yarn.resourcemanager.ha.enabled	<p>Enable RM high-availability. If enabled:</p> <ol style="list-style-type: none"> <li>1. The RM starts in the Standby mode by default and transitions to the Active mode after it is prompted to do so.</li> <li>2. The nodes in the RM ensemble are listed in <code>yarn.resourcemanager.ha.rm-ids</code>.</li> <li>3. The id of each RM comes from <code>yarn.resourcemanager.ha.id</code>,</li> <li>4. The actual physical addresses come from the configs of the pattern: <code>{rpc-config}.{id}</code>.</li> </ol> <p>Default value: false</p> <p>Default source: yarn-default.xml</p>
yarn.resourcemanager.hostname	<p>The hostname of the ResourceManager.</p> <p>Default value: 0.0.0.0</p> <p>Default source: yarn-default.xml</p>
yarn.resourcemanager.keytab	<p>The keytab for the ResourceManager.</p> <p>Default value: <code>/etc/krb5.keytab</code></p> <p>Default source: yarn-default.xml</p>

yarn.resourcemanager.leveldb-state-store.path	Default value: \${hadoop.tmp.dir}/yarn/system/rmstore Default source: yarn-default.xml
yarn.resourcemanager.max-completed-applications	The maximum number of completed applications RM keeps. Default value: 10000 Default source: yarn-default.xml
yarn.resourcemanager.nodemanager.minimum.version	The minimum allowed version of a connecting nodemanager. The valid values are NONE (no version checking), EqualToRM (the nodemanager's version is equal to or greater than the RM version), or a Version String. Default value: NONE Default source: yarn-default.xml
yarn.resourcemanager.nodemanager.heartbeat-interval-ms	The heart-beat interval in milliseconds for every NodeManager in the cluster. Default value: 1000 Default source: yarn-default.xml
yarn.resourcemanager.principal	The Kerberos principal for the ResourceManager. Default value:mapr Default source: code
yarn.resourcemanager.proxy-user-privileges.enabled	Default value: FALSE Default source: yarn-default.xml
yarn.resourcemanager.recovery.enabled	Enable RM to recover state after starting. If true, then yarn.resourcemanager.store.class must be specified. Default value: false When you configure failover configure.sh may change the default value by adding a value for this parameter in yarn-site.xml. For more information, see <a href="#">ResourceManager Configuration Properties</a> on page 1981.
yarn.resourcemanager.resource-tracker.address	Default value: \${yarn.resourcemanager.hostname}:8031 Default source: yarn-default.xml When you configure failover configure.sh may change the default value by adding a value for this parameter in yarn-site.xml. For more information, see <a href="#">ResourceManager Configuration Properties</a> on page 1981.
yarn.resourcemanager.resource-tracker.client.thread-count	Number of threads to handle resource tracker calls. Default value: 50 Default source: yarn-default.xml

yarn.resourcemanager.scheduler.address	<p>The address of the scheduler interface.</p> <p>Default value: <code>\${yarn.resourcemanager.hostname}:8030</code></p> <p>Default source: yarn-default.xml</p> <p>When you configure failover <code>configure.sh</code> may change the default value by adding a value for this parameter in <code>yarn-site.xml</code>. For more information, see <a href="#">ResourceManager Configuration Properties</a> on page 1981.</p>
yarn.resourcemanager.scheduler.class	<p>The class to use as the resource scheduler.</p> <p>Default value: <code>org.apache.hadoop.yarn.server.resourcemanager.scheduler.fair.FairScheduler</code></p> <p>Default source: code</p>
yarn.resourcemanager.scheduler.client.thread-count	<p>Number of threads to handle scheduler interface.</p> <p>Default value: 50</p> <p>Default source: yarn-default.xml</p>
yarn.resourcemanager.scheduler.monitor.enable	<p>Enable a set of periodic monitors (specified in <code>yarn.resourcemanager.scheduler.monitor.policies</code>) that affect the scheduler.</p> <p>Default value: false</p> <p>Default source: yarn-default.xml</p>
yarn.resourcemanager.scheduler.monitor.policies	<p>The list of <code>SchedulingEditPolicy</code> classes that interact with the scheduler. A particular module may be incompatible with the scheduler, other policies, or a configuration of either.</p> <p>Default value: <code>org.apache.hadoop.yarn.server.resourcemanager.monitor.capacity.ProportionalCapacityPreemptionPolicy</code></p> <p>Default source: yarn-default.xml</p>
yarn.resourcemanager.staging	<p>Default value: <code>/var/mapr/cluster/yarn/rm/staging</code></p> <p>Default source: code</p>
yarn.resourcemanager.state-store.max-completed-applications	<p>The maximum number of completed applications RM state store keeps, less than or equals to <code>\${yarn.resourcemanager.max-completed-applications}</code>. By default, it equals to <code>\${yarn.resourcemanager.max-completed-applications}</code>. This ensures that the applications kept in the state store are consistent with the applications remembered in RM memory. Any values larger than <code>\${yarn.resourcemanager.max-completed-applications}</code> will be reset to <code>\${yarn.resourcemanager.max-completed-applications}</code>. Note that this value impacts the RM recovery performance. Typically, a smaller value indicates better performance on RM recovery.</p> <p>Default value: <code>\${yarn.resourcemanager.max-completed-applications}</code></p> <p>Default source: yarn-default.xml</p>

yarn.resourcemanager.store.class	<p>The class to use as the persistent store. If org.apache.hadoop.yarn.server.resourcemanager.recovery.ZKRMStateStore is used, the store is implicitly fenced; meaning a single ResourceManager is able to use the store at any point in time. More details on this implicit fencing, along with setting up appropriate ACLs is discussed under yarn.resourcemanager.zk-state-store.root-node.acl.</p> <p>Default value: org.apache.hadoop.yarn.server.resourcemanager.recovery.FileSystemRMStateStore</p> <p>Default source: yarn-default.xml</p>
yarn.resourcemanager.system	<p>Default value: /var/mapr/cluster/yarn/rm/system</p> <p>Default source: code</p>
yarn.resourcemanager.system-metrics-publisher.dispatcher.pool-size	<p>Default value: 10</p> <p>Default source: yarn-default.xml</p>
yarn.resourcemanager.system-metrics-publisher.enabled	<p>Default value: FALSE</p> <p>Default source: yarn-default.xml</p>
yarn.resourcemanager.webapp.address	<p>The http address of the ResourceManager web application.</p> <p>Default value: \${yarn.resourcemanager.hostname}:8088</p> <p>Default source: yarn-default.xml</p> <p>When you configure failover configure.sh may change the default value by adding a value for this parameter in yarn-site.xml. For more information, see <a href="#">ResourceManager Configuration Properties</a> on page 1981.</p>
yarn.resourcemanager.webapp.delegation-token-auth-filter.enabled	<p>Default value: TRUE</p> <p>Default source: yarn-default.xml</p>
yarn.resourcemanager.webapp.https.address	<p>The https address of the ResourceManager web application.</p> <p>Default value: \${yarn.resourcemanager.hostname}:8090</p> <p>Default source: yarn-default.xml</p> <p>When you configure failover configure.sh may change the default value by adding a value for this parameter in yarn-site.xml. For more information, see <a href="#">ResourceManager Configuration Properties</a> on page 1981.</p>
yarn.resourcemanager.work-preserving-recovery.enabled	<p>Default value: TRUE</p> <p>Default source: yarn-default.xml</p>
yarn.resourcemanager.work-preserving-recovery.scheduling-wait-ms	<p>Default value: 10000</p> <p>Default source: yarn-default.xml</p>
yarn.resourcemanager.zk-acl	<p>ACL's to be used for ZooKeeper znodes.</p> <p>Default value: world:anyone:rwcd</p> <p>Default source: yarn-default.xml</p>

yarn.resourcemanager.zk-num-retries	Number of times RM tries to connect to ZooKeeper. Default value: 1000 Default source: yarn-default.xml
yarn.resourcemanager.zk-retry-interval-ms	Retry interval in milliseconds when connecting to ZooKeeper. Default value: 1000 Default source: yarn-default.xml
yarn.resourcemanager.zk-state-store.parent-path	Full path of the ZooKeeper znode where RM state will be stored. This must be supplied when using <code>org.apache.hadoop.yarn.server.resourcemanager.recovery.ZKRMStateStore</code> as the value for <code>yarn.resourcemanager.store.class</code> Default value: /rmstore Default source: yarn-default.xml
yarn.resourcemanager.zk-timeout-ms	ZooKeeper session timeout in milliseconds. Session expiration is managed by the ZooKeeper cluster itself, not by the client. This value is used by the cluster to determine when the client's session expires. Expirations happens when the cluster does not hear from the client within the specified session timeout period (i.e. no heartbeat). Default value: 10000 Default source: yarn-default.xml
yarn.scheduler.maximum-allocation-mb	The maximum allocation for every container request at the RM, in MBs. Memory requests higher than this won't take effect, and will get capped to this value. Default value: 8192 Default source: yarn-default.xml
yarn.scheduler.maximum-allocation-vcores	The maximum allocation for every container request at the RM, in terms of virtual CPU cores. Requests higher than this won't take effect, and will get capped to this value. Default value: 4 Default source: yarn-default.xml
yarn.scheduler.minimum-allocation-mb	The minimum allocation for every container request at the RM, in MBs. Memory requests lower than this won't take effect, and the specified value will get allocated at minimum. Default value: 1024 Default source: yarn-default.xml
yarn.scheduler.minimum-allocation-vcores	The minimum allocation for every container request at the RM, in terms of virtual CPU cores. Requests lower than this won't take effect, and the specified value will get allocated the minimum. Default value: 1 Default source: yarn-default.xml

yarn.resourcemanager.zk-timeout-ms	Default value: 10000 Default source: yarn-default.xml
yarn.scheduler.minimum-allocation-mb	Default value: 1024 Default source: yarn-default.xml
yarn.scheduler.minimum-allocation-vcores	Default value: 1 Default source: yarn-default.xml
yarn.sharedcache.admin.address	Default value: 0.0.0.0:8047 Default source: yarn-default.xml
yarn.sharedcache.admin.thread-count	Default value: 1 Default source: yarn-default.xml
yarn.sharedcache.app-checker.class	Default value: org.apache.hadoop.yarn.server.sharedcachemanager.RemoteAppChecker Default source: yarn-default.xml
yarn.sharedcache.checksum.algo.impl	Default value: org.apache.hadoop.yarn.sharedcache.ChecksumSHA256Impl Default source: yarn-default.xml
yarn.sharedcache.cleaner.initial-delay-mins	Default value: 10 Default source: yarn-default.xml
yarn.sharedcache.cleaner.period-mins	Default value: 1440 Default source: yarn-default.xml
yarn.sharedcache.cleaner.resource-sleep-ms	Default value: 0 Default source: yarn-default.xml
yarn.sharedcache.client-server.address	Default value: 0.0.0.0:8045 Default source: yarn-default.xml
yarn.sharedcache.client-server.thread-count	Default value: 50 Default source: yarn-default.xml
yarn.sharedcache.enabled	Default value: FALSE Default source: yarn-default.xml
yarn.sharedcache.nested-level	Default value: 3 Default source: yarn-default.xml
yarn.sharedcache.nm.uploader.replication.factor	Default value: 10 Default source: yarn-default.xml
yarn.sharedcache.nm.uploader.thread-count	Default value: 20 Default source: yarn-default.xml

yarn.sharedcache.root-dir	Default value: /sharedcache Default source: yarn-default.xml
yarn.sharedcache.store.class	Default value: org.apache.hadoop.yarn.server.sharedcachemanager.store.InMemorySCMStore Default source: yarn-default.xml
yarn.sharedcache.store.in-memory.check-period-mins	Default value: 720 Default source: yarn-default.xml
yarn.sharedcache.store.in-memory.initial-delay-mins	Default value: 10 Default source: yarn-default.xml
yarn.sharedcache.store.in-memory.staleness-period-mins	Default value: 10080 Default source: yarn-default.xml
yarn.sharedcache.uploader.server.address	Default value: 0.0.0.0:8046 Default source: yarn-default.xml
yarn.sharedcache.uploader.server.thread-count	Default value: 50 Default source: yarn-default.xml
yarn.sharedcache.webapp.address	Default value: 0.0.0.0:8788 Default source: yarn-default.xml
yarn.timeline-service.address	Default value: \${yarn.timeline-service.hostname}:10200 Default source: yarn-default.xml
yarn.timeline-service.client.max-retries	Default value: 30 Default source: yarn-default.xml
yarn.timeline-service.client.best-effort	Default value: FALSE Default source: yarn-default.xml To enable an application to run successfully after it is retried, set this to TRUE
yarn.timeline-service.client.retry-interval-ms	Default value: 1000 Default source: yarn-default.xml
yarn.timeline-service.client.socket-timeout-ms	Timeout for timeline client socket connection. Defaults to 60000 milliseconds (1 minute). Default source: yarn-default.xml
yarn.timeline-service.enabled	Default value: FALSE Default source: yarn-default.xml
yarn.timeline-service.generic-application-history.aux-services	Default value: HSVolumeManager Default source: code
yarn.timeline-service.handler-thread-count	Default value: 10 Default source: yarn-default.xml

yarn.timeline-service.hostname	Default value: 0.0.0.0 Default source: yarn-default.xml
yarn.timeline-service.http-authentication.simple.anonymous.allowed	Default value: TRUE Default source: yarn-default.xml
yarn.timeline-service.http-authentication.type	Default value: simple Default source: yarn-default.xml
yarn.timeline-service.keytab	Default value: /etc/krb5.keytab Default source: yarn-default.xml
yarn.timeline-service.leveldb-state-store.path	Default value: \${hadoop.tmp.dir}/yarn/timeline Default source: yarn-default.xml
yarn.timeline-service.leveldb-timeline-store.path	Default value: \${hadoop.tmp.dir}/yarn/timeline Default source: yarn-default.xml
yarn.timeline-service.leveldb-timeline-store.read-cache-size	Default value: 104857600 Default source: yarn-default.xml
yarn.timeline-service.leveldb-timeline-store.start-time-read-cache-size	Default value: 10000 Default source: yarn-default.xml
yarn.timeline-service.leveldb-timeline-store.start-time-write-cache-size	Default value: 10000 Default source: yarn-default.xml
yarn.timeline-service.leveldb-timeline-store.ttl-interval-ms	Default value: 300000 Default source: yarn-default.xml
yarn.timeline-service.recovery.enabled	Default value: FALSE Default source: yarn-default.xml
yarn.timeline-service.state-store-class	Default value: org.apache.hadoop.yarn.server.timeline.recovery.LeveldbTimelineStateStore Default source: yarn-default.xml
yarn.timeline-service.store-class	Default value: org.apache.hadoop.yarn.server.timeline.LeveldbTimelineStore Default source: yarn-default.xml
yarn.timeline-service.ttl-enable	Default value: TRUE Default source: yarn-default.xml
yarn.timeline-service.ttl-ms	Default value: 604800000 Default source: yarn-default.xml
yarn.timeline-service.webapp.address	Default value: \${yarn.timeline-service.hostname}:8188 Default source: yarn-default.xml

yarn.timeline-service.webapp.https.address	Default value: \${yarn.timeline-service.hostname}:8190 Default source: yarn-default.xml
yarn.timeline-service.webapp.all-ifaces	Redirects all opening container logs from timeline server to 0.0.0.0. Default value: TRUE Default source: code
yarn.use-central-logging-for-mapreduce-only	Default value: FALSE Default source: code

### Default mapred Parameters

Property	Description
io.sort.record.percent	Default value: 0.17 Default source: code
map.sort.class	Default value: org.apache.hadoop.util.QuickSort Default source: mapred-default.xml
mapr.localoutput.dir	Default value: output Default source: code
mapr.localspill.dir	Default value: spill Default source: code
mapr.map.keyprefix.ints	Default value: 1 Default source: code
mapr.mapred.localvolume.root.dir.name	Default value: nodeManager Default source: code
mapreduce.am.max-attempts	Default value: 2 Default source: mapred-default.xml
mapreduce.app-submission.cross-platform	Default value: FALSE Default source: mapred-default.xml
mapreduce.client.completion.pollinterval	Default value: 5000 Default source: mapred-default.xml
mapreduce.client.output.filter	Default value: FAILED Default source: mapred-default.xml
mapreduce.client.progressmonitor.pollinterval	Default value: 1000 Default source: mapred-default.xml
mapreduce.client.submit.file.replication	Default value: 10 Default source: mapred-default.xml
mapreduce.cluster.acls.enabled	Default value: FALSE Default source: mapred-default.xml

mapreduce.cluster.local.dir	Default value: \${hadoop.tmp.dir}/mapred/local Default source: mapred-default.xml
mapreduce.cluster.temp.dir	Default value: \${hadoop.tmp.dir}/mapred/temp Default source: mapred-default.xml
mapreduce.fileoutputcommitter.algorithm.version	Default value: 1 Default source: mapred-default.xml
mapreduce.framework.name	Default value: yarn Default source: code
mapreduce.ifile.readahead	Default value: TRUE Default source: mapred-default.xml
mapreduce.ifile.readahead.bytes	Default value: 4194304 Default source: mapred-default.xml
mapreduce.input.fileinputformat.list-status.num-threads	Default value: 1 Default source: mapred-default.xml
mapreduce.input.fileinputformat.split.minsize	Default value: 0 Default source: mapred-default.xml
mapreduce.input.lineinputformat.linespermap	Default value: 1 Default source: mapred-default.xml
mapreduce.job.acl-modify-job	Default value: Default source: mapred-default.xml
mapreduce.job.acl-view-job	Default value: Default source: mapred-default.xml
mapreduce.job.classloader	Default value: FALSE Default source: mapred-default.xml
mapreduce.job.committer.setup.cleanup.needed	Default value: TRUE Default source: mapred-default.xml
mapreduce.job.complete.cancel.delegation.tokens	Default value: TRUE Default source: mapred-default.xml
mapreduce.job.counters.max	Default value: 120 Default source: mapred-default.xml
mapreduce.job.emit-timeline-data	Default value: FALSE Default source: mapred-default.xml
mapreduce.job.end-notification.max.attempts	Default value: 5 Default source: mapred-default.xml

mapreduce.job.end-notification.max.retry.interval	Default value: 5000 Default source: mapred-default.xml
mapreduce.job.end-notification.retry.attempts	Default value: 0 Default source: mapred-default.xml
mapreduce.job.end-notification.retry.interval	Default value: 1000 Default source: mapred-default.xml
mapreduce.job.jvm.numtasks	Default value: 1 Default source: mapred-default.xml
mapreduce.job.map.output.collector.class	Default value: org.apache.hadoop.mapred.MapRFsOutputBuffer Default source: code
mapreduce.job.maps	Default value: 2 Default source: mapred-default.xml
mapreduce.job.max.split.locations	Default value: 10 Default source: mapred-default.xml
mapreduce.job.maxtaskfailures.per.tracker	Default value: 3 Default source: mapred-default.xml
mapreduce.job.queue.name	Default value: default Default source: mapred-default.xml
mapreduce.job.reduce.shuffle.consumer.plugin.class	Default value: org.apache.hadoop.mapreduce.task.reduce.DirectShuffle Default source: code
mapreduce.job.reduce.slowstart.completedmaps	Default value: 1.00 Default source: code
mapreduce.job.reducer.preempt.delay.sec	Default value: 0 Default source: mapred-default.xml
mapreduce.job.reducees	Default value: 1 Default source: mapred-default.xml
mapreduce.job.running.map.limit	Default value: 0 Default source: mapred-default.xml
mapreduce.job.running.reduce.limit	Default value: 0 Default source: mapred-default.xml
mapreduce.job.shuffle.provider.services	Default value: mapr_direct_shuffle Default source: code

mapreduce.job.speculative.minimum-allowed-tasks	Default value: 10 Default source: mapred-default.xml
mapreduce.job.speculative.retry-after-no-speculate	Default value: 1000 Default source: mapred-default.xml
mapreduce.job.speculative.retry-after-speculate	Default value: 15000 Default source: mapred-default.xml
mapreduce.job.speculative.slowtaskthreshold	Default value: 1 Default source: mapred-default.xml
mapreduce.job.speculative.speculative-cap-running-tasks	Default value: 0.1 Default source: mapred-default.xml
mapreduce.job.speculative.speculative-cap-total-tasks	Default value: 0.01 Default source: mapred-default.xml
mapreduce.job.split.metainfo.maxsize	Default value: 10000000 Default source: mapred-default.xml
mapreduce.job.token.tracking.ids.enabled	Default value: FALSE Default source: mapred-default.xml
mapreduce.job.ubertask.enable	Default value: FALSE Default source: mapred-default.xml
mapreduce.job.ubertask.maxmaps	Default value: 9 Default source: mapred-default.xml
mapreduce.job.ubertask.maxreduces	Default value: 1 Default source: mapred-default.xml
mapreduce.job.userlog.retain.hours	Default value: 24 Default source: mapred-default.xml
mapreduce.jobhistory.address	Default value: 0.0.0.0:10020 Default source: mapred-default.xml
mapreduce.jobhistory.admin.acl	Default value: * Default source: mapred-default.xml
mapreduce.jobhistory.admin.address	Default value: 0.0.0.0:10033 Default source: mapred-default.xml
mapreduce.jobhistory.cleaner.enable	Default value: TRUE Default source: mapred-default.xml
mapreduce.jobhistory.cleaner.interval-ms	Default value: 86400000 Default source: mapred-default.xml

mapreduce.jobhistory.client.thread-count	Default value: 10 Default source: mapred-default.xml
mapreduce.jobhistory.datestring.cache.size	Default value: 200000 Default source: mapred-default.xml
mapreduce.jobhistory.done-dir	Default value: \${yarn.app.mapreduce.am.staging-dir}/history/done Default source: mapred-default.xml
mapreduce.jobhistory.http.policy	Default value: HTTP_ONLY Default source: mapred-default.xml
mapreduce.jobhistory.intermediate-done-dir	Default value: \${yarn.app.mapreduce.am.staging-dir}/history/done_intermediate Default source: mapred-default.xml
mapreduce.jobhistory.joblist.cache.size	Default value: 20000 Default source: mapred-default.xml
mapreduce.jobhistory.keytab	Default value: /etc/security/keytab/jhs.service.keytab Default source: mapred-default.xml
mapreduce.jobhistory.loadedjobs.cache.size	Default value: 5 Default source: mapred-default.xml
mapreduce.jobhistory.max-age-ms	Default value: 604800000 Default source: mapred-default.xml
mapreduce.jobhistory.minicluster.fixed.ports	Default value: FALSE Default source: mapred-default.xml
mapreduce.jobhistory.move.interval-ms	Default value: 180000 Default source: mapred-default.xml
mapreduce.jobhistory.move.thread-count	Default value: 3 Default source: mapred-default.xml
mapreduce.jobhistory.principal	Default value: jhs/_HOST@REALM.TLD Default source: mapred-default.xml
mapreduce.jobhistory.recovery.enable	Default value: FALSE Default source: mapred-default.xml
mapreduce.jobhistory.recovery.store.class	Default value: org.apache.hadoop.mapreduce.v2.hs.HistoryServerFileSystemStateStoreService Default source: mapred-default.xml
mapreduce.jobhistory.recovery.store.fs.uri	Default value: \${hadoop.tmp.dir}/mapred/history/recoverystore Default source: mapred-default.xml

mapreduce.jobhistory.recovery.store.leveldb.path	Default value: \${hadoop.tmp.dir}/mapred/history/recoverystore Default source: mapred-default.xml
mapreduce.jobhistory.webapp.address	Default value: 0.0.0.0:19888 Default source: mapred-default.xml

### Environment Variables

Describes the environment variables specific to the HPE Ezmeral Data Fabric.

For core release 6.0 and later, environment variables should be set in `/opt/mapr/conf/env_override.sh`. Editing `/opt/mapr/conf/env.sh` is no longer recommended. For more information, see [About `env\_override.sh`](#) on page 3082.

Variable	Example Values	Description
CLDB_EXTERNAL_RPC_PORT	5000	If clients outside the cluster cannot reach CLDB on the default port, use the <code>CLDB_EXTERNAL_RPC_PORT</code> environment variable to specify the port on which CLDB can be reached.
JAVA_HOME	<code>/usr/lib/jvm/java-7-sun</code>	The directory where the correct version of Java is installed.
MAPR_ECOSYSTEM_LOGIN_OPTS	*hybrid*	Specifies the JAAS configuration to use with installed open source components.
MAPR_EXTERNAL	10.10.123.25,10.10.123.30	If your cluster nodes have multiple NICs, use the <code>MAPR_EXTERNAL</code> environment variable to grant external clients access to a cluster node on specific IP addresses. The value of the <code>MAPR_EXTERNAL</code> environment variable on a node is a comma-separated list of up to four IP addresses with no spaces.
MAPR_HOME	<code>/opt/mapr</code> (default)	The directory in which the core software is installed.  <b>CAUTION:</b> Specifying a <code>MAPR_HOME</code> directory other than <code>/opt/mapr</code> is not supported and can cause installation errors.
MAPR_JWT_TOKEN_LOCATION	<code>/tmp/jwt</code>	If SSO is configured, you can use this environment variable to set the location of the JWT token. Doing so removes the need to provide a ticket when issuing <code>maprcli</code> commands. It also removes the need to provide an AccessKey and SecretKey when issuing MinIO ( <code>mc</code> ) commands for the Object Store.
MAPR_SUBNETS	10.10.123.0/24,10.10.124.0/24	<code>MAPR_SUBNETS</code> is used for Data Fabric RPC to RPC communication. The MFS, CLDB, NFS, and LOOPBACKNFS modules use this environment variable. The NFS and LOOPBACKNFS modules use this environment variable when registering with CLDB. If you do not want Data Fabric to use all NICs on each node, use this environment variable to restrict Data Fabric traffic to specific NICs. Set <code>MAPR_SUBNETS</code> to a comma-separated list of up to four subnets in CIDR notation with no spaces. If you do not set <code>MAPR_SUBNETS</code> , Data Fabric uses all NICs present on the node. If <code>MAPR_SUBNETS</code> is set, make sure that the node can reach all nodes in the cluster (servers and clients) using the specified subnets.

Variable	Example Values	Description
MAPR_USER	mapr (default)	Used with <a href="#">configure.sh</a> on page 2826 to specify the user under which Data Fabric runs its services. If not explicitly set, it defaults to the user <code>mapr</code> . After <code>configure.sh</code> is run, the value is stored in <a href="#">daemon.conf</a> on page 2981 .

### About `env_override.sh`

Describes the purpose of the `env_override.sh` file.

The `env_override.sh` file allows you to create to store custom settings for environment variables.

By default, `/opt/mapr/conf/env.sh` contains environment variables for a HPE Ezmeral Data Fabric cluster, but upgrading to a new Data Fabric release causes the `env.sh` file to be replaced. (A backup is stored as `/opt/mapr/conf/env.sh<timestamp>`.) After `env.sh` is replaced, any custom settings are removed.

For Data Fabric 6.0 and later, keep any custom settings in `/opt/mapr/conf/env_override.sh`. It is no longer necessary to modify `env.sh`.

Upgrading a cluster does not remove or modify `env_override.sh`. `/opt/mapr/conf/env.sh` reads the `env_override.sh` file at the end of its execution. If the same parameter is listed in both `env.sh` and `env_override.sh`, the value specified in `env_override.sh` is used. If `env_override.sh` is not present, the values in `env.sh` are used.

You create `env_override.sh` from a blank file and insert `export` statements into the file. For example:

### Sample `env_override.sh` File

```
export CLDB_EXTERNAL_RPC_PORT=5000
export JAVA_HOME=/usr/lib/jvm/java-11-openjdk-11.0.8.10-0.e18_2.x86_64
export MAPR_HOME=/opt/mapr
export MAPR_EXTERNAL=10.10.123.25,10.10.123.30
export MAPR_SUBNETS=10.10.123.0/24,10.10.124.0/24
export MAPR_USER=mapr
export MAPR_ECOSYSTEM_LOGIN_OPTS=*hybrid*
```

### Controlling Access to JMX Metrics

Environment variables and `configure.sh` options introduced in release 6.2.0 let you control how metrics are collected and who can access the metrics from JMX-enabled services.

JMX is a technology for monitoring system services. In the HPE Ezmeral Data Fabric, you can use environment variables or `configure.sh` options to enable or disable access to JMX metrics. The JMX-enabled services are:

- CLDB
- Drill
- Hive
- NodeManager
- Oozie
- ResourceManager
- Spark

## Understanding the MAPR\_JMX Variables

The following table describes the environment variables. For release 6.2.0, JMX is enabled by default, and local binding is enabled by default:

Environment Variable	Default Value		Description
	Secure Cluster	Non-Secure Cluster	
MAPR_JMXAUTH*	true	false	Enables or disables authentication for JMX metrics for a node. JMXAUTH is only used in conjunction with MAPR_JMXLOCALHOST or MAPR_JMXREMOTEHOST. JMXAUTH is ignored if MAPR_JMXRLOCALBINDING is set to true.
MAPR_JMXDISABLE*	false	false	If set to true, disables JMX for the entire node. In this scenario, Collectd does not receive JMX metrics.
MAPR_JMXLOCALBINDING*	true	true	If set to true, disables TCP/IP listening on the the local JMX port. There is no TCP/IP listener at all after you turn on local binding. In this scenario, you can only get JMX metrics from the node itself by configuring a process that attaches to the Java process, such as a debugger tool. You can connect only to processes that you own.
MAPR_JMXLOCALHOST	false	false	Enables the JMX server in the Java processes to listen on the local host and on the JMX port number. The local host is a TCP/IP listener that listens on the local host only. It does not let you connect remotely.
MAPR_JMXREMOTEHOST	false	false	Enables the JMX server to listen on the JMX port and allows users from outside the cluster to connect to that port. You can turn on REMOTEHOST if you want to have a cluster with both LOCALBINDING and REMOTEHOST. Turning on REMOTEHOST allows you to use JConsole, Virtual VM, or any of these other tools to log in and look at what the Java processes is doing. If MAPR_JMXREMOTEHOST is set to true, the system always uses SSL and authentication.
MAPR_JMXSSL*	false	false	Enables or disables SSL for JMX metrics for a node. This variable is ignored if MAPR_JMXREMOTEHOST is set to true.

\*For internal use only. Manually changing the the value of this environment variable is not recommended.

## Changing the MAPR\_JMX Environment Variables

Suppose you want to change the value of MAPR\_JMXREMOTEHOST to true. Doing so allows you to use a tool, such as JConsole, to log in remotely and monitor the Java processes. To change the MAPR\_JMXREMOTEHOST setting:

1. Export the new value of MAPR\_JMXREMOTEHOST in /opt/mapr/conf/env\_override.sh:

```
export MAPR_JMXREMOTEHOST=true
```

2. Run `/opt/mapr/server/configure.sh -R`, and restart all services. For example:
  - a. Stop Warden by using the `systemctl stop mapr-warden` command.
  - b. Stop ZooKeeper by using the `systemctl stop mapr-zookeeper` command.
  - c. Restart ZooKeeper by using the `systemctl start mapr-zookeeper` command.
  - d. Restart Warden by using the `systemctl start mapr-warden` command.

### Using the JMX Options for `configure.sh`

The following `configure.sh` options are supported for managing JMX on individual nodes:

Option	Description
<code>-JMXEnable</code>	Enables JMX support for every service on the node where JMX is configured to be enabled. JMX is enabled by default.
<code>-JMXDisable</code>	Globally disables JMX support for all JMX-enabled services on the node.
<code>-JMXLocalBindingEnable</code>	Enables local binding for JMX connections. Local binding is enabled by default.
<code>-JMXLocalBindingDisable</code>	Disables local binding for JMX connections.
<code>-JMXLocalHostEnable</code>	Enables the local-host TCP port for JMX. This setting is mutually exclusive with <code>JMXRemoteHostEnable</code> .
<code>-JMXLocalHostDisable</code>	Disables the local-host TCP port for JMX.
<code>-JMXRemoteHostEnable</code>	Enables the remote TCP port for JMX. This setting is mutually exclusive with <code>JMXLocalHostEnable</code> .
<code>-JMXRemoteHostDisable</code>	Disables the remote TCP port for JMX.

To use `-JMX` options, run `configure.sh -R` with the `-JMX` option on the desired node. For example:

```
/opt/mapr/server/configure.sh -R -JMXRemoteHostEnable
```

#### Related concepts

Lists the ports used by Data Fabric services.

#### Ports Used by HPE Ezmeral Data Fabric Software

Lists the ports used by Data Fabric services.

#### Avoiding Port Conflicts

To avoid trouble with port conflicts on your Data Fabric clusters, try these tips:

- Remap the ports for the HBaseMaster and HBaseRegionServer services to ports below 32768.
- Set the ephemeral port range to stop at 50029 by changing the value in the file `/proc/sys/net/ipv4/ip_local_port_range`. Note that this setting changes the available number of ephemeral ports from the default of 28233 ports to 17233.

## Ports Needed for POSIX Clients and File System to Communicate With Each Other

POSIX clients communicate with the CLDB and server components of the Data Fabric filesystem. You need to open the relevant ports for TCP connectivity from POSIX clients to the Data Fabric file-system cluster nodes. Open the CLDB, file-system server, and file-system server instances ports, as detailed in the following section.

### Services and Ports Quick Reference

The following list defines the ports used by a Data Fabric cluster, along with the default port numbers. All the ports used by Data Fabric software are **TCP** ports.

<b>Airflow Webserver</b>	<p><i>Source IP:</i> Nodes/clients accessing Airflow webserver</p> <p><i>Destination IP:</i> Nodes running Airflow webserver</p> <p><i>Ports:</i> 8780</p> <p><i>Purpose:</i> Used by Airflow webserver clients to access the Airflow webserver</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>Airflow Scheduler</b>	<p><i>Source IP:</i> Airflow webserver</p> <p><i>Destination IP:</i> Nodes running Airflow scheduler</p> <p><i>Ports:</i> 8793</p> <p><i>Purpose:</i> Used by Airflow webserver to access the Airflow scheduler</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>API Server (apiserver)</b>	<p><i>Source IP:</i> Cluster nodes running apiserver</p> <p><i>Destination IP:</i> Cluster nodes running apiserver</p> <p><i>Ports:</i></p> <ul style="list-style-type: none"> <li>• 5701</li> <li>• 5702</li> </ul> <p><i>Purpose:</i> Clustering support</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>CLDB</b>	<p><i>Source IP:</i> Nodes running any Data Fabric services, clients interacting with the file system</p> <p><i>Destination IP:</i> Cluster nodes running CLDB services</p> <p><i>Ports:</i> 7222</p> <p>A client reads CLDB IP and port number from the <code>/opt/mapr/conf/mapr-clusters.conf</code> file. The client initially tries to communicate with CLDB on port 7222. Once it establishes the connection, it fetches the additional CLDB IPs and ports from the connected CLDB.</p> <p>By default, CLDB listens on ports 7222 and 7223. For performance reasons, additional ports may be opened, depending on the configuration parameter <code>cldb.num.rpc.threads</code> in the <code>/opt/mapr/conf/cldb.conf</code> file. For example, setting <code>cldb.num.rpc.threads=3</code>, opens up ports 7222, 7223 and 7224.</p>

 **NOTE:** The `cldb.num.rpc.threads` parameter is hard-coded with a default value of 3. To change this value, add this parameter with the new value to the `/opt/mapr/conf/cldb.conf` file.

 **NOTE:** If you upgrade from Core 5.2.x or Core 6 to Core 6.1 and above, the value of `cldb.num.rpc.threads` is not changed. The default remains as 3, which means three ports are open for each CLDB node.

The client tries connecting to the CLDBs till timeout occurs in the case of soft mount, while the client indefinitely retries in the case of hard mount. If a client cannot connect to a CLDB port, the CLDB is marked unreachable. For example, assume a CLDB with IP 10.10.10.10 and 3 ports 7222, 7223 and 7224. If a client fails to connect to the CLDB say on port 7223, the CLDB 10.10.10.10 is marked unreachable, and the client will not try the two other ports for the next few minutes. It tries to connect with the next CLDB entry in the list.

For load balancing at CLDB, a client will always pick a random port among the available CLDB ports.

*Purpose:* file system API calls

*Parameter and File where Port is Configured:*

- `/opt/mapr/conf/cldb.conf`
- `/opt/mapr/conf/warden.conf`
- `/opt/mapr/conf/mapr-clusters.conf`

#### CLDB JMX Monitor Port

*Source IP:* Nodes running CLDB services

*Destination IP:* CLDB JMX monitor port

*Ports:* 7220

*Purpose:* The port on which `Collectd` gathers CLDB metrics through JMX.

*Parameter and File where Port is Configured:* Not Applicable

#### CLDB web port

*Source IP:* Nodes/clients connecting to the CLDB GUI

*Destination IP:* Cluster nodes running CLDB services

*Ports:* 7221

*Purpose:* CLDB GUI for a cluster with security disabled. For a secure cluster, the port is 7443 as defined by the `maprlogin` utility.

*Parameter and File where Port is Configured:* `/opt/mapr/conf/cldb.conf`

#### maprlogin utility

*Source IP:* Connections using the `maprlogin` utility

*Destination IP:* Cluster nodes running CLDB services

*Ports:* 7443

*Purpose:* When security is enabled for a cluster, the CLDB listens for connections on port 7443. If security is disabled, the `maprlogin` utility is unable to reach the CLDB.

	<p><i>Parameter and File where Port is Configured: Not Applicable</i></p>
<b>Data Access Gateway</b>	<p><i>Source IP:</i> Clients using the HPE Ezmeral Data Fabric Database JSON REST API with HTTPS</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 8243</p> <p><i>Purpose:</i> The port used to connect to the Data Access Gateway using HTTPS</p> <p><i>Parameter and File where Port is Configured:</i> <code>rest.https.port</code> in <code>/opt/mapr/data-access-gateway/conf/properties.cfg</code></p>
<b>Data Access Gateway</b>	<p><i>Source IP:</i> Node.js OJAI client</p> <p><i>Destination IP:</i> Cluster nodes running the Data Access Gateway service</p> <p><i>Ports:</i> 5678</p> <p><i>Purpose:</i> The port used to connect the OJAI client to the Data Access Gateway</p> <p><i>Parameter and File where Port is Configured:</i> <code>grpc.service.port</code> in <code>/opt/mapr/data-access-gateway/conf/properties.cfg</code></p>
<b>Data Access Gateway</b>	<p><i>Source IP:</i> Python OJAI client</p> <p><i>Destination IP:</i> Cluster nodes running the Data Access Gateway service</p> <p><i>Ports:</i> 5678</p> <p><i>Purpose:</i> The port used to connect the OJAI client to the Data Access Gateway</p> <p><i>Parameter and File where Port is Configured:</i> <code>grpc.service.port</code> in <code>/opt/mapr/data-access-gateway/conf/properties.cfg</code></p>
<b>Data Access Gateway</b>	<p><i>Source IP:</i> Go OJAI client</p> <p><i>Destination IP:</i> Cluster nodes running the Data Access Gateway service</p> <p><i>Ports:</i> 5678</p> <p><i>Purpose:</i> The port used to connect the OJAI client to the Data Access Gateway</p> <p><i>Parameter and File where Port is Configured:</i> <code>grpc.service.port</code> in <code>/opt/mapr/data-access-gateway/conf/properties.cfg</code></p>
<b>Data Access Gateway</b>	<p><i>Source IP:</i> C# OJAI client</p> <p><i>Destination IP:</i> Cluster nodes running the Data Access Gateway service</p> <p><i>Ports:</i> 5678</p> <p><i>Purpose:</i> The port used to connect the OJAI client to the Data Access Gateway</p> <p><i>Parameter and File where Port is Configured:</i> <code>grpc.service.port</code> in <code>/opt/mapr/data-access-gateway/conf/properties.cfg</code></p>
<b>Data Access Gateway</b>	<p><i>Source IP:</i> Java OJAI thin client</p> <p><i>Destination IP:</i> Cluster nodes running the Data Access Gateway service</p> <p><i>Ports:</i> 5678</p>

**Apache Kafka Wire Protocol Service**

*Purpose:* The port used to connect the OJAI client to the Data Access Gateway

*Parameter and File where Port is*

*Configured:* `grpc.service.port` in `/opt/mapr/data-access-gateway/conf/properties.cfg`

*Source IP:* Apache Kafka Client

*Destination IP:* Cluster nodes running the Data Access Gateway service

*Ports:* 9092

*Purpose:* The port used by Apache Kafka Wire Protocol Service to connect the Kafka client to the Data Access Gateway service.

*Parameter and File where Port is Configured:*

`port` in `/opt/mapr/data-access-gateway/conf/kafka-server.conf`

**Drill JMX Port**

*Source IP:* Nodes running the Drillbit service

*Destination IP:* Drill JMX Port

*Ports:* 6090

*Purpose:* The port on which `Collectd` gathers Drill metrics via JMX.

*Parameter and File where Port is Configured:* Not Applicable

**Drill Web UI**

*Source IP:* Nodes running the Drillbit service

*Destination IP:* Nodes running the Drillbit service

*Ports:* 8047

*Purpose:* TCP port needed for the Drill Web UI and clients using REST API and nodes running the Drillbit service.

*Parameter and File where Port is Configured:*

`drill.exec.http.port` in `/opt/mapr/drill/drill-<version>/conf/drill-override.conf`

**Drill (User Port)**

*Source IP:* Nodes running the Drillbit service and clients using JDBC/ODBC

*Destination IP:* Nodes running the Drillbit service

*Ports:* 31010

*Purpose:* TCP user port address. Used between nodes in a Drill cluster. Needed for an external client, such as Tableau, to connect into the cluster nodes. Also needed for the Drill Web UI. You can also use this port to connect directly to a Drillbit.

*Parameter and File where Port is*

*Configured:* `drill.exec.rpc.user.server.port` in `/opt/mapr/drill/drill-<version>/conf/drill-override.conf`

**Drill (Control Port)**

*Source IP:* Nodes running the Drillbit service

*Destination IP:* Nodes running the Drillbit service

*Ports:* 31011

*Purpose:* TCP port that controls the port address. Used between nodes in a Drill cluster. Needed for multi-node installation of Drill.

*Parameter and File where Port is*

*Configured:* `drill.exec.rpc.bit.server.port`

<b>Drill (Data Port)</b>	<p><code>in /opt/mapr/drill/drill-&lt;version&gt;/conf/ drill-override.conf</code></p> <p><i>Source IP:</i> Nodes running the Drillbit service</p> <p><i>Destination IP:</i> Nodes running the Drillbit service</p> <p><i>Ports:</i> 31012</p> <p><i>Purpose:</i> TCP data port address. Used between nodes in a Drill cluster. Needed for multi-node installation of Drill.</p> <p><i>Parameter and File where Port is Configured:</i>  <code>drill.exec.rpc.bit.server.port + 1</code>  <code>in /opt/mapr/drill/drill-&lt;version&gt;/conf/ drill-override.conf</code></p>
<b>Drill (ZooKeeper Port)</b>	<p><i>Source IP:</i> Clients using JDBC/ODBC and nodes running ZooKeeper services</p> <p><i>Destination IP:</i> Nodes running the Drillbit service</p> <p><i>Ports:</i> 5181</p> <p><i>Purpose:</i> ZooKeeper port used to connect to Drill through the JDBC driver.</p> <p><i>Parameter and File where Port is Configured:</i> See the ZooKeeper entry in this list.</p>
<b>Elasticsearch (Components Communication Port)</b>	<p><i>Source IP:</i> Non-Elasticsearch components, such a web browser, curl, and Kibana, that connect to Elasticsearch.</p> <p><i>Destination IP:</i> Nodes running Elasticsearch for monitoring use cases</p> <p><i>Ports:</i> 9200</p> <p><i>Purpose:</i> Non-Elasticsearch components use this port when communicating with Elasticsearch.</p> <p><i>Parameter and File where Port is Configured:</i> You can configure a different port for monitoring use cases when you run the <a href="#">configure.sh</a> on page 2826 script with the <code>-ES</code> parameter.</p>
<b>Elasticsearch (Daemons Communication Port)</b>	<p><i>Source IP:</i> Nodes running Elasticsearch</p> <p><i>Destination IP:</i> Nodes running Elasticsearch for monitoring use cases</p> <p><i>Ports:</i> 9300</p> <p><i>Purpose:</i> Elasticsearch uses this port for communications between Elasticsearch daemons.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>Gateway</b>	<p><i>Source IP:</i> Nodes sending operations to replicate</p> <p><i>Destination IP:</i> Nodes running the gateway service</p> <p><i>Ports:</i> 7660</p> <p><i>Purpose:</i> The port used by gateway services to listen for incoming replication operations.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>Grafana</b>	<p><i>Source IP:</i> Web Browsers</p> <p><i>Destination IP:</i> Nodes running Grafana for monitoring</p> <p><i>Ports:</i> 3000</p>

<b>HBase Master</b>	<p><i>Purpose:</i> Web browsers use this port when connecting to Grafana.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> <p><i>Source IP:</i> HBase Clients</p> <p><i>Destination IP:</i> Nodes running HBase Master services</p> <p><i>Ports:</i> 16000</p> <p><i>Purpose:</i> HBase API and HBase shell use this port to connect to HBase Master</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/hbase/hbase-&lt;version&gt;/conf/hbase-site.xml</p>
<b>HBase Master Web UI</b>	<p><i>Source IP:</i> HBase Master Web UI clients</p> <p><i>Destination IP:</i> Nodes running HBase Master services</p> <p><i>Ports:</i> 16010</p> <p><i>Purpose:</i> Information Web UI of HBase Master</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/hbase/hbase-&lt;version&gt;/conf/hbase-site.xml</p>
<b>HBase Thrift Server</b>	<p><i>Source IP:</i> HBase Thrift Server clients</p> <p><i>Destination IP:</i> Nodes running HBase Thrift Server</p> <p><i>Ports:</i> 9090</p> <p><i>Purpose:</i> The HBase client uses this port to connect to HBase, using the Thrift protocol</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/hbase/hbase-&lt;version&gt;/conf/hbase-site.xml</p>
<b>HBase Thrift Web UI</b>	<p><i>Source IP:</i> HBase Thrift Web UI clients</p> <p><i>Destination IP:</i> Nodes running HBase Thrift</p> <p><i>Ports:</i> 9095</p> <p><i>Purpose:</i> Information Web UI of HBase Thrift</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/hbase/hbase-&lt;version&gt;/conf/hbase-site.xml</p>
<b>HBase REST Server</b>	<p><i>Source IP:</i> HBase REST Server clients</p> <p><i>Destination IP:</i> Nodes running HBase REST Server</p> <p><i>Ports:</i> 8080</p> <p><i>Purpose:</i> The HBase client uses this port to connect to HBase using the HTTP protocol</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/hbase/hbase-&lt;version&gt;/conf/hbase-site.xml</p>
<b>HBase REST Web UI</b>	<p><i>Source IP:</i> HBase REST Web UI clients</p> <p><i>Destination IP:</i> Nodes running HBase REST</p> <p><i>Ports:</i> 8086</p> <p><i>Purpose:</i> Information Web UI of HBase REST</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/hbase/hbase-&lt;version&gt;/conf/hbase-site.xml</p>

<b>HBase Regionserver</b>	<p><i>Source IP:</i> HBase Clients</p> <p><i>Destination IP:</i> Nodes running HBase Regionserver services</p> <p><i>Ports:</i> 16020</p> <p><i>Purpose:</i> HBase API and HBase shell use this port to connect to HBase RegionServer</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/hbase/hbase-&lt;version&gt;/conf/hbase-site.xml</p>
<b>HBase Regionserver UI</b>	<p><i>Source IP:</i> HBase Regionserver Web UI clients</p> <p><i>Destination IP:</i> Nodes running HBase Regionserver</p> <p><i>Ports:</i> 16030</p> <p><i>Purpose:</i> Information Web UI of HBase Regionserver</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/hbase/hbase-&lt;version&gt;/conf/hbase-site.xml</p>
<b>HistoryServer RPC</b>	<p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Nodes running MapReduce JobHistory Server</p> <p><i>Ports:</i> 10020</p> <p><i>Purpose:</i> Not Applicable</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>HistoryServer Web UI and REST APIs</b>	<p><i>Source IP:</i> Clients that access Job History Server UI in a non-secure cluster</p> <p><i>Destination IP:</i> Secure nodes running MapReduce JobHistory Server in a non-secure cluster</p> <p><i>Ports:</i> 19888</p> <p><i>Purpose:</i> Non-secure HistoryServer Web UI and REST APIs</p> <p><i>Parameter and File where Port is Configured:</i> See <a href="#">mapred-site.xml</a> on page 2989</p>
<b>HistoryServer Web UI and REST APIs</b>	<p><i>Source IP:</i> Clients that access Job History Server UI in a secure cluster</p> <p><i>Destination IP:</i> Secure nodes running MapReduce JobHistory Server in a secure cluster</p> <p><i>Ports:</i> 19890</p> <p><i>Purpose:</i> Secure HistoryServer Web UI and REST APIs</p> <p><i>Parameter and File where Port is Configured:</i> See <a href="#">mapred-site.xml</a> on page 2989</p>
<b>Hive Metastore</b>	<p><i>Source IP:</i> Nodes/clients performing Hive queries/operations</p> <p><i>Destination IP:</i> Nodes running the Hive metastore services</p> <p><i>Ports:</i> 9083</p> <p><i>Purpose:</i> Used by Hive clients to query/access the Hive metastore</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/hive/hive-&lt;version&gt;/conf/hive-site.xml</p>

<b>Hiveserver2</b>	<p><i>Source IP:</i> Nodes or clients performing hive queries using JDBC/ODBC</p> <p><i>Destination IP:</i> Nodes running Hiveserver2</p> <p><i>Ports:</i> 10000</p> <p><i>Purpose:</i> Port through which clients perform hive queries</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>Hiveserver2 Web UI</b>	<p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Nodes running Hiveserver2 Web UI</p> <p><i>Ports:</i> 10002</p> <p><i>Purpose:</i> Provides access to Hive configuration settings, local logs, metrics, and information about active sessions and queries.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>Hoststats</b>	<p>See <code>hoststats.port</code> and <code>hs.port</code> in the <a href="#">Warden configuration file</a>.</p>
<b>Httpfs</b>	<p><i>Source IP:</i> Nodes/clients accessing httpfs services</p> <p><i>Destination IP:</i> Nodes running httpfs services</p> <p><i>Ports:</i> 14000</p> <p><i>Purpose:</i> Used by httpfs file clients to access the httpfs server</p> <p><i>Parameter and File where Port is Configured:</i></p> <ul style="list-style-type: none"> <li><code>/opt/mapr/hadoop/hadoop-&lt;version&gt;/etc/hadoop/httpfs-env.sh</code></li> </ul>
<b>Hue Webservice</b>	<p><i>Source IP:</i> Nodes/clients accessing Hue web services</p> <p><i>Destination IP:</i> Nodes running Hue web services</p> <p><i>Ports:</i> 8888</p> <p><i>Purpose:</i> Used by Hue webservice clients to access the Hue webservice</p> <p><i>Parameter and File where Port is Configured:</i> <code>/opt/mapr/hue/hue*/desktop/conf/hue.ini</code></p>
<b>KSQL</b>	<p><i>Source IP:</i> All cluster nodes</p> <p><i>Destination IP:</i> Nodes running KSQL</p> <p><i>Ports:</i> 8084</p> <p><i>Purpose:</i> KSQL</p> <p><i>Parameter and File where Port is Configured:</i> <code>\$KSQL_INSTALL_DIR/etc/ksql/ksqlserver.properties</code></p>
<b>Kafka Connect</b>	<p><i>Source IP:</i> All cluster nodes</p> <p><i>Destination IP:</i> Nodes running Kafka Connect</p> <p><i>Ports:</i> 8083</p> <p><i>Purpose:</i> Kafka Connect REST API calls</p> <p><i>Parameter and File where Port is Configured:</i> <code>/opt/mapr/kafka/kafka-&lt;version&gt;/config/connect-distributed.properties</code></p>

<b>Kafka REST</b>	<p><i>Source IP:</i> All cluster nodes</p> <p><i>Destination IP:</i> Nodes running Kafka REST</p> <p><i>Ports:</i> 8082</p> <p><i>Purpose:</i> Kafka Connect REST API calls</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/kafka-rest/kafka-rest-&lt;version&gt;/config/kafka-rest.properties</p>
<b>Kafka Schema Registry</b>	<p><i>Source IP:</i> All cluster nodes</p> <p><i>Destination IP:</i> Nodes running Kafka Schema Registry</p> <p><i>Ports:</i> 8087</p> <p><i>Purpose:</i> Kafka Schema Registry API calls</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/schema-registry/schema-registry-&lt;version&gt;/config/schema-registry.properties</p>
<b>Kibana</b>	<p><i>Source IP:</i> Web browsers</p> <p><i>Destination IP:</i> Nodes running Kibana for monitoring use cases</p> <p><i>Ports:</i> 5601</p> <p><i>Purpose:</i> Web browsers use this port when connecting to Grafana.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>MAST Gateway</b>	<p><i>Source IP:</i> Nodes running MAST Gateway service</p> <p><i>Destination IP:</i> Nodes running MAST Gateway service</p> <p><i>Ports:</i> 8660</p> <p><i>Purpose:</i> Data Fabric clients use this port to connect to the MAST Gateway</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/conf/mastgateway.conf</p>
<b>file system server</b>	<p><i>Source IP:</i> Nodes running any Data Fabric services, clients interacting with the file system</p> <p><i>Destination IP:</i> Nodes running FileServer services</p> <p><i>Ports:</i> 5660, 5692, 5724, and 5756</p> <p><i>Purpose:</i> The filesystem is a random read-write distributed filesystem that allows applications to concurrently read and write directly to disk. Clients use these ports to access the file-system server.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>file system server</b>	<p><i>Source IP:</i> Nodes running the gateway service</p> <p><i>Destination IP:</i> Nodes running the file system</p> <p><i>Ports:</i> 6660</p> <p><i>Purpose:</i> The port on which gateway nodes send replicated operations to nodes in destination clusters.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>file system server instances</b>	<p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p>

<b>Object Store</b>	<p><i>Ports:</i> See <a href="#">Working with Multiple Instances of the File System</a> on page 1088</p> <p><i>Purpose:</i> Multiple file system instances</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p> <p><i>Source IP:</i> Nodes accessing MOSS</p> <p><i>Destination IP:</i> Nodes running MOSS</p> <p><i>Ports:</i> 9000</p> <p><i>Purpose:</i> Port for MOSS</p> <p><i>Parameter and File where Port is Configured:</i> The <code>moss.port</code> option in <code>/opt/mapr/conf/moss.conf</code>.</p>
<b>S3 Gateway</b>	<p> <b>CAUTION:</b> The default port for S3 Gateway is also 9000. If you run S3 Gateway and Object Store, change one of the ports to avoid conflicts.</p> <p><i>Source IP:</i> Nodes accessing the S3 Gateway server</p> <p><i>Destination IP:</i> Nodes running the S3 Gateway server</p> <p><i>Ports:</i> 9000</p> <p><i>Purpose:</i> Port for the S3 Gateway server</p> <p><i>Parameter and File where Port is Configured:</i> The <code>ports</code> option in <code>/opt/mapr/objectstore-client/objectstore-client-&lt;version&gt;/conf/minio.json</code></p>
<b>NFS</b>	<p><i>Source IP:</i> Nodes/clients accessing the filesystem via the NFS protocol</p> <p><i>Destination IP:</i> Nodes running Data Fabric NFS Services</p> <p><i>Ports:</i> 2049</p> <p><i>Purpose:</i> NFSv3 or NFSv4 access to the file system</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>NFS</b>	<p><i>Source IP:</i> Nodes running NFS services</p> <p><i>Destination IP:</i> Nodes running NFS services</p> <p><i>Ports:</i> 9997, 9998</p> <p><i>Purpose:</i> NFS VIP Management</p> <p><i>Parameter and File where Port is Configured:</i> <code>/opt/mapr/conf/nfsserver.conf</code></p>
<b>NodeManager JMX Port</b>	<p><i>Source IP:</i> Nodes running NodeManager</p> <p><i>Destination IP:</i> NodeManager JMX Port</p> <p><i>Ports:</i> 8027</p> <p><i>Purpose:</i> The port on which Collectd gathers metrics from NodeManager nodes via JMX.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>NodeManager</b>	<p><i>Source IP:</i> Nodes running NodeManager</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 8099</p>

	<p><i>Purpose:</i> The node manager manages the health of each node in the cluster.</p> <p><i>Parameter and File where Port is Configured:</i> <code>yarn.nodemanager.address</code> in <code>/opt/mapr/hadoop/hadoop-&lt;version&gt;/etc/hadoop/yarn-site.xml</code></p>
<b>NodeManager Localizer RPC</b>	<p><i>Source IP:</i> Nodes running NodeManager</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 8040</p> <p><i>Purpose:</i> The port that node manager uses to localize resources for a node. With localization, remote resources are downloaded to the local filesystem for access.</p> <p><i>Parameter and File where Port is Configured:</i> <code>yarn.nodemanager.localizer.address</code> in <code>/opt/mapr/hadoop/hadoop-&lt;version&gt;/etc/hadoop/yarn-site.xml</code></p>
<b>NodeManager Web UI and REST APIs</b>	<p><i>Source IP:</i> External Web browsers and REST clients accessing NodeManager services in a non-secure cluster</p> <p><i>Destination IP:</i> Nodes running NodeManager services in a non-secure cluster</p> <p><i>Ports:</i> 8042</p> <p><i>Purpose:</i> NodeManager HTTP port</p> <p><i>Parameter and File where Port is Configured:</i> <code>yarn.nodemanager.webapp.address</code> in <code>/opt/mapr/hadoop/hadoop-&lt;version&gt;/etc/hadoop/yarn-site.xml</code></p>
<b>NodeManager Web UI and REST APIs</b>	<p><i>Source IP:</i> External Web browsers and REST clients accessing NodeManager services in a secure cluster</p> <p><i>Destination IP:</i> Nodes running NodeManager services in a secure cluster</p> <p><i>Ports:</i> 8044</p> <p><i>Purpose:</i> NodeManager HTTPS port</p> <p><i>Parameter and File where Port is Configured:</i> <code>yarn.nodemanager.webapp.https.address</code> in <code>/opt/mapr/hadoop/hadoop-&lt;version&gt;/etc/hadoop/yarn-site.xml</code></p>
<b>OpenTSDB</b>	<p><i>Source IP:</i> OpenTSDB clients, such as <code>Collectd</code>.</p> <p><i>Destination IP:</i> Nodes running OpenTSDB for monitoring use cases.</p> <p><i>Ports:</i> 4242</p> <p><i>Purpose:</i> <code>Collectd</code> uses this port to write metrics to OpenTSDB.</p> <p><i>Parameter and File where Port is Configured:</i> You can configure a different port for monitoring use cases when you run <a href="#">configure.sh</a> on page 2826 script with the <code>-OT</code> parameter.</p>
<b>Port Mapper</b>	<p><i>Source IP:</i> Nodes running Data Fabric NFS Services</p> <p><i>Destination IP:</i> Nodes/clients accessing the filesystem using the NFS protocol</p> <p><i>Ports:</i> 111</p>

	<p><i>Purpose:</i> RPC Portmap services used to connect to the file system using NFSv3</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>Ranger (nonsecure Admin UI for http)</b>	<p><i>Source IP:</i> Nodes or clients accessing the Ranger Admin (UI/API) service</p> <p><i>Destination IP:</i> Nodes running the Ranger Admin service</p> <p><i>Ports:</i> 6080</p> <p><i>Purpose:</i> Used by Ranger Admin clients to access the Ranger Admin service</p> <p><i>Parameter and File where Port is Configured:</i> <code>ranger.service.http.port</code> in <code>/opt/mapr/ranger/ranger-2.3.0/ranger-admin/conf/ranger-admin-site.xml</code></p>
<b>Ranger (secure Admin UI for https)</b>	<p><i>Source IP:</i> Nodes or clients accessing the Ranger Admin (UI/API) service</p> <p><i>Destination IP:</i> Nodes running the Ranger Admin service</p> <p><i>Ports:</i> 6182</p> <p><i>Purpose:</i> Used by Ranger Admin clients to access the Ranger Admin service</p> <p><i>Parameter and File where Port is Configured:</i> <code>ranger.service.https.port</code> in <code>/opt/mapr/ranger/ranger-2.3.0/ranger-admin/conf/ranger-admin-site.xml</code></p>
<b>Ranger Usersync</b>	<p><i>Source IP:</i> Nodes or clients accessing the Ranger Usersync service</p> <p><i>Destination IP:</i> Nodes running the Ranger Usersync service</p> <p><i>Ports:</i> 5151</p> <p><i>Purpose:</i> Used by the Ranger Admin to access the Ranger Usersync service</p> <p><i>Parameter and File where Port is Configured:</i> <code>ranger.usersync.port</code> in <code>/opt/mapr/ranger/ranger-2.3.0/ranger-usersync/conf/ranger-ugsync-site.xml</code></p>
<b>ResourceManager JMX Port</b>	<p><i>Source IP:</i> Nodes running ResourceManager</p> <p><i>Destination IP:</i> ResourceManager JMX port</p> <p><i>Ports:</i> 8025</p> <p><i>Purpose:</i> The port on which Collectd gathers metrics from the ResourceManager using JMX.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>ResourceManager Admin RPC</b>	<p><i>Source IP:</i> Applications that access the ResourceManager</p> <p><i>Destination IP:</i> Nodes running ResourceManager</p> <p><i>Ports:</i> 8033</p> <p><i>Purpose:</i> The port that applications use to access the ResourceManager RPC</p> <p><i>Parameter and File where Port is Configured:</i> <code>yarn.resourcemanager.admin.address</code></p>

	<p>in /opt/mapr/hadoop/hadoop-&lt;version&gt;/etc/hadoop/yarn-site.xml</p> <p><i>Source IP:</i> Clients that submit YARN applications</p> <p><i>Destination IP:</i> Nodes running ResourceManager</p> <p><i>Ports:</i> 8032</p> <p><i>Purpose:</i> The port that clients use to access the YARN applications</p> <p><i>Parameter and File where Port is Configured:</i> yarn.resourcemanager.address in /opt/mapr/hadoop/hadoop-&lt;version&gt;/etc/hadoop/yarn-site.xml</p>
<p><b>ResourceManager Client RPC</b></p>	<p><i>Source IP:</i> Applications that access the ResourceManager</p> <p><i>Destination IP:</i> Nodes running ResourceManager</p> <p><i>Ports:</i> 8031</p> <p><i>Purpose:</i> The port that applications use to access the Resource Manager Tracker RPC</p> <p><i>Parameter and File where Port is Configured:</i> yarn.resourcemanager.resource-tracker.address in /opt/mapr/hadoop/hadoop-&lt;version&gt;/etc/hadoop/yarn-site.xml</p>
<p><b>ResourceManager Resource Tracker RPC (for NodeManagers)</b></p>	<p><i>Source IP:</i> Applications that access the ResourceManager</p> <p><i>Destination IP:</i> Nodes running ResourceManager</p> <p><i>Ports:</i> 8030</p> <p><i>Purpose:</i> The port on which the applications in the cluster talk to the ResourceManager.</p> <p><i>Parameter and File where Port is Configured:</i> yarn.resourcemanager.scheduler.address in /opt/mapr/hadoop/hadoop-&lt;version&gt;/etc/hadoop/yarn-site.xml</p>
<p><b>ResourceManager Scheduler RPC (for ApplicationMasters)</b></p>	<p><i>Source IP:</i> Clients that access ResourceManager UI in a non-secure cluster</p> <p><i>Destination IP:</i> Nodes running ResourceManager master in a non-secure cluster</p> <p><i>Ports:</i> 8088</p> <p><i>Purpose:</i> ResourceManager Web UI</p> <p><i>Parameter and File where Port is Configured:</i> yarn.resourcemanager.webapp.address in /opt/mapr/hadoop/hadoop-&lt;version&gt;/etc/hadoop/yarn-site.xml</p>
<p><b>ResourceManager Web UI (HTTP)</b></p>	<p><i>Source IP:</i> Clients that access ResourceManager UI in a secure cluster</p> <p><i>Destination IP:</i> Nodes running ResourceManager master in a secure cluster</p> <p><i>Ports:</i> 8090</p> <p><i>Purpose:</i> ResourceManager Web UI</p> <p><i>Parameter and File where Port is Configured:</i> yarn.resourcemanager.webapp.address in /opt/mapr/hadoop/hadoop-&lt;version&gt;/etc/hadoop/yarn-site.xml</p>
<p><b>ResourceManager Web UI (HTTPS)</b></p>	

<b>Shuffle HTTP</b>	<p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Shuffle HTTP</p> <p><i>Ports:</i> 13562</p> <p><i>Purpose:</i> The port that MapReduce Shuffle uses. Transferring the map outputs to reducer inputs in sorted form is the shuffle operation.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>Spark Standalone Master (RPC)</b>	<p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 7077</p> <p><i>Purpose:</i> The port on which to submit jobs in a Spark standalone cluster.</p> <p><i>Parameter and File where Port is Configured:</i> SPARK_MASTER_PORT in SPARK_HOME/conf/spark-env.sh</p>
<b>Spark Standalone Master (Web UI)</b>	<p><i>Source IP:</i> Nodes/clients accessing Spark services in a non-secure cluster</p> <p><i>Destination IP:</i> Nodes running Spark services in a non-secure cluster</p> <p><i>Ports:</i> 8580</p> <p><i>Purpose:</i> The port on which browsers connect to Spark master in a non-secure Spark standalone cluster.</p> <p><i>Parameter and File where Port is Configured:</i> SPARK_MASTER_WEBUI_PORT in SPARK_HOME/conf/spark-env.sh</p>
<b>Spark Standalone Master (Web UI)</b>	<p><i>Source IP:</i> Nodes/clients accessing Spark services in a secure cluster</p> <p><i>Destination IP:</i> Nodes running Spark services in a secure cluster</p> <p><i>Ports:</i> 8980</p> <p><i>Purpose:</i> The port on which browsers connect to a Spark master in a secure Spark standalone cluster.</p> <p><i>Parameter and File where Port is Configured:</i> SPARK_MASTER_WEBUI_PORT in SPARK_HOME/conf/spark-env.sh</p>
<b>Spark Standalone Worker</b>	<p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 8081</p> <p><i>Purpose:</i> The port on which browsers connect to Spark workers in a Spark standalone cluster.</p> <p><i>Parameter and File where Port is Configured:</i> SPARK_WORKER_WEBUI_PORT in SPARK_HOME/conf/spark-env.sh</p>
<b>Spark Thrift Server (if start and stop server using Spark scripts)</b>	<p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 10000</p> <p><i>Purpose:</i> The port on which JDBC clients connect to Spark Thrift server.</p>

<b>Spark Thrift Server (if start and stop server through Warden, starting in EEP 4.0)</b>	<p><i>Parameter and File where Port is Configured:</i> hive.server2.thrift.port in SPARK_HOME/conf/hive-site.xml</p> <p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 2304</p> <p><i>Purpose:</i> The port on which JDBC clients connect to Spark Thrift server.</p> <p><i>Parameter and File where Port is Configured:</i> hive.server2.thrift.port in SPARK_HOME/conf/hive-site.xml</p>
<b>Spark History Server</b>	<p><i>Source IP:</i> Clients that access Spark Job History in a non-secure cluster</p> <p><i>Destination IP:</i> Nodes running Spark History Server in a non-secure cluster</p> <p><i>Ports:</i> 18080</p> <p><i>Purpose:</i> The port on which browsers connect to a non-secure Spark history server.</p> <p><i>Parameter and File where Port is Configured:</i> spark.history.ui.port in SPARK_HOME/conf/spark-default.conf "</p>
<b>Spark History Server</b>	<p><i>Source IP:</i> Clients that access Spark Job History in a secure cluster</p> <p><i>Destination IP:</i> Nodes running Spark History Server in a secure cluster</p> <p><i>Ports:</i> 18480</p> <p><i>Purpose:</i> The port on which browsers connect to a secure Spark history server.</p> <p><i>Parameter and File where Port is Configured:</i> spark.ssl.historyServer.port in SPARK_HOME/conf/spark-defaults.conf (starting from Spark-2.2.1)</p>
<b>Spark External Shuffle Service</b>	<p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 7337</p> <p><i>Purpose:</i> The port on which Spark jobs connect to External Shuffle server.</p> <p><i>Parameter and File where Port is Configured:</i> spark.shuffle.service.port in SPARK_HOME/conf/spark-default.conf</p>
<b>Tez Shuffle</b>	<p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 13563</p> <p><i>Purpose:</i> Port to communicate with the Tez Shuffler. A Tez specific shuffle handler allows data to be shuffled in a way that takes advantage of the new features in Tez</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>Timeline Server</b>	<p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p>

	<p><i>Ports:</i> 10200</p> <p><i>Purpose:</i> Hadoop IPC port used for internal communication in Hadoop</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>Timeline Server Web Interface (HTTP)</b>	<p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 8188</p> <p><i>Purpose:</i> Non-secure web access for the Timeline Server. The Timeline Server allows storage and retrieval of an application's current and historic information in a generic fashion.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>Timeline Server Web Interface (HTTPS)</b>	<p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 8190</p> <p><i>Purpose:</i> Secure web access for the Timeline Server</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>Tomcat Port (Hive-on-Tez UI)</b>	<p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 9383</p> <p><i>Purpose:</i> The non-secure port to access the Tez UI. Hive-on-Tez speeds up execution of Hive queries.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>Tomcat SSL Port (Hive-on-Tez UI)</b>	<p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 9393</p> <p><i>Purpose:</i> The secure port to access the Tez UI.</p> <p><i>Parameter and File where Port is Configured:</i> Not Applicable</p>
<b>Web UI</b>	<p><i>Source IP:</i> External web browser accessing either a <i>non-secure</i> or a <i>secure</i> cluster</p> <p><i>Destination IP:</i> Nodes running the Control System Web UI in a non-secure or a secure cluster</p> <p><i>Ports:</i> 8443</p> <p><i>Purpose:</i> Control System Web UI</p> <p><i>Parameter and File where Port is Configured:</i> /opt/mapr/apiserver/conf/properties.cfg</p>
<b>Zeppelin</b>	<p><i>Source IP:</i> Not Applicable</p> <p><i>Destination IP:</i> Not Applicable</p> <p><i>Ports:</i> 9995</p> <p><i>Purpose:</i> The port to connect to the Zeppelin Docker container</p> <p><i>Parameter and File where Port is Configured:</i> Configurable by setting ZEPPELIN_SSL_PORT when running the Zeppelin Docker image</p>

**ZooKeeper**

*Source IP:* Nodes running ZooKeeper services, clients executing ZooKeeper API calls

*Destination IP:* Nodes running ZooKeeper services

*Ports:* 5181

*Purpose:* ZooKeeper API calls

*Parameter and File where Port is Configured:*

- /opt/mapr/zookeeper/zookeeper-<version>/conf/zoo.cfg
- /opt/mapr/conf/warden.conf, /opt/mapr/conf/cldb.conf
- /opt/mapr/hbase/hbase-<version>/conf/hbase-site.xml
- /opt/mapr/hive/hive-<version>/conf/hive-site.xml

**ZooKeeper follower-to-leader Communication**

*Source IP:* Nodes running ZooKeeper services

*Destination IP:* Nodes running ZooKeeper services

*Ports:* 2888

*Purpose:* ZooKeeper Server > Server Communication

*Parameter and File where Port*

*is Configured:* /opt/mapr/zookeeper/zookeeper-<version>/conf/zoo.cfg

**ZooKeeper Leader Election**

*Source IP:* Nodes running ZooKeeper services

*Destination IP:* Nodes running ZooKeeper services

*Ports:* 3888

*Purpose:* ZooKeeper Server > Server Communication

*Parameter and File where Port*

*is Configured:* /opt/mapr/zookeeper/zookeeper-<version>/conf/zoo.cfg

**Log Files**

Lists the log files for each HPE Ezmeral Data Fabric component.

The table below provides information on the log files for the components.

Component	Type of Log	Log File	Configuration File	Rotation	Maximum File Size	# of Backups	Expiration Period
CLDB	Main	/opt/mapr/logs/cldb.log	/opt/mapr/conf/log4j.cldb.properties	By Size	100MB	9	-
	Disk Balancer	/opt/mapr/logs/cldbdiskbalancer.log	/opt/mapr/conf/log4j.cldb.properties	Daily	-	-	10 days
	Role Balancer	/opt/mapr/logs/cldbrolebalancer.log	/opt/mapr/conf/log4j.cldb.properties	Daily	-	-	10 days
	Time Skew	/opt/mapr/logs/timeskew.log	/opt/mapr/conf/log4j.cldb.properties	Daily	-	-	10 days
	Data Fabric filesystem Summary	/opt/mapr/logs/cdbfsummary.log	/opt/mapr/conf/log4j.cldb.properties	Daily	-	-	10 days
	Audit	/opt/mapr/logs/cdbaudit.json	/opt/mapr/conf/log4j.cldb.properties	Daily	-	-	-
	Guts	/opt/mapr/logs/cdbguts.log	/opt/mapr/conf/log4j.properties	-	-	-	10 days
	Proxy	/opt/mapr/logs/cdbproxy.log	/opt/mapr/conf/log4j.properties	-	-	-	10 days

Component	Type of Log	Log File	Configuration File	Rotation	Maximum File Size	# of Backups	Expiration Period
WebServer	Main	/opt/mapr/apiserver/logs/apiserver.log	/opt/mapr/apiserver/conf/properties.cfg	Every Startup	-	10	10 days
			/opt/mapr/conf/log4j.mcs.properties	Daily	-	-

## Increasing Log Retention

To increase log retention for specific component, you can modify the configuration file and reset the value of the properties.

### Increasing Log Retention for file system

In the `/opt/mapr/conf/mfs.conf` file, increase the value for the `mfs.max.logfile.size.in.mb` property. The value for this property is computed using the following formula:

```
maxSizePerLogFile = maxLogSize / MAX_NUM_OF_LOG_FILES
```

Here:

- `maxLogSize` specifies the total amount of space that file system log files can consume.
- `MAX_NUM_OF_LOG_FILES` specifies the total number of file system log files (5 hard coded).

For example, for a value of 10 GB, there will be 5 log files (`mfs.log-3` to `mfs.log-3.4`) of 2GB each.

### Increasing Log Retention for CLDB

**NOTE:** This setting does not impact audit logging.

In the `/opt/mapr/conf/log4j2.cldb.xml` file, modify the `SizeBasedTriggeringPolicy` and `DefaultRolloverStrategy` properties.

- Modify the `size` attribute for `SizeBasedTriggeringPolicy` that specifies the size of each `cldb.log` before rolling over to write to a new log file. For example,
 

```
<SizeBasedTriggeringPolicy size="1024MB"/>
```
- Modify the `max` attribute for `DefaultRolloverStrategy` that specifies the number of `cldb.log*` files to be retained before the oldest one is deleted. For example,
 

```
<DefaultRolloverStrategy max="20" fileIndex="min"/>
```

With the aforementioned values for `SizeBasedTriggeringPolicy` and `DefaultRolloverStrategy`, the CLDB log files can grow to 20GB (1024\*20), before they are purged.

**IMPORTANT:** You must restart CLDB on all nodes for the change in the values of CLDB log retention properties to take effect. Restart the passive CLDB nodes first, followed by restarting of the active CLDB node, so that the active CLDB node fails over to a passive CLDB node with the new values for CLDB log retention properties. Run the following command to restart a CLDB node.

```
maprcli node services -cldb restart -nodes $(hostname)
```

### Increasing Log Retention for Hadoop Services

You can increase log retention for `ResourceManager`, `NodeManager`, `HistoryServer`, and `TimelineServer` by modifying the following properties in the `/opt/mapr/hadoop/hadoop-<Version>/etc/hadoop/log4j.properties` file:

- `hadoop.log.maxfilesize` — specifies the size of each `<service-name>-<hostname>.log` before rolling over.
- `hadoop.log.maxbackupindex` — specifies the number of `<service-name>-<hostname>.log*` before the oldest one is deleted.

For example, suppose the following configuration:

- `hadoop.log.maxfilesize = 1024Mb`
- `hadoop.log.maxbackupindex = 10`

There will be 10 GB of total service-specific logs (1GB per file) before the oldest file is purged.

### Setting the Tracing Level

To check all the modules and their current logging levels, run the following command:

```
maprcli trace info
```

To set the tracing level for a module, run the `maprcli trace setlevel` command. For example:

```
maprcli trace setlevel -module FuseMonitor -level DEBUG
```

### Configuring Profiling for Operations

To check the amount of time it took to complete each operation (from the time of submission), enable profiling for client RPC and file system operations. To enable profiling for:

- Client RPC, run the following command:

```
fcdebug -s <shmid> -m ClntProfileRpc -l DEBUG
```

**TIP:** For more information, see [fcdebug](#).

Enabling profiling for the client RPC will allow you to determine, for each RPC, the amount of time it took to receive a response after submitting the request.

- file system operations, run the following command:

```
maprcli trace setlevel -module FSProfile -level debug
```

**TIP:** For more information, see [maprcli](#).

Enabling profiling for file system operations will allow you to determine the amount of time it took file system to process each operation.

By default, profiling is disabled for both client RPC and file system operations. Once enabled, the log for:

- Client RPC should look similar to the following:

```
2016-06-16 10:58:04,6404 DEBUG ClntProfileRpc
fs/client/fileclient/cc/client.cc:3483 Thread: 32188 Profile: CltRpcDone:

```

### Archiving CLDB Logs

The CLDB logs can be archived by setting the value for the configuration parameter, `cldb.logarchiver.enabled`, using the `maprccli config save` command. The value can be:

- 0 — disable
- 1 — enable

To:

- Enable archiving, run the following command:

```
maprccli config save -values '{"cldb.logarchiver.enabled":"1"}'
```

- Disable archiving, run the following command:

```
maprccli config save -values '{"cldb.logarchiver.enabled":"0"}'
```

The default value for this parameter is 2, which indicates that the CLDB log archiving is disabled; but on clusters with 50 or more file system nodes, the CLDB log archiving will be automatically enabled unless the value is explicitly set to 0.

