46:16 2011

```

## exports

### Access control for hosts

On each node, the file `/opt/mapr/conf/exports` lists the clusters and mount points available to mount with NFS.

Specify access control for hosts with a space-separated list of hosts, appending `(rw)` for read-write or `(ro)` for read-only access after each host. To specify a default access for all hosts not otherwise specified, add `(rw)` or `(ro)` after a space at the end of a line. The `exports` file follows the same semantics as a standard UNIX exports table. The following export options are supported:

Export option	Definition
ro	Provides read-only access.
rw	Provides read-write access.
root_squash	Squashes root privileges for remote users. For example, you can use: <pre>/mapr (rw,root_squash)</pre> This entry prevents the <code>/mapr</code> directory from being written to by the root user on remote hosts.
no_root_squash	Turns off root squashing for remote users.
all_squash	Squashes every remote user, including root.
anonuid, anongid	Specifies user and group IDs to use with remote users from a particular host.

### Restricting clusters to specific hosts

To restrict access to a specific export path to particular hosts, use the following format:

```
<Path> <space-separated list of hosts and access rights>
```

For example, the line `/mapr/cluster1 host01(rw) host02(ro)` restricts read-write access to the cluster in `/mapr/cluster1` to host `host01`, and restricts read-only access to host `host02`. No other hosts have access.

**NOTE:** After making changes to this file, you do not have to restart the NFS server. You can run a `maprcli` command to refresh the exports definition without a restart. See [nfsmgmt](#) refresh exports.

## Sample exports file

```
# Sample Exports file

# for /mapr exports
# <Path> <exports_control>

#access_control -> order is specific to default
# list the hosts before specifying a default for all
# host01(ro) host02(ro) host03(ro) (rw)
# enforces ro for a.b.c.d & 1.2.3.4 and everybody else is rw

# special path to export clusters in mapr-clusters.conf. To disable
exporting,
# comment it out. to restrict access use the exports_control
#
/mapr (rw)

#to export only certain clusters, comment out the /mapr & uncomment.
# Note: this will cause /mapr to be unexported
#/mapr/clustername (rw)

#to export /mapr only to certain hosts (using exports_control)
#/mapr a.b.c.d(rw) e.f.g.h(ro)

# export /mapr/cluster1 rw to a.b.c.d & ro to e.f.g.h (denied for others)
#/mapr/cluster1 a.b.c.d(rw) e.f.g.h(ro)

# export /mapr/cluster2 only to e.f.g.h (denied for others)
#/mapr/cluster2 e.f.g.h(rw)

# export /mapr/cluster3 rw to e.f.g.h & ro to others
#/mapr/cluster2 e.f.g.h(rw) (ro)
```

## gateway.conf

Describes configuration parameters for the data-fabric gateway.

The `/opt/mapr/conf/gateway.conf` file specifies configuration parameters for the gateway that supports table and stream replication.

 **WARNING:** Changing the default settings in the `gateway.conf` file is not recommended and is not likely to improve performance. If you still need to make changes to the `gateway.conf` file, you must restart the gateway after doing so. See [Configuring Gateways for Table and Stream Replication](#) on page 1521.

Field	Default	Description
gateway.port	7660	The gateway listening port.
gateway.receive.numthreads	128	The number of worker threads to receive replication stream requests.
gateway.flush.numthreads	128	The number of flush threads to send put requests to replicas.
gateway.put.mem.mb	128	The maximum size limit (in MB) of the putbuffer memory.

Field	Default	Description
gateway.logfile.size.mb	1024	The maximum size limit (in MB) of the data-fabric gateway log file. When the size limit is reached, the logs get rolled over.
gateway.es.request.maxsize.kb	128	The maximum size limit (in KB) of replication requests distributed by data-fabric source clusters. <i>This property is no longer supported.</i>
gateway.es.cluster.maxClients	1	Max number of clients for the HPE Ezmeral Data Fabric Streams. <i>This property is no longer supported.</i>

#### Example gateway.conf file

```
#
# Gateway Config file.
# Properties defined in this file are loaded during startup
# and are valid for only Gateway which loaded the config.
# These parameters are not persisted anywhere else.
#
# Gateway listening port
#gateway.port=7660
# Number of worker threads to receive replication stream requests
#gateway.receive.numthreads=128
# Number of flush threads to send put requests to replicas
#gateway.flush.numthreads=128
#
# Max limit on putbuffer memory in MB
#gateway.put.mem.mb=128
#
# Max limit on log file size
#gateway.logfile.size.mb=1024
#
#
# Gateway ES properties
#gateway.es.request.maxsize.kb=128
#gateway.es.cluster.maxClients=1
```

#### Related concepts

[Administering Data Fabric Gateways](#) on page 1519

A HPE Ezmeral Data Fabric gateway mediates one-way communication between a source HPE Ezmeral Data Fabric cluster and a destination cluster. You can replicate HPE Ezmeral Data Fabric Database tables (binary and JSON) and HPE Ezmeral Data Fabric Streams streams. HPE Ezmeral Data Fabric gateways also apply updates from JSON tables to their secondary indexes and propagate Change Data Capture (CDC) logs.

[Configuring Gateways for Table and Stream Replication](#) on page 1521

Configuring gateways involves installing the `mapr-gateway` package on nodes on a Data Fabric destination cluster and then configuring the Data Fabric source cluster to communicate with the destination cluster. The Data Fabric source cluster is configured by specifying the destination cluster's CLDB node and gateway nodes.

[Gateways for Replicating HPE Ezmeral Data Fabric Database Tables](#) on page 752

In HPE Ezmeral Data Fabric Database table replication, HPE Ezmeral Data Fabric Database replicates updates to tables (binary and JSON) on source Data Fabric clusters to replicas of those tables on destination Data Fabric clusters. Gateways are services that receive these updates and apply them to the replicas. These gateways also propagate updates from JSON tables to their secondary indexes.

**Related tasks**

[Specifying the Location of Gateways](#) on page 1077

Describes how to set the location of the HPE Ezmeral Data Fabric gateways using either the Control System or the CLI.

**Related reference**

[cluster gateway delete](#) on page 2044

Deletes the list of Data Fabric gateways from a source Data Fabric cluster.

[cluster gateway get](#) on page 2046

Lists the Data Fabric gateways that a source Data Fabric cluster is using.

[cluster gateway list](#) on page 2048

Lists all the gateways that a source Data Fabric cluster is using.

[cluster gateway local](#) on page 2049

Lists the gateways configured on the Data Fabric cluster on which this command is run.

[cluster gateway resolve](#) on page 2052

Lists the gateways configured on a Data Fabric cluster that are running at the time that the command is issued.

[cluster gateway set](#) on page 2054

Specifies the locations of the Data Fabric gateways that a source Data Fabric cluster can use for table replication to a destination Data Fabric cluster or for indexing table data in an Elasticsearch cluster.

**More information**

[Managing Gateways](#) on page 1523

Describes the commands for listing gateways, checking status of gateways, managing gateways if they fail, and troubleshooting gateways.

**mapr.login.conf**

The HPE Ezmeral Data Fabric uses the Java Authentication and Authorization Service (JAAS) to control security features. The `/opt/mapr/conf/mapr.login.conf` file specifies configuration parameters for JAAS. Contact HPE support before changing any parameters in this file other than the ones listed in this document.

**The MAPR\_SERVER\_KERBEROS Stanza**

The CLDB uses this stanza to verify users that are authenticating with Kerberos. This stanza requires the `com.sun.security.auth.module.Krb5LoginModule` module.

Attribute	Default Value	Description
keyTab	<code>"/opt/mapr/conf/mapr.keytab"</code>	File path to the keytab file.
principal	<code>"mapr/my.cluster.com"</code>	The Kerberos principal to use.

**The MAPR\_WEBSERVER\_KERBEROS Stanza**

Web UIs on the cluster use this stanza to evaluate SPNEGO requests. This stanza requires the `com.sun.security.auth.module.Krb5LoginModule` module.

Attribute	Default Value	Description
keyTab	<code>"/opt/mapr/conf/mapr.keytab"</code>	File path to the keytab file.

Attribute	Default Value	Description
principal	"HTTP/yourhost"	The principal <i>must</i> be HTTP. This principal is used to negotiate authentication for Web services over SPNEGO. You can set the value for <i>yourhost</i> manually, but be aware that you must set the principal in the <code>mapr.keytab</code> file to match this value.

### The jpamLogin Stanza

The Data Fabric cluster uses this stanza to verify user ID and password authentication to all the servers on the cluster. You can modify this stanza to alter the PAM configuration used by the cluster. The `net.sf.jpam.jaas.JpamLoginModule` module is sufficient for this stanza. There are three provided default services. The order of the `serviceName` in the stanza (at cluster startup) determines which PAM configuration file to use. If a failure occurs with a configuration, Data Fabric ignores the error and proceeds with the next entry.

Attribute	Provided Default Values	Description
serviceName	<ul style="list-style-type: none"> <li>sudo</li> <li>sshd</li> <li>mapr-admin</li> </ul>	<p>The PAM configurations to use for validating passwords, shown in their order of use.</p> <p>The configuration files are typically in <code>/etc/pam.d</code>.</p>

### Other Stanzas

The `Server`, `Client`, `Server_simple`, `Client_simple`, and `hadoop_maprsasl` stanzas control important aspects of your cluster's stability. Consult with HPE support before modifying these stanzas.

#### mapr-clusters.conf

Provides information and instructions for configuring clusters to create the global namespace.

You can define one or more clusters in the `/opt/mapr/conf/mapr-clusters.conf` file on a node or client. To define a cluster, you specify the CLDB nodes in the cluster. Defining a cluster creates the global namespace. Note that the `mapr-clusters.conf` file on each node or client must have the same cluster configuration and naming convention to create the global namespace.

The following section describes the configuration format of the `mapr-clusters.conf` file:

#### Format:

```
<cluster-name1> secure=false <CLDB> <CLDB> ... <CLDB>
[ clustername2 <CLDB> <CLDB> <CLDB> ]
[ ... ]
```

The `<CLDB>` string format can contain multiple space-separated instances of the following:

- `host:ip:port` - Host, IP, and port (uses DNS to resolve hostnames, or provided IP if DNS is down)
- `host:port` - Hostname and IP (uses DNS to resolve host, specifies port)
- `ip:port` - IP and port (avoids using DNS to resolve hosts, specifies port)
- `host` - Hostname only (default, uses DNS to resolve host, uses default port)
- `ip` - IP only (avoids using DNS to resolve hosts, uses default port)

You can edit `mapr-clusters.conf` manually to add more clusters. For example:

```
<cluster-name3> <CLDB> <CLDB> <CLDB>
```

### Security enabled, with and without Kerberos

With security enabled, without Kerberos, the format for the `mapr-clusters.conf` file is:

```
<clusternam1> secure=true <CLDB> <CLDB> ... <CLDB>
  [ <clusternam2> <CLDB> <CLDB> ... <CLDB> ]
  [ ... ]
```

With Kerberos enabled, the format for the `mapr-clusters.conf` file is:

```
<clusternam1> secure=true kerberosEnable=true <CLDB> <CLDB> ... <CLDB>
  [ <clusternam2> <CLDB> <CLDB> ... <CLDB> ]
  [ ... ]
```

**NOTE:** Before renaming a cluster using the `mapr-clusters.conf` file, stop the warden on all the nodes.

### Adding multihomed CLDB entries to `mapr-clusters.conf` with `configure.sh`

In this example, the cluster `my.cluster.com` has CLDB servers at `nodeA`, `nodeB`, `nodeC`, and `nodeD`. The CLDB servers `nodeB` and `nodeD` have two NICs each at `eth0` and `eth1`. The entries in `mapr-clusters.conf` are separated by spaces for each server's entry. Within a server's entry, individual interfaces are separated by semicolons (`;`).

The command

```
configure.sh -N my.cluster.com -C nodeAeth0,nodeCeth0 -M
nodeBeth0,nodeBeth1 -M nodeDeth0,nodeDeth1 -Z zknodeA
```

generates the following entry in `mapr-clusters.conf`:

```
my.cluster.com nodeAeth0 nodeBeth0;nodeBeth1 nodeCeth0 nodeDeth0;nodeDeth1
```

### Cluster Limits

There is no limit for the number of clusters for HDFS and NFSv3. However, the maximum number of clusters for FUSE is 16.

### mapred-site.xml

Lists the parameters for MapReduce configuration.

MapReduce is a type of application that can run on the Hadoop 2.x framework. MapReduce configuration options are stored in the `/opt/mapr/hadoop/hadoop-2.x.x/etc/hadoop/mapred-site.xml` file and are editable by the `root` user. This file contains configuration information that overrides the default values for MapReduce parameters. Overrides of the default values for core configuration properties are stored in the [HPE Ezmeral Data Fabric Parameters](#) on page 3037 file.

To override a default value for a property, specify the new value within the `<configuration>` tags, using the following format:

```
<property>
  <name> </name>
  <value> </value>
  <description> </description>
</property>
```

## Configurations for MapReduce Applications

The configuration comprises the following parameters:

<b>mapreduce.framework.name</b>	<i>Value:</i> yarn <i>Description:</i> Execution framework set to Hadoop YARN.
<b>mapreduce.input.fileinputformat.split.maxblocknum</b>	<i>Value:</i> 0 <i>Description:</i> Number of blocks that can be added to one split. A value of 0 means that a single split is generated per node.
<b>mapreduce.map.memory.mb</b>	<i>Value:</i> 1024 <i>Description:</i> Larger resource limit for maps.
<b>mapreduce.map.java.opts</b>	<i>Value:</i> -Xmx900m --add-opens java.base/java.lang=ALL-UNNAMED -XX:+UseParallelGC <i>Description:</i> Larger heap-size for child jvms of maps.
<b>mapreduce.reduce.memory.mb</b>	<i>Value:</i> 3072 <i>Description:</i> Larger resource limit for reduces.
<b>mapreduce.reduce.java.opts</b>	<i>Value:</i> -Xmx2560m --add-opens java.base/java.lang=ALL-UNNAMED -XX:+UseParallelGC <i>Description:</i> Larger heap-size for child jvms of reduces.
<b>mapreduce.task.io.sort.mb</b>	<i>Value:</i> 512 <i>Description:</i> Higher memory limit while sorting data for efficiency.
<b>mapreduce.task.io.sort.factor</b>	<i>Value:</i> 100 <i>Description:</i> More streams merged at once while sorting files.
<b>mapreduce.reduce.shuffle.parallelcopies</b>	<i>Value:</i> 50 <i>Description:</i> Higher number of parallel copies run by reduces to fetch outputs from very large number of maps.

## Configurations for MapReduce JobHistory Server

The configuration comprises the following parameters:

<b>mapr.localspill.expiration.date</b>	<i>Value:</i> days <i>Description:</i> Property to determine spill files expiration date in days. Default value is 30 days.
<b>mapreduce.jobhistory.address</b>	<i>Value:</i> MapReduce JobHistory Server <i>host:port</i> <i>Description:</i> Default port is 10020.
<b>mapreduce.jobhistory.webapp.address</b>	<i>Value:</i> MapReduce JobHistory Server Web UI <i>host:port</i> <i>Description:</i> Default port is 19888.
<b>mapreduce.jobhistory.intermediate-done-dir</b>	<i>Value:</i> /mr-history/tmp <i>Description:</i> Directory where history files are written by MapReduce applications.
<b>mapreduce.jobhistory.intermediate-done-scan-timeout</b>	<i>Value:</i> milliseconds

<b>mapreduce.jobhistory.done-dir</b>	<p><i>Description:</i> Timeout in milliseconds for rescanning the <code>done_intermediate</code> user directory to reduce JobHistory Server loading. Information about a job is received with a delay equal to the timeout. Adjust the setting based on the cluster load. Start with 5000 ms and increase timeout as needed.</p> <p><i>Value:</i> <code>/mr-history/done</code></p> <p><i>Description:</i> Directory where history files are managed by the MapReduce JobHistory Server.</p>
<b>mapreduce.jobhistory.webapp.https.address</b>	<p><i>Value:</i> Secure MapReduce JobHistory Server Web UI <code>host:port</code> (HTTPS)</p> <p><i>Description:</i> Default port is 19890.</p>

### Sample Hadoop 2.x `mapred-site.xml` File

The following `mapred-site.xml` file defines values for two job history parameters.