If/when archiving is enabled:

- All static CLDB log files, except the active `cldb.log` file, are periodically scanned and archived in `/var/mapr/cldblog/<hostname>` directory.

- The filename for the archived log file is autogenerated based on the date and timestamp on the first log line in the file chosen for archival.

For example, suppose a log file with the following first line:

```
2017-04-06 12:42:16,020 INFO CLDB [main]: Loading properties file : /opt/
mapr/conf/cldb.conf
```

The archived log filename in `/var/mapr/cldblog/<hostname>` directory will be:  
2017-04-06\_12.42.16.020

## Enabling Runtime Logging

To enable logging at runtime for the file client (`libfsalmapr.so` library), run the `fcdebug` utility:

```
/opt/mapr/server/tools/fcdebug -s <shmid> -m <module> [-l <level>]
/opt/mapr/server/tools/fcdebug -i -s <shmid>
```

Before running this command, make a note of the following:

- If necessary, run `maprcli trace info` to retrieve the list of modules.  
The default value for module is all.
- Level should be one of FATAL, ERROR, WARN, INFO, DEBUG.  
If level is not specified, default level is applied for the module.
- The `-i` lists the current debug level of all modules.
- The `shmid` is available in the `fsal.log-*` files when `libMapRClient` is loaded.

For example, the first line in the log file is something similar to the following:

```
2017-02-13 11:56:32,6809 ERROR FuseAPI fs/client/fileclient/cc/
fuse_api.cc:1371
Thread: 428 Shmid to be used by fcdebug 512720897
```

This `shmid` can be used with `fcdebug`.

**NOTE:** Run `fcdebug` once for every library (every library has a separate shared memory). The `shmid`s can be found in the respective `fsal` log files.

## Viewing Audit Logs

The following sections describe audit logs for execution of any `maprcli` command, REST API call, or action in Control System, and audit logs for cluster administration, file system, table, and stream operations.

### *Viewing Log Entries for Audited maprcli Command Executions*

Describes where audit records of operations performed using the CLI are stored and how to view them.

The execution of any `maprcli` command on the cluster is logged in the local filesystem on the node on which the execution happened. The log file is `/opt/mapr/mapr-cli-audit-log/audit.log.json`. Auditing of CLI operations is always enabled, whether or not auditing is enabled for cluster-level operations with the `maprcli audit cluster` command.

Typical log entries provide a timestamp of the execution, the UID of the user who ran the command, the IP address from which the user ran the command, the command itself, and the status of the execution. Status codes are 0 for success and 1 for failure. The error messages field provides the reasons for failures.

Below are some typical log entries:

```
{ "timestamp" :
  { "$date" : "2015-06-15T11:45:56.434Z" }, "uid" : 2147483632, "ipAddress" :
  "10.10.20.12", "command" : "volume info", "arguments" :
  { "name" : "mapr.opt" }, "status" :
  1, "errors" : [ "Volume lookup of mapr.opt failed, No such volume" ] }
{ "timestamp" :
  { "$date" : "2015-06-15T11:49:34.434Z" }, "uid" : 2147483632, "ipAddress" :
  "10.10.20.12", "command" : "alarm add", "arguments" : { "baseService" : "1", "alarm" :
  "NODE_ALARM_SERVICE_GATEWAY_DOWN", "service" : "gateway", "displayName" : "Gateway
  ServiceDown",
  "serviceName" : "GatewayService", "terse" : "nagwsd" }, "status" : 1, "errors" :
  [ "Terse name of
  nagwsd already exists in the system.", "Alarm
  NODE_ALARM_SERVICE_GATEWAY_DOWN already
  exists in the system." ] }
{ "timestamp" :
  { "$date" : "2015-06-15T11:49:52.598Z" }, "uid" : 2147483632, "ipAddress" :
  "10.10.20.12", "command" : "volume create", "arguments" :
  { "name" : "mapr.hbase", "path" : "/hbase",
  "replicationtype" : "low_latency" }, "status" : 1, "errors" : [ "Volume Name
  mapr.hbase, Already In Use" ] }
```

#### *Viewing Audit Logs for Cluster Administration*

Describes where audit records of cluster administration operations are stored and how to view them.

Entries for audit logs are initially held in memory until 128 operations have been logged or 10 seconds have elapsed, whichever happens first. At that point, the new log entries are flushed to disk.

Audit logs are in JSON format, so they can be queried by Drill or processed by other third-party tools or your own scripts.

Audit logs are readable only by the `mapr` and `root` users on the cluster where the logs are located. These users can also copy and delete audit logs.

The `status` field in every log entry shows the status of the attempted operation. The status codes are taken from the Linux `errno.h` file. For a list of these codes, see [Status Codes That Can Appear in Audit Logs](#).

Audit logs use Coordinated Universal Time (UTC) in the records of audited operations.

The cleanup of old audit log files is handled by Warden either when they are older than 10 days (the default retention time) or when they are older than the number of days set for the `log.retention.time` parameter in the `/opt/mapr/conf/warden.conf` file. To prevent Warden from removing the log files, by default, `cldbaudit*` and `authaudit*` are listed under the `log.retention.exceptions` parameter in the `warden.conf` file.

To enable Warden to automatically cleanup log files, remove `cldbaudit*` and `authaudit*` from the `log.retention.exceptions` parameter in the `warden.conf` file and, if you want a shorter cleanup time, set the value for `log.retention.time` parameter in the `warden.conf` file. The value for `log.retention.time` must be specified in milliseconds.

To disable all exceptions, comment out the `log.retention.exceptions` parameter, that is, `#log.retention.exceptions`. When this parameter is null, that is, `log.retention.exceptions=`, no files are picked for log cleanup.

### Viewing Audit Logs for File System, Table, and Stream Operations

Describes where file system, HPE Ezmeral Data Fabric Database, and HPE Ezmeral Data Fabric Streams audit logs are stored and how to view them.

Operations on the HPE Ezmeral Data Fabric file, database, and event data are captured and recorded in the audit logs. The operations take place within volumes and have effects at the level of the file system.

These audit logs are stored in a system volume created specifically to store them. This volume is created automatically during cluster installations and upgrades. Operations are logged on the nodes on which the operations are executed, which could differ from the nodes where operations are initiated. Logs are stored in the file system at `/var/mapr/local/<node_name>/audit/`. By default, only root and the cluster administrator (typically `mapr`) can read the log files. To allow other users to read the logs, set ACEs on the directory granting `readfile (rf)`, `readdir (rd)`, and `lookupdir (ld)` permissions to the users. For example:

```
~# hadoop mfs -setace -R -aces "rf:u:root|u:mapr|u:m7user1,rd:u:root|u:mapr|u:m7user1,ld:u:root|u:mapr|u:m7user1" /var/mapr/local/sample.qa.lab/audit/
```

**NOTE:** For more information, see [Enabling Volume, Directory, and File Authorizations with ACEs](#) on page 1853.

### Audit logs for operations on directories and files

Operations on directories and files, as well as the deletion of HPE Ezmeral Data Fabric Database tables, are logged in files that have this naming convention: `FSAudit.log.json-dd-mm-yyyy-<001-999>`

To see what information is recorded in typical log entries, see [Example Log Entries for Audited File System Operations](#).

### Audit logs for operations on HPE Ezmeral Data Fabric Database tables and HPE Ezmeral Data Fabric Streams

All operations on HPE Ezmeral Data Fabric Database tables and HPE Ezmeral Data Fabric Streams are logged in files that have this naming convention: `DBAudit.log.json-dd-mm-yyyy-<001-999>`

Operations that result from `maprcli` commands, REST calls, or activity in MCS are also logged in `/opt/mapr/mapr-cli-audit-log/audit.log.json` on the local file system of the nodes where the operations are processed.

To see what information is recorded in typical log entries, see [Example Log Entries for Audited Operations on HPE Ezmeral Data Fabric Database Binary and JSON Tables](#) on page 3125.

**NOTE:** Due to how the creation of tables is processed internally, sometimes the creation of tables is logged in `FSAudit.log.json`, rather than in `DBAudit.log.json`.

### Common Features of Audit Logs for File System, Table, and Stream Operations

Entries for audit logs are initially held in memory until 128 operations have been logged or 10 seconds have elapsed, whichever happens first. At that point, the new log entries are flushed to disk, depending on the [coalesce](#) interval.

The coalesce interval represents the interval of time during which READ, WRITE, or GETATTR operations on one file from one client IP address and UID/GID are logged only once for a particular operation, if auditing is enabled.

For example, suppose that a client application reads a single file three times in 6 minutes, so that there is one read at 0 minutes, another at 3 minutes, and a final read at 6 minutes. If the coalesce interval is at least 6 minutes, then only the first read operation is logged. However, if the interval is between 4 minutes, then only the first and third read operations are logged. If the interval is 2 minutes, all three read operations are logged.

Now however, if the client was also writing to the file, irrespective of the coalesce interval for the read operation in the example stated previously, the write operation is logged, as it is a different operation from reading.

The default value is 60 minutes. Setting this field to a larger number helps prevent audit logs from growing quickly. To change the coalesce interval, see [volume audit](#) on page 2583.

Audit logs are in JSON format, so they can be queried by Drill or processed by other third-party tools or your own scripts.

Audit logs are readable only by the `mapr` and `root` users on the cluster where the logs are located. These users can also copy and delete audit logs.

The status field in every log entry shows the status of the attempted operation. The status codes are taken from the Linux `errno.h` file. For a list of these codes, see [Status Codes That Can Appear in Audit Logs](#).

Audit logs use Coordinated Universal Time (UTC) in the records of audited operations.

When operations are performed on directories, files, or tables that are being audited, the full names for those objects, as well as the current volume and the name of the user performing the operation, are not immediately available to the auditing feature. What are immediately available are IDs for those objects and users. Converting IDs to names at run-time would be costly for performance. Therefore, audit logs contain file identifiers (FIDs) for directories, files, and tables; volume identifiers for volume; and user identifiers (UIDs) for users.

You can resolve identifiers into names by using the [expandaudit](#) utility. This utility creates a copy of the log files for a specified volume, and in that copy are the names of the file system objects, users, and volumes that are in the audit log records. You can then query or process the copy.

A sample of the logs is as follows:

```
{ "timestamp" :
  { "$date" : "2021-07-14T13:05:01.506Z" }, "resource" : "test-audit-logs", "operation" : "volumeMirrorPermCheck", "username" : "root", "uid" : 0, "clientip" : "10.163.167.214", "status" : 0 }
{ "timestamp" :
  { "$date" : "2021-07-14T08:44:01.553Z" }, "resource" : "255", "operation" : "volumeLookup", "username" : "root", "uid" : 0, "clientip" : "10.163.167.214", "status" : 2 }
```

**NOTE:** There will be an entry in the audit log for each IP address on a node. For example, suppose there is a node with multiple IP addresses. The audit log on this node may show multiple entries of the same operation, each associated with a different IP address.

**NOTE:** The number of bytes read or written is not recorded.

### Example Log Entries for Audited File System Operations

When auditing of file system operations is enabled at the cluster level, volume level, and file system level, each operation on a directory or file is logged on the node on which the operation was initiated.

Typical log entries provide a timestamp of the operation, the type of operation, the UID of the user who ran the command, the IP address from which the user ran the command, identifiers of the affected resources, the volume identifier, and the status of the operation. Status codes come from the Linux `errno.h` file. For a list of these codes, see [Status Codes That Can Appear in Audit Logs](#).

**NOTE:** Due to the way that the creation of tables is processed internally, sometimes the creation of tables is logged in `FSAudit.log.json`, rather than in `DBAudit.log.json`.

Below are some typical log entries:

```
{ "timestamp" :
  { "$date" : "2015-06-06T10:44:22.800Z" }, "operation" : "MKDIR", "uid" : 0, "ipAddress" :
  :
```

```

"10.10.104.51", "parentFid": "2049.51.131248", "childFid": "2049.56.131258", "childName":
"ycsbTmp_1433587462796", "volumeId": 68048396, "status": 0}
{"timestamp":
{"$date": "2015-06-06T10:44:22.823Z"}, "operation": "LOOKUP", "uid": 0, "ipAddress":
"10.10.105.51", "srcFid": "2049.56.131258", "srcName": "range0", "volumeId": 68048396, "status": 2}
{"timestamp":
{"$date": "2015-06-06T10:44:22.824Z"}, "operation": "CREATE", "uid": 0, "ipAddress":
"10.10.104.51", "parentFid": "2049.56.131258", "childFid": "2049.57.131260", "childName": "range0",
"volumeId": 68048396, "status": 0}
{"timestamp":
{"$date": "2015-06-06T10:44:22.838Z"}, "operation": "WRITE", "uid": 0, "ipAddress":
"10.10.105.51", "srcFid": "2049.57.131260", "volumeId": 68048396, "status": 0}
{"timestamp":
{"$date": "2015-06-06T10:44:48.628Z"}, "operation": "READ", "uid": 0, "ipAddress":
"10.10.105.51", "srcFid": "2049.63.131272", "volumeId": 68048396, "status": 0}

```

To convert the user IDs to usernames, file identifiers to pathnames, and volume IDs to volume names, run the [expandaudit](#) on page 2874 utility. For example, here are the same audit records after they were processed by this utility:

```

{"timestamp": {"$date=2015-06-06T10:44:22.800Z"}, "operation": "MKDIR", "user": "root", "uid": "0", "ipAddress":
"10.10.104.51", "parentPath": "/ycsb1433587356934", "childPath": "/ycsb1433587356934/ycsbTmp_1433587462796",
"childName": "ycsbTmp_1433587462796", "VolumeName": "mapr.cluster.root", "volumeId": "68048396", "status": "0"}
{"timestamp": {"$date=2015-06-06T10:44:22.823Z"}, "operation": "LOOKUP", "user": "root", "uid": "0", "ipAddress":
"10.10.105.51", "srcPath": "/ycsb1433587356934/ycsbTmp_1433587462796", "srcName": "range0", "VolumeName":

range6", "VolumeName": "mapr.cluster.root",
"volumeId": "68048396", "status": "0"}

```

#### Example Log Entries for Audited Operations on HPE Ezmeral Data Fabric Database Binary and JSON Tables

When auditing of table operations is enabled at the cluster level, volume level, and file system level, each operation on a table is logged on the node where the operation was executed, which could differ from the node where the operation was initiated.

Typical log entries provide a timestamp of the operation, the type of operation, the UID of the user who ran the command, the IP address from which the user ran the command, identifiers of the affected resources,

and the status of the operation. Fields such as “ColumnFamily” and “Column” for some operations are also included when applicable. Row keys are not included. Status codes come from the Linux `errno.h` file. For a list of these codes, see [Status Codes That Can Appear in Audit Logs](#).

 **NOTE:** Due to the way that the creation of tables is processed internally, sometimes the creation of tables is logged in `FSAudit.log.json`, rather than in `DBAudit.log.json`.

 **NOTE:** Audit logs do not display the indices of array elements when there are put or update operations on arrays that are in documents within JSON tables.

Below are some typical log entries:

```
{ "timestamp" :
{ "$date" : "2015-06-06T11:31:02.621Z" }, "operation" : "DB_GET", "uid" : 0, "ipAddress" :
"10.10.105.51", "volumeId" : 48210891, "tableFid" : "2751.77.131402", "status" : 0 }
{ "timestamp" :
{ "$date" : "2015-06-06T11:31:02.623Z" }, "operation" : "DB_SCAN", "uid" : 0, "ipAddress" :
"10.10.104.51", "volumeId" : 48210891, "tableFid" : "2751.77.131402", "status" : 0 }
{ "timestamp" :
{ "$date" : "2015-06-06T11:31:02.624Z" }, "operation" : "DB_PUT", "uid" : 0, "ipAddress" :
"10.10.104.51", "volumeId" : 48210891, "columnFamily" : "cf0", "columnQualifier" : "c0", "tableFid" :
"2751.77.131402", "status" : 0 }
```

To convert the user IDs to usernames, file identifiers to pathnames, and volume IDs to volume names, run the [expandaudit](#) utility. For example, here are the same audit records after they were processed by this utility:

```
{ "timestamp" :
{ "$date" : "2015-06-06T11:31:02.621Z" }, "operation" : "DB_GET", "uid" : 0, "ipAddress" :
"10.10.105.51", "VolumeName" : "mapr.cluster.root", "volumeId" : 48210891, "tablePath" :
"/ycsb1433588330006/ycsbTable0", "status" : 0 }
{ "timestamp" : " { $date=2015-06-06T11:03:16.721Z }", "operation" : "DB_SCAN", "user" :
"root", "uid" :
"0", "ipAddress" : "10.10.105.51", "VolumeName" : "mapr.cluster.root", "volumeId" : "
48210891", "tablePath" :
"/ycsb1433588330006/ycsbTable0", "status" : "0" }
{ "timestamp" :
{ "$date" : "2015-06-06T11:31:02.624Z" }, "operation" : "DB_PUT", "uid" : 0, "ipAddress" :
"10.10.104.51", "VolumeName" : "mapr.cluster.root", "volumeId" : 48210891, "columnF
amily" : "cf0",
"columnQualifier" : "c0", "tablePath" : "/ycsb1433588330006/
ycsbTable0", "status" : 0 }
```

## Managing Audit Logs for File System and Table Operations

There are three parameters that you can use to manage audit logs for file system and table operations:

- `-maxSize`
- `-retention`
- `-coalesce`

You can set the first two parameters with the `maprccli audit data` command. You can set the third parameter with the `maprccli volume audit` command.

### Effects of the `-maxSize` parameter

When you enable auditing with the `audit data` on page 2030 `maprcli audit data` command, you can use the `-maxSize` parameter to specify the size at which an alarm is raised concerning the size of the audit volume. The alarm is displayed on the dashboard in the Control System and in the output of the `alarm list` on page 2017 `maprcli alarm list` command. This alarm simply means that the threshold size has been reached. Audited operations are still logged to the audit volume in question.

There are three actions that you can take:

- If you decide that you want to be notified when the audit volume reaches a smaller or larger size, you can change the threshold by running the `maprcli audit data` command and changing the value of the `-maxSize` parameter.
- If you want to try preventing audit log files from growing as quickly as they are, you can change the number of identical operations that are logged within a number of minutes. Run the `maprcli audit data` command and increase the value of the `-coalesce` parameter. This parameter is described subsequently.
- If you are concerned about longer-term space requirements for storing audit log files, you can change the number of days to keep old log files before they are deleted. Run the `maprcli audit data` command and decrease the value of the `-retention` parameter. This parameter is also described below.

### Effects of the `-retention` parameter

When you enable auditing with the `maprcli audit data` command, you can use the `-retention` parameter to specify how many days to keep old log files.

Audit logs are rotated every night at midnight UTC time . The saved audit logs are kept until the retention period expires.

For example, suppose the retention period is 30 days. The node 192.168.10.15 in the volume `/myVolume` contains 30 days of saved log files for file-system operations and the current date is March 30, 2016. The directory `/var/mapr/local/102.168.10.15/audit/` contains these log files:

```
FSAudit.log.json-30-03-2016-001
FSAudit.log.json-29-03-2016-001
FSAudit.log.json-28-03-2016-001
...
FSAudit.log.json-01-03-2016-001
```

**NOTE:** If MFS is restarted on the same day, audit logs gets rotated, and new files with convention -002, -003, and so on are created with each restart.

If there is no more disk space for new entries in audit logs, audit logging stops.

If the size of the audit log volume exceeds its quota, an alarm is raised, though logging continues. The alarm is `VOLUME_ALARM_ADVISORY_QUOTA_EXCEEDED`. You can view alarms in [the Control System](#) or by running the command `maprcli alarm list`. The default quota is 32 GB.

### Effects of the `-coalesce` parameter

The `coalesce` on page 6345 parameter represents the interval of time during which READ, WRITE, or GETATTR operations on one file from one client IP address and UID/GID are logged only once for a particular operation, if auditing is enabled.

For example, suppose that a client application reads a single file three times in 6 minutes, so that there is one read at 0 minutes, another at 3 minutes, and a final read at 6 minutes. If the coalesce interval is at

least 6 minutes, then only the first read operation is logged. However, if the interval is between 4 minutes, then only the first and third read operations are logged. If the interval is 2 minutes, all three read operations are logged.

Now however, if the client was also writing to the file, irrespective of the coalesce interval for the read operation in the example stated previously, the write operation is logged, as it is a different operation from reading.

The default value is 60 minutes. Setting this field to a larger number helps prevent audit logs from growing quickly.

### Status Codes That Can Appear in Audit Logs

In the `status` field in entries in audit logs, numeric codes other than 0 for success can appear. For the list of possible codes, their keyword equivalents, and descriptions, refer to the standard Linux `errno-base.h` and `errno.h` files. The `authaudit.log.json` file contains HTTP status codes. See [HTTP Status Codes](#) for more information.

### Viewing Application Logs

You can use logs to view the status and analyze the execution of applications in a cluster.

To view the status or to access logs for running applications, you can use the user interface associated with the YARN framework.

- For MapReduce version 2 or non-MapReduce applications, access the ResourceManager user interface from the Control System to view the status and logs for a particular application.

For completed applications, the distributed nature of YARN frameworks can make analyzing the execution of applications difficult because tasks and containers are scattered throughout the cluster. Without centralized or aggregated logging, you must manually access all the log files for a completed application by merging the log details for a particular application across multiple nodes in the cluster. With centralized or aggregated logging, you can access all the logs for a completed application in a centralized location. However, the steps to access logs for completed applications differ based on the configured logging option.

#### Logging Options

In a HPE Ezmeral Data Fabric cluster, the logging option that you configure defines how the logs are stored and accessed:

- **Centralized logging.** The logs are written to local volumes on the file system.
- **YARN log aggregation.** The logs are written to the local file system, and then the container logs from each node are aggregated and stored on the file system.
- **Local logging.** The log files for each job or application are written to the local file system. This method is the default behavior for MapReduce version 2 (MRv2) applications and non-MapReduce applications.
  - For MRv2 or other applications that run on YARN, the logs are written to the following directory on the local file system: `/opt/mapr/hadoop/hadoop-2.x.x/logs/userlogs/`

The logging options that you can choose from are determined by the type of jobs or applications that you run:

Type of Job or Application	Available Logging Options
MRv2	<ul style="list-style-type: none"> <li>• Centralized logging</li> <li>• YARN log aggregation</li> <li>• Local logging (default)</li> </ul>

Type of Job or Application	Available Logging Options
YARN applications (non-MapReduce)	<ul style="list-style-type: none"> <li>YARN log aggregation</li> <li>Local logging (default)</li> </ul>

If you enable centralized logging for MRv2, the MapReduce applications uses centralized logging, while the other YARN applications in the cluster use local logging.

**NOTE:** Select a logging option that stores the logs on the file system for the following reasons:

- Prevent job or application failures due to a lack of space on the local file system for logs.
- Prevent the loss or inaccessibility of logs due to node failure. Logs stored in a local volume are two-way replicated.

### YARN Log Aggregation

The YARN Log Aggregation option aggregates and moves log files for completed applications from the local file system to the HPE Ezmeral Data Fabric . This allows users to view the entire set of logs for a particular application using the HistoryServer UI or by running the `yarn logs` command.

By default, YARN container logs are not aggregated on the Data Fabric . Instead, the logs are retained for 3 hours on the local file system before they are deleted. To enable YARN log aggregation or to edit the configuration of YARN log aggregation, you must edit the `yarn-site.xml` file in the following directory: `/opt/mapr/hadoop/hadoop-2.x.x/etc/hadoop/`

### Enabling YARN Log Aggregation

To enable YARN log aggregation, add or edit the following properties in `yarn-site.xml`:

- Set the value of the `yarn.log-aggregation-enable` to `true`.
- Configure the `yarn.log.server.url` property to contain the URL of the YARN HistoryServer, which should look like the following:

secure cluster	<code>https://&lt;historyserver-host&gt;:19890/jobhistory/logs</code>
----------------	-----------------------------------------------------------------------

- Optional: Set the `yarn.nodemanager.remote-app-log-dir` value to a location in the HPE Ezmeral Data Fabric file system. By default, the location is `maprfs:///tmp/logs`.
- Optional: Set the `yarn.nodemanager.remote-app-log-dir-suffix` value to the name of the folder that should contain the logs for each user. By default, the folder name is `logs`.

Aggregated logs are owned by the user who runs the job. For example, if user **admin** runs a job, the logs are stored to `maprfs:///tmp/logs/admin`. If user **analyst** runs a job, the logs are stored to `maprfs:///tmp/logs/analyst`. If these two users do not share the same UNIX group, they will be unable to see each other's logs.

**NOTE:** If centralized logging and YARN log aggregation are enabled, the logs for MapReduce version 2 applications are managed by Centralized Logging while the logs for non-MapReduce applications are managed by YARN log aggregation.

### Enabling YARN Local-Node Log Aggregation

The steps in this procedure configure log aggregation for NodeManager processes, enabling you to store the logs on nodes (node-local volumes) where the YARN containers are launched.

To enable YARN local-node log aggregation, add or edit the following properties in the `yarn-site.xml` file:

1. Set the `yarn.node-local-log-aggregation.enable` value to `true`.

**NOTE:** The default setting for YARN Log Aggregation (`yarn.log-aggregation-enable`) should be removed or set to `false` in the `yarn-site.xml` file.

2. Optional: Set the `yarn.node-local-log-aggregation.metadata-path` value to a location in the system. By default the location is `maprfs:///NM_REMOTE_APP_LOG_DIR/<user>/logsMeta`. `NM_REMOTE_APP_LOG_DIR` should match the `yarn.nodemanager.remote-app-log-dir` property.

**NOTE:** The location should not be an absolute path (the location begins from `/`). In the file system (`maprfs`), the default setting for `NM_REMOTE_APP_LOG_DIR` is `/tmp/logs`.

3. Optional: Set the `node-local-log-aggregation.metadata-filename` value to the name of the metafile that should contain the information about containers for each node. By default, the file name is `containers.seq`. If you use default paths, the file is stored at `/tmp/logs/${user}/logsMeta/<appId>/<nodeName>/containers.seq`.
4. Restart NodeManager and HistoryServer services.

Aggregated logs are owned by the user who runs the job.

Different users cannot see each other's logs. For example, if the HPE Ezmeral Data Fabric user **admin** runs a job, the logs are stored in `maprfs:///var/mapr/local/<nodeNames>/mapred/nodeManager/logs/admin/<appId>`. If a user **analyst** runs a job, the logs are stored in `maprfs:///var/mapr/local/<nodeNames>/mapred/nodeManager/logs/analyst/<appId>`.

### Viewing Logs for Completed Applications

With YARN log aggregation, you can use `yarn` commands or the HistoryServer UI to access logs for completed applications.

### View Application Logs from the Command Line

#### About this task

Get the application ID and then view log files for the application.

#### Get the Application ID

To get the application ID for an application that is in a "running" state, you can run the following command:

```
yarn application -list
```

However, if you run `yarn application -list` after a job completes, the command will not return any information.

To get the application ID for an application in any state (submitted, accepted, or running), run the following command:

```
yarn application -list -appStates ALL
```

The `yarn application -list` command returns information similar to the following, including the application ID:

```
20/10/19 14:57:51 INFO
client.MapRZKBasedRMFailoverProxyProvi
der: Updated RM address to
node1.cluster.com/192.168.33.11:8032
Total number of applications
(application-types: [] and states:
[SUBMITTED, ACCEPTED, RUNNING]):1
Application-Id Application-Name
Application-Type User Queue State
Final-State Progress Tracking-URL
application_1603118361219_0002
QuasiMonteCarlo MAPREDUCE mapr
root.mapr ACCEPTED UNDEFINED 0% N/A
```

### View Application Logs

Run the following command to view log files for an application:

```
yarn logs -applicationId
<application-ID>

//Example: yarn logs -applicationId
application_1603118361219_0002
```

### Using UI to View Logs for Completed Applications

Explains how to view HistoryServer logs using the graphical interface.

#### About this task

You can view the logs for completed applications through the Control System and by directly accessing the HistoryServer UI.

### Using the Control System to View the HistoryServer Logs for Completed Applications

#### Procedure

1. Log on to the Control System and click **Services** to display the list of services.

**NOTE:** The **Services** menu is not available on the Kubernetes version of the Control System.

2. Click the **History Server** link in the list of services to display the **JobHistory** page in a new tab.
3. Click the job ID link for the job you want to view the logs for.
4. Click the logs link in the **Logs** column of the **Application Master** section.

### Using the HistoryServer UI to View Logs for Completed Applications

#### Procedure

1. Open a browser and go to the following URL to open the JobHistory page:

#### Non-secure cluster

```
http://<IP address of HistoryServer
node>:19888
```

**Secure cluster**

```
https://<IP address of
HistoryServer node>:19890
```

2. Click the job ID link for the job for which you want to view the logs.
3. Click the logs link in the **Logs** column of the **Application Master** section.

## Editing the Retention Settings of Aggregated Logs

**About this task**

By default, aggregate logs are stored on the HPE Ezmeral Data Fabric file system for 30 days. The retention time for aggregated logs also applies to centralized logs.

To edit the retention settings, add or edit the following properties in the *yarn-site.xml* file:

**Procedure**

1. Set the value of `yarn.log-aggregation.retain-seconds` to the duration that the logs are maintained. If you set a negative value for `yarn.log-aggregation.retain-seconds`, logs are not deleted.

**NOTE:** The duration specified by `yarn.log-aggregation.retain-seconds` starts from the time that the application starts running. Therefore, if you configure the duration, be sure to consider how long you want the log to remain in addition to the amount of time that the application will take to run. For example, if you expect most applications to take 20 seconds to run, do not set the value of this property to 20 seconds because the log might be deleted as soon as the applications completes.

2. Optionally, set the `yarn.log-aggregation.retain-check-interval-seconds` to specify how often the log retention check should be run. By default, it is one-tenth of the log retention time.

**Results**

For more details about the properties that impact the YARN container logs and the aggregation option, see [yarn-site.xml](#).

*Centralized Logging*

Describes the centralized logging feature of HPE Ezmeral Data Fabric.

Data Fabric's Centralized Logging feature provides a job-centric or application-centric view of all log files generated by a MapReduce program. With centralized logging, the log files are written to local volumes in the Data Fabric filesystem. You can run the `maprcli job linklogs` command for running or completed jobs to create a centralized log directory populated with symbolic links to all log files pertaining to the specified jobs or to the application.

## Managing Centralized Logs for MapReduce Version 2 Applications

To manage centralized logs for MapReduce Version 2 applications, enable centralized logging, configure log retention, and view application logs.

## Enabling Centralized Logging for MapReduce Version 2

Describes how to enable central logging for MapReduce version 2 applications.

**About this task**

As of MapR version 4.0.2, you can use centralized logging for MapReduce version 2 applications. However, this feature is disabled by default. In MapR version 4.0.1, centralized logging is not supported for MapReduce version 2 applications.

**Procedure**

- Configure the `yarn.use-central-logging-for-mapreduce-only` property in the `yarn-site.xml` file to enable or disable centralized logging.

The `yarn-site.xml` file is located in the following directory: `/opt/mapr/hadoop/hadoop-2.x.x/etc/hadoop/`.

- To disable centralized logging, remove the property `yarn.use-central-logging-for-mapreduce-only` from the `yarn-site.xml` file, or set the value of `yarn.use-central-logging-for-mapreduce-only` to `false` in the `yarn-site.xml` file.
- To enable centralized logging, set the value of `yarn.use-central-logging-for-mapreduce-only` to `true` in the `yarn-site.xml` file. If you enable centralized logging while applications are running, restart all ResourceManagers. In a production cluster, restart ResourceManagers one at a time to prevent interruption to the running applications. The applications running during this process may not have centralized logging enabled.

**Configuring Log Retention Time for MapReduce Version 2 Applications**

Lists the parameter that controls the log retention time for MapReduce applications.

**Procedure**

- Set the value of `yarn.log-aggregation.retain-seconds` to the number of seconds you want to retain the logs once the application starts in the `yarn-site.xml` file.

The value defaults to 30 days. The value that you set for this property also applies to the retention of aggregated YARN logs.

The `yarn-site.xml` file is in the following directory: `/opt/mapr/hadoop/hadoop-2.x.x/etc/hadoop`.

**Viewing Logs for Completed MapReduce Version 2 Applications**

With centralized logging, you can use `maprcli` or the HistoryServer user interface to access completed logs.

**Using the Command Line to View Logs for Completed Applications**

Describes how to view logs from the CLI.

**Procedure**

1. Use the `maprcli job linklogs` command to create centralized logs for completed applications. For example, you can run the following `maprcli job linklogs` command to create centralized logs for `application_1434605941718_0001`:

```
maprcli job linklogs -jobid application_1434605941718_0001 -todir /logsdire
```

The centralized log directory contains symbolic links that are organized by hostname and containerID.

2. To determine where the logs are located, run the following command on the directory that contains the symlinks to the log files for a specific container:

```
hadoop mfs -ls <toDir>/<applicationID>/hosts/<hostName>/<containerID>
```

For example, if you specified `logsdDir` as the directory, you might issue a command similar to the following example. The system then displays the location of the log files:

```
hadoop mfs -ls /logsdDir/application_1434605941718_0001/hosts/
qa-node178.qa.lab/container_e02_1434605941718_0001_01_000003

Found 1 items
lrwxrwxrwx U U 3 root root 138 2015-06-18 05:50 0
/logsdDir/application_1434605941718_0001/hosts/qa-node178.qa.lab/
container_e02_1434605941718_0001_01_000003
->
../../../../var/mapr/local/qa-node178.qa.lab/logs/yarn/userlogs/
application_1434605941718_0001/container_e02_1434605941718_0001_01_000003
p 2068.40.262432 qa-node178.qa.lab:5660 qa-node175.qa.lab:5660
```

The link location appears after the arrow.

3. To determine the types of log files that are available for this container and the path to each available log file, run the following command:

```
hadoop fs -ls <link location>
```

For example:

```
hadoop fs -ls ../../../../../../var/mapr/local/qa-node178.qa.lab/logs/yarn/
userlogs/application_1434605941718_0001/
container_e02_1434605941718_0001_01_000003

-rw-r----- 2 root root 2337 2015-06-18 05:48
../../../../var/mapr/local/qa-node178.qa.lab/logs/yarn/userlogs/
application_1434605941718_0001/
container_e02_1434605941718_0001_01_000003/syslog
```

In this example, the path to the `syslog` is the only one that is displayed in the output. However, the `stdout` or `stderr` may also be available depending on what is generated by the application.

4. Run one of the following options to view the contents of a log file:
  - a) To view the end of the log file, run `hadoop fs -tail <path to log file>`.

```
hadoop fs -tail ../../../../../../var/mapr/local/
qa-node178.qa.lab/logs/yarn/userlogs/application_1434605941718_0001/
container_e02_1434605941718_0001_01_000003/syslog
```

- b) To view the entire log file, run `hadoop fs- cat <path to log file>`.

```
hadoop fs- cat ../../../../../../var/mapr/local/
qa-node178.qa.lab/logs/yarn/userlogs/application_1434605941718_0001/
container_e02_1434605941718_0001_01_000003/syslog
```

Using the HistoryServer UI to View Logs for Completed Applications  
Describes how to view logs using the HistoryServer interface.

**About this task**

You can view the logs in the HistoryServer interface.

View Logs in the HistoryServer Interface Launched Using the Control System

**Procedure**

1. Log on to the Control System and click **Services** to display the list of services installed on the cluster.
2. Click the HistoryServer link in the list of services to open the **Job History** page in a new tab.
3. Click the Job ID link for the job for which you want to view the logs.
4. Click the logs link in the **Logs** column of the **Application Master** section.

View Logs Using the HistoryServer Interface

**Procedure**

1. Go the URL similar to the following example, to open the Job History page:

```
<IP address of HistoryServer node>:19888
```

2. Click the Job ID link for the job for which you want to view the logs.
3. Click the logs link in the **Logs** column of the **Application Master** section.

**Viewing the Service Log**

Explains how to view service logs using Kibana.

**About this task**

If Kibana is installed on the node, you can view the service log in the Kibana UI from the Control System. To view the log in the Kibana UI from the Control System:

**Procedure**

1. Log in to the Control System and do one of the following:
  - Click **Services** to display the list of services installed on the cluster.
  - Go to the **Summary** tab in the [service information page](#) for the service.
2. Click  in the **Log Viewer** column to view the log for the associated service in the Kibana UI. See [Kibana User Guide](#) for more information.

**Cluster Maintenance Schedule**

Lists a sample maintenance schedule for the cluster.

A maintenance schedule shows which tasks a cluster administrator should perform daily, weekly, monthly, and quarterly, along with the initial setup tasks. This sample schedule is offered as a template that you can customize to suit your needs.

Initial Setup	Daily	Weekly	Monthly	Quarterly
Perform hardware checks	Check alarms	Check logs (cluster and job logs)	Clean up logs	Audit storage use
Check Prerequisites	Onboard new users	Check for zombie jobs	Reevaluate node and volume topology	Perform security audit

Initial Setup	Daily	Weekly	Monthly	Quarterly
Verify Installation	Offboard users	Perform simple performance test	Check performance (jobs, I/O)	Upgrade core, Hive, HCatalog
High Availability planning	Check cluster health	Verify snapshots	Verify mirrors	
Set up VIPs for NFS for the HPE Ezmeral Data Fabric	Perform hardware maintenance (disks)	Remove old snapshots	Clean up data	
Benchmark and tuning		Failbacks to restore service layout	file system balancing	
Set up node and volume topologies				
Capacity planning			Upgrade ecosystem components (other than Hive and HCatalog, which are done quarterly)	
Set up user permissions (ACLs, directory permissions, users, home directories)				
Set up quotas				
Set up compression				
Configure cluster queues for MapReduce jobs				
Set up schedules (fair scheduler, capacity scheduler, job placement)				
Set up snapshots and mirrors				
Configure NICs				
Set up monitoring tools				
Set up security				
Create a disaster recovery plan				

### Language Support for HPE Ezmeral Data Fabric Database Tables

This section lists the human languages that HPE Ezmeral Data Fabric tables can store, retrieve, and process.

Data Fabric tables can store, retrieve, and process data in the following languages:

#### A

Abaza Abkhazian Achinese Acoli Adangme Adyghe Afar Afrikaans Aghem Ainu Akan Akkadian Akoose Albanian Aleut Amharic Amo Ancient Egyptian Ancient Greek Angika Arabic Aragonese Aramaic Arapaho Arawak Armenian Aromanian Assamese Assyrian Neo-Aramaic Asturian Asu Atikamekw Atsam Avaric Avestan Awadhi Aymara Azerbaijani

## Troubleshooting Cluster Administration

---

Lists the common errors and their solutions.

The following list identifies how to address several cluster administration issues:

### The URL reported by YARN for tracking job details does not load.

This URL uses the output of the `hostname -f` command, which must be the fully qualified domain name (FQDN) for the node. On Ubuntu, make sure that the `/etc/hostname` file is configured with the node's FQDN. On CentOS/Redhat, make sure that the `/etc/sysconfig/network` file is configured with the node's FQDN, then restart the node.

### The ResourceManager does not start.

If the ResourceManager does not come up, check the following:

- Check that you supplied the correct ResourceManager hostname or IP address in the `-RM` parameter when running [configure.sh](#) on each node at installation time. If you are not sure, you can re-run [configure.sh](#) to correct the problem.
- Do not specify a ResourceManager port with the hostname or IP address in the `-RM` parameter; there is no `<port>` option.
- Make sure that you specified the same ResourceManager hostname or IP address on all nodes when running [configure.sh](#).
- For more information about what might be causing a problem, check the ResourceManager logs: `/opt/mapr/hadoop/hadoop-<version>/logs`

### The NodeManager does not start.

If the NodeManager does not come up, check the following:

- Make sure that the fileserver role is installed on the node by looking in the `/opt/mapr/roles` directory.
- Make sure that the fileserver service is running, using either the [service list](#) command or the Control System.
- For more information about what might be causing a problem, check the NodeManager logs: `/opt/mapr/hadoop/hadoop-2.3.0/logs`

### Job history is not available.

If job history is not recorded, check the following:

- Make sure that the HistoryServer role is installed on the desired node by looking in the `/opt/mapr/roles` directory. Note that only one node in the cluster can have the HistoryServer role.

- Make sure the HistoryServer is running on the desired node, using either the [service list](#) command or the Control System.
- Check that you supplied the correct HistoryServer hostname or IP address in the `-HS` parameter when running [configure.sh](#) on each node at installation time. If you are not sure, you can re-run [configure.sh](#) to correct the problem.

### Submitted applications do not show up in the ResourceManager.

If you submit an application and it does not appear in the ResourceManager, check the following:

- Make sure the application is running in YARN and not as a local application (check for `app_local` or `job_local` in the application output).
- Check the class path on which the application was invoked, and make sure that `/opt/mapr/hadoop/hadoop-<version>/etc/hadoop` includes the class paths.
- Make sure that you are running the correct version of Hadoop. Example:

```
ls -l /usr/bin/hadooplrwxrwxrwx 1
root root 40
Mar
4 11:38 /usr/bin/hadoop -> /opt/
mapr/hadoop/hadoop-2.3.0/bin/hadoop
```

### The application throws a ClassNotFoundException exception at job submission time.

If you submit an application and it throws the ClassNotFoundException exception, check the following:

- Check that the application jar is correctly packaged with the required class.
- Make sure that you are running the correct version of Hadoop. Example:

```
ls -l /usr/bin/hadooplrwxrwxrwx 1
root root 40
Mar
4 11:38 /usr/bin/hadoop -> /opt/
mapr/hadoop/hadoop-2.3.0/bin/hadoop
```

### I want to move the HistoryServer and ResourceManager to different nodes.

If you have installed the HistoryServer and the ResourceManager on the same node (when you initially ran [configure.sh](#) you did not specify the `-HS` parameter, or you specified the same IP address or hostname for both the `-RM` and `-HS` parameters), you can use [configure.sh](#) to move one or both services to different nodes. Make sure to specify both the `-HS` parameter and the `-RM` parameter, because if you only specify the `-RM` parameter the HistoryServer will move to the ResourceManager node.

### Timing issue prevents services from starting on a secure cluster.

If your cluster has security features enabled, you may encounter a timing issue that results in services failing to start during initial configuration with the `-F` option. (This issue does not arise if you are bringing up a cluster that has already been installed and configured.)

When you run the `configure.sh` script with the `-F` option, the ZooKeeper and Warden services start up on the primary node first, then as other nodes are installed, services are automatically started on those nodes. However, because of this timing issue, Warden may fail to communicate with ZooKeeper, and the cluster may fail to come up.

If you encounter this problem, do not use the `-F` option. Instead, stop all ZooKeeper and Warden services on all nodes, then start the ZooKeeper services on all of the ZooKeeper nodes (that is, the nodes where the ZooKeeper packages are installed). Finally, start the Warden services on all nodes.

### How to find a node's serverid.

Some `maprcli` commands take an argument `serverid`, which is a unique identifier for each node in a cluster. This id is also sometimes referred to as the *node id*.

To find the `serverid`, use the `maprcli node list` command, which lists information about all nodes in a cluster. The `id` field is the value to use for `serverid`.

For example:

```
maprcli node list -columns hostname,id
  id                               hostname
ip
4800813424089433352 node-28.lab
10.10.20.28
6881304915421260685 node-29.lab
10.10.20.29
4760082258256890484 node-31.lab
10.10.20.31
8350853798092330580 node-32.lab
10.10.20.32
2618757635770228881 node-33.lab
10.10.20.33
```

You can also get this listing as a JSON object by using the `-json` option. For example:

```
maprcli node list -columns
id,hostname -json
{
  "timestamp":1358537735777,
  "status":"OK",
  "total":5,
  "data":[
    {
      "id":"4800813424089433352",
      "ip":"10.10.20.28",
      "hostname":"node-28.lab"
    },
    {
      "id":"6881304915421260685",
      "ip":"10.10.20.29",
```

```

"hostname": "node-29.lab"
    },
    {
      "id": "4760082258256890484",
      "ip": "10.10.20.31",
      "hostname": "node-31.lab"
    },
    {
      "id": "8350853798092330580",
      "ip": "10.10.20.32",
      "hostname": "node-32.lab"
    },
    {
      "id": "2618757635770228881",
      "ip": "10.10.20.33",
      "hostname": "node-33.lab"
    }
  ]
}

```

**Error 'mv Failed to rename maprfs...' when moving files across volumes.**

Prior to version 2.1, you cannot move files across volume boundaries in the HPE Ezmeral Data Fabric Platform. You can move files within a volume using the `hadoop fs -mv` command, but attempting to move files to a different volume results in an error of the form "mv: Failed to rename maprfs://<source path> to <destination path>".

As a workaround, you can copy the file(s) from source volume to destination volume, and then remove the source files.

The example below shows the failure occurring. In this example directories /a and /b are mount-points for two distinct volumes.

```

hadoop fs -ls /
  Found 2 items
  drwxrwxrwx - root root
0 2011-12-02 15:14 /a
  drwxrwxrwx - root root
0 2011-12-02 15:09 /b

hadoop fs -put testfile /a
hadoop fs -ls /a
  Found 1 items
  -rwxrwxrwx 3 root root
2048000 2011-12-02 15:18 /a/testfile

root@node1:~# hadoop fs -mv /a/
testfile /b
  mv: Failed to rename maprfs://
10.10.80.71:7222/a/testfile to /b

```

The following example shows the work-around, moving a file `/a/testfile` to directory `/b`, and then removing the source file.

```
hadoop fs -cp /a/testfile /b/testfile
hadoop fs -ls /b
  Found 1 items
    -rwxrwxrwx   3 root root
2048000 2011-12-02 15:19 /b/testfile

hadoop fs -rmr /a/testfile
  Deleted maprfs://
10.10.80.71:7222/a/testfile

hadoop fs -ls /a
```

This workaround is only necessary if `/a` and `/b` correspond to different volumes.

**'ERROR com.mapr.baseutils.cldbutils.CLDBRpcCommonUtils' in cldb.log, caused by mixed-case cluster name in mapr-clusters.conf.**

HPE Ezmeral Data Fabric cluster names are case sensitive. However, some versions of MapR v1.2.x have a bug in which the cluster names specified in `/opt/mapr/conf/mapr-clusters.conf` are not treated as case sensitive. If you have a cluster with a mixed-case name, after upgrading from v1.2 to v2.0+, you may experience CLDB errors (in particular for mirror volumes) which generate messages like the following in `cldb.log`:

```
2012-07-31 04:43:50,716 ERROR
com.mapr.baseutils.cldbutils.CLDBRpcCommonUtils
[VolumeMirrorThread]: Unable to reach
cluster with name: qacluster1.2.9. No
entry found in file /conf/
mapr-clusters.conf for cluster
qacluster1.2.9.
Failing the CLDB RPC with status 133
```

(The path given in this message is relative to `/opt/mapr/`, which might be misleading.)

As a work-around after upgrading, to continue working with mirror volumes created in v1.2, duplicate any lines with upper-case letters in `mapr-clusters.conf`, converting all letters to lower case.

Mirror volumes created in v2.0+ do not exhibit this behavior.

**HPE Ezmeral Data Fabric Control System does not display on Internet Explorer.**

The HPE Ezmeral Data Fabric Control System supports Internet Explorer version 9 and above. In IE9, **Compatibility View** under the **Tools** menu must be turned off, or else the user interface will not display correctly.

**Unable to kill a job using the Metrics UI.**

The following error displays when the root user tries to kill a job using the Metrics UI: Failed to get Job information for job\_x, Error: mapr is not allowed to impersonate root

To resolve this issue, add the following properties to [core-site.xml](#) in directory `/opt/mapr/hadoop/hadoop-0.20.2/etc/`:

```
<property>
<name>hadoop.proxyuser.mapr.groups</name>
<value>*</value>
<description>Allow the superuser mapr to impersonate any member of any group</description>
</property>

<property>
<name>hadoop.proxyuser.mapr.hosts</name>
<value>*</value>
<description>The superuser can connect from any host to impersonate a user</description>
</property>
```

#### **YARN logs are deleted before the application completes.**

The duration that YARN container logs are maintained starts from the time that the application starts running.

When YARN container logs are not aggregated, the YARN container logs are retained for 3 hours on each node. To update the duration, edit the value of `yarn.nodemanager.log.retain-seconds` in the [yarn-site.xml](#) file.

When YARN container log aggregation is enabled, by default, the aggregated logs are not deleted. However, this setting can be overridden in [yarn-site.xml](#) file. To update the duration, edit the value of `log-aggregation.retain-seconds` in the [yarn-site.xml](#) file.

You must consider how long you want the log to remain past the amount of time that the application will take to run. For example, if you expect most applications to take 20 seconds to run, do not set the value of this property to 20 seconds because the log may be deleted before the applications completes.

#### **YARN applications fail because /tmp subdirectories have been deleted.**

Some RHEL and CentOS platforms include the `tmpwatch` service by default. This service cleans up the `/tmp` directory on a regular basis. However, this operation causes the deletion of directories that are needed for applications to run (for example, `nm-local-dir` for YARN). The running NodeManager process does not re-create these missing directories, causing applications to fail.

#### **Jobs fail when the timeline server is down**

The timeline server for the Hive-on-Tez user interface does not support high availability. Jobs fail when the resource manager cannot connect to the timeline server. However, you can change the `yarn.timeline-service.client.best-effort` property to `TRUE` in the [yarn-site.xml](#) file to allow applications to run successfully even when the timeline server is down.

## Best Practices for Backing Up HPE Ezmeral Data Fabric Information

Lists the best practices and performance considerations to follow when backing up HPE Ezmeral Data Fabric information.

To back up configuration information and data from your HPE Ezmeral Data Fabric cluster, you must install the appropriate Linux backup client from your backup software provider on your servers in your HPE Ezmeral Data Fabric cluster. Your backup client user must have the proper filesystem, and volume permissions. For details on how to configure HPE Ezmeral Data Fabric volume permissions see [Creating Volume-level ACLs](#) on page 1848 and [Managing Access Controls](#) on page 1846.

### Backup Configuration Data

By default, all installation files on the cluster, for each server in the cluster, are stored in a single directory on each server in the HPE Ezmeral Data Fabric cluster. To ensure that you backup all the configuration files, HPE Ezmeral Data Fabric supported applications, as well as log files, back up the `/opt/mapr` directory for all servers in the cluster.

Note that the `/opt/mapr` location includes all log files. Log files can add a significant amount of data to your backup environment, so evaluate if they are needed for your business continuity requirements. To backup just the configuration files for the cluster, backup the `/opt/mapr/conf` directory from all servers in the cluster.

### Backup Volume Data

HPE Ezmeral Data Fabric's recommended way to backup and restore data, is to enable and configure snapshots and volume mirroring for your data, to another HPE Ezmeral Data Fabric cluster. This step ensures that your business continuity and disaster recovery needs are met.

See the following links for setting up Snapshots, Mirroring, Table and Streams replications.

- Snapshots: [Managing Snapshots](#) on page 1262
- Mirrors: [Mirror Volumes](#) on page 489
- Data Fabric DB Table Replication: [Managing Table Replication](#) on page 1423
- Data Fabric Streams Replication: [Stream Replication](#) on page 787

If you do not have a secondary cluster to mirror your data, back up your volumes by specifying the following path in your Linux backup agent: `/mapr/cluster_name/` - For example: `/mapr/my.cluster.com/`.

### Performance Considerations When Backing Large Data Sets

You could run into bandwidth and performance limitations when you specify only one path to your HPE Ezmeral Data Fabric cluster, where your data in your volumes is stored on only one Linux host agent. The bottleneck can occur due to the size of that data you are backing up (large file sizes), or due to the number of files you have in your directory structure (millions of files in one directory).

To mitigate performance issues, break up the volumes across multiple Linux backup agents, with specific mount paths. For example:

```
HPE Ezmeral Data Fabric Linux Host 1 (hostname1):
  /mapr/my.cluster.com/volume1
  /mapr/my.cluster.com/volume2
  /mapr/my.cluster.com/volume3
```

```
HPE Ezmeral Data Fabric Linux Host 2 (hostname2):
  /mapr/my.cluster.com/volume4
```

```
/mapr/my.cluster.com/volume5
/mapr/my.cluster.com/volume6
```

**HPE Ezmeral Data Fabric Linux Host 3 (hostname3):**

```
/mapr/my.cluster.com/volume7
/mapr/my.cluster.com/volume8
/mapr/my.cluster.com/volume9
```

### Preserve Metadata About the Volumes

To preserve metadata such as permissions and [ACE](#) rules, run a pre-script process as the `mapr` user, in your backup agent. For example in your pre-script configuration for your host agent for your cluster, you would run:

```
maprcli volume dump create
    -name volumel -dumpfile volumel_fulldumpl -e statefilel
```

Some backup software may need "stderr" or "stdout" codes to run pre or post processing scripts within their product. In that case, you may need to write a bash script to dump the file to a location of your choice, and ensure that your backup agent is configured to backup that directory. Consult your backup software provider's documentation. For information on creating volume dumps, see [Create and Maintain Volume Dump File](#) on page 2627.

## IPv6 Support in Data Fabric

Describes the IPv6 support feature for Data Fabric.

 **IMPORTANT:** HPE Ezmeral Ecosystem Pack (EEP) components do not support IPv6.

Data Fabric can be installed on hosts with IPv6 addresses. In other words, external endpoints for Data Fabric can have IPv6 addresses. Data Fabric can communicate with clients over IPv6 addressing. Inter-cluster traffic and intra-cluster traffic over IPv6 connections is supported with IPv4 compatibility.

Data Fabric deployment over IPv6 addresses is possible when both the hardware hosting Data Fabric and the Data Fabric software are able to detect and support IPv6 addresses.

The underlying hardware that hosts Data Fabric must have a network interface card (NIC) that supports IPv6 addressing.

An application that wishes to communicate with Data Fabric over IPv6 can do so, when Data Fabric is installed on IPv6-compatible hardware and IPv6 support is enabled on Data Fabric.

 **NOTE:** When you have a network interface card (NIC) that supports both IPv4 and IPv6 addressing, each IP address must be identifiable by a distinct hostname. In other words, a single hostname must NOT map to both the IPv4 and IPv6 addresses.

The following table describes the terminology related to IPv6 client/server nodes.

Term	Description
IPv6-aware	The term denotes readiness of the underlying hardware. It indicates that the NIC associated with a node that hosts Data Fabric is IPv6 compatible, and can communicate with other nodes with IPv6 and IPv4 addresses.
IPv6-unaware	The term denotes readiness of the underlying hardware. It indicates that the NIC associated with a node that hosts Data Fabric is incompatible to handle IPv6 traffic, and can handle IPv4 traffic only.
IPv6-enabled	The term denotes that IPv6 is enabled on Data Fabric software. The Data Fabric node on which IPv6 is enabled is able to communicate with IPv6 addresses. The node is able to communicate with IPv4 addresses.

Term	Description
IPv6-only	The term denotes that IPv6 is enabled on Data Fabric software. The Data Fabric node on which IPv6 is enabled is able to communicate exclusively with IPv6 addresses only. Communication with IPv4 addresses is not supported on this node.

The following matrix explains in detail the communication between a client node and a Data Fabric node for various IP address type combinations.

Type of application (Type of client node)	IPv6-unaware server (IPv4 -only server node)	IPv6-unaware server (IPv6-enabled server node)	IPv6-aware server (IPv6-only server node)	IPv6-aware server (IPv6-enabled server node)
IPv6-unaware client (IPv4-only node)	client-server communication takes place over IPv4	client-server communication takes place over IPv4	no communication	client-server communication takes place over IPv4
IPv6-unaware client (IPv6-enabled node)	client-server communication takes place over IPv4	client-server communication takes place over IPv4	no communication	client-server communication takes place over IPv4
IPv6-aware client (IPv6-only node)	no communication	no communication	client-server communication takes place over IPv6	client-server communication takes place over IPv6
IPv6-aware client (IPv6-enabled node)	client-server communication takes place over IPv4	client-server communication takes place over IPv4	client-server communication takes place over IPv6	client-server communication takes place over IPv6

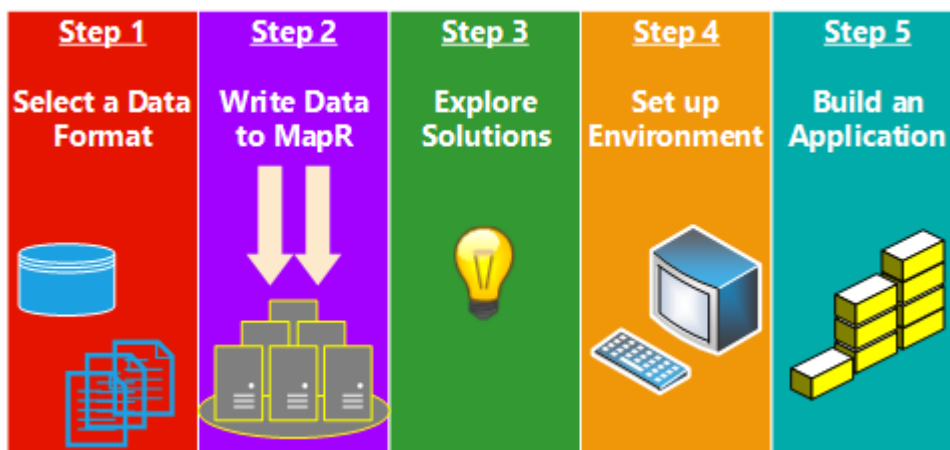

## 7.8.0 Development

This section contains information related to application development for Ezmeral ecosystem components and HPE Ezmeral Data Fabric products, including the file system, Database (Key-Value and JSON), and Event Streams.

### Application Development Process

Before you start developing applications on the HPE Ezmeral Data Fabric platform, consider how you will get the data into the platform, the storage format of the data, the type of processing or modeling that is required, and how the data will be accessed.

At a high-level, building an application comes down to the following steps:

1. [Step 1: Select a Data Storage Format](#) on page 3148
2. [Step 2: Write Data to HPE Ezmeral Data Fabric](#) on page 3151
3. [Step 3: Explore Ways to Work With the Data](#) on page 3151
4. [Step 4: Set Up the Development Environment](#) on page 3154
5. [Step 5: Build the Application](#) on page 3162

## Step 1: Select a Data Storage Format

Consider the data format options and determine how you want to use to store your data.

Keep in mind that a single application can access data from a variety of data formats. The following data formats are available.

### HPE Ezmeral Data Fabric File Store

HPE Ezmeral Data Fabric File Store is a random read-write distributed file system that allows applications to concurrently read and write directly to files. This data store is great for storing and scanning large data sets of historical data, and for sharing files between various services and applications. Any node with access to the file system can access files on it.

Consider the following examples:

- Write large amounts of user click-stream data for a web site in a simple directory structure based on the date, and then process that data using tools like Spark, Drill, Hive or another MapReduce application.
- Store various types of images, audio files, and video files in one shared directory so that web or mobile applications can render the content as required.
- Share configuration files or internationalized resources among various applications by storing these files in a shared directory.
- Simplify the deployment of new applications by adding java libraries (.jar files) to a shared directory and then including the directory in the classpath of one or more applications.
- Store the Docker files and images in a shared location which can be accessed by various servers. This provides a single, shared location from which users can launch containers.

When you store large data sets, use a file format in which the data can be consumed efficiently. For example, Parquet, ORC, sequence files are good for storing and scanning. Parquet is great for storing data on the file system because it stores data in columnar format, which can be partitioned. Parquet also works well for use cases where you query the data with Drill or process the data with Spark applications. Note that you can use CSV or JSON formats, but they scanning these formats is less efficient.

For more information about the file system, see [File System](#) on page 482.

### HPE Ezmeral Data Fabric Database

HPE Ezmeral Data Fabric Database is an enterprise-grade, high performance, NoSQL database management system that supports both binary and JSON tables. Consider using HPE Ezmeral Data Fabric Database tables when you want to query and organize large amounts data. It also integrates with Drill, Apache Spark, Hive and other MapReduce tools to provide applications the ability to scan or query large data sets in an efficient, distributed way.

HPE Ezmeral Data Fabric Database provides the following features:

- **A flexible schema.** Each row or document can have its own set of attributes.

- **Efficient random access.** Applications can quickly access one or more records using a row key, document ID, or a conditional queries.
- **Easy and efficient data mutation.** Applications can insert, update, and delete rows or documents.

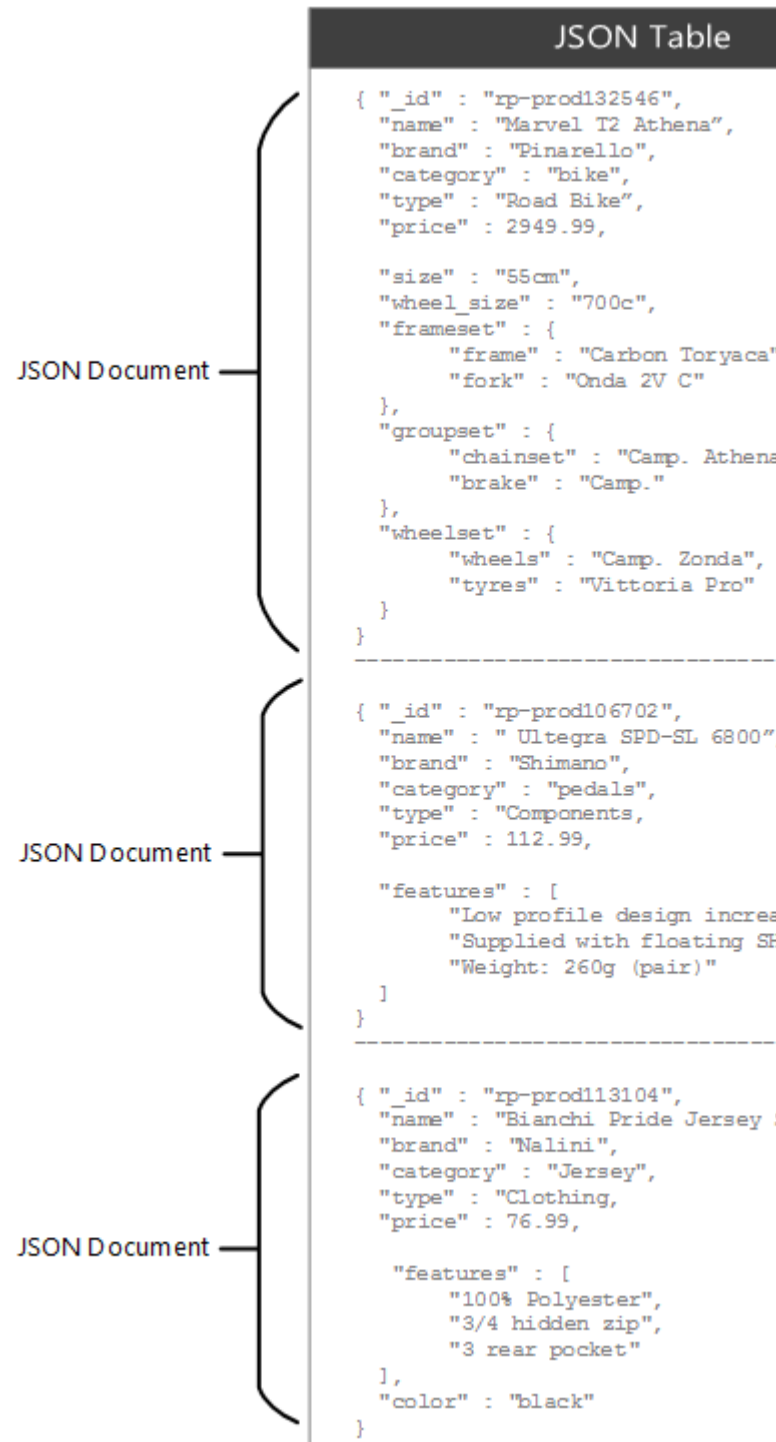

#### **HPE Ezmeral Data Fabric Database Binary Tables**

HPE Ezmeral Data Fabric Database binary tables consist of rows that are identified by primary keys and row data is identified by key/value pairs. HPE Ezmeral Data Fabric Database tables are similar to HBase tables in that HPE Ezmeral Data Fabric Database does not determine or store the datatype of each value in the table. But, HPE Ezmeral Data Fabric Database tables perform operations more efficiently than HBase table. You might want to use binary tables when you want to create or use an existing HBase application. However, on the Converged Data Platform, JSON tables are usually preferred due to their flexibility.

#### **HPE Ezmeral Data Fabric Database JSON Tables**

A HPE Ezmeral Data Fabric Database JSON tables provide a flexible, powerful schema that you can customize based on the data that you want to represent. Each row in a JSON table corresponds to an JSON document with an unique `_id` and each JSON document can have a different set of columns. HPE Ezmeral Data Fabric Database JSON tables determine the datatype of each value based on the type of data written to the document.

The following example lists three JSON documents from a single JSON table. Note that the attributes associated with each document varies.

For more information, see [HPE Ezmeral Data Fabric Database](#) on page 623.

### HPE Ezmeral Data Fabric Streams

HPE Ezmeral Data Fabric Streams is a publish/subscribe messaging solution that uses the Apache Kafka API. HPE Ezmeral Data Fabric Streams writes events as messages in a topic and topics are part of a stream. Producer applications can publish events to a stream and consumer applications can read all or a subset of the messages in a stream. By default, messages are stored in a topic for 7 days and then automatically purged. However, you can shorten or extend the time-to-live (ttl) for messages in a stream based on your use case.

For more information, see [HPE Ezmeral Data Fabric Streams](#) on page 758.

## Step 2: Write Data to HPE Ezmeral Data Fabric

Depending on your use case, move existing data onto the HPE Ezmeral Data Fabric platform or write data directly to the platform.

You can write batch data or streaming data to HPE Ezmeral Data Fabric. Batch data refers to data that is already in a data-store while streaming data refers to the continuous flow of real-time messages that have yet to be written to a data-store. Streaming data is generally processed as it is received while batch data is processed after a set of data is written to the datastore. There are many ways to write batch and streaming data to the platform, the following sections provide a few examples.

### Write Batch Data to the Platform

You can use an NFS client, hadoop command, or ecosystem components to write batch data to file system. Basic POSIX file system operations can be used to move data to file system. For example, you can use NFS clients, POSIX clients, or applications that utilize libraries such as java.io to access the file system. Hadoop commands and hdfs APIs can be used to add or update files on the file system. For example, you can use the hadoop `distcp` command to [copy data from HDFS to file system](#). Hadoop Ecosystem components, such as Apache Flume, can also be used to push log files to file system.

You can also write, update, or delete batch data to HPE Ezmeral Data Fabric Database tables. Applications can use the OJAI API to write to JSON tables or the HBase API to write to binary tables.

### Write Streaming Data to the Platform

Write streaming event data as messages in HPE Ezmeral Data Fabric Event Data Streams topics using Kafka APIs or a REST client application. [C](#), [Java](#), or [Python](#) applications can produce messages to one or more topics in event streams. Additionally, applications written in any language can use the [REST Proxy](#) to produce messages to one or more topics in an event stream. For example, a financial service application, written in Java, could produce messages about stock market activity to an event stream topic.

## Step 3: Explore Ways to Work With the Data

Once the data is in the HPE Ezmeral Data Fabric platform, explore the various features and components available on the platform and determine your path. You may want to access data in its initial format or perform some data modeling or processing prior to accessing the data.

The following sections provide some examples to help you determine which approach will work for your particular use case.

### Process Data

When developing applications that ingest data, consider if the data requires some processing before the data can be consumed or stored.

Consider the following scenarios:

- **Process the Data Before Querying the Data**

To efficiently query data, you may want to convert the data into a different format. For example, if you want to use Drill to query event data, you can convert streaming data from topics to a JSON table to enable more efficient querying. To do this, ingest event data using HPE Ezmeral Data Fabric Streams, use the HPE Ezmeral Data Fabric Streams API to read the data from topics and the JSON API to store the data in a JSON table, then use Drill to query the JSON tables.

- **Process Data before Storing the Data**

You may also want to process the data based on business needs to perform some pre-processing before long term storage. For example, you can consume streaming data from a HPE Ezmeral Data Fabric Streams topic with a Spark Streaming application which performs calculations or adds additional data before storing the data in a different data-store such as a HPE Ezmeral Data Fabric Database JSON table.

- **Perform Calculations as the Data is Stored**

You may want to modify a single row in a table and then incrementally aggregate data. For example, you can use HPE Ezmeral Data Fabric Database tables to store large amounts of customer information or product catalog data and then read and write to a subset of that data. Then, modify a single row in a table to incrementally aggregate data. For example, to aggregate the number of clicks on a page, you can have a row key for each date and page. Internally, you can design the table to increment based on timestamp. The following example shows a row of data for the info page on 2017-02-22:

```

2017-01-22-info.html => key
Total : 1230 +1
H00 : 100
M1:1
M2: 5
...
M30 : 10
...
H20 : 50 +1
M1:1
...
M25: 1

```

- **Process Large Sets of Data**

There are also many methods to process files in their initial state. To process large sets of data on the HPE Ezmeral Data Fabric File Store, it is common to use Spark or MapReduce applications. MapReduce applications perform parallel, distributed processing of data in batches and are therefore a great way to process large datasets. Spark applications can be used to iteratively process large sets of data with machine learning algorithms. For an example of using a machine learning algorithm with a Spark application, see [Building a Recommendation Engine with Spark](#).

### Access Data

There are many use cases for why you might want to access data and many methods to access the data. Operational applications or E-commerce services may want to access data on the HPE Ezmeral Data Fabric platform to provide customers a view of transactional data. Business users may want to view user profile data or submit queries through a BI tool to visually analyze the data.

The following sections will provide some examples for how to access the data so that you can envision that will work for your use case.

- **Access Data in HPE Ezmeral Data Fabric File Store**

The most common way to access data in the HPE Ezmeral Data Fabric File Store is via a NFS mount point that is remote or local to the cluster. You can use HDFS commands as well but they are generally only used for migrating hadoop applications to the HPE Ezmeral Data Fabric platform. If you require high throughput, security, and scalability, consider installing the [POSIX client](#) as this provides a more efficient way to access data in the HPE Ezmeral Data Fabric File Store. You can also query the data directly using Drill.

- **Access Data in HPE Ezmeral Data Fabric Database**

The methods that you can use to access HPE Ezmeral Data Fabric Database table data differs based on the table type. You can access HPE Ezmeral Data Fabric Database binary table data with the HBase shell and applications that use the HBase API. You can access HPE Ezmeral Data Fabric Database JSON table data with the dbshell, and java applications that use the OJAI API. You can also use Drill or Spark to query HPE Ezmeral Data Fabric Database binary and JSON table data directly.

- **Access Data in HPE Ezmeral Data Fabric Streams**

Data in HPE Ezmeral Data Fabric Streams can be accessed by one or more stream consumers and the number of consumers can change over time depending on business needs.

Similar to the various ways you can write data to topics a stream, data in stream topics can be accessed by applications that utilize the Kafka API or a REST interface. You can also use Spark to query streams for new messages at a given interval and access any new messages that are available.

HPE Ezmeral Data Fabric Streams provides flexibility to add new consumers without making changes to the producer application. For example, you have a HPE Ezmeral Data Fabric Streams producer that writes all twitter feeds to a stream. Today, this stream is accessed by a single consumer application that provides access to twitter feeds with content related to IOT. The next week, there may be a request check for how many tweets originate from a specific account. Providing access to different data in an existing stream can be achieved by creating a new consumer which reads from the same stream.

#### Step 4: Set Up the Development Environment

Before you start building the application, figure out how your the application will connect to the cluster and what the library dependencies and installation requirements are.

Applications are often run on edge nodes which are nodes that are not part of the cluster. Setting up an edge node so that it can be used to develop and run applications consists of the following steps:

- Selecting a client that you will use to connect to the cluster.
- Installing additional clients required for your use case.
- Determining the application dependencies.

**NOTE:** The dependencies to build and run applications differ based on your use case and the various types of data or tools that are part of an application.

The following sub-topics include the various methods to connect to the cluster, and minimal requirements to build and run applications.

### Connect to the Cluster

Applications are often run on nodes that are not part of the Data Fabric cluster. There are many methods to connect to a Data Fabric cluster; this section briefly describes each option.

#### Data Fabric Client

The Data Fabric client includes the libraries and utilities required on an edge node to perform the following: connect to the cluster, submit MapReduce applications, submit YARN applications, run hadoop fs commands, and run hadoop mfs commands. However, to run applications that access data from HPE Ezmeral Data Fabric Database or HPE Ezmeral Data Fabric Streams, you must configure additional dependencies. For more information about the Data Fabric client, see [HPE Ezmeral Data Fabric Client](#) on page 396 and [How Data Fabric Clients Connect to the Cluster](#) on page 1012.

**NOTE:** Although it is not recommended, you can include the file system JAR file in the application instead of installing the Data Fabric client. However, there are caveats and specific requirements to make this work. For information, see [Using the File System JAR to Connect to the Cluster](#) on page 3155.

#### Data Fabric POSIX Clients

Data Fabric POSIX clients enable app servers, web servers, and other client nodes and applications to read and write directly and securely to the file system. For more information about the POSIX clients, see [POSIX Clients](#) on page 529 and [POSIX Clients](#) on page 423.

#### Data Fabric NFS Clients

You can mount the cluster itself via NFS so that your applications can read and write data directly. For more information, see [Managing the HPE Ezmeral Data Fabric NFS Service](#) on page 1542.

### Using the File System JAR to Connect to the Cluster

The file system JAR file includes the Data Fabric client libraries required to connect to the cluster. While this is strongly discouraged, application developers can bundle the file system JAR file in Data Fabric file system, HPE Ezmeral Data Fabric Database, and HPE Ezmeral Data Fabric Streams applications instead of installing the Data Fabric client on the edge node (node that runs the application). Applications should not bundle the file system JAR file unless the application meets certain requirements.

**IMPORTANT:** When bundling the file system JAR file, if there is a binary mismatch between the bundled JAR file and the version that the cluster expects, this can result in failures. In release 5.2.2 and later, the system detects the mismatch and prevents the application from starting. In releases earlier than 5.2.2, nodes running applications may run out of memory or shut down unexpectedly.

## Requirements

You can bundle the file system JAR (`maprfs-<version>-mapr.jar`) with applications that meet all of the following requirements:

- The application communicates directly with the file system, HPE Ezmeral Data Fabric Database, or HPE Ezmeral Data Fabric Streams
- The application does not run as a MapReduce or YARN job/application on the cluster.
- The application does not include file system JARs on the local machine in its classpath.
- The application accesses a cluster that is not secure.

## Configuring the Cluster Connection

When you include the file system JAR in an application instead of installing the Data Fabric client on the edge node, you must create and configure a `mapr-clusters.conf` file on node that runs the application.

1. Set a `MAPR_HOME` environment variable to a location such as `/opt/mapr`.
2. Create the `mapr-clusters.conf` file in the `$MAPR_HOME/conf` directory.
3. Configure the `mapr-clusters.conf` file with the cluster name and the list of CLDB nodes.

For example, the `mapr-clusters.conf` on an edge node would contain the following content if it was connecting to a cluster named `my.cluster` with CLDB nodes on `centos765`, `centos234`, and `centos123`:

```
my.cluster secure=false centos765 centos234 centos123
```

For more information about how to configure `mapr-clusters.conf`, see [mapr-clusters.conf](#) on page 2988.

For more information about how the Data Fabric client connects to the cluster, see [How Data Fabric Clients Connect to the Cluster](#) on page 1012.

## Using Maven to Include file system JAR as a Dependency

If you use Maven to bundle the file system JAR file with an application and you plan to run the application on a Data Fabric cluster where a patch has been applied, ensure that you specify both a system scope and a local system path to the file.

For example, to bundle the file system JAR file, the `pom.xml` file may include the following:

```
...
<groupId>com.mapr.hadoop</groupId>
  <artifactId>maprfs</artifactId>
  <version>${mapr.core.version}</version>
  <scope>system</scope>
  <systemPath>/opt/mapr/lib/maprfs-5.2.0-mapr.jar</systemPath>
...

```

By default, the Data Fabric Maven repository includes JAR files from <https://repository.mapr.com/maven/>. This default Maven repository includes JAR files associated with the GA packages for each Data Fabric release. Therefore, when a patch has been applied to the cluster, failure to specify a system scope may result in errors due to a binary mismatch between the file system JAR files used by the application and the cluster.

**Known Issues**

Nodes running applications with a bundled file system JAR file may run out of memory or shut down unexpectedly in the following scenarios:

**The version of the file system JAR included in the application differs from the version that is available on the cluster.**

This may occur when a patch was applied to some, but not all the nodes in the cluster. It can also occur when Maven is bundling the GA version of the JAR file when the cluster expects a newer, patched version.

**Two versions of the JAR are available on the node.**

For YARN applications, the NodeManager nodes that run the tasks or containers store local versions of the dependencies included with the application. In this scenario, since both the cluster’s file system JAR and the version included in the application are available on the node, it is unknown which JAR will be used when processing the application.

**HPE Ezmeral Data Fabric Database JSON Application Requirements**

The following tables include the minimal node requirements for building and running HPE Ezmeral Data Fabric Database JSON table applications.