```
<configuration>
  <property>
    <name>mapreduce.jobhistory.address</name>
    <value>__HS_IP__:10020</value>
  </property>
  <property>
    <name>mapreduce.jobhistory.webapp.address</name>
    <value>__HS_IP__:19888</value>
  </property>
</configuration>
```

### Configuration for Apache Shuffle

You can disable Direct Shuffle and enable Apache Shuffle for MapReduce applications through the following settings:

<b>mapreduce.job.shuffle.provider.services</b>	<i>Value:</i> <code>mapreduce_shuffle</code>
<b>mapreduce.job.reduce.shuffle.consumer.plugin.class</b>	<i>Value:</i> <code>org.apache.hadoop.mapreduce.task.reduce.Shuffle</code>
<b>mapreduce.job.map.output.collector.class</b>	<i>Value:</i> <code>org.apache.hadoop.mapred.MapTask\$MapOutputBuffer</code>
<b>mapred.ifile.outputstream</b>	<i>Value:</i> <code>org.apache.hadoop.mapred.IFileOutputStream</code>
<b>mapred.ifile.inputstream</b>	<i>Value:</i> <code>org.apache.hadoop.mapred.IFileInputStream</code>
<b>mapred.local.mapoutput</b>	<i>Value:</i> <code>true</code>
<b>mapreduce.task.local.output.class</b>	<i>Value:</i> <code>org.apache.hadoop.mapred.YarnOutputFiles</code>

### **mfs.conf**

Lists the parameters of the MFS configuration file.

The configuration file `/opt/mapr/conf/mfs.conf` specifies the following parameters about the file system server on each node.

 **WARNING:** You must restart the File Server after making changes to this file.

## Parameters

<code>mfs.server.ip</code>	<p><i>Default Value:</i> Not applicable</p> <p>Description: IP address of the File Server. For example, 192.168.10.10.</p>
<code>mfs.server.port</code>	<p><i>Default Value:</i> 5660</p> <p>Description: Port used for communication with the server.</p>
<code>mfs.cache.lru.sizes</code>	<p><i>Default Value:</i></p> <ul style="list-style-type: none"> <li>For version 4.0.1: inode:6:log:6:meta:10:dir:40:small:15</li> <li>For version 4.0.2 and later versions: inode:3:meta:6:small:27:dir:15:db:20:valc:3</li> </ul> <p>Description: LRU cache configuration. See the section, <b>Notes on LRU Cache Configuration</b> for more information.</p>
<code>mfs.on.virtual.machine</code>	<p><i>Default Value:</i> false</p> <p>Description: Specifies whether the file system is running on a virtual machine.</p>
<code>mfs.io.disk.timeout</code>	<p><i>Default Value:</i> 60 seconds</p> <p>Description: Timeout, in seconds, after which a disk is considered failed and taken offline. You can increase the timeout to tolerate slow disks.</p>
<code>mfs.max.disks</code>	<p><i>Default Value:</i> 48</p> <p>Description: Maximum number of disks supported on a single node.</p>
<code>mfs.max.logfile.size.in.mb</code>	<p><i>Default Value:</i> 1000 MB</p> <p>Description: The maximum amount of disk space that the MFS logs can consume before the oldest log file is deleted; based on the following calculation:</p> $\text{maxSizePerLogFile} = \frac{\text{maxLogSize}}{\text{MAX\_NUM\_OF\_LOG\_FILES}}$ <p>where</p> <ul style="list-style-type: none"> <li><code>maxLogSize</code> = total amount of space that MFS log files can consume</li> <li><code>MAX_NUM_OF_LOG_FILES</code> = total number of MFS log files</li> </ul>
<code>mfs.max.resync.count</code>	<p><i>Default Value:</i> 16</p> <p>Description: The number of parallel resync operations.</p>
<code>mfs.subnets.whitelist</code>	<p><i>Default Value:</i> Not Applicable</p> <p>Description: A list of subnets (up to 256 characters) that are allowed to make requests to the File Server service and access data on the cluster.</p>
<code>mfs.disk.iothrottle.count</code>	<p><i>Default Value:</i> 100</p>

	Description: The maximum number of outstanding requests on disk.
	 <b>NOTE:</b> You can disable throttling by setting a high value. This option is disabled if you set the value for <code>mfs.disk.is.ssd</code> to 1.
<code>mfs.disk.resynciothrottle.factor</code>	<i>Default Value:</i> 20 Description: Controls the amount of time to wait before submitting a request to disk. Increasing this value reduces the wait time, and decreasing this value increases the wait time. For example, setting the value to 40, halves the wait time, while setting the value to 10, doubles the wait time.
<code>mfs.network.resynciothrottle.factor</code>	<i>Default Value:</i> 20 Description: Controls the amount of time to wait before sending a resync operation over the network. Increasing this value reduces the wait time, and decreasing this value increases the wait time. For example, setting the value to 40, halves the wait time, while setting the value to 10, doubles the wait time.
<code>mfs.ssd.trim.enabled</code>	<i>Default Value:</i> 0 Description: Set this parameter to 1 to enable TRIM operations for SSD devices.
	 <b>NOTE:</b> Enable TRIM only if it is recommended by the SSD vendor.
<code>mfs.disk.is.ssd</code>	<i>Default Value:</i> 0 Description: Specifies whether (1) or not (0) the drives are SSD. If the value is 0, the drives are assumed to be rotations. If the value is 1, the noop scheduler on the SSD is automatically enabled, and I/O throttling is disabled.
<code>mfs.mem.debug.enabled</code>	<i>Default Value:</i> 0 Description: Specifies whether file server should (1) or should not (0) track all memory allocations. The default value is 0. If value is 1, you can determine the root cause for high memory allocation, or determine the component consuming the most memory.
<code>mfs.numrpthreads</code>	<i>Default Value:</i> 2 Description: Specifies the number of RPC threads per MFS instance. The valid range of values is from 1 to 4.
<code>mfs.db.max.concurrent.internal.ops</code>	<i>Default Value:</i> 73728 (72 * 1024) <i>Max Value:</i> 131072 (128 * 1024) <i>Min Value:</i> 36864 (36 * 1024) Description: Regulates how many BatchGet operations can run in parallel when secondary indexes are present on the table. PUT operations on tables with secondary indexes convert to BatchGet operations on the tables. PUT operations that convert to a high volume of BatchGets can degrade performance. BatchGet operations are spread equally across three threads (73728/3). Run <code>mrconfig dbinfo threads</code> to evaluate the throttling queue for each thread.
<code>mfs.num.compress.threads</code>	<i>Default Value:</i> 1

<code>mfs.max.aio.events</code>	Description: Reserved for internal use. <i>Default Value:</i> 5000
<code>mfs.disable.periodic.flush</code>	Description: Reserved for internal use. <i>Default Value:</i> 0
<code>mfs.ignore.container.delete</code>	Description: Reserved for internal use. <i>Default Value:</i> 0
<code>mfs.ignore.readdir.pattern</code>	Description: Reserved for internal use. <i>Default Value:</i> 0
<code>mfs.disable.IO.affinity</code>	Description: Reserved for internal use. <i>Default Value:</i> 0
<code>mfs.deserialize.length</code>	Description: Reserved for internal use. <i>Default Value:</i> 8192
<code>mfs.enable.nat</code>	Description: Reserved for internal use. <i>Default Value:</i> 0
<code>mfs.bulk.writes.enabled</code>	Description: Reserved for internal use. <i>Default Value:</i> 0

### Example

```
mfs.server.ip=192.168.10.10
mfs.server.port=5660
mfs.cache.lru.sizes=inode:3:meta:6:small:27:dir:15:db:20:valc:3
mfs.on.virtual.machine=0
mfs.io.disk.timeout=60
mfs.max.disks=48
```

### Notes on LRU Cache Configuration

The cache values are expressed as percentages, which vary based on the expected size of the data that the node is required to cache. The goal is to achieve a state in which most of the required data comes directly from the cache. You may need to tune the cache percentages based on your cluster configuration and the workload on specific nodes. Non-default allocations tend to work better for nodes that run only CLDB and nodes that do not have CLDB but do have a heavy HPE Ezmeral Data Fabric Database workload. Note the following recommendations.

- For CLDB-only nodes, increase the size of the cache for Dir LRU to 40%: change `dir:15` to `dir:40`. A CLDB-only node is a file server node that hosts only the CLDB volume `mapr.cldb.internal` (no user volume data is hosted on the node). Dir LRU is used to host B-tree pages.
- For non-CLDB nodes with no HPE Ezmeral Data Fabric Database workload, optimize the cache to host as many file pages as possible. Change the value of the parameter to: `inode:3:meta:6:small:27:dir:6`

The remainder of the cache is used to cache file data pages.

**Note:** You need to restart MFS for the change in `mfs.conf` to take effect.

### `nfsserver.conf`

Lists the parameters for the data-fabric NFS server.

The file `/opt/mapr/conf/nfssserver.conf` controls parameters related to data-fabric services and the warden. Most of the parameters are not intended to be edited directly by users. The following list shows the parameters of interest:

<b>Compression</b>	<p><i>Default Value:</i> true</p> <p><i>Description:</i> Indicates whether compression is on (true) or off (false).</p>
<b>ChunkSize</b>	<p><i>Default Value:</i> 67108864 bytes (64 MB)</p> <p><i>Description:</i> Size of each chunk.</p>
<b>CompThreads</b>	<p><i>Default Value:</i> 2</p> <p><i>Description:</i> Number of threads for compression or decompression.</p>
<b>DrCacheSize</b>	<p><i>Default Value:</i> 20480</p> <p><i>Description:</i> Duplicate request cache size.</p>
<b>DrCacheTimeout</b>	<p><i>Default Value:</i> 62 seconds</p> <p><i>Description:</i> Duplicate request cache timeout in seconds.</p>
<b>DRCacheTimeOutOpt</b>	<p><i>Default Value:</i> 0.5</p> <p><i>Description:</i> If the operations take more than <math>\text{DrCacheTimeout} * \text{DRCacheTimeOutOpt}</math>, the operations are not cached. For example, by default, if the operation takes more than 31 seconds — <math>(62 * .5) = 31</math> seconds — the operation is not cached. A value of 0 disables the cache.</p>
<b>HighMemLimitMB</b>	<p><i>Default Value:</i> disabled (Parameter is commented out in the file)</p> <p><i>Description:</i> The maximum amount of memory (in MB) that the NFS server process can use. If the NFS server process uses more memory than this value, then the server is automatically shutdown, and a Core file is generated for debugging.</p> <p>For example: <code>HighMemLimitMB=10000</code> indicates that the NFS server is shutdown if it consumes more than 10GB of memory.</p> <p>This parameter is effective only if you enable the <code>MemDebugEnabled</code> parameter.</p>
<b>LogLevel</b>	<p><i>Default Value:</i> INFO</p> <p><i>Description:</i> Sets the level of log messages displayed in the output. Levels include:</p> <ul style="list-style-type: none"> <li>• DEBUG</li> <li>• INFO</li> <li>• WARN</li> <li>• ERROR</li> <li>• CRITICAL</li> <li>• OFF</li> </ul>

**MaxLogFileSize***Default Value:* 1024 MB*Description:* The maximum amount of disk space that the NFS server logs can consume before the oldest log file is deleted, based on the following calculation:

```
maxSizePerLogFile = maxLogFileSize /
MAX_NUM_OF_LOG_FILES
```

where:

- `maxLogFileSize` is the total amount of space that NFS server log files may consume
- `MAX_NUM_OF_LOG_FILES` is the total number of NFS server log files

Logrotate support for both the `.log` and the `.err` files honor this setting.

**ATTENTION:** `MaxLogFileSize` is not a combined size of `.log` and `.err` files. The `.log` and `.err` files can individually grow up to this size.

**MemDebugEnabled***Default Value:* `false` (Parameter is commented out in the file)*Description:* Set this parameter to `true` to enable memory tracking for the NFS server. This parameter works along with the `HighMemLimitMB` parameter.**MinLenForDeserialization***Default Value:* 8192*Description:* Deserialize (if value is `> 0`) or do not deserialize (if value = `0`) the response in the compression thread. If value is greater than 0, MapR deserializes requests with length `>=` value in the compression thread. If value is 0, requests of length `<` value are deserialized in the RPC thread itself..**RamfsMntDir***Default Value:* `/ramfs/mapr`*Description:* Mount point for the `ramfs` file for `mmap`.**RamfsSize***Default Value:* `0.25`*Description:* Size of the ramfile to use (percent of total physical memory). A value of 0 disables the use of `ramfs`.**WindowsAceSupport***Default Value:* `false`*Description:* Allow (`true`) or deny (`false`) access to a Windows client when ACEs are set. If `true`, the mode bits are set to `777`, the Windows client is granted access, and the operation is allowed based on the permissions enforced using mode bits and/or ACEs. If value is `false`, the mode bits are set to `000` and the Windows client is denied access. For more information, see [Mounting NFS on a Windows Client](#) on page 1555.

**TIP:** Use separate NFS servers for Windows clients and non-Windows clients.

**warden.conf**

Lists the configuration parameters for Warden.

The file `/opt/mapr/conf/warden.conf` controls parameters related to Data Fabric services and the Warden. Most of the parameters are not intended to be edited directly by users. The following list describes the parameters of interest:

**NOTE:** When defining heapsize values for services, keep in mind that `service.heapsize.percent` is bound by `service.heapsize.min`, if defined, and `service.heapsize.max`.

<b>centralconfig.enabled</b>	<p><i>Sample Value:</i> true</p> <p><i>Description:</i> Specifies whether to enable central configuration.</p>
<b>cldb.port</b>	<p><i>Sample Value:</i> 7222</p> <p><i>Description:</i> The port to use for communicating with the CLDB.</p>
<b>enable.overcommit</b>	<p><i>Sample Value:</i> true</p> <p><i>Description:</i> Set this value to <code>true</code> to allow services to start up, even if their memory demands exceed the memory provided by the node.</p>
<b>hoststats.port</b>	<p><i>Sample Value:</i> 5660</p> <p><i>Description:</i> The port to use for communicating with the HostStats service.</p>
<b>hs.port</b>	<p><i>Sample Value:</i> 1111</p> <p><i>Description:</i> Hoststats listening port for Metrics RPC activity.</p>
<b>hs.rpcon</b>	<p><i>Sample Value:</i> true</p> <p><i>Description:</i> Indicates whether or not to configure Job Management.</p>
<b>hs.host</b>	<p><i>Sample Value:</i> localhost</p> <p><i>Description:</i> Hoststats hostname for RPC activity.</p>
<b>isDB</b>	<p><i>Sample Value:</i> true</p> <p><i>Description:</i> Specifies if HPE Ezmeral Data Fabric Database is in use. When this value is <code>false</code>, the <code>service.command.mfs.heapsize.percent</code> is set to 20. Do not manually edit this value. For more information, see <a href="#">Allocating Memory for Nodes</a> on page 1119..</p>
<b>kvstore.port</b>	<p><i>Sample Value:</i> 5660</p> <p><i>Description:</i> The port for communicating with the Key/Value Store.</p>
<b>log.retention.exceptions</b>	<p><i>Sample Value:</i> <code>mfs.log-*</code></p> <p><i>Description:</i> Retains the following log files instead of removing them during the log file cleanup that occurs every ten days: <code>cldb.log</code>, <code>hoststats.log</code>, <code>configure.log</code> and <code>mfs.log-*</code>.</p>

	<p>You can modify the list. This parameter accepts partial file names and asterisks. Log files listed as exceptions are retained indefinitely.</p> <p>To disable all exceptions, comment out this parameter, that is, <code>#log.retention.exceptions</code>. When this parameter is null, that is, <code>log.retention.exceptions=</code>, no files are picked for log cleanup.</p>
<b>log.retention.time</b>	<p><i>Sample Value:</i> 864000000</p> <p><i>Description:</i> All <code>.log</code> and <code>.out</code> files in the cluster are kept for a time period defined in milliseconds by the value of the <code>log.retention.time</code> parameter. The default value is ten days. Restart the Warden after changing this value.</p>
<b>mapr.home.dir</b>	<p><i>Sample Value:</i> <code>/opt/mapr</code></p> <p><i>Description:</i> Data Fabric installation directory.</p>
<b>mfs.port</b>	<p><i>Sample Value:</i> 7222</p> <p><i>Description:</i> The port to use for communicating with the Fileserver.</p>
<b>pollcentralconfig.interval.seconds</b>	<p><i>Sample Value:</i> 300</p> <p><i>Description:</i> The frequency (in seconds) to check for central configuration updates.</p>
<b>rpc.drop</b>	<p><i>Sample Value:</i> <code>false</code></p> <p><i>Description:</i> Drop outstanding metrics when the queue to send to hoststats is too large.</p>
<b>service.command.cldb.heapsize.max</b>	<p><i>Sample Value:</i> 4000</p> <p><i>Description:</i> The maximum heap space, specified in MB, that the CLDB can use.</p>
<b>service.command.cldb.heapsize.min</b>	<p><i>Sample Value:</i> 256</p> <p><i>Description:</i> The minimum heap space, specified in MB, that the CLDB can use.</p>
<b>service.command.cldb.heapsize.percent</b>	<p><i>Sample Value:</i> 8</p> <p><i>Description:</i> The percentage of heap space reserved for CLDB.</p>
<b>service.command.cldb.retryinterval.time.sec</b>	<p><i>Sample Value:</i> 600</p> <p><i>Description:</i> Specifies an interval in seconds. The warden attempts to restart a failed CLDB service when this interval expires.</p> <p> <b>NOTE:</b> The warden restarts the CLDB service only if the service has been stopped unintentionally - for example, the service crashed. Warden does not restart a CLDB service that has been stopped intentionally using the <code>maprcli node services</code> command.</p>
<b>service.command.mfs.heapsize.maxpercent</b>	<p><i>Sample Value:</i> 85</p>

	<p><i>Description:</i> The maximum percentage of heap space that can be allocated to the file system. Restart the Warden after modifying this setting.</p>
<b>service.command.mfs.heapsize.min</b>	<p><i>Sample Value:</i> 512</p> <p><i>Description:</i> The minimum heap space, specified in MB, that can be allocated to the file system. Restart the Warden after modifying this setting.</p>
<b>service.command.mfs.heapsize.percent</b>	<p><i>Sample Value:</i> 35</p> <p><i>Description:</i> The percentage of heap space reserved for the file system. If the value for <code>isDB</code> is <code>true</code>, you cannot set this property to a value lower than 35. If you set this parameter to a value lower than 35, the value reverts to 35 when the Warden restarts, to ensure that when the HPE Ezmeral Data Fabric Database is enabled, corresponding cache allocation occurs. If you want to lower the heap size allocated to the file system, you must change <code>service.command.mfs.heapsize.maxpercent</code> instead. Restart the Warden after modifying this setting.</p>
<b>service.command.nfs.heapsize.max</b>	<p><i>Sample Value:</i> 1000</p> <p><i>Description:</i> The maximum heap space, specified in MB, that the NFS can use.</p>
<b>service.command.nfs.heapsize.min</b>	<p><i>Sample Value:</i> 64</p> <p><i>Description:</i> The minimum heap space, specified in MB, that the NFS can use.</p>
<b>service.command.nfs.heapsize.percent</b>	<p><i>Sample Value:</i> 3</p> <p><i>Description:</i> The percentage of heap space reserved for the NFS.</p>
<b>service.command.os.heapsize.max</b>	<p><i>Sample Value:</i> 750</p> <p><i>Description:</i> The maximum heap space, specified in MB, that can be used by the operating system.</p>
<b>service.command.os.heapsize.min</b>	<p><i>Sample Value:</i> 256</p> <p><i>Description:</i> The minimum heap space, specified in MB, for use by the operating system.</p>
<b>service.command.os.heapsize.percent</b>	<p><i>Sample Value:</i> 3</p> <p><i>Description:</i> The percentage of heap space reserved for the operating system.</p>
<b>service.command.webserver.heapsize.min</b>	<p><i>Sample Value:</i> 512</p> <p><i>Description:</i> The minimum heap space, specified in MB, for use by the Control System.</p>
<b>service.command.webserver.heapsize.percent</b>	<p><i>Sample Value:</i> 3</p> <p><i>Description:</i> The percentage of heap space reserved for the Control System.</p>
<b>service.nice.value</b>	<p><i>Sample Value:</i> -10</p> <p><i>Description:</i> The <code>nice</code> priority under which all services run.</p>

<b>services.memoryallocation.alarm.threshold</b>	<p><i>Sample Value:</i> 95</p> <p><i>Description:</i> The maximum amount of system memory that services running on the node can use before triggering the <code>NODE_ALARM_MEMORY_ALLOCATION_EXCEEDED</code> alarm.</p>
<b>services.resetretries.time.sec</b>	<p><i>Sample Value:</i> 3600</p> <p><i>Description:</i> Specifies a time interval in seconds. The <code>services.retries</code> parameter sets the number of times that the warden attempts to restart failing services within this interval.</p>
<b>services.retries</b>	<p><i>Sample Value:</i> 3</p> <p><i>Description:</i> The number of times the Warden tries to restart a service that fails.</p>
<b>services.retryinterval.time.sec</b>	<p><i>Sample Value:</i> 1800</p> <p><i>Description:</i> The number of seconds after which the warden attempts several times to start a failed service. The number of attempts after each interval is specified by the parameter <code>services.retries</code>.</p>
<b>warden.enable.jmxremote</b>	<p><i>Sample Value:</i> false</p> <p><i>Description:</i> Set to <code>true</code> to enable the Warden JMX server.</p>
<b>zookeeper.servers</b>	<p><i>Sample Value:</i> 10.250.1.61:5181 10.10.1.230:5181</p> <p><i>Description:</i> Space separated list of Zookeeper servers.</p>

For information on configuration files for additional services, see [warden.<servicename>.conf](#).

### **warden.<servicename>.conf**

Describes the service configuration files that Warden supports.

The `warden.conf` configuration file is associated with the standard services that are provided by HPE Ezmeral Data Fabric. Warden supports service monitoring for additional services.

Each of these supported services requires a configuration file, `warden.<servicename>.conf`, which is included with the package for that service. When you install any of these service packages, its corresponding configuration file is stored in `/opt/mapr/conf/conf.d`. The configuration files and their packages are as follows:

<b>collectd</b>	<p><i>Configuration File:</i> <code>warden.collectd.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-collectd</code> package. This package is supported only for internal HPE Ezmeral Data Fabric Monitoring uses cases.</p>
<b>drill</b>	<p><i>Configuration File:</i> <code>warden.drill-bits.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-drill</code> package.</p>
<b>elasticsearch</b>	<p><i>Configuration File:</i> <code>warden.elasticsearch.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-elasticsearch</code> package. This package is supported only for internal HPE Ezmeral Data Fabric Monitoring uses cases.</p>
<b>fluentd</b>	<p><i>Configuration File:</i> <code>warden.fluentd.conf</code></p>

	<p><i>Description:</i> Installed with the <code>mapr-fluentd</code> package. This package is supported only for internal HPE Ezmeral Data Fabric Monitoring uses cases.</p>
<b>gateway</b>	<p><i>Configuration File:</i> <code>warden.gateway.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-gateway</code> package.</p>
<b>grafana</b>	<p><i>Configuration File:</i> <code>warden.grafana.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-grafana</code> package. This package is supported only for internal HPE Ezmeral Data Fabric Monitoring uses cases.</p>
<b>hue</b>	<p><i>Configuration File:</i> <code>warden.hue.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-hue</code> package.</p>
<b>httpsfs</b>	<p><i>Configuration File:</i> <code>warden.httpsfs.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-httpsfs</code> package.</p>
<b>hbase thrift server</b>	<p><i>Configuration File:</i> <code>warden.hbasethrift.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-hbasethrift</code> package.</p>
<b>hbase rest gateway</b>	<p><i>Configuration File:</i> <code>warden.hbase-rest.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-hbase-rest</code> package.</p>
<b>historyserver</b>	<p><i>Configuration File:</i> <code>warden.historyserver.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-historyserver</code> package.</p>
<b>hive metastore</b>	<p><i>Configuration File:</i> <code>warden.hivemeta.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-hivemetadata</code> package.</p>
<b>hiveserver2</b>	<p><i>Configuration File:</i> <code>warden.hs2.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-hiveserver2</code> package.</p>
<b>kibana</b>	<p><i>Configuration File:</i> <code>warden.kibana.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-kibana</code> package. This package is supported only for internal HPE Ezmeral Data Fabric Monitoring uses cases.</p>
<b>nodemanager</b>	<p><i>Configuration File:</i> <code>warden.nodemanager.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-nodemanager</code> package.</p>
<b>opentsdb</b>	<p><i>Configuration File:</i> <code>warden.opentsdb.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-opentsdb</code> package. This package is supported only for internal HPE Ezmeral Data Fabric Monitoring uses cases.</p>
<b>resourcemanager</b>	<p><i>Configuration File:</i> <code>warden.resourcemanager.conf</code></p>

<b>sentry</b>	<p><i>Description:</i> Installed with the <code>mapr-resourcemanager</code> package.</p> <p><i>Configuration File:</i> <code>warden.sentry.conf</code></p> <p><i>Description:</i> Installed with the <code>mapr-sentry</code> package. However, Sentry is not automatically monitored by the Warden. When Sentry is configured to use the database storage model, you can manually copy the <code>/opt/mapr/sentry/sentry-&lt;version&gt;/conf.d/warden.sentry.conf</code> file to the <code>/opt/mapr/conf/conf.d</code> directory to add Sentry to the list of services that the Warden monitors.</p>
<b>spark master</b>	<p><i>Configuration File:</i> <code>warden.spark-master.conf</code></p> <p><i>Description:</i> Installed with the <code>spark-master</code> package.</p>

### Configuring Service Properties

You can configure the following properties in the `warden.<servicename>.conf` file:

<b>services</b>	<p><i>Description:</i> Service name and number of nodes this service should run on, along with service dependencies. Format is <code>serviceName:N[depServiceName]</code>. Values for N = 1 or all</p>
<b>service.alarm.label</b>	<p><i>Description:</i> Specifies the alarm name for this service. This is the alarm name that appears in the CLI when you do not request a terse output. Once <code>tWarden</code> starts the service, you cannot edit this value.</p>
<b>service.alarm.tersename</b>	<p><i>Description:</i> Specifies the abbreviated alarm name for this service. This is the alarm name that appears in the Control System. Once Warden starts the service, you cannot edit this value.</p>
<b>service.command.monitor</b>	<p><i>Description:</i> Monitor string (if the service monitor command does not provide sufficient monitoring).</p>
<b>service.command.monitorcommand</b>	<p><i>Description:</i> Specifies a command that checks whether the service is running.</p>
<b>service.command.start</b>	<p><i>Description:</i> Service <code>start</code> command.</p>
<b>service.command.stop</b>	<p><i>Description:</i> Service <code>stop</code> command.</p>
<b>service.command.type</b>	<p><i>Description:</i> Indicates whether the script runs in background (and exits) or inline (script does not exit). Type is either <code>BACKGROUND</code> or <code>INLINE</code>.</p>
<b>service.depends.local</b>	<p><i>Description:</i> Indicates whether the service depends on a service instance locally, or on the master. Values = 1 (local) or 0 (master).</p>
<b>service.displayname</b>	<p><i>Description:</i> The name of the service to display.</p>
<b>service.env</b>	<p><i>Description:</i> Specifies environment variables to be use by the service. By default, it may include <code>MAPR_MAPREDUCE_MODE=default</code>. You can include a comma-separated list of environment variables. For</p>

	example, <code>service.env=MAPR_MAPREDUCE_MODE=default,ABC=1,XYZ=2.</code>
<code>service.heapsize.max</code>	<i>Description:</i> Maximum heapsize in MB.
<code>service.heapsize.min</code>	<i>Description:</i> Minimum heapsize in MB.
<code>service.heapsize.percent</code>	<i>Description:</i> Specifies heapsize percent.
<code>service.logs.location</code>	<i>Description:</i> Location of the service log files.
<code>service.port</code>	<i>Description:</i> Port where the service is running (for example, the hue webserver runs on port 8888).
<code>service.process.type</code>	<i>Description:</i> Specifies the type of process. For example, <code>service.process.type=JAVA</code> indicates that the process is a Java process.
<code>service.uri</code>	<i>Description:</i> To include a link to a user interface associated with this service in the Control System, enter a Uniform Resource Identifier (URI) in this property, and specify the port in the <code>service.ui.port</code> property. For example, enter <code>/service1</code> for this property and then enter 8080 in the <code>service.ui.port</code> property to provide the following UI link for this service in the MCS: <code>http://&lt;hostname&gt;:8080/service1</code>
<code>service.uri.port</code>	<i>Description:</i> If you want to include a link to the user interface associated with this service in the Control System, enter the port in this property and also specify the URI in the <code>service.uri</code> property.

## Memory Management for Services

The following memory parameters are used to reserve memory for the service:

- The `service.<servicename>.heapsize.percent` parameter controls the percentage of system memory allocated to the named service.
- The `service.<servicename>.heapsize.max` parameter defines the maximum heapsize used when invoking the service.
- The `service.<servicename>.heapsize.min` parameter defines the minimum heapsize used when invoking the service.

For example, the `service.command.gateway.heapsize.percent`, `service.command.gateway.heapsize.max`, and `service.command.gateway.heapsize.min` parameters in the `warden.gateway.conf` file control the amount of memory that Warden allocates to the gateway service before allocating memory to other services.

The actual heap size used when invoking a service is a combination of the three parameters according to the formula `max(heapsize.min, min(heapsize.max, total-memory * heapsize.percent / 100))`.

### warden.hs2.conf Example

The hiveserver2 configuration file, `warden.hs2.conf`, looks like this:

```

services=hs2:1
service.displayname=HiveServer2
service.command.start=/opt/mapr/hive/hive-0.13/bin/hive --start --service
hiveserver2
service.command.stop=/opt/mapr/hive/hive-0.13/bin/hive --stop --service
hiveserver2
service.command.type=BACKGROUND
service.command.monitorcommand=/opt/mapr/hive/hive-0.13/bin/
hive --status --service hiveserver2
service.port=9083
service.ui.port=9083
service.uri=about
service.logs.location=/tmp/mapr
service.process.type=JAVA

```

When `hiveserver2` is installed, the `warden.hs2.conf` file is placed in the directory `/opt/mapr/conf/conf.d`. If Warden is running, it detects the file and starts the service. If Warden is not running, the file is picked up when Warden starts. Warden monitors the service and displays the status on the Control System UI.

### yarn-site.xml

Describes the YARN configuration options.

YARN configuration options are stored in the `/opt/mapr/hadoop/hadoop-2.x.x/etc/hadoop/yarn-site.xml` file and are editable by the `root` user. This file contains configuration information that overrides the default values for YARN parameters. Overrides of the default values for core configuration properties are stored in the Default YARN parameters file.

To override a default value for a property, specify the new value within the `<configuration>` tags, using the following format:

```

<property>
  <name> </name>
  <value> </value>
  <description> </description>
</property>

```

The following configuration lists describe the possible entries that you can place between the `<name>` tags and between the `<value>` tags. The `<description>` tag is optional but recommended for maintainability.

### Configuration for ResourceManager

Comprises the following parameters:

<b>yarn.resourcemanager.hostname</b>	The hostname of the ResourceManager. The <a href="#">configure.sh</a> command automatically sets this value to the IP address that you provide with the <code>-RM</code> option. <i>Default value:</i> {IP Address}
<b>yarn.resourcemanager.scheduler.address</b>	The hostname and port of the Scheduler Interface. <i>Example value:</i> \$ {yarn.resourcemanager.hostname}:8030
<b>yarn.resourcemanager.resource-tracker.address</b>	The hostname and port of the Resource Manager.

*Example value:* \$  
`{yarn.resourcemanager.hostname}:8025`

**yarn.resourcemanager.address**

The address of the Applications Manager interface that is contained in the Resource Manager.

*Example value:* \$  
`{yarn.resourcemanager.address}:8041`

## Configuration for NodeManager

Comprises the following parameters:

**yarn.nodemanager.container-localizer.log.level**

*Default Value:* INFO

*Description:* You can change the log level for the container localizer by setting the configuring options in this property. Different configuring options available are INFO, DEBUG, and WARN. By default logs will be available in the Application Master logs location but based on your cluster configuration, they will be available in the application's localized log directory. This functionality is available by default starting in EEP 7.1.0. For previous EEP versions, request the patch. See [Applying a Patch](#) on page 465.

**yarn.nodemanager.max-retry-file-delete**

*Default Value:* 2

*Description:* Defines how many times the NodeManager can attempt to delete application-related directories from a volume when Spark is configured to use the mounted NFS directory instead of the /tmp directory on the local filesystem. Increasing the value for this property can prevent application cache data from accumulating in the volume. This functionality is available by default starting in EEP 7.1.0. For previous EEP versions, request the patch. See [Applying a Patch](#) on page 465.

**yarn.nodemanager.kill-container-child-process**

*Default Value:* false

*Description:* Enables NodeManager to automatically run the `kill -9` command to end processes that hang after YARN stops containers. Set to `true` to enable this behavior. This functionality is available by default starting in EEP 7.1.0. For previous EEP versions, request the patch. See [Applying a Patch](#) on page 465.

**yarn.nodemanager.container-executor.class**

*Default Value:*  
`org.apache.hadoop.yarn.server.nodemanager.LinuxContainerExecutor`

*Description:* Identifies how containers are executed.

Set to `LinuxContainerExecutor` by default, so that jobs can run as the user that submits the job.

**NOTE:** If a system user (a user with `userID<500`) wants to submit a job, you must add the user in the `container-executor.cfg` file. The user `mapr` is already configured as an allowed system user.

**yarn.nodemanager.aux-services**

*Default Value:* `mapreduce_shuffle, mapr_direct_shuffle`

<b>yarn.nodemanager.aux-services.mapreduce_shuffle.class</b>	<p><i>Description:</i> Selects a shuffle service that needs to be set for MapReduce to run.</p> <p><i>Default Value:</i> org.apache.hadoop.mapred.ShuffleHandler</p> <p><i>Description:</i> This property, in conjunction with other properties, sets <i>direct shuffle</i> as the default shuffle for MapReduce.</p>
<b>yarn.nodemanager.aux-services.mapr_direct_shuffle.class</b>	<p><i>Default Value:</i> com.mapr.hadoop.mapred.LocalVolumeAuxService</p> <p><i>Description:</i> This property, in conjunction with other properties, sets <i>direct shuffle</i> as the default shuffle for MapReduce.</p>

### Configuration for Timeline Server Security with MapR-SASL

Comprises the following parameter:

<b>yarn.timeline-service.http-authentication.type</b>	<p><i>Default Value:</i> com.mapr.security.maprauth.MaprDelegationTokenAuthenticationHandler</p> <p><i>Description:</i> The authentication used for the timeline server HTTP endpoint.</p>
-------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Configuration for Timeline Server Security with Kerberos

Comprises the following parameter:

<b>yarn.timeline-service.http-authentication.type</b>	<p><i>Default Value:</i> com.mapr.security.maprauth.MaprDelegationTokenAuthenticationHandler</p> <p><i>Description:</i> The authentication used for the timeline server HTTP endpoint.</p>
<b>yarn.timeline-service.http-authentication.kerberos.principal</b>	<p><i>Default Value:</i> principal(HTTP/nodex@NODEX)</p> <p><i>Description:</i> The Kerberos service principal for the timeline server HTTP endpoint.</p>
<b>yarn.timeline-service.http-authentication.kerberos.keytab</b>	<p><i>Default Value:</i> path to keytab(/opt/mapr/conf/mapr.keytab)</p> <p><i>Description:</i> The Kerberos keytab for the timeline server HTTP endpoint.</p>
<b>yarn.timeline-service.principal</b>	<p><i>Default Value:</i> mapr/nodex@NODEX</p> <p><i>Description:</i> The Kerberos principal for the timeline reader. NodeManager principal is used for the timeline collector as it runs as an auxiliary service inside NodeManager.</p>
<b>yarn.timeline-service.keytab</b>	<p><i>Default Value:</i> path to keytab(/opt/mapr/conf/mapr.keytab)</p> <p><i>Description:</i> The Kerberos keytab for the timeline reader. NodeManager keytab is used for the timeline collector as it runs as an auxiliary service inside NodeManager.</p>

### Configuration for MapReduce

Comprises the following parameter:

**mapreduce.job.shuffle.provider.services***Default Value:* `mapr_direct_shuffle`*Description:* This is the default shuffle handler for MapReduce. Contains a value from the `yarn.nodemanager.aux-services` property.

## Configuration for Container Logs

Comprises the following parameters:

**yarn.nodemanager.log-dirs***Default Value:* `/opt/mapr/hadoop/hadoop-<version>/logs/userlogs/<applicationID>/<containerID>/<filename>.log`*Description:* The location to store container logs on the node. An application's log directory is `${yarn.nodemanager.log-dirs}/application_${appid}`. Individual containers' log directories are named `container_${contid}`. Each container directory will contain the files `stderr`, `stdin`, and `syslog` generated by that container.**NOTE:** You can find the application ID associated with your job in the Control System.**yarn.log-aggregation-enable***Default Value:* `false`*Description:* Indicates whether the logs are aggregated.**yarn.nodemanager.log.retain-seconds***Default Value:* `10800` (3 hours)*Description:* Specifies the duration for which user logs are maintained, when log aggregation is disabled.**yarn.log-aggregation.retain-seconds***Default Value:* `-1`*Description:* Specifies the number of seconds to retain logs, when log aggregation is enabled. The default value of `-1`, disables the deletion of logs.**yarn.log-aggregation.retain-check-interval-seconds***Default Value:* `-1`*Description:* The interval between aggregated log retention checks. If set to `0` or a negative value, then the value is computed as one-tenth of the aggregated log retention time.**NOTE:** Setting this to a low value may cause unnecessary log retention checks.**yarn.nodemanager.remote-app-log-dir***Default Value:* `/tmp/logs`*Description:* The location on the filesystem where the logs are aggregated.**yarn.nodemanager.remote-app-log-dir-suffix***Default Value:* `logs`*Description:* The suffix for the directory that stores the aggregated logs for each user.

## Configuration for Apache Shuffle

You can disable Direct Shuffle and enable Apache Shuffle for MapReduce applications through the following setting:

**yarn.nodemanager.aux-services***Value:* mapreduce\_shuffle**zoo.cfg**

Lists the ZooKeeper configuration file.

**Example zoo.cfg File**

The file `/opt/mapr/zookeeper/zookeeper-$version/conf/zoo.cfg` specifies ZooKeeper configuration parameters.

```
# The number of milliseconds of each tick
tickTime=2000
# The number of ticks that the initial
# synchronization phase can take
initLimit=20
# The number of ticks that can pass between
# sending a request and getting an acknowledgement
syncLimit=10
# the directory where the snapshot is stored.
dataDir=/opt/mapr/zkdata
# the port at which the clients will connect
clientPort=5181
# max number of client connections
maxClientCnxns=1000
#autopurge interval - 24 hours
autopurge.purgeInterval=24
#superuser to allow zk nodes delete
superUser=mapr
#readuser to allow read zk info for authenticated clients
readUser=anyone
# cldb key location
mapr.cldbkeyfile.location=/opt/mapr/conf/cldb.key
#security provider name
authMech=MAPR-SECURITY
# security auth provider
authProvider.1=org.apache.zookeeper.server.auth.SASLAuthenticationProvider
# use maprserverticket not userticket for auth
mapr.usemaprserverticket=true
#
# Added for 3.4.11-mapr
#
# ZK-to-ZK server authentication using MAPR-SASL
# Set quorum.auth.enableSasl=false for insecure cluster, =true for secure
cluster
quorum.auth.enableSasl=true
quorum.auth.learnerRequireSasl=true
quorum.auth.serverRequireSasl=true
quorum.auth.learner.loginContext=QuorumLearner
quorum.auth.server.loginContext=QuorumServer
quorum.cnxn.threads.size=20
#
# Added for 3.5.6-mapr
#
# ZK server-to-server SSL encryption
#
sslQuorum=true
serverCnxnFactory=org.apache.zookeeper.server.NettyServerCnxnFactory
ssl.quorum.keyStore.location=/opt/mapr/conf/ssl_keystore.pl2
ssl.quorum.keyStore.password=<randomly generated password>
ssl.quorum.trustStore.location=/opt/mapr/conf/ssl_truststore.pl2
ssl.quorum.trustStore.password=<randomly generated password>
ssl.quorum.protocol=TLS
```

```

ssl.quorum.enabledProtocols=TLSv1.2
# MapR uses the cluster name in the certificates, no host names
ssl.quorum.hostnameVerification=false
#
# The Jetty Admin Server allows ZK access via a URL
# Like http://localhost:8080/commands/stat
# Default port 8080 may cause conflicts; thus server disabled by default
# admin.serverPort=8080
admin.enableServer=false
#
# For upgrade from an existing 3.4.11 or older that had no snapshots
snapshot.trust.empty=true
#

```

 **WARNING:** `maxClientCnxns` limits the number of concurrent ZooKeeper connections that a single client machine may make. This value does not set a limit for the whole cluster. The default is 100. If you plan to run more than 100 jobs from a single node, increase this value.

 **ATTENTION:** By default, only **authenticated** users (users with a valid ticket) are allowed to execute ZooKeeper related commands. To allow **all** users to execute ZooKeeper related commands, add the entry `sessionRequireClientSASLAuth=false` to this file and restart ZooKeeper.

### Enable Encrypted Quorum Communication

Perform the following steps to enable encrypted quorum communication between ZooKeeper nodes:

1. Copy all `*.p12` certificates from the master CLDB node to all the ZooKeeper nodes.
2. Set the user and group of all the `*.p12` certificates to `mapr` on all the ZooKeeper nodes.
3. Set `sslQuorum=true` in the `zoo.cfg` file.
4. Restart ZooKeeper and Warden:

```

service mapr-zookeeper restart
service mapr-warden restart

```

### Related tasks

[Enabling Security](#) on page 1770

Describes how to enable security for the cluster, platform, ecosystem components, and network-based connections.

### `zookeeper-env.sh`

Use this file to load or unload JMX parameters for ZooKeeper.

By default, in all Data Fabric versions, the ZooKeeper JMX parameters are not loaded.

To load ZooKeeper JMX parameters, set the `JMXDISABLE` parameter to `false` in the `zookeeper-env.sh` file within the `/opt/mapr/zookeeper/zookeeper-$version/conf` directory.