**Java Applications**

Node Requirements	Method(s) to Meet Requirement
A connection to the Data Fabric cluster.	Select one of the following options: <ul style="list-style-type: none"> <li>• Install and configure the Data Fabric client.</li> <li>• Install the PACC and run an application container.</li> <li>• Use the file system JAR to connect to the cluster.</li> </ul> For more information, see <a href="#">Connect to the Cluster</a> on page 3155.
The OJAI Query Service is installed	To use secondary indexes, you may need to enable this service. See <a href="#">Preparing Clusters for Querying using Secondary Indexes on JSON Tables</a> on page 1450 for more information.
HPE Ezmeral Data Fabric Database libraries are configured as a dependency.	When you build an application, use the Maven Repository to determine the dependencies. The POM file should include the Data Fabric Repository and the OJAI Driver project.  When you run the application, provide the dependencies in the application's classpath.  For more information, see <a href="#">Compiling and Running Java OJAI Applications</a> on page 3450
Other items to consider.	If an ecosystem component, such as Spark, runs or integrates with the application, you may need to include additional dependencies in the POM file.  For example, to use the HPE Ezmeral Data Fabric Database OJAI Connector for Apache Spark, see <a href="#">Configuring the HPE Ezmeral Data Fabric Database OJAI Connector for Apache Spark</a> on page 4649

**HPE Ezmeral Data Fabric Database Binary Application Requirements**

The following tables include the minimal node requirements for building and running HPE Ezmeral Data Fabric Database binary table applications.

## Java Applications

Node Requirement	Method(s) to Meet Requirement
A connection to the Data Fabric cluster.	<p>Select one of the following options:</p> <ul style="list-style-type: none"> <li>• Install and configure the Data Fabric client.</li> <li>• Install the PACC and run an application container.</li> <li>• Use the file system JAR to connect to the cluster.</li> </ul> <p>For more information, see <a href="#">Connect to the Cluster</a> on page 3155.</p>
The HBase client is installed.	<p>Install the HBase client. The HBase client is as part of the EEP installation. For more information, see <a href="#">7.8.0 Installation</a> on page 70.</p> <p> <b>NOTE:</b> The HBase client is include when you install PACC.</p>
HBase client library files are configured as an application dependency.	<p>When you build the application, use the Maven Repository to determine the dependencies. The POM file should include the Data Fabric Repository and the HBase client dependency.</p> <p>When you run an application, include the <code>hbase classpath</code> script and additional dependencies in the application's classpath.</p> <p>For more information, see <a href="#">Compiling and Running HPE Ezmeral Data Fabric Database Binary Applications</a> on page 3267</p>
Other Items	<p>If an ecosystem component, such as Spark, runs or integrates with the application, you may need to include additional dependencies in the POM file.</p>

## C Applications

Node Requirement	Method(s) to Meet Requirement
A connection to the Data Fabric cluster.	<p>Select one of the following options:</p> <ul style="list-style-type: none"> <li>• Install and configure the Data Fabric client.</li> <li>• Install the PACC and run an application container.</li> <li>• Use the file system JAR to connect to the cluster.</li> </ul> <p>For more information, see <a href="#">Connect to the Cluster</a> on page 3155.</p>
The HBase Client is installed.	<p>Install the HBase client. The HBase client is as part of the EEP installation. For more information, see <a href="#">7.8.0 Installation</a> on page 70.</p> <p> <b>NOTE:</b> The HBase client is include when you install PACC.</p>
The <code>libMapRClient</code> library and <code>libjvm</code> shared libraries are in the application's library search path and the <code>libMapRClient</code> header files are in this directory: <code>/opt/mapr/include/hbase</code>	<p>For more information, see <a href="#">Building and Launching C Applications</a> on page 3261.</p>

## HPE Ezmeral Data Fabric Streams Application Requirements

The following tables include the minimal node requirements for building and running HPE Ezmeral Data Fabric Streams consumer and producer applications.

### Java Applications

Node Requirement	Method(s) to Meet Requirement
A connection to the Data Fabric cluster.	<p>Select one of the following options:</p> <ul style="list-style-type: none"> <li>• Install and configure the Data Fabric client.</li> <li>• Install the PACC and run an application container.</li> <li>• Use the file system JAR to connect to the cluster.</li> </ul> <p>For more information, see <a href="#">Connect to the Cluster</a> on page 3155.</p>
The Streams Java Client is installed.	<p>Install the HPE Ezmeral Data Fabric Streams Java Client. The HPE Ezmeral Data Fabric Streams Java client (<code>mapr-kafka</code>) is available as part of the EEP installation. For more information, see <a href="#">7.8.0 Installation</a> on page 70.</p> <p> <b>NOTE:</b> The Streams Java Client is included when you install PACC.</p>
Streams Java client and the Data Fabric Streams project library files are configured as an application dependency.	<p>When you build the application, use the Maven Repository to determine the dependencies. The POM file should include the Data Fabric Repository, the HPE Ezmeral Data Fabric Streams Java Client dependency, and the HPE Ezmeral Data Fabric Streams project dependency.</p> <p>When you run an application, include the dependencies in the application's classpath.</p> <p>For more information, see <a href="#">Compiling and Running HPE Ezmeral Data Fabric Streams Java Apps</a> on page 3574</p>
Other Items	<p>If an ecosystem component, such as Spark, runs or integrates with the application, you may need to include additional dependencies in the POM file.</p>

## File System Application Requirements

The following tables include the minimal node requirements for building and running file system applications.

### Java Applications

Node Requirement	Method(s) to Meet Requirement
A connection to the Data Fabric cluster.	<p>Select one of the following options:</p> <ul style="list-style-type: none"> <li>• Install and configure the Data Fabric client.</li> <li>• Install the PACC and run an application container.</li> <li>• Use the file system JAR to connect to the cluster.</li> </ul> <p>For more information, see <a href="#">Connect to the Cluster</a> on page 3155.</p>

Node Requirement	Method(s) to Meet Requirement
Include hadoop-common libraries as a dependency.	<p>When you compile the application, use the Maven Repository to determine the dependencies. The POM file should include the Data Fabric Repository and the hadoop-common dependency:</p> <pre data-bbox="833 338 1458 926"> &lt;repositories&gt;   &lt;repository&gt; &lt;id&gt;mapr-releases&lt;/id&gt;   &lt;url&gt;https://repository.mapr.com/maven/&lt;/url&gt; &lt;snapshots&gt;&lt;enabled&gt;&gt;false&lt;/enabled&gt;&lt;/snapshots&gt;   &lt;releases&gt;&lt;enabled&gt;&gt;true&lt;/enabled&gt;&lt;/releases&gt; &lt;/repository&gt; &lt;/repositories&gt;  &lt;dependencies&gt;   &lt;dependency&gt;     &lt;groupId&gt;org.apache.hadoop&lt;/groupId&gt;     &lt;artifactId&gt;hadoop-common&lt;/artifactId&gt;     &lt;version&gt;\${hadoop.version}&lt;/version&gt;   &lt;/dependency&gt; &lt;/dependencies&gt; </pre> <p>When you run the application, include the following in the application's classpath: `hadoop classpath`</p> <p>For more information, see <a href="#">Compiling and Running a Java Application</a> on page 3225.</p>

**NOTE:**

When you develop a Java application, you can use a dependency management tool such as Maven to compile your application. However, it is recommended that you do the following instead:

1. Compile the Java application without including dependencies
2. Specify the required classpath when you submit the application to the cluster

If you choose to bundle the JAR file, and there is a mismatch between the bundled JAR file and the version that your Data Fabric cluster expects, this can result in failures. The failures differ depending on the version of Data Fabric you are using. For more information, see [Using the File System JAR to Connect to the Cluster](#) on page 3155.

**C Applications**

Node Requirement	Method(s) to Meet Requirement
A connection to the Data Fabric cluster.	<p>Select one of the following options:</p> <ul style="list-style-type: none"> <li>• Install and configure the Data Fabric client.</li> <li>• Install the PACC and run an application container.</li> </ul> <p>For more information, see <a href="#">Connect to the Cluster</a> on page 3155.</p>

Node Requirement	Method(s) to Meet Requirement
Include the libhdfs libraries and Data Fabric libraries when you compile the application.	<p>The Data Fabric libraries are available in the following location: <code>/opt/mapr/lib</code></p> <p>Link to the libhdfs libraries in the following location: <code>MAPR_HOME/hadoop/hadoop-2.x/</code></p> <p>For more information, see <a href="#">Compiling and Running C Applications on File System Clients</a> on page 3167</p>

### YARN Application Requirements

The following tables include the minimal node requirements for building and running YARN applications.

Node Requirement	Method(s) to Meet Requirement
A connection to the Data Fabric cluster.	<p>Select one of the following options:</p> <ul style="list-style-type: none"> <li>• Install and configure the Data Fabric client.</li> <li>• Install the PACC and run an application container.</li> </ul> <p>For more information, see <a href="#">Connect to the Cluster</a> on page 3155.</p>
Hadoop libraries are configured as an application dependency.	<p>When you compile the application, use the Maven Repository to determine the dependencies. The POM file should include the Data Fabric Repository and the hadoop-common dependency:</p> <pre>&lt;repositories&gt;   &lt;repository&gt;     &lt;id&gt;mapr-releases&lt;/id&gt;    &lt;url&gt;https:// repository.mapr.com/maven/&lt;/url&gt;     &lt;snapshots&gt;&lt;enabled&gt;false&lt;/enabled&gt;&lt;/ snapshots&gt;     &lt;releases&gt;&lt;enabled&gt;true&lt;/enabled&gt;&lt;/ releases&gt;   &lt;/repository&gt; &lt;/repositories&gt;  &lt;dependencies&gt;   &lt;dependency&gt;     &lt;groupId&gt;org.apache.hadoop&lt;/groupId&gt;     &lt;artifactId&gt;hadoop-common&lt;/ artifactId&gt;     &lt;version&gt;\${hadoop.version}&lt;/version&gt;   &lt;/dependency&gt; &lt;/dependencies&gt;</pre> <p>When you run the application, include the following in the application's classpath: <code>`hadoop classpath`</code></p> <p>Note: Based on how you submit the application, the classpath locations and requirements differ. See <a href="#">External Applications and Classpath</a> on page 3826 and <a href="#">Classpath Construction</a> on page 3827.</p>

Node Requirement	Method(s) to Meet Requirement
Other Items	<ul style="list-style-type: none"> <li>• If an ecosystem component, such as Spark, runs or integrates with the application, you may need to include additional dependencies in the POM file.</li> <li>• Any third-party library that is required by a MapReduce program must be accessible to this node and the data node that processes the job or application. For more information, see <a href="#">Managing Third-Party Libraries</a> on page 3827.</li> </ul>

## Step 5: Build the Application

Start building an application! This section lists a few of the sample applications available in HPE Ezmeral Data Fabric.

**NOTE:** When building and running your application, you may want to use a classpath for printing to standard output. The following classpaths are available:

**mapr classpath**

Prints CLASSPATH to standard output. This classpath could be used to build your application classpath to run HPE Ezmeral Data Fabric applications for YARN and other components.

**mapr clientclasspath**

Prints CLASSPATH for HPE Ezmeral Data Fabric Database clients to standard output. The clientclasspath could be used to build the classpath to run your HPE Ezmeral Data Fabric Database (binary and JSON) and HPE Ezmeral Data Fabric Streams applications.

### HPE Ezmeral Data Fabric Database JSON

[Managing JSON Tables](#) on page 3306

This section describes how to create, list, and delete JSON tables as well as set permissions and manage column families using either the Data Fabric Java API library or the HPE Ezmeral Data Fabric Database Shell commands.

[Creating JSON Documents in Java OJAI](#) on page 3329

This section provides several Java examples of creating a document.

[Examples: Inserting JSON Documents](#) on page 3338

This section shows how to insert a document or data into a document store (HPE Ezmeral Data Fabric Database JSON table) with Java and dbshell.

[Examples: Querying JSON Documents](#) on page 3409

This section provides several examples of querying documents.

[HPE Ezmeral Data Fabric Database JSON MapReduce: Sample App](#) on page 3501

This sample Java application extends the Apache Hadoop MapReduce framework to read records (JSON documents) from a JSON table and inserts new documents into another JSON table. This API library allows you to write your own MapReduce applications to write data from one JSON table to another.

### HPE Ezmeral Data Fabric Database Binary

[C API Examples](#) on page 3244

This section provides examples using the HPE Ezmeral Data Fabric Database libMapRClient C API to operate on HPE Ezmeral Data Fabric Database binary tables.

**[HPE Ezmeral Data Fabric Database Sample C Application on page 3248](#)**

This section provides additional sample C applications that accesses and performs operations on HPE Ezmeral Data Fabric Database binary tables.

**HPE Ezmeral Data Fabric Streams Streams**

**[Sample Java Consumer on page 3517](#)**

This sample Java consumer application iterates through the returned records, extracts the value of each message, and prints the value to standard output.

**[Sample Java Producer on page 3519](#)**

This sample Java producer application publishes messages to a stream topic.

**[Developing a HPE Ezmeral Data Fabric Streams C Application on page 3594](#)**

These sample C applications publish messages to a stream topic and consumes the messages.

**[Developing HPE Ezmeral Data Fabric Streams Python Applications on page 3796](#)**

These sample Python applications publish messages to a stream topic and consumes the messages.

**file system**

**[Sample Applications on page 3229](#)**

This sample Java application demonstrates how to set, get, modify, and delete ACEs on files using the Java APIs.

**[hdfs\\_write\\_revised.c on page 3172](#)**

This C application demonstrates how to write to files by using the hdfsWrite() and hdfsPwrite() APIs.

**[hdfs\\_read\\_revised.c on page 3180](#)**

This C application demonstrates how to read from files by using the hdfsRead() and hdfsPread() APIs.

**[hdfs\\_connect\\_as\\_user.c on page 3187](#)**

This C application demonstrates how to create and write to files impersonating another user by using the hdfsConnectAsUser() API.

**Github Repo**

You can find additional sample code on the [MapR Demos Github repository](#).

**File Store and Apps**

The following sections provide information about accessing the File Store with C and Java applications.

**Copying Data from Apache Hadoop to a Data Fabric Cluster**

Describes the procedure to copy data from an Apache Hadoop to a Data Fabric cluster.

You can use the hdfs protocol, webhdfs protocol, or NFS for the HPE Ezmeral Data Fabric to copy data from Apache Hadoop to a Data Fabric cluster.

The following table describes these methods:

Method	Description
hdfs:// protocol	Use the <code>hadoop distcp</code> command with the <code>hdfs://</code> protocol to copy data from an HDFS cluster into a Data Fabric cluster if the HDFS cluster and the Data Fabric cluster use the same RPC protocol version. For all other scenarios, use the <code>webhdfs://</code> protocol or NFS for the HPE Ezmeral Data Fabric gateway to copy data to a Data Fabric cluster.

Method	Description
webhdfs:// protocol	Use the <code>hadoop distcp</code> command with the <code>webhdfs://</code> protocol to copy data from an HDFS cluster into a Data Fabric cluster.
NFS	Mount a Data Fabric cluster to an HDFS cluster using NFS for the HPE Ezmeral Data Fabric mount. Then use the <code>hadoop distcp</code> command to copy data between the two clusters.

### Copy Data Using the `hdfs://` Protocol

Describes the procedure to copy data from a HDFS cluster to a HPE Ezmeral Data Fabric cluster using the `hdfs://` protocol.

Before you can copy data from an HDFS cluster to a HPE Ezmeral Data Fabric cluster using the `hdfs://` protocol, you must configure the HPE Ezmeral Data Fabric cluster to access the HDFS cluster. To do this, complete the steps listed in [Configuring a HPE Ezmeral Data Fabric Cluster to Access an HDFS Cluster](#) for the security scenario that best describes your HDFS and HPE Ezmeral Data Fabric clusters, and then complete the steps listed under [Verifying Access to an HDFS Cluster](#).

You also need the following information:

- `<NameNode>` - the IP address or hostname of the NameNode in the HDFS cluster
- `<NameNode Port>` - the port for connecting to the NameNode in the HDFS cluster
- `<HDFS path>` - the path to the HDFS directory from which you plan to copy data
- `<Data Fabric File system path>` - the path in the HPE Ezmeral Data Fabric cluster to which you plan to copy HDFS data
- `<file>` - a file in the HDFS path

To copy data from HDFS to HPE Ezmeral Data Fabric file system using the `hdfs://` protocol, complete the following steps:

1. Run the following Hadoop command to determine if the HPE Ezmeral Data Fabric cluster can read the contents of a file in a specified directory on the HDFS cluster:

```
hadoop fs -cat <NameNode>:<NameNode port>/<HDFS path>/<file>
```

#### Example

```
hadoop fs -cat hdfs://nn1:8020/user/sara/contents.xml
```

2. If the HPE Ezmeral Data Fabric cluster can read the contents of the file, run the `distcp` command to copy the data from the HDFS cluster to the HPE Ezmeral Data Fabric cluster:

```
hadoop distcp hdfs://<NameNode>:<NameNode Port>/<HDFS path> maprfs://<Data Fabric File system path>
```

#### Example

```
hadoop distcp hdfs://nn1:8020/user/sara maprfs:///user/sara
```

### Copying Data Using the `webhdfs://` Protocol

Describes how to copy data from a HDFS cluster to a HPE Ezmeral Data Fabric cluster using the `webhdfs://` protocol.

Before you can copy data from an HDFS cluster to a HPE Ezmeral Data Fabric cluster using the `webhdfs://` protocol, you must configure the HPE Ezmeral Data Fabric cluster to access the HDFS cluster. To do this, complete the steps listed in [Configuring a HPE Ezmeral Data Fabric Cluster to Access an HDFS Cluster](#) for the security scenario that best describes your HDFS and HPE Ezmeral Data Fabric clusters, and then complete the steps listed under [Verifying Access to an HDFS Cluster](#).

The HDFS cluster must have WebHDFS enabled. Verify that the following parameter exists in the `hdfs-site.xml` file and that the value is set to `true`.

```
<property>
<name>dfs.webhdfs.enabled</name>
<value>true</value>
</property>
```

You also need the following information:

- `<NameNode>` - the IP address or hostname of the NameNode in the HDFS cluster
- `<NameNode HTTP Port>` - the HTTP port on the NameNode in the HDFS cluster
- `<HDFS path>` - the path to the HDFS directory from which you plan to copy data
- `<MapR filesystem path>` - the path in the HPE Ezmeral Data Fabric cluster to which you plan to copy HDFS data

To copy data from the HDFS to the HPE Ezmeral Data Fabric file system using the `webhdfs://` protocol, complete the following step:

Run the following command from a node in the HPE Ezmeral Data Fabric cluster:

```
hadoop distcp webhdfs://<NameNode>:<NameNode HTTP Port>/<HDFS path>
maprfs:///<MapR filesystem path>
```

### Example

```
hadoop distcp webhdfs://nn2:50070/user/sara maprfs:///user/sara
```

**NOTE:** The triple slashes in `maprfs:///...` are required.

### Copying Data Using NFS for the HPE Ezmeral Data Fabric

Describes how to copy files from one data-fabric cluster to another using NFS for the HPE Ezmeral Data Fabric.

If NFS for the HPE Ezmeral Data Fabric is installed on the Data Fabric cluster, you can mount the Data Fabric cluster to the HDFS cluster and then copy files from one cluster to the other using `hadoop distcp`. If you do not have NFS for the HPE Ezmeral Data Fabric installed and a mount point configured, see [Accessing Data with NFS v3](#) on page 1550 and [Managing the HPE Ezmeral Data Fabric NFS Service](#) on page 1542.

To perform a copy using `distcp` via NFS for the HPE Ezmeral Data Fabric, you need the following information:

- `<MapR NFS Server>` - the IP address or hostname of the NFS server in the data-fabric cluster
- `<maprfs_nfs_mount>` - the NFS export mount point configured on the data-fabric cluster; default is `/mapr`
- `<hdfs_nfs_mount>` - the NFS for the HPE Ezmeral Data Fabric mount point configured on the HDFS cluster

- <NameNode> - the IP address or hostname of the NameNode in the HDFS cluster
- <NameNode Port> - the port on the NameNode in the HDFS cluster
- <HDFS path> - the path to the HDFS directory from which you plan to copy data
- <MapR file system path> - the path in the Data Fabric cluster to which you plan to copy HDFS data

To copy data from HDFS to the Data Fabric file system using NFS for the HPE Ezmeral Data Fabric, complete the following steps:

### 1. Mount HDFS.

Issue the following command to mount the Data Fabric cluster to the HDFS NFS for the HPE Ezmeral Data Fabric mount point:

```
mount <Data Fabric NFS Server>:/<maprfs_nfs_mount> /<hdfs_nfs_mount>
```

#### Example

```
mount 10.10.100.175:/mapr /hdfsmount
```

### 2. Copy data.

- a. Issue the following command to copy data from the HDFS cluster to the Data Fabric cluster:

```
hadoop distcp hdfs://<NameNode>:<NameNode Port>/<HDFS path> file:///<hdfs_nfs_mount>/<MapR file system path>
```

#### Example

```
hadoop distcp hdfs://nn1:8020/user/sara/file.txt file:///hdfsmount/user/sara
```

- b. Issue the following command from the Data Fabric cluster to verify that the file was copied to the Data Fabric cluster:

```
hadoop fs -ls /<MapR file system path>
```

#### Example

```
hadoop fs -ls /user/sara
```

## Accessing the File System with C Applications

HPE Ezmeral Data Fabric provides a modified version of `libhdfs` that supports access to the data-fabric file system. You can develop applications with C that read files, write to files, change file permissions and file ownership, create and delete files and directories, rename files, and change the access and modification times of files and directories.

`libMapRClient` supports and makes modifications to the `hadoop-<version>` version of `libhdfs`. The API reference notes which APIs are supported by `hadoop-<version>`.

`libMapRClient`'s version of `libhdfs` contains the following changes and additions:

- There are no calls to a JVM, so applications run faster and more efficiently.
- Changes to APIs

- *hadoop-<version>*: Support for `hdfsBuilder` structures for connections to HDFS is limited. Some of the parameters are ignored.
- *hadoop-<version>*: `hdfsGetDefaultBlockSize()`: If the file system that the client is connected to is an instance of file system, the returned value is 256 MB, regardless of the actual setting.
- *hadoop-<version>*: `hdfsCreateDirectory()`: The parameters for buffer size, replication, and block size are ignored for connections to the data-fabric file system.
- *hadoop-<version>*: `hdfsGetDefaultBlockSizeAtPath()`: If the file system that the client is connected to is an instance of file system, the returned value is 256 MB, regardless of the actual setting.
- *hadoop-<version>*: `hdfsOpenFile()`: The parameters for buffer size and replication are ignored for connections to the data-fabric file system.
- APIs that are unique to `libMapRClient` for *hadoop-<version>*
  - `hdfsCreateDirectory2()`
  - `hdfsGetNameContainerSizeBytes()`
  - `hdfsOpenFile2()`
  - `hdfsSetRpcTimeout()`
  - `hdfsSetThreads()`

### Installing and Configuring File System C Clients

Install the `mapr-client` package on the nodes on which you plan to build and run client applications. This package installs the `libMapRClient` library. See [Setting Up the Client](#).

**NOTE:** The `mapr-core` package contains the files that are in the `mapr-client` package. If you have installed the `mapr-core` package, you do not need to install the `mapr-client` package.

The modified versions of `libhdfs` are installed in this directory:

```
MAPR_HOME/hadoop/hadoop-<version>/
```

### Compiling and Running C Applications on File System Clients

The HPE Ezmeral Data Fabric file system exposes the HDFS API. If you already have a client program built to use `libhdfs`, you do not have to relink your program just to access the file system. However, re-linking to the Data Fabric-specific shared library `libMapRClient.so` will give you better performance on the file system. Unlike `libhdfs.so`, `libMapRClient.so` does not make Java calls to access the file system.

The following script sets environment variables to necessary values and compiles one of the sample applications. Use this script as an example for building and launching your own applications.

When you set `HADOOP_HOME` for your own client applications, set it to the path for the version of `libhdfs` that your application uses. The path is:

```
MAPR_HOME/hadoop/hadoop-<version>/
```

Also, set the path to your application in the `gcc` command, of course.

This script assumes that `MAPR_HOME` is set to the default value of `/opt/mapr`.

```
#!/bin/bash
#Setup environment
```

```

export HADOOP_HOME=${MAPR_HOME}/hadoop/hadoop-<version>/
export LD_LIBRARY_PATH=${LD_LIBRARY_PATH}:${MAPR_HOME}/lib/
export LD_RUN_PATH=${LD_RUN_PATH}:${MAPR_HOME}/lib
GCC_OPTS="-Wl,--allow-shlib-undefined -I. -I${HADOOP_HOME}/include/"

#Compile and Link
gcc ${GCC_OPTS} ${HADOOP_HOME}src/c++/libhdfs/hdfs_read.c -o hdfs_read -L$
{MAPR_HOME}/lib -lMapRClient

#Launch the application
./hdfs_read

```

**NOTE:**

- The compiled `libMapRClient` is statically linked to the following third-party libraries:
  - Crypto++: `libcryptoapp.a` (v5.6.2)
  - Protobuf: `libprotobuf-lite.a` (v2.5.0)
- If a client application connects to the local fileserver, before launching the application you can set the `MAPR_CLIENT_SHMEM` environment variable to control how much of the local system memory should be devoted to the resources and buffers used for communication between the client application and the local fileserver. By default, the size of the shared memory is 20 MB. If you want to change this value, specify it as a number of pages. For example, to set the shared memory at 128 MB, multiply 128 by 10242 bytes and then divide the product by 8192 bytes. In this case, the value would be 16384 pages.

**Overview of the File System C APIs in `libMapRClient`**

Although you can use the file system C APIs to perform other tasks, the most common use of the file system C APIs is to write to and read from files.

Review the following information for an overview of the steps required to use file system C APIs in `libMapRClient`:

1. Create a connection to the MapR file system running on a MapR cluster. For information about connections, see [Establishing Connections to Filesystems](#).
2. Create or open a file. You can create explicitly or by calling one of the `hdfsOpen()` APIs and specifying a file that doesn't exist. Opening a file sets the current offset to 0, the first byte in the file. You can move file offset explicitly with the `hdfsSeek()` API. Writes done by `hdfsWrite()` and reads done by `hdfsRead()` increment the offset by the number of bytes written or read.

Use `hdfsTell()` to find out what the current offset is.

For information about how to specify the location of a file to create or open, see [Specifying Paths to Files and Directories](#).

3. Write to or read from the file. When you write to a file, you pass a buffer that contains the data that you want to write. Writes can be done from the default offset, which is 0 when the file is opened, appended to the end of the file, or done from an offset that you specify. Write buffers are flushed to the server periodically. For more information about writes, see [Writing to Files](#).

When you read from a file, you pass a pointer to a buffer for storing the data that is read. Reads can be done from the default offset or from an offset that you specify. For more information about reads, see [Reading from Files](#).

#### 4. Close the file.

Closing a file implicitly flushes any remaining write buffers to the server. It also frees resources that are associated with the file.

#### 5. Disconnect from the file system.

For more detailed information about these steps, see:

### Establishing Connections to the File System

The APIs for establishing connections to the file system and returning file-system handles are:

- `hadoop-<version>: hdfsConnect()`
- `hadoop-<version>: hdfsConnectAsUser()`

**NOTE:** This API ignores the impersonation request and is therefore equivalent to `hdfsConnect()`.

- `hadoop-<version>: hdfsConnectNewInstance()`

The `hdfsConnectAsNewUserInstance()` API is not supported for connections to file system file servers.

These APIs behave in the same way:

- If `default` is specified for the `host` parameter, the APIs connect to the first cluster listed in the file `MAPR_HOME/conf/mapr-clusters.conf`. (`MAPR_HOME` defaults to `/opt/mapr`.)
- If a hostname or IP address is specified for the `host` parameter:
  1. Look in `MAPR_HOME/conf/mapr-clusters.conf` on the client node to match the specified hostname or IP address to a CLDB host and port.
  2. If they find a match, they try to connect to the cluster, and all standard features for connections to Data Fabric clusters are available. These features include high availability across CLDBs and secure connections.
  3. If they do not find a match or if they cannot locate a `mapr-clusters.conf` file, they try to connect to the CLDB host specified in the call to create the connection. However, the standard features for connections to Data Fabric clusters are not available. For example, if the cluster is secured, the connection will fail.

It is possible to have more than one open connection at a time. For each connection, simply return the file-system handle to a different instance of `hdfsFS`, as in this example:

```
//Connect to Cluster 1 (picked up from /opt/mapr/conf/
mapr-clusters.conf)
    hdfsFS fs1 = hdfsConnectNewInstance("default", 7222);
//Connect to Cluster 2
    hdfsFS fs2 = hdfsConnectNewInstance("n1c", 7222);
//Connect to Cluster 3
    hdfsFS fs3 = hdfsConnectNewInstance("n1d", 7222);
```

You can then obtain file handles for files in each connected cluster, as in this example. For each cluster, this example code calls `hdfsOpenFile()`, passing in the handle to the file system, the absolute path to a file (and the file is created before being opened, if it doesn't already exist) and a file-access flag that specifies to open the file in write-only mode. This mode truncates existing files to offset 0, deleting their content.

Ignore the last three parameters for this example. `hdfsOpenFile()` returns a handle to the file or an error message, if the open operation fails.

```
//Create files for write operations on all clusters
const char* writePath = "/tmp/write-file1.txt";
hdfsFile writeFile1 = hdfsOpenFile(fs1, writePath, O_WRONLY, 0, 0,
0);
    if (!writeFile1) {
        fprintf(stderr, "Failed to open %s for writing on Cluster 1!\n",
writePath);
        exit(-2);
    }
    hdfsFile writeFile2 = hdfsOpenFile(fs2, writePath, O_WRONLY, 0, 0,
0);
    if (!writeFile2) {
        fprintf(stderr, "Failed to open %s for writing on Cluster 2!\n",
writePath);
        exit(-2);
    }
    hdfsFile writeFile3 = hdfsOpenFile(fs3, writePath, O_WRONLY, 0, 0,
0);
    if (!writeFile3) {
        fprintf(stderr, "Failed to open %s for writing on Cluster 3!\n",
writePath);
        exit(-2);
    }
    fprintf(stderr, "Opened %s for writing successfully on all 3
clusters...\n", writePath);
```

After working with the files, close them and disconnect from the file system, as in this example:

```
// Close all files
if (writeFile1)
    hdfsCloseFile(fs1, writeFile1);
if (writeFile2)
    hdfsCloseFile(fs2, writeFile2);
if (writeFile3)
    hdfsCloseFile(fs3, writeFile3);

// Disconnect from all clusters
hdfsDisconnect(fs1);
hdfsDisconnect(fs3);
hdfsDisconnect(fs3);
```

### Specifying Paths to Files and Directories

Many of the APIs require clients to pass a path to a file or directory. You can specify absolute paths or relative paths. Absolute paths must begin with a forward slash. Relative paths are relative to the working directory, which you can set by calling `hdfsSetWorkingDirectory()` and find out by calling `hdfsGetWorkingDirectory()`. Any path that does not begin with a forward slash is considered to be relative to the working directory.

The maximum length of paths is 4096 bytes.

You cannot specify paths to a cluster other than the cluster for the current connection. All paths are local to the cluster connected to. You can, however, explicitly connect to multiple clusters, as described in [Establishing Connections to the File System](#) on page 3169.

### Writing to Files

There are two APIs for writing to files: `hdfsWrite()` and `hdfsPwrite()`. With both APIs, you pass a buffer that contains the data to write. You also pass the length of the buffer in bytes. There maximum length

of the buffer is the maximum size of the datatype that is used to specify the buffer length. The datatype is a custom datatype: `tSize`, a signed 32-bit integer.

Both APIs return the number of bytes that were written. Flushes to the server happen automatically at intervals during a write operation. After a write operation is finished, either call `hdfsFlush()` explicitly or call `hdfsFlush()` implicitly by calling `hdfsCloseFile()` to be sure that any data remaining in the write buffer is flushed.

For an example of both APIs in action, see [hdfs\\_write\\_revised.c](#).

**NOTE:** The `core-site.xml` flags:

- `fs.mapr.flush.unaligned` default setting (`false`) enables flushes to the server in 8K boundaries. Unaligned flushes can happen only if idle flusher (`fs.mapr.write.idleflush.timeout`) is triggered. If this behavior is not desired, set the value for `fs.mapr.flush.unaligned` to `true`, which will enable flushing of unaligned write buffers (so that even small writes can be flushed on every subsequent write call).
- `fs.mapr.write.idleflush.timeout` automatically flushes the buffer, by default, after 3 seconds for all the open files. This can be disabled by setting the value to 0. If value is specified, buffer is flushed automatically between  $n$  to  $n+1$  seconds. For example, if value is 3 seconds, the write buffer is not cached after 4 seconds.

See also: [Default core Parameters](#).

### Using `hdfsWrite()`

When a file is opened in write-only mode or read-write mode, the file is truncated from offset 0, effectively deleting the content of the file. Therefore, the initial write to the file begins at offset 0. You can start subsequent writes anywhere in the file after first calling `hdfsSeek()` to move to the desired offset. After a write operation, the offset is located at the last written byte.

If the file is opened in append mode, data is appended to the end of the file only.

If a call to `hdfsSeek()` moves the offset past the end of the file before a call to `hdfsWrite()`, the result is a hole in the file between the previous end of the file and the offset at which the write begins.

You can obtain the size of a file in bytes by calling `hdfsGetPathInfo()`.

On error, pending write buffers are flushed to the server.

### Using `hdfsPwrite()`

Whereas `hdfsWrite()` increments the current offset by the amount of bytes returned by the API (except in case of error), `hdfsPwrite()` does not change the value of current offset. If the current offset before the call to `hdfsPwrite()` is 0 and you specify the offset 10 for the write operation, after the write the current offset remains 0.

If a call to `hdfsPwrite()` specifies an offset that is past the end of the file, the result is a hole in the file between the previous end of the file and the offset at which the write begins.

You can obtain the size of a file in bytes by calling `hdfsGetPathInfo()`.

On error, pending write buffers are flushed to the server.

### Reading from Files

There are two APIs for reading from files: `hdfsRead()` and `hdfsPread()`. With both `hdfsRead()` and `hdfsPread()`, you pass a pointer to a buffer for the runtime to read bytes into and the length of the buffer. There maximum length of the buffer is the maximum size of the datatype that is used to specify the buffer length. The datatype is a custom datatype: `tSize`, a signed 32-bit integer.

Both functions return the number of bytes that are actually read.

For an example of both APIs in action, see [hdfs\\_read\\_revised.c](#).

### Using `hdfsRead()`

Whenever you open a file, the file pointer is placed at offset 0. If you want to start reading at an offset other than 0, call `hdfsSeek()` to move the file pointer forward to that offset before you call `hdfsRead()`.

When you call `hdfsSeek()`, you specify the offset as a value of type `tOffset`, which is a fixed-width, signed 64-byte integer type for storing offsets. `tOffset` is defined in `hdfs.h`.

If a file is already open and you are not sure what the current offset is, you can find out by calling `hdfsTell()`.

After `hdfsRead()` finishes a read operation, the current offset is set to the last byte read plus one.

### Using `hdfsPread()`

With `hdfsPread()`, you specify the offset at which you want to start reading, so you don't first have to call `hdfsSeek()` to move to that offset.

However, the offset that you specify does not change the current offset in the file. After `hdfsPread()` finishes the read operation, the current offset is not set to the last byte read plus one. Instead, the current offset remains as it was before the read operation.

### Sample Applications

The following applications demonstrate how to write to and read from files using the APIs:

#### `hdfs_write_revised.c`

#### Sample Application

This application demonstrates how to write to files by using the APIs `hdfsWrite()` and `hdfsPwrite()`: `hdfs_write_revised.c`

Before running this application:

- Ensure that you have access either to a cluster running file system.
- Ensure that a text-based file that you have access to exists on the cluster. Note the path to the file and the size of the file in bytes.
- The content of the file will be deleted before the first write is performed by the application.
- Decide on the length in bytes of a string to write to the file.

To build and run it, download it from this page to a Data Fabric client or to a system with the `mapr-core` package installed. Then, modify the `run.sh` script in [Building and Running C Applications on file system Clients](#) to point to this sample application. Run the script and then run the application.

The application includes these header files:

- `stdio.h`
- `hdfs.h`
- `errno.h`
- `fcntl.h`

The APIs are defined in `hdfs.h`. The file `fcntl.h` defines the file-access flags.

The application performs the actions that are described in the following sections.

**Takes a filename, file size, and buffer size as input**

When you launch the application, provide the path and name of the file, the size of the file, and the number of bytes to write.

```
hdfs_write <filename> <filesize>
<bufferSize>
```

**Sets an RPC timeout**

`hdfsSetRpcTimeout()` is specific to the `libMapRClient` version of `libhdfs` and takes a value that is specified in seconds. The default is 99 seconds. If you change this value, set it either to 0 (which eliminates timeouts) or to a value greater than 30.

```
int err = hdfsSetRpcTimeout(30);
if (err) {
    fprintf(stderr, "Failed to set rpc
timeout!\n");
    exit(-1);
}
```

**Connects to a filesystem, using an API that is supported in the hadoop-2.x version of libhdfs**

The application tries to connect to the first file system cluster that is specified in the `mapr-clusters.conf` file in the `MAPR_HOME/conf` directory on the client. After connecting to the filesystem, the application returns a handle to the filesystem.

```
hdfsFS fs = hdfsConnect("default", 0);
if (!fs) {
    fprintf(stderr, "Oops! Failed to
connect to hdfs!\n");
    exit(-1);
}
```

**Stores the values of the arguments**

The application stores the values of the arguments in a character array and in two variables of type `tSize`. This datatype is defined in `hdfs.h` and is a fixed-width, signed 32-byte integer type for storing the size of data for read or write operations.

```
const char* rfile = argv[1];
tSize fileSize = strtoul(argv[2],
NULL, 10);
tSize bufferSize = strtoul(argv[3],
NULL, 10);
```

**Opens the file that you specified**

The application opens the specified file, passing the following values to the `hdfsOpenFile()` function:

- The handle to the filesystem
- The name of the file, which you supplied when you launched the application.

- A flag to indicate the mode in which to open the file. In this case, the flag is `O_WRONLY`. This flag creates the file if the file does not exist and truncates the file if the file does exist. If the file existed and you wanted to preserve the content of the file, you would specify `O_WRONLY | O_APPEND` for flag. These flags are defined in the header file `fcntl.h`.
- The default chunk size for the directory in which the file is either located or will be created. This value is specified by the 0 in the last parameter.

Although there are two other parameters in the `hdfsOpenFile()` function – the fourth and fifth, the `libMapRClient` version of `libhdfs` ignores them.

```
hdfsFile writeFile = hdfsOpenFile(fs,
rfile, O_WRONLY, 0, 0, 0);
if (!writeFile) {
    fprintf(stderr, "Failed to open %s
for writing!\n", rfile);
    exit(-2);
}
```

**Creates a buffer of the size that you specified and populates the buffer**

At this point that the application, creates a string to populate the buffer. This is the data that the application will write.

```
char* buffer = malloc(sizeof(char) *
bufferSize);
if(buffer == NULL) {
    fprintf(stderr, "Failed to allocate
memory!\n");
    return -2;
}
int i;
for (i=0; i<bufferSize; i++) {
    buffer[i] = 'a' + i%26;
}
```

**Writes an entire file with `hdfsWrite()`**

The application calls the function `writeLength()`:

```
int ret = writeLength(fs, writeFile,
buffer, bufferSize, fileSize);
if (ret < 0) {
    goto done;
}
```

This function writes the content of the buffer to the file, starting at offset 0.

```
int
writeLength(hdfsFS fs, hdfsFile
writeFile, char *buffer, tSize
bufferSize, tSize writeSize)
{
    tSize writeBytes = 0;
    tSize ret = 0;
    uint64_t totalWrite = 0;
    if (fs == NULL || writeFile == NULL
```

```

|| buffer == NULL) {
    return -1;
}
if (writeSize == 0) {
    return 0;
}
for
(writeBytes=0; writeBytes<writeSize;
writeBytes+=bufferSize) {
    ret = hdfsWrite(fs, writeFile,
(void*)buffer, bufferSize);
    if (ret > 0) {
        totalWrite += ret;
    } else {
        fprintf(stderr, "hdfsWrite
failed with error %d \n", errno);
        hdfsCloseFile(fs, writeFile);
        return -1;
    }
}
return 0;
}

```

**Seeks an offset and writes from that offset with hdfsWrite()**

The application next calls the function `writeAtOffse()`:

```

tSize writeBytes =
writeAtOffset(fs, writeFile, 0,
buffer, bufferSize);
if (writeBytes < 0) {
    goto done;
}

```

This function writes the content of the buffer to the file, starting at the specified offset. If the file already exists, the file is first truncated to this offset before the write operation begins. In this case, the specified offset is 0.

The difference between this function and the previous function is that, before writing, it calls `hdfsSeek()` to move to the specified offset in the file.

```

tSize
writeAtOffset(hdfsFS fs, hdfsFile
writeFile, tOffset offset,
char *buffer, tSize
bufferSize)
{
    tSize ret = 0;
    if (fs == NULL || writeFile == NULL
|| buffer == NULL) {
        return -1;
    }
    ret = hdfsSeek(fs, writeFile,
offset);
    if (!ret) {
        //hdfsWrite will return -1 if
ret != number of bytes asked to
//be written.
        ret = hdfsWrite(fs, writeFile,
buffer, bufferSize);
        if (ret < 0) {

```

```

        fprintf(stderr, "hdfsWrite
failed with error %d \n", errno);
    }
    } else {
        fprintf(stderr, "hdfsSeek failed
with error %d \n", errno);
    }
    if (ret < 0) {
        //hdfsWrite does a flush in case
of an error, explicit flush
        //is not required.
        hdfsCloseFile(fs, writeFile);
    }
    //Current offset within the file
will be positioned at (offset +
writeBytes)th byte.
    return ret;
}

```

### Performs a positional write with hdfsPwrite()

The application next calls the function `positionalWrite()`:

```

writeBytes = positionalWrite(fs,
writeFile, 20, buffer, bufferSize);
if (writeBytes < 0) {
    goto done;
}

```

This function writes the content of the buffer to the file, starting at the offset that you specify.

```

tSize
positionalWrite(hdfsFS fs, hdfsFile
writeFile, tOffset offset,
                char *buffer, tSize
bufferSize)
{
    tSize writeBytes = 0;
    if (fs == NULL || writeFile == NULL
|| buffer == NULL) {
        return -1;
    }
    writeBytes = hdfsPwrite(fs,
writeFile, offset, buffer,
bufferSize);
    if (writeBytes < 0) {
        fprintf(stderr, "hdfsPwrite
failed with error %d \n", errno);
        hdfsCloseFile(fs, writeFile);
    }
    //Current offset within the file
will not be advanced if hdfsPwrite is
used
    return writeBytes;
}

```

### Closes the file

```

hdfsCloseFile(fs, writeFile);

```

**Frees the buffer**

```
free(buffer);
```

**Disconnects from the filesystem**

```
hdfsDisconnect(fs);
```

**Example hdfs\_write\_revised.c File**

## hdfs\_read\_revised.c

### Sample Application

This application demonstrates how to read from files by using the APIs `hdfsRead()` and `hdfsPread()`: `hdfs_read_revised.c`

Before running this application:

- Ensure that you have access to a cluster running file system.
- Ensure that a text-based file that you have access to exists on the cluster. Note the path to the file.
- Decide on the number of bytes to read from the file.

To build and run it, download it from this page and copy it to a Data Fabric client. Then, modify the `run.sh` script in [Building and Running C Applications on file system Clients](#) to point to this sample application. Run the script and then run the application.

The application includes these header files:

- `stdio.h`
- `hdfs.h`
- `errno.h`
- `fcntl.h`

The APIs are defined in `hdfs.h`. The file `fcntl.h` defines the file-access flags.

The application performs the actions that are described in the following sections.

#### Takes a filename and buffer size as input

After compiling the application, type the following command to launch the application and pass in the path and name of the file, as well as the size of the buffer to read data into:

```
hdfs_read <filename> <buffer size>
```

#### Sets an RPC timeout

`hdfsSetRpcTimeout()` is specific to the `libMapRClient` version of `libhdfs` and takes a value that is specified in seconds. The default is 99 seconds. If you change this value, set it either to 0 (which eliminates timeouts) or to a value greater than 30.

```
int err = hdfsSetRpcTimeout(30);
if (err) {
    fprintf(stderr, "Failed to set rpc
timeout!\n");
    exit(-1);
}
```

#### Connects to a filesystem, using an API that is supported in the hadoop-2.x version of libhdfs

The application tries to connect to the first file system cluster that is specified in the `mapr-clusters.conf` file in the `MAPR_HOME/conf` directory on the client.

After connecting to the filesystem, the application returns a handle to the filesystem.

```
hdfsFS fs = hdfsConnect("default", 0);
if (!fs) {
    fprintf(stderr, "Oops! Failed to
connect to hdfs!\n");
    exit(-1);
}
```

### Stores the values of the arguments

The application stores them in a character array and in a variable of type `tSize`. This datatype is defined in `hdfs.h` and is a fixed-width, signed 32-byte integer type for storing the size of data for read or write operations.

```
const char* rfile = argv[1];
tSize bufferSize = strtoul(argv[2],
NULL, 10);
```

### Opens the file that you specified

The application opens the specified file, passing the following values to the `hdfsOpenFile()` function:

- The handle to the filesystem
- The name of the file, which you supplied when you launched the application.
- A flag to indicate the mode in which to open the file. In this case, the flag is `O_RDONLY`, which specifies read-only mode.
- The default chunk size for the directory in which the file is either located or will be created. This value is specified by the 0 in the last parameter.

Although there are two other parameters in the `hdfsOpenFile()` function – the fourth and fifth, the `libMapRClient` version of `libhdfs` ignores them.

```
hdfsFile readFile = hdfsOpenFile(fs,
rfile, O_RDONLY, 0, 0, 0);
if (!readFile) {
    fprintf(stderr, "Failed to open %s
for reading!\n", rfile);
    exit(-2);
}
```

### Creates a buffer of the size that you specified

This is the buffer that the application will read data into.

```
char* buffer = malloc(sizeof(char)
* bufferSize);
if(buffer == NULL) {
    fprintf(stderr, "Failed to allocate
memory!\n");
    return -2;
}
```

**Reads an entire file with hdfsRead**

The application calls the function `readEntireFile()`:

```
//Read entire file from the beginning
int ret = readEntireFile(fs,
readFile, buffer, bufferSize);
if (ret < 0) {
    goto done;
}
```

This function uses a WHILE loop. In each loop iteration, the function reads an amount of data that is equal to the size of the buffer. When the amount of bytes read is less than the size of the buffer, the end of the file has been reached and the function breaks the loop. The number of bytes read is added to a total in each iteration.

```
int
readEntireFile(hdfsFS fs, hdfsFile
readFile, char *buffer, tSize
bufferSize)
{
    tSize readBytes = bufferSize;
    uint64_t totalRead = 0;
    if (fs == NULL || readFile == NULL
|| buffer == NULL) {
        return -1;
    }
    while (readBytes == bufferSize) {
        readBytes = hdfsRead(fs,
readFile, (void*)buffer, bufferSize);
        if (readBytes > 0) {
            totalRead += readBytes;
        } else {
            if (readBytes < 0) {
                fprintf(stderr, "hdfsRead
failed with error %d \n", errno);
                hdfsCloseFile(fs, readFile);
                return -1;
            }
            break;
        }
    }
    return 0;
}
```

**Seeks an offset and reads from that offset with hdfsRead()**

The application next calls the function `readAtOffset()`, passing in 0 as the offset from which to start reading the file.

```
//Read file at a particular offset
//In this case, we are reading from
offset 0
tSize readBytes = readAtOffset(fs,
readFile, 0, buffer, bufferSize);
if (readBytes < 0) {
    goto done;
}
```

This function calls `hdfsSeek()` to move to the specified offset in the file.

If the seek is successful, the function reads from that offset until the buffer is full. The function then returns the number of bytes that were read.

If the seek or the read is not successful (meaning `hdfsSeek()` or `hdfsRead()` returned -1), the function closes the file and returns -1.

The offset in the file is the next byte after the end of the data that was read.

```
tSize
readFromOffset(hdfsFS fs, hdfsFile
readFile, tOffset offset,
               char *buffer, tSize
bufferSize)
{
    tSize ret = 0;
    if (fs == NULL || readFile == NULL
|| buffer == NULL) {
        return -1;
    }
    ret = hdfsSeek(fs, readFile,
offset);
    if (!ret) {
        ret = hdfsRead(fs, readFile,
buffer, bufferSize);
        if (ret < 0) {
            fprintf(stderr, "hdfsRead
failed with error %d \n", errno);
        }
    } else {
        fprintf(stderr, "hdfsSeek failed
with error %d \n", errno);
    }
    if (ret < 0) {
        hdfsCloseFile(fs, readFile);
    }
    //Current offset within the file
will be positioned at (offset +
readBytes)th byte.
    return ret;
}
```

### Performs a positional read with `hdfsPread()`

The application calls `positionalRead()`, passing 100 as the offset from which to start the read.

```
readBytes = positionalRead(fs,
readFile, 100, buffer, bufferSize);
if (readBytes < 0) {
    goto done;
}
```

The function reads data into the buffer, starting at offset 100, without first calling `hdfsSeek()` to move the offset to that position. The offset is not moved to 100 before the read begins. The offset stays where it is, the read begins at offset 100, and (after the read) the offset remains where it was before the read. The offset in the file is ignored by the positional read.

```
tSize
positionalRead(hdfsFS fs, hdfsFile
```

```

readFile, tOffset offset,
                char *buffer, tSize
bufferSize)
{
    tSize readBytes = 0;
    if (fs == NULL || readFile == NULL
    || buffer == NULL) {
        return -1;
    }
    readBytes = hdfsPread(fs, readFile,
offset, buffer, bufferSize);
    if (readBytes < 0) {
        fprintf(stderr, "hdfsPread failed
with error %d \n", errno);
        hdfsCloseFile(fs, readFile);
    }
    //Current offset within the file
will not be advanced if hdfsPread is
used
    return readBytes;
}

```

**Closes the file**

```
hdfsCloseFile(fs, readFile);
```

**Frees the buffer**

```
free(buffer);
```

**Disconnects from the filesystem**

```
hdfsDisconnect(fs);
```

## hdfs\_connect\_as\_user.c

### Sample Application

This application demonstrates how to create and write to files impersonating another user by using the API `hdfsConnectAsUser()`.

Before running this application, ensure that you have access to a cluster running Data Fabric file system.

To build and run it, download it from this page and copy it to a Data Fabric client or to a system with the `mapr-core` package installed. Then, modify the `run.sh` script in [Building and Running C Applications on file system Clients](#) to point to this sample application. Run the script and then run the application.

The application includes these header files:

- `stdio.h`
- `hdfs.h`
- `stdlib.h`
- `string.h`

**NOTE:** The impersonation APIs are defined in `hdfs.h`.

The application performs the actions that are described in the following sections.

#### Takes two usernames and a hostname as input

After compiling the application, type the following command to launch the application and pass in the two usernames (to impersonate) and host name:

```
hdfs_connect_as_user <username1>
<username2> <hostname>if (argc < 4) {
    fprintf(stderr, "Provide two
usernames to impersonate and the host
name\n");
    printf("USAGE: ./
hdfs_connect_as_user mapruser1
mapruser2 10.10.xx.xxx\n");
    exit(EXIT_FAILURE);
}
```

#### Stores the values of the arguments

The application stores the values of the arguments in character arrays. The application uses the port, 7222, to connect to the given host, and uses character arrays for user directory and file path.

```
char *impersonate_user1 = argv[1];
char *impersonate_user2 = argv[2];
char *host_addr = argv[3];
```

**Populates the directory path and file path**

```
int port_num = 7222;
char user1_dir[100];
char writePath[100];
int ret_val;
```

The application creates a default path for the user directory and file.

```
sprintf(user1_dir, "/tmp/%s_dir",
impersonate_user1);
sprintf(writePath, "%s/test_file",
user1_dir);
```

**Sets an RPC timeout**

The `hdfsSetRpcTimeout()` is specific to the `libMapRClient` version of `libhdfs` and takes a value that is specified in seconds. The default is 99 seconds. If you change this value, set it either to 0 (which eliminates timeouts) or to a value greater than 30.

```
int err = hdfsSetRpcTimeout(30);
if (err) {
    fprintf(stderr, "Failed to set rpc
timeout!\n");
    exit(-1);
}
```

**Connects to the filesystem as the impersonated user**

The application connects to the filesystem as the impersonated user (<username1>) using `hdfsConnectAsUser()`. If successful, this operation returns a handle to the filesystem.

```
printf("Impersonate user: %s\n",
impersonate_user1);
printf("Connecting using
hdfsConnectAsUser() as user %s\n",
impersonate_user1);
hdfsFS fs_handle =
hdfsConnectAsUser(host_addr,
port_num, impersonate_user1);
if (fs_handle == NULL) {
    printf("hdfsConnectAsUser()
failed.\n");
    exit(EXIT_FAILURE);
}
```

**Creates a directory as the impersonated user**

The application creates a directory under `/tmp` as the impersonated user (<username1>).

```
printf("User1: Create a directory :
%s\n", user1_dir);
ret_val =
hdfsCreateDirectory(fs_handle,
user1_dir);
if (ret_val != EXIT_SUCCESS) {
    printf("hdfsCreateDirectory()
failed.\n");
    exit(EXIT_FAILURE);
}
```

**Creates and opens a file**

The application creates a file and opens the file, passing the following values to the `hdfsOpenFile()` function:

- The handle to the filesystem.
- A flag to indicate the mode in which to open the file. In this case, the flag is `O_WRONLY|O_CREAT`. This flag creates the file and opens it for writing.

For more details, see `hdfsOpenFile()` documentation.

```
printf("User1: Create and write to
the file as user1 : %s\n", writePath);
hdfsFile writeFile =
hdfsOpenFile(fs_handle, writePath,
O_WRONLY|O_CREAT, 0, 0, 0);
if(!writeFile) {
    printf("hdfsOpenFile() failed.\n");
    exit(EXIT_FAILURE);
}
```

**Writes to the open file**

The application writes to the open file as the impersonated user (<username1>).

```
char* buffer = "Hello, from user 1!";
tSize num_written_bytes =
hdfsWrite(fs_handle, writeFile,
(void*)buffer, strlen(buffer)+1);
if (hdfsFlush(fs_handle, writeFile)) {
    printf("failed to flush %s\n",
writePath);
    exit(EXIT_FAILURE);
}
```

**Closes the file**

The application closes the file after successfully writing to the file as the impersonated user (<username1>).

```
printf("User1: Close file %s.\n",
writePath);
hdfsCloseFile(fs_handle, writeFile);
```

**Connects to the filesystem as the impersonating user**

The application connects to the filesystem as the second user (<username2>) using `hdfsConnectAsUser()` and returns a handle to the filesystem.

```
printf("Impersonate user: %s\n",
impersonate_user2);
printf("Connecting using
hdfsConnectAsUser() as user %s\n",
impersonate_user2);
hdfsFS fs_handle2 =
hdfsConnectAsUser(host_addr,
port_num, impersonate_user2);
if (fs_handle2 == NULL) {
    printf("hdfsConnectAsUser()
failed.\n");
}
```

**Tries to write to the file as the impersonating user**

```
exit(EXIT_FAILURE);
}
```

The application tries to open the file created by the impersonated user (<username1>) and write to the file as the impersonating user (<username2>). This operation fails as the impersonating user (<username2>) is denied access to the file created by the impersonated user (<username1>) and the application returns error EACCES.

```
printf("User2: Try opening file
created by user1 for writing : %s\n",
writePath);
hdfsFile writeFile2 =
hdfsOpenFile(fs_handle2, writePath,
O_WRONLY, 0, 0, 0);
int errNum = errno;
if(writeFile2) {
    printf("User2: hdfsOpenFile()
should have failed for %s.\n",
impersonate_user2);
    exit(EXIT_FAILURE);
} else {
    if (errNum == EACCES) {
        printf("User2: As expected
hdfsOpenFile() with EACCES.\n");
    } else {
        printf("User2: hdfsOpenFile()
failed with errno:%d expected %d.\n",
errNum, EACCES);
        exit(EXIT_FAILURE);
    }
}
```

**Deletes a directory**

The application deletes a directory as the impersonated user (<username1>) using the filesystem handle created for this user.

```
printf("Delete directory : %s\n",
user1_dir);
ret_val = hdfsDelete(fs_handle,
user1_dir, 1);
if (ret_val != EXIT_SUCCESS) {
    printf("hdfsDelete() failed.\n");
    exit(EXIT_FAILURE);
}
```

**Disconnects the impersonating user**

The application disconnect the impersonating user (<username2>) from the filesystem.

```
printf("Disconnect the impersonation
user2.\n");
ret_val = hdfsDisconnect(fs_handle2);
if (ret_val != EXIT_SUCCESS) {
    printf("hdfsDisconnect()
failed.\n");
    exit(EXIT_FAILURE);
}
```

**Disconnects the impersonated user**

The application disconnect the impersonated user (<username1>) from the filesystem.

```
printf("Disconnect the impersonation
user1.\n");
ret_val = hdfsDisconnect(fs_handle);
if (ret_val != EXIT_SUCCESS) {
    printf("hdfsDisconnect()
failed.\n");
    exit(EXIT_FAILURE);
}
```

ret_val = hdfsDisconnect(fs_handle2);
if (ret_val != EXIT_SUCCESS) {
    printf("hdfsDisconnect() failed.\n");
    exit(EXIT_FAILURE);
}
exit(EXIT_SUCCESS);
}

```

## Reference for the file system C APIs

The following sections describe the custom datatypes, structures, and APIs in the `libMapRClient` version of `libhdfs`:

### Type Definitions

`libhdfs` defines the following custom data types, which are supported by `libMapRClient`:

#### **tObjectKind**

An enumeration, the values of which are 'F' for file and 'D' for directory. Used to specify whether an object is a file or directory.

#### **tOffset**

A signed 64-bit integer that is used to specify an offset within a file and the size of a file.

#### **tPort**

An unsigned 16-bit integer that is used to specify a port to use in connections to filesystems.

#### **tSize**

A signed 32-bit integer that is used to specify the size of data in bytes to read or write.

**tTime**

A data type of `time_t` that is used to specify a time in seconds.

**Structures**

`libhdfs` defines these structures, which are supported by `libMapRClient`.

**hdfsBuilder**

*Supported by `libhdfs` for `hadoop-2.x`*

This structure can be passed to `hdfsBuilderConnect()` for creating connections to file system clusters. In the `libMapRClient`, four of the parameters are ignored. `forceNewInstance` is ignored, though the header file does not indicate this.

```
struct hdfsBuilder {
    int forceNewInstance;
    const char *nn;
    tPort port;
    const char *kerbTicketCachePath; // Ignored
    const char *userName;           // Ignored
    struct hdfsBuilderConfOpt *opts; // Ignored
};
```

**Parameters**

`nn`

Specifies the CLDB node to connect to when `hdfsBuilderConnect()` is called. This value is set by `hdfsBuilderSetNameNode()`.

- If `default` is specified for the `host` parameter, `hdfsBuilderConnect()` will connect to the first cluster listed in the file `MAPR_HOME/conf/mapr-clusters.conf`. (`MAPR_HOME` defaults to `/opt/mapr`.)
- If a hostname or IP address is specified for the `host` parameter, `hdfsBuilderConnect()`, look in `MAPR_HOME/conf/mapr-clusters.conf` on the client node to match the specified hostname or IP address to a CLDB host and port.
  - If they find a match, they try to connect to the cluster and all standard features for connections to Data Fabric clusters are available. These features include high availability across CLDBs and secure connections.
  - If they do not find a match or if they cannot locate a `mapr-clusters.conf` file, they try to connect to the CLDB host specified in the call to create the connection. However, the standard features for connections to Data Fabric clusters are not available. For example, if the cluster is secured, the connection will fail.

`port`

Specifies the port to connect to on the CLDB node. This value is set by `hdfsBuilderSetNameNodePort()`.

**hdfsFileInfo**

*Supported by `libhdfs` for `hadoop-2.x`*

This structure is returned by `hdfsGetPathInfo()` and deleted by `hdfsFreeFileInfo()`. It contains information about the file or directory that is specified in the call to `hdfsGetPathInfo()`.

`ParameterstObjectKind mKind`

Specifies whether the object is a file or directory.

```
char *mName
```

Specifies the name of the object.

```
tTime mLastMod
```

Specifies the epoch time in milliseconds of the last modification to the object.

```
tOffset mSize
```

Specifies the size of the object in bytes.

```
short mReplication
```

Specifies the count of replicas of the object.

```
tOffset mBlockSize
```

Specifies the block size for the object.

```
char *mOwner
```

Specifies the owner of the object.

```
char *mGroup
```

Specifies the group that is associated with the object.

```
short mPermissions
```

Specifies the permissions on the object.

```
tTime mLastAccess
```

Specifies the epoch time in milliseconds at which the object was created.

## APIs

The following sections provide information about the hdfs APIs:

*hdfsAvailable()*

*Supported by libMapRClient for hadoop-2.x*

Returns the number of bytes that can be read from an input stream without blocking. This number is simply the size of the file in bytes.

## Signature

```
int hdfsAvailable(hdfsFS fs, hdfsFile file)
```

## Parameters

Parameter	Description
fs	The handle of the file system where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
file	The file handle. Obtain this handle with one of the <code>hdfsOpenFile()</code> APIs.

## Return Value

Returns the size of the file in bytes, -1 on error.

Check `errno` for error codes and meanings.

errno is set to EINVAL if the arguments provided are invalid.

*hdfsBuilderConnect()*

*Supported by libMapRClient for hadoop-2.x*

Connects to a Data Fabric file system using the parameters that are specified in an `hdfsBuilder` structure.

### Signature

```
hdfsFS hdfsBuilderConnect(struct hdfsBuilder *bld)
```

### Parameters

Parameter	Description
bld	The builder to use for the connection. This value cannot be NULL.

### Return Value

Returns the handle to the file system or NULL on error.

*hdfsBuilderSetForceNewInstance()*

*Not supported for file system*

This API is ignored.

*hdfsBuilderSetKerbTicketCachePath()*

*Not supported for file system*

This API is ignored.

*hdfsBuilderSetNameNode()*

*Supported by libMapRClient for hadoop-2.x*

Specifies a CLDB node for an `hdfsBuilder` structure.

### Signature

```
void hdfsBuilderSetNameNode(struct hdfsBuilder *bld, const char *nn)
```

### Parameters

Parameter	Description
bld	An <code>hdfsBuilder</code> structure. This value cannot be NULL.
nn	The hostname or IP address of a name node. Use NULL to connect to the local file system. Use default to connect to the first file system cluster that is listed in the <code>MAPR_HOME/conf/mapr-clusters.conf</code> file on the client.

*hdfsBuilderSetNameNodePort()*

*Supported by libMapRClient for hadoop-2.x*

Sets the port in an `hdfsBuilder` structure.

**Signature**

```
void hdfsBuilderSetNameNodePort(struct hdfsBuilder *bld, tPort port)
```

**Parameters**

Parameter	Description
bld	An <code>hdfsBuilder</code> structure. This value cannot be NULL.
port	The port to use for connections. If the CLDB node is set to NULL or default, use 0.

*hdfsBuilderSetUserName()*

*Not supported for file system*

This API is ignored.

*hdfsChmod()*

*Supported by libMapRClient for hadoop-2.x*

Changes permissions on a file or directory in the manner of the `chmod` command.

**Signature**

```
int hdfsChmod(hdfsFS fs, const char* path, short mode)
```

**Parameters**

Parameter	Description
fs	The handle to the file system. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
path	The path to the file or directory.
mode	The bitmask for the new permissions.

**Return Value**

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

`errno` is set to `EINVAL` if the input arguments are invalid.

`errno` is set to `EPERM` if the process does not have enough privileges to perform the operation.

*hdfsChown()*

*Supported by libMaprClient for hadoop-2.x*

Changes ownership of a file or directory in the manner of the `chown` command.

**!** **ATTENTION:**

- To permit a client to resolve user or group from a server, set the `fs.mapr.server.resolve.user` parameter to `true` in `core-site.xml`, for both secure and non secure clusters. Setting this is essential when the client does not belong to the same domain as the mapr cluster nodes, and does not have any knowledge of users present in that domain.
- To permit CLDB to resolve user or group, set the `cldb.security.resolve.user` configuration parameter to `1` on a non-secure cluster as follows:

```
maprcli config save -values {"cldb.security.resolve.user":1}
```

You do not have to set this parameter for a secure cluster, as it is already set to `1`.

**Signature**

```
int hdfsChown(hdfsFS fs, const char* path, const char *owner, const char *group)
```

**Parameters**

Parameter	Description
fs	The handle to the file system. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
path	The path to the file or directory
owner	The user to own the file or directory. Set to <code>NULL</code> to keep the owner as is.
group	The group to own the file or directory. Set to <code>NULL</code> to keep the owner as is.

**Return Value**

Returns `0` on success, `-1` on error.

Check `errno` for error codes and meanings.

`errno` is set to `EINVAL` if the input arguments are invalid.

`errno` is set to `EPERM` if the process does not have enough privileges to perform the operation.

*hdfsCloseFile()*

*Supported by `libMapRClient` for `hadoop-2.x`*

Closes an open file. Flushes all pending write buffers for the file and releases resources that are associated with the file.

**Signature**

```
int hdfsCloseFile(hdfsFS fs, hdfsFile file)
```

## Parameters

Parameter	Description
fs	The handle of the file system where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
file	The file handle. Obtain this handle with one of the <code>hdfsOpenFile()</code> APIs.

## Return Value

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

*hdfsConnect()*

*Supported by `libMapRClient` for `hadoop-2.x`*

Connects to a file system cluster.

If a connection to the cluster in which the remote host is located already exists, the functions return a handle to this existing connection.

If a connection to the cluster does not already exist, the functions return a handle to a new connection instance.

Note that if `default` is used for the `host` parameter, this means connect to the first cluster listed in the `MAPR_HOME/conf/mapr-clusters.conf` file on the client.

For more information about connections, see [Establishing Connections to file system](#).

## Signature

```
hdfsFS hdfsConnect(const char* host, tPort port)
```

## Parameters

Parameter	Description
host	<p>A string containing either a hostname or an IP address of a CLDB node of a file system cluster.</p> <p>To connect to the first file system cluster that is specified in <code>MAPR_HOME/conf/mapr-clusters.conf</code> on the client, pass the value <code>default</code> and use the port number 0.</p> <p>This parameter does not accept NULL as a value.</p>
port	The port on which the host is listening.

## Return Value

Returns a handle to the connected file system, or NULL on error.

Check `errno` for error codes and meanings.

*hdfsConnectAsUser()*

*Supported by `libMapRClient` for `hadoop-2.x`*

Connects to a file system cluster as specified user.

If a connection to the cluster in which the remote host is located already exists, the functions return a handle to this existing connection.

If a connection to the cluster does not already exist, the functions return a unique handle to a connection instance for each user.

**NOTE:** If `default` is used for the `host` parameter, this means connect to the first cluster listed in the `MAPR_HOME/conf/mapr-clusters.conf` file on the client.

For more information about connections, see [Establishing Connections to file system](#).

### Signature

```
hdfsFS hdfsConnectAsUser(const char* host, tPort port, const char* user)
```

### Parameters

Parameter	Description
<code>host</code>	A string containing either a hostname or an IP address of a CLDB node of a file system cluster.  To connect to the first file system cluster that is specified in <code>MAPR_HOME/conf/mapr-clusters.conf</code> on the client, pass the value <code>default</code> and use the port number 0.  This parameter does not accept NULL as a value.
<code>port</code>	The port on which the host is listening.
<code>user</code>	The user connected to the cluster.

### Return Value

Returns a handle to the connected file system, or NULL on error.

*hdfsConnectAsUid()*

Connects to a file system cluster as specified user ID.

*Supported by libMapRClient for hadoop-2.x*

If a connection to the cluster in which the remote host is located already exists, the function returns a handle to this existing connection.

If a connection to the cluster does not already exist, the function returns a unique handle to a connection instance for the specified user ID.

**NOTE:** To connect to the first cluster listed in the `MAPR_HOME/conf/mapr-clusters.conf` file on the client, use `default` as the value for the `host` parameter.

For more information about connections, see [Establishing Connections to the File System](#) on page 3169.

### Signature

```
hdfsFS hdfsConnectAsUid(const char* host, tPort port, uid_t uid)
```

## Parameters

Parameter	Description
host	A string containing either a hostname or an IP address of a CLDB node of a file system cluster.  To connect to the first file system cluster that is specified in <code>MAPR_HOME/conf/mapr-clusters.conf</code> on the client, pass the value <code>default</code> and use the port number 0.  This parameter does not accept NULL as a value.
port	The port on which the host is listening.
user ID	The ID of the user connected to the cluster.

## Return Value

Returns a handle to the connected file system, or NULL on error.

*hdfsConnectAsUserNewInstance()*

*Supported by libMapRClient for hadoop-2.x*

Connects to a file system cluster as specified user.

The function returns a handle to a new connection instance.

**NOTE:** If `default` is used for the `host` parameter, this means connect to the first cluster listed in the `MAPR_HOME/conf/mapr-clusters.conf` file on the client.

For more information about connections, see [Establishing Connections to file system](#).

## Signature

```
hdfsFS hdfsConnectAsUserNewInstance(const char* host, tPort port, const char* user)
```

## Parameters

Parameter	Description
host	A string containing either a hostname or an IP address of a CLDB node of a file system cluster.  To connect to the first file system cluster that is specified in <code>MAPR_HOME/conf/mapr-clusters.conf</code> on the client, pass the value <code>default</code> and use the port number 0.  This parameter does not accept NULL as a value.
port	The port on which the host is listening.

## Return Value

Returns a handle to the connected file system, or NULL on error.

*hdfsConnectNewInstance()*

*Supported by libMapRClient for hadoop-2.x*

Connects to a file system cluster.

The function returns a handle to a new connection instance.

**NOTE:** If `default` is used for the `host` parameter, this means connect to the first cluster listed in the `MAPR_HOME/conf/mapr-clusters.conf` file on the client.

For more information about connections, see [Establishing Connections to file system](#).

### Signature

```
hdfsFS hdfsConnectNewInstance(const char* host, tPort port)
```

### Parameters

Parameter	Description
<code>host</code>	A string containing either a hostname or an IP address of a CLDB node of a file system cluster.  To connect to the first file system cluster that is specified in <code>MAPR_HOME/conf/mapr-clusters.conf</code> on the client, pass the value <code>default</code> and use the port number 0.  This parameter does not accept NULL as a value.
<code>port</code>	The port on which the host is listening.
<code>user</code>	The user connected to the cluster.

### Return Value

Returns a handle to the connected file system, or NULL on error.

*hdfsCopy()*

This API is not supported.

*hdfsCreateDirectory()*

*Supported by libMapRClient for hadoop-2.x*

Creates a file or directory at the specified path. Intermediate directories in the path that do not exist are created.

### Signature

```
int hdfsCreateDirectory(hdfsFS fs, const char* path)
```

### Parameters

Parameter	Description
<code>fs</code>	The handle of the file system in which to create the file or directory. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
<code>path</code>	The path of the directory.

### Return Value

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

errno is set to EINVAL if the input arguments are not valid, EEXIST if the directory already exists, or EACCES if the parent directory does not allow the user write permission.

*hdfsCreateDirectory2()*

*Supported by libMapRClient for hadoop-2.x*

Makes the given file and all non-existent parents into directories. Stores the size of the name container in a location that you pass a pointer into, so that you can keep track of this size. The size is in bytes.

Keeping track of the size of the name container is useful when you are creating files that are less than or equal to 64 KB. When the size of all of the such files together for one name container exceeds 64 GB, operations on the name container can become inefficient. If the size of a name container reaches 64 GB, you can switch to a new or different volume.

### Signature

```
int hdfsCreateDirectory2(hdfsFS fs, const char* path, tSize
*nameSizeInBytes)
```

### Parameters

Parameter	Description
fs	The handle of the file system in which to create the file or directory. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
path	The path of the directory.
nameSizeInBytes	A pointer to a memory buffer that can store the size in bytes of the name container.

### Return Value

Returns 0 on success, -1 on error.

Check errno for error codes and meanings.

*hdfsDelete()*

*Supported by libMapRClient for hadoop-2.x*

Deletes the specified directory or file.

### Signature

```
int hdfsDelete(hdfsFS fs, const char* path, int recursive)
```

### Parameters

Parameter	Description
fs	The handle of the file system where the file or directory to delete is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
path	The path of the file.

Parameter	Description
recursive	<p>A value of 0 deletes the specified directory, if the directory is empty. If the directory is not empty, an error is returned.</p> <p>A non-zero value deletes the specified directory and all of its subdirectories.</p> <p>If the specified object is a file, not a directory, this parameter is ignored.</p>

**Return Value**

Returns 0 on success, -1 on error.

Check errno for error codes and meanings. Some of the key errors are ESTALE, EACCES, and EPERM.

*hdfsDisconnect()*

*Supported by libMapRClient for hadoop-2.x*

Disconnects from the specified file system.

Even if there is an error, the resources that are associated with the file system handle are freed.

**Signature**

```
int hdfsDisconnect(hdfsFS fs)
```

**Parameter**

Parameter	Description
fs	The handle of the file system to disconnect from. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.

**Return Value**

Returns 0 on success, -1 on error.

Check errno for error codes and meanings.

*hdfsExists()*

*Supported by libMapRClient for hadoop-2.x*

Checks whether a given directory or file exists on the file system.

**Signature**

```
int hdfsExists(hdfsFS fs, const char* path)
```

**Parameters**

Parameter	Description
fs	The file system handle. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
path	The directory or file to check the existence of.

**Return Value**

Returns 0 if the directory or file exists, -1 on error.

Check errno for error codes and meanings.

*hdfsExists2()*

*Supported by libMapRClient for hadoop-2.x*

Checks the file system directly (avoiding a client cache) to determine whether a given file or directory exists.

**Signature**

```
int hdfsExists2(hdfsFS fs, const char* path)
```

**Parameters**

Parameter	Description
fs	The file system handle. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
path	The directory or file to check the existence of.

**Return Value**

Returns 0 if the directory or file exists, -1 on error.

Check errno for error codes and meanings.

*hdfsFileFreeReadStatistics()*

This API is not supported.

*hdfsFileGetReadStatistics()*

This API is not supported.

*hdfsFileIsOpenForRead()*

This API is not supported.

*hdfsFileIsOpenForWrite()*

This API is not supported.

*hdfsFlush()*

*Supported by libMapRClient for hadoop-2.x*

Flushes the write buffer for the specified file to the server

**Signature**

```
int hdfsFlush(hdfsFS fs, hdfsFile file)
```

**Parameters**

Parameter	Description
fs	The file system handle. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.

Parameter	Description
file	The file handle. Obtain this handle with one of the <code>hdfsOpenFile()</code> APIs.

**Return Value**

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

`errno` is set to `EINVAL` if the input arguments are invalid.

*hdfsFreeBuilder()*

Supported by *libMapRClient* for *hadoop-2.x*

Frees the memory that was used by an `hdfsBuilder` structure and its parameter values.

**Signature**

```
void hdfsFreeBuilder(struct hdfsBuilder *bld)
```

**Parameters**

Parameter	Description
bld	An <code>hdfsBuilder</code> structure. The value cannot be <code>NULL</code> .

*hdfsFreeFileInfo()*

Supported by *libMapRClient* for *hadoop-2.x*

Frees up the array of `hdfsFileInfo` structures that is returned by `hdfsListDirectory()`, including allocated fields.

**Signature**

```
void hdfsFreeFileInfo(hdfsFileInfo *hdfsInfo, int numEntries)
```

**Parameters**

Parameter	Description
hdfsInfo	The array of dynamically-allocated <code>hdfsFileInfo</code> structures.
numEntries	The size of the array.

*hdfsFreeHosts()*

Supported by *libMapRClient* for *hadoop-2.x*

Frees an array that was returned by `hdfsGetHosts()`.

**Signature**

```
void hdfsFreeHosts(char ***blockHosts)
```

**Parameters**

Parameter	Description
blockHosts	The two-dimensional array that was returned by <code>hdfsGetHosts()</code> .

*hdfsGetCapacity()*

*Supported by libMapRClient for hadoop-2.x*

Returns the capacity in bytes of the connected file system.

**Signature**

```
tOffset hdfsGetCapacity(hdfsFS fs)
```

**Parameters**

Parameter	Description
fs	The file system handle. Obtain this handle by calling one of the <code>hdfsConnect()</code> APIs.

**Return Value**

Returns the capacity in bytes of the connected file system, -1 on error.

Check `errno` for error codes and meanings.

`errno` can be set to `EINVAL` in case of error.

*hdfsGetDefaultBlockSize()*

*Supported by libMapRClient for hadoop-2.x*

Gets the default size of blocks for the connected file system.

**Signature**

```
tOffset hdfsGetDefaultBlockSize(hdfsFS fs)
```

**Parameters**

Parameter	Description
fs	The handle of file system. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.

**Return Value**

Returns 256 MB.

Returns -1 on error.

Check `errno` for error codes and meanings.

*hdfsGetDefaultBlockSizeAtPath()*

*Supported by libMapRClient for hadoop-2.x*

Gets the block size of a file at the specified path.

## Signature

```
tOffset hdfsGetDefaultBlockSizeAtPath(hdfsFS fs, const char *path)
```

## Parameters

Parameter	Description
fs	The handle of the file system. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
path	The location and name of the file.

## Return Value

Returns 256 MB.

Check `errno` for error codes and meanings.

*hdfsGetHosts()*

*Supported by libMapRClient for hadoop-2.x*

Gets hostnames where a particular block, as determined by the offset and block size, is stored. Due to replication, a single block could be present on multiple hosts.

This function can be useful for understanding the performance implications of file access, and to validate or verify changes to the replication factor.

## Signature

```
char*** hdfsGetHosts(hdfsFS fs, const char* path, tOffset start, tOffset length)
```

## Parameters

Parameter	Description
fs	The handle of the file system where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
path	The path of the file.
start	The start of the block.
length	The length of the block.

## Return Value

If successful, returns a dynamically-allocated two-dimensional array of hostnames. The last element in the array is NULL.

Returns NULL on error.

Check `errno` for error codes and meanings.

*hdfsGetNameContainerSizeBytes()*

*Unique to libMapRClient*

Get the size of the container hosting the path.

Keeping track of the size of the name container is useful when you are creating files that are less than or equal to 64 KB. When the size of all of the such files together for one name container exceeds 64 GB, operations on the name container can become inefficient. If the size of a name container reaches 64 GB, you can switch to a new or different volume.

### Signature