```
JMXDISABLE=false
```

Restart the ZooKeeper process: `service mapr-zookeeper restart`.

To unload ZooKeeper JMX parameters, set:

```
JMXDISABLE=true
```

in `zookeeper-env.sh`. Restart the ZooKeeper process: `service mapr-zookeeper restart`.

## Alarms Reference

The pages in this section provide details about all of the types of alarms.

### User/Group Alarms

User/group alarms indicate problems with user or group quotas. The following tables describe the Data Fabric user/group alarms.

- Entity Advisory Quota Alarm
- Entity Quota Alarm

#### Entity Advisory Quota Alarm

<b>UI Column</b>	User Advisory Quota Alarm
<b>Logged As</b>	AE_ALARM_AEADVISORY_QUOTA_EXCEEDED
<b>Meaning</b>	A user or group has exceeded its advisory quota. See <a href="#">Setting Quota Defaults for Users and Groups</a> on page 1075 for more information about user/group quotas.
<b>Resolution</b>	No immediate action is required. To avoid exceeding the hard quota, clear space on volumes created by the user or group, or stop further data writes to those volumes.
<b>Configuration</b>	Configurable when setting/modifying entity properties. See <a href="#">Configuring the Alarm Threshold Using the CLI</a> on page 1081 for more information.

#### Entity Quota Alarm

<b>UI Column</b>	User Quota Alarm
<b>Logged As</b>	AE_ALARM_AEQUOTA_EXCEEDED
<b>Meaning</b>	A user or group has exceeded its quota. Further writes by the user or group will fail. See <a href="#">Setting Quota Defaults for Users and Groups</a> on page 1075 and <a href="#">Set or Modify Quotas for Users and/or Groups</a> on page 1270 for more information about user/group quotas.
<b>Resolution</b>	Free some space on the volumes created by the user or group, or increase the user or group quota.
<b>Configuration</b>	Configurable when setting/modifying entity properties. See <a href="#">Configuring the Alarm Threshold Using the CLI</a> on page 1081 for more information.

### Cluster Alarms

Cluster alarms indicate problems that affect the cluster as a whole. The following sections describe the data-fabric cluster alarms.

#### CLDB Low Memory Alarm

<b>UI Column</b>	Cluster freespace above CLDB heapsize
<b>Logged As</b>	CLUSTER_ALARM_CLDB_HEAPSIZE

<b>Meaning</b>	The CLDB process needs more memory to cache containers.
<b>Resolution</b>	<p>The CLDB heap size is no longer sufficient for the CLDB to cache containers. The solution is to increase the CLDB memory settings on all CLDB nodes, using the same value for the minimum and maximum heap sizes. The text the alarm code provides will include the minimum amount of memory required to be sufficient; however, to accommodate future growth, you should set these values to a somewhat higher number. For example, if the alarm indicates that the CLDB needs 4000 MB, you should set the minimum and maximum heap sizes to a larger value such as 4400 MB.</p> <p>The CLDB memory settings are controlled by the following parameters in the <code>warden.conf</code> file located in <code>\$MAPR_HOME/conf/::</code></p> <pre>service.command.cldb.heapsize.max=&lt;max heap size&gt; service.command.cldb.heapsize.min=&lt;min heap size&gt;</pre> <p>Restart the Warden service on each CLDB node after you edit the <code>warden.conf</code> file.</p>
 <b>License Near Expiration</b>	
<b>UI Column</b>	License Near Expiration Alarm
<b>Logged As</b>	CLUSTER_ALARM_LICENSE_NEAR_EXPIRATION
<b>Meaning</b>	The Enterprise Edition license associated with the cluster is within 30 days of expiration.
<b>Resolution</b>	Renew the Enterprise Edition license.
<b>Configuration</b>	Configurable at cluster level. See <a href="#">Configuring the Alarm Threshold Using the CLI</a> on page 1081 for more information.
 <b>License Expired</b>	
<b>UI Column</b>	License Expiration Alarm
<b>Logged As</b>	CLUSTER_ALARM_LICENSE_EXPIRED
<b>Meaning</b>	The Enterprise Edition license associated with the cluster has expired. Enterprise Edition features have been disabled.
<b>Resolution</b>	Renew the Enterprise Edition license.
 <b>Cluster Almost Full</b>	
<b>UI Column</b>	Cluster Almost Full
<b>Logged As</b>	CLUSTER_ALARM_CLUSTER_ALMOST_FULL
<b>Meaning</b>	The cluster storage is almost full. The percentage of storage used before this alarm is triggered is 90% by default, and is controlled by the configuration parameter <code>cldb.cluster.almost.full.percentage</code> .
<b>Resolution</b>	Reduce the amount of data stored in the cluster. If the cluster storage is less than 90% full, check

<b>Configuration</b>	the <code>cldb.cluster.almost.full.percentage</code> parameter via the <code>config load</code> command, and adjust it if necessary via the <code>config save</code> command.
<b>Cluster Full</b>	
<b>UI Column</b>	Cluster Full
<b>Logged As</b>	CLUSTER_ALARM_CLUSTER_FULL
<b>Meaning</b>	The cluster storage is full. MapReduce operations have been halted.
<b>Resolution</b>	Free up some space on the cluster.
<b>Maximum Licensed Nodes Exceeded alarm</b>	
<b>UI Column</b>	Licensed Nodes Exceeded Alarm
<b>Logged As</b>	CLUSTER_ALARM_LICENSE_MAXNODES_EXCEEDED
<b>Meaning</b>	The cluster has exceeded the number of nodes specified in the license.
<b>Resolution</b>	Remove some nodes, or upgrade the license to accommodate the added nodes.
<b>New Cluster Features Disabled</b>	
<b>UI Column</b>	New Cluster Features Disabled
<b>Logged As</b>	CLUSTER_ALARM_NEW_FEATURES_DISABLED
<b>Meaning</b>	Features added in version 2.0 or 3.0 are not enabled on the cluster.
<b>Resolution</b>	Enable the latest features for the data-fabric version that you are currently running.
<b>Upgrade in Progress</b>	
<b>UI Column</b>	Software Installation & Upgrades
<b>Logged As</b>	CLUSTER_ALARM_UPGRADE_IN_PROGRESS
<b>Meaning</b>	A rolling upgrade of the cluster is in progress.
<b>Resolution</b>	No action is required. Performance may be affected during the upgrade, but the cluster should still function normally. After the upgrade is complete, the alarm is cleared.
<b>VIPAssignment Failure</b>	
<b>UI Column</b>	VIP Assignment Alarm
<b>Logged As</b>	CLUSTER_ALARM_UNASSIGNED_VIRTUAL_IPS
<b>Meaning</b>	Core software was unable to assign a VIP to any NFS servers.

<b>Resolution</b>	Check the VIP configuration, and make sure at least one of the NFS servers in the VIP pool are up and running. See <a href="#">Setting Up VIPs for NFS</a> . This alarm can also indicate that a VIP's hostname exceeds the maximum allowed length of 16. Check the log file <code>/opt/mapr/logs/nfsmon.log</code> for additional information.
<b>DARE Enabled</b>	
<b>UI Column</b>	DARE Enabled Alarm
<b>Logged As</b>	CLUSTER_ALARM_DARE_COPY_MASTER_KEY
<b>Meaning</b>	Data-at-rest encryption (DARE) is enabled on the cluster.
<b>Resolution</b>	When DARE is enabled on the cluster, a data-at-rest encryption master key file is generated and stored in the <code>/opt/mapr/conf/tokens</code> folder on the CLDB node. Before dismissing the alarm, make a backup of the <code>/opt/mapr/conf/tokens</code> folder. For an upgraded cluster, you must also back up the <code>dare.master.key</code> stored in <code>/opt/mapr/conf/</code> . Loss of the master key file or the <code>/opt/mapr/conf/tokens</code> folder can be catastrophic and irreversible and might result in loss of data.
<b>DARE Incompatible</b>	
<b>UI Column</b>	DARE Incompatible Alarm
<b>Logged As</b>	CLUSTER_ALARM_DARE_INCOMPATIBLE
<b>Meaning</b>	Not all nodes on the cluster are enabled for data-at-rest encryption (DARE).
<b>Resolution</b>	When DARE is enabled on certain nodes in the cluster, there may still be some nodes that are not (yet) enabled for DARE. Enable DARE on all the nodes before dismissing the alarm.
<b>Too Many Snapshots</b>	
<b>UI Column</b>	Too Many Snapshots
<b>Logged As</b>	CLUSTER_ALARM_TOO_MANY_SNAPSHOT_CONTAINERS
<b>Meaning</b>	There are too many snapshots on this cluster.
<b>Resolution</b>	Delete snapshots from the cluster before dismissing the alarm.
<b>Insights running in trial mode</b>	
<b>UI Column</b>	Insights running in trial mode
<b>Logged As</b>	CLUSTER_ALARM_INSIGHTS_TRIAL_MODE
<b>Meaning</b>	The insights feature that is enabled on the cluster is running in trial mode with Hive Metastore using the Derby RDBMS to store insights table metadata.

**Resolution** Associate the Hive metastore with a production grade RDBMS such as PostgreSQL or MySQL. The alarm will be cleared once this is done.

## Node Alarms

Node alarms indicate problems in individual nodes. The following tables describe the MapR node alarms.

### CLDB Service Alarm

<b>UI Column</b>	CLDB Alarm
<b>Logged As</b>	NODE_ALARM_SERVICE_CLDB_DOWN
<b>Meaning</b>	The CLDB service on the node has stopped running.
<b>Resolution</b>	Go to the <a href="#">node information page</a> or the <b>Services</b> page in the Control System to check whether the CLDB service is running. The warden will try three times to restart the service automatically. After an interval (30 minutes by default) the warden will again try three times to restart the service. The interval can be configured using the parameter <code>services.retryinterval.time.sec</code> in <code>warden.conf</code> on page 2997. If the warden successfully restarts the CLDB service, the alarm is cleared. If the warden is unable to restart the CLDB service, see <a href="#">more troubleshooting information</a> .

### Core Present Alarm

<b>UI Column</b>	Core Present
<b>Logged As</b>	NODE_ALARM_CORE_PRESENT
<b>Meaning</b>	A service on the node has crashed and created a core dump file. When all core files are removed, the alarm is cleared.
<b>Resolution</b>	See <a href="#">troubleshooting information</a> .

### Debug Logging Active

<b>UI Column</b>	Excess Logs Alarm
<b>Logged As</b>	NODE_ALARM_DEBUG_LOGGING
<b>Meaning</b>	Debug logging is enabled on the node.
<b>Resolution</b>	Debug logging generates enormous amounts of data, and can fill up disk space. If debug logging is not absolutely necessary, turn it off: use the <code>setloglevel</code> on page 2366 command. If it is absolutely necessary, make sure that the logs in <code>/opt/mapr/logs</code> are not in danger of filling the entire disk.

### Disk Failure

<b>UI Column</b>	Disk Failure Alarm
<b>Logged As</b>	NODE_ALARM_DISK_FAILURE

<b>Meaning</b>	A disk has failed on the node.
<b>Resolution</b>	Check the disk health log ( <code>/opt/mapr/logs/faileddisk.log</code> ) to determine which disk failed and view any SMART data provided by the disk. See <a href="#">Managing Disks</a> on page 1138.
<b>Duplicate Host ID</b>	
<b>UI Column</b>	Duplicate Host Id
<b>Logged As</b>	NODE_ALARM_DUPLICATE_HOSTID
<b>Meaning</b>	Two or more nodes in the cluster have the same host ID.
<b>Resolution</b>	Multiple nodes with the same host ID are prevented from joining the cluster, in order to prevent addressing problems that can lead to data loss. To correct the problem and clear the alarm, make sure all host IDs are unique and use the <code>maprcli node allow-into-cluster</code> command to un-ban the affected host IDs.
<b>FileServer Service Alarm</b>	
<b>UI Column</b>	FileServer Alarm
<b>Logged As</b>	NODE_ALARM_SERVICE_FILESERVER_DOWN
<b>Meaning</b>	The FileServer service on the node has stopped running.
<b>Resolution</b>	Go to the <a href="#">node information page</a> or the <b>Services</b> page in the Control System to check whether the FileServer service is running. The warden will try three times to restart the service automatically. After an interval (30 minutes by default) the warden will again try three times to restart the service. The interval can be configured using the parameter <code>services.retryinterval.time.sec</code> in <code>warden.conf</code> on page 2997 file. If the warden successfully restarts the FileServer service, the alarm is cleared. If the warden is unable to restart the FileServer service, see <a href="#">more troubleshooting information</a> .
<b>Gateway Service Alarm</b>	
<b>Label for Alarm on MCS UI</b>	Gateway Service Down
<b>Text for Alarm on Log File</b>	NODE_ALARM_SERVICE_GATEWAY_DOWN
<b>Meaning</b>	The gateway service has stopped running.
<b>Resolution</b>	Go to the <a href="#">node information page</a> or the <b>Services</b> page in the Control System to check whether the gateway service is running. The warden will try three times to restart the service automatically. After an interval (30 minutes by default) the warden will again try three times to restart the service. The interval can be configured using the

parameter `services.retryinterval.time.sec` in `warden.conf` on page 2997. If the warden successfully restarts the gateway service, the alarm is cleared. If the warden is unable to restart the gateway service, see [more troubleshooting information](#).

### Beeswax Service Alarm

**Label for Alarm on MCS UI**

NODE\_ALARM\_SERVICE\_BEESWAX\_DOWN

**Text for Alarm on Log File**

NODE\_ALARM\_SERVICE\_BEESWAX\_DOWN

**Meaning**

The Beeswax service has stopped running.

**Resolution**

Go to the [node information page](#) or the **Services** page in the Control System to check if the Beeswax service is running. The warden will try three times to restart the service automatically. After an interval (30 minutes by default) the warden will again try three times to restart the service. The interval can be configured using the parameter `services.retryinterval.time.sec` in `warden.conf` on page 2997. If the warden successfully restarts the Beeswax service, the alarm is cleared. If the warden is unable to restart the Beeswax service, see [more troubleshooting information](#).

### S3 Server Alarm

**Label for Alarm on MCS UI**

S3 Server Down

**Text for Alarm on Log File**

NODE\_ALARM\_SERVICE\_S3SERVER\_DOWN

**Meaning**

The S3 server has stopped running.

**Resolution**

Go to the [node information page](#) or the **Services** page in the Control System to check whether the S3 server is running. The warden will try three times to restart the S3 server automatically. After an interval (30 minutes by default) the warden will again try three times to restart the S3 server. The interval can be configured using the parameter `services.retryinterval.time.sec` in `warden.conf` on page 2997. If the warden successfully restarts the S3 server, the alarm is cleared. If the warden is unable to restart the S3 server, see [more troubleshooting information](#).

### Heartbeat Processing Slow

**UI Column**

Heartbeat Processing Slow Alarm

**Logged As**

NODE\_ALARM\_HB\_PROCESSING\_SLOW

**Meaning**

The time that has elapsed since the CLDB processed the previous heartbeat from the file system node has exceeded 5 seconds.

**Resolution**

When the CLDB is processing a heartbeat from a node, it will compare the current time to the time at which the previous heartbeat from that node was processed. If the elapsed time exceeds 5 seconds

then this alarm is raised. If this alarm occurs frequently, investigate what might be causing the relevant node or nodes to be busy, or whether the CLDB nodes have enough resources to handle their load.

### HBMaster Service Alarm

<b>UI Column</b>	HBase Master Alarm
<b>Logged As</b>	NODE_ALARM_SERVICE_HBMASTER_DOWN
<b>Meaning</b>	The HBMaster service on the node has stopped running.
<b>Resolution</b>	To check whether the HBMaster service is running, go to the <a href="#">node information page</a> or the <b>Services</b> page in the Control System. Warden will try three times to restart the service automatically. After an interval (30 minutes by default), Warden will again try three times to restart the service. The interval can be configured using the <code>services.retryinterval.time.sec</code> parameter in the <code>warden.conf</code> file. If Warden successfully restarts the HBMaster service, the alarm is cleared. If Warden is unable to restart the HBMaster service, it might be necessary to contact technical support.

### HBRegion Service Alarm

<b>UI Column</b>	Hbase RegionServer Alarm
<b>Logged As</b>	NODE_ALARM_SERVICE_HBREGION_DOWN
<b>Meaning</b>	The HBRegion service on the node has stopped running.
<b>Resolution</b>	To check whether the HBRegion service is running, go to the <a href="#">node information page</a> or the <b>Services</b> page in the Control System. Warden will try three times to restart the service automatically. After an interval (30 minutes by default), Warden will again try three times to restart the service. The interval can be configured using the <code>services.retryinterval.time.sec</code> parameter in the <code>warden.conf</code> file. If Warden successfully restarts the HBRegion service, the alarm is cleared. If Warden is unable to restart the HBRegion service, it might be necessary to contact technical support.

### High MAST Gateway Memory Alarm

<b>UI Column</b>	High Memory Usage
<b>Logged As</b>	NODE_ALARM_HIGH_MASTGATEWAY_MEMORY
<b>Meaning</b>	Memory consumption of MAST Gateway exceeds the memory allocated for MAST Gateway.
<b>Resolution</b>	Tune the percentage of node memory allocated for MAST Gateway in the <code>/opt/mapr/conf/conf.d/warden.mastgateway.conf</code> file. See <a href="#">Configuring</a>

[MAST Gateway](#) for more information. If core is generated for this error, contact HPE support.

### HistoryServer Alarm

<b>UI Column</b>	HistoryServer Alarm
<b>Logged As</b>	NODE_ALARM_SERVICE_HISTORYSERVER_DOW N
<b>Meaning</b>	The HistoryServer on the node has stopped running.
<b>Resolution</b>	Go to the <a href="#">node information page</a> or the <b>Services</b> page in the Control System to check whether HistoryServer is running. Warden will try three times to restart the service automatically ever 30 minutes (by default). This 30 minute interval can be reconfigured using the parameter <code>services.retryinterval.time.sec</code> in the <code>warden.conf</code> on page 2997 file.  If warden successfully restarts the HistoryServer, the alarm is cleared. If Warden is unable to restart the HistoryServer, see <a href="#">more troubleshooting information</a> .

### HiveMeta Alarm

<b>UI Column</b>	HiveMeta Alarm
<b>Logged As</b>	NODE_ALARM_SERVICE_HIVEMETA_DOWN
<b>Meaning</b>	The HiveMeta service on the node has stopped running.
<b>Resolution</b>	Go to the <a href="#">node information page</a> or the <b>Services</b> page in the Control System to check whether Hive Metastore is running. Warden will try three times to restart the service automatically ever 30 minutes (by default). This 30 minute interval can be reconfigured using the parameter <code>services.retryinterval.time.sec</code> in the <code>warden.conf</code> on page 2997 file.  If Warden successfully restarts the Hive Metastore service, the alarm is cleared. If Warden is unable to restart the Hive Metastore service, see <a href="#">more troubleshooting information</a> .

### HiveServer 2 Alarm

<b>UI Column</b>	HiveServer 2 Alarm
<b>Logged As</b>	NODE_ALARM_SERVICE_HS2_DOWN
<b>Meaning</b>	The HiveServer 2 service on the node has stopped running.
<b>Resolution</b>	Go to the <a href="#">node information page</a> or the <b>Services</b> page in the Control System to check whether HiveServer 2 is running. Warden will try three times to restart the service automatically ever 30 minutes (by default). This 30 minute interval can be reconfigured using the parameter <code>services.retryinterval.time.sec</code> in the <code>warden.conf</code> on page 2997 file.

If Warden successfully restarts the HiveServer 2 service, the alarm is cleared. If Warden is unable to restart the HiveServer 2 service, see [more troubleshooting information](#).

### Hoststats Alarm

<b>UI Column</b>	HostStats
<b>Logged As</b>	NODE_ALARM_SERVICE_HOSTSTATS_DOWN
<b>Meaning</b>	The Hoststats service on the node has stopped running.
<b>Resolution</b>	Go to the <a href="#">node information page</a> or the <b>Services</b> page in the Control System to check whether the Hoststats service is running. The warden will try three times to restart the service automatically. After an interval (30 minutes by default) the warden will again try three times to restart the service. The interval can be configured using the parameter <code>services.retryinterval.time.sec</code> in <code>warden.conf</code> on page 2997 file. If the warden successfully restarts the service, the alarm is cleared. If the warden is unable to restart the service, review <a href="#">more troubleshooting information</a> .

### Incorrect Topology Alarm

<b>UI Column</b>	CLDB Alarm
<b>Logged As</b>	NODE_ALARM_INCORRECT_TOPOLOGY_ALARM
<b>Meaning</b>	The <code>mapr.cldb.internal</code> volume's topology (normally <code>/cldb</code> ) must include all CLDB nodes. This alarm signifies that one or more CLDB nodes are outside the CLDB volume's topology.
<b>Resolution</b>	There are two ways to resolve this alarm: <ul style="list-style-type: none"> <li>• Move any stray CLDB nodes into the topology in which <code>mapr.cldb.internal</code> resides. See <a href="#">Setting Up Volume Topology</a> on page 1224 for more information.</li> <li>• Change the volume topology of <code>mapr.cldb.internal</code> to include the stray CLDB nodes. See <a href="#">Administering Volumes</a> on page 1161 for more information.</li> </ul>

### Installation Directory Full Alarm

<b>UI Column</b>	Installation Directory Full
<b>Logged As</b>	NODE_ALARM_OPT_MAPR_FULL
<b>Meaning</b>	The partition <code>/opt/mapr</code> on the node is running out of space (95% full).
<b>Resolution</b>	Free up some space in <code>/opt/mapr</code> on the node.

### Instance Mismatch Alarm

<b>UI Column</b>	Instance Mismatch Alarm
<b>Logged As</b>	NODE_ALARM_NUM_INSTANCES_MISMATCH
<b>Meaning</b>	The number of file system instances is not as configured.
<b>Resolution</b>	Restart warden on the node by running the following command:

```
service mapr-warden restart
```

### High FileServer Memory Alarm

<b>UI Column</b>	High FileServer Memory Alarm
<b>Logged As</b>	NODE_ALARM_HIGH_MFS_MEMORY
<b>Meaning</b>	Memory consumed by <b>fileserver</b> service on the node is in excess of the allotted amount.
<b>Resolution</b>	Log on as root to the node for which the alarm is raised, and restart the Warden: <code>service mapr-warden restart</code>
<b>Configuration</b>	Configurable at cluster level. See <a href="#">Configuring the Alarm Threshold Using the CLI</a> on page 1081 for more information.

### MapR User Mismatch

<b>UI Column</b>	MapR User Mismatch Alarm
<b>Logged As</b>	NODE_ALARM_MAPRUSER_MISMATCH
<b>Meaning</b>	The cluster nodes are not all set up to run MapR services as the same user (for example, some nodes are running MapR as <code>root</code> while others are running as <code>mapr_user</code> ).
<b>Resolution</b>	For the nodes on which the User Mismatch alarm is raised, follow the steps in <a href="#">Changing the User for Data Fabric Services from the Command-Line</a> on page 1135.

### Memory Allocation Alarm

<b>UI Column</b>	Memory Allocation Alarm
<b>Logged As</b>	NODE_ALARM_MEMORY_ALLOCATION_EXCEED
<b>Meaning</b>	The percentage of system memory required to run services on the node exceeds the set threshold and could potentially overload the node. If you installed a service on the node that causes the sum of memory used by the services on the node to exceed the threshold set, the system raises the alarm.
<b>Resolution</b>	To clear the alarm, you can add more memory to the node, stop a service from running on the node, or remove a service from the node. You can run

the `service list` command to see the memory allocated to each service on the node. See [service list](#) for more information.

The `services.memoryallocation.alarm.threshold` property in `warden.conf` defines the maximum amount of system memory that services running on the node can use before triggering the alarm. The default setting for this property is 95 percent:

```
services.memoryallocation.alarm.threshold=95
```

The percentage of system memory that services can use on the node should not exceed 95. Restart the Warden service on the node after you edit the `warden.conf` file.

## Memory Usage Alarm

**UI Column**

Memory Usage Alarm

**Logged As**

NODE\_ALARM\_MEMORY\_SWAPPING

**Meaning**

The HostStats service raises this alarm for swap space when the delta of swap in memory and the delta of swap out memory exceeds the threshold set over a specific time period.

**Resolution**

To clear the alarm, you can increase the physical memory or reduce the load running on the node. You can run the `service list` command to see the memory allocated to each service on the node. See [service list](#) for more information.

The memory swapping alarm is controlled by the following properties in `/opt/mapr/conf/hoststats.conf`:

- `alarm.swapping.threshold`
- `alarm.swapping.counter`

The memory threshold for swap in and swap out is defined by the `alarm.swapping.threshold` property, which is set to 100MB by default. The duration over which HostStats checks the delta of the memory is defined by the `alarm.swapping.counter`, which is set to 100 seconds by default.

## High NFS4 Memory Alarm

**UI Column**

High NFS4 Process Memory Consumption

**Logged As**

NODE\_ALARM\_HIGH\_NFS4\_MEMORY

**Meaning**

Memory consumed by **NFS4** service on the node is in excess of the allotted amount.

**Resolution**

Log on as root to the node for which the alarm is raised, and restart the NFS4 service or Warden:

```
service mapr-warden restart
```

<b>Configuration</b>	Configurable at cluster level. See <a href="#">Configuring the Alarm Threshold Using the CLI</a> on page 1081 for more information.
<b>NFS Gateway Alarm</b>	
<b>UI Column</b>	NFS Service Down
<b>Logged As</b>	NODE_ALARM_SERVICE_NFS_DOWN
<b>Meaning</b>	The NFS service on the node has stopped running.
<b>Resolution</b>	Go to the <a href="#">node information page</a> or the <b>Services</b> page in the Control System to check whether the NFS service is running. The warden will try three times to restart the service automatically. After an interval (30 minutes by default) the warden will again try three times to restart the service. The interval can be configured using the parameter <code>services.retryinterval.time.sec</code> in <code>warden.conf</code> on page 2997 file. If the warden successfully restarts the NFS service, the alarm is cleared. If the warden is unable to restart the NFS service, see <a href="#">more troubleshooting information</a> .
<b>NFSv4 Service Alarm</b>	
<b>UI Column</b>	NFSv4 Service Down
<b>Logged As</b>	NODE_ALARM_SERVICE_NFS4_DOWN
<b>Meaning</b>	The NFSv4 service on the node has stopped running.
<b>Resolution</b>	Go to the <a href="#">node information page</a> or the <b>Services</b> page in the Control System to check whether the NFS service is running. The warden will try three times to restart the service automatically. After an interval (30 minutes by default) the warden will again try three times to restart the service. The interval can be configured using the parameter <code>services.retryinterval.time.sec</code> in <code>warden.conf</code> on page 2997 file. If the warden successfully restarts the NFS service, the alarm is cleared. If the warden is unable to restart the NFS service, refer to <a href="#">NFSv4 Troubleshooting</a> on page 1588 to restart the service.
<b>NodeManager Alarm</b>	
Explains how to resolve the issue with the Node Manager service stopping on the node.	
<b>UI Column</b>	NodeManager Alarm
<b>Logged As</b>	NODE_ALARM_SERVICE_NODEMANAGER_DOWN
<b>Meaning</b>	The NodeManager service on the node has stopped running.
<b>Resolution</b>	Go to the <a href="#">node information page</a> or the <b>Services</b> page in the Control System to check whether NodeManager is running. Warden will try three times to restart the service automatically ever 30 minutes (by default). This 30 minute interval can be reconfigured using the parameter <code>services.retryinterval.time.sec</code> in the <code>warden.conf</code> on page 2997 file.

If warden successfully restarts the NodeManager, the alarm is cleared. If warden is unable to restart the NodeManager, see [more troubleshooting information](#).

### No Disk Attached Alarm

<b>UI Column</b>	No Disk Attached Alarm
<b>Logged As</b>	NODE_ALARM_NO_DISK_ATTACHED
<b>Meaning</b>	There are one or more file system instances on a node with no SP assigned to them.
<b>Resolution</b>	To clear the alarm, assign at least one SP per file system.

### No Heartbeat Alarm

Describes the NODE\_ALARM\_NO\_HEARTBEAT alarm.

<b>UI Column</b>	No Heartbeat Alarm
<b>Logged As</b>	NODE_ALARM_NO_HEARTBEAT
<b>Meaning</b>	Node is not undergoing maintenance, and no heartbeat detected for over 5 minutes.
<b>Resolution</b>	Check the status of the node manually.
<b>Configuration</b>	Configurable at cluster level. See <a href="#">Configuring the Alarm Threshold Using the CLI</a> on page 1081 for more information.

This alarm is raised when a node is down for more than 5 minutes. By default, this alarm is not raised if an edge node is down. To raise an alarm for edge nodes as well, set the [CLDB parameter](#) `cldb.ignore.posix.only.hb.alarm` to 0 using the command:

```
/opt/mapr/bin/maprcli config save -values
'{cldb.ignore.posix.only.hb.alarm:"0"}
```

### Security Certificate Expiry Alarm

Describes the NODE\_ALARM\_CERTIFICATE\_NEAR\_EXPIRATION alarm.

<b>UI Column</b>	SSL Certificate Expiry
<b>Logged As</b>	NODE_ALARM_CERTIFICATE_NEAR_EXPIRATION
<b>Meaning</b>	SSL certificates are expiring within the number of days denoted by the CLDB setting <code>cldb.ssl.cert.expiring.alarm.days</code> . See <a href="#">cldb.conf</a> on page 2976 for more information.
<b>Resolution</b>	Renew the SSL certificates. See <a href="#">Importing a Certificate Authority Signed (CA Signed) SSL Certificate Into a MapR Cluster</a> for more information.
<b>Configuration</b>	None.
<b>Specification</b>	This alarm is raised when any of the first ten security certificates in <code>/opt/mapr/conf/ssl_keystore</code> or in <code>/opt/mapr/conf/ssl_truststore</code> are set to expire within the number of days denoted by the CLDB setting <code>cldb.ssl.cert.expiring.alarm.days</code> .

Once the alarm is raised, the administrator needs to find out the certificates that are expiring, and renew them.

To find out the certificates that are expiring, use the `/opt/mapr/server/getSSLExpiryCerts.py` Python script. For example:

```
python /opt/mapr/server/
getSSLExpiryCerts.py -print
    Below certificates
    expiring in the next 120 days
    Truststore:
        Alias: 100day valid
until: Mon Jul 13 04:04:15 PDT 2020
        Alias: 65day valid
until: Mon Jun 08 03:45:44 PDT 2020
        Alias: 70day valid
until: Sat Jun 13 03:46:00 PDT 2020
        Alias: 80day valid
until: Tue Jun 23 03:46:14 PDT 2020
        Alias: 90day valid
until: Fri Jul 03 04:03:57 PDT 2020
    Keystore:
        Alias: 3daymay17 valid
until: Thu May 21 04:20:26 PDT 2020
```

### Related reference

[cldb.conf](#) on page 2976

Contains the configuration for CLDB nodes.

### Node Too Many Containers

#### UI Column

Too Many Containers Alarm

#### Logged As

NODE\_ALARM\_TOO\_MANY\_CONTAINERS

#### Meaning

Number of containers on this node reached the maximum limit.

#### Resolution

Delete unused volumes or Snapshots. You can reset the maximum with:

```
maprcli config save -values
{"pernode.numcntrs.alarm.thr": "<number>"
}
```

#### Configuration

Configurable at cluster level.

This alarm is also raised when total number of containers (including snap containers) exceed 10 times the value of `pernode.numcntrs.alarm.thr`.

See [Configuring the Alarm Threshold Using the CLI](#) on page 1081 for more information.

### PAM Misconfigured Alarm

#### UI Column

Pam Misconfigured Alarm

#### Logged As

NODE\_ALARM\_PAM\_MISCONFIGURED

<b>Meaning</b>	The PAM authentication on the node is configured incorrectly.
<b>Resolution</b>	See <a href="#">PAM Configuration</a> .
<b>ResourceManager Alarm</b>	
<b>UI Column</b>	ResourceManager Alarm
<b>Logged As</b>	NODE_ALARM_SERVICE_RESOURCEMANAGER_DOWN
<b>Meaning</b>	The ResourceManager service on the node has stopped running.
<b>Resolution</b>	<p>Go to the <a href="#">node information page</a> or the <b>Services</b> page in the Control System to check whether ResourceManager is running. Warden will try three times to restart the service automatically ever 30 minutes (by default). This 30 minute interval can be reconfigured using the parameter <code>services.retryinterval.time.sec</code> in the <code>warden.conf</code> on page 2997 file.</p> <p>If warden successfully restarts the ResourceManager, the alarm is cleared. If warden is unable to restart the ResourceManager, see <a href="#">more troubleshooting information</a>.</p>
<b>Root Partition Full Alarm</b>	
<b>UI Column</b>	Root Partition Full
<b>Logged As</b>	NODE_ALARM_ROOT_PARTITION_FULL
<b>Meaning</b>	The root partition (/) on the node is running out of space (99% full).
<b>Resolution</b>	Free up some space in the root partition of the node.
<b>Tiny Buckets Flush Alarm</b>	
<b>UI Column</b>	Lot of Tiny Buckets Flushed
<b>Logged As</b>	NODE_ALARM_TINY_BUCKET_FLUSH
<b>Meaning</b>	Indicates lot of small buckets (<= 8mb) are getting flushed in DB resulting in performance degradation. You may see put operation performance going down during this phase and will need to take corrective actions to fix it. This will not bring down the cluster and data is still accessible.
<b>Resolution</b>	Increase memory for file system as number of active tablets is very high.
<b>Time Skew Alarm</b>	
<b>UI Column</b>	Time Skew Alarm
<b>Logged As</b>	NODE_ALARM_TIME_SKEW
<b>Meaning</b>	The clock on the node is out of sync with the master CLDB by more than 20 seconds.

<b>Resolution</b>	Use NTP to synchronize the time on all the nodes in the cluster.
<b>Version Alarm</b>	
<b>UI Column</b>	Version Alarm
<b>Logged As</b>	NODE_ALARM_VERSION_MISMATCH
<b>Meaning</b>	One or more services on the node are running an unexpected version or there is a mismatch in the file system patch versions on the nodes.
<b>Resolution</b>	Stop the node, Restore the correct version of any services you have modified, and re-start the node. See <a href="#">Administering Nodes</a> on page 1095.
<b>WebServer Service Alarm</b>	
<b>UI Column</b>	Webserver Alarm
<b>Logged As</b>	NODE_ALARM_SERVICE_WEBSERVER_DOWN
<b>Meaning</b>	The WebServer service on the node has stopped running.
<b>Resolution</b>	Go to the <a href="#">node information page</a> or the <b>Services</b> page in the Control System to check whether the WebServer service is running. The warden will try three times to restart the service automatically. After an interval (30 minutes by default) the warden will again try three times to restart the service. The interval can be configured using the parameter <code>services.retryinterval.time.sec</code> in <code>warden.conf</code> on page 2997. If the warden successfully restarts the WebServer service, the alarm is cleared. If the warden is unable to restart the WebServer service, see <a href="#">more troubleshooting information</a> .

### Table-Replication Alarms

You can view table-replication alarms using the Control System and the CLI. See [Viewing Active Table Replication Alarms](#) on page 1686 for more information.

#### Table Replication Errors

Explains the alarm that is raised when there are table replication errors.

<b>Logged As</b>	VOLUME_ALARM_TABLE_REPL_ERROR
<b>Meaning</b>	This alarm displays the paths and names of the source tables for which the alarms were issued. Up to ten (10) source tables, that have encountered an error, are displayed.

### Diagnostics

To identify the cause of the alarm, run the `maprcli table replica list` command. This command displays an `errors` field with additional information about the error.

```
maprcli table replica list -path <table path>
```

The `errors` field provides the following information:

- Code - table replication error code:
- Host - host that the error occurred on
- Msg - error message information

For additional information about possible causes of the error, see the following log files (located in the `/opt/mapr/logs` directory):

- `mfs.log-5` - for the nameserver node of the source table
- `mfs.log-5` - for the nameserver node of the destination table
- `gateway.log`

### Error Conditions

Possible Error Conditions	Description
A missing table or column family on the destination cluster	If a column family no longer exists in the replica, pause replication with the <code>maprcli table replica pause</code> command, recreate the column family with the <code>maprcli table cf createcommand</code> , run the CopyTable utility to copy data from the source table into the column family, and then resume replication with the <code>maprcli table replica resume</code> command.
A mismatch in column family names for the table on the destination cluster	If the column family still exists in the replica but the name of the column family was changed, run the <code>maprcli table cf edit</code> command with the parameter <code>-newcfname</code> set to the correct name. Replication will resume automatically.
Unreachable gateways on the destination cluster	This error occurs only if none of the gateways on the cluster are reachable.
Autosetup with directcopy has failed while copying data from the source to the replica	This error could be raised under the following conditions: <ul style="list-style-type: none"> <li>• If this error occurs due to a connection failure, this alarm should get resolved once the connection is restored.</li> <li>• If this error occurs due to other error conditions such as missing tables, mis-matched column families, or an unreachable gateway, the error condition may not get resolved on its own and may need administration action. For example, if a PUT operation fails on destination cluster due to an Out-Of-Space condition, the administrator will need to add more storage before the PUT retry succeeds.</li> </ul>

### Table Replication Lag High

**Logged As**

VOLUME\_ALARM\_TABLE\_REPL\_LAG\_HIGH

**Meaning**

These alarms display the paths and names of the source tables for which the replication lag is high. High lag times might be caused by these conditions:

- High load on the source or replica

- Low network bandwidth between the source and replicas
- Miscellaneous error conditions that prevent replication from proceeding
- Replication explicitly paused on the source cluster

**Configuration**

Configurable at the volume level. See [volume create](#) on page 2592 for more information.

**Table Replication Asynchronous****Logged As**

VOLUME\_ALARM\_TABLE\_REPL\_ASYNC

**Meaning**

These alarms display the pathnames of the source tables that are involved.

If HPE Ezmeral Data Fabric Database is replicating synchronously and it judges the latency of the replication stream to be too high, it will switch to asynchronous replication temporarily.

After a new gateway is created, an existing gateway is restarted, or after latency is sufficiently reduced, HPE Ezmeral Data Fabric Database switches the mode of replication back to synchronous.

You can also check whether a source table is being replicated synchronously or asynchronously by running the command [table replica list](#) on page 2517.

**Elasticsearch Formatting Alarm****Logged As**

NODE\_ALARM\_SERVICE\_ELASTICSEARCH\_EXCP

**Meaning**

The put of primary table cannot be converted/formatted for pushing to Elasticsearch. If the primary table has Elasticsearch as one of its replicas, that may miss updates on some rows as they could not be converted to a supported format for Elasticsearch.

**Resolution**

Check for rows that could not be formatted for pushing to Elasticsearch in file system logs and insert row with data that can be pushed to Elasticsearch.

**Secondary Index Alarms**

Secondary index alarms indicate issues that HPE Ezmeral Data Fabric Database might encounter while updating secondary indexes. It is important that you understand what the alarms indicate, and how to resolve the issue causing them.

**Secondary Index Update Lag High****Logged As**

VOLUME\_ALARM\_TABLE\_INDEX\_LAG\_HIGH

**Meaning**

This alarm displays the paths and names of the source tables for which replication lag is high. High lag times might be caused by these conditions:

- High load on the source or replica

- Low network bandwidth between the source and replicas
- Miscellaneous error conditions that prevent replication from proceeding
- Replication explicitly paused on the source cluster

**Resolution**

If you have configured the threshold for this alarm too low, you can increase the threshold. You configure this lag at the volume level by specifying the `dbindexlagsecalarmthresh` parameter. See [volume modify](#) on page 2681 for more information.

**Secondary Index Update Error****Logged As**

VOLUME\_ALARM\_TABLE\_INDEX\_ERROR

**Meaning**

This alarm occurs if the JSON table regions cannot connect to any of the internal gateways used to update fields in a secondary index. This might be caused by these conditions:

- The replication gateway failed.
- You have configured too few replication gateway instances.

**Resolution**

If the gateway failed, restart it. Otherwise, add more gateways. See [Managing Gateways](#) on page 1523 for further information.

**Secondary Index Encoding Error****Logged As**

VOLUME\_ALARM\_TABLE\_INDEX\_ENCODING\_ERROR

**Meaning**

This alarm occurs when any of the following encoding errors occur during index updates:

- The indexed rowkey size is too big (> 32 Kb).
- The indexed field contains a CAST function, and a failure occurs evaluating the CAST function.

**Resolution**

You must either correct your underlying data or redefine the index to avoid missing rows. See [Troubleshooting Secondary Index Encoding Errors](#) on page 1463 for details about how to identify these errors and possible corrective actions.

You also must manually [clear this alarm](#), even if you drop the index or the table.

**Volume Alarms**

Volume alarms indicate problems in individual volumes. The following sections describe the data-fabric volume alarms.

**Compaction Failed****UI Column**

Volume Compaction Failed

<b>Logged As</b>	VOLUME_ALARM_COMPACTON_FAILURE
<b>Meaning</b>	Data could not be purged as the compactor did not complete the run.
<b>Resolution</b>	Wait for the compactor to run again or manually trigger the compactor using the <a href="#">volume compact</a> on page 2588 command.
<b>Compaction Skipped Large Container Volume Alarm</b>	
Compaction is skipped due to large container with garbage below the garbage threshold in the container.	
<b>Label for Alarm on MCS UI</b>	Compaction Skipped Large Container
<b>Text for Alarm on Log File</b>	VOLUME_ALARM_COMPACTON_SKIPPED_LARGE_CONTAINER
<b>Meaning</b>	<p>Compaction has been skipped for the container because container size is large, but the amount of garbage to be reclaimed from the container is not large enough. When the amount of garbage to reclaim is less than the value specified for <code>mastgateway.ctc.opt.largenuminodes.threshmb</code> (default is 2GB), compaction is skipped. Refer to <a href="#">Data Compaction and Recall Criteria</a> on page 515 for details on data compaction and recall criteria.</p> <p>Compaction is skipped for some large containers having garbage beyond configured threshold. This happens when the value of the configuration variable, <code>mastgateway.ctc.opt.largenuminodes.skipqualifiedctrs.enabled</code>, is set to 1.</p> <p> <b>NOTE:</b> Refer to <a href="#">config</a> on page 2095 for the detailed description of the configuration variables.</p>
<b>Resolution</b>	<p>Use one of the following ways as suitable.</p> <ul style="list-style-type: none"> <li>• Increase the garbage threshold high enough so that when compaction runs, the actual amount of garbage goes below this higher threshold. The variable, <code>mastgateway.ctc.opt.largenuminodes.threshmb</code>, represents the garbage threshold.</li> <li>• Run compaction manually with a lower overhead threshold. This causes compactor to free up more space. However, this option causes compaction to run longer. Default overhead threshold is 30%. Refer to <a href="#">Running the Compactor Using the CLI and REST API</a> on page 1256 for details on running compaction manually.</li> </ul> <p>The alarm goes away when compaction frees up enough space in the container. The alarm continues to display if the garbage in the container after compaction is above the garbage threshold.</p>
<b>Data Unavailable</b>	
<b>UI Column</b>	Data Alarm
<b>Logged As</b>	VOLUME_ALARM_DATA_UNAVAILABLE

<b>Meaning</b>	This is a potentially very serious alarm that may indicate data loss. Some of the data on the volume cannot be located. This alarm indicates that enough nodes have failed to bring the replication factor of part or all of the volume to zero. For example, if the volume is stored on a single node and has a replication factor of one, the Data Unavailable alarm will be raised if that volume fails or is taken out of service unexpectedly. If a volume is replicated properly (and therefore is stored on multiple nodes) then the Data Unavailable alarm can indicate that a significant number of nodes is down.
<b>Resolution</b>	Investigate any nodes that have failed or are out of service. <ul style="list-style-type: none"> <li>You can see which nodes have failed by looking at the <a href="#">Node Health</a> pane in the <b>Overview</b> page in the Control System.</li> <li>Check the cluster(s) for any snapshots or mirrors that can be used to re-create the volume.</li> </ul> For additional troubleshooting information, see <a href="#">how to handle this alarm</a> .

**Data Under-Replicated**

Describe the alarm that is triggered when a volume is under replicated.

<b>UI Column</b>	Replication Alarm
<b>Logged As</b>	VOLUME_ALARM_DATA_UNDER_REPLICATED
<b>Meaning</b>	The volume replication factor is lower than the desired replication factor set for the volume. This can be caused by failing disks or nodes, or the cluster may be running out of storage space.
<b>Resolution</b>	Investigate any nodes that are failing. You can see which nodes have failed by looking at the <a href="#">Node Health</a> pane in the <b>Overview</b> page on the Control System. Determine whether it is necessary to add disks or nodes to the cluster. This alarm is generally raised when the nodes that store the volumes or replicas have not sent a heartbeat for five minutes. To prevent re-replication during normal maintenance procedures, Data Fabric waits a specified interval (by default, one hour) before considering the node dead and re-replicating its data. You can control this interval by setting the <code>cldb.fs.mark.rereplicate.sec</code> parameter using the <code>config save</code> command. For additional troubleshooting information, see <a href="#">how to handle this alarm</a> .

**Warm-Tier Data Node Down**

Provides the resolution for the Warm-Tier Data Node Down alarm.

<b>UI Column</b>	Warm-Tier Data Node Down
<b>Logged As</b>	VOLUME_ALARM_DEGRADED_EC_STRIPES
<b>Meaning</b>	One of the nodes or SPs, on which either the data or parity fragments associated with the tiering enabled volume resides, is offline or down.

<b>Resolution</b>	Data Fabric tolerates failure of nodes equal to the number of parity fragments. However, to ensure the availability of data, add nodes to the topology or cluster.
<b>Data Under-Encoded</b>	
<b>UI Column</b>	Volume Data Under-Encoded
<b>Logged As</b>	VOLUME_ALARM_CRITICALLY_DEGRADED_EC_S TRIPES
<b>Meaning</b>	The number of nodes that are down is equal to the number of parity fragments.
<b>Resolution</b>	Data Fabric tolerates failure of nodes equal to the number of parity fragments. However, to ensure the availability of data, add nodes to the topology or cluster.
<b>Data Below-Parity</b>	
<b>UI Column</b>	Volume Data Below-Parity
<b>Logged As</b>	VOLUME_ALARM_EC_DATA_UNAVAILABLE
<b>Meaning</b>	The number of SPs or nodes that are offline or down exceed the number of parity fragments set for the tiering-enabled volume. MapR only tolerates failure of nodes equal to the number of parity fragments set for the tiering-enabled volume.
<b>Resolution</b>	Add more nodes to the topology or cluster.
<b>Offload/Recall Failed</b>	
<b>UI Column</b>	Volume Offload/Recall Failed
<b>Logged As</b>	VOLUME_ALARM_OFFLOAD_RECALL_FAILURE
<b>Meaning</b>	The volume data could not be offloaded or could not be recalled.
<b>Resolution</b>	Check the log file for more information on the error. For some errors, CLDB tries to offload the data again after a brief wait. For more information, see <a href="#">Retrying Failed Operation</a> on page 1253.
<b>Inodes Limit Exceeded</b>	
<b>UI Column</b>	Inodes Exceeded Alarm
<b>Logged As</b>	VOLUME_ALARM_INODES_EXCEEDED
<b>Meaning</b>	The volume contains too many files or the size of the namespace container size has exceeded the configured limit.
<b>Resolution</b>	This alarm indicates that not enough volumes are set up to handle the number of files stored in the cluster or the size of the name container exceeds the limit. Typically, each user or project should have

	a separate volume. To resolve the name container issue, investigate the cause for the alarm. After careful consideration, create one or more volumes and move data into the new volumes.
	See <a href="#">How to handle the VOLUME_ALARM_INODES_EXCEEDED alarm in MapR</a> for more information on resolving this alarm.
<b>Configuration</b>	Configurable at cluster and volume level. See <a href="#">Configuring the Alarm Threshold Using the CLI</a> on page 1081 for more information.
<b>Large Row</b>	
<b>UI Label</b>	Large Row
<b>Logged As</b>	VOLUME_ALARM_TABLE_LARGE_ROW_WARNING
<b>Meaning</b>	A row in a table within the specified volume has reached 75% of the maximum supported row size of 2 GB. The alarm provides the rowkey and the name of the table. If the rowsize exceeds 2 GB, subsequent HPE Ezmeral Data Fabric Database operations on the corresponding table region will fail with an I/O error.
<b>Resolution</b>	<p>Ensure that client applications that access the table are managing row data correctly, so that no row exceeds 2 GB. The method of resolving the alarm depends on the way in which client applications were managing row data.</p> <p>For example, if client applications allowed too many versions of cell data, delete excess versions. If client applications neglected to remove old columns or column families, remove those manually.</p>
<b>Mirror Failure</b>	
<b>UI Column</b>	Mirror Alarm
<b>Logged As</b>	VOLUME_ALARM_MIRROR_FAILURE
<b>Meaning</b>	A mirror operation failed.
<b>Resolution</b>	Make sure the CLDB is running on both the source cluster and the destination cluster. Look at the CLDB log ( <code>/opt/mapr/logs/cldb.log</code> ) and the MapR filesystem log ( <code>/opt/mapr/logs/mfs.log</code> ) on both clusters for more information. If the attempted mirror operation was between two clusters, make sure that both clusters are reachable over the network. Make sure the source volume is available and reachable from the cluster that is performing the mirror operation. For more troubleshooting information, see <a href="#">how to handle this alarm</a> .
<b>No Nodes in Topology</b>	
<b>UI Column</b>	No Nodes in Vol Topo
<b>Logged As</b>	VOLUME_ALARM_NO_NODES_IN_TOPOLOGY

<b>Meaning</b>	The path specified in the volume's topology no longer corresponds to a physical topology that contains any nodes, either due to node failures or changes to node topology settings. While this alarm is raised, MapR places data for the volume on nodes outside the volume's topology to prevent write failures.
<b>Resolution</b>	Add nodes to the specified volume topology, either by moving existing nodes or adding nodes to the cluster. See <a href="#">Understanding Topology</a> on page 487.

**Snapshot Failure**

<b>UI Column</b>	Snapshot Alarm
<b>Logged As</b>	VOLUME_ALARM_SNAPSHOT_FAILURE
<b>Meaning</b>	A snapshot operation failed.
<b>Resolution</b>	Make sure the CLDB is running. Look at the CLDB log ( <code>/opt/mapr/logs/cldb.log</code> ) and the Data Fabric file system log ( <code>/opt/mapr/logs/mfs.log</code> ) on both clusters for more information. If the attempted snapshot was a scheduled snapshot that was running in the background, try a manual snapshot. For more troubleshooting information, see <a href="#">how to handle thi alarm</a> .

**Snapshot Restore Failure**

Describes the alarm that is triggered when the Snapshot Restore operation fails repeatedly.

<b>UI Column</b>	Snapshot Restore Failure Alarm
<b>Logged As</b>	VOLUME_ALARM_SNAPRESTORE_MAXRETRIES_EXCEEDED
<b>Meaning</b>	The snapshot restore operation failed and is retried for more than five (5) times for a single container.
<b>Resolution</b>	View MFS and CLDB logs to determine the cause of failure. Ensure that the master containers for all nodes are up and running.

**Related concepts**

[Restoring a Volume From a Snapshot](#) on page 517

Provides a synopsis of restoring a volume from a snapshot. Describes the implications, and the prerequisites.

**Topology Almost Full**

<b>UI Column</b>	Vol Topo Almost Full
<b>Logged As</b>	VOLUME_ALARM_TOPOLOGY_ALMOST_FULL
<b>Meaning</b>	The nodes in the specified topology are running out of storage space.
<b>Resolution</b>	Move volumes to another topology, enlarge the specified topology by adding more nodes, or add disks to the nodes in the specified topology.

**Configuration** Configurable at cluster level. See [Configuring the Alarm Threshold Using the CLI](#) on page 1081 for more information.

### Label Almost Full

The alarm that is triggered when Storage Pools/Nodes with the specified label are running out of space.

**UI Column** Vol Label Almost Full

**Logged As** VOLUME\_ALARM\_LABEL\_ALMOST\_FULL

**Meaning** The free storage space on Storage Pools/Nodes with the specified label is lesser than the threshold value. This can disrupt creation/replication of containers with the specified label.

**Resolution** Move volumes to another topology with sufficient free storage space on nodes with the specified label, enlarge the current topology by adding more nodes with the specified label, or add disks with the specified label to the nodes in the current topology.

**Configuration** Configurable at cluster level. See [Configuring the VOLUME\\_ALARM\\_LABEL\\_ALMOST\\_FULL alarm](#) for more information.

### Topology Full Alarm

**UI Column** Vol Topo Full

**Logged As** VOLUME\_ALARM\_TOPOLOGY\_FULL

**Meaning** The nodes in the specified topology have out of storage space.

**Resolution** Move volumes to another topology, enlarge the specified topology by adding more nodes, or add disks to the nodes in the specified topology.

### Label Full Alarm

The alarm that is triggered when Storage Pools/Nodes with the specified label are completely out of space.

**UI Column** Vol Label Full

**Logged As** VOLUME\_ALARM\_LABEL\_FULL

**Meaning** There is no more free storage space on Storage Pools/Nodes with the specified label. This will definitely disrupt creation/replication of containers with the specified label.

**Resolution** Move volumes to another topology with sufficient free storage space on nodes with the specified label, enlarge the current topology by adding more nodes with the specified label, or add disks with the specified label to the nodes in the current topology.

**NOTE:** There is a [Label Almost Full](#) on page 3035 alarm that is raised when the available storage space goes below the configured threshold.

### Volume Advisory Quota Alarm

<b>UI Column</b>	Vol Advisory Quota Alarm