```
int tSize hdfsGetNameContainerSizeBytes(hdfsFS fs, const char *path)
```

### Parameters

Parameter	Description
path	Path of the file or directory residing on the container.

### Return Value

Returns size of the container on success; -1 on error.

Check errno for error codes and meanings.

errno is set to EINVAL if the input arguments are invalid.

*hdfsGetPathInfo()*

*Supported by libMapRClient for hadoop-2.x*

Returns a dynamically-allocated `hdfsFileInfo` structure that contains information about the given path.

Call `hdfsFreeFileInfo()` when the structure is no longer needed.

See `hdfsFileInfo()` for information about the information that this object contains.

### Signature

```
hdfsFileInfo * hdfsGetPathInfo(hdfsFS fs, const char* path)
```

### Parameters

Parameter	Description
fs	The file system handle. Obtain this by calling one of the <code>hdfsConnect()</code> APIs.
path	The path of the file.

### Return Value

Returns a dynamically-allocated `hdfsFileInfo` structure on success, and NULL on error.

errno is set to EINVAL for invalid arguments and to EACCES for invalid access.

*hdfsGetUsed()*

*Supported by libMapRClient for hadoop-2.x*

Returns the total number of bytes bytes that are being used by all of the files in the file system.

### Signature

```
tOffset hdfsGetUsed(hdfsFS fs)
```

**Parameters**

Parameter	Description
fs	The file system handle.

**Return Value**

Returns the total size in bytes or -1 on error.

Check errno for error codes and meanings.

*hdfsGetWorkingDirectory()*

*Supported by libMapRClient for hadoop-2.x*

Gets the current working directory for the file system. Before calling this method, the application must have called `hdfsSetWorkingDirectory()`.

**Signature**

```
char* hdfsGetWorkingDirectory(hdfsFS fs, char *buffer, size_t bufferSize)
```

**Parameters**

Parameter	Description
fs	The file system handle.
buffer	The buffer in which to copy path of current working directory.
bufferSize	The length of user-buffer.

**Return Value**

Returns the buffer on success, NULL on error.

errno is set to EINVAL for invalid arguments.

*hdfsGetXattr()*

*Supported by libMapRClient for hadoop-2.x*

Gets extended attribute values from a file.

**Signature**

```
int hdfsGetXattr(hdfsFS fs, const char* path, const char *name, char *value, size_t size);
```

**Parameters**

Parameter	Description
fs	The handle of the file system where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
name	The name of the extended attribute.
path	The path to the file.
size	The size of the buffer.

Parameter	Description
value	The value for the extended attribute that is read from the system and written to the buffer.

### Return Value

Returns:

- Current size of the value of the extended attribute on success
- -1 on error

Check `errno` for error codes and meanings.

*hdfsListDirectory()*

*Supported by libMapRClient for hadoop-2.x*

Gets list of files and directories for a given path. Returns the information in a dynamically allocated array of `hdfsFileInfo` structures.

`hdfsFreeFileInfo()` should be called to deallocate memory when this structure is no longer needed.

This method is the equivalent of the `ls -l` command.

### Signature

```
hdfsFileInfo *hdfsListDirectory(hdfsFS fs, const char* path, int
*numEntries)
```

### Parameters

Parameter	Description
fs	The handle of the file system. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
path	The path of the directory.
numEntries	Set to the number of files/directories in path. Cannot be 0 or NULL.

### Return Value

Returns a dynamically-allocated array of `hdfsFileInfo` structures on success and NULL on error.

Check `errno` for error codes and meanings.

*hdfsMove()*

This API is not supported.

*hdfsNewBuilder()*

*Supported by libMapRClient for hadoop-2.x*

Returns an `hdfsBuilder` structure. You can set values for its parameters and then pass it to `hdfsBuilderConnect()`.

### Signature

```
struct hdfsBuilder *hdfsNewBuilder(void)
```

**Return Value**

Returns a new `hdfsBuilder` structure.

Returns `ENOMEM` if unable to allocate memory for a new `hdfsBuilder` structure.

*hdfsOpenFile()*

*Supported by libMapRClient for hadoop-2.x*

Opens a file in the specified mode. Creates the file and intermediate directories if they do not exist.

Requires a valid file system handle, which one of the `hdfsConnect()` APIs can provide.

Before the call to `hdfsOpenFile()`, `hdfsExists()` can check that the file exists, if a check is needed.

After finishing work on a file, call `hdfsCloseFile()` to free the memory that is associated with the file.

**Signature**

```
hdfsFile hdfsOpenFile(hdfsFS fs, const char* path, int flags, int
bufferSize, short replication, tSize blockSize)
```

**Parameters**

Parameter	Description
fs	The handle of the file system where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
path	The full path to the file.

Parameter	Description
flags	<p>One of the following values. These flags are included in the <code>fcntl.h</code> header file.</p> <p><b>O_RDONLY</b> Opens the file in read-only mode with the current offset at 0.</p> <p><b>O_RDWR</b> Opens the file in read-write mode. If the file already exists, it is truncated to offset 0, effectively deleting the content of the file to offset 0.</p> <p><b>O_RDWR   O_APPEND</b> Opens the file in read-write mode with the current offset at 0. Writing to the file with <code>hdfsWrite()</code> appends the written data to the end of the file. Data written with <code>hdfsPwrite()</code> is not appended, but written starting at the offset specified in the call to that API.</p> <p><b>O_WRONLY</b> Opens the file in write-only mode. If the file already exists, it is truncated to offset 0, effectively deleting the content of the file.</p> <p><b>O_WRONLY   O_APPEND</b> Opens the file in write-only mode with the current offset at 0. Writing to the file with <code>hdfsWrite()</code> appends the written data to the end of the file. Data written with <code>hdfsPwrite()</code> is not appended, but written starting at the offset specified in the call to that API.</p>
bufferSize	<i>Ignored for files on Data Fabric file system</i>
replication	<i>Ignored for files on Data Fabric file system</i>
blocksize	The size of chunks for the file in bytes. Specify 0 if you want to use the value that is specified for the <code>fs.mapr.block.size</code> parameter in the <code>/opt/mapr/hadoop/hadoop-2.x/etc/hadoop/core-site.xml</code> file on the client (if the client is using the <code>libMapRClient</code> version of <code>hadoop-2.x</code> ). If this parameter is not set in <code>core-site.xml</code> , the default value is taken from the directory's <code>.dfs_attributes</code> file.

### Return Value

Returns the handle to the open file or NULL on error.

Check `errno` for error codes and meanings.

*hdfsOpenFile2()*

*Supported by libMapRClient for hadoop-2.x*

Opens a file in a given mode. Creates the file if the file does not exist.

If `hdfsOpenFile2()` creates a file, it stores the size of the name container in a location that you pass a pointer into, so that you can keep track of this size. The size is in bytes.

Keeping track of the size of the name container is useful when you are creating files that are less than or equal to 64 KB. When the size of all of the such files together for one name container exceeds 64 GB, operations on the name container can become inefficient. If the size of a name container reaches 64 GB, you can switch to a new or different volume.

Before the call to `hdfsOpenFile2()`, `hdfsExists()` can check that the file exists, if a check is needed.

After finishing work on a file, call `hdfsCloseFile()` to free the resources that are associated with the file.

**Signature**

```
hdfsFile hdfsOpenFile2(hdfsFS fs, const char* path, int flags, int
bufferSize, short replication, tSize blockSize, tSize *nameSizeInBytes)
```

**Parameters**

Parameter	Description
fs	The handle of the file system where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
path	The full path to the file.

Parameter	Description
flags	<p>One of the following values. These flags are included in the <code>fcntl.h</code> header file.</p> <p><b>O_RDONLY</b> Opens the file in read-only mode with the current offset at 0.</p> <p><b>O_RDWR</b> Opens the file in read-write mode. If the file already exists, it is truncated to offset 0, effectively deleting the content of the file.</p> <p><b>O_RDWR   O_APPEND</b> Opens the file in read-write mode with the current offset at 0. Writing to the file with <code>hdfsWrite()</code> appends the written data to the end of the file. Data written with <code>hdfsPwrite()</code> is not appended, but written starting at the offset specified in the call to that API.</p> <p><b>O_WRONLY</b> Opens the file in write-only mode. If the file already exists, it is truncated to offset 0, effectively deleting the content of the file.</p> <p><b>O_WRONLY   O_APPEND</b> Opens the file in write-only mode with the current offset at 0. Writing to the file with <code>hdfsWrite()</code> appends the written data to the end of the file. Data written with <code>hdfsPwrite()</code> is not appended, but written starting at the offset specified in the call to that API.</p>
bufferSize	<i>Ignored for files on Data Fabric file system</i>
replication	<i>Ignored for files on Data Fabric file system</i>
blocksize	The size of chunks for the file in bytes. Use 0 if you want to use the value that is specified for the <code>fs.mapr.block.size</code> parameter in the <code>/opt/mapr/hadoop/hadoop-2.x/etc/hadoop/core-site.xml</code> file on the client (if the client is using the <code>libMapRClient</code> version of <code>hadoop-2.x</code> ). If this parameter is not set in <code>core-site.xml</code> , the default value is taken from the directory's <code>.dfs_attributes</code> file.
nameSizeInBytes	A pointer to a memory buffer that can store the size in bytes of the name container. The value is returned only if <code>hdfsOpenFile2()</code> creates the specified file because the file does not already exist.

**Return Value**

Returns the handle to the open file or NULL on error.

Check `errno` for error codes and meanings.

*hdfsPread()*

*Supported by libMapRClient for hadoop-2.x*

Reads an open file from a specified offset.

Whereas `hdfsRead()` increments the current offset in the file by the number of bytes that are read, `hdfsPread()` does not change the current offset. For example, if the current offset is 0 and `hdfsPread()` starts reading from offset 100, after the read the current offset is still 0.

**Signature**

```
tSize hdfsPread(hdfsFS fs, hdfsFile file, tOffset position, void* buffer,
tSize length)
```

**Parameters**

Parameter	Description
fs	The handle of the file system where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
file	The file handle. Obtain this handle with one of the <code>hdfsOpenFile()</code> APIs.
position	Offset from which to read.
buffer	The buffer to copy read bytes into.
length	The length of the buffer. The maximum size of <code>tSize</code> is the maximum buffer length.

**Return Value**

Returns the number of bytes actually read, which can be less than than the length of the buffer if the end of the file is reached during the read. Returns -1 on error.

On error, `errno` is set to one of the following values:

- EACCES if the access permissions are violated.
- ESTALE if the file doesn't exist on the server.
- EINVAL if the arguments are invalid or if the file type doesn't support read operations.

To recover from errors, close the file by calling `hdfsCloseFile()`.

*hdfsPwrite()*

*Supported by libMapRClient for hadoop-2.x*

Writes starting at a specified position in an open file.

Whereas `hdfsWrite()` increments the current offset by the amount of bytes returned by the API (except in case of error), `hdfsPwrite()` does not change the value of current offset. If the current offset before the call to `hdfsPwrite()` is 0 and you specify the offset 10 for the write operation, after the write the current offset remains 0.

If a call to `hdfsPwrite()` specifies an offset that is past the end of the file, the result is a hole in the file between the previous end of the file and the offset at which the write begins.

You can obtain the size of a file in bytes by calling `hdfsGetPathInfo()`.

Flushes to the server happen automatically at intervals during a write operation. After a write operation is finished, either call `hdfsFlush()` explicitly or call `hdfsFlush()` implicitly by calling `hdfsCloseFile()` to be sure that any data remaining in the write buffer is flushed.

On error, pending write buffers are flushed to the server.

### Signature

```
tSize hdfsPwrite(hdfsFS fs, hdfsFile file, tOffset position, const void*
buffer, tSize length)
```

### Parameters

Parameter	Description
fs	The handle of the file system where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
file	The handle of the file. Obtain this handle with one of the <code>hdfsOpenFile()</code> APIs.
position	The offset at which to start writing.
buffer	The data to write.
length	The number of bytes to write. The maximum length is the maximum size of <code>tSize</code> .

### Return Value

Returns the number of bytes written, -1 on error.

Check `errno` for error codes and meanings.

*hdfsRead()*

*Supported by libMapRClient for hadoop-2.x*

Reads data from the current offset in an open file. After the read, the current offset is incremented by the number of bytes read.

To read from a specific offset, first call `hdfsSeek()` to move to that offset in the file. Then, call `hdfsRead()`.

Alternatively, call `hdfsPread()`, specifying an offset in the call. `hdfsPread()` does not increment the current offset in the file. The offset that you specify in the call is used only for the read.

### Signature

```
tSize hdfsRead(hdfsFS fs, hdfsFile file, void* buffer, tSize length)
```

### Parameters

Parameter	Description
fs	The file system handle. File system handle can be obtained using one of the <code>hdfsConnect()</code> APIs.

Parameter	Description
file	The file handle. Obtain this handle with one of the <code>hdfsOpenFile()</code> APIs.
buffer	The buffer to copy bytes into during the read.
length	The length of the buffer. The maximum length of the buffer is the maximum size of <code>tSize</code> .

### Returned Value

Returns the number of bytes actually read, which can be less than than the length of the buffer if the end of the file is reached during the read. Returns -1 on error.

Check `errno` for error codes and meanings.

*hdfsReadStatisticsGetRemoteBytesRead()*

This API is not supported.

*hdfsRename()*

*Supported by libMapRCient for hadoop-2.x*

Renames the specified file. For information about the format to use for paths, see [Specifying Paths to Files and Directories](#).

### Signature

```
int hdfsRename(hdfsFS fs, const char* oldPath, const char* newPath)
```

### Parameters

Parameter	Description
fs	The handle of the file system where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
oldPath	The path of the source file.
newPath	The path of the destination file.

### Return Value

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

*hdfsSeek()*

*Supported by libMapRClient for hadoop-2.x*

Moves the current offset to another offset in the specified file.

### Signature

```
int hdfsSeek(hdfsFS fs, hdfsFile file, tOffset desiredPos)
```

**Parameters**

Parameter	Description
fs	The handle for the file system where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
file	The handle to the file. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
desiredPos	The offset to move forward to.

**Return Value**

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

*hdfsSetTicketAndKeyFile()*

Dynamically loads a ticket file

*Supported by `libMapRClient` for `hadoop-2.x`*

Use this API to dynamically load a ticket file to connect to newly added clusters and nodes, without restarting your application.

**Signature**

```
int hdfsSetTicketAndKeyFile(const char *fname)
```

**Parameters**

Parameter	Description
fname	The name of the ticket file to reload.

**Return Value**

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

*hdfsSetReplication()*

This API is not supported.

*hdfsSetRpcTimeout()*

*Unique to `libMapRClient`*

Sets the RPC timeout in seconds. Before creating a connection to a file system cluster, you can set an RPC timeout for your connections to CLDB nodes and file servers, passing the number of seconds for the timeout as an integer.

**Signature**

```
int hdfsSetRpcTimeout(int seconds)
```

**Parameters**

Parameter	Description
seconds	The time in seconds to wait before timing out. The default is 99 seconds. If you change the value, set it either to 0 or to greater than 30 seconds. If RPC timeout is set to 0, remote procedure calls will continue to be retried until they are successful.

**Return Value**

Returns 0 on success, -1 on error.

Check errno for error codes and meanings.

*hdfsSetThreads()*

*Unique to libMapRClient*

Configures the number of threads for flushing write buffers. This number is specific to individual clients. The default number is 8.

The number of threads must be positive. If it isn't, EINVAL is returned.

**Signature**

```
int hdfsSetThreads(int threads)
```

**Parameters**

Parameter	Description
threads	The number of threads for flushing write buffers.

**Return Value**

Returns the current number of flush threads for the client, -1 on error. Check errno for error codes and meanings.

*hdfsSetWorkingDirectory()*

*Supported by libMapRClient for hadoop-2.x*

Set the working directory. All relative paths will be resolved relative to it.

For example, if you call this API to set the working directory to `/mycluster/myvolume` and subsequently call `hdfsOpenFile()` with the path `/temp/tmp.txt`, the full path to the file to open is assumed to be `/mycluster/myvolume/temp/tmp.txt`.

**Signature**

```
int hdfsSetWorkingDirectory(hdfsFS fs, const char* path)
```

**Parameters**

Parameter	Description
fs	The handle of the file system where the directory is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
path	The path of the new working directory.

**Return Value**

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

`errno` is set to `EINVAL` for invalid arguments.

*hdfsSetXattr()*

*Supported by libMapRClient for hadoop-2.x*

Sets extended attribute on a file.

**Signature**

```
int hdfsSetXattr(hdfsFS fs, const char* path, const char *name, int
nameLen, char *value, int valueLen);
```

**Parameters**

Parameter	Description
fs	The handle of the file system where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
name	The name of the extended attribute.
nameLen	The length of the name of the extended attribute.
path	The path to the file.
value	The value for the extended attribute.
valueLen	The length of the value of the extended attribute.

**Return Value**

Returns 0 on success, -1 on error.

Check `errno` for error codes and meanings.

*hdfsTell()*

*Supported by libMapRClient for hadoop-2.x*

Gets the current offset in the file in bytes.

**Signature**

```
tOffset hdfsTell(hdfsFS fs, hdfsFile file)
```

**Parameters**

Parameter	Description
fs	The handle of the file system where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
file	The file handle. Obtain this handle with one of the <code>hdfsOpenFile()</code> APIs.

**Return Value**

Returns the current offset in bytes, or -1 on error.

Check `errno` for error codes and meanings.

*hdfsUtime()*

Changes the access and modification times of a file or directory.

*Supported by libMapRClient for hadoop-2.x*

**Signature**

```
int hdfsUtime(hdfsFS fs, const char* path, tTime mtime, tTime atime)
```

**Parameters**

Parameter	Description
fs	The handle of the file system where the file or directory is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
path	The path to the file or directory.
mtime	The new modification time or 0 (if you want to set only the access time) in seconds.
atime	The new access time or 0 (if you want to set only the modification time) in seconds.  For more information, see the <code>atimeUpdateTimeInterval</code> entry in <a href="#">volume create</a> on page 2592.

**Return Value**

Returns 0 on success, -1 on error.

`errno` is set to `EINVAL` if the input arguments are invalid.

`errno` is set to `EPERM` if the process does not have enough privileges to perform the operation.

*hdfsWrite()*

*Supported by libMapRClient for hadoop-2.x*

Writes to the specified open file.

If the file is opened in write-only mode, writes start at offset 0 because write-only mode causes the content of the file to be truncated when the file is opened.

If the file is opened in append mode, data is appended to the end of the file.

If there are concurrent writes that start at the same offset, only the last write to finish persists.

If a call to `hdfsSeek()` moves the offset past the end of the file before a call to `hdfsWrite()`, the result is a hole in the file between the previous end of the file and the offset at which the write begins.

You can obtain the size of a file in bytes by calling `hdfsGetPathInfo()`.

Flushes to the server happen automatically at intervals during a write operation. After a write operation is finished, either call `hdfsFlush()` explicitly or call `hdfsFlush()` implicitly by calling `hdfsCloseFile()` to be sure that any data remaining in the write buffer is flushed.

On error, pending write buffers are flushed to the server.

### Signature

```
tsize hdfsWrite(hdfsFS fs, hdfsFile file, const void* buffer, tSize length)
```

### Parameters

Parameter	Description
fs	The handle of the file system where the file is located. Obtain this handle with one of the <code>hdfsConnect()</code> APIs.
file	The handle of the file. Obtain this handle with one of the <code>hdfsOpenFile()</code> APIs.
buffer	The buffer containing the data to be written.
length	The number of bytes to write. This value cannot be zero. The maximum length of the buffer is the maximum size of the <code>tSize</code> data type.

### Return Value

Returns the number of bytes written, -1 on error.

Check `errno` for error codes and meanings.

## Accessing HPE Ezmeral Data Fabric File Store in Java Applications

As a high-performance file system, portions of the HPE Ezmeral Data Fabric File Store file client are based on a native `maprfs` library. When developing an application, specifying dependence on the JAR file that includes the `maprfs` library enables you to build applications without having to manage platform-specific dependencies.

The following sections describe how to access the HPE Ezmeral Data Fabric File Store in a Java program.

### Writing a Java Application

In your Java application, you will use a Configuration object to interface with the file system. When you instantiate a Configuration object, it is created with values from Hadoop configuration files.

If the program is built with JAR files from the Data Fabric installation, the Hadoop 1 configuration files are in the `$MAPR_HOME/hadoop/hadoop-<version>/conf` directory, and the Hadoop 2 configuration files are in the `$HADOOP_HOME/etc/hadoop` directory. This Hadoop configuration directory is in the `hadoop` classpath that you include when you compile and run the Java program.

If the program is built through maven using `mapr` maven artifacts, the default Hadoop configuration files are included in the maven artifacts. The user needs to programmatically update the Hadoop configuration to match the Hadoop configuration files on the Data Fabric cluster.

**Sample Code**

The following sample code shows how to interface with Data Fabric file system using Java. The example creates a directory, writes a file, then reads the contents of the file.

```

/* Copyright (c) 2009 & onwards. MapR
Tech, Inc., All rights reserved */

//package com.mapr.fs;

import java.net.*;
import org.apache.hadoop.fs.*;
import org.apache.hadoop.conf.*;

/**
 * Assumes mapr installed in /opt/mapr
 *
 * Compilation:
 * javac -cp $(hadoop classpath)
MapRTest.java
 *
 * Run:
 * java -cp .:$(hadoop classpath)
MapRTest /test
 */
public class MapRTest
{
    public static void main(String
args[]) throws Exception {
        byte buf[] = new
byte[ 65*1024];
        int ac = 0;
        if (args.length != 1) {

System.out.println("usage: MapRTest
pathname");
            return;
        }

        // maprfs:/// -> uses
the first entry in /opt/mapr/conf/
mapr-clusters.conf
        // maprfs:///mapr/
my.cluster.com/
        // /mapr/my.cluster.com/

        // String uri = "maprfs:///";
String dirname = args[ac++];

        Configuration conf = new
Configuration();

        //FileSystem fs =
FileSystem.get(URI.create(uri),
conf); // if wanting to use a
different cluster
        FileSystem fs =
FileSystem.get(conf);

        Path dirpath = new
Path( dirname + "/dir");
        Path wfilepath = new

```

```

Path( dirname + "/file.w");
    //Path rfilepath = new
Path( dirname + "/file.r");
    Path rfilepath = wfilepath;

    // try mkdir
    boolean res =
fs.mkdirs( dirpath);
    if (!res) {

System.out.println("mkdir failed,
path: " + dirpath);
    return;
    }

    System.out.println( "mkdir( "
+ dirpath + ") went ok, now writing
file");

    // create wfile
    FSDataOutputStream ostr =
fs.create( wfilepath,
            true, // overwrite
            512, // buffersize
            (short) 1, //
replication
                (long)
(64*1024*1024) // chunksize
            );
    ostr.write(buf);
    ostr.close();

    System.out.println( "write( "
+ wfilepath + ") went ok");

    // read rfile
    System.out.println( "reading
file: " + rfilepath);
    FSDataInputStream istr =
fs.open( rfilepath);
    int bb = istr.readInt();
    istr.close();
    System.out.println( "Read
ok");
    }
}

```

## Compiling and Running a Java Application

You can compile and run the Java application using JAR files from the mapr maven repository or from the Data Fabric installation.

### Using JARs from the Maven Repository

Maven artifacts from version 2.1.2 onward are published to <https://repository.mapr.com/maven/>. When compiling for Data Fabric core version 6.1, add the following dependency to the `pom.xml` file for your project:

```

<dependency>
  <groupId>org.apache.hadoop</

```

```

groupId>
  <artifactId>hadoop-common</
artifactId>
  <version>2.7.0-mapr-1808</version>
</dependency>

```

This dependency adds the dependencies from the mapr maven repository the next time you do a `mvn clean install`. The JAR that includes the `maprfs` library is a dependency for the `hadoop-common` artifact.

For a complete list of artifacts and further details, see [Maven Artifacts for the HPE Ezmeral Data Fabric](#) on page 4759.

### Using JARs from the Data Fabric Installation

The `maprfs` library is included in the `hadoop` classpath. Add the `hadoop` classpath to the JAVA classpath when you compile and run the Java application.

- To compile the sample code, use the following command:

```

javac -cp $(hadoop classpath)
MapRTest.java

```

- To run the sample code, use the following command:

```

java -cp .:$(hadoop classpath)
MapRTest /test

```

### Loading the Data Fabric Native Library

By default, the root class loader will load the native library to allow all children to see and access it. If the native library is loaded by a child class, other classes will not be able to access the library. To allow applications and associated child classes to access the symbols and variables in the native library, we recommend loading the native library via the root loader.

The loading of the native library via the root class loader is accomplished by injecting code into the root loader. If Data Fabric runs on top of applications (such as Tomcat) where it does not have access to the root class loader, the native library will not be loaded. Child classes that try to access the symbols under the assumption that the root class loader successfully loaded the native library will fail.

The parameter `-Dmapr.library.flatclass`, when specified with Java, disables the injection of code via the root class loader, thus disabling the loading of the native library using the root class loader. Instead, the application trying to access the symbols can load the native library themselves. However, since the native library can be loaded only once and can only be seen by the application loading it, ensure that only one application within the JVM attempts to load and access the native library.

### Garbage Collection in Data Fabric

The garbage collection (GC) algorithms in Java provide opportunities for performance optimizations for your application. Java provides the following GC algorithms:

- *Serial GC*. This algorithm is typically used in client-style applications that don't require low pause times. Specify `-XX:+UseSerialGC` to use this algorithm.

- *Parallel GC*, which is optimized to maximize throughput. Specify `-XX:+UseParNewGC` to use this algorithm.
- *Mostly-Concurrent* or *Concurrent Mark-Sweep GC*, which is optimized to minimize latency. Specify `-XX:+UseConcMarkSweepGC` to use this algorithm.
- *Garbage First GC*, a new GC algorithm intended to replace Concurrent Mark-Sweep GC. Specify `-XX:+UseG1GC` to use this algorithm.

Consider testing your application with different GC algorithms to determine their effects on performance.

#### Flags for GC Debugging

Set the following flags in Java to log the GC algorithm's behavior for later analysis:

```
-verbose:gc
-Xloggc:<filename>
-XX:+PrintGCDetails
-XX:+PrintGCDateStamps
-XX:+PrintTenuringDistribution
-XX:+PrintGCApplicationConcurrentTime
-XX:+PrintGCApplicationStoppedTime
```

For more information, see the Java [Garbage Collection Tuning](#) document or the Java [Garbage Collection](#) links.

#### Converting fid and volid

The following file system APIs are available in `com.mapr.fs.MapRFileSystem` for converting fid to file path and volid to volume name:

- `public String getMountPathFidCached(String fidStr) throws IOException`
- `public String getVolumeNameCached(int volId) throws IOException`
- `public String getVolumeName(int volId) throws IOException`
- `public String getMountPathFid(String fidStr) throws IOException`

#### Converting fid to File Path

The `getMountPathFid(string)` and `getMountPathFidCached(string)` APIs can be used for converting file ID to the full path to the file. The `getMountPathFid()` API makes a call to CLDB and file system to get the file path from the fid. Because this API does not cache or store this information locally, it might make repeated requests to CLDB and file system for the same fid and this might result in many RPCs to both CLDB and file system. The `getMountPathFidCached()` API makes a call the CLDB and file system one time and stores the information locally in the shared library of the client. For subsequent calls, it uses the locally stored information to retrieve the file path from the fid. However, if there are many files in the volume, there might still be a large number of calls to CLDB and file system to determine the file path for each fid in the volume. The caching is useful if the API attempts to determine the file path for the same fid repeatedly. The cache is purged after 15 seconds. If the file name changes before the cache is purged, you will see the old name for the file until the cache expires. You can use these APIs to convert the fid to the file path.

For example, the [sample consumer application](#) and the sample [uncached consumer application](#) for consuming audit logs as stream messages use these methods as shown below.

- **Sample Cached Consumer**

```
{
    String token =
    stl.nextToken();
    /* If the field has fid,
    expand it using Cached API */
    if (token.endsWith("Fid")) {
        String lfidStr =
        stl.nextToken();
        String path= null;
        try {
            path =
            fs.getMountPathFidCached(lfidStr);
            // Expand FID to path
        } catch (IOException e){
        }
        lfidPath =
        "\"FidPath\\\":\\""+path+"\", ";
        // System.out.println("\nPATH
        for fid " + lfidStr + "is " +
        path);
    }
}
```

- **Sample Uncached Consumer**

```
{
    String token =
    stl.nextToken();
    if (token.endsWith("Fid")) {
        String lfidStr =
        stl.nextToken();
        String path= null;
        try {
            path =
            fs.getMountPathFid(lfidStr); //
            Expand FID to path
        } catch (IOException e){
        }
        lfidPath =
        "\"FidPath\\\":\\""+path+"\", ";
        // System.out.println("\nPATH
        for fid " + lfidStr + "is " +
        path);
    }
}
```

### Converting volid to Volume Name

The `getVolumeName()` and `getVolumeNameCached()` APIs can be used for converting volume IDs to volume name. The `getVolumeName()` API makes a call to the CLDB every time to get the volume name from the volid and this may result in too many RPCs to CLDB. The `getVolumeNameCached()` API makes a call to the CLDB one time and stores the information locally in the shared library of the client. For subsequent calls, it uses the locally stored information to retrieve the

volume name from the valid. The cache is purged after 15 seconds. You can use these APIs to convert the valid to volume name.

For example, the [sample consumer application](#) and the sample [uncached consumer application](#) for consuming audit logs as stream messages uses these methods as shown below.

- **Sample Cached Consumer**

```
if (token.endsWith("volumeId")) {
    String valid =
    stl.nextToken();
    String name= null;
    try {
        int volumeId =
        Integer.parseInt(valid);
        // Cached API to
        convert volume Id to volume Name
        name =
        fs.getVolumeNameCached(volumeId);
    }
    catch (IOException e){
    }
    lvolName =
    "\"VolumeName\":" + name + "\", ";
    //
    System.out.println("\nVolume Name
    for valid " + valid + " is " +
    name);
}
```

- **Sample Uncached Consumer**

```
if (token.endsWith("volumeId")) {
    String valid =
    stl.nextToken();
    String name= null;
    try {
        int volumeId =
        Integer.parseInt(valid);
        // API to convert
        volume Id to volume Name
        name =
        fs.getVolumeName(volumeId);
    }
    catch (IOException e){
    }
    lvolName =
    "\"VolumeName\":" + name + "\", ";
    //
    System.out.println("\nVolume Name
    for valid " + valid + " is " +
    name);
}
```

### Sample Applications

Demonstrates how to set ACEs using the Java APIs.

## Sample Application

The sample application demonstrates how to set, get, modify, and delete ACES on files using the Java APIs.

Before running this application, verify that you have access to a cluster running file system. To build and run this application:

1. Set the classpath:

```
export CLASSPATH=`hadoop classpath`
```

2. Compile the java file:

```
javac FileAceTest.java
```

3. Run the final `FileAceTest.class` file.

The application imports the following libraries:

- `java.io.*`
- `java.net.*`
- `java.util.*`

The application performs the actions described in the following sections.

### Connects to a file system

The application tries to connect to the first file system cluster that is specified in the `mapr-clusters.conf` file in the `$MAPR_HOME/conf` directory on the client. After connecting to the file system, the application returns a handle to the file system.

```
Configuration conf = new
Configuration();
FileSystem fs = FileSystem.get(conf);
//MapRFileSystem fs =
getMapRFileSystem();
```

### Creates a new directory and a new file in the directory

The application creates a new directory and a file in the directory.

```
Path testDir = new Path(rootDir +
"FileAceTest");
mkdir(fs, testDir);

Path testFile = new Path(testDir + "/"
testFile");
createFile(fs, testFile);
```

### Sets ACEs on the new directory and the file

The application then sets ACEs to grant `m7user1` user or the root user permissions to list the contents of the directory, which is required for the user to write and/or execute files in the directory. In addition, the

application sets ACEs on the file in the directory to grant the m7user1 user read access on the file.

```
MapRFileAce ace = new
MapRFileAce(MapRFileAce.AccessType.REA
DFILE);
ace.setBooleanExpression("u:m7user1");
aces.add(ace);
ace = new
MapRFileAce(MapRFileAce.AccessType.REA
DDIR);
ace.setBooleanExpression("u:m7user1 |
u:root");
aces.add(ace);
((MapRFileSystem)fs).setAces(testDir,
aces);
((MapRFileSystem)fs).setAces(testFile,
aces);
```

**Verifies the ACEs set on the directory and file**

The application then prints the ACEs set on the directory and file.

```
List<MapRFileAce> newDirAces =
((MapRFileSystem)fs).getAces(testDir);
System.out.println("Path: " +
testDir);
for (int i = 0; i <
newDirAces.size(); ++i) {

System.out.println(newDirAces.get(i).g
etAccessType() + ": " +

newDirAces.get(i).getBooleanExpressio
n());
}

List<MapRFileAce> newFileAces =
((MapRFileSystem)fs).getAces(testFile)
;
System.out.println("Path: " +
testFile);
for (int i = 0; i <
newFileAces.size(); ++i) {

System.out.println(newFileAces.get(i).
getAccessType() + ": " +

newFileAces.get(i).getBooleanExpressio
n());
}
```

**Modifies the ACEs on the directory and file**

The application modifies the ACEs on the directory to grant m7user2 user also permissions to list the contents of the directory, which is required for the users to write and/or execute files in the directory. It also modifies the ACEs on the file to grant write access on the file to m7user2 user. Please note that when modifying ACEs on the file to grant write access

to m7user2 user, the application does not change read access, which was granted to m7user1 user.

```
aces = new ArrayList<MapRFileAce>();
ace = new
MapRFileAce(MapRFileAce.AccessType.REA
DDIR);
ace.setBooleanExpression("u:m7user1 |
u:root|u:m7user2");
aces.add(ace);
ace = new
MapRFileAce(MapRFileAce.AccessType.WRI
TEFILE);
ace.setBooleanExpression("u:m7user2");
aces.add(ace);
((MapRFileSystem)fs).modifyAces(testDi
r, aces);
((MapRFileSystem)fs).modifyAces(testFi
le, aces);
```

**Verifies the changes to ACEs on the directory and file**

The application prints the changes in ACEs on the directory and the file.

```
newDirAces =
((MapRFileSystem)fs).getAces(testDir);
System.out.println("Path: " +
testDir);
for (int i = 0; i <
newDirAces.size(); ++i) {

System.out.println(newDirAces.get(i).g
etAccessType() + ": " +

newDirAces.get(i).getBooleanExpressio
n());
}

newFileAces =
((MapRFileSystem)fs).getAces(testFile)
;
System.out.println("Path: " +
testFile);
for (int i = 0; i <
newFileAces.size(); ++i) {

System.out.println(newFileAces.get(i).
getAccessType() + ": " +

newFileAces.get(i).getBooleanExpressio
n());
}
```

**Deletes ACEs on directory and file**

The application deletes all ACEs on the directory and the file.

```
((MapRFileSystem)fs).deleteAces(testDi
r);
((MapRFileSystem)fs).deleteAces(testFi
le);
```

**Verifies the ACEs on the directory and the file**

The application prints the ACEs on the directory and the file after they are deleted.

```
newDirAces =
((MapRFileSystem)fs).getAces(testDir);
System.out.println("Path: " +
testDir);
if (newDirAces == null ||
newDirAces.size() == 0)
    System.out.println("AceCount: 0");
else
    System.out.println("AceCount: " +
newDirAces.size());
System.out.println("");
newFileAces =
((MapRFileSystem)fs).getAces(testFile)
;
System.out.println("Path: " +
testFile);
if (newFileAces == null ||
newFileAces.size() == 0)
    System.out.println("AceCount: 0");
else
    System.out.println("AceCount: " +
newFileAces.size());
```

**Example FileAceTest.java File**

```
import java.io.*;
import java.net.*;
import java.util.*;

import org.apache.hadoop.fs.*;
import org.apache.hadoop.conf.*;

import com.mapr.fs.MapRFileAce;
import com.mapr.fs.MapRFileSystem;

public class FileAceTest {
    public FileSystem fs = null;

    public static void mkdir(FileSystem fs, Path path) throws IOException {
        boolean res = fs.mkdirs(path);
        if (!res) {
            throw new IOException("mkdir failed, path: " + path);
        }
    }

    public static void createFile(FileSystem fs, Path path) throws Exception {
        byte buf[] = new byte[1024];

        FSDataOutputStream ostr = fs.create(path,
            true, // overwrite
            512, // buffersize
            (short) 1, // replication
            (long)(64*1024*1024) // chunksize
        );

        ostr.write(buf);
        ostr.close();
    }
}
```

```

public static void rmR(FileSystem fs, Path path) throws IOException {
    boolean res = fs.delete(path, true /*recursive*/);
    if (!res) {
        throw new IOException("rmR failed, path: " + path);
    }
}

public static void main(String args[]) throws Exception {
    String rootDir = "maprfs:///";

    Configuration conf = new Configuration();
    FileSystem fs = FileSystem.get(conf);

    Path testDir = new Path(rootDir + "FileAceTest");
    mkDir(fs, testDir);

    Path testFile = new Path(testDir + "/testFile");
    createFile(fs, testFile);

    ArrayList<MapRFileAce> aces = new ArrayList<MapRFileAce>();

    // Set
    System.out.println("SETTING ACES");
    MapRFileAce ace = new MapRFileAce(MapRFileAce.AccessType.READFILE);
    ace.setBooleanExpression("u:m7user1");
    aces.add(ace);
    ace = new MapRFileAce(MapRFileAce.AccessType.READDIR);
    ace.setBooleanExpression("u:m7user1|u:root");
    aces.add(ace);
    ((MapRFileSystem)fs).setAces(testDir, aces);
    ((MapRFileSystem)fs).setAces(testFile, aces);

    // Get
    System.out.println("GETTING ACES");
    List<MapRFileAce> newDirAces = ((MapRFileSystem)fs).getAces(testDir);
    System.out.println("Path: " + testDir);
    for (int i = 0; i < newDirAces.size(); ++i) {
        System.out.println(newDirAces.get(i).getAccessType() + ": " +
            newDirAces.get(i).getBooleanExpression());
    }
    System.out.println("");
    List<MapRFileAce> newFileAces = ((MapRFileSystem)fs).getAces(testFile);
    System.out.println("Path: " + testFile);
    for (int i = 0; i < newFileAces.size(); ++i) {
        System.out.println(newFileAces.get(i).getAccessType() + ": " +
            newFileAces.get(i).getBooleanExpression());
    }

    // Modify
    System.out.println("MODIFYING ACES");
    aces = new ArrayList<MapRFileAce>();
    ace = new MapRFileAce(MapRFileAce.AccessType.READDIR);
    ace.setBooleanExpression("u:m7user1|u:root|u:m7user2");
    aces.add(ace);
    ace = new MapRFileAce(MapRFileAce.AccessType.WRITEFILE);
    ace.setBooleanExpression("u:m7user2");
    aces.add(ace);
    ((MapRFileSystem)fs).modifyAces(testDir, aces);
    ((MapRFileSystem)fs).modifyAces(testFile, aces);

    // Get
    System.out.println("GETTING ACES");
    newDirAces = ((MapRFileSystem)fs).getAces(testDir);
    System.out.println("Path: " + testDir);

```

```

for (int i = 0; i < newDirAces.size(); ++i) {
    System.out.println(newDirAces.get(i).getAccessType() + ": " +
        newDirAces.get(i).getBooleanExpression());
}
System.out.println("");
newFileAces = ((MapRFileSystem)fs).getAces(testFile);
System.out.println("Path: " + testFile);
for (int i = 0; i < newFileAces.size(); ++i) {
    System.out.println(newFileAces.get(i).getAccessType() + ": " +
        newFileAces.get(i).getBooleanExpression());
}

// Delete
System.out.println("DELETING ACES");
((MapRFileSystem)fs).deleteAces(testDir);
((MapRFileSystem)fs).deleteAces(testFile);

// Get
System.out.println("GETTING ACES");
newDirAces = ((MapRFileSystem)fs).getAces(testDir);
System.out.println("Path: " + testDir);
if (newDirAces == null || newDirAces.size() == 0)
    System.out.println("AceCount: 0");
else
    System.out.println("AceCount: " + newDirAces.size());
System.out.println("");
newFileAces = ((MapRFileSystem)fs).getAces(testFile);
System.out.println("Path: " + testFile);
if (newFileAces == null || newFileAces.size() == 0)
    System.out.println("AceCount: 0");
else
    System.out.println("AceCount: " + newFileAces.size());

// Get
System.out.println("GETTING ACES");
newDirAces = ((MapRFileSystem)fs).getAces(testDir);
System.out.println("Path: " + testDir);
for (int i = 0; i < newDirAces.size(); ++i) {
    System.out.println(newDirAces.get(i).getAccessType() + ": " +
        newDirAces.get(i).getBooleanExpression());
}
System.out.println("");
newFileAces = ((MapRFileSystem)fs).getAces(testFile);
System.out.println("Path: " + testFile);
for (int i = 0; i < newFileAces.size(); ++i) {
    System.out.println(newFileAces.get(i).getAccessType() + ": " +
        newFileAces.get(i).getBooleanExpression());
}

// Remove path
rmR(fs, testDir);
}
}

```

## Troubleshooting

**My application that includes maprfs-0.1.jar is now missing dependencies and fails to link.**

As of version 2.1.2, the contents of maprfs-0.1.jar are now in two JAR files:

- maprfs-<version>.jar

- `maprfs-jni-<version>.jar`

The `<version>` refers to the version of the distribution. For example, if you have an existing application written for `maprfs-0.1.jar` and you update it to load `maprfs-2.1.2.jar`, you must also include `maprfs-jni-2.1.2.jar`. This change was made to enable loading on distributed class-loader environments that use the `maprfs` libraries to access the filesystem from multiple contexts.

These JAR files are installed in the `/opt/mapr/hadoop/hadoop<version>/lib/` directory, or can be accessed via the Maven Central Repository.

## HPE Ezmeral Data Fabric Database and Apps

---

This section contains information about developing client applications for JSON and key-value tables.

### Why use HPE Ezmeral Data Fabric Database?

From a developer's point-of-view, HPE Ezmeral Data Fabric Database provides the following capabilities:

- **Extreme scale for CRUD operations:** Enabled by the integration of HPE Ezmeral Data Fabric Database with the HPE Ezmeral Data Fabric Filesystem, CRUD operations are extremely fast and efficient.
- **Flexible data model:** HPE Ezmeral Data Fabric Database can be used as both a [document database](#) and a [column-oriented database](#). So if the content structure changes, the applications do not need to be re-written.
- **Rich query:** Integration with [Apache Drill](#) on page 3928 for HPE Ezmeral Data Fabric Database provides a low-latency distributed query engine for large-scale datasets, including structured and semi-structured/nested data.
- **Integration with Apache Spark:** HPE Ezmeral Data Fabric Database provides [HPE Ezmeral Data Fabric Database Connectors for Apache Spark](#) on page 4647 that allow you to access HPE Ezmeral Data Fabric Database tables through Spark applications.
- **Strong data consistency:** Consistently fast response with strong data consistency with row/document level ACID transactions and in-memory database options for faster speeds.

HPE Ezmeral Data Fabric Database JSON provides additional benefits:

- **High performance via [Secondary Indexes on page 674](#):** No memory copying. No need to retrieve the full document to make updates due the log-based database architecture. No application changes needed to leverage secondary indexes for efficient query execution.
- **Easy application development:** JSON constructs such as maps, arrays, and data types are supported natively.
- **Language-specific client APIs:** Java, Python, and Node.js client APIs

**NOTE:** HPE Ezmeral Data Fabric has a universal namespace which means that the same namespace is used for files, tables, and streams. A universal namespace streamlines application development for different operations.

## How Do I Get Started with HPE Ezmeral Data Fabric Database JSON?

The following diagram illustrates an end-to-end flow associated with getting started with HPE Ezmeral Data Fabric Database JSON.

 **NOTE:** *This flow is not the only way to get started!*

You can also run through end-to-end examples using preconfigured, single node HPE Ezmeral Data Fabric clusters. The following table describes an option:

### Container for Developers

[Development Environment for HPE Ezmeral Data Fabric](#) on page 62 is a Docker container that runs a single node cluster. Using [HPE Ezmeral Data Fabric Database JSON: Getting Started](#), you can do the following:

- Set up the Docker container
- Import data into HPE Ezmeral Data Fabric Database JSON tables
- Use HPE Ezmeral Data Fabric Database Shell to query, insert, and update JSON documents in HPE Ezmeral Data Fabric Database JSON tables
- Use Drill to query HPE Ezmeral Data Fabric Database JSON tables
- Run sample Java OJAI applications
- Run a sample Spark application using the HPE Ezmeral Data Fabric Database OJAI Connector for Apache Spark

## Installing the mapr-client Package

The `mapr-client` package must be installed on each node where you will be building and running your applications. This package installs all of the MapR Libraries needed for application development regardless of programming language or type of HPE Ezmeral Data Fabric Database table (binary or JSON).

### About this task

**NOTE:** The `mapr-core` package contains the files that are in the `mapr-client` package. If you have installed the `mapr-core` package, you do not need to install the `mapr-client` package.

Complete the following steps to install the `mapr-client` package from a repository:

### Procedure

1. Configure the repository to point to <https://package.ezmeral.hpe.com/releases/<release version>/<operating system>>

For example, if your VM has a CentOS operating system, edit the `/etc/yum.repos.d/mapr_core.repo` file to add the location.

2. Based on your operating system, run one of the following commands to install the package:
  - On RHEL/Centos: `yum install mapr-client`
  - On Ubuntu: `apt-get install mapr-client`
  - On SLES: `zypper install mapr-client`

## Passing the HPE Ezmeral Data Fabric Database Table Path

This topic describes the methods for passing a HPE Ezmeral Data Fabric Database table name. Binary table names can be passed by either specifying the table path in the API or by setting the table path in the `core-site.xml` file. JSON table names are passed by specifying the table path in the API.

### Specifying the Table Path in the API

With this method, you provide the complete path to the table using the following format: `/mapr/<cluster>/<volume>/<table>`

**NOTE:** This format is independent of the programming language. This method is used for both HPE Ezmeral Data Fabric Database binary and JSON tables.

For example, if you were adding a new column family to a table and you had the following information:

- Cluster name: `newyork`
- Volume name: `vol1`
- Table name: `table1`

The table path would be `/mapr/newyork/vol1/table1`

### Specifying the Table Path in the `core-site.xml` File

With this method, you specify the table path with `hbase.table.namespace.mappings` property in the `/opt/mapr/hadoop/hadoop-2.7.0/etc/hadoop/core-site.xml` file.

**NOTE:** This method is specific to HPE Ezmeral Data Fabric Database binary tables only. This method is independent of the programming language.

In the following example, all tables that you create and access via the API, will be in the `/tables_dir1` directory. If you specified the table name `table1` in the API, the full path to the table would be `/tables_dir1/table1`.

```
<property>
  <name>hbase.table.namespace.mappings</name>
  <value>*:/tables_dir1</value>
</property>
```

## Tuning Parameters for Client Apps

Though tuning client applications is generally not necessary, Data Fabric does offer tuning parameters to change the behavior of client-side caching.

Client application cache pending puts in buffers that are unique to each tablet (*region*, in HBase terminology). Individual put buffers are flushed when they are full or idle. As a result of this architecture and behavior, client applications tend to send RPCs of 128KB when flushing puts to disk, which results in better performance than flushing a single global buffer would, as that could result in a large number of small RPCs.

You can change the values of parameters that affect how put buffers are flushed. Set values for them in the `hbase-site.xml` file or `core-site.xml` file in your Data Fabric installation. If a non-default value for a parameter is set in both files, the value in the `hbase-site.xml` file is used.

### **db.mapr.putbuffer.threshold.mb**

Specifies the size of the cumulative put buffer for all tablets in the client application. When this threshold is reached, the put buffer that is most full is flushed to its tablet.

	<p>The default value is 32MB.</p> <p>Increasing this value can improve performance when an application performs operations on very large tables or on a very large number of tables.</p>
<b>db.mapr.putbuffer.threshold.sec</b>	<p>Specifies the number of seconds that HPE Ezmeral Data Fabric Database should wait before flushing an idle put buffer.</p> <p>The default value is 3.</p> <p>This parameter has no effect if automatic flushing is enabled.</p>
<b>fs.mapr.tablettru.size.kb</b>	<p>Specifies the size of the metadata cache for all tables in a client application..</p> <p>The metadata for each tablet is 128 bytes.</p> <p>The default value of this parameter is 512KB, which allows for the caching of the metadata of 4,096 tablets.</p> <p>When this metadata cache is full, any operation on a tablet for which the metadata is not cached requires an RPC to fetch that tablet's metadata. Moreover, caching the newly retrieved metadata removes from the cache the metadata of a different tablet.</p> <p>Increasing this value can improve performance when an application performs operations on very large tables or on a very large number of tables.</p>
<b>fs.mapr.threads</b>	<p>Specifies the number of threads to use when flushing put buffers. Each thread makes synchronous RPCs when flushing.</p> <p>The default value is 64.</p>

## Developing Applications for Binary Tables

HPE Ezmeral Data Fabric Database provides a C API, `libMapRClient` and partially supports the Apache HBase 1.1 Java APIs for performing operation on HPE Ezmeral Data Fabric Database binary tables.

The HPE Ezmeral Data Fabric Database C API, `libMapRClient`, runs more efficiently on HPE Ezmeral Data Fabric Database and performs faster against HPE Ezmeral Data Fabric Database tables than the open source library of C APIs, `libhbase`, that is used to create and access Apache HBase tables. The `libMapRClient` header files are in this directory: **`/opt/mapr/include/hbase`**

HPE Ezmeral Data Fabric Database also supports all of the Apache HBase 1.1 Java APIs, except where noted in this documentation. For a number of critical Java APIs, for filters, and for comparators, this documentation explicitly lists what is supported, rather than what is not supported.

You can easily port existing applications that use the open-source version of `libhbase` or the HBase Java APIs to use HPE Ezmeral Data Fabric Database binary tables.

### Current Limitations

- Custom HBase filters are not supported.
- HBase co-processors are not supported.

**NOTE:** Filters used with Scan operations support regular expressions. When you filter scans on HPE Ezmeral Data Fabric Database tables, you can use regular expressions that comprise the Perl Compatible Regular Expressions (PCRE) library as well as a subset of the regular expressions that are supported in `java.util.regex.pattern`. See [HBase Java Regular Expressions Support](#) on page 3296 for a list of supported regular expressions.

### Creating C Apps - Binary Tables

Data Fabric provides a library of C APIs – `libMapRClient` – for performing operations on HPE Ezmeral Data Fabric Database binary tables.

The HPE Ezmeral Data Fabric Database `libMapRClient` C API library is Data Fabric's extension of the `libhbase` C API library. The `libMapRClient` header files are in this directory: `/opt/mapr/include/hbase`

`libMapRClient` uses the following conventions:

- All data types are prefixed with 'hb\_'.
- All exported functions are annotated with `HBASE_API`, prefixed with 'hb\_' and named using the following convention: 'hb\_<subject>\_<operation>\_[<object>|<property>]'
- All asynchronous APIs take a callback which is triggered when a request completes. This callback can be triggered in the caller's thread or in another thread. To avoid any potential deadlock or starvation, applications should not block in the callback routine.
- All callbacks take a void pointer for application developers to supply their own data. This void pointer is passed when callback is triggered.

**NOTE:** No explicit batching is supported for asynchronous APIs.

**WARNING:** It is the responsibility of applications to free up all backing data buffers. However, for asynchronous APIs, applications must wait before freeing buffers until after receiving callbacks or manipulating results. For better performance of asynchronous APIs, `libMapRClient` does not copy data buffers that are allocated for mutations, gets, and scans. These buffers hold table names, name space identifiers, row keys, column-family names, and column names or qualifiers. Instead, `libMapRClient` temporarily takes ownership of the buffers and references them with pointers until the callback is triggered. Therefore, applications should not free memory buffers before receiving callbacks for mutations. Applications also should not free memory buffers before receiving results for gets and scans. If applications must read results, the applications should not free memory buffers until the results are destroyed.

**NOTE:** When one of these asynchronous APIs is invoked, a work item is created and queued for processing on the client:

- `hb_client_destroy()`
- `hb_get_send()`
- `hb_mutation_send()`
- `hb_scanner_destroy()`
- `hb_scanner_next()`

The work item is picked up as soon as possible by a thread in a thread pool.

Client applications can often call these asynchronous APIs faster than the work items are processed. To ensure that the queue of work items does not grow without bound, the configuration parameter `fs.mapr.pool.queue.max_size` is set by default to 10,000. You can modify this parameter in the `/opt/mapr/conf/dbclient.conf` file for a client.

Whenever the number of work items in the queue reaches this limit, `libMapRClient` returns the `ENOBUFS` error for each asynchronous call. Client applications are expected to handle this error, and can try the call again later.

### libMapRClient C APIs

This section provides the HPE Ezmeral Data Fabric Database `libMapRClient` C API library. This library is MapR's extension of the `libhbase` C API library. The `libMapRClient` header files are in the directory: `/opt/mapr/include/hbase`.

The `libMapRClient` API implements functions in addition to the functions in the `libhbase` API.

**NOTE:** Your applications need include only the `hbase.h` header file. The header files are provided for display purposes.

#### **admin.h**

Describes the APIs for Apache HBase table administration operations such as creating and enabling tables, checking if tables exist, and deleting tables, to name a few .

#### **client.h**

Describes the APIs for Apache HBase client side operations such as creating and terminating client connections, and flushing buffered client-side writes to Apache HBase.

#### **coldesc.h**

Describes the APIs for performing operations such as creation, deletion, and setting the maximum and minimum number of cell versions to be retained for each Apache HBase column family.

#### **connection.h**

`libMapRClient` includes a function in the `connection.h` header file: `hb_connection_create_as_user()`. This function provides support for impersonation, so that you can connect to a HPE Ezmeral Data Fabric cluster and access HPE Ezmeral Data Fabric Database tables by using a specific username.

The user that is passed with the `hb_connection_create_as_user()` API must have permissions on the tables that the application accesses. For example, to read from a table, the user must have the `readperm` permission. To write to a

table, the user must have the `writetperm` permission. See [Enabling Table and Stream Authorizations with ACEs](#) on page 1355.

For `hb_connection_create()` and `hb_connection_create_as_user()`, the standard C APIs for Apache HBase require a list of ZooKeeper nodes. For HPE Ezmeral Data Fabric Database, this list is interpreted as a list of CLDB nodes. The `zk_root` parameter is ignored. If `zk_quorum` is NULL, then the connection is created to the default cluster that is listed in the `mapr-clusters.conf` file.

<b>get.h</b>	Describes the APIs to query and fetch data from Apache HBase tables.
<b>hbase.h</b>	Describes the APIs and data structures of a C client for Apache HBase.
<b>log.h</b>	Describes the APIs to manage Apache HBase logs.
<b>macros.h</b>	Defines internal macros that Apache HBase uses for its operations.
<b>multiget.h</b>	Describes the APIs to queue and manage multiple GET requests to fetch data from Apache HBase tables.
<b>mutations.h</b>	Describes the APIs for row and column mutations on Apache HBase tables.
<b>result.h</b>	Describes the buffers for internal temporary storage of results.
<b>scanner.h</b>	Describes the APIs for the client side scanner to scan and request rows from the Apache HBase server.
<b>types.h</b>	Defines the data types and error codes that Apache HBase uses.

### C API Examples

This section provides examples using the HPE Ezmeral Data Fabric Database `libMapRClient` C API to operate on HPE Ezmeral Data Fabric Database binary tables.

The HPE Ezmeral Data Fabric Database `libMapRClient` C API library is MapR's extension of the `libhbase` C API library. The `libMapRClient` header files are in this directory: `/opt/mapr/include/hbase`

#### *Filtering SCAN Operation Results Example*

This example shows filtering on the results of a SCAN operation.

```
for (uint32_t i = 0; i < num_filters; ++i) {
    hb_scanner_t scanner = NULL;
    hb_scanner_create(client, &scanner);
    hb_scanner_set_table(scanner, table_name, table_name_len);
    hb_scanner_set_num_max_rows(scanner, 3); // maximum 3 rows at a time
    hb_scanner_set_num_versions(scanner, 10); // up to 10 versions of the
cell
    hb_scanner_set_filter(scanner, (byte_t *)filters[i],
strlen(filters[i]));
    hb_scanner_next(scanner, scan_callback, NULL); // dispatch the call
```

```
wait_for_scan();
}
```

This example uses the following array of filters:

```
static char filters[][200] = {"RandomRowFilter(0.5)",
    "ColumnCountGetFilter(2)",
    "ColumnPaginationFilter(1)",
    "ColumnPrefixFilter('column-a')",
    "FamilyFilter(=, 'binaryprefix:f')",
    "PrefixFilter('row_') AND QualifierFilter(<, 'binaryprefix:g')",
    "SKIP TimestampsFilter(1392222222222)",
    "WHILE ValueFilter(=, 'binaryprefix:cell2_value_v1')",
    "FuzzyRowFilter('row00', '00001')",
    "TimestampsFilter(1430937732000, 1431024132000)"};
}
```

**NOTE:** For more information about support for HBase Java Filters by the HPE Ezmeral Data Fabric Database C API, see [HBase Java Filters Support](#) on page 3262

#### *Filtering GET Operation Results Example*

This example shows filtering on the results of a GET operation.

```
{
    bytebuffer rowKey = bytebuffer_strcpy("row_with_two_cells");
    hb_get_t get = NULL;
    hb_get_create(rowKey->buffer, rowKey->length, &get);
    hb_get_add_column(get, FAMILIES[0], 1, NULL, 0);
    hb_get_add_column(get, FAMILIES[1], 1, NULL, 0);
    hb_get_set_table(get, table_name, table_name_len);
    hb_get_set_num_versions(get, 10); // up to ten versions of each column
    hb_get_set_filter(get, (byte_t *)filters[9], strlen(filters[9]));
    get_done = false;
    hb_get_send(client, get, get_callback, rowKey);
    wait_for_get();
}
```

This example uses the following array of filters:

```
static char filters[][200] = {"RandomRowFilter(0.5)",
    "ColumnCountGetFilter(2)",
    "ColumnPaginationFilter(1)",
    "ColumnPrefixFilter('column-a')",
    "FamilyFilter(=, 'binaryprefix:f')",
    "PrefixFilter('row_') AND QualifierFilter(<, 'binaryprefix:g')",
    "SKIP TimestampsFilter(1392222222222)",
    "WHILE ValueFilter(=, 'binaryprefix:cell2_value_v1')",
    "FuzzyRowFilter('row00', '00001')",
    "TimestampsFilter(1430937732000, 1431024132000)"};
}
```

**NOTE:** For more information about support for HBase Java Filters by the HPE Ezmeral Data Fabric Database C API, see [HBase Java Filters Support](#) on page 3262

#### *Impersonation Example*

This sample application demonstrates the capabilities of the new C API for impersonation.

The sample also shows how to use the API in your own programs. The application is located in the `/opt/mapr/examples/interactive` directory.

**Prerequisite for compiling and running this sample application**

Install the `mapr-client` package on the node where you will build the application. See [Installing the Data Fabric Client \(Non-FIPS\)](#) on page 396. If the `mapr-core` package is already installed, you do not need to install the `mapr-client` package.

**Compiling this sample application**

To compile and run this sample application, set the `MAPR_IMPERSONATION_ENABLED` environment variable to `true` and then read the instructions in the `README` file in the `/opt/mapr/examples/interactive` directory.

Though the application links against `libjvm`, a Java virtual machine (JVM) is not spawned. However, the `libMapRClient` does have Java dependencies.

**Set Time Range Example**

This example scans HPE Ezmeral Data Fabric Database binary tables and sets the time range.

```
int32_t scanWithTimeranges( std::string table_name, int32_t num_versions,
uint64_t max_num_rows, std::string start_row_key,
                        std::string end_row_key, int64_t min_ts, int64_t max_ts,
std::string name_space, std::string column_name) {
    hb_scanner_t scanner = NULL;
    int32_t retCode;

    scan_num_rows = 0;
    scan_cell_count = 0;
    scan_done = false;
    // scanner object create
    hb_scanner_create(client, &scanner);

    scan_data_t *scan_data = (scan_data_t *) calloc(1,
sizeof(scan_data_t));

    // set the table to scan
    scan_data->table_name_ = bytebuffer_printf("%s",
table_name.c_str());
    hb_scanner_set_table(scanner, (char *)
scan_data->table_name_->buffer, scan_data->table_name_->length);

    // start and end row - optional
    scan_data->start_row_key_ = bytebuffer_printf("%s",
start_row_key.c_str());
    hb_scanner_set_start_row(scanner, scan_data->start_row_key_->buffer,
scan_data->start_row_key_->length);

    scan_data->end_row_key_ = bytebuffer_printf("%s",
end_row_key.c_str());
    hb_scanner_set_end_row(scanner, scan_data->end_row_key_->buffer,
scan_data->end_row_key_->length);

    // add columns
    bytebuffer cfName = bytebuffer_printf("%s",
data_qualifier[0].c_str());
    bytebuffer columnName = bytebuffer_printf("%s",
data_qualifier[1].c_str());
    retCode=hb_scanner_add_column(scanner, (byte_t
*)cfName->buffer, cfName->length, columnName->buffer, columnName->length);

    // set versions
    hb_scanner_set_num_versions(scanner, num_versions);

    // set timerange
```

```

hb_scanner_set_timerange(scanner, min_ts, max_ts);

// scan data
retCode = hb_scanner_next(scanner, scan_callback, scan_data);
return retCode;
}

```

### Set Time Stamp Example

This example scans HPE Ezmeral Data Fabric Database binary tables and sets the time stamp.

```

int32_t scanWithTimestamp( std::string table_name, int32_t num_versions,
uint64_t max_num_rows, std::string start_row_key,
                        std::string end_row_key, int64_t ts, std::string
name_space, std::string column_name) {
    hb_scanner_t scanner = NULL;
    int32_t retCode;

    scan_num_rows = 0;
    scan_cell_count = 0;
    scan_done = false;

    // scanner object create
    hb_scanner_create(client, &scanner);

    scan_data_t *scan_data = (scan_data_t *) calloc(1,
sizeof(scan_data_t));

    // set the table to scan
    scan_data->table_name_ = bytebuffer_printf("%s",
table_name.c_str());
    hb_scanner_set_table(scanner, (char *)
scan_data->table_name_->buffer, scan_data->table_name_->length);

    // start and end row - optional
    scan_data->start_row_key_ = bytebuffer_printf("%s",
start_row_key.c_str());
    hb_scanner_set_start_row(scanner, scan_data->start_row_key_->buffer,
scan_data->start_row_key_->length);

    scan_data->end_row_key_ = bytebuffer_printf("%s",
end_row_key.c_str());
    hb_scanner_set_end_row(scanner, scan_data->end_row_key_->buffer,
scan_data->end_row_key_->length);

    // add columns
    bytebuffer cfName = bytebuffer_printf("%s",
data_qualifier[0].c_str());
    bytebuffer columnName = bytebuffer_printf("%s",
data_qualifier[1].c_str());
    retCode=hb_scanner_add_column(scanner, (byte_t
*)cfName->buffer, cfName->length, columnName->buffer, columnName->length);

    // set versions
    hb_scanner_set_num_versions(scanner, num_versions);

    // set timestamp
    hb_scanner_set_timestamp(scanner, ts);

    // scan data
    retCode = hb_scanner_next(scanner, scan_callback, scan_data);
    return retCode;
}

```

### Delete Specific Cells Example

This example deletes specific cells that correspond to a specific timestamp.

```

nt32_t deleteRowExactTS(std::string table_name, std::string row_key,
    std::vector<std::string> data, int64_t ts) {

    int32_t retCode = 0;
    // initialize delete object
    hb_delete_t del = NULL;

    row_data_t *row_data = (row_data_t *) calloc(1, sizeof(row_data_t));
    row_data->key = bytebuffer_printf("%s", row_key.c_str());
    row_data->tablename = bytebuffer_printf("%s", table_name.c_str());

    // create delete object
    hb_delete_create(row_data->key->buffer, row_data->key->length,
&del);

    cell_data_t *prevCell=NULL;
    // add cells that needs to be deleted
    for(int t=0; t < (int)data.size(); t++) {
        vector<string> data_qualifier = split(data.at(t),':');
        cell_data_t *cell_data= new_cell_data();
        if(t==0)
            row_data->first_cell = cell_data;
        else
            prevCell->next_cell = cell_data;

        cell_data->columnFamily =
bytebuffer_printf("%s",data_qualifier[0].c_str());
        cell_data->columnName =
bytebuffer_printf("%s",data_qualifier[1].c_str());

        //add column, fam/column/ts to delete the exact version
        retCode=hb_delete_add_column_exact(del,
cell_data->columnFamily->buffer, cell_data->columnFamily->length,
cell_data->columnName->buffer,cell_data->columnName->length,ts);
        prevCell = cell_data;
    }

    // set the table name in delete mutation object
    hb_mutation_set_table(del, (const char
*)row_data->tablename->buffer,row_data->tablename->length);

    //send the delete request
    retCode = hb_mutation_send(client, del, delete_callback, row_data);
    return retCode;
}

```

### HPE Ezmeral Data Fabric Database Sample C Application

Data Fabric provides a sample C application that accesses and performs operations on HPE Ezmeral Data Fabric Database binary tables. This section describes the various operation performed by the application.

The sample C application is located in the /opt/mapr/examples/sample directory.

### Prerequisites

In order to compile and run the sample application, install the `mapr-client` package on the node where you will build the application. See [Impersonation Example](#) on page 3245. If the `mapr-core` package is already installed, you do not need to install the `mapr-client` package.

## Compiling

To compile and run the sample application, read the instructions in the README file in the `/opt/mapr/examples/sample` directory.

*Set the log level and specify the log stream*

## APIs used

These two APIs are defined in the header file `log.h`:

- `hb_log_set_level()`: Sets the log output level. The levels are defined in the header file `types.h`.
- `hb_log_set_stream()`: Sets the location of the log output. By default, log messages are sent to `stderr`.

## Code

```
hb_log_set_level(HBASE_LOG_LEVEL_DEBUG); // defaults to INFO
const char *logFilePath = getenv("HBASE_LOG_FILE");
if (logFilePath != NULL) {
    FILE* logFile = fopen(logFilePath, "a");
    if (!logFile) {
        retCode = errno;
        fprintf(stderr, "Unable to open log file \"%s\"", logFilePath);
        perror(NULL);
        goto cleanup;
    }
    hb_log_set_stream(logFile); // defaults to stderr
}
```

Log levels are specified in the header file `types.h`.