<b>Logged As</b>	VOLUME_ALARM_ADVISORY_QUOTA_EXCEEDED
<b>Meaning</b>	A volume has exceeded its advisory quota.
<b>Resolution</b>	No immediate action is required. To avoid exceeding the hard quota, clear space on the volume or stop further data writes.
<b>Configuration</b>	Configurable in volume properties. See <a href="#">Configuring the Alarm Threshold Using the CLI</a> on page 1081 for more information.
<b>Volume Become Master Stuck</b>	
<b>UI Column</b>	VOLUME BECOME MASTER STUCK
<b>Logged As</b>	VOLUME_ALARM_BECOME_MASTER_STUCK
<b>Meaning</b>	This means that there are some containers (associated with the volume) that don't have Master role. The alarm description displays the containers on which Master role is not assigned.
<b>Resolution</b>	Run <code>dump containerinfo</code> on page 2143 command to determine the node on which role is not assigned and restart that node. If you see the alarm after the node is restarted, contact HPE support.
<b>Volume CGs Violating Reliability Alarm</b>	
<b>UI Column</b>	Vol CGs Violating Reliability Alarm
<b>Logged As</b>	VOLUME_ALARM_CGS_VIOLATING_RACK_RELIABILITY
<b>Meaning</b>	A volume has violated rack reliability constraints. This alarm is raised after more parity containers of a CG are allocated and located in a rack of the volume ectopology. This might occur when nodes in the backend EC volume are moved across racks of ectopology.
<b>Resolution</b>	CGs are properly moved to another rack. The software triggers internal actions that move CG containers across racks to ensure that they conform to <code>honorrackreliability</code> requirements. After required containers are moved, the software clears the alarm.
<b>Configuration</b>	Configurable in volume properties. See the <code>honorrackreliability ec rack reliability</code> parameter in <a href="#">Volume Modify</a> or <a href="#">volume create</a> on page 2592 for more information.
<b>Volume with Non-Local Containers</b>	
<b>UI Column</b>	Local Volume containers non-local
<b>Logged As</b>	VOLUME_ALARM_DATA_CONTAINERS_NONLOCAL
<b>Meaning</b>	This is a local volume and its containers should all reside on the same node. Some containers

were created on another node, which may cause performance issues in MapReduce applications.

**Resolution**

Recreate the local volume or review information on [how to handle this alarm](#).

**Volume Quota Alarm****UI Column**

Vol Quota Alarm

**Logged As**

VOLUME\_ALARM\_QUOTA\_EXCEEDED

**Meaning**

A volume has exceeded its quota. Further writes to the volume will fail.

**Resolution**

Free some space on the volume or increase the volume hard quota.

**Configuration**

Configurable in volume properties. See [Configuring the Alarm Threshold Using the CLI](#) on page 1081 for more information.

**HPE Ezmeral Data Fabric Environment**

This section provides information associated with the Data Fabric environment.

**HPE Ezmeral Data Fabric Parameters**

Describes Data Fabric parameters and their default values.

The following table lists user-configurable parameters and their default values. These default values reflect those in the default configuration files, plus any overrides shipped out-of-the-box in `core-site.xml`, `mapred-site.xml` or other configuration files. You can override these values by editing or adding them in `mapred-site.xml` or `core-site.xml` using the `-D` option to the `hadoop jar` command whenever you submit a job or set values explicitly in your code.

Parameter	Default
fs.mapr.bailout.on.library.mismatch	true
fs.mapr.bind.retries	false
fs.mapr.working.dir	
fs.maprfs.impl	
fs.ramfs.impl	
fs.s3.block.size	33554432
fs.s3.blockSize	33554432
fs.s3.buffer.dir	
fs.s3.impl	
fs.s3.maxRetries	4
fs.s3.sleepTimeSeconds	10
fs.s3n.block.size	33554432
fs.s3n.blockSize	33554432
fs.s3n.impl	
fs.trash.interval	0

Parameter	Default
hadoop.logfile.count	10
hadoop.logfile.size	10000000
hadoop.native.lib	TRUE
hadoop.proxyuser.root.groups	root
hadoop.proxyuser.root.hosts	
hadoop.rpc.socket.factory.class.default	
hadoop.security.authentication	simple
hadoop.security.authorization	FALSE
hadoop.security.group.mapping	
hadoop.security.uid.cache.secs	14400
hadoop.tmp.dir	
hadoop.util.hash.type	murmur
hadoop.workaround.non.threadsafe.getpwuid	FALSE
io.bytes.per.checksum	512
io.compression.codecs	
io.file.buffer.size	8192
io.mapfile.bloom.error.rate	0.005
io.mapfile.bloom.size	1048576
io.serializations	
io.skip.checksum.errors	FALSE
io.sort.factor	256
io.sort.mb	380
io.sort.record.percent	0.17
io.sort.spill.percent	0.99
ipc.client.connect.max.retries	10
ipc.client.connection.maxidletime	10000
ipc.client.idlethreshold	4000
ipc.client.kill.max	10
ipc.client.max.connection.setup.timeout	20
ipc.client.tcpcnodelay	TRUE
ipc.server.listen.queue.size	128
ipc.server.tcpcnodelay	TRUE
job.end.retry.interval	30000
jobclient.completion.poll.interval	5000
jobclient.output.filter	FAILED
jobclient.progress.monitor.poll.interval	1000

Parameter	Default
keep.failed.task.files	FALSE
local.cache.size	1.07E+10
map.sort.class	
mapr.centrallog.dir	logs
mapr.localoutput.dir	output
mapr.localspill.dir	spill
mapr.localvolumes.path	
mapr.map.keyprefix.ints	1
mapr.task.diagnostics.enabled	FALSE
mapreduce.heartbeat.10	300
mapreduce.heartbeat.100	1000
mapreduce.heartbeat.1000	10000
mapreduce.job.complete.cancel.delegation.tokens	TRUE
mapreduce.maprfs.use.compression	TRUE
mapreduce.reduce.input.limit	-1
mapreduce.task.classpath.user.precedence	FALSE
maprfs.openfid2.prefetch.bytes	0
tasktracker.http.threads	2
topology.node.switch.mapping.impl	

### Default HPE Ezmeral Data Fabric Configurations

Lists sources from which default Data Fabric configuration parameters are derived.

The default values for configuration parameters can come from various sources:

- marpred-default.xml
- core-default.xml
- yarn-default.xml
- Data Fabric code
- Hadoop code

The topics in this section include the default values for each parameter and the source of the default.

**NOTE:** For each parameter, an entry in the <name>-site.xml file overrides the default.

### Default Core Parameters

Property	Description
dfs.bytes-per-checksum	Default value: 512 Default source: code

dfs.ha.fencing.ssh.connect-timeout	Default value: 30000 Default source: core-default.xml
dfs.namenode.checkpoint.dir	Default value: \${hadoop.tmp.dir}/dfs/secondary Default source: code
dfs.namenode.checkpoint.edits.dir	Default value: \${fs.checkpoint.dir} Default source: code
dfs.namenode.checkpoint.period	Default value: 3600 Default source: code
file.blocksize	Default value: 67108864 Default source: core-default.xml
file.bytes-per-checksum	Default value: 512 Default source: core-default.xml
file.client-write-packet-size	Default value: 65536 Default source: core-default.xml
file.replication	Default value: 1 Default source: core-default.xml
file.stream-buffer-size	Default value: 4096 Default source: core-default.xml
fs.AbstractFileSystem.file.impl	Default value: org.apache.hadoop.fs.local.LocalFs Default source: core-default.xml
fs.AbstractFileSystem.ftp.impl	Default value: org.apache.hadoop.fs.ftp.FtpFs Default source: core-default.xml
fs.AbstractFileSystem.har.impl	Default value: org.apache.hadoop.fs.HarFs Default source: core-default.xml
fs.AbstractFileSystem.hdfs.impl	Default value: com.mapr.fs.MFS Default source: code
fs.AbstractFileSystem.maprfs.impl	Default value: com.mapr.fs.MFS Default source: code
fs.AbstractFileSystem.viewfs.impl	Default value: org.apache.hadoop.fs.viewfs.ViewFs Default source: core-default.xml
fs.automatic.close	Default value: TRUE Default source: core-default.xml
fs.checkpoint.size	Default value: 67108864 Default source: code

fs.client.resolve.remote.symlinks	Default value: TRUE Default source: core-default.xml
fs.defaultFS	Default value: maprfs:/// Default source: code
fs.df.interval	Default value: 60000 Default source: core-default.xml
fs.du.interval	Default value: 600000 Default source: core-default.xml
fs.file.impl	Default value: org.apache.hadoop.fs.LocalFileSystem Default source: code
fs.ftp.host	Default value: 0.0.0.0 Default source: core-default.xml
fs.ftp.host.port	Default value: 21 Default source: core-default.xml
fs.ftp.impl	Default value: org.apache.hadoop.fs.ftp.FTPFileSystem Default source: code
fs.har.impl	Default value: org.apache.hadoop.fs.HarFileSystem Default source: code
fs.har.impl.disable.cache	Default value: TRUE Default source: core-default.xml
fs.hdfs.impl	Default value: com.mapr.fs.MapRFileSystem Default source: code
fs.hftp.impl	Default value: org.apache.hadoop.hdfs.HftpFileSystem Default source: code
fs.hsftp.impl	Default value: org.apache.hadoop.hdfs.HsftpFileSystem Default source: code
fs.kfs.impl	Default value: org.apache.hadoop.fs.kfs.KosmosFileSystem Default source: code
fs.mapr.flush.unaligned	Default value: false Default source: code
fs.mapr.rathreads	Default value: 0 Default source: code
fs.mapr.working.dir	Default value: /user/\$USERNAME/ Default source: code

fs.mapr.write.idleflush.timeout	Default value: 3 seconds Default source: code
fs.maprfs.impl	Default value: com.mapr.fs.MapRFileSystem Default source: code
fs.permissions.umask-mode	Default value: 22 Default source: core-default.xml
fs.ramfs.impl	Default value: org.apache.hadoop.fs.InMemoryFileSystem Default source: code
fs.s3.block.size	Default value: 33554432 Default source: code
fs.s3.blockSize	Default value: 33554432 Default source: code
fs.s3.buffer.dir	Default value: \${hadoop.tmp.dir}/s3 Default source: core-default.xml
fs.s3.impl	Default value: org.apache.hadoop.fs.s3native.NativeS3FileSystem Default source: code
fs.s3.maxRetries	Default value: 4 Default source: core-default.xml
fs.s3.sleepTimeSeconds	Default value: 10 Default source: core-default.xml
fs.s3a.attempts.maximum	Default value: 10 Default source: core-default.xml
fs.s3a.buffer.dir	Default value: \${hadoop.tmp.dir}/s3a Default source: core-default.xml
fs.s3a.connection.establish.timeout	Default value: 5000 Default source: core-default.xml
fs.s3a.connection.maximum	Default value: 15 Default source: core-default.xml
fs.s3a.connection.ssl.enabled	Default value: TRUE Default source: core-default.xml
fs.s3a.connection.timeout	Default value: 50000 Default source: core-default.xml
fs.s3a.fast.buffer.size	Default value: 1048576 Default source: core-default.xml

fs.s3a.fast.upload	Default value: FALSE Default source: core-default.xml
fs.s3a.impl	Default value: org.apache.hadoop.fs.s3a.S3AFileSystem Default source: core-default.xml
fs.s3a.max.total.tasks	Default value: 1000 Default source: core-default.xml
fs.s3a.multipart.purge	Default value: FALSE Default source: core-default.xml
fs.s3a.multipart.purge.age	Default value: 86400 Default source: core-default.xml
fs.s3a.multipart.size	Default value: 104857600 Default source: core-default.xml
fs.s3a.multipart.threshold	Default value: 2147483647 Default source: core-default.xml
fs.s3a.paging.maximum	Default value: 5000 Default source: core-default.xml
fs.s3a.threads.core	Default value: 15 Default source: core-default.xml
fs.s3a.threads.keepalivetime	Default value: 60 Default source: core-default.xml
fs.s3a.threads.max	Default value: 256 Default source: core-default.xml
fs.s3n.block.size	Default value: 33554432 Default source: code
fs.s3n.blockSize	Default value: 33554432 Default source: code
fs.s3n.impl	Default value: org.apache.hadoop.fs.s3native.NativeS3FileSystem Default source: code
fs.s3n.multipart.copy.block.size	Default value: 5368709120 Default source: core-default.xml
fs.s3n.multipart.uploads.block.size	Default value: 67108864 Default source: core-default.xml
fs.s3n.multipart.uploads.enabled	Default value: FALSE Default source: core-default.xml

fs.swift.impl	Default value: org.apache.hadoop.fs.swift.snative.SwiftNativeFileSystem Default source: core-default.xml
fs.webhdfs.impl	Default value: org.apache.hadoop.hdfs.web.WebHdfsFileSystem Default source: code
ftp.blocksize	Default value: 67108864 Default source: core-default.xml
ftp.bytes-per-checksum	Default value: 512 Default source: core-default.xml
ftp.client-write-packet-size	Default value: 65536 Default source: core-default.xml
ftp.replication	Default value: 3 Default source: core-default.xml
ftp.stream-buffer-size	Default value: 4096 Default source: core-default.xml
ha.failover-controller.cli-check.rpc-timeout.ms	Default value: 20000 Default source: core-default.xml
ha.failover-controller.graceful-fence.connection.retries	Default value: 1 Default source: core-default.xml
ha.failover-controller.graceful-fence.rpc-timeout.ms	Default value: 5000 Default source: core-default.xml

io.seqfile.lazyldecompress	Default value: TRUE Default source: core-default.xml
io.seqfile.local.dir	Default value: \${hadoop.tmp.dir}/io/local Default source: core-default.xml
io.seqfile.sorter.recordlimit	Default value: 1000000 Default source: core-default.xml

io.serializations	Default value: org.apache.hadoop.io.serializer.WritableSerialization Default source: code
io.skip.checksum.errors	Default value: FALSE Default source: core-default.xml
ipc.client.connect.max.retries	Default value: 10 Default source: core-default.xml
ipc.client.connect.max.retries.on.timeouts	Default value: 45 Default source: core-default.xml
ipc.client.connect.retry.interval	Default value: 1000 Default source: core-default.xml
ipc.client.connect.timeout	Default value: 20000 Default source: core-default.xml
ipc.client.connection.maxidletime	Default value: 10000 Default source: core-default.xml
ipc.client.fallback-to-simple-auth-allowed	Default value: FALSE Default source: core-default.xml
ipc.client.idlethreshold	Default value: 4000 Default source: core-default.xml
ipc.client.kill.max	Default value: 10 Default source: core-default.xml
ipc.client.max.connection.setup.timeout	Default value: 20 Default source: code
ipc.client.tcpnodelay	Default value: TRUE Default source: code
ipc.server.listen.queue.size	Default value: 128 Default source: core-default.xml
ipc.server.max.connections	Default value: 0 Default source: core-default.xml
ipc.server.tcpnodelay	Default value: TRUE Default source: code
mapr.home	Default value: /opt/mapr Default source: code
mapr.host	Default value: <hostname> Default source: code

mapr.localvolumes.path	Default value: /var/mapr/local Default source: code
mapr.mapred.localvolume.mount.path	Default value: \${mapr.localvolumes.path}/\${mapr.host}/mapred Default source: code
mapr.mapred.localvolume.root.dir.path	Default value: \${mapr.mapred.localvolume.mount.path}/\${mapr.mapred.localvolume.root.dir.name} Default source: code
net.topology.impl	Default value: org.apache.hadoop.net.NetworkTopology Default source: core-default.xml
net.topology.node.switch.mapping.impl	Default value: org.apache.hadoop.net.ScriptBasedMapping Default source: core-default.xml
net.topology.script.number.args	Default value: 100 Default source: core-default.xml
nfs.exports.allowed.hosts	Default value: * rw Default source: core-default.xml
rpc.metrics.quantile.enable	Default value: FALSE Default source: core-default.xml
s3.blocksize	Default value: 67108864 Default source: core-default.xml
s3.bytes-per-checksum	Default value: 512 Default source: core-default.xml
s3.client-write-packet-size	Default value: 65536 Default source: core-default.xml
s3.replication	Default value: 3 Default source: core-default.xml
s3.stream-buffer-size	Default value: 4096 Default source: core-default.xml
s3native.blocksize	Default value: 67108864 Default source: core-default.xml
s3native.bytes-per-checksum	Default value: 512 Default source: core-default.xml
s3native.client-write-packet-size	Default value: 65536 Default source: core-default.xml
s3native.replication	Default value: 3 Default source: core-default.xml

s3native.stream-buffer-size	Default value: 4096 Default source: core-default.xml
tfile.fs.input.buffer.size	Default value: 262144 Default source: core-default.xml
tfile.fs.output.buffer.size	Default value: 262144 Default source: core-default.xml
tfile.io.chunk.size	Default value: 1048576 Default source: core-default.xml

### Default YARN Parameters

Parameter	Description
mapreduce.job.hdfs-servers	Default value: \${fs.defaultFS} Default source: yarn-default.xml
yarn.acl.enable	Indicates whether ACLs are enabled. Default value: FALSE Default source: yarn-default.xml
yarn.admin.acl	ACL of who can be admin of the YARN cluster. Default value: * Default source: yarn-default.xml
yarn.am.liveness-monitor.expiry-interval-ms	The expiry interval for application master reporting. Default value: 600000 Default source: yarn-default.xml
yarn.app.mapreduce.job.update-status-max-retries	The number of job status update retries. Default value: 0 (retried only 1 time) For a value N, the update is retried 1+N times.
yarn.app.mapreduce.job.update-status-retry-interval	The interval in milliseconds for job status update retries. Default value: 2000 (2000 millisecond or 2 seconds delay is observed before each retry attempt)
yarn.client.application-client-protocol.poll-interval-ms	The interval that the yarn client library uses to poll the completion status of the asynchronous API of application client protocol. Default value: 200 Default source: yarn-default.xml

yarn.client.failover-proxy-provider	<p>When HA is enabled, the class to be used by Clients, AMs and NMs to failover to the Active RM. It should extend <code>org.apache.hadoop.yarn.client.RMFailoverProxyProvider</code>.</p> <p>Default value: <code>org.apache.hadoop.yarn.client.ConfiguredRMFailoverProxyProvider</code></p> <p>Default source: <code>yarn-default.xml</code></p> <p>When you configure failover <code>configure.sh</code> may change the default value by adding a value for this parameter in <code>yarn-site.xml</code>. For more information, see <a href="#">ResourceManager Configuration Properties</a>.</p>
yarn.client.failover-retries	<p>When HA is enabled, the number of retries per attempt to connect to a ResourceManager. In other words, it is the <code>ipc.client.connect.max.retries</code> to be used during failover attempts.</p> <p>Default value: 0</p> <p>Default source: <code>yarn-default.xml</code></p>
yarn.client.failover-retries-on-socket-timeouts	<p>When HA is enabled, the number of retries per attempt to connect to a ResourceManager on socket timeouts. In other words, it is the <code>ipc.client.connect.max.retries.on.timeouts</code> to be used during failover attempts.</p> <p>Default value: 0</p> <p>Default source: <code>yarn-default.xml</code></p>
yarn.client.max-nodemanager-proxies	<p>Maximum number of proxy connections for node manager. It should always be more than 1. <code>NMClient</code> and <code>MRAppMaster</code> will use this to cache connection with node manager. There will be at max one connection per node manager. Ex. configuring it to a value of 5 will make sure that client will at max have 5 connections cached with 5 different node managers. These connections will be timed out if idle for more than system wide idle timeout period. The token if used for authentication then it will be used only at connection creation time. If new token is received then earlier connection should be closed in order to use newer token. This and <code>(yarn.client.nodemanager-client-async.thread-pool-max-size)</code> are related and should be sync (no need for them to be equal).</p> <p>Default value: 0</p> <p>Default source: <code>yarn-default.xml</code></p>
yarn.client.nodemanager-client-async.thread-pool-max-size	<p>Max number of threads in <code>NMClientAsync</code> to process container management events.</p> <p>Default value: 500</p> <p>Default source: <code>yarn-default.xml</code></p>
yarn.client.nodemanager-connect.max-wait-ms	<p>Default value: 900000</p> <p>Default source: <code>yarn-default.xml</code></p>
yarn.client.nodemanager-connect.retry-interval-ms	<p>Default value: 10000</p> <p>Default source: <code>yarn-default.xml</code></p>

yarn.dfs-logging.dir-glob	Default value: maprfs:///var/mapr/local/*/logs/yarn/userlogs Default source: Code
yarn.dfs-logging.handler-class	Default value: com.mapr.hadoop.yarn.util.MapRFSLoggingHandler Default source: Code
yarn.external.token.manager	Default value: com.mapr.hadoop.yarn.security.MapRTicketManager Default source: Code
yarn.http.policy	Configures the HTTP endpoint for YARN Daemons. The following values are supported: -HTTP_ONLY : Service is provided only on http -HTTPS_ONLY : Service is provided only on https Default value: HTTP_ONLY Default source: yarn-default.xml
yarn.ipc.rpc.class	RPC class implementation. Default value: org.apache.hadoop.yarn.ipc.HadoopYarnProtoRPC Default source: yarn-default.xml
yarn.log-aggregation.retain-check-interval-seconds	How long to wait between aggregated log retention checks. If set to 0 or a negative value, then the value is computed as one-tenth of the aggregated log retention time. Default value: -1 Default source: yarn-default.xml See <a href="#">YARN Log Aggregation</a> .
yarn.log-aggregation.retain-seconds	How long to keep aggregation logs before deleting them. -1 disables. Default value: 2592000 Default source: code See <a href="#">YARN Log Aggregation</a> .
yarn.log-aggregation-enable	Whether to enable log aggregation. Default value: FALSE Default source: yarn-default.xml See <a href="#">YARN Log Aggregation</a> .
yarn.mapr.ticket.expiration	Default value: 604800000 Default source: code
yarn.nm.liveness-monitor.expiry-interval-ms	How long to wait until a NodeManager is considered dead. Default value: 600000 Default source: yarn-default.xml

yarn.nodemanager.container-localizer.log.level	Configuring container localizer logs Default value: INFO Default source: code
yarn.nodemanager.address	The address of the container manager in the NM. Default value: \${yarn.nodemanager.hostname}:0 Default source: yarn-default.xml
yarn.nodemanager.admin-env	Environment variables that should be forwarded from the NodeManager's environment to the container's environment. Default value: MALLOC_ARENA_MAX=\$MALLOC_ARENA_MAX Default source: yarn-default.xml
yarn.nodemanager.aux-services	The valid service name should only contain a-zA-Z0-9_ and can not start with numbers. Default value: mapreduce_shuffle, mapr_direct_shuffle Default source: code
yarn.nodemanager.aux-services.mapr_direct_shuffle.class	Default value: com.mapr.hadoop.mapred.LocalVolumeAuxService Default source: code
yarn.nodemanager.aux-services.mapreduce_shuffle.class	Default value: org.apache.hadoop.mapred.ShuffleHandler Default source: yarn-default.xml
yarn.nodemanager.check-interval-localizing-container.ms	The frequency at which the ApplicationMaster checks the running time of the localizing container. Specified in milliseconds. Default value: -1 Default source: YarnConfiguration
yarn.nodemanager.container-executor.class	Identifies who will execute (launch) the containers. Default value: org.apache.hadoop.yarn.server.nodemanager.LinuxContainerExecutor Default source: code
yarn.nodemanager.container-manager.thread-count	Number of threads the container manager uses. Default value: 20 Default source: yarn-default.xml
yarn.nodemanager.container-monitor.interval-ms	How often to monitor containers. Default value: 3000 Default source: yarn-default.xml
yarn.nodemanager.container-monitor.procfss-tree.smaps-based-rss.enabled	Default value: FALSE Default source: yarn-default.xml

yarn.nodemanager.delete.debug-delay-sec	<p>Number of seconds after an application finishes before the NodeManager's DeletionService will delete the application's localized file directory and log directory. To diagnose Yarn application problems, set this property's value large enough (for example, to 600 = 10 minutes) to permit examination of these directories. After changing the property's value, you must restart the NodeManager in order for it to have an effect. The roots of Yarn applications' work directories are configurable with the yarn.nodemanager.local-dirs property (see below), and the roots of the Yarn applications' log directories is configurable with the yarn.nodemanager.log-dirs property (see also below).</p> <p>Default value: 0 Default source: yarn-default.xml</p>
yarn.nodemanager.delete.thread-count	<p>Number of threads used in cleanup.</p> <p>Default value: 4 Default source: yarn-default.xml</p>
yarn.nodemanager.disk-health-checker.interval-ms	<p>Frequency of running disk health checker code.</p> <p>Default value: 1200000 Default source: yarn-default.xml</p>
yarn.nodemanager.disk-health-checker.max-disk-utilization-per-disk-percentage	<p>Default value: 90 Default source: yarn-default.xml</p>
yarn.nodemanager.disk-health-checker.min-free-space-per-disk-mb	<p>Default value: 0 Default source: yarn-default.xml</p>
yarn.nodemanager.disk-health-checker.min-healthy-disks	<p>The minimum fraction of number of disks to be healthy for the nodemanager to launch new containers. This correspond to both yarn-nodemanager.local-dirs and yarn.nodemanager.log-dirs. i.e. If there are less number of healthy local-dirs (or log-dirs) available, then new containers will not be launched on this node.</p> <p>Default value: 0.25 Default source: yarn-default.xml</p>
yarn.nodemanager.docker-container-executor.exec-name	<p>Default value: /usr/bin/docker Default source: yarn-default.xml</p>
yarn.nodemanager.env-whitelist	<p>Environment variables that containers may override rather than use NodeManager's default.</p> <p>Default value: JAVA_HOME,HADOOP_COMMON_HOME,HADOOP_HDFS_HOME,HADOOP_CONF_DIR,HADOOP_YARN_HOME</p> <p>Default source: yarn-default.xml</p>
yarn.nodemanager.external.token.localizer	<p>Default value: com.mapr.hadoop.yarn.nodemanager.MapRTicketLocalizer</p> <p>Default source: code</p>

yarn.nodemanager.health-checker.interval-ms	Frequency of running node health script. Default value: 600000 Default source: yarn-default.xml
yarn.nodemanager.health-checker.script.timeout-ms	Script time out period. Default value: 1200000 Default source: yarn-default.xml
yarn.nodemanager.hostname	The hostname of the NM. Default value: 0.0.0.0 Default source: yarn-default.xml
yarn.nodemanager.keytab	Keytab for NM. Default value: /etc/krb5.keytab Default source: yarn-default.xml
yarn.nodemanager.linux-container-executor.cgroups.hierarchy	The cgroups hierarchy under which to place YARN processes (cannot contain commas). If yarn.nodemanager.linux-container-executor.cgroups.mount is false (that is, if cgroups have been pre-configured), then this cgroups hierarchy must already exist and be writable by the NodeManager user, otherwise the NodeManager may fail. Only used when the LCE resources handler is set to the CgroupsLCEResourcesHandler. Default value: /hadoop-yarn Default source: yarn-default.xml
yarn.nodemanager.linux-container-executor.cgroups.mount	Whether the LCE should attempt to mount cgroups if not found. Only used when the LCE resources handler is set to the CgroupsLCEResourcesHandler. Default value: false Default source: yarn-default.xml
yarn.nodemanager.linux-container-executor.cgroups.strict-resource-usage	Default value: FALSE Default source: yarn-default.xml
yarn.nodemanager.linux-container-executor.nonsecure-mode.limit-users	Default value: TRUE Default source: yarn-default.xml
yarn.nodemanager.linux-container-executor.nonsecure-mode.local-user	Default value: nobody Default source: yarn-default.xml
yarn.nodemanager.linux-container-executor.nonsecure-mode.user-pattern	The allowed pattern for UNIX user names enforced by Linux-container-executor when used in nonsecure mode (use case for this is using cgroups). The default value is taken from /usr/sbin/adduser. Default value: ^[_A-Za-z0-9][-_A-Za-z0-9]{0,255}?[!\$]? Default source: yarn-default.xml

yarn.nodemanager.linux-container-executor.resources-handler.class	<p>The class which should help the LCE handle resources.</p> <p>Default value: org.apache.hadoop.yarn.server.nodemanager.util.DefaultLCEResourcesHandler</p> <p>Default source: yarn-default.xml</p>
yarn.nodemanager.local-cache.max-files-per-directory	<p>It limits the maximum number of files which will be localized in a single local directory. If the limit is reached then sub-directories will be created and new files will be localized in them. If it is set to a value less than or equal to 36 [which are sub-directories (0-9 and then a-z)] then NodeManager will fail to start. For example; [for public cache] if this is configured with a value of 40 ( 4 files + 36 sub-directories) and the local-dir is /tmp/local-dir1, then it will allow 4 files to be created directly inside /tmp/local-dir1/filecache. For files that are localized further, it will create a sub-directory "0" inside /tmp/local-dir1/filecache and will localize files inside it until it becomes full. If a file is removed from a sub-directory that is marked full, then that sub-directory will be used back again to localize files.</p> <p>Default value: 8192</p> <p>Default source: yarn-default.xml</p>
yarn.nodemanager.local-dirs	<p>List of directories to store localized files in. An application's localized file directory will be found in: \${yarn.nodemanager.local-dirs}/usercache/\${user}/appcache/application_\${appid}. Individual containers' work directories, called container_\${contid}, will be subdirectories of this.</p> <p>Default value: \${hadoop.tmp.dir}/nm-local-dir</p> <p>Default source: yarn-default.xml</p>
yarn.nodemanager.localizer.address	<p>Address where the localizer IPC is.</p> <p>Default value: \${yarn.nodemanager.hostname}:8040</p>
yarn.nodemanager.localizer.cache.cleanup.interval-ms	<p>Interval in between cache cleanups.</p> <p>Default value: 60000</p> <p>Default source: yarn-default.xml</p>
yarn.nodemanager.localizer.cache.target-size-mb	<p>Target size of localizer cache in MB, per local directory.</p> <p>Default value: 10240</p> <p>Default source: yarn-default.xml</p>
yarn.nodemanager.localizer.client.thread-count	<p>Number of threads to handle localization requests.</p> <p>Default value: 5</p> <p>Default source: yarn-default.xml</p>
yarn.nodemanager.localizer.fetch.thread-count	<p>Number of threads to use for localization fetching.</p> <p>Default value: 4</p> <p>Default source: yarn-default.xml</p>

yarn.nodemanager.log.retain-seconds	Time in seconds to retain user logs. Only applicable if log aggregation is disabled. Default value: 10800 Default source: yarn-default.xml
yarn.nodemanager.log-aggregation.compression-type	T-file compression types used to compress aggregated logs. Default value: none Default source: yarn-default.xml
yarn.nodemanager.log-aggregation.roll-monitoring-interval-seconds	Default value: -1 Default source: yarn-default.xml
yarn.nodemanager.log-dirs	Where to store container logs. An application's localized log directory will be found in <code>\${yarn.nodemanager.log-dirs}/application_\${appid}</code> . Individual containers' log directories will be below this, in directories named <code>container_\${contid}</code> . Each container directory will contain the files <code>stderr</code> , <code>stdin</code> , and <code>syslog</code> generated by that container. Default value: <code>\${yarn.log.dir}/userlogs</code> Default source: yarn-default.xml
yarn.nodemanager.pmem-check-enabled	Whether physical memory limits will be enforced for containers. Default value: true Default source: yarn-default.xml
yarn.nodemanager.process-kill-wait.ms	Max time to wait for a process to come up when trying to cleanup a container. Default value: 2000 Default source: yarn-default.xml
yarn.nodemanager.recovery.enabled	Default value: TRUE Default source: yarn-default.xml
yarn.nodemanager.remote-app-log-dir	Where to aggregate logs to. Default value: <code>/tmp/logs</code> Default source: yarn-default.xml
yarn.nodemanager.remote-app-log-dir-suffix	The remote log dir will be created at <code>{yarn.nodemanager.remote-app-log-dir}/\${user}/{thisParam}</code> Default value: logs Default source: yarn-default.xml
yarn.nodemanager.resource.cpu-vcores	Number of CPU cores that can be allocated for containers. Default value: <code>\${nodemanager.resource.cpu-vcores}</code> Default source: code

yarn.nodemanager.resource.io-spindles	Default value: \${nodemanager.resource.io-spindles} Default source: code
yarn.nodemanager.resource.memory-mb	Amount of physical memory, in MB, that can be allocated for containers. Default value: \${nodemanager.resource.memory-mb} Default source: code
yarn.nodemanager.resource.percentage-physical-cpu-limit	Default value: 100 Default source: yarn-default.xml
yarn.nodemanager.resourcemanager.minimum.version	The minimum allowed version of a resourcemanager that a nodemanager will connect to. The valid values are NONE (no version checking), EqualToNM (the resourcemanager's version is equal to or greater than the NM version), or a Version String. Default value: NONE Default source: yarn-default.xml
yarn.nodemanager.sleep-delay-before-sigkill.ms	Number of ms to wait between sending a SIGTERM and SIGKILL to a container. Default value: 250 Default source: yarn-default.xml
yarn.nodemanager.vmem-check-enabled	Whether virtual memory limits will be enforced for containers. Default value: false Default source: yarn-default.xml
yarn.nodemanager.vmem-pmem-ratio	Ratio between virtual memory to physical memory when setting memory limits for containers. Container allocations are expressed in terms of physical memory, and virtual memory usage is allowed to exceed this allocation by this ratio. Default value: 2.1 Default source: yarn-default.xml
yarn.nodemanager.webapp.address	NM Webapp address. Default value: \${yarn.nodemanager.hostname}:8042 Default source: yarn-default.xml
yarn.nodemanager.windows-container.cpu-limit.enabled	Default value: FALSE Default source: yarn-default.xml
yarn.nodemanager.windows-container.memory-limit.enabled	Default value: FALSE Default source: yarn-default.xml

yarn.resourcemanager.address	<p>The address of the applications manager interface in the ResourceManager.</p> <p>Default value: \${yarn.resourcemanager.hostname}:8032</p> <p>Default source: yarn-default.xml</p> <p>When you configure failover configure.sh may change the default value by adding a value for this parameter in yarn-site.xml. For more information, see <a href="#">ResourceManager Configuration Properties</a> on page 1981.</p>
yarn.resourcemanager.admin.address	<p>The address of the ResourceManager admin interface.</p> <p>Default value: \${yarn.resourcemanager.hostname}:8033</p> <p>Default source: yarn-default.xml</p> <p>When you configure failover configure.sh may change the default value by adding a value for this parameter in yarn-site.xml. For more information, see <a href="#">ResourceManager Configuration Properties</a> on page 1981.</p>
yarn.resourcemanager.admin.client.thread-count	<p>Number of threads used to handle the ResourceManager admin interface.</p> <p>Default value: 1</p> <p>Default source: yarn-default.xml</p>
yarn.resourcemanager.am.max-attempts	<p>The maximum number of application attempts. This is a global setting for all ApplicationMasters. Each ApplicationMaster can specify its individual maximum number of application attempts via the API, but the individual number cannot be more than the global upper bound. If it is, the ResourceManager will override it. The default number is set to 2, to allow at least one retry for the ApplicationMaster.</p> <p>Default value: 2</p> <p>Default source: yarn-default.xml</p>
yarn.resourcemanager.application-tokens.master-key-rolling-interval-secs	<p>Interval for the roll over for the master key used to generate application tokens.</p> <p>Default value: 86400</p> <p>Default source: yarn-default.xml</p>
yarn.resourcemanager.aux-services	<p>Default value: RMVolumeManager</p> <p>Default source: code</p>
yarn.resourcemanager.aux-services.HSVolumeManager.class	<p>Default value: com.mapr.hadoop.yarn.resourcemanager.RMVolumeManager</p> <p>Default source: code</p>
yarn.resourcemanager.aux-services.RMVolumeManager.class	<p>Default value: com.mapr.hadoop.yarn.resourcemanager.RMVolumeManager</p> <p>Default source: code</p>

yarn.resourcemanager.client.thread-count	The number of threads used to handle applications manager requests. Default value: 50 Default source: yarn-default.xml
yarn.resourcemanager.configuration.provider-class	Default value: org.apache.hadoop.yarn.LocalConfigurationProvider Default source: yarn-default.xml
yarn.resourcemanager.connect.max-wait.ms	Maximum time to wait to establish connection to the ResourceManager. Default value: 900000 Default source: yarn-default.xml
yarn.resourcemanager.connect.retry-interval.ms	How often to retry connecting to the ResourceManager. Default value: 30000 Default source: yarn-default.xml
yarn.resourcemanager.container.liveness-monitor.interval-ms	How often to check that containers are still alive. Default value: 600000 Default source: yarn-default.xml
yarn.resourcemanager.container-tokens.master-key-rolling-interval-secs	Interval for the roll over for the master key used to generate container tokens. It is expected to be much greater than yarn.nm.liveness-monitor.expiry-interval-ms and yarn.rm.container-allocation.expiry-interval-ms. Otherwise the behavior is undefined. Default value: 86400 Default source: yarn-default.xml
yarn.resourcemanager.delayed.delegation-token.removal-interval-ms	Interval at which the delayed token removal thread runs. Default value: 30000 Default source: yarn-default.xml
yarn.resourcemanager.dir	Default value: /var/mapr/cluster/yarn/rm Default source: code
yarn.resourcemanager.fs.state-store.num-retries	Default value: 0 Default source: yarn-default.xml
yarn.resourcemanager.fs.state-store.retry-interval-ms	Default value: 1000 Default source: yarn-default.xml
yarn.resourcemanager.fs.state-store.retry-policy-spec	hdfs client retry policy specification. hdfs client retry is always enabled. Specified in pairs of sleep-time and number-of-retries and (t0, n0), (t1, n1), ..., the first n0 retries sleep t0 milliseconds on average, the following n1 retries sleep t1 milliseconds on average, and so on. Default value: 2000, 500 Default source: yarn-default.xml

yarn.resourcemanager.fs.state-store.uri	<p>URI pointing to the location of the FileSystem path where RM state will be stored. This must be supplied when using <code>org.apache.hadoop.yarn.server.resourcemanager.recovery.FileSystemRMStateStore</code> as the value for <code>yarn.resourcemanager.store.class</code></p> <p>Default value: <code>/var/mapr/cluster/yarn/rm/system</code></p> <p>Default source: code</p>
yarn.resourcemanager.ha.automatic-failover.embedded	<p>Enable embedded automatic failover. The embedded elector relies on the RM state store to handle fencing, and is primarily intended to be used in conjunction with <code>ZKRMStateStore</code>.</p> <p>Default value: TRUE</p> <p>Default source: yarn-default.xml</p>
yarn.resourcemanager.ha.automatic-failover.enabled	<p>Enable automatic failover.</p> <p>Default value: TRUE</p> <p>Default source: yarn-default.xml</p>
yarn.resourcemanager.ha.automatic-failover.zk-base-path	<p>The base znode path to use for storing leader information, when using ZooKeeper based leader election.</p> <p>Default value: <code>/yarn-leader-election</code></p> <p>Default source: yarn-default.xml</p>
yarn.resourcemanager.ha.custom-ha-rmaddressfinder	<p>Default value: <code>org.apache.hadoop.yarn.client.MapRZKBasedRMAddressFinder</code></p> <p>Default source: code</p>