```
/**
 * Log levels
 */
typedef enum {
    HBASE_LOG_LEVEL_INVALID = 0,
    HBASE_LOG_LEVEL_FATAL   = 1,
    HBASE_LOG_LEVEL_ERROR   = 2,
    HBASE_LOG_LEVEL_WARN    = 3,
    HBASE_LOG_LEVEL_INFO    = 4,
    HBASE_LOG_LEVEL_DEBUG   = 5,
    HBASE_LOG_LEVEL_TRACE   = 6
} HBaseLogLevel;
```

*Create a connection*

## API used: `hb_connection_create()`

Use this function to connect to the Data Fabric cluster.

This API takes three parameters:

```
const char *zk_ensemble,      /* [in] NULL terminated, comma separated
                              * string of CLDB servers. e.g.
                              * "<server1[:port]>,..." */
const char *zk_root,         /* [in] Ignored for MapR-DB. */
hb_connection_t *connection_ptr); /* [out] pointer to hb_connection_t */
```

There are two methods by which you can use the `zk_ensemble` parameter to determine how the Data Fabric client connection locates the Data Fabric cluster to connect to:

**Set `zk_ensemble` to NULL to connect to the default cluster that is defined in the `mapr-clusters.conf` file.**

HPE recommends this method, which uses the configuration information that is listed for the cluster in the `mapr-clusters.conf` file.

**Set `zk_ensemble` to a string that includes hostnames or IP addresses.**

With this method, the client application can connect to a non-default cluster explicitly. The client application searches through the `mapr-clusters.conf` file to find a cluster entry with a matching hostname/IP address. The first entry that is found to contain a matching hostname[:port]/IP address[:port] is used for the connection, as is the configuration information for that entry.

If none of the hostnames or IP addresses specified for `zk_ensemble` are located in entries in `mapr-clusters.conf`, or if `mapr-clusters.conf` does not exist, the client application tries to connect to the first specified hostname[:port]/IP address[:port]. If the client application cannot make a connection, it moves to the next specified hostname[:port]/IP address[:port].

**WARNING:** Because no `mapr-clusters.conf` file is involved, no additional configuration information is used for connections. For example, connections made in this way cannot be secure because no security parameters are provided.

## Examples

```
//connect to default cluster specified in mapr-clusters.conf (preferred)
if ((err = hb_connection_create(NULL,
                                NULL,
                                &connection)) != 0) {
    HBASE_LOG_ERROR("Could not create MapR-DB connection : errorCode = %d.",
err);
    goto cleanup;
}

//Connect directly to cluster with these specified IP addresses.
//Typically this means there is no mapr-clusters.conf and security not used.
if ((err = hb_connection_create("192.168.1.1:7222,192.168.1.2:7222",
                                NULL /* ignored */,
                                &connection)) != 0) {
    HBASE_LOG_ERROR("Could not create MapR-DB connection : errorCode = %d.",
err);
    goto cleanup;
}
```

## Code in the sample application

```
if ((retCode = hb_connection_create(zk_ensemble,
                                    zk_root_znode,
                                    &connection)) != 0) {
    HBASE_LOG_ERROR("Could not create HBase connection : errorCode = %d.",
retCode);
    goto cleanup;
}
```

This API is defined in the header file `connection.h`:

### *Create a table*

The sample application creates a table by calling a function named `ensureTable`.

### APIs used

The definition of this function uses these APIs:

APIs defined in the header file `admin.h`.

- `hb_admin_table_create()`: Creates a table. Returns 0 on success or an error code.
- `hb_admin_table_delete()`: Deletes a table. Returns 0 on success or an error code.
- `hb_admin_destroy()`: Disconnects the `hb_admin` object, releasing any internal objects or connections that were created in the background.
- `hb_admin_table_disable()`: Disables an HBase table. Returns 0 on success or an error code. Only sets a flag in memory to say that the table is disabled.

**NOTE:** Tables never need to be disabled or enabled in HPE Ezmeral Data Fabric Database, which has no notion of disabling or enabling tables. However, applications ported from HBase to HPE Ezmeral Data Fabric Database will attempt to disable and enable tables. By placing a flag in memory, HPE Ezmeral Data Fabric Database allows those applications to proceed without error when performing admin functions on tables.

- `hb_admin_table_enable()`: Enables an HBase table. Returns 0 on success or an error code. As with `hb_admin_table_disable`, this function sets a flag in memory and performs no other operation.
- `hb_admin_table_enabled()`: Checks whether an HBase table is enabled. Returns 0 if the table is enabled. If the table is disabled, returns either the error message `HBASE_TABLE_DISABLED` or an error code, if an error occurs. In HPE Ezmeral Data Fabric Database, this API only checks for the existence of an in-memory flag that indicates whether to consider a table as disabled or enabled.
- `hb_admin_table_exists()`: Checks whether a table exists. Returns 0 on success or an error code.

APIs defined in the header file `coldesc.h`.

- `hb_coldesc_create()`: Creates a column-family descriptor. Returns a handle to an `hb_columndesc` object or NULL, if unsuccessful.
- `hb_coldesc_set_maxversions()`: Sets the maximum number of cell versions to be retained for the column family. The default is 3.
- `hb_coldesc_set_minversions()`: Sets the minimum number of cell versions to be retained for the column family. The default is 0.
- `hb_coldesc_set_ttl()`: Sets the time-to-live value in seconds for data in column cells. The default is forever.

- `hb_coldesc_set_inmemory()`: Boolean. Determines whether preference is given to values of this column family for storage with row keys. Because row keys are cached in memory in preference to row data, column-family data that is stored inline with the row keys is also cached in memory.

For all column families in a table together, up to 200 bytes of row data will be stored inline with each row key. Storing data inline with a row key might speed retrieval of the data from a column family because disk access can often be avoided. For each column family, up to 32 bytes can be stored inline with each row key even if its `inmemory` parameter is set to `false`, but preference will be given to column families where this parameter is set to `true`. A column family can have more than 32 bytes stored inline if its `inmemory` parameter is set to `true`.

If the total number of bytes for all column families together exceeds 200 for a row, then preference for inclusion within the inline storage for that row is given to column families that have the `inmemory` parameter set to `true`. All of the data for a column family will be stored in-line with the row key, or none will be. If the contents in a column family for a particular row are larger than the maximum number of bytes that are allowed to be stored for that column family, no data at all will be stored in-line for that column family.

The default value for the `inmemory` parameter is `false`.

- `hb_coldesc_destroy()`: Releases resources that are held by a column-family descriptor.

### Sequence of steps in the `ensureTable` function

1. Create an admin handle from the connection.
2. Using the admin handle, check whether the specified table exists.
3. If the table exists, delete it.
4. Specify columns and column families for the table.
5. Create the table.
6. Check whether the table is enabled. If it isn't enabled, enable it.
7. Disable the table and then enable it again.
8. Destroy the column descriptors.
9. Destroy the `hb_admin` structure.

### Code for the `ensureTable` function at line 325

```
static int
ensureTable(hb_connection_t connection, const char *table_name) {
    int32_t retCode = 0;
    hb_admin_t admin = NULL;

    if ((retCode = hb_admin_create(connection, &admin)) != 0) {
        HBASE_LOG_ERROR("Could not create HBase admin : errorCode = %d.",
retCode);
        goto cleanup;
    }

    if ((retCode = hb_admin_table_exists(admin, NULL, table_name)) == 0) {
        HBASE_LOG_INFO("Table '%s' exists, deleting...", table_name);
        if ((retCode = hb_admin_table_delete(admin, NULL, table_name)) != 0) {
            HBASE_LOG_ERROR("Could not delete table %s[%d].", table_name,
retCode);
        }
    }
}
```

```

        goto cleanup;
    }
} else if (retCode != ENOENT) {
    HBASE_LOG_ERROR("Error while checking if the table exists: errorCode =
%d.", retCode);
    goto cleanup;
}

hb_coldesc_create(FAMILIES[0], 1, &HCD[0]);
hb_coldesc_set_maxversions(HCD[0], 2);
hb_coldesc_set_minversions(HCD[0], 1);
hb_coldesc_set_ttl(HCD[0], 2147480000);
hb_coldesc_set_inmemory(HCD[0], 1);

hb_coldesc_create(FAMILIES[1], 1, &HCD[1]);

HBASE_LOG_INFO("Creating table '%s'...", table_name);
if ((retCode = hb_admin_table_create(admin, NULL, table_name, HCD, 2)) ==
0) {
    HBASE_LOG_INFO("Table '%s' created, verifying if enabled.", table_name);
    retCode = hb_admin_table_enabled(admin, NULL, table_name);
    CHECK_API_ERROR(retCode,
        "Table '%s' is %senabled, result %d.", table_name, retCode?"not
":"");
    retCode = hb_admin_table_disable(admin, NULL, table_name);
    CHECK_API_ERROR(retCode,
        "Attempted to disable table '%s', result %d.", table_name);
    retCode = hb_admin_table_disable(admin, NULL, table_name);
    CHECK_API_ERROR(retCode,
        "Attempted to disable table '%s' again, result %d.", table_name);
    retCode = hb_admin_table_enable(admin, NULL, table_name);
    CHECK_API_ERROR(retCode,
        "Attempted to enable table '%s', result %d.", table_name);
    retCode = hb_admin_table_enable(admin, NULL, table_name);
    CHECK_API_ERROR(retCode,
        "Attempted to enable table '%s' again, result %d.", table_name);
}
hb_coldesc_destroy(HCD[0]);
hb_coldesc_destroy(HCD[1]);

cleanup:
if (admin) {
    hb_admin_destroy(admin, NULL, NULL);
}
return retCode;
}

```

### Code to call the ensureTable function

```

if ((retCode = ensureTable(connection, table_name)) != 0) {
    HBASE_LOG_ERROR("Failed to ensure table %s : errorCode = %d", table_name,
retCode);
    goto cleanup;
}

```

*Create a client***API used**

`hb_client_create()`: Initializes a handle to `hb_client_t` object that can be passed to other APIs. You need to use this method only once per cluster. The returned handle is thread-safe. This API is defined in the `client.h` header file.

**Code**

```
if ((retCode = hb_client_create(connection, &client)) != 0) {
    HBASE_LOG_ERROR("Could not connect to HBase cluster : errorCode = %d.",
retCode);
    goto cleanup;
}
```

*Asynchronously put ten rows of one cell each*

**APIs used in this operation**

The first 6 APIs are defined in the header file `mutations.h`:

- `hb_put_create()`: Creates a structure for the put operation and returns its handle.
- `hb_mutation_set_table()`: Sets the name of the table for the put operation.
- `hb_mutation_set_bufferable()`: Sets whether or not the RPC call for the put operation can be buffered on the client side.
- `hb_put_add_cell()`: Adds a cell to the put structure. The row key of the cell must be the same as the row key of the put structure.
- `hb_mutation_send()`: Queues the put operation for sending to the server. Mutations are not performed atomically and can be batched in a non-deterministic way on either the client side or the server side. Any buffer attached to a mutation object (put or delete) must not be altered until the callback has been received.

The last API is defined in the header file `client.h`:

- `hb_client_flush()`: Flushes any buffered client-side write operations to the server. The callback is invoked after everything that was buffered at the time of the call is flushed. Invocation of the callback is a guarantee that all outstanding RPC calls are complete.

**Sequence of steps in this code extract**

1. Create a row object named `row_data`.
2. Create a put object.
3. Specify the name of the table.
4. Set whether or not the RPC call for the put operation can be buffered on the client side.
5. Create cell data.
6. Create a cell.
7. Add the cell to the row.

8. Queue the put.
9. After following the steps above 10 times, flush the puts to the server.
10. Wait for the RPC calls to complete.

#### Code

```
// let's send a batch of 10 puts with single cell asynchronously
outstanding_puts_count += num_puts;
for (int i = 0; i < num_puts; ++i) {
    row_data_t *row_data = (row_data_t *) calloc(1, sizeof(row_data_t));
    row_data->key = bytearray_printf("%s%02d", rowkey_prefix, i);
    hb_put_create(row_data->key->buffer, row_data->key->length, &put);
    hb_mutation_set_table(put, table_name, table_name_len);
    hb_mutation_set_durability(put, DURABILITY_SKIP_WAL);
    hb_mutation_set_bufferable(put, false);

    cell_data_t *cell_data = new_cell_data();
    row_data->first_cell = cell_data;
    cell_data->value = bytearray_printf("%s%02d", value_prefix, i);

    hb_cell_t *cell = (hb_cell_t*) calloc(1, sizeof(hb_cell_t));
    cell_data->hb_cell = cell;

    cell->row = row_data->key->buffer;
    cell->row_len = row_data->key->length;
    cell->family = FAMILIES[rand() % 2];
    cell->family_len = 1;
    cell->qualifier = column_a->buffer;
    cell->qualifier_len = column_a->length;
    cell->value = cell_data->value->buffer;
    cell->value_len = cell_data->value->length;
    cell->ts = HBASE_LATEST_TIMESTAMP;

    hb_put_add_cell(put, cell);
    HBASE_LOG_INFO("Sending row with row key : '%.*s'.",
                  cell->row_len, cell->row);
    hb_mutation_send(client, put, put_callback, row_data);
}
hb_client_flush(client, client_flush_callback, NULL);
wait_for_flush();

wait_for_puts(); // outside the loop, wait for 10 puts to complete
```

#### *Asynchronously put two cells in a single row*

#### *APIs used*

These APIs are defined in the header file `mutations.h`:

- `hb_put_create()`: Creates a structure for the put operation and returns its handle.
- `hb_mutation_set_table()`: Sets the table name for the mutation.
- `hb_put_add_cell()`: Adds a cell to the put structure. The row key of the cell must be the same as the row key of the put structure.
- `hb_mutation_send()`: Queues the put operation for sending to the server. Mutations are not performed atomically and can be batched in a non-deterministic way on either the client side or the server side. Any buffer attached to a mutation object (put or delete) must not be altered until the callback has been received.

**Sequence of steps**

1. Create a row object named `row_data`.
2. Create a put object.
3. Specify the name of the table.
4. Create cell data for the first cell.
5. Create the first cell.
6. Add the data to the first cell.
7. Add the first cell to the row.
8. Create cell data for the second cell.
9. Create the second cell.
10. Add the data to the second cell.
11. Add the second cell to the row.
12. Queue the put.
13. Wait 3 seconds, flush the queue, and wait for the RPC calls to complete.

`wait_for_puts()` without `hb_client_flush()`: Waits for all outstanding put requests to be flushed. If `hb_client_flush()` is not called before `wait_for_puts()`, it can take up to three seconds for outstanding put requests to be flushed.

**Code**

```
// now, let's put two cells in a single row
outstanding_puts_count++;
{
    row_data_t *row_data = (row_data_t *) calloc(1, sizeof(row_data_t));
    row_data->key = bytebuffer_printf("row_with_two_cells");
    hb_put_create(row_data->key->buffer, row_data->key->length, &put);
    hb_mutation_set_table(put, table_name, table_name_len);
    hb_mutation_set_durability(put, DURABILITY_SYNC_WAL);

    // first cell
    cell_data_t *cell1_data = new_cell_data();
    row_data->first_cell = cell1_data;
    cell1_data->value = bytebuffer_printf("cell1_value_v1");

    hb_cell_t *cell1 = (hb_cell_t*) calloc(1, sizeof(hb_cell_t));
    cell1_data->hb_cell = cell1;

    cell1->row = row_data->key->buffer;
    cell1->row_len = row_data->key->length;
    cell1->family = FAMILIES[0];
    cell1->family_len = 1;
    cell1->qualifier = column_a->buffer;
    cell1->qualifier_len = column_a->length;
    cell1->value = cell1_data->value->buffer;
    cell1->value_len = cell1_data->value->length;
    cell1->ts = 1391111111111L;
    hb_put_add_cell(put, cell1);
}
```

```

// second cell
cell_data_t *cell2_data = new_cell_data();
cell1_data->next_cell = cell2_data;
cell2_data->value = bytebuffer_printf("cell2_value_v1");

hb_cell_t *cell2 = (hb_cell_t*) calloc(1, sizeof(hb_cell_t));
cell2_data->hb_cell = cell2;

cell2->row = row_data->key->buffer;
cell2->row_len = row_data->key->length;
cell2->family = FAMILIES[1];
cell2->family_len = 1;
cell2->qualifier = column_b->buffer;
cell2->qualifier_len = column_b->length;
cell2->value = cell2_data->value->buffer;
cell2->value_len = cell2_data->value->length;
cell2->ts = 1391111111111L;
hb_put_add_cell(put, cell2);

HBASE_LOG_INFO("Sending row with row key : '%.*s'.",
               cell1->row_len, cell1->row);
hb_mutation_send(client, put, put_callback, row_data);
wait_for_puts();
}

```

*Asynchronously put a second version in one column of one row*

### APIs used

These APIs are defined in the header file mutations.h:

- `hb_put_create()`: Creates a structure for the put operation and returns its handle.
- `hb_mutation_set_table()`: Sets the table name for the mutation.
- `hb_put_add_cell()`: Adds a cell to the put structure. The row key of the cell must be the same as the row key of the put structure.
- `hb_mutation_send()`: Queues the put operation for sending to the server. Mutations are not performed atomically and can be batched in a non-deterministic way on either the client side or the server side. Any buffer attached to a mutation object (put or delete) must not be altered until the callback has been received.

### Sequence of steps

1. Create a row object named `row_data`.
2. Create a put object.
3. Specify the name of the table.
4. Create cell data for the first cell.
5. Create the first cell.
6. Add the data to the cell, using a later timestamp than in the previous operation.
7. Add the first cell to the row.
8. Queue the put.

9. Wait 3 seconds, flush the queue, and wait for the RPC calls to complete.

### Code

```
// now, let's put second version in one column
outstanding_puts_count++;
{
    row_data_t *row_data = (row_data_t *) calloc(1, sizeof(row_data_t));
    row_data->key = bytebuffer_printf("row_with_two_cells");
    hb_put_create(row_data->key->buffer, row_data->key->length, &put);
    hb_mutation_set_table(put, table_name, table_name_len);
    hb_mutation_set_durability(put, DURABILITY_SYNC_WAL);

    // first cell
    cell_data_t *cell_data = new_cell_data();
    row_data->first_cell = cell_data;
    cell_data->value = bytebuffer_printf("cell_value_v2");

    hb_cell_t *cell = (hb_cell_t*) calloc(1, sizeof(hb_cell_t));
    cell_data->hb_cell = cell;

    cell->row = row_data->key->buffer;
    cell->row_len = row_data->key->length;
    cell->family = FAMILIES[0];
    cell->family_len = 1;
    cell->qualifier = column_a->buffer;
    cell->qualifier_len = column_a->length;
    cell->value = cell_data->value->buffer;
    cell->value_len = cell_data->value->length;
    cell->ts = 139222222222L;
    hb_put_add_cell(put, cell);

    HBASE_LOG_INFO("Sending row with row key : '%.*s'.",
                  cell->row_len, cell->row);
    hb_mutation_send(client, put, put_callback, row_data);
    wait_for_puts();
}
```

*Scan the entire table*

### APIs used

These APIs and more are defined in the header file `scanner.h`:

- `hb_scanner_create()`: Creates a client side row scanner. The returned scanner is not thread safe. No RPC will be invoked until the call to fetch the next set of rows is made. You can set the various attributes of this scanner until that point. @returns 0 on success, non-zero error code in case of failure.
- `hb_scanner_next()`: Request the next set of results from the server. You can set the maximum number of rows returned by this call using `hb_scanner_set_num_max_rows()`.
- `hb_scanner_num_max_rows()`: Sets the maximum number of rows to scan per call to `hb_scanner_next()`.
- `hb_scanner_num_versions()`: Sets the maximum versions of a column to fetch.
- `hb_scanner_set_table()`: Sets the name of the table to scan.

### Sequence of steps

1. Create the scanner object.

2. Set the name of the table to scan.
3. Set the number of rows to scan at a time.
4. Set the number of versions to scan.
5. Request the next set of results from the server.
6. `wait_for_scan()`: wait for the rpc call to complete.

### Code

```
// now, scan the entire table
{
    hb_scanner_t scanner = NULL;
    hb_scanner_create(client, &scanner);
    hb_scanner_set_table(scanner, table_name, table_name_len);
    hb_scanner_set_num_max_rows(scanner, 3); // maximum 3 rows at a time
    hb_scanner_set_num_versions(scanner, 10); // up to 10 versions of the
cell
    hb_scanner_next(scanner, scan_callback, NULL); // dispatch the call
    wait_for_scan();
}
```

*Fetch a row that has two cells*

### APIs used

- `hb_get_add_column()`: Adds a column family and optionally a column qualifier to an `hb_get_t` object.
- `hb_get_create()`: Creates an `hb_get_t` object and populates the handle `get_ptr`.
- `hb_get_send()`: Queues the get request. The callback specified by `cb` is called on completion. Any buffers attached to the get object can be reclaimed only after the callback is received.
- `hb_get_set_num_versions()`: Sets maximum number of latest values of each column to be fetched. This API is optional.
- `hb_get_set_table()`: Sets the name of the table to get data from.

### Sequence of steps

1. Create a row object named `rowKey`.
2. Create a get object.
3. Specify the column families and optional column qualifiers to get values from.
4. Specify the name of the table.
5. Specify the number of versions of the column values to get.
6. Queue the get request.
7. Wait for the get to complete.

**Code**

```
// fetch a row with row-key="row_with_two_cells"
{
  bytearray rowKey = bytearray_strcpy("row_with_two_cells");
  hb_get_t get = NULL;
  hb_get_create(rowKey->buffer, rowKey->length, &get);
  hb_get_add_column(get, FAMILIES[0], 1, NULL, 0);
  hb_get_add_column(get, FAMILIES[1], 1, NULL, 0);
  hb_get_set_table(get, table_name, table_name_len);
  hb_get_set_num_versions(get, 10); // up to ten versions of each column
  get_done = false;
  hb_get_send(client, get, get_callback, rowKey);
  wait_for_get();
}
```

*Delete a specific version of a column in the row that was fetched*

**APIs used**

The APIs that are used are defined in the header file `mutations.h`.

- `hb_delete_add_column()`: Set the column criteria for `hb_delete_t` object. Set the qualifier to `NULL` to delete all columns of a family. Only the cells with timestamp less than or equal to the specified timestamp are deleted. Set the timestamp to `INT64_MAX` to delete all versions of the column. This API is optional for deletes.
- `hb_delete_create()`: Creates a structure for delete operation and return its handle.
- `hb_mutation_set_table()`: Sets the table name for the mutation.
- `hb_mutation_send()`: Queues the put operation for sending to the server. Mutations are not performed atomically and can be batched in a non-deterministic way on either the client side or the server side. Any buffer attached to a mutation object (put or delete) must not be altered until the callback has been received.

**Sequence of steps**

1. Create a delete object for a row with a particular row key.
2. Add a column to the delete object.
3. Specify the name of the table from which to delete the cell version.
4. Queue the delete.
5. Wait three seconds for the delete to be flushed, then wait for the RPC call to complete.

**Code**

```
// delete a specific version of a column
{
  bytearray rowKey = bytearray_strcpy("row_with_two_cells");
  hb_delete_t del = NULL;
  hb_delete_create(rowKey->buffer, rowKey->length, &del);
  hb_delete_add_column(del, FAMILIES[0], 1,
    column_a->buffer, column_a->length, 1391111111112L);
  hb_mutation_set_table(del, table_name, table_name_len);
  delete_done = false;
  hb_mutation_send(client, del, delete_callback, rowKey);
}
```

```
wait_for_delete();
}
```

*Destroy the client and the connection*

### APIs used

- `hb_client_destroy()`: Cleans up `hb_client_t` handle and releases any held resources. The callback is called after the connections are closed, but just before the client is freed. This API is defined in the header file `client.h`.
- `hb_connection_destroy()`: Destroys the connection and frees all resources allocated at creation time. This API is defined in the header file `connection.h`.

### Sequence of steps

1. Destroy the client.
2. Destroy the connection.

### Code

```
if (client) {
    HBASE_LOG_INFO("Disconnecting client.");
    hb_client_destroy(client, client_disconnection_callback, NULL);
    wait_client_disconnection();
}
if (connection) {
    hb_connection_destroy(connection);
}
```

## Building and Launching C Applications

This topic describes basic setup for building and launching C application using the `libMapRClient` C API library

### Prerequisites

The HPE Ezmeral Data Fabric Database `libMapRClient` C API library is Data Fabric's extension of the `libhbase` C API library). The `libMapRClient` header files are in this directory: **`/opt/mapr/include/hbase`**

- Verify that the `mapr-client` package is installed on the node. The `mapr-client` package must be installed on each node that builds an application. The `libMapRClient` header files are in this directory: `/opt/mapr/include/hbase`.
- Verify that both the `libMapRClient` library and `libjvm` shared libraries are in the application's library search path.

### Building Applications

When building applications that use `libMapRClient`, run this command:

```
gcc -o <application_name> <source_file> -I/opt/mapr/include/hbase -L/opt/mapr/lib/ -lMapRClient -L/usr/lib/jvm/java-7-sun/jre/lib/amd64/server -ljvm
```

For example, the following command builds the `hello_hbase` application with the `hello_hbase.c` source code:

```
gcc -o hello_hbase hello_hbase.c -I/opt/mapr/include/hbase -L/opt/mapr/lib/ -lMapRClient -L/usr/lib/jvm/java-7-sun/jre/lib/amd64/server -ljvm
```

#### NOTE:

- The compiled `libMapRClient` is statically linked to the following third-party libraries: Crypto++: `libcryptoapp.a` (v5.6.2)Protobuf: `libprotobuf-lite.a` (v2.5.0)
- The `libMapRClient` library has dependencies on `libjvm`, though a JVM is not instantiated. In general, the `libjvm` library is located within the JDK/JRE installation directory.

## Launching Applications

Before launching an application, set this value for the environment variable `LD_LIBRARY_PATH`:

```
/opt/mapr/lib:/usr/lib/jvm/java-6-openjdk-amd64/jre/lib/amd64/server
```

If the client is on Windows, append the following directories to the `PATH` environment variable:

- `$MAPR_HOME/lib`
- `$JAVA_HOME/bin/server`

If the application uses the `hb_connection_create_as_user` API for impersonation, set the `MAPR_IMPERSONATION_ENABLED` environment variable to `true`.

## What To Do Next

Launch the application!

### HBase Java Filters Support

The `hb_get_set_filter()` and `hb_scanner_set_filter()` C APIs are used to filter the results of GET and SCAN operations. These APIs are in the `get.h` and `scanner.h` header files.

They both take filters that are passed as strings, as well as the length of these strings. HPE Ezmeral Data Fabric Database parses the strings to construct filters.

Their signatures are:

```
int32_t hb_get_set_filter(hb_get_t get, const byte_t *filter, const int32_t filterLen);
int32_t hb_scanner_set_filter(hb_scanner_t scanner, const byte_t *filter, const int32_t filterLen);
```

For examples, see [Filtering GET Operation Results Example](#) on page 3245 and [Filtering SCAN Operation Results Example](#) on page 3244.

### Filter Format and Arguments

Filters are specified in the Thrift Filter Language and are in this format: `FilterName (argument, argument, ... , argument)`. Arguments that represent strings are enclosed in single quotation marks (`'`). Arguments that represent booleans, integers, or comparison operators (`<`, `<=`, `=`, `!=`, `>`, `>=`) are not enclosed in single quotation marks.

## Binary Operators

You can combine filters by using the binary operators `AND` and `OR`. For example, `PrefixFilter ('Row') AND PageFilter (1) AND FirstKeyOnlyFilter ()` returns all key-value pairs that match the following conditions:

- The row containing the key-value must start with the prefix "Row".
- The key-value must be located in the first row of the table.
- The key-value must be the first key-value pair in the row.

For another example, `(RowFilter (=, 'binary:Row 1') AND TimeStampsFilter (74689, 89734)) OR ColumnRangeFilter ('abc', true, 'xyz', false))` returns all key-value pairs that

Match both of the following conditions:

- The key-value is in a row for which the row key is "Row 1".
- The key-value has a timestamp of either 74689 or 89734.

Or match this condition:

- The key-value is located in a column that is lexicographically greater than or equal to "abc" and less than "xyz".

## Unary Operators

You can also use the following unary operators with filters:

- `SKIP`

For a particular row, if any of the key-values don't pass the filter condition, the entire row is skipped. For example, `SKIP ValueFilter (0)` omits rows in which any values are not 0.

- `WHILE`

Rows are tested in order against the filter condition. Rows that meet the condition are included in the result set. When a row fails to meet the condition, filter processing stops and no more rows are tested.

### *Evaluation of Filters*

When filters are combined with the binary operators, unary operators, or both, they are evaluated according to these rules:

1. First, evaluate the contents of parentheses.
2. Next, evaluate filters that use unary operators. Both `SKIP` and `WHILE` operators have the same precedence.
3. Finally, evaluate filters that use the binary operators. `AND` has higher precedence than `OR`.

For example, in a filter of the form `Filter1 AND Filter2 OR Filter3`, `Filter1 AND Filter2` is evaluated and the result is `X`. Then, `X OR Filter3` is evaluated.

For another example, a filter of the form `Filter1 AND SKIP Filter2 OR Filter3` is evaluated in these steps:

1. Evaluate `SKIP Filter2` with the result being `X`.
2. Evaluate `Filter1 AND X` with the result being `Y`.
3. Evaluate `Y OR Filter3`.

### Compare Operators and Comparators

This topic describes the compare operators and comparators for comparison filters.

The comparison filters `DependentColumnFilter`, `FamilyFilter`, `QualifierFilter`, `RowFilter`, and `ValueFilter` use the following syntax:

```
filter(<compareOperator>, <comparatorType:Value>)
```

### Compare Operators

The following compare operators are supported: `<`, `<=`, `=`, `!=`, `>`, `>=`

### Comparators

There are four comparators:

Comparator	Description
BinaryComparator	This comparator lexicographically compares against the specified byte array . Values are byte arrays. For example, <code>binary:abc</code> matches values that are lexicographically greater than "abc".
BinaryPrefixComparator	This comparator lexicographically compares against a specified byte array. It only compares up to the length of this byte array. Values are byte arrays. For example, <code>binaryprefix:abc</code> matches values in which the first 3 characters are lexicographically equal to "abc"
RegexStringComparator	This comparator compares against the specified byte array using the given regular expression. You can use only the <code>=</code> and <code>!=</code> compare operators with this comparator. Values are regular expressions. For example, <code>regexstring:ab*yz</code> matches values that begin with "ab" and end with "yz".
SubStringComparator	This comparator tests whether the given substring appears in a specified byte array. The comparison is case insensitive. You can use only the <code>=</code> and <code>!=</code> compare operators with this comparator. Values are strings. For example, <code>substring:abc123</code> matches values that contains the substring "abc123".

### Supported Filters

Filter	Format	Description
ColumnCountGetFilter	<code>ColumnCountGetFilter(x)</code>	Returns the first x columns in a row. Used for GET operations.

Filter	Format	Description
ColumnPaginationFilter	<code>ColumnPaginationFilter(x,y)</code>	Returns the first x columns after the number y of columns that is specified for the offset.
ColumnPrefixFilter	<code>ColumnPrefixFilter('prefix')</code>	Returns only those key-values in columns that have names that start with the specified prefix. The column prefix must be of the form "qualifier".
ColumnRangeFilter	<code>ColumnRangFilter('minColumn', 'maxColumn', boolean, boolean)</code>	<p>Returns only those key-values that are in columns that have names between minColumn and maxColumn.</p> <p>For example, if minColumn is 'an', and maxColumn is 'be', the filter returns key-values from columns named 'ana', 'bad', but not from columns named 'bed' or 'eye'. If minColumn is null, there is no lower bound. If maxColumn is null, there is no upper bound.</p> <p>This filter also takes two boolean variables to indicate whether to include the minColumn and maxColumn.</p>
DependentColumnFilter	<code>DependentColumnFilter('family', 'qualifier')</code>	Tries to locate the specified column in each row and returns all key-values that have the same timestamp in that column. If a row does not contain the specified column, none of the key-values in that row are returned.
FamilyFilter	<code>FamilyFilter(compareOperator, 'comparator:value')</code>	Filters by column family. If the comparison returns true, the filter returns all of the key-values in the matching column family.
FirstKeyOnlyFilter	<code>FirstKeyOnlyFilter()</code>	Returns the first key-value from each row.
FirstKeyValueMatchingQualifiersFilter	<code>FirstKeyValueMatchingQualifier('qualifier_1', 'qualifier_2', ... 'qualifier_n')</code>	Serially compares each qualifier in a row with the given qualifiers. If the current qualifier matches any of the given qualifiers, the filter stops and includes the current row (up to the current qualifier) in the result set.

Filter	Format	Description
FuzzyRowFilter	<code>FuzzyRowFilter('rowkey', 'fuzzy_info')</code>	<p>Filters data based on fuzzy row key. Performs fast-forwards during scanning. It takes pairs (row key, fuzzy info) to match row keys. Where fuzzy info is a byte array with 0 or 1 as its values:</p> <p>0 - means that this byte in provided row key is fixed, i.e. row key's byte at same position must match</p> <p>1 - means that this byte in provided row key is NOT fixed, i.e. row key's byte at this position can be different from the one in provided row key</p> <p>Example: Let's assume row key format is <code>userId_actionId_year_month</code>. Length of <code>userId</code> is fixed and is 4, length of <code>actionId</code> is 2 and year and month are 4 and 2 bytes long respectively. Let's assume that we need to fetch all users that performed certain action (encoded as "99") in Jan of any year. Then the pair (row key, fuzzy info) would be the following: row key = <code>"????_99_????_01"</code> (one can use any value instead of "?") fuzzy info = <code>"\x01\x01\x01\x01\x00\x00\x00\x00\x01\x01\x01\x01\x00\x00\x00"</code> i.e. fuzzy info tells the matching mask is <code>"????_99_????_01"</code>, where at ? can be any value.</p>
InclusiveStopFilter	<code>InclusiveStopFilter('rowKey')</code>	Returns all key-values that are in the rows up to and including the specified row that has the specified row key.
KeyOnlyFilter	<code>KeyOnlyFilter()</code>	Returns the key component of each key-value.
MultipleColumnPrefixFilter	<code>MultipleColumnPrefixFilter('prefix_1', 'prefix_2', ..., 'prefix_n')</code>	Returns the key-values from columns that have names that begin with any of the specified prefixes.
PageFilter	<code>PageFilter(pageSize)</code>	Returns the number of rows that is equivalent to the specified page size..
PrefixFilter	<code>PrefixFilter('rowKey_prefix')</code>	Returns the key-values from a row that has a key which starts with the specified row-key prefix.
QualifierFilter	<code>QualifierFilter(compareOperator, 'comparator:value')</code>	Filters by column. If the comparison returns true, the filter returns all of the key-values in the matching column.
RandomRowFilter	<code>RandomRowFilter(probability)</code>	Filters by probability. For example, <code>RandomRowFilter(0.25)</code> means that there is a 1 in 4 chance that the filter will pick the first row, a 1 in 4 chance that the filter will pick the next row, and so on until all rows in the table have been processed in this way.

Filter	Format	Description
RowFilter	<code>RowFilter(compareOperator, 'comparator:value')</code>	Filters by row key. If the comparison returns true, the filter returns all of the key-values in the matching row.
SingleColumnValueExcludeFilter	<code>SingleColumnValueExcludeFilter('columnFamily', 'qualifier', compareOperator, 'comparator:value')</code>	This filter takes the same arguments and behaves the same as <code>SingleColumnValueFilter</code> : however, if the column is found and the condition passes, all of the columns of the row will be returned except for the tested column value.
SingleColumnValueFilter	<code>SingleColumnValueFilter('columnFamily', 'qualifier', compareOperator, 'comparator:value')</code>	This filter takes a column family, a qualifier, a compare operator and a comparator. If the specified column is not found: all of the columns of that row will be emitted. If the column is found and the comparison with the comparator returns true, all of the columns of the row will be emitted. If the condition fails, the row will not be returned.
SkipFilter	<code>SKIP filter</code>	<a href="#">See the description of the SKIP unary operator above</a> .
TimeStampsFilter	<code>TimeStampsFilter('timestamp_1', 'timestamp_2', ..., 'timestamp_n')</code>	Returns the key-values that have timestamps that match any of the specified timestamps.
ValueFilter	<code>ValueFilter(compareOperator, 'comparator:value')</code>	Filters by key-value. If the comparison returns true, the filter returns the matching key-value.
WhileMatchFilter	<code>WHILE filter</code>	<a href="#">See the description of the WHILE unary operator above</a> .

### Creating Java Apps - Binary Tables

This topic describes the supported Apache HBase Java APIs used for CRUD operations on HPE Ezmeral Data Fabric Database [binary tables](#).

HPE Ezmeral Data Fabric Database supports all of the Apache HBase 1.0 Java APIs, except where noted in this documentation. For a number of critical Java APIs, for filters, and for comparators, this documentation explicitly lists what is supported, rather than what is not supported.

Code written for Apache HBase can be easily ported to use HPE Ezmeral Data Fabric Database binary tables.

HPE Ezmeral Data Fabric Database binary tables do not support low-level HBase API calls that are used to manipulate the state of an Apache HBase cluster. HBase API calls that are not supported by HPE Ezmeral Data Fabric Database tables report successful completion to allow legacy code written for Apache HBase to continue executing, but do not perform any actual operations.

**NOTE:** For the list of supported HBase v0.98 APIs, refer to the [HBase Java API Support](#) on page 3269.

### Compiling and Running HPE Ezmeral Data Fabric Database Binary Applications

For applications that use the HPE Ezmeral Data Fabric Database Java API for binary tables, use Maven to compile and determine the application's dependencies. Then, when you run the application, specify those dependencies in the application's classpath.

## Compile and Determine Dependencies

1. Add the Data Fabric maven repository to the list of repositories in your application's `pom.xml`, if it is not there already:

```
<repository>
  <id>mapr-releases</id>
  <url>https://repository.mapr.com/maven/</url>
  <snapshots><enabled>true</enabled></snapshots>
  <releases><enabled>true</enabled></releases>
</repository>
```

For more information, see [Maven Artifacts for the HPE Ezmeral Data Fabric](#) on page 4759.

2. Add a dependency to the HBase client project:

```
<dependencies>
<dependency>
  <groupId>org.apache.hbase</groupId>
  <artifactId>hbase-client</artifactId>
  <version><version selected from the repository></version>
</dependency>
</dependencies>
```

### NOTE:

- The `hbase-client` version mentioned above is an example. The actual version that your application requires is based on the current EEP and Data Fabric core version that you are running. The file versions are listed in the following location: <https://repository.mapr.com/nexus/content/groups/mapr-public/org/apache/hbase/hbase-client/> Ensure that the version tags include reference to `m7-<maprversion>`. Otherwise, your applications will not be able to access HPE Ezmeral Data Fabric Database binary tables.
- If your application uses both the HPE Ezmeral Data Fabric Database JSON and HPE Ezmeral Data Fabric Database Binary APIs, you may encounter a conflict in the `netty` library used by each API. To avoid this, exclude the `netty` library from your `hbase-client` dependency as follows:

```
<dependency>
  <groupId>org.apache.hbase</groupId>
  <artifactId>hbase-client</artifactId>
  <version><version selected from the repository></version>
  <exclusions>
    <exclusion>
      <artifactId>netty-all</artifactId>
      <groupId>io.netty</groupId>
    </exclusion>
  </exclusions>
</dependency>
```

3. Use Maven to compile the application and resolve dependencies. For example, you can run `mvn clean package`.

## Running Applications

When you develop a Java application, you can use a dependency management tool such as Maven to compile your application. However, it is recommended that you do the following instead:

1. Compile the Java application without including dependencies
2. Specify the required classpath when you submit the application to the cluster

If you choose to bundle the JAR file, and there is a mismatch between the bundled JAR file and the version that your Data Fabric cluster expects, this can result in failures. The failures differ depending on the version of Data Fabric you are using. For more information, see [Using the File System JAR to Connect to the Cluster](#) on page 3155.

If the cluster is secure, the node must also have a Data Fabric ticket configured for the user that runs the application. See [Managing Tickets](#) on page 1822.

You can use the following command to launch HPE Ezmeral Data Fabric Database binary applications:

```
java -cp <classpath>:. -Djava.library.path=/opt/mapr/lib <main class JAR>
<command line arguments>
```

**NOTE:** The classpath should include items that are part of the 'hbase classpath' script plus any other required dependencies.

## HBase Java API Support

This topic describes the methods in the Apache HBase Java API library that are supported for HPE Ezmeral Data Fabric Database tables.

### Admin Method Support

This topic lists the methods that the HPE Ezmeral Data Fabric Database supports in the HBase interface Admin.

The HPE Ezmeral Data Fabric Database tables support the following HBase methods, except where noted.

**abort**(String why, Throwable e)

*Modifier and Type:* void

*Purpose:* Aborts the server or client

*Supported:* No

**addColumn**(TableName tableName, HColumnDescriptor column)

*Modifier and Type:* void

*Purpose:* Adds a column to an existing table

*Supported:* Yes

**assign**(byte[] regionName)

*Modifier and Type:* void

*Purpose:* Assigns a region

*Supported:* No

**balancer**( )

*Modifier and Type:* boolean

*Purpose:* Invokes the balancer

**NOTE:** The HPE Ezmeral Data Fabric Database does not require balancing. Therefore, the method is ignored.

*Supported:* No

**cloneSnapshot**(byte[] snapshotName, TableName tableName)

*Modifier and Type:* void

*Purpose:* Creates a new table by cloning the snapshot content

*Supported:* No

<code>cloneSnapshot(String snapshotName, TableName tableName)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Creates a new table by cloning the snapshot content <i>Supported:</i> No
<code>close()</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Releases any resources held <i>Supported:</i> Yes
<code>closeRegion(byte[] regionname, String serverName)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Closes a region <i>Supported:</i> No
<code>closeRegion(ServerName sn, HRegionInfo hri)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Closes a region <i>Supported:</i> No
<code>closeRegion(String regionname, String serverName)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Closes a region <i>Supported:</i> No
<code>closeRegionWithEncodedRegionName(String encodedRegionName, String serverName)</code>	<i>Modifier and Type:</i> boolean <i>Purpose:</i> For expert administrators. <i>Supported:</i> No
<code>compact(TableName tableName, byte[] columnFamily)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Compacts a column family within a table <i>Supported:</i> No
<code>compact(TableName tableName)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Compacts a table <i>Supported:</i> No
<code>compactRegion(byte[] regionName, byte[] columnFamily)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Compacts a column family within a region <i>Supported:</i> No
<code>compactRegion(byte[] regionName)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Compacts an individual region <i>Supported:</i> No
<code>compactRegionServer(ServerName sn, boolean major)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Compacts all regions on the region server <i>Supported:</i> No
<code>coprocessorService()</code>	<i>Modifier and Type:</i> CoprocessorRpcChannel <i>Purpose:</i> Creates and returns a RpcChannel instance connected to the active master <i>Supported:</i> No
<code>coprocessorService(ServerName sn)</code>	<i>Modifier and Type:</i> CoprocessorRpcChannel <i>Purpose:</i> Creates and returns a RpcChannel instance connected to the active master <i>Supported:</i> No
<code>createNamespace(NamespaceDescriptor descriptor)</code>	<i>Modifier and Type:</i> void

	<i>Purpose:</i> Creates a new namespace
	<i>Supported:</i> No
<code>createTable(HTableDescriptor desc, byte[] startKey, byte[] endKey, int numRegions)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Creates a new table with the specified number of regions
	<i>Supported:</i> Yes
<code>createTable(HTableDescriptor desc, byte[][] splitKeys)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Creates a new table with an initial set of empty regions defined by the specified split keys
	<i>Supported:</i> Yes
<code>createTable(HTableDescriptor desc)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Creates a new table
	<i>Supported:</i> Yes
<code>createTableAsync(HTableDescriptor desc, byte[][] splitKeys)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Creates a new table but does not block and wait for it to come online
	 <b>NOTE:</b> The HPE Ezmeral Data Fabric Database treats this method as synchronous and returns null when the table is created.
	<i>Supported:</i> Yes
<code>deleteColumn(String tableName, String columnName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Deletes a column from a table
	<i>Supported:</i> Yes
<code>deleteColumn(TableName tableName, byte[] columnName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Deletes a column from a table
	<i>Supported:</i> Yes
<code>deleteNamespace(String name)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Deletes an existing namespace.
	<i>Supported:</i> No
<code>deleteSnapshot(byte[] snapshotName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Deletes an existing snapshot
	<i>Supported:</i> No
<code>deleteSnapshot(String snapshotName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Deletes an existing snapshot
	<i>Supported:</i> No
<code>deleteSnapshots(Pattern pattern)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Deletes existing snapshots whose names match the specified pattern
	<i>Supported:</i> No
<code>deleteSnapshots(String regex)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Deletes existing snapshots whose names match the specified pattern
	<i>Supported:</i> No
<code>deleteTable(String tableName)</code>	<i>Modifier and Type:</i> void

	<i>Purpose:</i> Deletes a table
	<i>Supported:</i> Yes
<code>deleteTable(byte[] tableName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Deletes a table
	<i>Supported:</i> Yes
<code>deleteTable(TableName tableName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Deletes a table
	<i>Supported:</i> Yes
<code>deleteTables(Pattern pattern)</code>	<i>Modifier and Type:</i> HTableDescriptor[]
	<i>Purpose:</i> Delete tables that match the passed-in pattern, and waits on completion
	<i>Supported:</i> Yes
<code>deleteTables(String regex)</code>	<i>Modifier and Type:</i> HTableDescriptor[]
	<i>Purpose:</i> Delete tables that match the passed-in regular expression, and waits on completion
	<i>Supported:</i> Yes
<code>disableTable (String tableName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Disables table, and waits for completion
	 <b>NOTE:</b> The HPE Ezmeral Data Fabric Database does not require disabling of tables. Therefore, although it supports these methods, it only flags the table as disabled, and does not perform any other operation.
	<i>Supported:</i> Yes
<code>disableTable(TableName tableName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Disables table, and waits for completion
	 <b>NOTE:</b> The HPE Ezmeral Data Fabric Database does not require disabling of tables. Therefore, although it supports these methods, it only flags the table as disabled, and does not perform any other operation.
	<i>Supported:</i> Yes
<code>disableTableAsync (String tableName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Disables the table, but does not block and wait for it be completely disabled
	<i>Supported:</i> Yes
<code>disableTableAsync(TableName tableName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Disables the table, but does not block and wait for it be completely disabled
	<i>Supported:</i> Yes
<code>disableTables(Pattern pattern)</code>	<i>Modifier and Type:</i> HTableDescriptor[]
	<i>Purpose:</i> Disables tables that match the passed-in pattern, and waits on completion
	<i>Supported:</i> Yes
<code>disableTables(String regex)</code>	<i>Modifier and Type:</i> HTableDescriptor[]

	<i>Purpose:</i> Disable tables that match the passed-in regular expression, and waits on completion
	<i>Supported:</i> Yes
<code>enableCatalogJanitor(boolean enable)</code>	<i>Modifier and Type:</i> boolean
	<i>Purpose:</i> Enables/Disables the catalog janitor
	<i>Supported:</i> No
<code>enableTable(String tableName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Enables a table
	 <b>NOTE:</b> The HPE Ezmeral Data Fabric Database does not require enabling of tables. Therefore, although it supports this method, it only flags the table as enabled, and does not perform any other operation.
	<i>Supported:</i> Yes
<code>enableTable(byte[] tableName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Enables a table
	 <b>NOTE:</b> The HPE Ezmeral Data Fabric Database does not require enabling of tables. Therefore, although it supports this method, it only flags the table as enabled, and does not perform any other operation.
	<i>Supported:</i> Yes
<code>enableTable(TableName tableName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Enables a table
	 <b>NOTE:</b> The HPE Ezmeral Data Fabric Database does not require enabling of tables. Therefore, although it supports this method, it only flags the table as enabled, and does not perform any other operation.
	<i>Supported:</i> Yes
<code>enableTableAsync (String tableName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Enables the table, but does not block and wait for it be completely enabled
	<i>Supported:</i> Yes
<code>enableTableAsync(TableName tableName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Enables the table, but does not block and wait for it be completely enabled
	<i>Supported:</i> Yes
<code>enableTables(Pattern pattern)</code>	<i>Modifier and Type:</i> HTableDescriptor[]
	<i>Purpose:</i> Enable tables that match the passed-in pattern, and waits on completion
	<i>Supported:</i> Yes
<code>enableTables(String regex)</code>	<i>Modifier and Type:</i> HTableDescriptor[]
	<i>Purpose:</i> Enable tables that match the passed-in regular expression. and waits on completion
	<i>Supported:</i> Yes
<code>execProcedure(String signature, String instance, Map&lt;String,String&gt; props)</code>	<i>Modifier and Type:</i> void

<code>execProcedureWithRet(String signature, String instance, Map&lt;String,String&gt; props)</code>	<p><i>Purpose:</i> Executes a distributed procedure on a cluster</p> <p><i>Supported:</i> No</p> <p><i>Modifier and Type:</i> &gt;byte[]</p> <p><i>Purpose:</i> Executes a distributed procedure on a cluster.</p> <p><i>Supported:</i> No</p>
<code>flush(TableName tableName)</code>	<p><i>Modifier and Type:</i> &gt;void</p> <p><i>Purpose:</i> Flushes a table</p> <p><i>Supported:</i> Yes</p>
<code>flush(byte[] tableNameOrRegionName)</code>	<p><i>Modifier and Type:</i> &gt;void</p> <p><i>Purpose:</i> Flushes a table</p> <p><i>Supported:</i> Yes</p>
<code>flush(String tableNameOrRegionName)</code>	<p><i>Modifier and Type:</i> &gt;void</p> <p><i>Purpose:</i> Flushes a table</p> <p><i>Supported:</i> Yes</p>
<code>flushRegion(byte[] regionName)</code>	<p><i>Modifier and Type:</i> &gt;void</p> <p><i>Purpose:</i> Flushes an individual region</p> <p><i>Supported:</i> Yes</p>
<code>getAlterStatus(byte[] tableName)</code>	<p><i>Modifier and Type:</i> Pair&lt;Integer, Integer&gt;</p> <p><i>Purpose:</i> Gets the status of the alter command - indicates the number of regions that have received the updated schema Asynchronous operation</p> <p> <b>NOTE:</b> The HPE Ezmeral Data Fabric Database always returns (0,0).</p> <p><i>Supported:</i> No</p>
<code>getAlterStatus(TableName tableName)</code>	<p><i>Modifier and Type:</i> Pair&lt;Integer, Integer&gt;</p> <p><i>Purpose:</i> Gets the status of the alter command - indicates the number of regions that have received the updated schema Asynchronous operation</p> <p> <b>NOTE:</b> The HPE Ezmeral Data Fabric Database always returns (0,0).</p> <p><i>Supported:</i> No</p>
<code>getClusterStatus()</code>	<p><i>Modifier and Type:</i> ClusterStatus</p> <p><i>Purpose:</i> Gets the status of the cluster</p> <p><i>Supported:</i> No</p>
<code>getCompactionState(String tableNameOrRegionName)</code>	<p><i>Modifier and Type:</i> CompactionState</p> <p><i>Purpose:</i> Get the current compaction state of a table</p> <p><i>Supported:</i> No</p>
<code>getCompactionState(TableName tableName)</code>	<p><i>Modifier and Type:</i> org.apache.hadoop.hbase.protobuf.generated.AdminProtos.GetRegionInfoResponse.CompactionState</p> <p><i>Purpose:</i> Gets the current compaction state of a table</p> <p><i>Supported:</i> No</p>

<code>getCompactionStateForRegion(byte[] regionName)</code>	<p><i>Modifier and Type:</i> org.apache.hadoop.hbase.protobuf.generated.AdminProtos.GetRegionInfoResponse.CompactionState</p> <p><i>Purpose:</i> Gets the current compaction state of a region</p> <p><i>Supported:</i> No</p>
<code>getConfiguration()</code>	<p><i>Modifier and Type:</i> org.apache.hadoop.conf.Configuration</p> <p><i>Purpose:</i> Gets the configuration used by the instance</p> <p><i>Supported:</i> Yes</p>
<code>getConnection()</code>	<p><i>Modifier and Type:</i> Connection</p> <p><i>Purpose:</i> Gets the connection used by this object</p> <p><i>Supported:</i> Yes</p>
<code>getMasterCoproprocessors()</code>	<p><i>Modifier and Type:</i> String[]</p> <p><i>Purpose:</i> Helper delegate to getClusterStatus().getMasterCoproprocessors()</p> <p><i>Supported:</i> No</p>
<code>getMasterInfoPort()</code>	<p><i>Modifier and Type:</i> int</p> <p><i>Purpose:</i> Gets the information port of the current master, if one is available</p> <p><i>Supported:</i> No</p>
<code>getNamespaceDescriptor(String name)</code>	<p><i>Modifier and Type:</i> NamespaceDescriptor</p> <p><i>Purpose:</i> Gets a namespace descriptor by name</p> <p><i>Supported:</i> No</p>
<code>getOnlineRegions(ServerName sn)</code>	<p><i>Modifier and Type:</i> List&lt;HRegionInfo&gt;</p> <p><i>Purpose:</i> Gets all the online regions on a region server</p> <p><i>Supported:</i> No</p>
<code>getOperationTimeout()</code>	<p><i>Modifier and Type:</i> int</p> <p><i>Purpose:</i> The HPE Ezmeral Data Fabric Database never uses the timeout value</p> <p> <b>NOTE:</b> If you use the v1.1 API with the HPE Ezmeral Data Fabric Database, the method is ignored.</p> <p><i>Supported:</i> No</p>
<code>getQuotaRetriever(QuotaFilter filter)</code>	<p><i>Modifier and Type:</i> QuotaRetriever</p> <p><i>Purpose:</i> Returns a QuotaRetriever to list the quotas based on the filter</p> <p><i>Supported:</i> No</p>
<code>getTableDescriptor (byte[] tableName)</code>	<p><i>Modifier and Type:</i> HTableDescriptor</p> <p><i>Purpose:</i> Gets the table descriptor</p> <p><i>Supported:</i> Yes</p>
<code>getTableDescriptor(TableName tableName)</code>	<p><i>Modifier and Type:</i> HTableDescriptor</p> <p><i>Purpose:</i> Gets the table descriptor</p> <p><i>Supported:</i> Yes</p>
<code>getTableDescriptors(List&lt;String&gt; names)</code>	<p><i>Modifier and Type:</i> HTableDescriptor[]</p>

	<i>Purpose:</i> Gets table descriptors <i>Supported:</i> Yes
<code>getTableDescriptorsByTableName(List&lt;TableName&gt; tableNames)</code>	<i>Modifier and Type:</i> HTableDescriptor[] <i>Purpose:</i> Gets table descriptors <i>Supported:</i> Yes
<code>getTableRegions(byte[] tableName)</code>	<i>Modifier and Type:</i> List<HRegionInfo> <i>Purpose:</i> Gets the regions of a given table <i>Supported:</i> Yes
<code>getTableRegions(TableName tableName)</code>	<i>Modifier and Type:</i> List<HRegionInfo> <i>Purpose:</i> Gets the regions of a given table <i>Supported:</i> Yes
<code>isAborted()</code>	<i>Modifier and Type:</i> boolean <i>Purpose:</i> Queries on the catalog janitor state. The HPE Ezmeral Data Fabric Database always returns false. <i>Supported:</i> No
<code>isCatalogJanitorEnabled()</code>	<i>Modifier and Type:</i> boolean <i>Purpose:</i> Queries on the catalog janitor state. The HPE Ezmeral Data Fabric Database always returns false. <i>Supported:</i> No
<code>isProcedureFinished(String signature, String instance, Map&lt;String,String&gt; props)</code>	<i>Modifier and Type:</i> boolean <i>Purpose:</i> Checks the current state of the specified procedure <i>Supported:</i> No
<code>isSnapshotFinished(org.apache.hadoop.hbase.protobuf.generated.HBaseProtos.SnapshotDescription snapshot)</code>	<i>Modifier and Type:</i> boolean <i>Purpose:</i> Checks the current state of the passed snapshot <i>Supported:</i> No
<code>isTableAvailable(String tableName)</code>	<i>Modifier and Type:</i> boolean <i>Purpose:</i> Checks if all regions of the table are available <i>Supported:</i> Yes
<code>isTableAvailable(TableName tableName, byte[][] splitKeys)</code>	<i>Modifier and Type:</i> boolean <i>Purpose:</i> Checks if the table has been created with the specified number of splitkeys that was used while creating the given table <i>Supported:</i> No
<code>isTableAvailable(TableName tableName)&gt;</code>	<i>Modifier and Type:</i> boolean <i>Purpose:</i> Returns true if all regions of the table are available <i>Supported:</i> Yes
<code>isTableDisabled(String tableName)</code>	<i>Modifier and Type:</i> boolean <i>Purpose:</i> Checks if the table is offline

<code>isTableDisabled(TableName tableName)</code>	<p> <b>NOTE:</b> Although the HPE Ezmeral Data Fabric Database supports this method, it only checks the flag.</p> <p><i>Supported:</i> Yes</p> <p><i>Modifier and Type:</i> boolean</p> <p><i>Purpose:</i> Checks if the table is offline</p>
<code>isTableEnabled(String tableName)</code>	<p> <b>NOTE:</b> Although the HPE Ezmeral Data Fabric Database supports this method, it only checks the flag.</p> <p><i>Supported:</i> Yes</p> <p><i>Modifier and Type:</i> boolean</p> <p><i>Purpose:</i> Checks if the table is online</p>
<code>isTableEnabled(TableName tableName)</code>	<p> <b>NOTE:</b> Although the HPE Ezmeral Data Fabric Database supports this method, it only checks the flag, and does not change the flag.</p> <p><i>Supported:</i> Yes</p> <p><i>Modifier and Type:</i> boolean</p> <p><i>Purpose:</i> Checks if the table is online</p>
<code>listNamespaceDescriptors()</code>	<p> <b>NOTE:</b> Although the HPE Ezmeral Data Fabric Database supports this method, it only checks the flag, and does not change the flag.</p> <p><i>Supported:</i> Yes</p> <p><i>Modifier and Type:</i> NamespaceDescriptor[]</p> <p><i>Purpose:</i> Lists available namespace descriptors</p> <p><i>Supported:</i> No</p>
<code>listSnapshots()</code>	<p><i>Modifier and Type:</i> List&lt;org.apache.hadoop.hbase.protobuf.generated.HBaseProtos.SnapshotDescription&gt;</p> <p><i>Purpose:</i> Lists completed snapshots</p> <p><i>Supported:</i> No</p>
<code>listSnapshots(Pattern pattern)</code>	<p><i>Modifier and Type:</i> List&lt;org.apache.hadoop.hbase.protobuf.generated.HBaseProtos.SnapshotDescription&gt;</p> <p><i>Purpose:</i> Lists all the completed snapshots that match the given pattern</p> <p><i>Supported:</i> No</p>
<code>listSnapshots(String regex)</code>	<p><i>Modifier and Type:</i> List&lt;org.apache.hadoop.hbase.protobuf.generated.HBaseProtos.SnapshotDescription&gt;</p> <p><i>Purpose:</i> Lists all the completed snapshots that match the given regular expression</p> <p><i>Supported:</i> No</p>
<code>listTableDescriptorsByNamespace(String name)</code>	<p><i>Modifier and Type:</i> HTableDescriptor[]</p> <p><i>Purpose:</i> Gets the list of table descriptors by namespace</p> <p><i>Supported:</i> No</p>
<code>listTableNames()</code>	<p><i>Modifier and Type:</i> TableName[]</p>

	<i>Purpose:</i> Lists all the names of userspace tables
	<i>Supported:</i> Yes
<code>listTableNames(Pattern pattern, boolean includeSysTables)</code>	<i>Modifier and Type:</i> TableName[ ]
	<i>Purpose:</i> Lists all the names of userspace tables that match the specified pattern
	<i>Supported:</i> Yes
<code>listTableNames(Pattern pattern)</code>	<i>Modifier and Type:</i> TableName[ ]
	<i>Purpose:</i> Lists all the names of userspace tables that match the specified pattern
	<i>Supported:</i> Yes
<code>listTableNames(String regex, boolean includeSysTables)</code>	<i>Modifier and Type:</i> TableName[ ]
	<i>Purpose:</i> Lists all the names of userspace tables that match the specified regular expression
	<i>Supported:</i> Yes
<code>listTableNames(String regex)</code>	<i>Modifier and Type:</i> TableName[ ]
	<i>Purpose:</i> Lists all the names of userspace tables that match the specified regular expression
	<i>Supported:</i> Yes
<code>listTableNamesByNamespace(String name)</code>	<i>Modifier and Type:</i> TableName[ ]
	<i>Purpose:</i> Gets the list of table names by namespace
	<i>Supported:</i> Yes
<code>listTables()</code>	<i>Modifier and Type:</i> HTableDescriptor[ ]
	<i>Purpose:</i> Lists all the userspace tables
	<i>Supported:</i> Yes
<code>listTables(Pattern pattern, boolean includeSysTables)</code>	<i>Modifier and Type:</i> HTableDescriptor[ ]
	<i>Purpose:</i> Lists all the tables that match the given pattern.
	 <b>NOTE:</b> The HPE Ezmeral Data Fabric Database does not have system tables and therefore, the boolean value is ignored.
	<i>Supported:</i> Yes
<code>listTables(Pattern pattern)</code>	<i>Modifier and Type:</i> HTableDescriptor[ ]
	<i>Purpose:</i> Lists all the userspace tables matching the given pattern.
	<i>Supported:</i> Yes
<code>listTables(String regex, boolean includeSysTables)</code>	<i>Modifier and Type:</i> HTableDescriptor[ ]
	<i>Purpose:</i> Lists all the tables matching the given pattern.
	 <b>NOTE:</b> The HPE Ezmeral Data Fabric Database does not have system tables and therefore, the boolean value is ignored.
	<i>Supported:</i> Yes
<code>listTables(String regex)</code>	<i>Modifier and Type:</i> HTableDescriptor[ ]
	<i>Purpose:</i> Lists all the userspace tables that match the given regular expression.
	<i>Supported:</i> Yes

<code>majorCompact(byte[] tableNameOrRegionName)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Compacts a table, or an individual region. <i>Supported:</i> Deprecated
<code>majorCompact(String tableNameOrRegionName)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Compacts a table, or an individual region. <i>Supported:</i> Deprecated
<code>majorCompact(byte[] tableNameOrRegionName, byte[] columnFamily)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Compacts a column family within a table, or a region <i>Supported:</i> Deprecated
<code>majorCompact(String tableNameOrRegionName, String columnFamily)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Compact a column family within a table, or a region <i>Supported:</i> Deprecated
<code>majorCompactRegion(byte[] regionName, byte[] columnFamily)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Compacts a column family within a region <i>Supported:</i> No
<code>majorCompactRegion(byte[] regionName)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Compacts a table, or an individual region <i>Supported:</i> No
<code>mergeRegions(byte[] nameOfRegionA, byte[] nameOfRegionB, boolean forcible)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Merges two regions <i>Supported:</i> No
<code>modifyColumn(TableName tableName, HColumnDescriptor columnFamily)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Modifies an existing column family on a table <i>Supported:</i> Yes
<code>modifyColumn(TableName tableName, HColumnDescriptor columnFamily)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Modifies an existing column family on a table <i>Supported:</i> Yes
<code>modifyNamespace(NamespaceDescriptor descriptor)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Modifies an existing namespace <i>Supported:</i> No
<code>modifyTable(byte[] tableName, HTableDescriptor htd)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Modifies an existing table <i>Supported:</i> Yes
<code>modifyTable(final String tableName, final HTableDescriptor htd)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Modifies an existing table <i>Supported:</i> Yes
<code>modifyTable(TableName tableName, HTableDescriptor htd)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Modifies an existing table. This method is the more IRB friendly version. <i>Supported:</i> Yes
<code>move(byte[] encodedRegionName, byte[] destServerName)</code>	<i>Modifier and Type:</i> void

	<i>Purpose:</i> Moves the region to the destination
	<i>Supported:</i> No
<code>offline(byte[] regionName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Offlines specified region from master's in-memory state
	<i>Supported:</i> No
<code>restoreSnapshot(byte[] snapshotName, boolean takeFailSafeSnapshot)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Restores the specified snapshot on the original table
	<i>Supported:</i> No
<code>restoreSnapshot(byte[] snapshotName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Restores the specified snapshot on the original table
	<i>Supported:</i> No
<code>restoreSnapshot(String snapshotName, boolean takeFailSafeSnapshot)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Restores the specified snapshot on the original table
	<i>Supported:</i> No
<code>restoreSnapshot(String snapshotName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Restores the specified snapshot on the original table
	<i>Supported:</i> No
<code>rollWALWriter(ServerName serverName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Rolls the log writer.
	<i>Supported:</i> No
<code>runCatalogScan()</code>	<i>Modifier and Type:</i> int
	<i>Purpose:</i> Requests a scan of the catalog table
	<i>Supported:</i> No
<code>setBalancerRunning(boolean on, boolean synchronous)</code>	<i>Modifier and Type:</i> boolean
	<i>Purpose:</i> Turns the load balancer on or off
	 <b>NOTE:</b> The HPE Ezmeral Data Fabric Database does not require balancing. Therefore, the method just sets a flag. There is no impact on the Data Fabric table.
	<i>Supported:</i> No
<code>setQuota(QuotaSettings quota)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Applies the new quota settings
	<i>Supported:</i> No
<code>shutdown()</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Shuts down the HBase cluster
	<i>Supported:</i> No
<code>snapshot(byte[] snapshotName, TableName tableName)</code>	<i>Modifier and Type:</i> void
	<i>Purpose:</i> Creates a timestamp consistent snapshot for the given table
	<i>Supported:</i> No

<code>snapshot(org.apache.hadoop.hbase.protobuf.generated.HBaseProtos.SnapshotDescription snapshot)</code>	<p><i>Modifier and Type:</i> void</p> <p><i>Purpose:</i> Takes a snapshot, and waits for the server to complete that snapshot (blocking).</p> <p><i>Supported:</i> No</p>
<code>snapshot(String snapshotName, TableName tableName, org.apache.hadoop.hbase.protobuf.generated.HBaseProtos.SnapshotDescription.Type type)</code>	<p><i>Modifier and Type:</i> void</p> <p><i>Purpose:</i> Creates a typed snapshot of the table</p> <p><i>Supported:</i> No</p>
<code>snapshot(String snapshotName, TableName tableName)</code>	<p><i>Modifier and Type:</i> void</p> <p><i>Purpose:</i> Takes a snapshot for the given table</p> <p><i>Supported:</i> No</p>
<code>split(byte[] tableNameOrRegionName)</code>	<p><i>Modifier and Type:</i> void</p> <p><i>Purpose:</i> Splits a table</p> <p> <b>NOTE:</b> The <code>tableNameOrRegionName</code> parameter has a different format when used with Data Fabric tables than with Apache HBase tables. With Data Fabric tables, specify both the table path and the FID as a comma-separated list.</p> <p><i>Supported:</i> Yes</p>
<code>split(TableName tableName, byte[] splitPoint)</code>	<p><i>Modifier and Type:</i> void</p> <p><i>Purpose:</i> Splits a table.</p> <p> <b>NOTE:</b> The <code>tableNameOrRegionName</code> parameter has a different format when used with Data Fabric tables than with Apache HBase tables. With Data Fabric tables, specify both the table path and the FID as a comma-separated list.</p> <p><i>Supported:</i> No</p>
<code>split(TableName tableName)</code>	<p><i>Modifier and Type:</i> void</p> <p><i>Purpose:</i> Splits a table.</p> <p> <b>NOTE:</b> The <code>tableNameOrRegionName</code> parameter has a different format when used with Data Fabric tables than with Apache HBase tables. With Data Fabric tables, specify both the table path and the FID as a comma-separated list.</p> <p><i>Supported:</i> Yes</p>
<code>splitRegion(byte[] regionName, byte[] splitPoint)</code>	<p><i>Modifier and Type:</i> void</p> <p><i>Purpose:</i> Splits an individual region.</p> <p><i>Supported:</i> No</p>
<code>splitRegion(byte[] regionName)</code>	<p><i>Modifier and Type:</i> void</p> <p><i>Purpose:</i> Splits an individual region</p> <p><i>Supported:</i> Yes</p>
<code>stopMaster()</code>	<p><i>Modifier and Type:</i> void</p> <p><i>Purpose:</i> Shuts down the current HBase master only</p> <p><i>Supported:</i> No</p>

<code>stopRegionServer(String hostnamePort)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Stops the designated region server <i>Supported:</i> No
<code>tableExists(TableName tableName)</code>	<i>Modifier and Type:</i> boolean <i>Purpose:</i> Returns whether a table with the specified name exists <i>Supported:</i> Yes
<code>tableExists(byte[] tableName)</code>	<i>Modifier and Type:</i> boolean <i>Purpose:</i> Returns whether a table with the specified name exists <i>Supported:</i> Yes
<code>tableExists(String tableName)</code>	<i>Modifier and Type:</i> boolean <i>Purpose:</i> Returns whether a table with the specified name exists <i>Supported:</i> Yes
<code>takeSnapshotAsync(org.apache.hadoop.hbase.protobuf.generated.HBaseProtos.SnapshotDescription snapshot)</code>	<i>Modifier and Type:</i> org.apache.hadoop.hbase.protobuf.generated.MasterProtos.SnapshotResponse <i>Purpose:</i> Takes a snapshot without waiting for the server to complete that snapshot (asynchronous). Ensure that you take only a single snapshot at a time, or the results may be undefined. <i>Supported:</i> No
<code>truncateTable(TableName tableName, boolean preserveSplits)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Truncates a table <i>Supported:</i> Yes
<code>unassign(byte[] regionName, boolean force)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Unassigns a region from the current hosting region server <i>Supported:</i> No
<code>updateConfiguration()</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Updates the configuration, and triggers an online configuration change on all the region servers <i>Supported:</i> No
<code>updateConfiguration(ServerName server)</code>	<i>Modifier and Type:</i> void <i>Purpose:</i> Updates the configuration, and triggers an online configuration change on all the region servers <i>Supported:</i> No

**BufferedMutator Method Support**

This table indicates which methods HPE Ezmeral Data Fabric Database supports in the HBase interface `BufferedMutator`.

The following HBase methods are supported with HPE Ezmeral Data Fabric Database tables, except where noted.

Method Name	Modifier and Type	Description	Supported?
<code>close()</code>	void	Performs a flush() and releases any resources held.	Yes

Method Name	Modifier and Type	Description	Supported?
flush()	void	Executes all the buffered, asynchronous Mutation operations and waits until they are done.	Yes
getConfiguration()	org.apache.hadoop.conf.Configuration	Returns the Configuration object used by this instance.	Yes
getName()	TableName	Gets the fully qualified table name instance of the table that this BufferedMutator writes to.	Yes
getWriteBuffer()	long	Get the internal write buffer.	No
getWriteBufferSize()	long	Returns the maximum size in bytes of the write buffer for this HTable.	No
mutate(List<? extends Mutation> mutations)	void	Send some Mutation objects to the table.	Yes
mutate(Mutation mutation)	void	Sends a Mutation to the table.	Yes
setWriteBufferSize()	long	Sets the maximum size (in bytes) of the write buffer for this HTable	No

#### Connection Method Support

This table indicates which methods HPE Ezmeral Data Fabric Database supports in the HBase interface Connection.

The following HBase methods are supported with HPE Ezmeral Data Fabric Database tables, except where noted. For full details about this interface, see [Interface Connection](#).

Method Name	Modifier and Type	Description	Supported?
close()	void	Close this connection.	Yes
getAdmin()	Admin	Retrieve an Admin implementation to administer an HBase cluster.	Yes
getBufferedMutator(BufferedMutatorParams params)	BufferedMutator	Retrieve a BufferedMutator for performing client-side buffering of writes.	Yes
getBufferedMutator(TableName tableName)	BufferedMutator		Yes
getConfiguration()	org.apache.hadoop.conf.Configuration	Retrieve the Configuration object used by this connection.	Yes
getRegionLocator(TableName tableName)	RegionLocator	Retrieve a RegionLocator implementation to inspect region information on a table.	Yes

Method Name	Modifier and Type	Description	Supported?
getTable(TableName tableName)	Table	Retrieve a Table implementation for accessing a table.	Yes
getTable(TableName tableName, ExecutorService pool)	Table		Yes
isClosed()	boolean	Returns whether the connection is closed or not.	Yes

#### *ConnectionFactory Method Support*

This table indicates which methods HPE Ezmeral Data Fabric Database supports in the HBase class `ConnectionFactory`.

The following HBase methods are supported with HPE Ezmeral Data Fabric Database tables, except where noted. For full details about this class, see the [ConnectionFactory class in the Client package](#)..

Method Name	Modifier and Type	Description	Supported?
createConnection()	static Connection	Create a new Connection instance using default HBaseConfiguration.	Yes
createConnection(org.apache.hadoop.conf.Configuration conf)	static Connection	Create a new Connection instance using the passed conf instance.	Yes
createConnection(org.apache.hadoop.conf.Configuration conf, ExecutorService pool)	static Connection	Create a new Connection instance using the passed conf instance.	Yes
createConnection(org.apache.hadoop.conf.Configuration conf, ExecutorService pool, User user)	static Connection	Create a new Connection instance using the passed conf instance.	Yes
createConnection(org.apache.hadoop.conf.Configuration conf, User user)	static Connection	Create a new Connection instance using the passed conf instance.	Yes

#### *RegionLocator Method Support*

This table indicates which methods HPE Ezmeral Data Fabric Database supports in the HBase interface `RegionLocator`.

The following HBase methods are supported with HPE Ezmeral Data Fabric Database tables, except where noted. For full details about this interface, see [Interface RegionLocator](#) interface in the Client package.

Method Name	Modifier and Type	Description	Supported?
close()	void	Close this connection.	Yes
getAllRegionLocations()	List<HRegionLocation>	Retrieves all of the regions associated with this table.	Yes
getConfiguration()	Configuration	Retrieve the Configuration Object used by this RegionLocator.	Yes

Method Name	Modifier and Type	Description	Supported?
<code>getEndKeys()</code>	<code>byte[][]</code>	Gets the ending row key for every region in the currently open table.	Yes
<code>getName()</code>	<code>TableName</code>	Gets the fully qualified table name instance of this table.	Yes
<code>getRegionLocation(byte[] row)</code>	<code>HRegionLocation</code>	Finds the region on which the given row is being served.	Yes
<code>getRegionLocation(byte[] row, boolean reload)</code>	<code>HRegionLocation</code>		Yes
<code>getStartEndKeys()</code>	<code>Pair&lt;byte[][],byte[]&gt;</code>	Gets the starting and ending row keys for every region in the currently open table.	Yes
<code>getStartKeys()</code>	<code>byte[][]</code>	Gets the starting row key for every region in the currently open table.	Yes

#### Table Method Support

This table indicates which methods HPE Ezmeral Data Fabric Database supports in the HBase interface Table.

The following HBase methods are supported with HPE Ezmeral Data Fabric Database tables, except where noted. For full details about this interface, see [Interface Table](#) in the Client package.

Method Name	Modifier and Type	Description	Supported?
<code>append(Append append)</code>	<code>Result</code>	Appends values to one or more columns within a single row.	Yes
<code>batch(List&lt;? extends Row&gt; actions)</code>	<code>Object[]</code>	A batch call on Deletes, Gets, Puts, Increments, Appends and RowMutations.	Deprecated
<code>batch(List&lt;? extends Row&gt; actions, Object[] results)</code>	<code>void</code>	Method that does a batch call on Deletes, Gets, Puts, Increments and Appends.	Yes
<code>batchCallback(List&lt;? extends Row&gt; actions, org.apache.hadoop.hbase.client.coprocessor.Batch.Callback&lt;R&gt; callback)</code>	<code>Object[]</code>	Method that does a batch call on Deletes, Gets, Puts, Increments and Appends with a callback.	Yes <sup>Footnote</sup> .

<sup>1</sup> Not fully supported. When used with HPE Ezmeral Data Fabric Database, the callback is ignored.

<sup>2</sup> Not fully supported. When used with HPE Ezmeral Data Fabric Database, the durability is ignored.

Method Name	Modifier and Type	Description	Supported?
<code>batchCallback(List&lt;? extends Row&gt; actions, Object[] results, org.apache.hadoop.hbase.client.coprocessor.Batch.Callback&lt;R&gt; callback)</code>	<code>&lt;R&gt; void</code>	Same as <code>batch(List, Object[])</code> , but with a callback. HPE Ezmeral Data Fabric Database ignores the callback.	Yes <a href="#">Footnote</a> .
<code>batchCoprocessorService(com.google.protobuf.Descriptors.MethodDescriptor methodDescriptor, com.google.protobuf.Message request, byte[] startKey, byte[] endKey, R responsePrototype, org.apache.hadoop.hbase.client.coprocessor.Batch.Callback&lt;R&gt; callback)</code>	<code>&lt;R extends com.google.protobuf.Message&gt; void</code>	Creates an instance of the given Service subclass for each table region spanning the range from the startKey row to endKey row (inclusive), all the invocations to the same region server will be batched into one call.	No
<code>batchCoprocessorService(com.google.protobuf.Descriptors.MethodDescriptor methodDescriptor, com.google.protobuf.Message request, byte[] startKey, byte[] endKey, R responsePrototype)</code>	<code>&lt;R extends com.google.protobuf.Message&gt; Map&lt;byte[],R&gt;</code>		No

Method Name	Modifier and Type	Description	Supported?
<code>checkAndDelete(byte[] row, byte[] family, byte[] qualifier, byte[] value, Delete delete)</code>	boolean	Atomically checks if a row/family/qualifier value matches the expected value.	Yes
<code>checkAndDelete(byte[] row, byte[] family, byte[] qualifier, CompareFilter.CompareOp compareOp, byte[] value, Delete delete)</code>	boolean		Yes
<code>checkAndMutate(byte[] row, byte[] family, byte[] qualifier, CompareFilter.CompareOp compareOp, byte[] value, RowMutations mutation)</code>	boolean		Yes
<code>checkAndPut(byte[] row, byte[] family, byte[] qualifier, byte[] value, Put put)</code>	boolean		Yes
<code>checkAndPut(byte[] row, byte[] family, byte[] qualifier, CompareFilter.CompareOp compareOp, byte[] value, Put put)</code>	boolean		Yes
<code>close()</code>	void		Releases any resources held or pending changes in internal buffers.
<code>coprocessorService(byte[] row)</code>	CoprocessorRpcChannel	Creates and returns a RpcChannel instance connected to the table region containing the specified row.	No

Method Name	Modifier and Type	Description	Supported?
<code>coprocessorService(Class&lt;T&gt; service, byte[] startKey, byte[] endKey, org.apache.hadoop.hbase.client.coprocessor.Batch.Call&lt;T,R&gt; callable, org.apache.hadoop.hbase.client.coprocessor.Batch.Callback&lt;R&gt; callback)</code>	<T extends <code>com.google.protobuf.Service, R&gt; void</code>	Creates an instance of the given Service subclass for each table region spanning the range from the startKey row to endKey row (inclusive), and invokes the passed Batch.Call.call(T) method with each Service instance.	No
<code>coprocessorService(Class&lt;T&gt; service, byte[] startKey, byte[] endKey, org.apache.hadoop.hbase.client.coprocessor.Batch.Call&lt;T,R&gt; callable)</code>	<T extends <code>com.google.protobuf.Service, R&gt; Map&lt;byte[], R&gt;</code>		No
<code>delete(Delete delete)</code>	void	Deletes the specified cells/row.	Yes
<code>delete(List&lt;Delete&gt; deletes)</code>	void	Deletes the specified cells/rows in bulk.	Yes
<code>exists(Get get)</code>	boolean	Test for the existence of columns in the table, as specified by the Get.	Yes
<code>existsAll(List&lt;Get&gt; gets)</code>	boolean[]	Test for the existence of columns in the table, as specified by the Gets, in batch.	Yes
<code>get(Get get)</code>	Result	Extracts certain cells from a given row.	Yes
<code>get(List&lt;Get&gt; gets)</code>	Result[]	Extracts certain cells from the given rows, in batch.	Yes
<code>getConfiguration()</code>	<code>org.apache.hadoop.conf.Configuration</code>	Returns the Configuration object used by this instance.	Yes
<code>getName()</code>	TableName	Gets the fully qualified table name instance of this table.	Yes
<code>getScanner(byte[] family, byte[] qualifier)</code>	ResultScanner	Gets a scanner on the current table for the given family and qualifier.	Yes
<code>getScanner(byte[] family)</code>	ResultScanner	Gets a scanner on the current table for the given family.	Yes
<code>getScanner(Scan scan)</code>	ResultScanner	Returns a scanner on the current table as specified by the Scan object.	Yes
<code>getTableDescriptor()</code>	HTableDescriptor	Gets the table descriptor for this table.	Yes
<code>getWriteBufferSize()</code>	long	Returns the maximum size in bytes of the write buffer for this HTable.	No

Method Name	Modifier and Type	Description	Supported?
<code>increment(Increment increment)</code>	Result	Increments one or more columns within a single row.	Yes
<code>incrementColumnValue(byte[] row, byte[] family, byte[] qualifier, long amount, Durability durability)</code>	long	Atomically increments a column value.	Yes <a href="#">Footnote</a> .
<code>incrementColumnValue(byte[] row, byte[] family, byte[] qualifier, long amount)</code>	long	See <code>incrementColumnValue(byte[], byte[], byte[], long, Durability)</code> .	Yes
<code>mutateRow(RowMutations rm)</code>	void	Performs multiple mutations atomically on a single row.	Yes
<code>put(List&lt;Put&gt; puts)</code>	void	Puts some data in the table, in batch.	Yes
<code>put(Put put)</code>	void	Puts some data in the table.	Yes
<code>setWriteBufferSize(long writeBufferSize)</code>	void	Sets the size of the buffer in bytes.	No

#### *HColumnDescriptor and HTableDescriptor Support*

This section describes the supported fields in the `HColumnDescriptor` and the `HTableDescriptor` classes.

HPE Ezmeral Data Fabric Database supports all of the methods that are in these classes. However, it supports only a subset of their fields.

#### **HColumnDescriptor Class**

Field	Description
BLOCKSIZE	Size of blocks in files stored to the filesystem (hfiles).
BLOOMFILTER	Whether or not to use bloomfilters.
COMPRESSION	Compression type.
IN_MEMORY	Whether to serve from memory or not.
MIN_VERSIONS	Minimum number of versions to keep.
NAME	Name of the column family.
TTL	Time to live of cell contents.
VERSIONS	Number of versions to keep.

#### **HTableDescriptor Class**

Field	Description
AUTOSPLIT	Specifies whether to split the table into regions automatically as the table grows. The average size of each region is determined by the <code>regionsize</code> parameter.  The default value is <code>true</code> .

Field	Description
BULKLOAD	Boolean. Specifies whether to perform a full bulk load of the table. The default is <code>false</code> . For more information, see <a href="#">Bulk Loading and Data Fabric Tables</a> .

Field	Description
DELETE_TTL	<p>Used for multi-master replication.</p> <p>Normally, delete operations are purged after the affected table cells are updated. Whereas the result of an update is saved in a table until another change overwrites or deletes it, the result of a delete is not saved. In multi-master replication, this difference can lead to tables being unsynchronized.</p> <p>Example</p> <p>Suppose that you have set up multi-master replication between table <code>customers</code> in the cluster <code>sanfrancisco</code> and table <code>customers</code> in the cluster <code>newyork</code>. Client applications then make these two changes:</p> <ol style="list-style-type: none"> <li>1. On <code>/mapr/sanfrancisco/customers</code>, put row A at 10:00:00 AM.</li> <li>2. On <code>/mapr/newyork/customers</code>, delete row A at 10:00:01 AM.</li> </ol> <p>On <code>/mapr/sanfrancisco/customers</code>, the order of operations is:</p> <ol style="list-style-type: none"> <li>1. Put row A with a timestamp of 10:00:00 AM</li> <li>2. Delete row A with a timestamp of 10:00:01 AM (This operation is replicated from <code>/mapr/newyork/customers</code>.)</li> </ol> <p>On <code>/mapr/newyork/customers</code>, the order of operations is:</p> <ol style="list-style-type: none"> <li>1. Delete row A with a timestamp of 10:00:01 AM</li> <li>2. Put row A with a timestamp of 10:00:00 AM (This operation is replicated from <code>/mapr/sanfrancisco/customers</code>.)</li> </ol> <p>Now, though the put happened on <code>/mapr/sanfrancisco/customers</code> at 10:00:00 AM, the put reaches <code>/mapr/newyork/customers</code> several seconds after that. Suppose that the actual time that the put arrives at <code>/mapr/newyork/customers</code> is 10:00:03 AM.</p> <p>To ensure that both tables stay synchronized, <code>/mapr/newyork/customers</code> should preserve the delete until after the put is replicated. Then, the delete can be applied after the put. Therefore, the time-to-live for the delete should be at least long enough for the put to arrive at <code>/mapr/newyork/customers</code>. In this case, the time-to-live should be at least 3 seconds.</p> <p>In general, the time-to-live for deletes should be greater than the amount of time that it takes replicated operations to reach replicas. By default, the value is 24 hours.</p> <p>For example, suppose (to extend the scenario above) that you pause replication during weekdays and resume it on weekends. The put takes place on Monday morning <code>/mapr/sanfrancisco/customers</code> at 10:00:00 AM and the delete takes place at <code>/mapr/newyork/customers</code> at 10:00:01 AM. Replication does not resume until 12:00:00 AM Saturday morning. Given the volume of operations to be replicated and the potential for network problems, it is possible that these operations will not be replicated until Sunday. In this scenario, a value of 7 days for <code>DELETE_TTL</code> (7 multiplied by 24 hours) should provide sufficient margin.</p>

Field	Description
NAME	Name of the table.

### *Support for HBase Java Filters Support*

HPE Ezmeral Data Fabric Database supports the following Java filters, which work identically to their Apache HBase versions. See the [Apache HBase API](#) for more information, specifically, the [Apache HBase Filter](#) package.

Filter	Description
<code>ColumnCountGetFilter</code>	Simple filter that returns first N columns on row only. This filter was written to test filters in Get and as soon as it gets its quota of columns, <code>filterAllRemaining()</code> returns true. This makes this filter unsuitable as a Scan filter.
<code>ColumnPaginationFilter</code>	A filter, based on the <code>ColumnCountGetFilter</code> , takes two arguments: limit and offset. This filter can be used for row-based indexing, where references to other tables are stored across many columns, in order to efficient lookups and paginated results for end users. Only most recent versions are considered for pagination.
<code>ColumnPrefixFilter</code>	This filter is used for selecting only those keys with columns that matches a particular prefix. For example, if prefix is 'an', it will pass keys with columns like 'and', 'anti' but not keys with columns like 'ball', 'act'.
<code>ColumnRangeFilter</code>	This filter is used for selecting only those keys with columns that are between <code>minColumn</code> to <code>maxColumn</code> . For example, if <code>minColumn</code> is 'an', and <code>maxColumn</code> is 'be', it will pass keys with columns like 'ana', 'bad', but not keys with columns like 'bed', 'eye' If <code>minColumn</code> is null, there is no lower bound. If <code>maxColumn</code> is null, there is no upper bound. <code>minColumnInclusive</code> and <code>maxColumnInclusive</code> specify if the ranges are inclusive or not.
<code>DependentColumnFilter</code>	A filter for adding inter-column timestamp matching Only cells with a correspondingly timestamped entry in the target column will be retained Not compatible with <code>Scan.setBatch</code> as operations need full rows for correct filtering
<code>FamilyFilter</code>	This filter is used to filter based on the column family. It takes an operator (equal, greater, not equal, etc) and a byte [] comparator for the column family portion of a key.  This filter can be wrapped with <code>WhileMatchFilter</code> and <code>SkipFilter</code> to add more control. Multiple filters can be combined using <code>FilterList</code> . If an already known column family is looked for, use <code>Get.addFamily(byte[])</code> directly rather than a filter.

Filter	Description
FilterList	<p>Implementation of <code>Filter</code> that represents an ordered List of Filters which will be evaluated with a specified boolean operator <code>FilterList.Operator.MUST_PASS_ALL</code> (AND) or <code>FilterList.Operator.MUST_PASS_ONE</code> (OR). Since you can use Filter Lists as children of Filter Lists, you can create a hierarchy of filters to be evaluated. <code>FilterList.Operator.MUST_PASS_ALL</code> evaluates lazily: evaluation stops as soon as one filter does not include the <code>KeyValue</code>. <code>FilterList.Operator.MUST_PASS_ONE</code> evaluates non-lazily: all filters are always evaluated. Defaults to <code>FilterList.Operator.MUST_PASS_ALL</code>.</p>
FirstKeyOnlyFilter	<p>A filter that will only return the first KV from each row.</p> <p>This filter can be used to more efficiently perform row count operations.</p>
FirstKeyValueMatchingQualifiersFilter	<p>The filter looks for the given columns in <code>KeyValue</code>. Once there is a match for any one of the columns, it returns <code>ReturnCode.NEXT_ROW</code> for remaining <code>KeyValues</code> in the row.</p> <p><b>Note:</b> It may emit KVs which do not have the given columns in them, if these KVs happen to occur before a KV which does have a match. Given this caveat, this filter is only useful for special cases like <code>RowCounter</code>.</p>
FuzzyRowFilter	<p>Filters data based on fuzzy row key. Performs fast-forwards during scanning. It takes pairs (row key, fuzzy info) to match row keys. Where fuzzy info is a byte array with 0 or 1 as its values:</p> <ul style="list-style-type: none"> <li>• 0 - means that this byte in provided row key is fixed, i.e. row key's byte at same position must match</li> <li>• 1 - means that this byte in provided row key is NOT fixed, i.e. row key's byte at this position can be different from the one in provided row key</li> </ul> <p>Example: Let's assume row key format is <code>userId_actionId_year_month</code>. Length of <code>userId</code> is fixed and is 4, length of <code>actionId</code> is 2 and <code>year</code> and <code>month</code> are 4 and 2 bytes long respectively. Let's assume that we need to fetch all users that performed certain action (encoded as "99") in Jan of any year. Then the pair (row key, fuzzy info) would be the following: row key = "????_99_????_01" (one can use any value instead of "?") fuzzy info = "\x01\x01\x01\x01\x00\x00\x00\x00\x01\x01\x01\x01\x00\x00" i.e. fuzzy info tells the matching mask is "????_99_????_01", where at ? can be any value.</p>
InclusiveStopFilter	<p>A Filter that stops after the given row. There is no "RowStopFilter" because the Scan spec allows you to specify a stop row. Use this filter to include the stop row, eg: [A,Z].</p>
KeyOnlyFilter	<p>A filter that will only return the key component of each KV (the value will be rewritten as empty).</p> <p>This filter can be used to grab all of the keys without having to also grab the values.</p>

Filter	Description
<code>MultipleColumnPrefixFilter</code>	This filter is used for selecting only those keys with columns that matches a particular prefix. For example, if prefix is 'an', it will pass keys will columns like 'and', 'anti' but not keys with columns like 'ball', 'act'.
<code>PageFilter</code>	Implementation of Filter interface that limits results to a specific page size. It terminates scanning once the number of filter-passed rows is > the given page size.  Note that this filter cannot guarantee that the number of results returned to a client are <= page size. This is because the filter is applied separately on different region servers. It does however optimize the scan of individual HRegions by making sure that the page size is never exceeded locally.
<code>PrefixFilter</code>	Pass results that have same row prefix.
<code>QualifierFilter</code>	This filter is used to filter based on the column qualifier. It takes an operator (equal, greater, not equal, etc) and a byte [] comparator for the column qualifier portion of a key.  This filter can be wrapped with <code>WhileMatchFilter</code> and <code>SkipFilter</code> to add more control. Multiple filters can be combined using <code>FilterList</code> . If an already known column qualifier is looked for, use <code>Get.addColumn(byte[], byte[])</code> directly rather than a filter.
<code>RandomRowFilter</code>	A filter that includes rows based on a chance.
<code>RowFilter</code>	This filter is used to filter based on the key. It takes an operator (equal, greater, not equal, etc) and a byte [] comparator for the row, and column qualifier portions of a key.  This filter can be wrapped with <code>WhileMatchFilter</code> to add more control. Multiple filters can be combined using <code>FilterList</code> . If an already known row range needs to be scanned, use <code>CellScanner</code> start and stop rows directly rather than a filter.
<code>SingleColumnValueExcludeFilter</code>	A Filter that checks a single column value, but does not emit the tested column. This will enable a performance boost over <code>SingleColumnValueFilter</code> , if the tested column value is not actually needed as input (besides for the filtering itself).

Filter	Description
SingleColumnValueFilter	<p>This filter is used to filter cells based on value. It takes a <code>CompareFilter.CompareOp</code> operator (equal, greater, not equal, etc), and either a byte [] value or a <code>ByteArrayComparable</code>.</p> <p>If we have a byte [] value then we just do a lexicographic compare. For example, if passed value is 'b' and cell has 'a' and the compare operator is LESS, then we will filter out this cell (return true). If this is not sufficient (eg you want to deserialize a long and then compare it to a fixed long value), then you can pass in your own comparator instead.</p> <p>You must also specify a family and qualifier. Only the value of this column will be tested. When using this filter on a <code>CellScanner</code> with specified inputs, the column to be tested should also be added as input (otherwise the filter will regard the column as missing).</p> <p>To prevent the entire row from being emitted if the column is not found on a row, use <code>setFilterIfMissing(boolean)</code>. Otherwise, if the column is found, the entire row will be emitted only if the value passes. If the value fails, the row will be filtered out.</p> <p>In order to test values of previous versions (timestamps), set <code>setLatestVersionOnly(boolean)</code> to false. The default is true, meaning that only the latest version's value is tested and all previous versions are ignored.</p> <p>To filter based on the value of all scanned columns, use <code>ValueFilter</code>.</p>
SkipFilter	<p>A wrapper filter that filters an entire row if any of the Cell checks do not pass.</p> <p>For example, if all columns in a row represent weights of different things, with the values being the actual weights, and we want to filter out the entire row if any of its weights are zero. In this case, we want to prevent rows from being emitted if a single key is filtered. Combine this filter with a <code>ValueFilter</code>:</p> <pre data-bbox="820 1318 1458 1430">scan.setFilter(new SkipFilter(new ValueFilter(CompareOp.NOT_EQUAL, new BinaryComparator(Bytes.toBytes(0))));</pre> <p>Any row which contained a column whose value was 0 will be filtered out (since <code>ValueFilter</code> will not pass that Cell). Without this filter, the other non-zero valued columns in the row would still be emitted.</p>
TimestampsFilter	<p>Filter that returns only cells whose timestamp (version) is in the specified list of timestamps (versions).</p> <p>Note: Use of this filter overrides any time range/time stamp options specified using <code>Get.setTimeRange(long, long)</code>, <code>Scan.setTimeRange(long, long)</code>, or <code>Scan.setTimeStamp(long)</code>. See the <a href="#">Apache HBase API, Client package</a> for detailed information.</p>

Filter	Description
ValueFilter	This filter is used to filter based on column value. It takes an operator (equal, greater, not equal, etc) and a byte [] comparator for the cell value.  This filter can be wrapped with WhileMatchFilter and SkipFilter to add more control. Multiple filters can be combined using FilterList. To test the value of a single qualifier when scanning multiple qualifiers, use SingleColumnValueFilter.
WhileMatchFilter	A wrapper filter that returns true from filterAllRemaining() as soon as the wrapped filters Filter.filterRowKey(byte[], int, int), Filter.filterKeyValue(org.apache.hadoop.hbase.Cell), Filter.filterRow() or Filter.filterAllRemaining() methods returns true.

### HBase Java Regular Expressions Support

This topic defines the subset of Java regular expressions that are supported for HPE Ezmeral Data Fabric Database tables.

Filters used with Scan operations support regular expressions. When you filter scans on HPE Ezmeral Data Fabric Database tables, you can use regular expressions that comprise the [Perl-Compatible Regular Expressions library](#), as well as a subset of the regular expressions that are supported in `java.util.regex.pattern`.

### Characters

Pattern	Description
x	The character x
\\	The backslash character
\\On	The character with octal value On (0 <= n <= 7)
\\Onn	The character with octal value Onn (0 <= n <= 7)
\\xhh	The character with hexadecimal value 0xhh
\\t	The tab character ('\\u0009')
\\n	The newline (line feed) character ('\\u000A')
\\r	The carriage-return character ('\\u000D')
\\f	The form-feed character ('\\u000C')
\\a	The alert (bell) character ('\\u0007')
\\e	The escape character ('\\u001B')
\\cx	The control character corresponding to x

**Character Classes**

Pattern	Description
[abc]	a, b, or c (simple class)
[Supported Regular Expressions in MapR Tables^abc]	Any character except a, b, or c (negation)
[a-zA-Z]	a through z or A through Z, inclusive (range)

**Predefined Character Classes**

Pattern	Description
.	Any character (may or may not match line terminators)
\d	A digit: [0-9]
\D	A non-digit: [Supported Regular Expressions in MapR Tables^0-9]
\s	A whitespace character: [ \t\n\x0B\r]
\S	A non-whitespace character: [Supported Regular Expressions in MapR Tables^\s]
\w	A word character: [a-zA-Z_0-9]
\W	A non-word character: [Supported Regular Expressions in MapR Tables^\w]

**Classes for Unicode Blocks and Categories**

Pattern	Description
\p{Lu}	An uppercase letter (simple category)
\p{Sc}	A currency symbol

**Boundaries**

Pattern	Description
^	The beginning of a line
\$	The end of a line
\b	A word boundary
\B	A non-word boundary
\A	The beginning of the input
\G	The end of the previous match
\Z	The end of the input but for the final terminator, if any

Pattern	Description
\z	The end of the input

### Greedy Quantifiers

Pattern	Description
X?	X, once or not at all
X*	X, zero or more times
X+	X, one or more times
X{n}	X, exactly n times
X{n,}	X, at least n times
X{n,m}	X, at least n but not more than m times

### Reluctant Quantifiers

Pattern	Description
X??	X, once or not at all
X*?	X, zero or more times
X+?	X, one or more times
X{n}?	X, exactly n times
X{n,}?	X, at least n times
X{n,m}?	X, at least n but not more than m times

### Possessive Quantifiers

Pattern	Description
X?+	X, once or not at all
X*+	X, zero or more times
X++	X, one or more times
X{n}+	X, exactly n times
X{n,}+	X, at least n times
X{n,m}+	X, at least n but not more than m times

**Logical Operators**

Pattern	Description
XY	X followed by Y
X Y	Either X or Y
(X)	X, as a capturing group

**Back References**

Pattern	Description
\n	Whatever the nth capturing group matches

**Quotation**

Pattern	Description
\	Nothing, but quotes the following character
\Q	Nothing, but quotes all characters until \E
\E	Nothing, but ends quoting started by \Q

**Special Constructs**

Pattern	Description
(?:X)	X, as a non-capturing group
(?=X)	X, via zero-width positive lookahead
(?!X)	X, via zero-width negative lookahead
(?<=X)	X, via zero-width positive lookbehind
(?<!X)	X, via zero-width negative lookbehind
(?>X)	X, as an independent, non-capturing group

*HBase Java Comparators Support*

HPE Ezmeral Data Fabric Database supports the following Java filters, which work identically to their Apache HBase versions. See the [Apache HBase API](#) for more information, specifically, the [Apache HBase Filter](#) package.

Comparator	Description
>BinaryComparator	A binary comparator which lexicographically compares against the specified byte array using <code>Bytes.compareTo(byte[], byte[])</code> .
BinaryPrefixComparator	A comparator which compares against a specified byte array, but only compares up to the length of this byte array. For the rest it is similar to BinaryComparator.

Comparator	Description
BitComparator	A bit comparator which performs the specified bitwise operation on each of the bytes with the specified byte array. Then returns whether the result is non-zero.
NullComparator	A binary comparator which lexicographically compares against the specified byte array using <code>Bytes.compareTo(byte[], byte[])</code> .
RegexStringComparator	<p>This comparator is for use with <code>CompareFilter</code> implementations, such as <code>RowFilter</code>, <code>QualifierFilter</code>, and <code>ValueFilter</code>, for filtering based on the value of a given column. Use it to test if a given regular expression matches a cell value in the column.</p> <p>Only <code>EQUAL</code> or <code>NOT_EQUAL</code> comparisons are valid with this comparator.</p> <p>For example:</p> <pre>ValueFilter vf = new ValueFilter(CompareOp.EQUAL,     new RegexStringComparator(         // v4 IP address         "(((25[0-5] 2[0-4][0-9] [01]? [0-9][0-9]?)\\.){3,3}" +         "(25[0-5] 2[0-4][0-9] [01]? [0-9][0-9]?)\\.([0-9]+)?" +         " " +         // v6 IP address         "([\\dA-Fa-f]{1,4}:){7}[\\ \\dA-Fa-f]{1,4})(:[\\d]{1,3}.)*" +         "{3}[\\d]{1,3})?)(\\/[ 0-9]+)?");</pre>
SubstringComparator	<p>This comparator is for use with <code>SingleColumnValueFilter</code>, for filtering based on the value of a given column. Use it to test if a given substring appears in a cell value in the column. The comparison is case insensitive.</p> <p>Only <code>EQUAL</code> or <code>NOT_EQUAL</code> tests are valid with this comparator.</p> <p>For example:</p> <pre>SingleColumnValueFilter scvf =     new SingleColumnValueFilter("col",     CompareOp.EQUAL,     new SubstringComparator("substr"));</pre>

### Unsupported HBase Java Methods

This topic identifies the HBase Java methods that are not supported for HPE Ezmeral Data Fabric Database tables. Attempts to call any of these methods results in an `UnsupportedOperationException` exception.

### Methods for ACLs for cells:

- `Put.setACL(String user, org.apache.hadoop.hbase.security.access.Permission perms)`

- `Append.setACL(Map<String,org.apache.hadoop.hbase.security.access.Permission> perms)`
- `Delete.setACL(Map<String,org.apache.hadoop.hbase.security.access.Permission> perms)`
- `Increment.setACL(Map<String,org.apache.hadoop.hbase.security.access.Permission> perms)`

#### Methods for cell visibility:

- `Put.setCellVisibility(org.apache.hadoop.hbase.security.visibility.CellVisibility expression)`
- `Append.setCellVisibility(org.apache.hadoop.hbase.security.visibility.CellVisibility expression)`
- `Delete.setCellVisibility(org.apache.hadoop.hbase.security.visibility.CellVisibility expression)`
- `Increment.setCellVisibility(org.apache.hadoop.hbase.security.visibility.CellVisibility expression)`

#### Methods for time-to-live for cell values:

- `Put.setTTL(long ttl)`
- `Append.setTTL(long ttl)`
- `Delete.setTTL(long ttl)`
- `Increment.setTTL(long ttl)`

#### Other methods

- `Delete.deleteFamilyVersion(byte[] family, long timestamp)`
- `Scan.setReversed(boolean reversed)`
- `Scan.setBatch()`
- `Scan.setCaching()`
- `Scanner.next(int nbRows)`

#### Impersonation through the HBase REST Gateway

Impersonation enables access to tables via user IDs other than the user that runs the Gateway.

You can enable user impersonation to access HPE Ezmeral Data Fabric Database tables via the HBase REST Gateway. This feature is not supported in earlier combinations of MapR and HBase packages.

Impersonation is only supported if the REST Gateway is running as the `mapr` user (`MAPR_USER`).

You can enable impersonation via the Gateway on both non-secure and secure MapR clusters (secured using either MapR SASL or Kerberos). HPE Ezmeral Data Fabric Database does not support gateway impersonation using a Thrift interface.

**NOTE:** Impersonation for HBase REST Gateway is enabled by default on secure clusters.

## Enabling Impersonation on a Non-Secure Cluster

### About this task

To enable impersonation on a non-secure cluster, follow these steps:

### Procedure

1. Install the `mapr-hbase` package on a cluster that is running version 4.0.2 or later. This package contains all of the HBase binaries. For installation details, see [HBase Client and HPE Ezmeral Data Fabric Database](#).
2. Enable simple authentication via the REST Gateway by appending the following property to the `hbase-site.xml` file (`/opt/mapr/hbase/hbase<hbase_version>/conf/hbase-site.xml`): The simple authentication protocol is a Hadoop pseudo authenticator that serves as an example and is part of the `hadoop-common` package.

```
<property>
<name>hbase.rest.authentication.type</name>
<value>simple</value>
</property>
```

3. Set the following environment variable to enable impersonation:

```
export MAPR_IMPERSONATION_ENABLED=1
```

4. Start the REST Gateway server as the `MAPR_USER`.

```
/opt/mapr/hbase/hbase<hbase_version>/bin/hbase-daemon.sh start rest -p
port
```

### Using Custom Authentication

This section describes how to use Hadoop pseudo authentication for custom authentication.

### About this task

Editing the `hbase-site.xml` file is the procedure to follow if you want to use Hadoop pseudo authentication. Alternatively, you can write and use your own authenticator to substitute for the "simple" configuration by implementing the Hadoop AuthenticationHandler interface. If you are using custom authentication, place your authenticator jar in the following directory:

```
/opt/mapr/hbase/hbase-<hbase_version>/lib/
```

Then start the REST Gateway.

### Mapping to HBase Table Namespaces

This section describes mapping table namespaces between Apache HBase tables and HPE Ezmeral Data Fabric Database [binary tables](#).

The MapR implementations of the HBase Java API and `libhbase` differentiate between Apache HBase tables and HPE Ezmeral Data Fabric Database tables according to table names. In certain cases, such as migrating code from Apache HBase tables to HPE Ezmeral Data Fabric Database tables, users need to force the API they are using to access a HPE Ezmeral Data Fabric Database table, even though the table name could map to an Apache HBase table. The `hbase.table.namespace.mappings` property allows you to map Apache HBase table names to HPE Ezmeral Data Fabric Database tables. This property is typically set in the configuration file `/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/core-site.xml`.

In general, if a table name includes a slash (/), the name is assumed to be a path to a HPE Ezmeral Data Fabric Database table, because slash is not a valid character for Apache HBase table names. In the case of "flat" table names without a slash, namespace conflict is possible, and you might need to use table mappings.

### Table Mapping Naming Conventions

A table mapping takes the form `name:map`, where `name` is the table name to redirect and `map` is the modification made to the name. The value in `name` can be a literal string or contain the `*` wildcard. When mapping a name with a wild card, the mapping is treated as a directory. Requests to tables with names that match the wild card are sent to the directory in the mapping.

When mapping a name that is a literal string, you can choose from two different behaviors:

- End the mapping with a slash to indicate that this mapping is to a directory. For example, the mapping `mytable1:/user/aaa/` sends requests for table `mytable1` to the full path `/user/aaa/mytable1`.
- End the mapping without a slash, which creates an alias and treats the mapping as a full path. For example, the mapping `mytable1:/user/aaa` sends requests for table `mytable1` to the full path `/user/aaa`.

### Mappings and Table Listing Behaviors

When you use the `list` command without specifying a directory, the command's behavior depends on two factors:

- Whether a table mapping exists
- Whether Apache HBase is installed and running

Here are three different scenarios and the resulting `list` command behavior for each.

- There is a table mapping for `*`, as in `*:/tables`. In this case, the `list` command lists the tables in the mapped directory.
- There is no mapping for `*`, and Apache HBase is installed and running. In this case, the `list` command lists the HBase tables.
- There is no mapping for `*`, and Apache HBase is not installed or is not running.
  - For HBase 0.98.12, the shell will try to connect to an HBase cluster but it will return an error instead.
  - For HBase 1.1 or above, if the `mapr.hbase.default.db` property in the `hbase-site.xml` is set to `hbase`, the `list` command will return an error stating that HBase is not available. If the `mapr.hbase.default.db` property is set to `maprdb`, `list` command will list the HPE Ezmeral Data Fabric Database tables under the user's home directory.

### Example 1: Map all HBase tables to HPE Ezmeral Data Fabric Database tables in a directory

In this example, any flat table name `foo` is treated as a HPE Ezmeral Data Fabric Database table in the directory `/tables_dir/foo`.

```
<property>
  <name>hbase.table.namespace.mappings</name>
  <value>*:/tables_dir</value>
</property>
```

**Example 2: Map specific Apache HBase tables to specific HPE Ezmeral Data Fabric Database tables**

In this example, the Apache HBase table name `mytable1` is treated as a HPE Ezmeral Data Fabric Database table at `/user/aaa/mytable1`. The Apache Hbase table name `mytable2` is treated as a HPE Ezmeral Data Fabric Database table at `/user/bbb/mytable2`. All other Apache HBase table names are treated as stock Apache HBase tables.

```
<property>
  <name>hbase.table.namespace.mappings</name>
  <value>mytable1:/user/aaa/,mytable2:/user/bbb/</value>
</property>
```

**Example 3: Combination of specific table names and wildcards**

Mappings are evaluated in order. In this example, the flat table name `mytable1` is treated as a HPE Ezmeral Data Fabric Database table at `/user/aaa/mytable1`. The flat table name `mytable2` is treated as a HPE Ezmeral Data Fabric Database table at `/user/bbb/mytable2`. Any other flat table name `foo` is treated as a HPE Ezmeral Data Fabric Database table at `/tables_dir/foo`.

```
<property>
  <name>hbase.table.namespace.mappings</name>
  <value>mytable1:/user/aaa/,mytable2:/user/bbb/,*/tables_dir</value>
</property>
```

**Thread-pool Settings for Performance**

The HPE Ezmeral Data Fabric Database C APIs internally have one thread pool per client. Threads work on the async tasks enqueued by a client application. There are two thread-pool parameters that you can modify in the `/opt/mapr/conf/dbclient.conf` file for better application performance.

**fs.mapr.pool.threads**

This parameter controls the number of connections that a client application makes with HPE Ezmeral Data Fabric Database for append, increment, read, and scan requests. For a higher rate of throughput to HPE Ezmeral Data Fabric Database, you can increase this value. The default value is 10.

**fs.mapr.highpri.pool.threads**

This parameter controls the number of threads that invoke application-provided callbacks. If an application's callbacks are not lightweight but instead perform complex calculations that require significant processing, increase this value to avoid delays in invoking callbacks. The default value is 2.

**Building MapReduce Applications**

This section provides information about building and running custom MapReduce application that access HPE Ezmeral Data Fabric Database binary tables.

The steps for building and running custom MapReduce applications that run against HPE Ezmeral Data Fabric Database are the same as the steps for building and running custom MapReduce applications that run against Apache HBase. The steps are documented in the Apache HBase Reference Guide at <http://hbase.apache.org/book.html#mapreduce>.

However, you must use an HBase JAR file from MapR's Maven repository at <https://repository.mapr.com/nexus/content/groups/mapr-public/org/apache/hbase/hbase-server/>. The name of the JAR file that you use must contain the version of HBase and the version of MapR that you are using.

For example, if you are using HBase 1.1 and MapR version 5.1, you would use the file `hbase-server-1.1.1-mapr-1602.jar`.

## Performing Bulkloads with MapReduce

This section describes custom MapReduce applications used to perform bulkloads for HPE Ezmeral Data Fabric Database binary tables.

You can use the `HFileOutputFormat.configureIncrementalLoad()` method for writing custom MapReduce applications to perform bulk loads. Although the name of the method implies that you can use it only for incremental bulk loads, the method also works for full bulk loads, provided that the `-bulkload`, `BULKLOAD`, or `Bulkload` parameter for a table is set to true, as described in [Bulk Loading and HPE Ezmeral Data Fabric Database Tables](#).

If you have a custom MapReduce applications that does not use `HFileOutputFormat.configureIncrementalLoad()`, simply use the path to the HPE Ezmeral Data Fabric Database table that you want to load. Using `HFileOutputFormat.configureIncrementalLoad()` provides at least two advantages:

This method performs a number of tasks that your application would otherwise need to do explicitly:

1. Inspects the table to configure a total order partitioner
2. Uploads the partitions file to the cluster and adds it to the DistributedCache
3. Sets the number of reduce tasks to match the current number of regions
4. Sets the output key/value class to match `HFileOutputFormat`'s requirements
5. Sets the reducer up to perform the appropriate sorting (either `KeyValueSortReducer` or `PutSortReducer`)

This method turns off Speculative Execution automatically. For details, see the note below.

### **WARNING:** Turning off Speculative Execution

Speculative Execution of MapReduce tasks is on by default. For custom applications that load HPE Ezmeral Data Fabric Database binary tables, it is recommended to turn Speculative Execution off. When it is on, the tasks that import data might run multiple times. Multiple tasks for an incremental bulkload could insert one or more versions of a record into a table. Multiple tasks for a full bulkload could cause loss of data if the source data continues to be updated during the load.

If your custom MapReduce application uses `HFileOutputFormat.configureIncrementalLoad()`, you do not have to turn off Speculative Execution manually.

`HFileOutputFormat.configureIncrementalLoad()` turns it off automatically. Speculative Execution is automatically turned off for MapReduce utilities such as `CopyTable` and `ImportTsv`.

If you are writing a custom MapReduce application that does not use the `HFileOutputFormat.configureIncrementalLoad()` method for bulk loading, you must turn off Speculative Execution manually.

Turn off Speculative Execution by setting the following MapReduce version 2 parameter to false:

```
mapreduce.map.speculative
```

If the job is programmatically written, you can turn off Speculative Execution at the code level:

```
job.setSpeculativeExecution(false);
```

## Setting for OJAI Applications to Use Data Fabric Client Features

Describes how to set the classpath for OJAI applications to use data-fabric client features.

When you launch an OJAI application that needs to submit MapReduce or YARN applications, or to run `hadoop fs` or `hadoop mfs` commands, ensure that you prefix the classpath with `/opt/mapr/conf:/opt/mapr/hadoop/hadoop-2.7.0/etc/hadoop`. Alternatively, copy the `core-site.xml` file to the `/src/main/resources/` folder.

## Developing Applications for JSON Tables

As part of its support for JSON tables, HPE Ezmeral Data Fabric Database implements the OJAI API. The OJAI API provides methods for creating, reading, updating, and deleting JSON documents in HPE Ezmeral Data Fabric Database JSON tables. It is available in Java, and starting in EEP 6.0, also available in Node.js, Python, C#, and Go. HPE Ezmeral Data Fabric Database also provides a HPE Ezmeral Data Fabric Database JSON Client API for managing JSON tables and a HPE Ezmeral Data Fabric Database JSON REST API for performing basic operations using HTTP calls.

The following shows the general flow for developing an OJAI client application that accesses HPE Ezmeral Data Fabric Database JSON tables:

1. Make a connection to HPE Ezmeral Data Fabric Database using the OJAI Connection and Driver interfaces.
2. Request a HPE Ezmeral Data Fabric Database JSON table using the JSON DocumentStore.
3. Specify the table, document, or column family operation.
4. Perform the operation on the table.
5. Return the results.

For additional information about OJAI, refer to the following:

- [OJAI wiki page](#)
- [OJAI github repository](#) - The README file provides an introduction to OJAI

The HPE Ezmeral Data Fabric Database JSON Client API, implemented in Java, enables you to create, drop, and alter HPE Ezmeral Data Fabric Database JSON tables and column families.

You can also use HTTP calls to create, delete, and query HPE Ezmeral Data Fabric Database JSON tables [Using the HPE Ezmeral Data Fabric Database JSON REST API](#) on page 3482.

### API Documentation

The following are links to the detailed API pages:

- [Java OJAI Client API](#)
- [Node.js OJAI Client API](#)
- [Python OJAI Client API](#)
- [C# OJAI Client API](#)
- [Go OJAI Client API](#)
- [HPE Ezmeral Data Fabric Database JSON Client API](#)

**NOTE:** Beginning with MapR version 6.0, the HPE Ezmeral Data Fabric Database `Table` interface in the HPE Ezmeral Data Fabric Database JSON Client API is deprecated and replaced by the `DocumentStore` interface in the OJAI API.

### Managing JSON Tables

This section describes how to create, list, and delete JSON tables, alter JSON table attributes, set permissions, and manage column families. You can perform these operations using either the HPE Ezmeral Data Fabric Database JSON Client API library or HPE Ezmeral Data Fabric Database Shell commands.

## HPE Ezmeral Data Fabric Database JSON Client API

The HPE Ezmeral Data Fabric Database JSON Client API is a Java library. There is not a Python implementation of the library, but you can create and drop HPE Ezmeral Data Fabric Database JSON tables in the Python OJAI client.

### Admin API

Use the methods in this interface to perform these tasks:

- Create JSON tables
- Alter JSON tables
- Delete JSON tables
- List JSON tables in a folder
- See if a JSON table exists

For a full list of methods, see the [MapR Admin interface](#)

### TableDescriptor API

Use the methods in this interface to perform these tasks:

- Create tables with non-default values for one or more of their parameters
- Alter tables

For a full list of interfaces and methods, see the [MapR TableDescriptor interface](#).

## HPE Ezmeral Data Fabric Database Shell

The `mapr dbshell` is a tool for the creation and lightweight manipulation of JSON tables and documents. To run `dbshell`, enter `mapr dbshell` on the command line after logging into a node in a MapR cluster. See [HPE Ezmeral Data Fabric Database Shell \(JSON Tables\)](#) on page 5500 for more information.

### Creating JSON Tables

This topic describes how to create HPE Ezmeral Data Fabric Database JSON tables using either programmatic APIs or `dbshell`.

**NOTE:** Before creating a table, you typically create a directory and MapR volume. This is not required; however, it is a good practice. For example, assuming both the directory and volume names are `sample`, the command would be:

```
// Create directories with hadoop
hadoop fs -mkdir /sample

// Create a MapR volume using maprcli create volume
maprcli volume create -name sample -path /sample -type rw
```

## Java

The following Java code examples show you how to create a table in the following ways:

- By using the default values for the table attributes,
- By setting specific values for the table attributes.

See the [Admin](#) and [TableDescriptor](#) APIs for more information.

The following example shows how to create a table by calling an Admin object's `createTable()` method and passing, as an argument, the path that you want to use for the new table:

```
public void createJSONTable(String tablePath) throws DBException {
    try (Admin admin = MapRDB.newAdmin()) {
        if (!admin.tableExists(tablePath)) {
            admin.createTable(tablePath);
        }
    }
}
```

Tables created with this version of the `createTable()` method use the default values for their attributes.

Alternatively, the following example shows how to create a table by passing a `TableDescriptor` object as an argument to the `createTable()` method:

```
/* Create a TableDescriptor for the table to create,
 * passing in the path of the table.
 */
TableDescriptor tableDescriptor = MapRDB.newTableDescriptor(tablePath);

/* Pass the TableDescriptor object and the path to the table
 * to the Admin.createTable() method.
 */
public void createJSONTable(String tablePath, TableDescriptor
tableDescriptor) throws DBException {
    try (Admin admin = MapRDB.newAdmin()) {
        if (!admin.tableExists(tablePath)) {
            admin.createTable(tableDescriptor);
        }
    }
}
```

This alternative allows you to set values for some of the table's attributes.

### Node.js

To create a table in the Node.js OJAI client, call the `Connection.createStore()` method:

```
connection.createStore(table_path)
    .then((store) => {
        // Process result
        ...
    });
```

The method returns a `DocumentStore` object.

### Python

To create a table in the Python OJAI client, call the `Connection.create_store()` method:

```
store = connection.create_store(store_path=table_path)
```

The method returns a `DocumentStore` object.

## dbshell

The following **dbshell** command shows code syntax for creating a table:

```
# mapr dbshell
maprdb root:> create /<tablePath>/<tableName>
```

## C#

To create a table in the C# OJAI client, call the `connection.CreateStore(string storePath)` method:

```
var store = connection.CreateStore(string storePath);
```

The method returns a `DocumentStore` object.

## Go

To create a table in the Go OJAI client, call the `connection.CreateStore()` function:

```
store, error := connection.CreateStore("/store_path")
```

The function returns a new `DocumentStore` and an error.

## Listing JSON Tables

This topic describes how to list the JSON tables by using either the HPE Ezmeral Data Fabric Database JSON Client API or HPE Ezmeral Data Fabric Database Shell.

### Permission Required

The `readAce` permission on the volumes where the JSON tables are located. [Setting Whole Volume ACEs](#) on page 1358

## Java

The table is listed by calling HPE Ezmeral Data Fabric Database JSON Client API `Admin` object's `listTables()` method and passing, as an argument, the path of the folder.

Use a conditional loop to iterate through the returned list and retrieve the names of the tables.

```
public void listTables(String parentFolder) throws DBException {
    try (Admin admin = MapRDB.newAdmin()) {
        for(Path tablePath : admin.listTables(parentFolder)) {
            System.out.println(tablePath);
        }
    }
}
```

**NOTE:** The parameter `parentFolder` provides a path to a folder that is in the MapR filesystem. See "**Table Paths**" in [HPE Ezmeral Data Fabric Database JSON Tables](#) for examples.

## dbshell

```
# mapr dbshell
maprdb root:> list /demo
/demo/user
/demo/checkin
/demo/review
/demo/business
```

```
/demo/tip
5 table(s) found.
```

See [dbshell list](#) on page 5518 for further details.

### Altering JSON Table Attributes

This topic describes how to change the values of table attributes by using the HPE Ezmeral Data Fabric Database JSON Client API.

In this example, the code turns off the `bulkload` flag on the table. Applications will typically need to turn off this flag after a bulk load of the table with the `import`, `importJSON`, or `copytable` utility.

Create a `TableDescriptor` object for an existing table by passing the path of the table to the `Admin` interface's `getTableDescriptor()` method.

### Permissions Required

The `readAce` and `writeAce` permissions on the volumes where the JSON tables are located. For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1358.

### Example

Tables are altered a by using the `TableDescriptor` object and then passing that object to the `Admin` interface's `altertable()` method.

```
public void alterTable(String tablePath) throws DBException {
    try (Admin admin = MapRDB.newAdmin()) {
        TableDescriptor tableDesc = admin.getTableDescriptor(tablePath);
        // set bulk load to false
        tableDesc.setBulkLoad(false);
        admin.alterTable(tableDesc);
    }
}
```

### Deleting JSON Tables

This topic describes how to delete HPE Ezmeral Data Fabric Database JSON tables using either programmatic APIs or `dbshell`.

#### Java

To delete a table in the Java OJAI client, call an `Admin` object's `deleteTable()` method and pass, as an argument, the path of the table to delete:

```
public void deleteTable(String tablePath) throws DBException {
    try (Admin admin = MapRDB.newAdmin()) {
        if (admin.tableExists(tablePath)) {
            admin.deleteTable(tablePath);
        }
    }
}
```

#### Node.js

To delete a table in the Node.js OJAI client, call the `Connection.deleteStore()` method:

```
connection.deleteStore(table_path)
    then((deleteResponse) => {
        // Process deleteReponse
        ...
    });
```

## Python

To delete a table in the Python OJAI client, call the `Connection.delete_store()` method:

```
rc = connection.delete_store(store_path=table_path)
```

## dbshell

```
# mapr dbshell
maprdb root:> drop <table path>
```

See [dbshell drop](#) on page 5504 for additional details.

## C#

To delete a table in the C# OJAI client, call the `connection.DeleteStore(string storePath)` method:

```
connection.DeleteStore(string storePath);
```

## Go

To delete a table in the Go OJAI client, call the `connection.DeleteStore()` function:

```
err := connection.DeleteStore("/store_path")
```

## Permissions Required

You must have both the `readAce` and `writeAce` permissions on the volumes where the JSON tables are located to delete it. For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1358.

### Permission Types for Fields and Column Families in JSON Tables

By using ACEs, you can grant or deny access to fields and column families that are in JSON tables.

There are three types of permission:

- Traverse (`traverseperm`)
- Read (`readperm`)
- Write (`writeperm`)

### Traverse (`traverseperm`)

This permission allows the grantee to descend a hierarchy of fields to access fields on which the grantee has write or read permission.

For example, suppose that a user has read and write access to only field b below.

To access field **b**, the user would need to be able to traverse (pass through) field **a**. In this case, because the entire document is in the default column family, the user could be granted traverse permission on the default column family. Field **a** would inherit the traverse permission.

If a user was denied traverse permission on the default column family, the user would not be able to access field **b**. Granting traverse permission on field **a** in this case would have no effect.

In the example below, field a is part of the cf1 column family.

To be able to read and write at field b, the user could be granted the traverse permission on the column family.

**Read (readperm)**

The read permission allows the grantee to read from a field.

This permission extends to fields that are nested below the field on which the permission was granted. However, grantees can be explicitly denied the permission on any of the nested fields.

**Write (writeperm)**

This permission allows the grantee to delete a field, insert a value into a field, or overwrite field value.

As illustrated in the two diagrams below, deleting a field also deletes all fields that are nested within that field, even those fields on which the write permission is explicitly denied.

*Obtaining readperm and writeperm on Fields*

In this scenario, you want to perform an operation on a field, and the operation requires that you have readperm and writeperm permissions on that field. How you obtain these permissions depends on whether the field is in the default column family or a non-default column family.

**If the field is in the default column family**

In the document below, you want to perform an operation on field `c`, which is in the default column family. The operation requires you to have `readperm` and `writeperm` on field `c`.

**Figure 28: Schematic diagram of an JSON document in which all fields are in the default column family**

**Case 1: You have `readperm` and `writeperm` on the default column family**

In this case, field `c` inherits these permissions, assuming that the permissions were not denied on field `a` or `b`.

If you do not have `readperm` and `writeperm` on field `a` or `b`, you need `traverseperm` on the field that denied you those permissions. You also need `readperm` and `writeperm` explicitly granted to you on field `c`. You could be granted these permissions with the `maprcli table cf colperm set` command, as in these examples:

```

maprcli table cf colperm set -path
<path to JSON table>
-cfname default -name
a.b -traverseperm u:<user ID> |
<existing ACE for this field>
maprcli table cf colperm set -path
<path to JSON table> -cfname default
  
```

```
-name a.b.c -readperm u:<user ID>
| <existing ACE for this
field> -writeperm
u:<user ID> | <existing ACE for this
field>
```

### Case 2: You do not have `readperm` and `writeperm` on the default column family

In this case, you need the `traverseperm` permission on the default column family. Fields `a` and `b` inherit this permission. You also need `readperm` and `writeperm` on field `c`.

You could be granted these permissions with commands similar to these:

```
maprcli table cf edit -path
<path to JSON table> -cfname
default -traverseperm
u:<user ID> | <existing ACE for this
field>
maprcli table cf colperm set -path
<path to JSON table> -cfname
default -name a.b.c
-readperm u:<user ID> | <existing ACE
for this field> -writeperm u:<user
ID> |
<existing ACE for this field>
```

### If the field is in a non-default column family

**NOTE:** Non-default column families are an advanced feature of HPE Ezmeral Data Fabric Database's native JSON support. For information about them, see [Column Families in JSON table](#).

In the following document, you want to perform an operation on field `c`, which is in the column family `cf1` that is defined at field `b` with the path `a.b`.

**Figure 29: Schematic diagram of an JSON document in which fields `b` and `c` are in a column family that has the path `a.b`**

**Case 1: You do not have `readperm` and `writperm` on field `b`**

You need `traverseperm` on field `b` and both `readperm` and `writperm` on field `c`. You can be granted these permissions with commands similar to these:

```
/opt/mapr/bin/maprcli table cf
edit -path <path to JSON
table> -cfname cf1
-traverseperm u:<user ID> | <existing
ACE for this field>
maprcli table cf colperm set -path
<path to JSON table> -cfname
cf1 -name a.b.c
-readperm u:<user ID> | <existing ACE
for this field> -writperm u:<user
ID> |
<existing ACE for this field>
```

**Case 2: You do have `readperm` and `writperm` on field `b`**

You do not need any further permissions. Field `c` inherits your `readperm` and `writperm` permissions from field `b`.

*Obtaining readperm or writeperm on Fields*

In this scenario, you want to perform an operation on a field, and the operation requires that you have `readperm` or `writeperm` permissions on that field. How you obtain either permission depends on whether the field is in the default column family or a non-default column family.

**If the field is in the default column family**

In the following document, you want to perform an operation on field `c`, which is in the default column family. The operation requires you to have `readperm` or `writeperm` on field `c`.

**Figure 30: Schematic diagram of an JSON document in which all fields are in the default column family**

**Case 1: You have the same permission (`readperm` or `writeperm`) on the default column family**

In this case, field `c` inherits the permission, assuming that the permission was not denied on field `a` or `b`.

If you do not have `readperm` or `writeperm` on field `a` or `b`, you need `traverseperm` on the field that denied you the permission that you need. You also need `readperm` or `writeperm` explicitly granted to you on field `c`.

Example commands to grant these permissions:

```
/opt/mapr/bin/maprcli table cf
colperm set -path <path to JSON
table> -cfname
```

```
default -name a.b -traverseperm
u:<user ID> | <existing ACE for this
field>
```

The next example command grants `readperm`:

```
/opt/mapr/bin/maprcli table cf
colperm set -path <path to JSON
table> -cfname
default -name a.b.c -readperm u:<user
ID> | <existing ACE for this field>
```

### Case 2: You do not have the same permission (`readperm` or `writeperm`) on the default column family

In this case, you need the `traverseperm` permission on the default column family. You also need `readperm` or `writeperm` explicitly granted to you on field `c`.

Example commands to grant these permissions:

```
/opt/mapr/bin/maprcli table cf
edit -path <path to JSON
table> -cfname cf1
-traverseperm u:<user ID> | <existing
ACE for this field>
```

This next example command grants `readperm`:

```
/opt/mapr/bin/maprcli table cf
colperm set -path <path to JSON
table> -cfname cf1
-name a.b.c -readperm u:<user ID> |
<existing ACE for this field>
```

### If the field is in a non-default column family

**NOTE:** Non-default column families are an advanced feature of HPE Ezmeral Data Fabric Database's native JSON support. For information about them, see [Column Families in JSON Tables](#).

In the following document, you want to perform an operation on field `c`, which is in the column family that is defined at field `b` with the path `a.b`. The operation requires you to have `readperm` or `writeperm` on field `c`.

**Figure 31: Schematic diagram of an JSON document in which fields **b** and **c** are in a column family that has the path **a.b****

**Case 1: You do not have the permission you need (readperm or writeperm) on field **b****

You need `traverseperm` on field **b**, and you need `readperm` or `writeperm` granted to you explicitly on field **c**.

Example commands to grant these permissions:

```
/opt/mapr/bin/maprcli table cf
edit -path <path to JSON
table> -cfname cf1
-traverseperm u:<user ID> | <existing
ACE for this field>
maprcli table cf colperm set -path
<path to JSON table> -cfname cf1
-name a.b.c -readperm u:<user ID> |
<existing ACE for this field>
```

**Case 2: You do have the permission you need (readperm or writeperm) on field **b****

You do not need any further permissions. Field **c** inherits your `readperm` and `writeperm` permissions from field **b**.

*Setting Permissions on Arrays*

If you are granting permissions on a field and the field contains array data, you must grant the permission on the array field. This grants access not only to array data in the field, but also nested documents and

scalar data. It is also possible to set permissions on subfields within nested documents that are stored in an array.

**NOTE:** This topic describes the behavior of permissions in HPE Ezmeral Data Fabric Database version 6.1 and later, regardless of the data-fabric version you used to grant the permissions.

### Granting Permissions on Array Elements

Suppose you have the following documents where `person` is:

- An array of nested documents in document `id001`
- A single nested document in document `id002`
- A scalar value in document `id003`

```
{
  "_id" : "id001",
  "person" : [
    { "name" : { "last" : "Smith", "first" : "John" } },
    { "name" : { "last" : "Subramanium", "first" : "Ananya" } }
  ]
}
{
  "_id" : "id002",
  "person" : { "name" : { "last" : "Doe", "first" : "Jane" } }
}
{
  "_id" : "id003",
  "person" : "Unknown"
}
```

If you grant a user read permission on the array `person[ ]`, that user can read every field in every nested document within the array in document `id001`. The permission also enables the user to read the `person` field in documents `id002` and `id003`.

If you receive an error when trying to grant permission on `person[ ]` because you previously granted permission on `person`, then you (or an administrator with the appropriate permissions) must first remove the existing permission on `person`. If you expect the schema of the `person` field to evolve to include non-array and array data, then you should grant the permission on `person[ ]` rather than `person` to avoid having to remove the conflicting `person` permission.

You cannot grant permissions on individual elements in an array; for example: `person[1]`. Granting permission on an array enables access to the entire array.

### Granting Permissions on Nested Document Fields in an Array

If you want to restrict read access to only specific fields in `person`, whether the field is an array of nested documents or a single nested document, perform the following steps:

1. Deny the user read permission on the array `person[ ]`.
2. Grant the user traverse permission on the array `person[ ]`.
3. Grant the user read permission on the specific fields.

For example, to grant the user read permission on only the first names in the nested documents for the third step, grant read permission on `person[ ].name.first`. The permission enables the user to read the field in all nested documents in documents `id001` and `id002`.

If permissions already exist on `person.name.first`, then all attempts to define permissions on `person[].name.first` fails. You (or an administrator with the appropriate permissions) must first remove the existing permission on `person.name.first`. Similar to the scenario described in the previous section, if you expect the schema of the `person` field to evolve to include individual nested documents as well as arrays of nested documents, then you should grant the permission on `person[].name.first` to avoid having to remove the conflicting permission.

If you already have permissions on `person[].name.first`, then attempting to define permissions on `person.name.first` fails. There is no need to add this permission.

*Granting Permissions on JSON Tables*

Summarizes the default ACEs for the supported ways of setting read, traverse, and write permissions.

The default permissions for column families are determined when tables are created. The default permissions for fields are inherited from the column family where the fields are located.

Action	Method	Permissions	Default Access-Control Expressions
Set default permissions on new column families when creating a JSON table.	Java API	-defaultreadperm -defaulttraverseperm -defaultwriteperm	u:<ID of the process>
	maprcli table create		u:<user ID of table creator>
	mapr dbshell		
	Control System		
Set default permissions on new column families when editing a JSON table.	maprcli table edit		Current ACEs
	Control System		
Set permissions on a column family when creating the column family.	maprcli table cf create	-readperm -traverseperm -writeperm -indexperm	ACEs for -defaultreadperm, -defaulttraverseperm, and -defaultwriteperm
	Control System		
Set permissions on a column family when editing the column family.	maprcli table cf edit		Current ACEs
	Control System		
Set permissions on individual fields.	maprcli table cf colperm set		Inherited from column family or parent field
	Control System		
Set the dynamic mask	maprcli table cf column datamask set	-defaultunmaskedreadperm -unmaskedreadperm	Set to the table creator
	maprcli table cf colperm set		
	maprcli table create		
	maprcli table edit		
	maprcli table cf create		
	maprcli table cf edit		
	maprcli table cf colperm set		
	Control System		

## Managing Column Families

JSON tables store data in column families, which are collections of fields that are stored together on disk.

Each table has a default column family, which is default storage for all fields in the documents of a table. You can create additional column families to store data for a collection of fields in a separate location on disk. Queries that operate only on data that is stored in a column family are more efficient and better performing than queries on the same data when that data is stored with other data in a table. You can also cache values from a column family in memory.

Applications do not need to be aware of the existence of column families. They perform CRUD operations by using the paths of fields in a document. For example, to update any of the fields below `a.c`, an application does not need to be aware that the field is in the column family at the path `a.c`. The application simply moves through the document along the path to the field.

For more information, see [Column Families in JSON Tables](#) on page 654.

### Creating Column Families

You can create column families with the HPE Ezmeral Data Fabric Database JSON Java API library by using the `Admin.createTable(TableDescriptor tableDescriptor)` method.

Add a column family to the `TableDescriptor` object before passing that object to the `createTable()` method.

### Restriction

If any existing column family in a JSON table, including the default column family, uses a time-to-live that is greater than 0, you cannot create any additional column families in that table. See [Setting TTL for Data](#).

### Permissions Required

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `createrenamefamilyperm` on the table

### Example

Here is an example of using the API to create two column families -- the default column family and a custom column family -- during the creation of a table:

```
/* Create a TableDescriptor for the table to create,
   passing in the path of the table. */
TableDescriptor tableDescriptor = MapRDB.newTableDescriptor(tablePath);

/* Create a FamilyDescriptor for the default column family.
   When you create a table with the API, you must also create
   the default column family.
   After creating the FamilyDescriptor, add it to
   the TableDescriptor. */
FamilyDescriptor defaultfamilyDesc = MapRDB.newDefaultFamilyDescriptor();
tableDescriptor.addFamily(defaultfamilyDesc);

/* Create a FamilyDescriptor for the custom column family
   to create. The setJsonFieldPath() method specifies the field
   at which to create the column family.
   After creating the FamilyDescriptor, add it to
   the TableDescriptor. */
FamilyDescriptor familyDescriptor = MapRDB.newFamilyDescriptor()
    .setName("CF1")
    .setJsonFieldPath("a.b");
tableDescriptor.addFamily(familyDescriptor);
```

```
// Pass the TableDescriptor to the Admin.createTable() method.
public void createJSONTable(String tablePath, TableDescriptor
tableDescriptor) throws DBException {
    try (Admin admin = MapRDB.newAdmin()) {
        if (!admin.tableExists(tablePath)) {
            admin.createTable(tableDescriptor);
        }
    }
}
```

### Alternative Method

You can also create column families in JSON tables by running the command `table cf create`.

#### *Altering Column Families*

You can alter column families, including the default column family for a table, by using the `Admin.alterFamily()` method in the HPE Ezmeral Data Fabric Database JSON Java API library.

### Permissions Required

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `createrenamefamilyperm` on the table

### Example

Here is an example of using the API to change the name of a column family:

```
public void alterColumnFamily(String tablePath, String familyName,
String newFamilyName) throws DBException {
    try (Admin admin = MapRDB.newAdmin()) {

        /* Get a TableDescriptor object for the table. This object
           gives access to the column families that are in the table. */
        TableDescriptor tableDesc = admin.getTableDescriptor(tablePath);

        /* Get a FamilyDescriptor object for the column family to
           change the name of. /
        FamilyDescriptor familyDesc = tableDesc.getFamily(familyName);

        // Rename the column family.
        familyDesc.setName(newFamilyName);

        /* Call alterFamily(), passing in the path of the table,
           the original name of the column family, and the
           FamilyDescriptor in which the new name was set. */
        admin.alterFamily(tablePath, familyName, familyDesc);
    }
}
```

### Alternative Method

You can also edit column families in JSON tables by running the command `table cf edit`.

#### *Deleting Column Families*

You can delete a column family (except for the default column family) in a JSON table with the `Admin.deleteFamily()` Java method.

**!** **IMPORTANT:** Starting in the 6.0 release, you cannot delete a column family from a JSON table.

**Permissions Required**

The `readAce` and `writeAce` permissions on the volumes where the JSON tables are located. For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1358.

**Behavior**

The data that is in the specified column family is deleted. If the column family is followed by one or more column families in a hierarchy, the other column families in the hierarchy are unaffected and still accessible. For example, if column family `CF1` at path `a.c` is followed by column family `CF2` at path `a.c.f`, `CF2` remains accessible and only the data in `CF1` is deleted.

Before deleting the column family CF1 at a.c	After deleting the column family CF1 at a.c
<pre>{   "a" : {     "b" : "value_b",     "c" : {       "d" : "value_d",       "e" : "value_e",       "f" : {         "g" :           "value_g",         "h" : "value_h"       }     }   } }</pre>	<pre>{   "a" : {     "b" : "value_b",     "c" : {       "d" : "",       "e" : "",       "f" : {         "g" :           "value_g",         "h" : "value_h"       }     }   } }</pre>

**Example of using the `Admin.deleteFamily()` method**

```
public void deleteColumnFamily(String tablePath, String familyName) throws
DBException {
  try (Admin admin = MapRDB.newAdmin()) {
    if (admin.tableExists(tablePath)) {
      admin.deleteFamily(tablePath, familyName);
    }
  }
}
```

Parameter	Description
<code>tablePath</code>	The path of the table in the MapR filesystem. See the "Table Paths" section in <a href="#">HPE Ezmeral Data Fabric Database JSON Tables</a> on page 651.
<code>familyName</code>	The name of the column family to delete. You cannot delete the default column family. If <code>familyName</code> is equal to "default", the API returns an exception.

*Setting TTL for Data*

You can delete stale JSON documents in JSON tables automatically by setting a time-to-live (TTL) value on the column family.

TTL is set only on the default column family in a JSON table. The duration that you set applies to each entire JSON document in the JSON table.

**NOTE:** Only the default column family can exist in order to set TTL; no other column families can exist in the JSON table. You also cannot set the TTL for a JSON table if it has secondary indexes.

Data can become stale. If the data in an JSON document has not been updated within a certain period of time, you might want to delete the document. In the case of a large amount of JSON documents, applications should not have to track the time between updates and then delete the expired documents.

Because the time-to-live that is set on a column family affects an entire JSON table, only the default column family is allowed to have a non-default time-to-live value. In addition, to prevent multiple column families from having non-default time-to-live values, additional column families can not be created in a table if the default column family has a non-default value. This is because if more than one column family had a non-default TTL value, fragments of documents would expire at different times, leading to inconsistent views of data.

### Permission Required

The `writeAce` permission on the volumes where the JSON tables are located. For information about how to set permissions on volumes, see [Setting Whole Volume ACEs](#) on page 1358.

### Example: Setting the default column family to a non-default time-to-live value

If you set the time-to-live parameter for the default column family to 864,000 seconds, JSON documents in that table are considered to be stale if the document's data has not been updated within 10 days and are automatically deleted.

The following code example creates a JSON table, the default column family and sets the TTL to a non-default value of 10 days (864,000 seconds).

```
/* Create a TableDescriptor for the table to create,
   passing in the path of the table. */
TableDescriptor tableDescriptor = MapRDB.newTableDescriptor(tablePath);

/* Create a FamilyDescriptor for the default column family.
   When you create a table with the API, you must also create
   the default column family.
   Set the TTL to 10 days.
   After creating the FamilyDescriptor, add it to
   the TableDescriptor. */
FamilyDescriptor defaultfamilyDesc = MapRDB.newDefaultFamilyDescriptor()
    .setTTL(864000);
tableDescriptor.addFamily(defaultfamilyDesc);

// Pass the TableDescriptor to the Admin.createTable() method.
public void createJSONTable(String tablePath, TableDescriptor
tableDescriptor) throws DBException {
    try (Admin admin = MapRDB.newAdmin()) {
        if (!admin.tableExists(tablePath)) {
            admin.createTable(tableDescriptor);
        }
    }
}
```

### Managing JSON Documents

To perform CRUD operations (create, read, update, and delete) on JSON documents in HPE Ezmeral Data Fabric Database JSON tables using the OJAI API, you use `Document`, `DocumentStore`, and `DocumentMutation` objects.

You can also perform these operations using [HPE Ezmeral Data Fabric Database Shell \(JSON Tables\)](#) on page 5500.

**Document**

To create a JSON document, you must create a `Document` object. See the following for information specific to each language:

**Java**

To create a JSON document in Java OJAI, use the [Document](#) interface.

See [Creating JSON Documents in Java OJAI](#) on page 3329 to learn about the different ways to create `Document` objects in Java.

**Node.js**

To create a `Document` object in Node.js OJAI, simply create a JSON object.

See [Sample OJAI Code for Creating JSON Documents](#) on page 3334 for an example of how to do this.

**Python**

The preferred approach is to create a `Document` object in Python is to create a Python dictionary. You can also use the [Document](#) interface.

See [Creating JSON Documents in Python OJAI](#) on page 3333 to learn about these two ways to create JSON documents in Python.

**C#**

To create a `Document` object in C# OJAI, create a C# object.

See [Sample OJAI Code for Creating JSON Documents](#) on page 3334 for an example of how to do this.

For C# OJAI examples, see this [Github page](#).

**Go**

To create a `Document` object in Go OJAI, create a Go structure.

See [Sample OJAI Code for Creating JSON Documents](#) on page 3334 for an example of how to do this.

**DocumentStore**

After you create a `Document` object, you can pass it to the `DocumentStore` interface. The interface has methods to perform the following tasks:

- Delete documents from tables
- Insert documents into tables
- Replace documents in tables

See the following for API links to the `DocumentStore` interface in each language:

**Java**

[DocumentStore](#)

**NOTE:** By default, OJAI implements non-buffered writes. If you want buffered writes instead, use the `ojai.mapr.documentstore.buffer-writes` option and with the `Document` object. This option is available only in the Java OJAI API. See [Enabling Buffered Writes in Java OJAI](#) on page 3454 for more information.

**Node.js**

[DocumentStore](#)

**Python**

[DocumentStore](#)

**C#**

[DocumentStore](#)

For C# OJAI examples, see this [Github page](#).

**Go**

[DocumentStore](#)

### DocumentMutation

To make changes to JSON documents, create a `DocumentMutation` object. A `DocumentMutation` enables you to perform OJAI mutations, which includes replacing, updating, combining, and deleting fields in a JSON document. For a list of available mutations, see [Using OJAI Mutation Syntax](#) on page 3346.

**Java**

To create a `DocumentMutation` object, call the methods in the `DocumentMutation` class corresponding to the mutation operations you want to perform. See [DocumentMutation](#) for a list of available methods.

Pass the `DocumentMutation` object to either the [DocumentStore.checkAndUpdate](#) or [DocumentStore.update](#) method to apply the changes to the document. The first method accepts a [QueryCondition](#) parameter that must evaluate to true for the mutation to be applied. Both methods have an `_id` parameter corresponding to the document to be updated.

**Node.js**

To create a `DocumentMutation` object, create a JSON object [Using OJAI Mutation Syntax](#) on page 3346.

Pass the `DocumentMutation` object to either the [DocumentStore.checkAndUpdate](#) or [DocumentStore.update](#) method to apply the changes to the document. The `DocumentStore.checkAndUpdate()` method accepts an OJAI query condition parameter that must evaluate to true for the mutation to be applied. Both methods have an `_id` parameter corresponding to the document to be updated.

**Python**

To create a `DocumentMutation` object, create a Python dictionary object [Using OJAI Mutation Syntax](#) on page 3346.

Pass the `DocumentMutation` object to either the [DocumentStore.check\\_and\\_update](#) or [DocumentStore.update](#) method to apply the changes to the document. The `DocumentStore.check_and_update()` method accepts an OJAI query condition parameter that must evaluate to true for the mutation to be applied. Both

methods have an `_id` parameter corresponding to the document to be updated.

## C#

To create a `DocumentMutation` object, create a C# object [Using OJAI Mutation Syntax](#) on page 3346.

Pass the `DocumentMutation` object to either the `DocumentStore.CheckAndUpdate` or `DocumentStore.Update` method to apply the changes to the document. The `DocumentStore.CheckAndUpdate` method accepts an OJAI query condition parameter that must evaluate to true for the mutation to be applied. Both methods have an `_id` parameter corresponding to the document to be updated.

For C# OJAI examples, see this [Github page](#).

## Go

To create a `DocumentMutation` object, create a Go structure [Using OJAI Mutation Syntax](#) on page 3346.

Pass the `DocumentMutation` structure to either the `DocumentStore.CheckAndUpdate` or `DocumentStore.Update` method to apply the changes to the document. The `DocumentStore.CheckAndUpdate` method accepts an OJAI query condition parameter that must evaluate to true for the mutation to be applied. Both methods have an `_id` parameter corresponding to the document to be updated.

By default, the default maximum size of a JSON document is 32 MB. A `DocumentMutation` does not enforce this limit. HPE Ezmeral Data Fabric Database enforces the limit when you pass your `DocumentMutation` object to the `DocumentStore` method. See [JSON Document Size](#) on page 637 for information about how to increase this limit.

See [Examples: Updating JSON Documents](#) on page 3354 for examples that use mutations.

### Creating JSON Documents in OJAI

The way you create a JSON document in your OJAI application depends on the language you use.

#### *Creating JSON Documents in Java OJAI*

There are several ways to create JSON documents in your Java OJAI application. They all require you to call the `Connection.newDocument` method to create a `Document` object.

#### More information

[Connection](#)

[Document](#)

### Create a Document Using a Document Object in Java OJAI

You can create a new JSON document in your Java OJAI client by first calling the `Connection.newDocument()` method to create a `Document` object, and then calling methods on the object to specify document fields and values.

The following shows the detailed sequence of steps:

1. Create a new JSON document by calling the `newDocument()` method in the `Connection` class.
2. Specify the ID of the document with the `setId()` method.
3. Specify field names and their values with the `set()` or `setArray()` method.
4. Return the results in a `Document` object.

For example, suppose you want to create the following JSON document:

```
{
  "_id" : "movie0000001",
  "title" : "OJAI -- The Documentary",
  "studio" : "MapR Technologies, Inc.",
  "release_date" : "2015-09-29",
  "trailers" : {
    "teaser" : "https://10.10.21.90/trailers/teaser",
    "theatrical" : "https://10.10.21.90/trailers/theatrical"
  },
  "characters" : [
    "Heroic Developer",
    "Evil Release Manager",
    "Mad Development Manager"
  ],
  "box_office_gross" : 1000000000L
}
```

The following method creates the document:

```
public Document buildDocument() {
    return connection.newDocument()
        .setId("movie0000001")
        .set("title", "OJAI -- The Documentary")
        .set("studio", "MapR Technologies, Inc.")
        .set("release_date", Values.parseDate("2015-09-29"))
        .set("trailers.teaser", "https://10.10.21.90/trailers/teaser")
        .set("trailers.theatrical", "https://10.10.21.90/trailers/
theatrical")
        .setArray("characters",
            ImmutableList.of(
                "Heroic Developer", "Evil Release Manager", "Mad
Development Manager"))
        .set("box_office_gross", 1000000000L);
}
```

### Create a Document from a JSON String in Java OJAI

You can create a new JSON document in your Java OJAI client by passing a JSON string to the `Connection.newDocument()` method.

To create the following JSON document:

```
{
  "_id": "id001",
  "a": 1,
  "b": "aString",
  "array": [
    1,
    2,
    "arrStr",
    {
      "c": "arrMapStr"
    }
  ]
}
```

Call `Connection.newDocument()`, passing in a JSON string with escaped quotes:

```
Document pojoDoc = connection.newDocument(
    "{ \"_id\": \"id001\", \"a\": 1, \"b\": \"aString\", \"array\": [1, 2, \"arrStr\", \"c\": \"arrMapStr\"] }");
```

### Create a Document from a JavaBean

You can create a new JSON document in your Java OJAI client by passing a JavaBean to the `Connection.newDocument(Object bean)` method. Through an example, the content shows you a sample JavaBean class, how to create a bean for that class, how to create a JSON document from the bean, and how to convert a JSON document back to a bean.

### Sample JavaBean Class

Suppose that you are using a JavaBean class named `ExampleJson`:

```
package com.example;

import java.util.ArrayList;
import java.util.HashMap;
import java.util.List;
import java.util.Map;
import javax.annotation.Generated;
import com.fasterxml.jackson.annotation.JsonAnyGetter;
import com.fasterxml.jackson.annotation.JsonAnySetter;
import com.fasterxml.jackson.annotation.JsonIgnore;
import com.fasterxml.jackson.annotation.JsonInclude;
import com.fasterxml.jackson.annotation.JsonProperty;
import com.fasterxml.jackson.annotation.JsonPropertyOrder;

@JsonInclude(JsonInclude.Include.NON_NULL)
@Generated("org.jsonschema2pojo")
@JsonPropertyOrder({
    "a",
    "b",
    "array"
})

public class ExampleJson {

    @JsonProperty("a")
    private Double a;
    @JsonProperty("b")
    private String b;
    @JsonProperty("array")
    private List<Object> array = new ArrayList<Double>();
    @JsonIgnore
    private Map<String, Object> additionalProperties = new HashMap<String, Object>();

    /**
     *
     * @return
     * The a
     */
    @JsonProperty("a")
    public Double getA() {
        return a;
    }

    /**
     *
     */
}
```

```

    * @param a
    * The a
    */
    @JsonProperty("a")
    public void setA(Double a) {
        this.a = a;
    }

    /**
     *
     * @return
     * The b
     */
    @JsonProperty("b")
    public String getB() {
        return b;
    }

    /**
     *
     * @param b
     * The b
     */
    @JsonProperty("b")
    public void setB(String b) {
        this.b = b;
    }

    /**
     *
     * @return
     * The array
     */
    @JsonProperty("array")
    public List<Object> getArray() {
        return array;
    }

    /**
     *
     * @param array
     * The array
     */
    @JsonProperty("array")
    public void setArray(List<Object> array) {
        this.array = array;
    }

    @JsonAnyGetter
    public Map<String, Object> getAdditionalProperties() {
        return this.additionalProperties;
    }

    @JsonAnySetter
    public void setAdditionalProperty(String name, Object value) {
        this.additionalProperties.put(name, value);
    }
}

```

## Create a Bean

You can create a bean for the `ExampleJson` class with the following code:

```
ExampleJson bean = new ExampleJson();

bean.setA(1);
bean.setB("aString");

List arrList = new ArrayList();
arrList.add(1);
arrList.add(2);
arrList.add("arrStr");

Map arrMap = new HashMap();
arrMap.put("c", "arrMapStr");
arrList.add(arrMap);
bean.setArray(arrList);
```

## Create a New Document from a Bean

After creating the `ExampleJson` bean, you can create a JSON document using the bean with the following call:

```
Document pojoDoc = connection.newDocument(bean);
```

The document will have the following structure:

```
{
  "a":1,
  "b":"aString",
  "array":[
    1,
    2,
    "arrStr",
    {
      "c":"arrMapStr"
    }
  ]
}
```

## Create a JavaBean from a JSON Document

You can also create a JavaBean from a JSON document. For example, suppose you modify the document that you created earlier:

```
pojoDoc.set("d", "10");
```

The following converts the modified document back into an `ExampleJson` bean:

```
ExampleJson bean = pojoDoc.toJavaBean(ExampleJson.class);
```

### *Creating JSON Documents in Python OJAI*

There are two ways to create JSON documents in your Python OJAI application, one of which is the preferred approach.

The preferred way to create a Python dictionary object and then pass it to the `Connection.new_document()` method:

```
json_dict = {
    "_id" : "movie00000001",
    "title" : "OJAI -- The Documentary",
    "studio" : "MapR Technologies, Inc.",
    "release_date" : "2015-09-29",
    "trailers" : {
        "teaser" : "https://10.10.21.90/trailers/teaser",
        "theatrical" : "https://10.10.21.90/trailers/theatrical"
    },
    "characters" : [
        "Heroic Developer",
        "Evil Release Manager",
        "Mad Development Manager"
    ],
    "box_office_gross" : 1000000000L
}
new_document = connection.new_document(dictionary=json_dict)
```

Alternatively, you can call Document interface methods to set fields and values:

```
doc = connection.new_document()
    .set_id("movie00000001")
    .set('title', 'OJAI - The Documentary')
    .set('studio', 'MapR Technologies, Inc.')
    .set('release_date', ODate.parse(date_str='2015-09-29'))
    .set('trailers.teaser', 'https://10.10.21.90/trailers/teaser')
    .set('trailers.theatrical', 'https://10.10.21.90/trailers/
theatrical')
    .set('characters', ['Heroic Developer', 'Evil Release Manager',
'Mad Development Manager'])
    .set('box_office_gross', 1000000000)
```

See the following for more details about the APIs:

        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Json string
        var jsonStr =
            @"{" +
                @"""_id"":""id001""," +
                @"""name"":""Joe""," +
                @"""age"":{" +
                    @"$numberInt"":""50""}," +
                @"""address"":{" +
                    @"street"":""555 Moon Way""," +
                    @"city"":""Gotham"" +
                @"}" +
            @}";

        // Create a document from jsonStr
        var documentJson = connection.NewDocument(jsonStr);

        // Print the OJAI Document
        Console.WriteLine(documentJson.ToJsonString());

        // Create new document with the same fields using constructor
        var documentConstructed = connection.NewDocument()
            .SetID("id001")
            .Set("name", "Joe")
            .Set("age", 50)
            .Set("address.street", "555 Moon Way")
            .Set("address.city", "Gotham");

        // Print the OJAI Document
        Console.WriteLine(documentConstructed.ToJsonString());

        // Close the OJAI connection
        connection.Close();
    }
}
```

**Go**

The code is available at [001\\_get\\_connection\\_create\\_document.go](#).

```
package main

import (
    "fmt"
```

```

    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=node1.cluster.com"

    // Create a connection to data access server
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Json string or map from which the Document will be created
    newMap := map[string]interface{}{
        "_id": "id001",
        "name": "Joe",
        "age": 50,
        "address": map[string]interface{}{
            "street": "555 Moon Way",
            "city": "Gotham",
        },
    }

    // Create new document from json_document
    newDocument := connection.CreateDocumentFromMap(newMap)

    // Print the new OJAI Document
    fmt.Println(newDocument.AsJsonString())

    // Close connection
    connection.Close()
}

```

### Examples: Inserting JSON Documents

This section contains sample code that inserts a JSON document into a HPE Ezmeral Data Fabric Database JSON table. It also shows the HPE Ezmeral Data Fabric Database Shell syntax for inserting documents.

#### Java

The following code is available at [OJAI\\_002\\_GetStoreAndInsertDocuments.java](#).

After you create the JSON document, call the [DocumentStore.insertOrReplace](#) method to insert the document into HPE Ezmeral Data Fabric Database.

```

*/
package com.mapr.ojai.examples;

import org.ojai.Document;
import org.ojai.store.Connection;
import org.ojai.store.DocumentStore;
import org.ojai.store.DriverManager;

import com.mapr.ojai.examples.data.Dataset;
import com.mapr.ojai.examples.data.User;

public class OJAI_002_GetStoreAndInsertDocuments {

    public static void main(String[] args) {

        System.out.println("==== Start Application ===");

        // Create an OJAI connection to MapR cluster
        final Connection connection = DriverManager.getConnection("ojai:mapr:");

        // Get an instance of OJAI
        final DocumentStore store = connection.getStore("/demo_table");

        for (final User someUser : Dataset.users) {
            // Create an OJAI Document form the Java bean (there are other ways
too)
            final Document userDocument = connection.newDocument(someUser);

            System.out.println("\t inserting "+ userDocument.getId());

            // insert the OJAI Document into the DocumentStore
            store.insertOrReplace(userDocument);
        }

        // Close this instance of OJAI DocumentStore
        store.close();

        // close the OJAI connection and release any resources held by the
connection
        connection.close();

        System.out.println("==== End Application ===");
    }
}

```

## Node.js

The following code is available at [OJAI\\_002\\_GetStoreAndInsertDocuments.js](#).

The following code creates a list of JSON objects and then calls the [DocumentStore.insertOrReplace](#) method to insert the document into HPE Ezmeral Data Fabric Database.

```

/*

        {'areaCode': '555', 'number': '542-5656'}]
    }
];
const promiseList = documentList.map((doc) => {
    // Print the OJAI Document
    console.log(JSON.stringify(doc));
    // Insert the OJAI Document into the DocumentStore
    return store.insertOrReplace(doc);
});
return Promise.all(promiseList);
})
.then(() => {
    // close the OJAI connection
    connection.close();
});

```

## Python

The following code is available at [002\\_get\\_store\\_and\\_insert\\_documents.py](#).

The following code creates a list of JSON dictionary objects, creates `Document` objects, and calls the `DocumentStore.insert_or_replace` method to insert the documents into HPE Ezmeral Data Fabric Database.

```

from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
    "ssl=true;" \
    "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
    "sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
if connection.is_store_exists('/demo_table'):
    store = connection.get_store('/demo_table')
else:
    store = connection.create_store('/demo_table')

document_list = [{ '_id': 'user0000',
    'age': 35,
    'firstName': 'John',
    'lastName': 'Doe',
    'address': {
        'street': '350 Hoger Way',
        'city': 'San Jose',
        'state': 'CA',
        'zipCode': 95134
    },
    'phoneNumbers': [
        {'areaCode': 555, 'number': 5555555},
        {'areaCode': '555', 'number': '555-5556'}]
    },
    { '_id': 'user0001',
    'age': 26,
    'firstName': 'Jane',
    'lastName': 'Dupont',
    'address': {

```

```

        'street': '320 Blossom Hill Road',
        'city': 'San Jose',
        'state': 'CA',
        'zipCode': 95196
    },
    'phoneNumbers': [
        {'areaCode': 555, 'number': 5553827},
        {'areaCode': '555', 'number': '555-6289'}]
    },
    {'_id': 'user0002',
    'age': 45,
    'firstName': 'Simon',
    'lastName': 'Davis',
    'address': {
        'street': '38 De Mattei Court',
        'city': 'San Jose',
        'state': 'CA',
        'zipCode': 95142
    },
    'phoneNumbers': [
        {'areaCode': 555, 'number': 5425639},
        {'areaCode': '555', 'number': '542-5656'}]
    }
]

for doc_dict in document_list:
    # Create new document from json_document
    new_document = connection.new_document(dictionary=doc_dict)
    # Print the OJAI Document
    print(new_document.as_json_str())

    # Insert the OJAI Document into the DocumentStore
    store.insert_or_replace(new_document)

# close the OJAI connection
connection.close()

```

## dbshell

The following shows the syntax to insert a document with HPE Ezmeral Data Fabric Database Shell. See [dbshell insert](#) on page 5516 for more information and examples.

```

# mapr dbshell
maprdb root:>

// Syntax for inserting a document using the document ID
maprdb root:> insert <table path> --value '{"_id": "<row-key", < table
field >}'

// Syntax for inserting a document using document value
maprdb root:> insert <table path> --id <row-key> --value '{"_id":
"<row-key", < table field >}'

```

## C#

The following code is available at [002\\_GetStoreAndInsertDocuments.cs](#).

The following code creates a list of JSON strings, creates Documents from the list, and calls the [DocumentStore.InsertOrReplace](#) method to insert the documents into the HPE Ezmeral Data Fabric Database.

```
using System;
using MapRDB.Driver;
using System.Collections.Generic;

public class GetStoreAndInsertDocuments
{
    public void GetStoreAndInsertDocuments()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        if (!connection.StoreExist("/demo_table"))
            connection.CreateStore("/demo_table");
        var store = connection.GetStore("/demo_table");

        var documentList = new List<string>
        {
            @"{ ""_id"": ""user0000"", " +
            @""age"": { ""$numberInt"": ""35"" }, " +
            @""firstName"": ""John"", " +

"542-5656"}},
        },
    },
}

for _, docMap := range documentArray {
    // Create new document from json_document
    newDocument := connection.CreateDocumentFromMap(docMap)
    // Print the new OJAI Document
    fmt.Println(newDocument.AsJsonString())
    //Insert the OJAI Document into the DocumentStore
    store.InsertOrReplaceDocument(newDocument)
}

// Close connection
connection.Close()
}

```

### Using OJAI Mutation Syntax

To perform updates using OJAI, you specify the document you want to update using its `_id` field, create *mutations* for that document, and then update it in your document store. OJAI defines a syntax for specifying mutations. Mutations allow you to append, decrement, delete, increment, combine, replace, and update fields in a document. This topic describes the syntax for the supported mutation operations and provides examples.

The following table lists the mutations OJAI supports. Each entry in the table contains a brief description of the mutation and a link to a section in this topic that describes the mutation in more detail.

Mutation Operation	Description
<a href="#">Append</a>	Appends values to binary, string, and array fields
<a href="#">Decrement</a>	Decrements field values
<a href="#">Delete</a>	Deletes fields
<a href="#">Increment</a>	Increments field values
<a href="#">Merge</a>	Combines a nested document with an existing document
<a href="#">Put</a>	Replaces field values or adds new fields
<a href="#">Set</a>	Updates field values or adds new fields

The examples in this topic use the following sample JSON document:

```

{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false }, { "decimal" : 123.456 } ],
    "c" : {
      "d" : 10,
      "e" : "Hello"
    }
  },
  "m" : "MapR wins"
}

```

## OJAI Append Mutations

### Syntax

```
{ "$append": { "fieldpath": value } }
```

```
{ "$append": [ { "fieldpath1": value1 },
  { "fieldpath2": value2 }, ... ] }
```

### Description

The `$append` mutation is a read-modify-write operation. Use it to append specified values to existing binary, string, or array type fields. If there is type mismatch in any intermediate field specified in a *fieldpath* for the document, the mutation fails with an error. For example, an append mutation on field path `a.b.c` fails if the field `a` is a scalar.

To append multiple field paths, use an array notation to list the field paths.

### Example

The following mutation appends an element to the array `a.b` and appends the string " MapR" to the end of the string already in the field path `a.c.e`:

```
{ "$append": [ { "a.b": { "appd": 1 } },
  { "a.c.e": " MapR" } ] }
```

The mutation results in the following document, with the field updates highlighted in bold:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false },
  { "decimal" : 123.456 }, { "appd" :
1 } ],
    "c" : {
      "d" : 10,
      "e" : "Hello MapR"
    }
  },
  "m" : "MapR wins"
}
```

## OJAI Decrement Mutations

### Syntax

```
{ "$decrement": "fieldpath" }
```

```
{ "$decrement":
  { "fieldpath": decrementValue } }
```

```
{ "$decrement":
  [ { "fieldpath1": decrementValue1 },
  { "fieldpath2": decrementValue2 }, ... ] }
```

### Description

The `$decrement` mutation decrements the value in the *fieldpath*. To decrement multiple field paths, use an array notation to list the field paths.

If the *fieldpath* does not exist, the mutation adds a new field to the document with the value *decrementValue*.

The *decrementValue* is optional and defaults to -1.

The mutation fails if there is a type mismatch in the field.

### Example

The following updates the value 10 in *a.c.d* to 5 by using the decrement mutation:

```
{"$decrement":{"a.c.d":5}}
```

The mutation results in the following document, with the field update highlighted in bold:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false },
    { "decimal" : 123.456 } ],
    "c" : {
      "d" : 5,
      "e" : "Hello"
    }
  },
  "m" : "MapR wins"
}
```

## OJAI Delete Mutations

### Syntax

```
{"$delete":"fieldpath"}
```

```
{"$delete":
["fieldpath1","fieldpath2",...]}
```

### Description

The *\$delete* mutation removes either a single field or a list of fields from a document. If the field does not exist, the delete ignores that field.

### Example

The following mutation removes two fields from the document:

```
{"$delete":["a.b[1]","a.c.e"]}
```

The mutation results in the following document:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false } ],
    "c" : {
      "d" : 10
    }
  },
  "m" : "MapR wins"
}
```

## OJAI Increment Mutations

### Syntax

```
{"$increment": "fieldpath"}
```

```
{"$increment":  
{"fieldpath": incrementValue}}
```

```
{"$increment":  
[{"fieldpath1": incrementValue1},  
{"fieldpath2": decrementValue2}, ...]}
```

### Description

The `$increment` mutation increments the value in the *fieldpath*. To increment multiple field paths, use an array notation to list the field paths.

If the *fieldpath* does not exist, the mutation adds a new field to the document with the value *incrementValue*.

The *incrementValue* is optional and defaults to 1.

The mutation fails if there is a type mismatch in the field.

### Example

The following updates the value 10 in `a.c.d` to 15 by using the increment mutation:

```
{"$increment": {"a.c.d": 5}}
```

The mutation results in the following document, with the field update highlighted in bold:

```
{  
  "_id" : "id1",  
  "a" : {  
    "b" : [ { "boolean" : false } ],  
    { "decimal" : 123.456 } ],  
    "c" : {  
      "d" : 15,  
      "e" : "Hello"  
    }  
  },  
  "m" : "MapR wins"  
}
```

## OJAI Merge Mutations

### Syntax

```
{"$merge":  
{"fieldpath": nestedDocument}}
```

### Description

The `$merge` mutation combines a *nestedDocument* with an existing document at a specified *fieldpath*. If the original document already contains subfields specified in the *nestedDocument*, then the mutation replaces the values for those subfields. Otherwise, it adds new subfields to the document.

**NOTE:** The `$merge` mutation does not support the array notation that other mutation operations provide.

To specify more than one merge operation in a single mutation, use the syntax described at either [Specifying Multiple Mutation Operations](#) on page 3352 or [OJAI Mutations Without Explicit Mutation Operation Names](#) on page 3353. When using these syntax variations, avoid specifying overlapping field paths. HPE Ezmeral Data Fabric Database treats these as [conflicting mutations](#) and discards conflicts.

## Examples

The following mutation replaces the pre-existing field path `a.c.d` with the value `11`. It adds a new subfield `y` to the nested document `a.c`.

```
{ "$merge": { "a.c": { "d": 11, "y": "yo" } } }
```

The mutation results in the following document, with the field updates highlighted in bold:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false } ],
    { "decimal" : 123.456 } ],
    "c" : {
      "d" : 11,
      "e" : "Hello",
      "y" : "yo"
    }
  },
  "m" : "MapR wins"
}
```

The following mutation replaces the value in the field path `a.b` and adds a new subfield `a.d`:

```
{ "$merge": { "a": { "b": 1, "d": "MapR" } } }
```

The mutation results in the following document, with the field updates highlighted in bold:

```
{
  "_id" : "id1",
  "a" : {
    "b" : 1,
    "c" : {
      "d" : 10,
      "e" : "Hello"
    },
    "d" : "MapR"
  },
  "m" : "MapR wins"
}
```

## OJAI Put Mutations

### Syntax

```
{ "$put": { "fieldpath": value } }
```

```
{ "$put": [ { "fieldpath1": value1 },
  { "fieldpath2": value2 }, ... ] }
```

**Description**

The `$put` mutation is a replace operation. It is not a read-modify-write operation; it does no validation on the data. If the specified *fieldpath* exists, the mutation replaces the *fieldpath*'s value with the new *value*, regardless of the type of the original value. For example, you can update a field `a.b` from an array to a nested document. If the *fieldpath* does not exist, the mutation creates a new field with the given *value*. Because the operation does no data validation, it is significantly faster than the `set` operation.

To replace multiple field paths, use an array notation to list the field paths.

**Example**

The following example replaces the pre-existing fields `a.b` and `a.c.d` with values whose types differ from the original types. It also adds a new field `a.x`.

```
{ "$put": [ { "a.b": { "boolean": true } },
  { "a.c.d": "eureka" }, { "a.x": 1 } ] }
```

The mutation results in the following document, with the field updates highlighted in bold:

```
{
  "_id" : "id1",
  "a" : {
    "b" : { "boolean" : true },
    "c" : {
      "d" : "eureka",
      "e" : "Hello"
    },
    "x" : 1
  },
  "m" : "MapR wins"
}
```

The mutation behaves as follows for the pre-existing fields:

- For `a.b`, the mutation replaces the original array of nested documents with a single nested document.
- For `a.c.d`, the mutation changes the field from an integer to a string.

**OJAI Set Mutations****Syntax**

```
{ "$set": { "fieldpath": value } }
```

```
{ "$set": [ { "fieldpath1": value1 },
  { "fieldpath2": value2 }, ... ] }
```

**Description**

The `$set` mutation updates one or more fields in a document. It is a read-modify-write operation. It validates the type of the existing value before applying the mutation. If the specified *fieldpath* does not exist in a document, the mutation creates a new field. If the *fieldpath* exists but is not of the same type as the type of new *value*, then the entire mutation fails.

**Example**

To update multiple field paths, use an array notation to list the field paths.

The following example updates the pre-existing fields `a.b[0]` and `a.c.d`. It also adds a new field `a.x`.

```
{ "$set": [ { "a.b[0].boolean": true },
  { "a.c.d": 11 }, { "a.x": 1 } ] }
```

The mutation results in the following document, with the field updates highlighted in bold:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : true },
  { "decimal" : 123.456 } ],
    "c" : {
      "d" : 11,
      "e" : "Hello"
    },
    "x" : 1
  },
  "m" : "MapR wins"
}
```

**Specifying Multiple Mutation Operations**

You can specify more than one operation in a single mutation by specifying each operation separated by a comma.

The following is a mutation with six operations:

```
{
  "$set": { "x": [1, 2, 3] },
  "$put": { "a.c.e": { "$binary": "AAAADg==" } },
  "$increment": "a.b[1].decimal",
  "$delete": "a.b[0]",
  "$merge": { "newDoc": { "k": "MapR DBShell rocks!!" } },
  "$append": { "m": "!!!" }
}
```

It results in the following document, with the field updates highlighted in bold:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "decimal" : 124.456 } ],
    "c" : {
      "d" : 10,
      "e" : { "$binary" : "AAAADg==" }
    }
  },
  "m" : "MapR wins!!!",
  "newDoc" : { "k" : "MapR DBShell rocks!!" },
  "x" : [ 1, 2, 3 ]
}
```

The mutation applies the updates in the following manner:

- The `$set` mutation adds a new array field `x` with the value `[1, 2, 3]`.

- The `$put` mutation replaces the string `"Hello"` with the nested document `{"$binary": "AAAADg=="}`.
- The `$increment` mutation increments the value `123.456` in the second element of the array `a.b`.
- The `$delete` mutation deletes the field path `a.b[0]`, resulting in a single element array `a.b`.
- The `$merge` mutation adds a new field `newDoc` with the nested document `{"k": "MapR DBShell rocks!!"}` as its value.
- The `$append` mutation appends the string `"!!!"` to the end of the string `"MapR wins"`.

### Conflicting Mutations

When you specify a mutation with field paths that are overlapping, HPE Ezmeral Data Fabric Database detects the conflict, discards the previous conflicting operation, and proceeds with the next operation.

For example, suppose you have the following document:

```
{"_id": "id1", "a": {"b": {"c": 5}}}
```

The following mutation has two operations with overlapping fields `a.b`:

```
{"$delete": "a.b", "$set": {"a.b.d": 10}}
```

You may have intended for the mutation to first delete `a.b` and then to replace it with `a.b.d` as follows:

```
{"_id": "id1", "a": {"b": {"d": "10"}}}
```

But the *actual* result is the following:

```
{"_id": "id1", "a": {"b": {"c": 5, "d": "10"}}}
```

In this case, the set operation on `a.b.d` causes the delete operation on `a.b` to be discarded.

**NOTE:** In the earlier example in this section, the `$increment` and `$delete` operations are not conflicting because one operates on `a.b[1]`, while the other operates on `a.b[0]`. On the other hand, the following are conflicting operations:

```
{"$increment": "a.b[1].decimal", "$delete": "a.b"}
```

### OJAI Mutations Without Explicit Mutation Operation Names

You can specify a mutation without using an explicit mutation name. These mutations run as merge operations.

For example, the following mutation merges the fields `k` and `a.c.d` to the document by adding a new field `k` and updating `a.c.d`:

```
{"k": "eureka", "a": {"c": {"d": 1234}}}
```

The mutation results in the following document, with updates highlighted in bold:

```
{
  "_id" : "id1",
  "a" : {
    "b" : [ { "boolean" : false }, { "decimal" : 123.456 } ],
    "c" : {
```

```

    "d" : 1234,
    "e" : "Hello"
  },
  "k" : "eureka",
  "m" : "MapR wins"
}

```

### Examples: Updating JSON Documents

This section contains sample code that updates a JSON document in a HPE Ezmeral Data Fabric Database JSON table using an OJAI mutation. It also shows the HPE Ezmeral Data Fabric Database Shell syntax for updating documents.

See [Using OJAI Mutation Syntax](#) on page 3346 for more details about OJAI mutations.

### Java

The following code is available at [OJAI\\_012\\_UpdateDocument.java](#). It does the following:

- Finds a document using the [DocumentStore.findById](#) method
- Creates a [DocumentMutation](#) that updates a field
- Updates the document by calling the [DocumentStore.update](#) method

```

package com.mapr.ojai.examples;

import org.ojai.store.Connection;
import org.ojai.store.DocumentMutation;
import org.ojai.store.DocumentStore;
import org.ojai.store.DriverManager;

public class OJAI_012_UpdateDocument {

    public static void main(String[] args) {

        System.out.println("==== Start Application ===");

        // Create an OJAI connection to MapR cluster
        final Connection connection = DriverManager.getConnection("ojai:mapr:");

        // Get an instance of OJAI DocumentStore
        final DocumentStore store = connection.getStore("/demo_table");

        String docId = "user0002";

        // Print the document before update

```

```

    System.out.println( "\t"+
store.findById(docId).getMap("address").toString() );

    // Create a DocumentMutation to update the zipCode field
    DocumentMutation mutation = connection.newMutation()
        .set("address.zipCode", 95196L);

    System.out.println("\tUpdating document "+ docId);

    // Update the Document with '_id' = "user0002"
    store.update(docId, mutation);

    // Print the document after update
    System.out.println( "\t"+
store.findById(docId).getMap("address").toString() );

    // Close this instance of OJAI DocumentStore
    store.close();

    // close the OJAI connection and release any resources held by the
connection
    connection.close();

    System.out.println("==== End Application ===");
}
}

```

### Node.js - Update

The following code is available at [OJAI\\_011\\_UpdateDocument.js](#). It does the following:

- Finds a document using the [DocumentStore.findById](#) method
- Creates an OJAI mutation that updates a field
- Updates the document by calling the [DocumentStore.update](#) method

```

/*
 * Copyright (c) 2018 MapR, Inc.
 *
 * Licensed under the Apache License, Version 2.0 (the "License");
 * you may not use this file except in compliance with the License.
 * You may obtain a copy of the License at

 * WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
 * See the License for the specific language governing permissions and
 * limitations under the License.
 */

const { ConnectionManager } = require('node-maprdb');

const connectionString = 'localhost:5678?' +
    'auth=basic;' +

```

```

'user=mapr;' +
'password=mapr;' +
'ssl=true;' +
'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
'sslTargetNameOverride=node1.mapr.com';

let connection;
let store;
const docId = 'user0002';

// Create a connection to data access server
ConnectionManager.getConnection(connectionString)
  .then((conn) => {
    connection = conn;
    // Get a store
    return connection.getStore('/demo_table');
  })
  .then((newStore) => {
    // Get a store and assign it as a DocumentStore object
    store = newStore;
    // Find the document before update
    return store.findById(docId);
  })
  .then((docBeforeUpdate) => {
    // Print the document before update
    console.log(`Document with id ${docId} before update`);
    console.log(docBeforeUpdate);

    const mutation = {'$put': {'address.zipCode': 95196}};
    return store.update(docId, mutation);
  })
  .then(() => {
    // Find the document after update
    return store.findById(docId);
  })
  .then((docAfterUpdate) => {
    // Print the document after update
    console.log(`Document with id ${docId} before update`);
    console.log(docAfterUpdate);
  });

```

### Node.js - Check and Update

The following code is available at [OJAI\\_012\\_CheckAndUpdateDocument.js](#). It does the following:

- Finds a document using the [DocumentStore.findById](#) method
- Creates an OJAI mutation that updates a field
- Creates an OJAI condition to apply in the check and update
- Performs the check and update on the document by calling the [DocumentStore.checkAndUpdate](#) method

```

/*
 * Copyright (c) 2018 MapR, Inc.
 *
 * Licensed under the Apache License, Version 2.0 (the "License");
 * you may not use this file except in compliance with the License.

* See the License for the specific language governing permissions and
* limitations under the License.
*/

const { ConnectionManager } = require('node-maprdb');

const connectionString = 'localhost:5678?' +
  'auth=basic;' +
  'user=mapr;' +
  'password=mapr;' +
  'ssl=true;' +
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
  'sslTargetNameOverride=nodel.mapr.com';

let connection;
let store;
const docId = 'user0002';

// Create a connection to data access server
ConnectionManager.getConnection(connectionString)
  .then((conn) => {
    connection = conn;
    // Get a store
    return connection.getStore('/demo_table');
  })
  .then((newStore) => {
    // Get a store and assign it as a DocumentStore object
    store = newStore;
    // Find the document before update
    return store.findById(docId);
  })
  .then((docBeforeUpdate) => {
    // Print the document before update
    console.log(`Document with id ${docId} before update`)
    console.log(docBeforeUpdate);

    const mutation = {'$put': {'address.zipCode': 95196}};
    const condition = {'$eq': {'address.street': '320 Blossom Hill Road'}}
    return store.checkAndUpdate(docId, mutation, condition);
  })
  .then((updateResult) => {
    console.log(updateResult);
    // Find the document after update
    return store.findById(docId);
  })
  .then((docAfterUpdate) => {
    // Print the document after update
    console.log(`Document with id ${docId} before update`)
    console.log(docAfterUpdate);
  });

```

## Python - Update

The following code is available at [012\\_update\\_document.py](#). It does the following:

- Finds a document using the `DocumentStore.find_by_id` method
- Creates an OJAI mutation that updates a field

- Updates the document by calling the [DocumentStore.update](#) method

```

from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
                "ssl=true;" \
                "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
                "sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

doc_id = 'user0002'

# Print the document before update
document_before_update = store.find_by_id(doc_id)
print("Document with id {0} before update".format(doc_id))
print(document_before_update)

# Create mutation to update the zipCode field
mutation = {'$set': {'address.zipCode': 95196}}

# Execute update
store.update(_id=doc_id, mutation=mutation)

document_after_update = store.find_by_id(doc_id)
print('Document with id {0} after update'.format(doc_id))
print(document_after_update)

```

### Python - Check and Update

The following code is available at [013\\_check\\_and\\_update\\_document.py](#). It does the following:

- Finds a document using the [DocumentStore.find\\_by\\_id](#) method
- Creates an OJAI mutation that updates a field
- Creates an OJAI condition to apply in the check and update
- Performs the check and update on the document by calling the [DocumentStore.check\\_and\\_update](#) method

```

from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
                "ssl=true;" \
                "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
                "sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

doc_id = 'user0001'

# Print the document before update
document_before_update = store.find_by_id(doc_id)
print("Document with id {0} before update".format(doc_id))
print(document_before_update)

```

```
# Create mutation to update the zipCode field
mutation = {'$put': {'address.zipCode': 99999}}

# Create condition
condition = {'$eq': {'address.street': '320 Blossom Hill Road'}}

# Execute check_and_update.
# Returns True if condition True and document was updated.
update_result = store.check_and_update(_id=doc_id,
                                       mutation=mutation,
                                       query_condition=condition)

print(update_result)

document_after_update = store.find_by_id(doc_id)
print('Document with id {0} after update'.format(doc_id))
print(document_after_update)
```

### dbshell

The following dbshell command is equivalent to the code examples. See [dbshell update](#) on page 5519 for more information and examples.

```
# mapr dbshell
maprdb root:> update /demo_table --id user002 --m {"$set":
{"address.zipCode":95196}}
```

### C# - Update

The following code is available at [012\\_UpdateDocument.cs](#). It does the following:

- Finds a document using the `DocumentStore.FindById` method to print the document before update.
- Creates an OJAI mutation that updates a field.
- Updates the document by calling the `DocumentStore.Update` method.

```
using System;
using MapRDB.Driver;

public class UpdateDocument
{
    public void UpdateDocument()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        var docId = "user0002";

        // Print the document before update
        var documentBeforeUpdate = store.FindById(docId);
```

```

        Console.WriteLine($"Document with id {docId} before update:");
        Console.WriteLine(documentBeforeUpdate);

        // Create mutation to update the zipCode field
        var mutation =
connection.NewDocumentMutation().Set("address.zipCode", (long)95196);

        // Execute update
        store.Update(docId, mutation);

        // Print the document after update
        var documentAfterUpdate = store.FindById(docId);
        Console.WriteLine($"Document with id {docId} after update:");
        Console.WriteLine(documentAfterUpdate);

        // Close the OJAI connection
        connection.Close();
    }
}

```

### C# - Check and Update

The following code is available at [013\\_CheckAndUpdateDocument.cs](#). It does the following:

- Finds a document using the `DocumentStore.FindById` method to print the document before update.
- Creates an OJAI mutation that updates a field.
- Creates an OJAI condition to apply in the check and update.
- Performs the check and update on the document by calling the `DocumentStore.CheckAndUpdate` method.

```

using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class CheckAndUpdateDocument
{
    public void CheckAndUpdateDocument()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        var docId = "user0001";

        // Print the document before update
        var documentBeforeUpdate = store.FindById(docId);
        Console.WriteLine($"Document with id {docId} before update:");
        Console.WriteLine(documentBeforeUpdate);

        // Create mutation to update the zipCode field
        var mutation =

```

```

connection.NewDocumentMutation().SetOrReplace("address.zipCode", 99999);

    // Create condition
    var condition = connection
        .NewQueryCondition()
        .Is("address.street", QueryOp.EQUAL, "320 Blossom Hill
Road")
        .Close()
        .Build();

    // Execute CheckAndUpdate.
    // Returns True if condition True and document was updated
    var updateResult = store.CheckAndUpdate(docId, condition, mutation);

    Console.WriteLine(updateResult);

    // Print the document after update
    var documentAfterUpdate = store.FindById(docId);
    Console.WriteLine($"Document with id {docId} after update:");
    Console.WriteLine(documentAfterUpdate);

    // Close the OJAI connection
    connection.Close();
}
}

```

### Go - Update

The following code is available at [012\\_update\\_document.go](#). It does the following:

- Finds a document using the `DocumentStore.FindByIdString` function to print the document before update
- Creates an OJAI mutation that updates a field
- Updates the document by calling the `DocumentStore.Update` function

```

package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=nodel.cluster.com"

    storeName := "/demo_table"
    documentId := "user0002"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }
}

```

```

// Get a store and assign it as a DocumentStore struct
store, err := connection.GetStore(storeName)
if err != nil {
    panic(err)
}

// Print the document before update
documentBeforeUpdate, err := store.FindByIdString(documentId)
if err != nil {
    panic(err)
}
fmt.Printf("Document with id %v before update.\n %v", documentId,
documentBeforeUpdate.AsJsonString())

// Create mutation to update the zipCode field
mutation := map[string]interface{}{"$set": map[string]interface{}
{"address.zipCode": 95196}}

// Execute update
err = store.Update(client.BosiFromString(documentId),
client.MosmFromMap(mutation))
if err != nil {
    panic(err)
}

// Print the document after update
documentAfterUpdate, err := store.FindByIdString(documentId)
if err != nil {
    panic(err)
}
fmt.Printf("Document with id %v after update.\n %v", documentId,
documentAfterUpdate.AsJsonString())

// Close connection
connection.Close()
}

```

### Go - Check and Update

The following code is available at [013\\_check\\_and\\_update\\_document.go](#). It does the following:

- Finds a document using the `DocumentStore.FindByIdString` function to print the document before update
- Creates an OJAI mutation that updates a field
- Creates an OJAI condition to apply in the check and update
- Performs the check and update on the document by calling the `DocumentStore.CheckAndUpdate` function

```

package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +

```

```

    "auth=basic;" +
    "user=mapr;" +
    "password=mapr;" +
    "ssl=true;" +
    "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
    "sslTargetNameOverride=nodel.cluster.com"

storeName := "/demo_table"
documentId := "user0001"

// Create a connection to DAG
connection, err := client.MakeConnection(connectionString)
if err != nil {
    panic(err)
}

// Get a store and assign it as a DocumentStore struct
store, err := connection.GetStore(storeName)
if err != nil {
    panic(err)
}

// Print the document before update
documentBeforeUpdate, err := store.FindByIdString(documentId)
if err != nil {
    panic(err)
}
fmt.Printf("Document with id %v before update.\n %v\n", documentId,
documentBeforeUpdate.AsJsonString())

// Create mutation to update the zipCode field
mutation := map[string]interface{}{"$put": map[string]interface{}
{"address.zipCode": 99999}}

// Create condition
condition := map[string]interface{}{"$eq": map[string]interface{}
{"address.street": "320 Blossom Hill Road"}}

// Execute update
// Returns True if condition True and document was updated.
res, err := store.CheckAndUpdate(
    client.BosiFromString(documentId),
    client.MoscFromMap(condition),
    client.MosmFromMap(mutation))
if err != nil {
    panic(err)
}

// Print the document after update
documentAfterUpdate, err := store.FindByIdString(documentId)
if err != nil {
    panic(err)
}
fmt.Printf("Update result: %v.\nDocument with id %v after update.\n
%v\n",
    res,
    documentId,
    documentAfterUpdate.AsJsonString())

// Close connection
connection.Close()
}

```

## Querying JSON Documents

This section describes how to query JSON documents in HPE Ezmeral Data Fabric Database JSON tables using the OJAI API library and HPE Ezmeral Data Fabric Database Shell. It includes sample programs using the OJAI API library and shows how to run the same queries in HPE Ezmeral Data Fabric Database Shell.

### Querying in OJAI Applications

To query HPE Ezmeral Data Fabric Database JSON tables in your OJAI applications, you use the OJAI `Query` interface. The typical flow of your application involves creating a connection, obtaining a handle to the HPE Ezmeral Data Fabric Database JSON table you want to query, constructing the query, performing the query, and then processing the results.

**NOTE:** The Node.js, Python, C#, and Go OJAI clients are supported starting in EEP 6.0.

## Description

The `DocumentStore` interface includes a `Query` interface. The `Query` interface allows you to build a query programmatically.

### Java

To construct an OJAI query, call the following methods in the `Query` interface:

- [Query.select](#)
- [Query.where](#)
- [Query.orderBy](#)
- [Query.offset](#)
- [Query.limit](#)

To run the query, pass the `Query` object to the [DocumentStore.find](#) method.

### Node.js

To construct an OJAI query, create a Node.js JSON object using [OJAI Query Syntax](#) on page 3388.

To run the query, pass the `Query` object to the [DocumentStore.find](#) method.

### Python

To construct an OJAI query, create a Python dictionary object using [OJAI Query Syntax](#) on page 3388.

To run the query, pass the `Query` object to the [DocumentStore.find](#) method.

**NOTE:** The following `Query` methods are available in the Python OJAI API, but creating a Python dictionary is the preferred approach:

- [Query.select](#)
- [Query.where](#)
- [Query.order\\_by](#)
- [Query.offset](#)
- [Query.limit](#)

### C#

To construct an OJAI query, create a C# object.

To run the query, pass the `Query` object to the `DocumentStore.Find` method.

**NOTE:** The following `Query` methods are available in the C# OJAI API:

- `Query.Select`
- `Query.Where`
- `Query.OrderBy`
- `Query.Offset`
- `Query.Limit`

## Go

To construct an OJAI query, create a `Go` object.

To run the query, pass the `Query` object to the `DocumentStore.FindQuery` function.

**NOTE:** The following `Query` functions are available in the Go OJAI API:

- `Query.Select`
- `Query.WhereCondition`
- `Query.OrderBy`
- `Query.Offset`
- `Query.Limit`

## Basic Application Flow

The following steps describe the basics in developing client applications that query HPE Ezmeral Data Fabric Database JSON tables using the OJAI API.

### Java

1. Create a `Connection` instance to your Data Fabric cluster using the `DriverManager` class:

```
Connection connection =
  DriverManager.getConnection("ojai:m
  apr:");
```

**NOTE:** Do not omit the ending colon in the connection string.

2. Obtain a `DocumentStore` handle to a HPE Ezmeral Data Fabric Database JSON table using the connection object:

```
DocumentStore store =
  connection.getStore(tablePath);
```

3. Create a [Query](#) object using the connection object:

```
Query query =
connection.newQuery();
```

4. Perform the query operation on the table:

```
QueryResult result =
store.find(query);
```

5. Process the results.

The following code snippet iterates through the [QueryResult](#) and prints each document as a JSON string:

```
for (final Document userDocument :
result) {
    // Print the OJAI Document

System.out.println(userDocument.asJ
sonString());
}
```

To process individual fields within a document, use the [DocumentReader](#) interface. The following code snippet iterates through the fields in a document and prints the fields that are strings:

```
Iterable it =
result.documentReaders();
for (DocumentReader reader : it) {
    EventType et = null;
    while ((et = reader.next()) !=
null) {
        if (et ==
EventType.STRING) {

System.out.println("Value of field
" + reader.getFieldName() + ": " +
reader.getString());
        }
    }
}
```

6. Close the result stream, the connection to the document store, and the connection to Data Fabric:

```
result.close();
store.close;
connection.close();
```

**Node.js****1. Create a connection:**

```

ConnectionManager.getConnection('localhost:5678?;user=mapr;password=mapr;ssl=false')
  .then((connection) => {
    // Process connection
    ...
  });

```

**2. Obtain a handle to a HPE Ezmeral Data Fabric Database JSON table using the connection object:**

```

connection.getStore(tablePath)
  .then((store) => {
    // Process store
    ...
  });

```

**3. Create a query object:**

```
const query = {};
```

**4. Perform the query operation on the table:**

```
const stream = store.find(query)
```

**5. Process the results:**

```
stream.on('data', (document) =>
  console.log(document));
```

**6. Close the connection to Data Fabric:**

```
stream.on('end', () => {
  console.log('end');
  connection.close();
});
```

**Python****1. Create a [Connection](#) instance to your Data Fabric cluster using the [ConnectionFactory](#) class:**

```

connection_str =
'localhost:5678?;user=mapr;password=mapr;ssl=false'
connection =
ConnectionFactory.get_connection(connection_str)

```

2. Obtain a [DocumentStore](#) handle to a HPE Ezmeral Data Fabric Database JSON table using the connection object:

```
store =
connection.get_store(table_path)
```

3. Create a [Query](#) object using the connection object:

```
query =
connection.new_query().build()
```

4. Perform the query operation on the table:

```
query_result = store.find(query)
```

5. Process the results.

The following code snippet iterates through the [QueryResult](#) and prints each document as a Python dictionary:

```
for doc in query_result:
    print(doc)
```

6. Close the connection to Data Fabric:

```
connection.close()
```

## C#

1. Create a [Connection](#) instance to your Data Fabric cluster using the [ConnectionFactory](#) class:

```
var connectionStr =
    $"localhost:5678?auth=basic;" +
        $"user=mapr;" +
        $"password=mapr;" +
        $"ssl=true;" +
        $"sslCA=/opt/mapr/conf/
ssl_truststore.pem;" +

    $"sslTargetNameOverride=node1.mapr.
com";
var connection =
    ConnectionFactory.CreateConnection(
        connectionStr);
```

2. Obtain a [DocumentStore](#) handle to a HPE Ezmeral Data Fabric Database JSON table using the connection object:

```
var store =
    connection.GetStore(storePath);
```

3. Create a [Query](#) object using the connection object:

```
var query =
connection.NewQuery().Build();
```

4. Perform the query operation on the table:

```
var queryResult =
store.Find(query);
```

5. Process the results.

The following code snippet iterates through the [QueryResult](#) and prints each document as a JSON:

```
var documentStream = await
queryResult.GetDocumentAsyncStream(
).GetAllDocuments();
foreach (var document in
documentStream)
{
Console.WriteLine(document.ToJsonSt
ring());
}
```

6. Close the connection to Data Fabric:

```
connection.Close();
```

**Go**

1. Create a [Connection](#) instance to your Data Fabric cluster:

```
connectionString :=
"localhost:5678?
auth=basic;user=mapr;password=mapr;
ssl=false"
connection, error :=
client.MakeConnection(connectionString)
```

2. Obtain a [DocumentStore](#) handle to a HPE Ezmeral Data Fabric Database JSON table using the connection object:

```
store,
error := connection.CreateStore("/
store_path")
```

**3. Create a [Query](#) object:**

```
query, err := client.MakeQuery()
query.Build()
```

**4. Perform the query operation on the table:**

```
queryResult, err :=
store.FindQuery(query,
&client.FindOptions{ })
```

**5. Process the results.**

The following code snippet iterates through the [QueryResult](#) and prints each document as a JSON:

```
for _, doc := range
queryResult.DocumentList() {
    fmt.Println(doc)
}
```

**6. Close the connection to Data Fabric:**

```
connection.Close()
```

See [Examples: Querying JSON Documents](#) on page 3409 for complete code examples.

**Related concepts**

[OJAI Distributed Query Service](#) on page 632

OJAI queries either directly access HPE Ezmeral Data Fabric Database JSON or leverage the OJAI Distributed Query Service. The OJAI Distributed Query Service provides distributed query support for HPE Ezmeral Data Fabric Database JSON, powered by Apache Drill. The data-fabric client automatically determines whether OJAI queries benefit from using the OJAI Distributed Query Service, when the service is available. This section describes the architecture, including the code paths and components involved. It also discusses queries that originate from Drill SQL, which leverage the full functionality of Drill.

*Comparisons and Sorts in OJAI Queries*

When running OJAI queries with comparisons and sorts, you need to be aware of how different data types behave. You also need to understand how sorting works in Data Fabric DB queries. Depending on the component that runs the sort, you may encounter unexpected behavior.

OJAI supports comparisons using the `QueryCondition` interface. For information about how to use this interface, see [Query Conditions in OJAI Applications](#) on page 3374.

When using the OJAI `query` where and `orderby`, and comparing and sorting across different data types, there are subtleties you should take into consideration. See [Using Comparable JSON Document Data Types in Comparisons and Sorts](#) on page 641 and [Using Non-comparable JSON Document Data Types in Comparisons and Sorts](#) on page 642 for more information.

If you do not have a secondary index defined that can generate your query's specified `orderby`, then your query requires an explicit sort. If you have installed the [OJAI Distributed Query Service](#) on page 632, the service performs the sort. If you have not, the Data Fabric client performs the sort, but restricts the amount of data it can sort. The default sort limit is 5000 documents. For example, if your query returns 10,000 documents, and you specify a query result `limit` of 5000 documents, the Data Fabric client can perform the sort.

 **IMPORTANT:** The Data Fabric client returns an error if your query result size exceeds the client's sort limit.

You can avoid errors due to the client sort limitation by adhering to the following guidelines:

- If you know the largest possible query result size when your queries specify an `orderby`, you can increase the sort limit of your client to that maximum size by setting the `ojai.mapr.query.max-client-sort-limit` parameter.

The following code snippets increase the limit to 6000:

#### Java

```
query.setOption("ojai.mapr.query.max-client-sort-limit", 6000);
```

**NOTE:** This option is not applicable to the Java OJAI Thin Client.

#### Node.js

```
const query
= { "$select": "col", "$options":
  { "ojai": { "mapr": { "query":
    { "max-client-sort": 6000 } } } } }
const stream = store.find(query)
```

#### Python

```
query = { "$select": "col", "$options":
  { "ojai": { "mapr": { "query":
    { "max-client-sort": 6000 } } } } }
query_result = store.find(query)
```

#### C#

```
var query =
connection.NewQuery()
    .Select("col")
    .SetMaxClientSortLimit(6000)
    .Build();

var queryResult =
store.Find(query);
```

#### Go

```
query := map[string]interface{}{
    "$select": "col",
    "$options": map[string]interface{}{
        {
            "ojai": map[string]interface{}{
```

```

"mapr":map[string]interface{}{
"query":map[string]interface{}{
"max-client-sort":6000}}}}
queryResult, err :=
store.FindQueryMap(query,
&client.FindOptions{ })

```

You can also set this option across all your OJAI clients by modifying a data access gateway property. See [Administering the Data Access Gateway - Application Properties](#) for details.

- If you do not know the largest possible query result size, specify a `limit` in your queries. If your query result size exceeds that `limit`, the client sorts the entire result set but returns only a subset of the rows up to the specified limit. This avoids the error, but may result in unintended behavior if your application is not expecting a truncated result. You should take corrective action if necessary.

See [Querying with Order By](#) on page 3439 for an example of how to set a query `limit`.

#### *Permissions and OJAI Queries*

You need to understand permission requirements because they affect filter conditions in your OJAI queries.

HPE Ezmeral Data Fabric Database enforces permissions when your application processes the query result. In the basic application flow shown in the previous section, this corresponds to step 5. In an application, if user1 performs the query while user2 processes the result, then the result corresponds to user2's permissions.

You should create a separate OJAI connection for each unique user. Sharing a connection across users can result in non-optimal queries or invalid permission errors.

The following permissions are required to query documents:

- The `readAce` permission on the volumes where the JSON tables that contain the documents are located. See [Setting Whole Volume ACEs](#) on page 1358.
- The `readperm` permission on the JSON table's column families containing fields being queried. See [Enabling Table and Stream Authorizations with ACEs](#) on page 1355.

If the user does not have the `readperm` permission on a field, HPE Ezmeral Data Fabric Database treats the field as non-existent for that user. When a query selects a non-existent field, HPE Ezmeral Data Fabric Database ignores the field. If a query filters on a non-existent field, the query behaves as follows:

Filter Condition on Non-existent Field	Behavior
Filter for specific values in the field	No documents qualify the filter because a non-existent field does not match any value.
Filter for non-matches in the field	All documents qualify the filter because a non-match on a non-existent field is a no-op.

The exception is the `rowkey` field. Access control on the `rowkey` is not available. Users can always select and filter on `rowkey`.

For information about setting permissions, see [Permission Types for Fields and Column Families in JSON Tables](#) on page 1393.

#### *OJAI Query Options*

OJAI supports query options that enable you to modify the behavior of your queries. This includes an option to force secondary index usage and options to influence the behavior of sorts.

## Available Query Options

The following table lists available query options. Some options may or may not apply, depending on whether your query uses the OJAI Distributed Query Service. The detailed descriptions make a note of this.

Option Name	Description	Details
<code>ojai.mapr.query.hint-using-index</code>	Forces the Data Fabric client to use a particular index, regardless of cost considerations	<a href="#">Forcing Secondary Index Usage in OJAI</a> on page 3373
<code>ojai.mapr.query.force-noncovering-sort</code>	Enables sort behavior to avoid partial sorts due to secondary index lags	<a href="#">Avoiding Partial Sorts with Secondary Indexes in OJAI</a> on page 3373
<code>ojai.mapr.query.max-client-sort-limit</code>	Sets the Data Fabric client sort limit	<a href="#">Comparisons and Sorts in OJAI Queries</a> on page 3370
<code>ojai.mapr.query.force-drill</code>	When set to <code>true</code> , forces the Data Fabric client to use the OJAI Distributed Query Service	<a href="#">Forcing Usage of the OJAI Distributed Query Service</a> on page 3374
<code>ojai.mapr.drill.&lt;OJAI Distributed Query Service Property Name&gt;</code>	Sets options for the OJAI Distributed Query Service	<a href="#">Setting OJAI Distributed Query Service Properties</a> on page 3374

## Setting Query Options

To set these options in your OJAI application, see the following topics:

<b>Java</b>	<a href="#">Setting Query Options in Java OJAI</a> on page 3454
<b>Node.js</b>	<a href="#">Setting Query Options in Node.js Using OJAI Query Syntax</a> on page 3462
<b>Python</b>	<a href="#">Setting Query Options in Python Using OJAI Query Syntax</a> on page 3472
<b>C#</b>	<a href="#">Setting Query Options in C# OJAI</a> on page 3476
<b>Go</b>	<a href="#">Setting Query Options in Go OJAI</a> on page 3480

## Forcing Secondary Index Usage in OJAI

To force the Data Fabric client to use an index, specify the name of the index with the `ojai.mapr.query.hint-using-index` option.

Regardless of cost considerations, the Data Fabric client attempts to use the specified index. To use the index, the index must benefit filter conditions, the order by, or projections in the query as described at [Queries that Benefit from Secondary Indexes](#) on page 700. Otherwise, the Data Fabric client ignores the option.

To force the Data Fabric client to *not* use any indexes, specify the table name without the full path as the second parameter in the calls shown earlier. For example, if the full path of your table is `/mapr/sanfrancisco/volume1/customer`, pass the name `customer` as the second parameter.

**NOTE:** Setting this option in your OJAI application has no effect if you are using the OJAI Distributed Query Service.

## Avoiding Partial Sorts with Secondary Indexes in OJAI

Partial sorts can occur due to secondary index lags. To avoid these lags, set the `ojai.mapr.query.force-noncovering-sort` option to `TRUE`.

This option forces the OJAI Distributed Query Service to explicitly sort the data. Do not set this option if you do not expect to encounter index lags. Otherwise, you lose the ordering advantage that secondary indexes provide.

For more information about why partial sorts occur, see [Partial Sorts with Non-Covering Indexes](#) on page 710.

### Forcing Usage of the OJAI Distributed Query Service

When set to `true`, the Data Fabric client uses the OJAI Distributed Query Service execution path, rather than selecting an execution path that it determines to be most optimal. See [OJAI Distributed Query Service](#) on page 632 for more information about the different query execution paths.

### Setting OJAI Distributed Query Service Properties

OJAI queries may leverage the OJAI Distributed Query Service. To modify OJAI Distributed Query Service property settings in your OJAI application, prefix the OJAI Distributed Query Service property name with `ojai.mapr.drill`.

For example, the option `ojai.mapr.drill.planner.enable_index_planning` disables using secondary indexes when queries use the Query Service.

See [Index Planning and Execution Configuration Options](#) on page 4115 for the list of available OJAI Distributed Query Service properties.

### Related concepts

[OJAI Distributed Query Service](#) on page 632

OJAI queries either directly access HPE Ezmeral Data Fabric Database JSON or leverage the OJAI Distributed Query Service. The OJAI Distributed Query Service provides distributed query support for HPE Ezmeral Data Fabric Database JSON, powered by Apache Drill. The data-fabric client automatically determines whether OJAI queries benefit from using the OJAI Distributed Query Service, when the service is available. This section describes the architecture, including the code paths and components involved. It also discusses queries that originate from Drill SQL, which leverage the full functionality of Drill.

### Query Conditions in OJAI Applications

You can create a query condition in an OJAI application in either of two ways. One way is to create an OJAI `QueryCondition` object and call methods in the class to construct your query condition. Another way is to create an OJAI query condition in a JSON format.

#### *Creating an OJAI QueryCondition Object*

The Java and Python OJAI clients support a `QueryCondition` interface. After you create a `QueryCondition` object, call methods in the class to construct your query condition.

### Creating a QueryCondition Object

#### Java

Java OJAI provides a `QueryCondition.is()` method for specifying query conditions. The method takes three arguments:

- The field path to apply the condition to
- The condition operator, represented as a `QueryCondition.Op`
- The value to compare the field path against

The field path is either a field in a JSON document, a subfield within a nested document, or an array element.

Depending on the type of the field path, you specify the comparison value as follows:

**Scalar Data**

You can specify the value using either a Java typed value (for example, `int`, `float`, or `String`) or a Java OJAI object. The API supports the following OJAI types:

- `ODate`
- `OInterval`
- `OTime`
- `OTimestamp`

**Nested Documents**

You can specify only equality and non-equality conditions on nested documents. You specify the nested document using a Java `Map` object. In the case of equality, all of the fields in the nested document must match. The order of the fields is not relevant.

**Arrays**

You can specify only equality and non-equality conditions on arrays. You specify an array using a Java `List` object. In the case of equality, the order of the elements and the element values must match.

In addition to `QueryCondition.is()`, `QueryCondition` also supports the following methods:

QueryCondition Method	Description
<code>equals()</code> <code>notequals()</code>	Match for equality or non-equality on nested documents and arrays
<code>in()</code>	Search for individual elements in an array
<code>like()</code>	Search for string values using SQL LIKE expressions

QueryCondition Method	Description
<code>matches()</code>	Search for string values using regular expressions.  You can use regular expressions that compose the Perl-Compatible Regular Expressions (PCRE) library as well as a subset of the regular expressions that are supported in <code>java.util.regex.pattern</code> . See <a href="#">HBase Java Regular Expressions Support</a> on page 3296 for a list of supported regular expressions.
<code>and()</code>	Begins a new AND condition block
<code>or()</code>	Begins a new OR condition block
<code>elementAnd()</code>	Begins a new <code>elementAnd</code> block. See <a href="#">OJAI Query Condition Operators</a> on page 3391 for a detailed description of this operator.
<code>close()</code>	Closes a compound condition block
<code>build()</code>	Builds the condition

**NOTE:** The material described in this section is a subset of the `QueryCondition` API. It introduces you to the basics of the API. For the complete API, see the [QueryCondition](#) interface.

## Python

Python OJAI provides a `QueryCondition.is_()` method for specifying query conditions. The method takes three arguments:

- The field path to apply the condition to
- The condition operator, represented as a `QueryConditionOp`
- The value to compare the field path against

The field path is either a field in a JSON document, a sub-field within a nested document, or an array element. Starting in MapR 6.1, you can also specify a container field path. See [OJAI Query Conditions Using Container Field Paths](#) on page 3400 for details.

Depending on the type of the field path, you specify the comparison value as follows:

### Scalar Data

You can specify the value using either a Python scalar value (for example, `int`, `float`, or `str`) or a Python OJAI object.

The API supports the following OJAI types:

- ODate
- OInterval
- OTime
- OTimestamp

**Nested Documents**

You can specify only equality and non-equality conditions on nested documents. You specify the nested document using a Python dictionary object. In the case of equality, all of the fields in the nested document must match. The order of the fields is not relevant.

**Arrays**

You can specify only equality and non-equality conditions on arrays. You specify an array using a Python list object. In the case of equality, the order of the elements and the element values must match.

In addition to `QueryCondition.is_()`, `QueryCondition` also supports the following methods:

QueryCondition Method	Description
<code>equals_()</code> <code>not_equals_()</code>	Match for equality or non-equality on nested documents and arrays
<code>in_()</code>	Search for individual elements in an array
<code>like_()</code>	Search for string values using SQL LIKE expressions
<code>matches_()</code>	Search for string values using regular expressions.  You can use regular expressions that comprise the Perl-Compatible Regular Expressions (PCRE) library as well as a subset of the regular expressions that are supported in <code>java.util.regex.pattern</code> . See <a href="#">HBase Java Regular Expressions Support</a> on page 3296 for a list of supported regular expressions.

QueryCondition Method	Description
<code>and_()</code>	Begins a new AND condition block
<code>or_()</code>	Begins a new OR condition block
<code>element_and()</code>	Begins a new <code>elementAnd</code> block. See <a href="#">OJAI Query Condition Operators</a> on page 3391 for a detailed description of this operator.
<code>close()</code>	Closes a compound condition block
<code>build()</code>	Builds the condition

**NOTE:**

- The material described in this section is a subset of the `QueryCondition` API. It introduces you to the basics of the API. For the complete API, see the [QueryCondition](#) interface.
- The preferred approach for creating query conditions in Python is to create the condition in a JSON format. See [Creating an OJAI Query Condition Using a JSON String](#) on page 3386

**C#**

C# OJAI provides a `QueryCondition.ls()` method for specifying query conditions. The method takes three arguments:

- The field path to apply the condition to
- The condition operator, represented as a `QueryOp`
- The value to compare the field path against

The field path is either a field in a JSON document, a sub-field within a nested document, or an array element. Starting in MapR 6.1, you can also specify a container field path. For details, see [OJAI Query Conditions Using Container Field Paths](#) on page 3400.

Depending on the type of the field path, you specify the comparison value as follows:

**Scalar Data**

You can specify the value using either a C# scalar value (for example, `int`, `float`, or `string`) or a C# OJAI object. The API supports the following OJAI types:

- `OjaiDate`
- `OjaiInterval`

- `OjaiTime`
- `OjaiTimestamp`

**Nested Documents**

You can specify only equality and non-equality conditions on nested documents. You specify the nested document using a C# object. In the case of equality, all of the fields in the nested document must match. The order of the fields is not relevant.

**Arrays**

You can specify only equality and non-equality conditions on arrays. You specify an array using a C# list of values of the specified type. In the case of equality, the order of the elements and the element values must match.

In addition to `QueryCondition.Is()`, `QueryCondition` also supports the following methods:

QueryCondition Method	Description
<code>Condition()</code>	Search for values using a specific condition.
<code>Equals()</code> <code>NotEquals()</code>	Match for equality or non-equality on nested documents and arrays.
<code>Exists()</code> <code>NotExists()</code>	Search for a field if the given field path exists, or verify that a field path does not exist.
<code>In()</code> <code>NotIn()</code>	Search for individual elements in an array or verify their absence.
<code>Like()</code> <code>NotLike()</code>	Search for string values using SQL LIKE expressions or verify they do not match the specified SQL LIKE expression.

QueryCondition Method	Description
Matches() NotMatches()	Search for string values using regular expressions.  You can use regular expressions that comprise the Perl-Compatible Regular Expressions (PCRE) library, as well as a subset of the regular expressions that are supported in <code>java.util.regex.pattern</code> . For a list of supported regular expressions, see <a href="#">HBase Java Regular Expressions Support</a> on page 3296.
SizeOf()	Search for a value of the specified size. The value must be one of the following types: <ul style="list-style-type: none"> <li>• string</li> <li>• binary</li> <li>• iDictionary</li> <li>• iList</li> </ul>
TypeOf() NotTypeOf()	Search for value of the specified Type or verify its absence.
And()	Begins a new AND condition block.
Or()	Begins a new OR condition block.
ElementAnd()	Begins a new ElementAnd block. For a detailed description of this operator, see <a href="#">OJAI Query Condition Operators</a> on page 3391.
Close()	Closes a compound condition block.
Build()	Builds the condition.

**NOTE:**

- The material described in this section is a subset of the [QueryCondition](#) API. It introduces you to the basics of the API. For the complete API, see the [QueryCondition](#) interface.
- The preferred approach for creating query conditions in C# is to create the condition in a JSON format. See [009\\_FindQueryWithSelectAndCondition.cs](#) or [Example: Creating a QueryCondition Object](#) on page 3383.

**Go**

Go OJAI provides a `QueryCondition.ls()` function for specifying query conditions. The function takes three arguments:

- The field path to apply the condition to
- The condition operator, represented as a `QueryOp`
- The value to compare the field path against

The field path is either a field in a JSON document, a sub-field within a nested document, or an array element. Starting in MapR 6.1, you can also specify a container field path. For details, see [OJAI Query Conditions Using Container Field Paths](#) on page 3400.

Depending on the type of the field path, you specify the comparison value as follows:

**Scalar Data**

You can specify the value using either a Go scalar value (for example, `int`, `float64`, or `string`) or a Go OJAI object. The API supports the following OJAI types:

- `OjaiDate`
- `OjaiTime`
- `OjaiTimestamp`

**Nested Documents**

You can specify only equality and non-equality conditions on nested documents. You specify the nested document using a Go object. In the case of equality, all of the fields in the nested document must match. The order of the fields is not relevant.

**Arrays**

You can specify only equality and non-equality conditions on arrays. You specify an array using a Go `list` of values of the specified type. In the case of equality, the order of the elements and the element values must match.

In addition to `QueryCondition.ls()`, `QueryCondition` also supports the following functions:

QueryCondition Function	Description
<code>AddCondition()</code>	Search for values using a specific condition.

QueryCondition Function	Description
Equals() NotEquals()	Match for equality or non-equality on nested documents and arrays.
Exists() NotExists()	Search for a field if the given field path exists, or verify that it does not exist.
In() NotIn()	Search for individual elements in an array or verify their absence.
Like() NotLike()	Search for string values using SQL LIKE expressions or verify they do not match the specified SQL LIKE expression.
Matches() NotMatches()	Search for string values using regular expressions.  You can use regular expressions that comprise the Perl-Compatible Regular Expressions (PCRE) library, as well as a subset of the regular expressions that are supported in <code>java.util.regex.pattern</code> . For a list of supported regular expressions, see <a href="#">HBase Java Regular Expressions Support</a> on page 3296.
TypeOf() NotTypeOf()	Search for value of the specified Type or verify its absence.
And()	Begins a new AND condition block.
Or()	Begins a new OR condition block.
ElementAnd()	Begins a new ElementAnd block. For a detailed description of this operator, see <a href="#">OJAI Query Condition Operators</a> on page 3391.
Close()	Closes a compound condition block.
Build()	Builds the condition.

**NOTE:**

- The material described in this section is a subset of the `Query` API. It introduces you to the basics of the API. For the complete API, see the [Query](#) interface.
- The preferred approach for creating query conditions in Go is to create the condition in a JSON format. See [009\\_find\\_query\\_with\\_select\\_and\\_condition.go](#) or [Example: Creating a QueryCondition Object](#) on page 3383.

**Example: Creating a QueryCondition Object**

The following example shows how to define a `QueryCondition` object for this query condition:

```
(a.b[0].boolean == false && (a.c.d != 5 || a.b[1].decimal > 1 ||
a.b[1].decimal < 10))
```

**Java**

```
QueryCondition qc =
connection.newCondition()
    .and()
        .is("a.b[0].boolean",
Op.EQUAL, false)
    .or()
        .is("a.c.d",
Op.NOT_EQUAL, 5)
        .is("a.b[1].decimal",
Op.GREATER, 1)
        .is("a.b[1].decimal",
Op.LESS, 10)
    .close()
    .close()
    .build();
```

Pass the `QueryCondition` object to the `Query.where` method. For a complete Java code example, see the [Java - OJAI QueryCondition Object](#) example at [Querying with Conditions](#) on page 3426.

**Python**

```
qc = connection.new_condition()
    .and_()
        .is_('a.b[0].boolean',
QueryConditionOp.EQUAL, False)
    .or_()
        .is_('a.c.d',
QueryConditionOp.NOT_EQUAL, 5)
        .is_('a.b[1].decimal',
QueryConditionOp.GREATER, 1)
        .is_('a.b[1].decimal',
QueryConditionOp.LESS, 10)
    .close()
    .close()
    .build()
```

Pass the `QueryCondition` object to the `Query.where` method. For a complete Python code example, see

the *Python - OJAI QueryCondition Object* example at [Querying with Conditions](#) on page 3426.

## C#

```
var condition =
connection.NewQueryCondition()
    .And()
        .Is("a.b[0].boolean",
QueryOp.EQUAL, false)
    .Or()
        .Is("a.c.d",
QueryOp.NOT_EQUAL, 5)
        .Is("a.b[1].decimal",
QueryOp.GREATER, 1)
        .Is("a.b[1].decimal",
QueryOp.LESS, 10)
    .Close()
    .Close()
    .Build();
```

Pass the `Condition` object to the `Query.Where` method. For a complete C# code example, see the *C# - OJAI QueryCondition Object* example at [Querying with Conditions](#) on page 3426.

## Go

```
condition, err :=
client.MakeCondition(
    client.And(),

    client.Is("a.b[0].boolean",
client.EQUAL, false),
    client.Or(),
        client.Is("a.c.d",
client.NOT_EQUAL, 5),

    client.Is("a.b[1].decimal",
client.GREATER, 1),

    client.Is("a.b[1].decimal",
client.LESS, 10),
    client.Close(),
    client.Close())
condition.Build()
```

Pass the `Condition` object to the `Query.WhereCondition` function. For a complete Go code example, see the *Go - OJAI QueryCondition Object* example at [Querying with Conditions](#) on page 3426.

## Examples: Using the `QueryCondition.elementAnd` Method

The following example shows how to write the `elementAnd` condition described at [Using elementAnd with Nested Documents](#) on page 3403, using a `QueryCondition` object:

## Java

```
QueryCondition qc =
connection.newCondition()
    .elementAnd("grades[]")
        .is("course",
QueryConditionOp.EQUALS, "history")
```

**Python**

```

        .is("score",
QueryConditionOp.EQUALS, 12)
        .close()
        .build();

```

```

qc = connection.new_condition()
    .element_and("grades[]")
        .is_("course",
QueryConditionOp.EQUALS, "history")
        .is_("score",
QueryConditionOp.EQUALS, 12)
        .close()
        .build()

```

**C#**

```

var condition =
connection.NewQueryCondition()
    .ElementAnd("grades[]")
        .Is("course", QueryOp.EQUALS,
"history")
        .Is("score", QueryOp.EQUALS,
12)
        .Close()
        .Build();

```

**Go**

```

        condition, err :=
client.MakeCondition(
        client.ElementAnd("grades[]"),
        client.Is("course",
client.EQUAL, "history"),
        client.Is("score",
client.EQUAL, 12),
        client.Close())
        condition.Build()

```

The following code corresponds to the example described at [Using elementAnd with Scalar Values](#) on page 3405 using a QueryCondition object:

**Java**

```

QueryCondition qc =
connection.newCondition()
    .elementAnd("values[]")
        .is("$",
QueryConditionOp.GREATER, 7)
        .is("$",
QueryConditionOp.LESS, 14)
        .close()
        .build();

```

**Python**

```

qc = connection.new_condition()
    .element_and("values[]")
        .is_("$",
QueryConditionOp.GREATER, 7)
        .is_("$",
QueryConditionOp.LESS, 14)
        .close()
        .build()

```

**C#**

```
var condition =
connection.NewQueryCondition()
    .ElementAnd("values[]")
        .Is("$", QueryOp.GREATER, 7)
        .Is("$", QueryOp.LESS, 14)
    .Close()
    .Build();
```

**Go**

```
condition, err :=
client.MakeCondition(
    client.ElementAnd("values[]"),
    client.Is("$",
client.EQUAL, 7),
    client.Is("$",
client.EQUAL, 14),
    client.Close())
condition.Build()
```

**Creating an OJAI Query Condition Using a JSON String**

You can create a query condition using OJAI syntax to specify the condition in JSON format. This is the preferred approach for the Node.js, Python, C#, and Go OJAI clients.

The following example shows you how to create the following query condition using the syntax:

```
(a.b[0].boolean == false && (a.c.d != 5 || a.b[1].decimal > 1 ||
a.b[1].decimal < 10))
```

**Java**

This is a Java string for the condition:

```
String jc = new String(
    '{ \
        "$and":[ \
            {"$eq": \
{"a.b[0].boolean":false}}, \
            {"$or":[ \
                {"$ne":{"a.c.d":5}}, \
                {"$gt": \
{"a.b[1].decimal":1}}, \
                {"$lt": \
{"a.b[1].decimal":10}} \
            ]} \
        ]} \
    )';
```

Pass the string to the [Query.where](#) method. See the [Java - OJAI Query Condition in JSON Format](#) example at [Querying with Conditions](#) on page 3426 for a complete Java code example.

**Node.js**

This is a Node.js JSON object for the condition:

```
query =
{ "$where":
  { "$and": [
    { "$eq":
      { "a.b[0].boolean": false } },
    { "$or": [
      { "$ne": { "a.c.d": 5 } },
      { "$gt":
```

```

{"a.b[1].decimal":1}},
      {"$lt":
{"a.b[1].decimal":10}}
      ]}
    ]}
  };

```

See the *Node.js - OJAI Query Condition in JSON Format* example at [Querying with Conditions](#) on page 3426 for a complete Node.js code example.

## Python

This is a Python dictionary for the condition:

```

query =
  {"$where":
    {"$and":[
      {"$eq":
        {"a.b[0].boolean":false}},
      {"$or":[
        {"$ne":{"a.c.d":5}},
        {"$gt":
          {"a.b[1].decimal":1}},
        {"$lt":
          {"a.b[1].decimal":10}}
        ]}
    ]}
  }

```

See the *Python - OJAI Query Condition in JSON Format* example at [Querying with Conditions](#) on page 3426 for a complete Python code example.

## C#

This is a JSON string for the condition:

```

var query =
  @"{"$where": " +
    @"{"$and": [ " +
      @"{"$eq":
{"a.b[0].boolean":false}}, " +
      @"{"$or": [ " +
+
        @"{"$ne":{"a.c.d":
{"$numberInt":"5"}}}, " +
+
        @"{"$gt":{"a.b[1].decimal":
{"$decimal":"1"}}}, " +
+
        @"{"$lt":{"a.b[1].decimal":
{"$decimal":"10"}}}" +
      @"]" +
    @"]" +
  @"}";

```

## Go

This is a JSON string for the condition:

```

query := "{\"$where\": " +
  "{\"$and\": [ " +
    "{\"$eq\":
{\\\"a.b[0].boolean\\\":false}}, " +
    "{\"$or\": [ " +
      "{\"$ne\":

```

```
{\"a.c.d\":5}}, \" +
    \"{\">$gt\":
    {\"a.b[1].decimal\":1}}, \" +
    \"{\">$lt\":
    {\"a.b[1].decimal\":10}}\" +
    \"}]\" +
    \"}\"
```

To learn about the complete OJAI syntax for query conditions, see [OJAI Query Condition Syntax](#) on page 3391.

**NOTE:** The OJAI clients are supported starting in EEP 6.0.0.

### OJAI Query Syntax

OJAI defines a syntax for specifying queries on JSON documents. You can use this syntax in Node.js and Python OJAI client applications and HPE Ezmeral Data Fabric Database shell.

See [Query with --query](#) on page 5507 to learn about how to use this syntax in HPE Ezmeral Data Fabric Database shell.

An OJAI query can include the following components:

- [Projection](#)
- [Condition](#)
- [Order by](#)
- [Limit](#)
- [Offset](#)
- [Options](#)

You can specify some or all these components in a query, separating each component with a comma.

### OJAI Query Projection

#### Syntax

```
"$select": "fieldpath"
```

```
"$select":
[ "fieldpath1", "fieldpath2", ... ]
```

#### Description

The projection is the list of field paths to select in your query. You can specify a single field path or multiple. When specifying multiple, use an array notation to list the field paths.

See [JSON Document Field Paths](#) on page 643 for more information about the syntax of different JSON document field paths.

#### Examples

Single field path:

```
"$select": "a.c.d"
```

## OJAI Query Condition

### Syntax

Multiple field paths:

```
"$select":["a.c.d", "a.c.e", "m[0]" ]
```

### Description

The condition filters your query result. See [OJAI Query Condition Syntax](#) on page 3391 for more information about the syntax of an *OJAIQueryCondition*.

### Example

If you have the following condition:

```
(a.b[0].boolean == false && (a.c.d != 5 || a.b[1].decimal > 1 || a.b[1].decimal < 10))
```

This is the OJAI JSON syntax for the condition:

```
"$where":{
  "$and":[
    {"$eq":{
      "a.b[0].boolean":false}},
    {"$or":[
      {"$ne":{"a.c.d":5}},
      {"$gt":{
        "a.b[1].decimal":1}},
      {"$lt":{
        "a.b[1].decimal":10}}
    ]}
  ]
}
```

## OJAI Query Order By

### Syntax

```
"$orderby": "fieldpath"
```

```
"$orderby": {"fieldpath": "order"}
```

```
"$orderby": [fieldpath1, fieldpath2, ...]
```

```
"$orderby": [{"fieldpath1": "order"}, {"fieldpath2": "order"}, ...]
```

### Description

The order by specifies the field paths on which to sort your query result. You can specify a single field path or multiple. When specifying multiple, use an array notation to list the field paths. For each field path, you can optionally specify an *order* of either *asc* or *desc*. Both *order* keywords are case insensitive. The default is *asc*. When specifying an *order*, enclose the *fieldpath* and *order* with curly braces.

**Examples**

Order on a single field path in the default `asc` order:

```
"$orderby": "a.c.e"
```

Order on a single field path in the `desc` order:

```
"$orderby": { "a.c.e": "desc" }
```

Order on two field paths, where the second specifies a `desc` order:

```
"$orderby": [ "a.c.d", { "a.c.e": "desc" } ]
```

**OJAI Query Limit****Syntax**

```
"$limit": positive-integer
```

**Description**

The number of documents to return from the query.

**Example**

Return only ten documents:

```
"$limit": 10
```

**OJAI Query Offset****Syntax**

```
"$offset": positive-integer
```

**Description**

The number of documents to skip before returning results to the client. The offset value has a direct effect on query time; as the offset value increases, query time also increases.

**Example**

Process the query and skip the first five documents in the result set before returning the results to the client.

```
"$offset": 5
```

**OJAI Query Options****Syntax**

```
"$options": { optionName: optionValue }
```

```
"$options":  
[ { optionName1: optionValue1 },  
  { optionName2: optionValue2 }, ... ]
```

**Description**

Settings that influence a query's execution path. See [OJAI Query Options](#) on page 3372 for a list of available options.

When specifying the *optionName*, you must separate the components of the option name, replacing the dots with curly braces and colons and enclosing each component in quotes.

**Example**

Force the query to use the OJAI Distributed Query Service by setting the `ojai.mapr.query.force-drill` option:

```
"$options": {"ojai": {"mapr": {"query": {"force-drill": true}}}}
```

**OJAI Query Condition Syntax**

OJAI defines a syntax for specifying query conditions that allows you to express query conditions in a JSON format. This topic describes the supported operators and provides examples of these query conditions.

When writing an OJAI application, you can also apply query conditions by calling OJAI API methods, corresponding to specific operators. This section does not discuss this alternative. For details on that alternative, see [Query Conditions in OJAI Applications](#) on page 3374.

**NOTE:** Using the JSON format is the preferred approach for Python and Node.js OJAI clients.

*OJAI Query Condition Operators*

OJAI supports comparison, existence, between, match, like, type of, size of, in, and logical operators.

Click the name in the following box to navigate to the section that provides details on each operator.

- |                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                        |

**Comparison Operators**

**Operators**

Operator	Syntax
Equals	<code>{"\$eq": {"fieldpath": value}}</code>
Greater Than	<code>{"\$gt": {"fieldpath": value}}</code>
Greater Than or Equals	<code>{"\$ge": {"fieldpath": value}}</code>
Less Than	<code>{"\$lt": {"fieldpath": value}}</code>

Operator	Syntax
Less Than or Equals	<pre>{ "\$le" :   { "fieldpath" : value } }</pre>
Not Equals	<pre>{ "\$ne" :   { "fieldpath" : value } }</pre>

**Description**

Compares the data in *fieldpath* against *value* for the specified operator.

Float and double data are approximate representations of decimal values. They may not return true in equality comparisons against their equivalent decimal values.

You can specify only equality and non-equality conditions on nested documents and arrays.

In the case of equality on nested documents, all of the fields in the nested document must match. The order of the fields is not relevant.

In the case of equality on arrays, both the order of the elements and the element values must match.

**Existence Operators****Exists****Syntax**

```
{ "$exists" : "field  
path" }
```

**Description**

Checks for existence of *fieldpath*.

**Not Exists****Syntax**

```
{ "$notexists" : "fi  
eldpath" }
```

**Description**

Checks for non-existence of *fieldpath*.

See [Existence Conditions with Container Field Paths](#) on page 3401 for details about how these operators behave when you use them with container field paths.

**Between****Syntax**

```
{ "$between" : { "fieldpath" :  
  [startValue, endValue] } }
```

**Description**

Checks if the value in *fieldpath* is in the range specified by *startValue* and *endValue*, where the values are inclusive.

## Matches Operators

### Operators

Operator	Syntax
Matches	<pre>{ "\$matches" :   { "fieldpath" : matchValue } }</pre>
Not Matches	<pre>{ "\$notmatches" :   { "fieldpath" : matchValue } }</pre>

### Description

Performs a regular expression match on *fieldPath* using *matchValue*.

You can use regular expressions that compose the Perl-Compatible Regular Expressions (PCRE) library as well as a subset of the regular expressions that are supported in `java.util.regex.pattern`. See [HBase Java Regular Expressions Support](#) for a list of supported regular expressions.

## Like Operators

### Operators

Operator	Syntax
Like	<pre>{ "\$like" :   { "fieldpath" : likeValue } }</pre>
Not Like	<pre>{ "\$notlike" :   { "fieldpath" : likeValue } }</pre>

### Description

Performs a SQL LIKE comparison on *fieldPath* where *likeValue* is a string with wildcard characters '%' and '\_'.

### Special-Purpose Characters for the Like Operators

The OJAI API allows you to use four special-purpose characters or patterns with *\$like* operator expressions:

Special-Purpose Character	Description	Example
%	Matches any string of zero or more characters.	"abc%" matches "abc", "abcd", "abcde232136", etc.  "%abc" matches "abc", "pqrabc", etc.
_	Matches a single character.	"_am" matches "ram", "sam", "Sam", "cam".

Special-Purpose Character	Description	Example
[ ]	Matches a single character in the specified set or range.	"[r-t]am" matches "ram", "sam", and "tam" but not "Sam" or "cam".
[^ ]	Matches a single character <b>not</b> in the specified set or range.	"[^r-t]am" matches "Sam", "pam", "jam", or "cam" but not "ram", "sam" and "tam".

When any of these special characters is used as a literal, the character can be enclosed within [ ]:

Literal	Corresponding Like Expression
"[a]"	"[[a]"
"a%"	"a[%]"
"a_c"	"a[_]c"

Note that "^" and "]" need not be escaped.

## Type of Operators

### Type Of

#### Syntax

```
{ "$typeof":
  { "fieldpath": "typeValue" } }
```

#### Description

Checks whether *fieldpath* is of type *typeValue*.

### Not Type Of

#### Syntax

```
{ "$nottypeof":
  { "fieldpath": "typeValue" } }
```

#### Description

Checks whether *fieldpath* is not of type *typeValue*.

*typeValue* can be any of map, array, binary, date, time,

timestamp, interval,  
double, float, long,  
int, short, byte,  
string, boolean, or  
null.

## Size Of

### Syntax

```
{ "$sizeof": { "fieldpath":  
  { "comparisonOp": intValue } } }
```

### Description

Compares the size of the data in *fieldpath* against *intValue*, using *comparisonOp*. The size varies depending on the type of *fieldPath*:

<b>String</b>	Length of string
<b>Array</b>	Number of elements in the array
<b>Nested document</b>	Number of subfields in the nested document

*comparisonOp* can be any of \$eq, \$lt, \$le, \$gt, \$ge, or \$ne.

## In Operators

### In

#### Syntax

```
{ "$in":  
  { "fieldpath": inOp  
    Values } }
```

#### Description

Checks whether the data in *fieldpath* is in the list specified by *inOpValues*.

### Not In

#### Syntax

```
{ "$notin":  
  { "fieldpath": inOp  
    Values } }
```

#### Description

Checks whether the data in *fieldpath* is not in the list specified by *inOpValues*

## Logical Operators

### And

#### Syntax

```
{ "$and":  
  [ OJAIQueryCondi  
    tions ] }
```

	<b>Description</b>	Applies logical AND on a list of conditions. <i>OJAIQueryConditions</i> is a comma-separated list of OJAI query conditions.
<b>Or</b>	<b>Syntax</b>	<pre>{ "\$or" :   [OJAIQueryCondi tions]}</pre>
	<b>Description</b>	Applies logical OR on a list of conditions. <i>OJAIQueryConditions</i> is a comma-separated list of OJAI query conditions.
<b>Element And</b>	<b>Syntax</b>	<pre>{   "\$elementAnd" : {     "containerFieldPa th" :     [OJAIQueryCondi tions]   } }</pre> <p> <b>NOTE:</b> Supported starting in MapR 6.1.</p>
	<b>Description</b>	<p>Applies multiple conditions as part of a group. All conditions must be true for a common array element.</p> <p><i>OJAIQueryConditions</i> is the comma-separated list of the OJAI query conditions.</p> <p><i>containerFieldPath</i> exhibits the following behaviors:</p> <ul style="list-style-type: none"> <li>• <i>containerFieldPath</i> specifies the container path prefix of the common container element.</li> </ul>

- If *containerFieldPath* refers to a container of nested documents, then you must use field paths relative to the common prefix in your *OJAIQueryConditions*.
- If the *containerFieldPath* refers to a container of scalar values, then you use the `$` symbol to refer to individual elements in your *OJAIQueryConditions*.

**NOTE:** There is no `elementOr` operator because it is semantically equivalent to an OR operator.

## Related concepts

[OJAI Query Condition Examples](#) on page 3397

This section contains examples that show you how to use different OJAI query condition operators in combination with different field references and data types.

[OJAI Query Conditions Using Container Field Paths](#) on page 3400

Starting in MapR 6.1, HPE Ezmeral Data Fabric Database supports the notion of a *container field path*. A container field path enables you to perform comparisons on a field path that is either a single value or an arbitrary array element. You can use container field paths with arrays and nested documents, including nested documents with multiple levels of nesting and multidimensional arrays.

[OJAI Query Conditions Using elementAnd](#) on page 3403

The `elementAnd` operator allows you to specify multiple conditions on the same array element using a container field path. This is in contrast to the `and` operator where conditions can refer to any array element. You can use `elementAnd` with both nested documents and scalar values. You can also use it in combination with other operators, including `between`, `and`, and `or`.

## OJAI Query Condition Examples

This section contains examples that show you how to use different OJAI query condition operators in combination with different field references and data types.

The examples in this section use the following JSON documents:

```
{ "_id" : "001", "name" : "Ipod 001", "tags" : [ "electronics", "ipod",
"apple" ] }
{ "_id" : "002", "name" : "Ipod 002", "tags" : "ipod" }
{ "_id" : "003", "name" : "Ipod 003", "tags" : 10 }
{ "_id" : "004", "name" : "Ipod 004", "tags" : [ 10, "ipod", { "t" :
"ipod" } ] }
{ "_id" : "005", "name" : "Ipod 005", "tags" : { "t" : "ipod" } }
{ "_id" : "006", "name" : "Ipod 006", "tags" : [ { "t" : "ipod" }, { "t" :
"apple" } ] }
```

```
{ "_id" : "007", "name" : "Ipod 007", "tags" : [ { "t" : "ipod", "v" : 10 }, { "t" : "apple", "v" : 9 } ] }
{ "_id" : "008", "name" : "Ipod 008", "tags" : { "t" : "ipod", "v" : 10 } }
```

Example	Documents Returned
<pre>{ "\$exists": "tags.v" }</pre> <p>Matches documents where <code>tags</code> is a nested document that has a <code>v</code> subfield.</p>	008
<pre>{ "\$eq": { "tags": 10 } }</pre> <p>Matches documents where <code>tags</code> equals the scalar value 10.</p>	003
<pre>{ "\$eq": { "tags.t": "ipod" } }</pre> <p>Matches documents where <code>tags</code> is a nested document with a subfield <code>t</code> equal to "ipod".</p>	005, 008
<pre>{ "\$eq": { "tags": { "t": "ipod" } } }</pre> <p>Matches documents where <code>tags</code> is a nested document with a single subfield <code>t</code> equal to "ipod".</p>	005
<pre>{ "\$eq": { "tags": { "v": 10, "t": "ipod" } } }</pre> <p>Matches documents where <code>tags</code> is a nested document with two subfields, <code>v</code> and <code>t</code>. <code>v</code> is equal to 10, and <code>t</code> is equal to "ipod". The order of subfields in the condition does not matter.</p>	008
<pre>{ "\$eq": { "tags": [ "electronics", "ipod", "apple" ] } }</pre> <p>Matches documents where <code>tags</code> is an array with the three elements listed.</p>	001
<pre>{ "\$eq": { "tags": [ "ipod", "electronics", "apple" ] } }</pre> <p>This example does not match any document, whereas the previous does, because the order of the elements in this example does not match the order in document 001.</p>	None
<pre>{ "\$between": { "tags": [ 5, 15 ] } }</pre> <p>Matches documents where <code>tags</code> is a scalar value between 5 and 15.</p>	003
<pre>{ "\$like": { "tags[1]": "ip%" } }</pre> <p>Matches documents where the first array element in <code>tags</code> qualifies the wildcard string "ip%"</p>	001, 004
<pre>{ "\$typeof": { "tags": "map" } }</pre> <p>Matches documents where <code>tags</code> is a nested document.</p>	005, 008
<pre>{ "\$typeof": { "tags": "array" } }</pre> <p>Matches documents where <code>tags</code> is an array.</p>	001, 004, 006, 007

Example	Documents Returned
<pre data-bbox="175 258 626 289">{"\$sizeof":{"tags":{"\$ge":3}}}</pre> <p data-bbox="159 317 1138 348">Matches documents where the size of the data in <code>tags</code> is greater than or equal to three.</p> <ul data-bbox="159 363 906 499" style="list-style-type: none"> <li>• 001 matches because the array has three elements</li> <li>• 002 matches because the string is of length four</li> <li>• 004 matches because the nested document has three subfields</li> </ul>	001, 002, 004
<pre data-bbox="175 552 824 583">{"\$in":{"tags":["ipod", 10, {"t":"ipod"}]}}</pre> <p data-bbox="159 615 1222 674">Matches documents where <code>tags</code> equals any of the values listed. Note that the values can be of different types.</p>	002, 003, 005
<pre data-bbox="175 720 808 888">{   "\$and":[     {"\$lt":{"tags[1].v":10}},     {"\$matches":{"tags[1].t":"ap{2}"}}   ] }</pre> <p data-bbox="159 919 1243 978">Matches documents where the first array element in <code>tags</code> has a nested document with a subfield <code>v</code> less than one, and the same nested document also matches the regular expression <code>"ap{2}"</code>.</p>	007
<pre data-bbox="175 1024 735 1192">{   "\$or":[     {"\$exists":"tags.v"},     {"\$typeof":{"tags":"string"}}   ] }</pre> <p data-bbox="159 1224 1187 1283">Matches documents where either <code>tags</code> is a nested document with a subfield <code>v</code>, or <code>tags</code> is a scalar string.</p>	002, 008

**NOTE:** You can improve the performance of queries with conditions by using secondary indexes. See [Queries that Benefit from Secondary Indexes](#) on page 700 for more details.

OJAI supports comparison, existence, `between`, `match`, `like`, `type of`, `size of`, `in`, and logical operators.

### OJAI Query Conditions Using Container Field Paths

Starting in MapR 6.1, HPE Ezmeral Data Fabric Database supports the notion of a *container field path*. A container field path enables you to perform comparisons on a field path that is either a single value or an arbitrary array element. You can use container field paths with arrays and nested documents, including nested documents with multiple levels of nesting and multidimensional arrays.

### Conditions with Container Field Paths on Arrays

If you have a field that has a single value rather than an array of values, when using the container notation, HPE Ezmeral Data Fabric Database treats the single value as an array with one element. This enables you to use a container field path to access a field that has both array elements and scalar values. The array elements and scalar values can be of any type.

Suppose you have the following set of documents:

```
{ "_id" : "001", "name" : "Ipod 001", "tags" : [ "electronics", "ipod",
"apple" ] }
{ "_id" : "002", "name" : "Ipod 002", "tags" : "ipod" }
{ "_id" : "003", "name" : "Ipod 003", "tags" : 10 }
{ "_id" : "004", "name" : "Ipod 004", "tags" : [ 10, "ipod", { "t" :
"ipod" } ] }
{ "_id" : "005", "name" : "Ipod 005", "tags" : { "t" : "ipod" } }
{ "_id" : "006", "name" : "Ipod 006", "tags" : [ { "t" : "ipod" }, { "t" :
"apple" } ] }
{ "_id" : "007", "name" : "Ipod 007", "tags" : [ { "t" : "ipod", "v" :
10 }, { "t" : "apple", "v" : 9 } ] }
{ "_id" : "008", "name" : "Ipod 008", "tags" : { "t" : "ipod", "v" : 10 } }
```

To find all documents that contain the tag named "ipod", you can use the following OJAI query condition, where you reference `tags` using a container field path:

```
{ "$eq" : { "tags[]" : "ipod" } }
```

The expression matches the following documents, with the matching condition highlighted in bold:

```
{ "_id" : "001", "name" : "Ipod 001", "tags" : [ "electronics", "ipod",
"apple" ] }
{ "_id" : "002", "name" : "Ipod 002", "tags" : "ipod" }
{ "_id" : "004", "name" : "Ipod 004", "tags" : [ 10, "ipod", { "t" :
"ipod" } ] }
```

Note that the matching documents have the following characteristics:

- In 001 and 004, `tags` are array fields.
- In 002, `tags` is a scalar value.
- In 001 and 004, the `tags` arrays have elements in addition to "ipod".

You can also use the AND operator to match multiple container field path conditions.

For example, the following condition finds all documents that have both "ipod" and "apple" tags:

```
{
  "$and" : [
    { "$eq" : { "tags[]" : "ipod" } },
    { "$eq" : { "tags[]" : "apple" } }
  ]
}
```

The expression matches the following document, with the matching conditions highlighted in bold:

```
{ "_id" : "001", "name" : "Ipod 001", "tags" : [ "electronics", "ipod", "apple" ] }
```

### Conditions with Container Field Paths on Nested Documents

You can also use the container field path in combination with a nested document subfield reference.

For example, using the same set of documents shown earlier, the following OJAI query condition finds all documents in which "ipod" is specified in the subfield named `t` within the `tags` nested document:

```
{ "$eq" : { "tags[.t]" : "ipod" } }
```

This expression returns the following documents, with the matching condition highlighted in bold:

```
{ "_id" : "004", "name" : "Ipod 004", "tags" : [ 10, "ipod", { "t" : "ipod" } ] }
{ "_id" : "005", "name" : "Ipod 005", "tags" : { "t" : "ipod" } }
{ "_id" : "006", "name" : "Ipod 006", "tags" : [ { "t" : "ipod" }, { "t" : "apple" } ] }
{ "_id" : "007", "name" : "Ipod 007", "tags" : [ { "t" : "ipod", "v" : 10 }, { "t" : "apple", "v" : 9 } ] }
{ "_id" : "008", "name" : "Ipod 008", "tags" : { "t" : "ipod", "v" : 10 } }
```

Note that the matching documents have the following characteristics:

- In 005 and 008, `tags` is a single nested document.
- In 006 and 007, `tags` is an array of nested documents.
- In 004, the `tags` array has both scalar data and a nested document.
- In 004 and 006, the `tags` array have other array elements that do not match the nested document subfield `t`.

### Existence Conditions with Container Field Paths

[Existence Operators](#) on page 3392 check for the existence and non-existence of a specified field path.

When you use `$exists` with a container field path, the specified field path can be any element in an array.

Using the same set of documents shown earlier, the following OJAI query condition finds all documents where the `tags` array has a nested document with a subfield `t`:

```
{ "$exists" : "tags[.t]" }
```

The expression matches the following documents with the matching condition highlighted in bold:

```
{ "_id" : "004", "name" : "Ipod 004", "tags" : [ 10, "ipod", { "t" : "ipod" } ] }
{ "_id" : "005", "name" : "Ipod 005", "tags" : { "t" : "ipod" } }
{ "_id" : "006", "name" : "Ipod 006", "tags" : [ { "t" : "ipod" }, { "t" : "apple" } ] }
{ "_id" : "007", "name" : "Ipod 007", "tags" : [ { "t" : "ipod", "v" : 10 }, { "t" : "apple", "v" : 9 } ] }
```

When you use `$notexists` with a container field path, it matches *any* element in the array that does not meet the existence condition:

```
{ "$notexists" : "tags[.t]" }
```

The expression returns the following documents with the matching condition highlighted in bold:

```
{ "_id": "001", "name": "Ipod 001", "tags": [ "electronics", "ipod", "apple" ] }
{ "_id": "002", "name": "Ipod 002", "tags": "ipod" }
{ "_id": "003", "name": "Ipod 003", "tags": "10" }
{ "_id": "004", "name": "Ipod 004", "tags": [ "10", "ipod", { "t": "ipod" } ] }
```

Even document 004 has a `tags[ ].t` element, the other elements in that document's `tags` array do not; therefore, the document qualifies the condition.

### Conditions with Container Field Paths Across Multiple Levels of Nested Documents

The following are examples of query conditions that match the sample document shown at [Container Field Paths Across Multiple Levels of Nested Documents](#):

```
{ "$eq": { "projects[ ].customer.contacts[ ].emails[ ].value": "jdoe@gmail.com" } }
```

```
{ "$eq": { "projects[ ].customer.contacts[ ].role": "CEO" } }
```

### Conditions with Container Field Paths on Multidimensional Arrays

The following examples reference documents that store the high and low temperatures for each day in a week. They use a two-dimensional array to store this data. The first element of each nested array element is the high temperature for a day, and the second element is the low. Typically, the two-dimensional array has seven array pairs, one for each day of the week. But in cases where data is unavailable, the document has only the days available.

For example, document 002 has a single dimensional array because it has data for only one day that week.

```
{
  "_id" : "001",
  "temps" : [[61,49],[74,51],[75,51],[74,52],[78,54],[75,53],[75,54]],
  "weekOf" : "4/29/2018"
}
{
  "_id" : "002",
  "temps" : [81,60],
  "weekOf" : "5/12/2018"
}
{
  "_id" : "003",
  "temps" : [[80,55],[78,54],[79,54],[77,53],[79,54],[77,54],[78,54]],
  "weekOf" : "5/13/2018"
}
```

As described at [Container Field Paths with Multidimensional Arrays](#), you can specify a container field path in a dimension only if it does not precede a dimension that specifies an explicit element. For example, the following condition is not allowed because the first dimension specifies a container field path and precedes element 1 in the second dimension:

```
// Invalid condition
{ "$ge": { "temps[ ][1]": 60 } }
```

The following table shows examples of conditions on multidimensional arrays that HPE Ezmeral Data Fabric Database supports:

Example	Documents Returned
<pre>{"\$ge": {"temps[][]": 60}}</pre> <p>Matches documents that have any temperature greater than 60.</p> <ul style="list-style-type: none"> <li>Documents 001 and 003 match because all days have high temperatures above 60.</li> <li>Document 002 matches because day 1 has a low temperature of 60.</li> </ul> <p>Although <code>temps</code> in this document is a one-dimensional array, the container notation treats it as a two-dimensional array.</p>	001, 002, 003
<pre>{"\$ge": {"temps[1][]": 75}}</pre> <p>Matches documents that have any temperature greater than 75 on the second day of the week</p>	003
<pre>{"\$eq": {"temps[]": [78, 54]}}</pre> <p>Matches documents that have a high and low temperature of 78 and 54 on the same day.</p> <ul style="list-style-type: none"> <li>Day 5 from document 001 matches this condition.</li> <li>Days 2 and 7 from document 003 match this condition.</li> </ul>	001, 003

### Related concepts

[OJAI Query Conditions Using `elementAnd`](#) on page 3403

The `elementAnd` operator allows you to specify multiple conditions on the same array element using a container field path. This is in contrast to the `and` operator where conditions can refer to any array element. You can use `elementAnd` with both nested documents and scalar values. You can also use it in combination with other operators, including `between`, `and`, and `or`.

### More information

[Container Field Paths](#) on page 645

[Indexes on Container Field Paths in Equality Conditions](#) on page 703

[Indexes on Container Field Paths in Range Conditions](#) on page 707

### *OJAI Query Conditions Using `elementAnd`*

The `elementAnd` operator allows you to specify multiple conditions on the same array element using a container field path. This is in contrast to the `and` operator where conditions can refer to any array element. You can use `elementAnd` with both nested documents and scalar values. You can also use it in combination with other operators, including `between`, `and`, and `or`.

### Using `elementAnd` with Nested Documents

Assume that you have the following set of documents that reflect student scores on courses. Each document has an array of `grades`. `Grades` is a nested document that reflects how the students scored on each course they took.

```
{ "_id": "001", "grades": [ { "course": "math", "score": 15.5 },
  { "score": 12, "course": "history" }, { "course": "english", "score": 8 } ] }
{ "_id": "002", "grades": [ { "course": "math", "score": 4 },
  { "course": "history", "score": 12, "cmts": "... " },
  { "course": "english", "score": 18 } ] }
{ "_id": "003", "grades": [ { "course": "math", "score": 11 },
  { "course": "history", "score": 15 }, { "course": "english", "score": 12 },
  { "course": "sports", "score": 4 } ] }
```

```
{ "_id": "004", "grades": [ { "course": "math", "score": 15.5 },
{ "course": "history", "score": 12, "details": { "info": "..."} } ] }
{ "_id": "005", "grades": [ { "course": "math", "score": 15.5 },
{ "course": "history", "score": 10 }, { "course": "physics", "score": 11 } ] }
```

If you want to find the students who scored 12 in history, you use the following `elementAnd` condition:

```
{
  "$elementAnd": {
    "grades[]": [
      { "$eq": { "course": "history" } },
      { "$eq": { "score": 12 } }
    ]
  }
}
```

The condition matches the following documents, with the matching conditions highlighted in bold:

```
{ "_id": "001", "grades": [ { "course": "math", "score": 15.5 },
{ "course": "history", "score": 12 }, { "course": "english", "score": 8 } ] }
{ "_id": "002", "grades": [ { "course": "math", "score": 4 },
{ "course": "history", "score": 12, "cmts": "..."},
{ "course": "english", "score": 18 } ] }
{ "_id": "004", "grades": [ { "course": "math", "score": 15.5 },
{ "course": "history", "score": 12, "details": { "info": "..."} } ] }
```

The example illustrates the following behavior:

- The positions of the subfields in the nested document are not significant.
- In document 002, there are other subfields in the nested document that do not match the specified conditions.

In contrast, the following example expresses a different condition, using `and` instead of `elementAnd`:

```
{
  "$and": [
    { "$eq": { "grades[].course": "history" } },
    { "$eq": { "grades[].score": 12 } }
  ]
}
```

This condition returns documents corresponding to students who have taken history and scored 12 on *any* course. The following are the matching documents, with the matching conditions highlighted in bold:

```
{ "_id": "001", "grades": [ { "course": "math", "score": 15.5 },
{ "course": "history", "score": 12 }, { "course": "english", "score": 8 } ] }
{ "_id": "002", "grades": [ { "course": "math", "score": 4 },
{ "course": "history", "score": 12, "cmts": "..."},
{ "course": "english", "score": 18 } ] }
{ "_id": "003", "grades": [ { "course": "math", "score": 11 },
{ "course": "history", "score": 15 }, { "course": "english", "score": 12 },
{ "course": "sports", "score": 4 } ] }
{ "_id": "004", "grades": [ { "course": "math", "score": 15.5 },
{ "course": "history", "score": 12, "details": { "info": "..."} } ] }
```

The example illustrates the following behavior:

- Besides returning the same documents as the previous `elementAnd` example, this condition also returns document 003.

- Document 003 matches because that student took history and scored 12 on english, rather than history.
- Document 005 does not match because although the student took history, the student did not score 12 on any courses.

### Using `elementAnd` with Scalar Values

If you apply `elementAnd` to a container of scalar values, you use the `$` symbol to denote an unspecified container element.

Suppose you have the following documents:

```
{ "_id" : "001", "name" : "a", "values" : [1, 2, 3, 6, 15] }
{ "_id" : "002", "name" : "b", "values" : [3, 6, 9, 10, 15] }
{ "_id" : "003", "name" : "c", "values" : [14] }
{ "_id" : "004", "name" : "c", "values" : 11 }
```

To find all documents where `values[]` contains a number between 7 and 11 (inclusive), you can use the following condition:

```
{
  "$elementAnd": {
    "values[]": [
      { "$ge": { "$": 7 } },
      { "$le": { "$": 11 } }
    ]
  }
}
```

The condition returns the following documents, with the matching numbers highlighted in bold:

```
{ "_id" : "002", "name" : "b", "values" : [3, 6, 9, 10, 15] }
{ "_id" : "004", "name" : "c", "values" : 11 }
```

The example illustrates the following behavior:

- In document 002, multiple elements in the array match the condition.
- In document 004, `values` is a scalar value.

Suppose you apply the following condition that uses `and` instead of `elementAnd`:

```
{
  "$and": [
    { "$ge": { "values[]": 7 } },
    { "$le": { "values[]": 11 } }
  ]
}
```

All documents except 003 match this `and` condition because in the matching documents, `values[]` contains *some* number greater than or equal to 7 and *some* number less than or equal to 11. The difference is that the same number does not need to match both conditions, which is the case for document 001.

### Using `between` with `elementAnd`

You cannot use a container field path in a `between` condition. To use the `between` operator to match against an arbitrary array element, you must include the `between` condition in an `elementAnd` condition.

The following table shows the proper way to specify a `between` condition that is equivalent to the `elementAnd` example from the previous section:

Correct Condition	Incorrect Condition
<pre>{   "\$elementAnd": {     "values[]": [       { "\$between": { "\$": [7, 11] } }     ]   } }</pre>	<pre>{ "\$between": { "values[]": [7, 11] } }</pre>

This example uses `between` to match against an arbitrary scalar array element. You can also use `between` to match against a subfield in a nested document, in which the nested document is an arbitrary array element.

For example, using the sample documents shown earlier, the following table shows the correct way to apply the `between` operator on the subfield `score` in the nested documents that are elements in the `grades` array:

Correct Condition	Incorrect Condition
<pre>{   "\$elementAnd": {     "grades[]": [       { "\$between": { "score": [15.5, 20] } }     ]   } }</pre>	<pre>{ "\$between": { "grades[] .score": [15.5, 20] } }</pre>

The condition returns the following documents, with the matching conditions highlighted in bold:

```
{ "_id": "001", "grades": [ { "course": "math", "score": 15.5 },
{ "course": "history", "score": 12 }, { "course": "english", "score": 8 } ] }
{ "_id": "002", "grades": [ { "course": "math", "score": 4 },
{ "cmts": "...", "course": "history", "score": 12 },
{ "course": "english", "score": 18 } ] }
{ "_id": "004", "grades": [ { "course": "math", "score": 15.5 },
{ "course": "history", "details": { "info": "...", "score": 12 } } ] }
{ "_id": "005", "grades": [ { "course": "math", "score": 15.5 },
{ "course": "history", "score": 10 }, { "course": "physics", "score": 11 } ] }
```

### Using Other Operators in `elementAnd` Conditions

You can also use operators like `or` in `elementAnd`'s query condition list.

For example, the following condition finds all students who scored 12 in either history or english:

```
{
  "$elementAnd": {
    "grades[]": [
      { "$or": [
        { "$eq": { "course": "history" } },
        { "$eq": { "course": "english" } }
      ] },
      { "$eq": { "score": 12 } }
    ]
  }
}
```

```

    ]
  }
}

```

The condition returns the following documents, with the matching conditions highlighted in bold:

```

{ "_id": "001", "grades": [ { "course": "math", "score": 15.5 },
  { "course": "history", "score": 12 }, { "course": "english", "score": 8 } ] }
{ "_id": "002", "grades": [ { "course": "math", "score": 4 },
  { "course": "history", "score": 12 },
  { "course": "english", "score": 18 } ] }
{ "_id": "003", "grades": [ { "course": "math", "score": 11 },
  { "course": "history", "score": 15 }, { "course": "english", "score": 12 },
  { "course": "sports", "score": 4 } ] }
{ "_id": "004", "grades": [ { "course": "math", "score": 15.5 },
  { "course": "history", "score": 12, "details": { "info": "..."} } ] }

```

### Combining `elementAnd` with Other Operators

You can combine `elementAnd` with other operators like `and`.

For example, using the sample documents shown earlier, suppose you want to find all students who scored 12 in history as well scored 15.5 in math. The following condition expresses this criteria:

```

{
  "$and": [
    {
      "$elementAnd": {
        "grades[]": [
          { "$eq": { "course": "history" } },
          { "$eq": { "score": 12 } }
        ]
      }
    },
    {
      "$elementAnd": {
        "grades[]": [
          { "$eq": { "course": "math" } },
          { "$eq": { "score": 15.5 } }
        ]
      }
    }
  ]
}

```

The condition returns the following documents, with the matching conditions highlighted in bold:

```

{ "_id": "001", "grades": [ { "course": "math", "score": 15.5 },
  { "course": "history", "score": 12 }, { "course": "english", "score": 8 } ] }
{ "_id": "004", "grades": [ { "course": "math", "score": 15.5 },
  { "course": "history", "score": 12, "details": { "info": "..."} } ] }

```

## Querying with HPE Ezmeral Data Fabric Database Shell

This section describes how to query JSON documents using either the `find` or `findbyid` command in HPE Ezmeral Data Fabric Database Shell (dbshell). It introduces the functionality the `find` command supports and describes the two ways to specify your queries. It also provides links to reference pages and examples.

The `findbyid` command allows you to retrieve a single document with a specified id from a HPE Ezmeral Data Fabric Database JSON table.

The `find` command allows you to specify projections and filter conditions (using JSON strings) to retrieve specific documents. It also allows you to specify the following options:

- Range of document IDs to retrieve
- Offset from which to start retrieval
- Order by to sort fields in the document
- Limit on the number of documents to retrieve

To invoke HPE Ezmeral Data Fabric Database shell, run the following command on a Data Fabric cluster node:

```
% mapr dbshell
```

For a complete list and description of options available, see [dbshell find or findbyid](#) on page 5504.

## Alternatives for Writing Dbshell Query Commands

You can construct your dbshell queries in one of two ways:

- Use individual options in the `find` command
- Use the `--query` option in the `find` command and specify keywords as arguments to `--query`

The following example illustrates the differences between the two alternatives.

Suppose you want to query the table `/apps/tab` with the following criteria:

- Select fields `f1` and `f2`
- Limit the result to ten documents
- Skip the first two documents
- Filter documents where the field `f3` equals 15
- Sorts on field `f1`

Click on each of the following tabs to see the syntax for each alternative:

### Use Individual Options in `find`

```
find /apps/tab --fields f1,f2 --limit
10 --offset 2 --where {"$eq":
{"f3":15}} --orderby f1
```

### Use the `--query` Option in `find`

```
find /apps/tab --query {"$select":
["f1","f2"],"$limit":10,"$offset":2,"$
where":{"$eq":
{"f3":15}},"$orderby":"f1"}
```

For more examples on how to use the two query alternatives, see the following links:

Use Individual Options in <code>find</code>	Use the <code>--query</code> Option in <code>find</code>
<a href="#">Query Examples with Other Options</a> on page 5512	<ul style="list-style-type: none"> <li>• <a href="#">Query with <code>--query</code></a> on page 5507</li> <li>• <a href="#">Query with <code>--orderby</code></a> on page 5511</li> </ul>

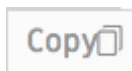

**NOTE:** With both options, you need to specify the query condition using [OJAI Query Condition Syntax](#) on page 3391.

### Examples: Querying JSON Documents

This section provides query examples using the OJAI API. The examples include querying by document ID, retrieving all documents in a store, selecting individual fields, specifying query conditions, and ordering your query result. For reference, the examples also include the equivalent HPE Ezmeral Data Fabric Database Shell (dbshell) commands.

If you hover over the right hand side of all code examples, you can use the  icon to copy and paste the code.

You can also download the code examples from github at <https://github.com/mapr-demos/ojai-examples.git>.

### Querying By ID

The examples in this section show you how to query for a single document ID.

#### Java

This example retrieves a single document identified by the ID `user001`.

**NOTE:** To query for a range of document IDs, you must specify an OJAI [QueryCondition](#). See [Querying with Conditions](#) on page 3426 for examples of the syntax.

package com.mapr.ojai.examples;

import org.ojai.Document;
import org.ojai.store.Connection;
import org.ojai.store.DocumentStore;
import org.ojai.store.DriverManager;

public class OJAI_003_FindById {

    public static void main(String[] args) {

        System.out.println("==== Start Application ===");
    }
}
```

```

// Create an OJAI connection to MapR cluster
final Connection connection = DriverManager.getConnection("ojai:mapr:");

// Get an instance of OJAI DocumentStore
final DocumentStore store = connection.getStore("/demo_table");

// fetch the OJAI Document by its '_id' field
final Document userDocument = store.findById("user0001");

// Print the OJAI Document
System.out.println(userDocument.asJsonString());

// Close this instance of OJAI DocumentStore
store.close();

// close the OJAI connection and release any resources held by the
connection
connection.close();

System.out.println("==== End Application ===");
}
}

```

## Node.js

This example retrieves a single document identified by the ID user0001.

**NOTE:** To query for a range of document IDs, you must specify an OJAI query condition. See [Querying with Conditions](#) on page 3426 for examples of the syntax.

```

const { ConnectionManager } = require('node-maprdb');

const connectionString = 'localhost:5678?' +
  'auth=basic;' +
  'user=mapr;' +
  'password=mapr;' +
  'ssl=true;' +
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
  'sslTargetNameOverride=nodel.mapr.com';

let connection;

ConnectionManager.getConnection(connectionString)
  .then((conn) => {

```

```

    connection = conn;
    // Get a store
    return connection.getStore('/demo_table');
  })
  .then((store) => {
    // fetch the OJAI Document by its '_id' field
    return store.findById('user0001');
  })
  .then((doc) => {
    // Print the OJAI Document
    console.log(doc);
    connection.close();
  });

```

## Python

This example retrieves a single document identified by the ID `user0001`.

**NOTE:** To query for a range of document IDs, you must specify an OJAI [QueryCondition](#). See [Querying with Conditions](#) on page 3426 for examples of the syntax.

```

from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
    "ssl=true;" \
    "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
    "sslTargetNameOverride=node1.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

# fetch the OJAI Document by its '_id' field
doc = store.find_by_id("user0001")

# Print the OJAI Document
print(doc)

# close the OJAI connection
connection.close()

```

## dbshell

The following is the equivalent of the code examples using dbshell. See [dbshell find or findbyid](#) on page 5504 for more details about the syntax dbshell provides.

```

# mapr dbshell
maprdb root:> findbyid /demo_table --id user0001

```

## C#

This example retrieves a single document identified by the ID `user0001`.

**NOTE:** To query for a range of document IDs, you must specify an OJAI [QueryCondition](#). See [Querying with Conditions](#) on page 3426 for examples of the syntax.

```

using System;
using MapRDB.Driver;

```

```

public class FindById
{
    public void FindById()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        // Fetch the OJAI Document by its '_id' field
        var document = store.FindById("user0001");

        // Print the OJAI Document
        Console.WriteLine(document);

        // Close the OJAI connection
        connection.Close();
    }
}

```

**Go**

This example retrieves a single document identified by the ID `user0001`.

**NOTE:** To query for a range of document IDs, you must specify an OJAI [Condition](#). See [Querying with Conditions](#) on page 3426 for examples of the syntax.

```

package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=nodel.cluster.com"

    storeName := "/demo_table"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Get a store and assign it as a DocumentStore struct
    store, err := connection.GetStore(storeName)
    if err != nil {

```

```

        panic(err)
    }

    // Fetch the OJAI Document by its '_id' field
    doc, err := store.FindByIdString("id0001")
    if err != nil {
        panic(err)
    }

    // Print the OJAI Document
    fmt.Println(doc.AsJsonString())

    // Close connection
    connection.Close()
}

```

### Querying and Returning All Documents

The examples in this section show you two ways of retrieving all documents from a document store.

#### Java - Example 1

The following example queries a document store and returns all documents by using the [DocumentStore.find](#) method.

```

/**
 * Copyright (c) 2017 MapR, Inc.
 *
 * Licensed under the Apache License, Version 2.0 (the "License");
 * you may not use this file except in compliance with the License.
 * You may obtain a copy of the License at
 *
 * http://www.apache.org/licenses/LICENSE-2.0
 *
 * Unless required by applicable law or agreed to in writing, software
 * distributed under the License is distributed on an "AS IS" BASIS,
 * WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
 * See the License for the specific language governing permissions and
 * limitations under the License.
 */
package com.mapr.ojai.examples;

import org.ojai.Document;
import org.ojai.DocumentStream;
import org.ojai.store.Connection;
import org.ojai.store.DocumentStore;
import org.ojai.store.DriverManager;

public class OJAI_004_FindAll {

    public static void main(String[] args) {

        System.out.println("==== Start Application ===");

        // Create an OJAI connection to MapR cluster
        final Connection connection = DriverManager.getConnection("ojai:mapr:");

        // Get an instance of OJAI DocumentStore
        final DocumentStore store = connection.getStore("/demo_table");

        // fetch all OJAI Documents from this store
        final DocumentStream stream = store.find();
    }
}

```

```

    for (final Document userDocument : stream) {
        // Print the OJAI Document
        System.out.println(userDocument.asJsonString());
    }

    // Close this instance of OJAI DocumentStore
    store.close();

    // close the OJAI connection and release any resources held by the
connection
    connection.close();

    System.out.println("==== End Application ===");
}
}
}

```

## Java - Example 2

The following example queries a document store and returns all documents. It creates a [Query](#) object and passes that to the [DocumentStore.findQuery](#) method.

```

/**

 * See the License for the specific language governing permissions and
 * limitations under the License.
 */

const { ConnectionManager } = require('node-maprdb');

const connectionString = 'localhost:5678?' +
    'auth=basic;' +
    'user=mapr;' +
    'password=mapr;' +
    'ssl=true;' +
    'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
    'sslTargetNameOverride=node1.mapr.com';

let connection;

// Create a connection to data access server
ConnectionManager.getConnection(connectionString)
    .then((conn) => {
        connection = conn;
        // Get a store
        return connection.getStore('/demo_table');
    })
    .then((store) => {
        // fetch all OJAI Documents from table

```

```

    return store.find({});
  })
  .then((queryResult) => {
    queryResult.on('data', (document) => console.log(document));
    queryResult.on('end', () => {
      // close the OJAI connection
      connection.close();
    });
  });
});

```

### Node.js - Example 2

The following example queries a document store and returns all documents. It creates an empty query and passes that to the [DocumentStore.find](#) method.

```

/*
 * Copyright (c) 2018 MapR, Inc.
 *
 * Licensed under the Apache License, Version 2.0 (the "License");
 * you may not use this file except in compliance with the License.
 * You may obtain a copy of the License at

 * limitations under the License.
 */

const { ConnectionManager } = require('node-maprdb');

const connectionString = 'localhost:5678?' +
  'auth=basic;' +
  'user=mapr;' +
  'password=mapr;' +
  'ssl=true;' +
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
  'sslTargetNameOverride=nodel.mapr.com';

let connection;

// Create a connection to data access server
ConnectionManager.getConnection(connectionString)
  .then((conn) => {
    connection = conn;
    // Get a store
    return connection.getStore('/demo_table');
  })
  .then((store) => {
    // options for find request
    const options = {
      'ojai.mapr.query.include-query-plan': true,
      'ojai.mapr.query.timeout-milliseconds': 10000
    }
    // fetch all OJAI Documents from table
    return store.find({}, options)
  })
  .then((queryResult) => {
    // get query plan
    console.log(queryResult.queryPlan);
  });

```

```

queryResult.on('data', (document) => {
  // Print OJAI Documents from document stream
  console.log(document);
});
queryResult.on('end', () => {
  // close the OJAI connection
  connection.close();
});
});

```

### Python - Example 1

The following example queries a document store and returns all documents by using the [DocumentStore.find](#) method.

```

from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
                "ssl=true;" \
                "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
                "sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

# fetch all OJAI Documents from table
query_result = store.find()

# Print OJAI Documents from document stream
for doc in query_result:
    print(doc)

# close the OJAI connection
connection.close()

```

### Python - Example 2

The following example queries a document store and returns all documents. It creates a [Query](#) object and passes that to the [DocumentStore.find](#) method.

```

from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
                "ssl=true;" \
                "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
                "sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

# Build an OJAI query
query = connection.new_query().build()

# options for find request
options = {
    'ojai.mapr.query.include-query-plan': True,

```

```

    'ojai.mapr.query.result-as-document': True,
    'ojai.mapr.query.timeout-milliseconds': 10000
}

# fetch all OJAI Documents from table
query_result = store.find(query, options=options)

# get query plan
print(query_result.get_query_plan())

doc_stream = query_result
# Print OJAI Documents from document stream
for doc in doc_stream:
    print(doc.as_dictionary())

# close the OJAI connection
connection.close()

```

### dbshell

The following is the equivalent of the code examples using dbshell. See [dbshell find or findbyid](#) on page 5504 for more details about the syntax dbshell provides.

```

# mapr dbshell
maprdb root:> find /demo_table

```

### C# - Example 1

The following example queries a document store and returns all documents by using the [GetAllDocuments](#) method.

```

using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class FindAllDocuments
{
    public async void FindAllDocuments()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        // Fetch all OJAI Documents from table
        var queryResult = store.Find();
        var documentStream = await queryResult.GetAllDocuments();

        // Print OJAI Documents from document stream
        foreach (var document in documentStream)
        {
            Console.WriteLine(document.ToJsonString());
        }
    }
}

```

```

        // Close the OJAI connection
        connection.Close();
    }
}

```

## C# - Example 2

The following example queries a document store and returns all documents. It creates a [Query](#) object and passes that to the [DocumentStore.Find](#) method.

```

using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class FindAllQuery
{
    public async void FindAllQuery()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=node1.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        // Build an OJAI query
        var query = connection.NewQuery().Build();

        // Options for find request
        var options = new QueryOptions()
        {
            IncludeQueryPlan = true,
            Timeout = 1000
        };

        // Fetch all OJAI Documents from table
        var queryResult = store.Find(query, options);

        // Get query plan
        Console.WriteLine(queryResult.GetQueryPlan());

        var documentStream = await
queryResult.GetDocumentAsyncStream().GetAllDocuments();
        // Print OJAI Documents from document stream
        foreach (var document in documentStream)
        {
            Console.WriteLine(document.ToDictionary());
        }

        // Close the OJAI connection
        connection.Close();
    }
}

```

### Go - Example 1

The following example queries a document store and returns all documents by using the [DocumentStore.FindAll](#) function.

```
package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=node1.cluster.com"

    storeName := "/demo_table"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Get a store and assign it as a DocumentStore struct
    store, err := connection.GetStore(storeName)
    if err != nil {
        panic(err)
    }

    // Fetch all OJAI Documents from table
    findResult, err := store.FindAll(&client.FindOptions{IncludeQueryPlan:
false, ResultAsDocument: true})

    // Print OJAI Documents from document stream
    for _, doc := range findResult.DocumentList() {
        fmt.Println(doc)
    }

    // Close connection
    connection.Close()
}
```

### Go - Example 2

The following example queries a document store and returns all documents. It creates a [Query](#) object and passes that to the [DocumentStore.FindQuery](#) function.

```
package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
```

```

// Create connection string
connectionString := "192.168.33.11:5678?" +
    "auth=basic;" +
    "user=mapr;" +
    "password=mapr;" +
    "ssl=true;" +
    "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
    "sslTargetNameOverride=nodel.cluster.com"

storeName := "/demo_table"

// Create a connection to DAG
connection, err := client.MakeConnection(connectionString)
if err != nil {
    panic(err)
}

// Get a store and assign it as a DocumentStore struct
store, err := connection.GetStore(storeName)
if err != nil {
    panic(err)
}

// Options for find request
options := &client.FindOptions{IncludeQueryPlan: true,
ResultAsDocument: true}

// Build an OJAI query
query, err := client.MakeQuery()
if err != nil {
    panic(err)
}

// Fetch all OJAI Documents from table
findResult, err := store.FindQuery(query, options)

// Get query plan
fmt.Println(findResult.QueryPlan())

// Print OJAI Documents from document stream
for _, doc := range findResult.DocumentList() {
    fmt.Println(doc)
}

// Close connection
connection.Close()
}

```

## Paginating Your Result

An alternative to returning all documents from a store is to specify a limit in the query. Another alternative is to paginate the result using offset and limit. [Querying with Order By](#) on page 3439 contains an example that shows you how to use offset and limit. Although the example also uses order by, you can use offset and limit independent of order by.

## Querying with Select

The examples in this section query a document store and retrieve specific fields from the documents.

**NOTE:** Selecting a specific field is also known as a *projection*. You can improve the performance of projection queries by using secondary indexes. See [Using Indexes to Optimize Projections in Queries](#) on page 711 for more details.

## Java

The following example shows how to retrieve the `_id` and `address.zipCode` fields from all documents in a store using the [Query.select](#) method.

```
/**

 */

const { ConnectionManager } = require('node-maprdb');

const connectionString = 'localhost:5678?' +
  'auth=basic;' +
  'user=mapr;' +
  'password=mapr;' +
  'ssl=true;' +
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
  'sslTargetNameOverride=nodel.mapr.com';

let connection;

// Create a connection to data access server
ConnectionManager.getConnection(connectionString)
  .then((conn) => {
    connection = conn;
    // Get a store
    return connection.getStore('/demo_table');
  })
  .then((store) => {
    // Create an OJAI query
    const query = {"$select": ["_id", "address.zipCode"]};
    // fetch OJAI Documents by query
    return store.find(query);
  })
  .then((queryResult) => {
    queryResult.on('data', (document) => {
      // Print OJAI Documents from document stream
      console.log(document);
    });
    queryResult.on('end', () => {
      // close the OJAI connection
      connection.close();
    });
  });
}

```

## Python

The following example shows how to retrieve the `_id` and `address.zipCode` fields from all documents in a store using an OJAI query.

```
from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
    "ssl=true;" \
    "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
    "sslTargetNameOverride=node1.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

# Create an OJAI query
query = {"$select": ["_id", "address.zipCode"]}

# options for find request
options = {
    'ojai.mapr.query.result-as-document': True
}

# fetch OJAI Documents by query
query_result = store.find(query, options=options)

# Print OJAI Documents from document stream
for doc in query_result:
    print(doc.as_dictionary())

# close the OJAI connection
connection.close()
```

## dbshell

The following two dbshell commands are equivalent to the code examples. See [dbshell find or findbyid](#) on page 5504 for more details about the syntax dbshell provides.

```
# mapr dbshell
maprdb root:> find /demo_table --query {"$select":["_id","address.zipcode"]}

maprdb root:> find /demo_table --fields _id,address.zipcode
```

## C#

The following example shows how to retrieve the `_id` and `address.zipCode` fields from all documents in a store using an OJAI query.

```
using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class FindQueryWithSelect
{
    public async void FindQueryWithSelect()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
```

```

        $"password=mapr;" +
        $"ssl=true;" +
        $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        $"sslTargetNameOverride=nodel.mapr.com";
var connection = ConnectionFactory.CreateConnection(connectionStr);

// Get a store and assign it as a DocumentStore object
var store = connection.GetStore("/demo_table");

//Create an OJAI query
var query = connection.NewQuery().Select("_id",
"address.zipCode").Build();

// Options for find request
var options = new QueryOptions(1000, true);

// Fetch OJAI Documents by query
var queryResult = store.Find(query, options);

var documentStream = await
queryResult.GetDocumentAsyncStream().GetAllDocuments();
// Print OJAI Documents from document stream
foreach (var document in documentStream)
{
    Console.WriteLine(document.ToDictionary());
}

// Close the OJAI connection
connection.Close();
    }
}

```

## Go

The following example shows how to retrieve the `_id` and `address.zipCode` fields from all documents in a store using an OJAI query.

```

package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=nodel.cluster.com"

    storeName := "/demo_table"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }
}

```

```

// Get a store and assign it as a DocumentStore struct
store, err := connection.GetStore(storeName)
if err != nil {
    panic(err)
}

// Options for find request
options := &client.FindOptions{ResultAsDocument: true}

// Create an OJAI query
query := map[string]interface{}{"$select": []interface{}{"_id",
"address.zipCode"}}

// Fetch all OJAI Documents from table
findResult, err := store.FindQueryMap(query, options)

// Print OJAI Documents from document stream
for _, doc := range findResult.DocumentList() {
    fmt.Println(doc)
}

// Close connection
connection.Close()
}

```

### Querying with Conditions

The examples in this section query a document store and return documents that have specific conditions.

For more information about how to specify query conditions in OJAI, see [Query Conditions in OJAI Applications](#) on page 3374.

**NOTE:** You can improve the performance of queries with conditions by using secondary indexes. See [Queries that Benefit from Secondary Indexes](#) on page 700 for more details.

### Java - OJAI QueryCondition Object

The following example shows how to return all documents from a store where `address.zipCode` equals 95196, using the [Query.where](#) method. It uses an OJAI [QueryCondition](#) to specify the condition.

```

/**

        final Query query = connection.newQuery()
            .where(
                connection.newCondition()
                    .is("address.zipCode", Op.EQUAL, 95196) // Build an OJAI
QueryCondition
                    .build() //
            )
            .build();

        // fetch all OJAI Documents from this store
        final DocumentStream stream = store.find(query);

        for (final Document userDocument : stream) {
            // Print the OJAI Document
            System.out.println(userDocument.asJsonString());
        }

        // Close this instance of OJAI DocumentStore
        store.close();

        // close the OJAI connection and release any resources held by the
connection
        connection.close();

        System.out.println("==== End Application ===");
    }
}

```

### Java - OJAI Query Condition in JSON Format

The following example shows how to return all documents from a store where `address.zipCode` equals 95196, using the [Query.where](#) method. It specifies the query condition using a JSON string.

```

* See the License for the specific language governing permissions and
* limitations under the License.
*/

const { ConnectionManager } = require('node-maprdb');

const connectionString = 'localhost:5678?' +
  'auth=basic;' +
  'user=mapr;' +
  'password=mapr;' +
  'ssl=true;' +
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
  'sslTargetNameOverride=nodel.mapr.com';

let connection;

// Create a connection to data access server
ConnectionManager.getConnection(connectionString)
  .then((conn) => {
    connection = conn;
    // Get a store
    return connection.getStore('/demo_table');
  })
  .then((store) => {
    // Create an OJAI query
    const query = {"$where": {"$eq": { 'address.zipCode': 95196 }}};
    // fetch OJAI Documents by query
    return store.find(query);
  })
  .then((queryResult) => {
    queryResult.on('data', (document) => {
      // Print OJAI Documents from document stream
      console.log(document);
    });
    queryResult.on('end', () => {
      // close the OJAI connection
      connection.close();
    });
  });
});

```

### Python - OJAI QueryCondition Object

The following example shows how to return all documents from a store where `address.zipCode` equals 95196, using the [Query.where](#) method. It uses an OJAI [QueryCondition](#) to specify the condition.

```

from mapr.ojai.ojai_query.QueryOp import QueryOp
from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
  "ssl=true;" \
  "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
  "sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

```

```

# Create an OJAI query
query = connection.new_query()\
    .where(connection.new_condition()\
        .is_('address.zipCode', QueryOp.EQUAL, 95196)\
        .close()\
        .build())\
    .build()

# fetch the OJAI Documents by query
query_result = store.find(query)

# Print OJAI Documents from document stream
for doc in query_result:
    print(doc)

# close the OJAI connection
connection.close()

```

### Python - OJAI Query Condition in JSON Format

The following example uses an OJAI query condition specified in JSON format to return all documents from a store where `address.zipCode` equals 95196.

```

from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
    "ssl=true;" \
    "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
    "sslTargetNameOverride=node1.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

# Create an OJAI query
query = {"$where": {"$eq": {"address.zipCode": 95196}}}

# options for find request
options = {
    'ojai.mapr.query.result-as-document': True
}

# fetch OJAI Documents by query
query_result = store.find(query, options=options)

# Print OJAI Documents from document stream
for doc in query_result:
    print(doc.as_dictionary())

# close the OJAI connection
connection.close()

```

### dbshell

The following two dbshell commands are equivalent to the code examples. See [dbshell find or findbyid](#) on page 5504 for more details about the syntax dbshell provides.

```

# mapr dbshell
maprdb root:> find /demo_table --q {"$where":{"$eq":{"address.zipCode":95196}}}

```

```
maprdb root:> find /demo_table --where {"$eq":
{"address.zipCode":95196}}
```

### C# - OJAI QueryCondition Object

The following example shows how to return all documents from a store where `address.zipCode` equals 95196, using the [Query.Where](#) method. It uses an OJAI [QueryCondition](#) to specify the condition.

```
using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class FindQueryWithCondition
{
    public async void FindQueryWithCondition()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=node1.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        //Create an OJAI query
        var query = connection
            .NewQuery()
            .Where(connection
                .NewQueryCondition()
                .Is("address.zipCode", QueryOp.EQUAL, 95196)
                .Close()
                .Build())
            .Build();

        // Fetch the OJAI Documents by query
        var queryResult = store.Find(query);

        var documentStream = await
        queryResult.GetDocumentAsyncStream().GetAllDocuments();
        // Print OJAI Documents from document stream
        foreach (var document in documentStream)
        {
            Console.WriteLine(document);
        }

        // Close the OJAI connection
        connection.Close();
    }
}
```

## C# - OJAI Query Condition in JSON Format

The following example uses an OJAI query condition specified in JSON format to return all documents from a store where `address.zipCode` equals 95196.

```
using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class FindQueryWithConditionJson
{
    public async void FindQueryWithConditionJson()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        // Create an OJAI query
        var query =
            @"{" +
                @"{"$where": " +
                    @"{" +
                        @"{"$eq": {"address.zipCode":
{"$numberLong": "95196"}}}"}" +
                @"}" +
            @"}";

        // Fetch OJAI Documents by query
        var queryResult = store.FindQuery(query);

        var documentStream = await queryResult.GetAllDocuments();
        // Print OJAI Documents from document stream
        foreach (var document in documentStream)
        {
            Console.WriteLine(document.ToDictionary());
        }

        // Close the OJAI connection
        connection.Close();
    }
}
```

## Go - OJAI QueryCondition Object

The following example shows how to return all documents from a store where `address.zipCode` equals 95196, using the [Query.WhereCondition](#) function. It uses an OJAI [Condition](#) to specify the condition.

```
package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)
```

```

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=node1.cluster.com"

    storeName := "/demo_table"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Get a store and assign it as a DocumentStore struct
    store, err := connection.GetStore(storeName)
    if err != nil {
        panic(err)
    }

    // Options for find request
    options := &client.FindOptions{ResultAsDocument: true}

    // Create a condition
    condition, err := client.MakeCondition(client.Is("address.zipCode",
client.EQUAL, 95196), client.Close())
    if err != nil {
        panic(err)
    }
    condition.Build()

    // Create an OJAI query
    query, err := client.MakeQuery(client.WhereCondition(condition))
    if err != nil {
        panic(err)
    }
    query.Build()

    // Fetch all OJAI Documents from table
    findResult, err := store.FindQuery(query, options)

    // Print OJAI Documents from document stream
    for _, doc := range findResult.DocumentList() {
        fmt.Println(doc)
    }

    // Close connection
    connection.Close()
}

```

### Go - OJAI Query Condition in JSON Format

The following example uses an OJAI query condition specified in JSON format to return all documents from a store where `address.zipCode` equals 95196.

```

package main

import (

```

```

    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=node1.cluster.com"

    storeName := "/demo_table"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Get a store and assign it as a DocumentStore struct
    store, err := connection.GetStore(storeName)
    if err != nil {
        panic(err)
    }

    // Options for find request
    options := &client.FindOptions{ResultAsDocument: true}

    // Create an OJAI query
    query := map[string]interface{}{
        "$where": map[string]interface{}{
            "$eq": map[string]interface{}{
                "address.zipCode": 95196
            }
        }
    }

    // Fetch all OJAI Documents from table
    findResult, err := store.FindQueryMap(query, options)

    // Print OJAI Documents from document stream
    for _, doc := range findResult.DocumentList() {
        fmt.Println(doc)
    }

    // Close connection
    connection.Close()
}

```

### Querying with Select and Conditions

The examples in this section query a document store and return specific fields from documents that have specific conditions.

For more information about how to specify query conditions in OJAI, see [Query Conditions in OJAI Applications](#) on page 3374.

**NOTE:** You can improve the performance of queries with conditions by using secondary indexes. See [Queries that Benefit from Secondary Indexes](#) on page 700 for more details.

## Java

The following example shows how to return the name, address.zipCode, age, and phoneNumber fields from documents that have address.zipCode equal to 95196. It uses the [Query.select](#) and [Query.where](#) methods, specifying the query condition as a JSON string.

```
/**

 */

const { ConnectionManager } = require('node-maprdb');

const connectionString = 'localhost:5678?' +
  'auth=basic;' +
  'user=mapr;' +
  'password=mapr;' +
  'ssl=true;' +
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
  'sslTargetNameOverride=nodel.mapr.com';

let connection;

// Create a connection to data access server
ConnectionManager.getConnection(connectionString)
  .then((conn) => {
    connection = conn;
    // Get a store
    return connection.getStore('/demo_table');
  })
  .then((store) => {
    // Create an OJAI query
    const query = {"$select": ["name",
      "adress.zipCode",
      "age",
      "phoneNumbers[0]"],
      "$where": {"$eq": {"address.zipCode": 95196}}};
    // fetch OJAI Documents by query
    return store.find(query);
  })
  .then((queryResult) => {
    queryResult.on('data', (document) => {
      // Print OJAI Documents from document stream
      console.log(document);
    });
  });

```

```

    queryResult.on('end', () => {
      // close the OJAI connection
      connection.close();
    });
  });
};

```

## Python

The following example shows how to return the name, address.zipCode, age, and phoneNumber fields from documents that have address.zipCode equal to 95196. It uses an OJAI query and condition.

```

from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
    "ssl=true;" \
    "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
    "sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

# Create an OJAI query
query = {"$select": ["name",
                    "adress.zipCode",
                    "age",
                    "phoneNumbers[0]"],
        "$where": {"$eq": {"address.zipCode": 95196}}}

# options for find request
options = {
    'ojai.mapr.query.result-as-document': True
}

# fetch OJAI Documents by query
query_result = store.find(query,
                          options=options)

# Print OJAI Documents from document stream
for doc in query_result:
    print(doc.as_dictionary())

# close the OJAI connection
connection.close()

```

## dbshell

The following two dbshell commands are equivalent to the code examples. See [dbshell find or findbyid](#) on page 5504 for more details about the syntax dbshell provides.

```

find /demo_table --query {
  "$select":["name","address.zipCode","age","phoneNumber[0]"],
  "$where":{"$eq":{"address.zipCode":95196}}
}

find /demo_table
--fields name,address.zipCode,age,phoneNumber[0]
--where {"$eq":{"address.zipCode":95196}}

```

**NOTE:** The commands are shown split across multiple lines for readability. When using dbshell, you must enter them in a single line.

## C#

The following example shows how to return the name, address.zipCode, age, and phoneNumber fields from documents that have address.zipCode equal to 95196. It uses an OJAI query and condition.

```
using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class FindQueryWithSelectAndCondition
{
    public async void FindQueryWithSelectAndCondition()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        // Create an OJAI condition
        var condition = connection
            .NewQueryCondition()
            .Is("address.zipCode", QueryOp.EQUAL, 95196)
            .Close()
            .Build();

        // Create an OJAI query
        var query = connection
            .NewQuery()
            .Select("name", "adress.zipCode", "age", "phoneNumbers[0]")
            .Where(condition)
            .Build();

        // Fetch OJAI Documents by query
        var queryResult = store.Find(query);

        var documentStream = await
        queryResult.GetDocumentAsyncStream().GetAllDocuments();
        // Print OJAI Documents from document stream
        foreach (var document in documentStream)
        {
            Console.WriteLine(document.ToJsonString());
        }

        // Close the OJAI connection
        connection.Close();
    }
}
```

## Go

The following example shows how to return the name, address.zipCode, age, and phoneNumber fields from documents that have address.zipCode equal to 95196. It uses an OJAI query and condition.

```
package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=nodel.cluster.com"

    storeName := "/demo_table"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Get a store and assign it as a DocumentStore struct
    store, err := connection.GetStore(storeName)
    if err != nil {
        panic(err)
    }

    // Options for find request
    options := &client.FindOptions{ResultAsDocument: true}

    // Create an OJAI query
    query := map[string]interface{}{"$select": []interface{}{"firstName",
"address.zipCode", "age", "phoneNumbers[0]"},
"$where": map[string]interface{}{
"$eq": map[string]interface{}{"address.zipCode": 95196}}}

    // Fetch all OJAI Documents from table
    findResult, err := store.FindQueryMap(query, options)

    // Print OJAI Documents from document stream
    for _, doc := range findResult.DocumentList() {
        fmt.Println(doc)
    }

    // Close connection
    connection.Close()
}
```

## Querying with Order By

The examples in this section query a document store and return specific fields from the documents, sorted in a specific order. One of the examples also uses offset and limit.

 **NOTE:** You can improve the performance of order by queries by using secondary indexes. See [Using Indexes to Optimize ORDER BY Queries](#) on page 708 for more information.

### Java - Order By

The following example shows how to return the `_id`, `firstName`, `lastName`, and `address.zipCode` fields from documents in a store, sorting the documents by `_id`. It uses the [Query.select](#) and [Query.orderBy](#) methods.

 **NOTE:** The example sorts in the default ascending order. To sort in descending order, modify the `orderBy` method call as follows:

```
orderBy("_id", SortOrder.DESC)
```

```

package com.mapr.ojai.examples;

import org.ojai.Document;
import org.ojai.DocumentStream;
import org.ojai.store.Connection;
import org.ojai.store.DocumentStore;
import org.ojai.store.DriverManager;
import org.ojai.store.Query;

public class OJAI_010_FindQueryWithOrderBy {

    public static void main(final String[] args) {

        System.out.println("==== Start Application ===");

        // Create an OJAI connection to MapR cluster
        final Connection connection = DriverManager.getConnection("ojai:mapr:");

        // Get an instance of OJAI DocumentStore
        final DocumentStore store = connection.getStore("/demo_table");

        // Build an OJAI query with an order by
        final Query query = connection.newQuery()
            .select("_id", "firstName", "lastName", "address.zipCode")
            .orderBy("_id")
            .build();

        // fetch all OJAI Documents from this store
        final DocumentStream stream = store.find(query);
```

```

    for (final Document userDocument : stream) {
        // Print the OJAI Document
        System.out.println(userDocument.asJsonString());
    }

    // Close this instance of OJAI DocumentStore
    store.close();

    // close the OJAI connection and release any resources held by the
connection
    connection.close();

    System.out.println("==== End Application ===");
}
}

```

### Java - Order By with Offset and Limit

The following example shows how to return the `_id`, `firstName`, `lastName`, and `address.zipCode` fields from documents in a store, sorting the documents by `_id`. It uses the [Query.select](#) and [Query.orderBy](#) methods. In addition, the returned documents are offset and limited by using the [Query.offset](#) and [Query.limit](#) methods.

**NOTE:** The example sorts in the default ascending order. To sort in descending order, modify the `orderBy` method call as follows:

```
orderBy("_id", SortOrder.DESC)
```

```

/**

 */

const { ConnectionManager } = require('node-maprdb');

```

```

const connectionString = 'localhost:5678?' +
  'auth=basic;' +
  'user=mapr;' +
  'password=mapr;' +
  'ssl=true;' +
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
  'sslTargetNameOverride=node1.mapr.com';

let connection;

// Create a connection to data access server
ConnectionManager.getConnection(connectionString)
  .then((conn) => {
    connection = conn;
    // Get a store
    return connection.getStore('/demo_table');
  })
  .then((store) => {
    // Create an OJAI query
    const query = {"$select": ["_id", "name"], "$orderby": {"_id": "asc"}};
    // fetch OJAI Documents by query
    return store.find(query);
  })
  .then((queryResult) => {
    queryResult.on('data', (document) => {
      // Print OJAI Documents from document stream
      console.log(document);
    });
    queryResult.on('end', () => {
      // close the OJAI connection
      connection.close();
    });
  });
});

```

### Node.js - Order By with Offset and Limit

The following example uses an OJAI query to return the `_id`, `firstName`, `lastName`, and `address.zipCode` fields from documents in a store, sort the documents by `_id`, offset the result by two documents, and limit the result to a single document.

**NOTE:** The example sorts in the default ascending order. To sort in descending order, modify the `orderby` specification as follows:

```
"$orderby": {"_id": "desc"}
```

```

/*
 * Copyright (c) 2018 MapR, Inc.
 *
 * Licensed under the Apache License, Version 2.0 (the "License");
 * you may not use this file except in compliance with the License.
 * You may obtain a copy of the License at
 *
 * http://www.apache.org/licenses/LICENSE-2.0

 * See the License for the specific language governing permissions and
 * limitations under the License.
 */

```

```

const { ConnectionManager } = require('node-maprdb');

const connectionString = 'localhost:5678?' +
  'auth=basic;' +
  'user=mapr;' +
  'password=mapr;' +
  'ssl=true;' +
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
  'sslTargetNameOverride=nodel.mapr.com';

let connection;

// Create a connection to data access server
ConnectionManager.getConnection(connectionString)
  .then((conn) => {
    connection = conn;
    // Get a store
    return connection.getStore('/demo_table');
  })
  .then((store) => {
    // Create an OJAI query
    const query = { "$offset": 2,
      "$select": [ "_id",
        "firstName",
        "lastName",
        "address.zipCode" ],
      "$limit": 1,
      "$orderby": { "_id": "asc" } };
    // fetch OJAI Documents by query
    return store.find(query);
  })
  .then((queryResult) => {
    queryResult.on('data', (document) => {
      // Print OJAI Documents from document stream
      console.log(document);
    });
    queryResult.on('end', () => {
      // close the OJAI connection
      connection.close();
    });
  });
}

```

### Python - Order By

The following example uses an OJAI query to return the `_id` and `name` fields from documents in a store and to sort the documents by `_id`.

**NOTE:** The example sorts in the default ascending order. To sort in descending order, modify the `orderby` specification as follows:

```
"$orderby": { "_id": "desc" }
```

```

from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
  "ssl=true;" \
  "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
  "sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

```

```
# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

# Create an OJAI query
query = {"$select": ["_id", "name"], "$orderby": {"_id": "asc"}}

# fetch OJAI Documents by query
query_result = store.find(query)

# Print OJAI Documents from document stream
for doc in query_result:
    print(doc)

# close the OJAI connection
connection.close()
```

### Python - Order By with Offset and Limit

The following example uses an OJAI query to return the `_id`, `firstName`, `lastName`, and `address.zipCode` fields from documents in a store, sort the documents by `_id`, offset the result by two documents, and limit the result to a single document.

**NOTE:** The example sorts in the default ascending order. To sort in descending order, modify the `orderby` method call as follows:

```
order_by('_id', desc)
```

```
from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

# Create a connection to data access server
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
    "ssl=true;" \
    "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
    "sslTargetNameOverride=nodel.mapr.com"
connection = ConnectionFactory.get_connection(connection_str=connection_str)

# Get a store and assign it as a DocumentStore object
store = connection.get_store('/demo_table')

# Create an OJAI query
query = {"$offset": 2,
        "$select": ["_id",
                    "firstName",
                    "lastName",
                    "address.zipCode"],
        "$limit": 1,
        "$orderby": {"_id": "asc"}}

# options for find request
options = {
    'ojai.mapr.query.result-as-document': True
}

# fetch OJAI Documents by query
query_result = store.find(query, options=options)

# Print OJAI Documents from document stream
for doc in query_result:
    print(doc.as_dictionary())
```

```
# close the OJAI connection
connection.close()
```

## dbshell

The following dbshell commands are equivalent to the code examples. See [dbshell find or findbyid](#) on page 5504 for more details about the syntax dbshell provides.

```
find /demo_table --query {
  "$select":["_id","firstName","lastName","address.zipCode"],
  "$orderby":"_id"
}

find /demo_table
  --fields _id,firstName,lastName,address.zipCode
  --orderby _id

find /demo_table --query {
  "$select":["_id","firstName","lastName","address.zipCode"],
  "$orderby":"_id",
  "$offset":2,
  "$limit":1
}

find /demo_table
  --fields _id,firstName,lastName,address.zipCode
  --orderby _id
  --offset 2
  --limit 1
```

**NOTE:** The commands are shown split across multiple lines for readability. When using dbshell, you must enter them in a single line.

## C# - Order By

The following example uses an OJAI query to return the `_id` and `name` fields from documents in a store and to sort the documents by `_id`.

**NOTE:** The example sorts in the default ascending order. To sort in descending order, modify the `OrderBy` specification as follows:

```
.OrderBy("_id", SortOrder.DESC)
```

```
using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class FindQueryWithOrderBy
{
    public async void FindQueryWithOrderBy()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);
```

```

// Get a store and assign it as a DocumentStore object
var store = connection.GetStore("/demo_table");

// Create an OJAI query
var query = connection
    .NewQuery()
    .Select("_id", "name")
    .OrderBy("_id", SortOrder.ASC)
    .Build();

// Fetch OJAI Documents by query
var queryResult = store.Find(query);

var documentStream = await
queryResult.GetDocumentAsyncStream().GetAllDocuments();
// Print OJAI Documents from document stream
foreach (var document in documentStream)
{
    Console.WriteLine(document);
}

// Close the OJAI connection
connection.Close();
}
}

```

### C# - Order By with Offset and Limit

The following example uses an OJAI query to return the `_id`, `firstName`, `lastName`, and `address.zipCode` fields from documents in a store, sort the documents by `_id`, offset the result by two documents, and limit the result to a single document.

**NOTE:** The example sorts in the default ascending order. To sort in descending order, modify the `OrderBy` method call as follows:

```
.OrderBy("_id", SortOrder.DESC)
```

```

using System;
using MapRDB.Driver;
using MapRDB.Driver.Ojai;

public class FindQueryWithOrderByLimitOffset
{
    public async void FindQueryWithOrderByLimitOffset()
    {
        // Create a connection to data access server
        var connectionStr = $"localhost:5678?auth=basic;" +
            $"user=mapr;" +
            $"password=mapr;" +
            $"ssl=true;" +
            $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
            $"sslTargetNameOverride=nodel.mapr.com";
        var connection = ConnectionFactory.CreateConnection(connectionStr);

        // Get a store and assign it as a DocumentStore object
        var store = connection.GetStore("/demo_table");

        // Create an OJAI query
        var query = connection
            .NewQuery()

```

```

        .Select("_id", "firstName", "lastName", "address.zipCode")
        .Offset(2)
        .Limit(1)
        .OrderBy("_id", SortOrder.ASC)
        .Build();

    // Fetch OJAI Documents by query
    var queryResult = store.Find(query);

    var documentStream = await
queryResult.GetDocumentAsyncStream().GetAllDocuments();
    // Print OJAI Documents from document stream
    foreach (var document in documentStream)
    {
        Console.WriteLine(document.ToJsonString());
    }

    // Close the OJAI connection
    connection.Close();
}
}

```

### Go - Order By

The following example uses an OJAI query to return the `_id` and `firstName` fields from documents in a store and to sort the documents by `_id`.

The example sorts in the default ascending order. To sort in descending order, modify the `orderby` specification as follows:

```
"$orderby": map[string]interface{}{"_id": "desc"}}
```

```

package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=node1.cluster.com"

    storeName := "/demo_table"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Get a store and assign it as a DocumentStore struct
    store, err := connection.GetStore(storeName)
    if err != nil {
        panic(err)
    }
}

```

```

// Options for find request
options := &client.FindOptions{ResultAsDocument: true}

// Create an OJAI query
query := map[string]interface{}{"$select": []interface{}{"_id",
"firstName"},
"$orderby": map[string]interface{}{"_id": "asc"}}

// Fetch all OJAI Documents from table
findResult, err := store.FindQueryMap(query, options)

// Print OJAI Documents from document stream
for _, doc := range findResult.DocumentList() {
    fmt.Println(doc)
}

// Close connection
connection.Close()
}

```

### Go - Order By with Offset and Limit

The following example uses an OJAI query to return the `_id`, `firstName`, `lastName`, and `address.zipCode` fields from documents in a store, sort the documents by `_id`, offset the result by two documents, and limit the result to a single document.

The example sorts in the default ascending order. To sort in descending order, modify the `orderby` function call as follows:

```
"$orderby": map[string]interface{}{"_id": "desc"}}
```

```

package main

import (
    "fmt"
    client "github.com/mapr/private-maprdb-go-client"
)

func main() {
    // Create connection string
    connectionString := "192.168.33.11:5678?" +
        "auth=basic;" +
        "user=mapr;" +
        "password=mapr;" +
        "ssl=true;" +
        "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
        "sslTargetNameOverride=node1.cluster.com"

    storeName := "/demo_table"

    // Create a connection to DAG
    connection, err := client.MakeConnection(connectionString)
    if err != nil {
        panic(err)
    }

    // Get a store and assign it as a DocumentStore struct
    store, err := connection.GetStore(storeName)
    if err != nil {
        panic(err)
    }
}

```

```

// Options for find request
options := &client.FindOptions{ResultAsDocument: true}

// Create an OJAI query
query := map[string]interface{}{"$select": []interface{}{"_id",
"firstName", "lastName", "address.zipCode"},
"$offset": 2,
"$limit": 1,
"$orderby": map[string]interface{}{"_id": "asc"}}

// Fetch all OJAI Documents from table
findResult, err := store.FindQueryMap(query, options)

// Print OJAI Documents from document stream
for _, doc := range findResult.DocumentList() {
    fmt.Println(doc)
}

// Close connection
connection.Close()
}

```

### Using the Java OJAI Client

This topic describes HPE Ezmeral Data Fabric Database functionality that is applicable to only the Java OJAI client. This includes instructions on how to compile your Java OJAI application, enable buffered writes, use the read your own writes feature, and enable available query options.

### Additional Resources

Examples: <https://github.com/mapr-demos/ojai-examples/tree/master/java/src/main/java/com/mapr/ojai/examples>

### Compiling and Running Java OJAI Applications

For applications that use the Java OJAI API, use Maven to compile and determine the application's dependencies. Then, when you run the application, specify those dependencies in the application's classpath.

### Compile and Determine Dependencies

Use Maven to compile and determine the application dependencies.

1. Add MapR's Maven repository to your `pom.xml` file, if it is not already added:

```

<repositories>
  <repository>
    <id>mapr-releases</id>
    <url>https://repository.mapr.com/nexus/content/repositories/
releases</url>
    <snapshots><enabled>true</enabled></snapshots>
    <releases><enabled>true</enabled></releases>
  </repository>
</repositories>

```

2. Add a dependency to the MapR OJAI driver project:

```
<dependencies>
  <dependency>
    <groupId>com.mapr.ojai</groupId>
    <artifactId>mapr-ojai-driver</artifactId>
    <version>6.0.0-mapr</version>
  </dependency>
</dependencies>
```

**NOTE:** Replace the `<version>` property with the HPE Ezmeral Data Fabric Database version that you are using.

3. Use Maven to compile the application and resolve dependencies.

### Run the Application

When you develop a Java application, you can use a dependency management tool such as Maven to compile your application. However, it is recommended that you do the following instead:

1. Compile the Java application without including dependencies
2. Specify the required classpath when you submit the application to the cluster

If you choose to bundle the JAR file, and there is a mismatch between the bundled JAR file and the version that your Data Fabric cluster expects, this can result in failures. The failures differ depending on the version of Data Fabric you are using. For more information, see [Using the File System JAR to Connect to the Cluster](#) on page 3155.

When the cluster is secure, the node must also have a MapR ticket configured for the user that runs the application.

You can use the following command to launch HPE Ezmeral Data Fabric Database JSON applications:

```
java -cp <classpath>:. -Djava.library.path=/opt/mapr/lib <main class JAR>
<command line arguments>
```

### Enable OJAI Tracing

To help debug your Java OJAI application, you can enable OJAI tracing. MapR uses the `log4j` API to log tracing messages. To enable writing these messages to standard output, follow these steps:

1. Set the following property in your `/opt/mapr/conf/log4j.properties` file:

```
log4j.logger.com.mapr.ojai.store.impl=TRACE, stdout
```

2. Add the following to your `java` launch command:

- In your `java` classpath, add the library that includes custom MapR `log4j` classes:

```
-cp /opt/mapr/lib/central-logging-7.8.0-mapr.jar:<other classpaths>:.
```

- Define the location of the `log4j.properties` file:

```
-Dlog4j.configuration=file:/opt/mapr/conf/log4j.properties
```

## Reading Your Own Writes in Java OJAI

The Java OJAI `DocumentStore` and `Query` APIs provide the ability to track writes to JSON tables. Use these APIs to ensure your application reads recent writes on JSON tables with secondary indexes.

### Description

You should use this feature if it is important for your query results to reflect synchronized data between a JSON table and its secondary indexes. Because HPE Ezmeral Data Fabric Database updates secondary indexes asynchronously, it is possible for a JSON table and its secondary indexes to become out-of-sync while the index update is in progress.

For example, consider the following scenario:

- Your application updates a JSON table.
- The JSON table includes an `address` field that is a nested document with a `zipCode` subfield.
- You have a secondary index on `zipCode`.
- Later in your application, you query the JSON table filtering on `zipCode`.

You want your query result to reflect the updates from earlier in your application. To achieve this, use the `DocumentStore` and `Query` APIs that enable you to retrieve up-to-date information from the index. The APIs synchronize write operations on the JSON table with read operations on a secondary index.

See [Asynchronous Secondary Index Updates](#) on page 718 for more information about index updates.

**NOTE:** The Python and Node.js OJAI APIs do not support this feature.

### API Details

The OJAI `DocumentStore` and `Query` interfaces provide the following methods to support this functionality.

<code>DocumentStore.beginTrackingWrites</code>	Begins tracking the write operations performed through this instance of <code>DocumentStore</code> . The method takes an optional <code>previousWritesContext</code> parameter. If you specify this parameter, the tracking uses that context as the base state.
<code>DocumentStore.endTrackingWrites</code>	Flushes any buffered writes operations for this <code>DocumentStore</code> and returns a <code>writesContext</code> . Use this context to ensure that writes are visible to later queries. You can use the context across <code>DocumentStore</code> objects in the same, as well as different, client processes, when the stores refer to the same JSON table. For example, you can pass the <code>writesContext</code> returned by one <code>DocumentStore</code> to a second <code>DocumentStore</code> , to begin write tracking on the second store.
<code>DocumentStore.clearTrackedWrites</code>	Stops the write tracking and clears any state on this <code>DocumentStore</code> instance.
<code>Query.waitForTrackedWrites</code>	Sets the <code>writesContext</code> parameter for this query. A <code>writesContext</code> allows this query to "see" all the writes that happened inside the <code>writesContext</code> of a <code>DocumentStore</code> .

For the complete API, see [Java OJAI Client API](#).

## Read Your Own Writes Example

A complete code example is available on github at [OJAI\\_013\\_ReadYourOwnWrite.java](#). The following are code snippets from that example. Each step contains links to corresponding lines of code in the github example:

1. Call [beginWriteTracking](#) to set the starting point for the commit context on the JSON table /demo\_table:

```
// Create an OJAI connection to MapR cluster
final Connection connectionNode1 =
DriverManager.getConnection("ojai:mapr:");

// Get an instance of OJAI DocumentStore
final DocumentStore storeNode1 = connectionNode1.getStore("/demo_table");

// initiate tracking of commit-context
storeNode1.beginTrackingWrites();
```

2. [Update](#) the zipCode of an existing user and [insert](#) a new user in /demo\_table:

```
// issue a set of mutations/insert/delete/etc
storeNode1.update("user0000",
connectionNode1.newMutation().set("address.zipCode", 95110L));
storeNode1.insertOrReplace(connectionNode1.newDocument(
    "{\"_id\": \"user0004\", \"firstName\": \"Joel\",
    \"lastName\": \"Smith\", \"age\": 56, \"address\": {\"zipCode\":
    {\"$numberLong\":95110}}}\"));
```

3. Call [endWriteTracking](#) to flush the write operations after step 1, including updates to the secondary index:

```
final String commitContext = storeNode1.endTrackingWrites();
```

The call also returns a commitContext.

4. Issue a query that calls [waitForTrackedWrites](#) with the `commitContext` from step 3:

```

/*
 * Next section of the code can run on the same or on a different node,
 * the `commitContext` obtained earlier needs to be propagated to that
 * node.
 */

// Create an OJAI connection to MapR cluster
final Connection connectionNode2 =
    DriverManager.getConnection("ojai:mapr:");

// Get an instance of OJAI DocumentStore
final DocumentStore storeNode2 = connectionNode2.getStore("/demo_table");

// Build an OJAI query and set its commit context with timeout of 2
seconds
final Query query = connectionNode2.newQuery()
    .select("_id", "firstName", "lastName", "address.zipCode")
    .where("{\"$gt\": {\"address.zipCode\": 95110}}")
    .waitForTrackedWrites(commitContext)
    .build();

```

The query filters on the indexed subfield `address.zipCode`. The `commitContext` ensures that the query result includes the changes made in step 2.

### Setting Query Options in Java OJAI

This topic describes how to set query options in your Java OJAI application.

See [OJAI Query Options](#) on page 3372 for a list of available query options.

To set an option, pass the option name as the first parameter to the [Query.setOption](#) method:

```
query.setOption("ojai.mapr.query.hint-using-index", indexName);
```

### Enabling Buffered Writes in Java OJAI

By default, HPE Ezmeral Data Fabric Database JSON does not buffer writes. You can improve performance by enabling buffered writes in your Java OJAI application.

#### Description

The buffered writes option can be set in the [Connection.getStore](#) method. You pass the option setting through a `Document` object in the second parameter to the method. The `Document` object sets `ojai.mapr.documentstore.buffer-writes` to either `true` or `false`. The default value is `false`, which means that writes are not buffered.

#### Example Code Snippet

The following code sample enables buffered writes:

```

final DocumentStore store =
    connection.getStore(
        "/demo_table",

connection.newDocument().set("ojai.mapr.documentstore.buffer-writes",
true));

```

### Using the Java OJAI Thin Client

Starting with EEP 6.3.0, you can use the Java OJAI Thin Client to write HPE Ezmeral Data Fabric Database JSON applications. The Java OJAI Thin Client provides a lightweight library that supports the

OJAI API. You can connect to HPE Ezmeral Data Fabric Database JSON, and add, update, and query documents in a HPE Ezmeral Data Fabric Database JSON table.

### Java OJAI Thin Client Benefits

The client provides you with the following benefits:

- Easy installation and use
- Access to HPE Ezmeral Data Fabric Database JSON through the OJAI interface
- An OJAI interface that is tailored to Java developers
- Support for L3/L4 (transport level) and L7 (application level) proxy load balancing

### Comparing the Java OJAI Client and the Java OJAI Thin Client

Note these considerations when deciding whether to use the Java OJAI Client or the Java OJAI Thin Client:

- Both the Java OJAI client and Java OJAI Thin Client use the same API ([Java OJAI Client API](#)).
- The Java OJAI client is more scalable, more performant, and more fault tolerant, but also more complicated to deploy. See [Using the Java OJAI Client](#) on page 3450.
- The Java OJAI Thin Client requires you to specify the service ([Data Fabric Data Access Gateway](#)) to which you will connect.
- The Java OJAI Thin Client is a pure Java client, while the Java OJAI client requires a JNI library.

### Installing the Data Fabric Data Access Gateway

To use the Java OJAI Thin Client, you must install the [Data Fabric Data Access Gateway](#) on your HPE Ezmeral Data Fabric cluster. The gateway serves as a proxy for translating requests between the Java OJAI Thin Client and the HPE Ezmeral Data Fabric cluster. To administer the gateway and configure load balancing, see [Administering the Data Access Gateway](#) on page 1955.

### Java OJAI Thin Client Security

The client supports username/password authentication. The initial connection (and token renewal) use these credentials. Subsequent communication uses JWT.

When connecting to a secure cluster, the client uses:

- X.509 certificates to authenticate with the Data Access Gateway
- TLS v1.2 to encrypt communication between the client and the Data Access Gateway

### Java OJAI Thin Client Connection String

The string you use to connect your OJAI client to a HPE Ezmeral Data Fabric cluster must have the following format:

```
"ojai:mapr:thin:@<hostname>[:<port>][?<option_name>=<option_value>;...]"
```

<hostname>

Name of the HPE Ezmeral Data Fabric Data Access Gateway host

<port>

Port number (see [Ports Used by HPE Ezmeral Data Fabric Software](#) on page 3084) that gRPC clients use to connect to the HPE Ezmeral Data Fabric Data Access Gateway

	Default: 5678
<code>auth=&lt;scheme_name&gt;</code>	The authentication scheme for the current connection; currently, only <code>basic</code>
<code>user=&lt;username&gt;</code>	The user name for <code>basic</code> authentication
<code>password=&lt;password&gt;</code>	The password for <code>basic</code> authentication
<code>ssl=true false</code>	Whether to establish a secure connection using SSL/TLS  An error is returned if there is a mismatch between your client and cluster security settings. The default for this option is <code>true</code> , which is the required setting if connecting to a secure HPE Ezmeral Data Fabric cluster. If connecting to a nonsecure HPE Ezmeral Data Fabric cluster, set it to <code>false</code> .  If set to <code>false</code> , the other SSL parameters are ignored.
<code>sslCA=&lt;path to PEM file containing CA certificate&gt;</code>	Path to a local file containing Certificate Authority (CA) signed certificates in PEM format. For information about the PEM format, see <a href="#">Configuring SSL for OJAI Clients</a> on page 3481.  Must be set if the <code>ssl</code> option is <code>true</code> .

Here is an example of a connection string:

```
"ojai:mapr:thin:@localhost:5678?
auth=basic;user=fred;password=george;sslCA=/opt/app/conf/rootca.pem"
```

### Advanced Parameters

Advanced parameters such as `maxmsgsize` are optional for the Java OJAI Thin Client connection string:

<code>maxmsgsize</code>	If you use thin-client version 1.0.2-mapr and later, <code>maxmsgsize</code> sets the maximum message size that the gRPC client accepts. The default is set to 32 MB, as this is the default maximum document size for HPE Ezmeral Data Fabric Database JSON tables.  The value specified in the connection string should be less than or equal to the value set in the Data Access Gateway configuration on the server side (see <a href="#">Administering the Data Access Gateway</a> on page 1955).
-------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Maven Coordinates

The Maven coordinates are:

```
<dependency>
  <groupId>com.mapr.ojai</groupId>
  <artifactId>mapr-ojai-driver-thin</artifactId>
  <version>1.0.3-mapr</version>
</dependency>
```

## Additional Resources

The Java OJAI Client examples at the following location also apply to the Java OJAI Thin Client. Only the connection string and the Maven artifact name will be different for the thin client: <https://github.com/mapr-demos/ojai-examples/tree/master/java/src/main/java/com/mapr/ojai/examples>

### Using the Node.js OJAI Client

Starting with EEP 6.0, you can use the Node.js OJAI client to write HPE Ezmeral Data Fabric Database JSON applications. The client provides you with a lightweight library that supports the OJAI API. You can connect to HPE Ezmeral Data Fabric Database JSON from middleware components, and add, update, and query documents in a HPE Ezmeral Data Fabric Database JSON table.

The client provides you with the following benefits:

- Easy installation and use
- Access to HPE Ezmeral Data Fabric Database JSON through the OJAI interface in Node.js
- An OJAI interface that is tailored to Node.js developers
- Support for Callback and Promise/Async Node.js asynchronous programming models
- Support for L3/L4 (transport level) and L7 (application level) proxy load balancing
- Use of JavaScript to manipulate HPE Ezmeral Data Fabric Database JSON documents

To use the Node.js OJAI client, you must install the [Data Fabric Data Access Gateway](#) on your HPE Ezmeral Data Fabric cluster. The gateway serves as a proxy for translating requests between the Node.js client and the HPE Ezmeral Data Fabric cluster. The gateway also performs data processing to keep the client lightweight. See [Administering the Data Access Gateway](#) on page 1955 for information about how to administer the gateway and configure load balancing.

**IMPORTANT:** HPE Ezmeral Data Fabric does not support running the Node.js OJAI client in a web browser.

## Additional Resources

Examples: <https://github.com/mapr-demos/ojai-examples/tree/master/nodejs>

Source Code: <https://github.com/mapr/maprdb-node-client>

### Getting Started with the Node.js OJAI Client

This section describes the software required to run the Node.js OJAI client, client/server security, and how to specify your connection string. It also provides links to documentation that shows you how to write Node.js OJAI applications.

The Node.js OJAI client is available starting in the EEP 6.0 release.

## Software Requirements

You must have the following software installed to run the client:

Client Software	Installation Notes
Node.js	Supported versions: <ul style="list-style-type: none"> <li>• 6.x</li> <li>• 8.x</li> <li>• 9.x</li> <li>• 10.x</li> </ul>
Node.js OJAI client	Install the client by using the following command: <pre>npm install node-maprdb</pre>

You also must have access to the following software:

- MapR/Data Fabric cluster 6.1 or later
- [Data Access Gateway 2.0](#) or later

To run a Node.js OJAI application, you simply need to install and configure the Data Access Gateway:

- [Installing the Data Access Gateway Service](#) on page 1955
- [Modifying Configuration Settings for the Data Access Gateway Service](#) on page 1956

### Node.js OJAI Client Security

The client supports username/password authentication. The initial connection (and token renewal) use these credentials. Subsequent communication uses JWT.

When connecting to a secure cluster, the client uses:

- X.509 certificates to authenticate with the Data Access Gateway
- TLS v1.2 to encrypt communication between the client and the Data Access Gateway

### Node.js OJAI Client Connection String

The string you use to connect your OJAI client to the cluster must have the following format:

```
"[ojai:mapr:thin:v1@]<hostname>[:<port>][?<option_name>=<option_value>;...]"
```

The prefix `ojai:mapr:thin:v1@` is optional.

**<hostname>**

Name of the Data Access Gateway host. For information about the host name, see [Configuring SSL for OJAI Clients](#) on page 3481.

**<port>**

Port number (see [Ports Used by HPE Ezmeral Data Fabric Software](#) on page 3084) that gRPC clients use to connect to the Data Access Gateway

Default: 5678

**auth=<scheme\_name>**

The authentication scheme for the current connection; currently, only `basic`

**user=<username>**

The user name for `basic` authentication

`password=<password>`The password for `basic` authentication`ssl=true|false`

Whether to establish a secure connection using SSL/TLS

An error is returned if there is a mismatch between your client and Data Access Gateway security settings. The default for this option is `true`, which is the required setting if connecting to a secure Data Access Gateway. If connecting to a non-secure Data Access Gateway, set it to `false`.

If set to `false`, the other SSL parameters are ignored.

Note that the `grpc.service.ssl.enabled` property controls the SSL setting for the Data Access Gateway. For more information, see [Administering the Data Access Gateway](#) on page 1955.

`sslCA=<path to PEM file containing CA certificate>`

Path to a local file containing Certificate Authority (CA) signed certificates in PEM format. For information about the PEM format, see [Configuring SSL for OJAI Clients](#) on page 3481.

Required when the `ssl` option is set to `true`.

`sslTargetNameOverride=<CA certificate common name>`

Fully qualified domain name specified in the SSL server certificate, which is different from the `<hostname>` in the connection string.

For example, imagine that you are using the following:

- Public network host name is `ec2-203-0-113-25.compute-1.amazonaws.com`.
- Internal DNS is `node1.mydomain.com`.
- CA signed certificate is issued to `node1.mydomain.com`.

Using these names, you must specify the following connection string:

```
"ec2-203-0-113-25.compute-1.amazonaws.com:5678?ssl=true;sslCA=/opt/app/conf/rootca.pem;sslTargetNameOverride=node1.mydomain.com"
```

Other examples of connection strings are the following:

```
"ojai:mapr:thin:v1@localhost:5678?auth=basic;user=fred;password=george;sslCA=/opt/app/conf/rootca.pem"
"localhost:5678?ssl=false;auth=basic;user=fred;password=george"
```

## Node.js OJAI Connection Retry Options

If your OJAI client cannot connect to your cluster, it waits 10 ms. After 10 ms, it makes a second connection attempt. If that fails, it continues the attempts up to a configurable number of retries. The following parameters control the number of retries and the wait time between attempts:

Connection Option Parameter	Description	Default Value
<code>ojai.mapr.rpc.wait-multiplier</code>	Multiplier that determines the wait time for subsequent attempts after the initial 10 ms wait. The previous wait time is multiplied by this parameter.	1000
<code>ojai.mapr.rpc.wait-max-attempt</code>	Maximum wait time between attempts regardless of the multiplier parameter	18000 ms
<code>ojai.mapr.rpc.max-retries</code>	Maximum number of retry attempts	7

The following examples demonstrate how these parameters work, including the default case:

Attempt #	Wait Time (in ms) for each Retry Attempt	
	Default Parameters:	
	<pre>{   'ojai.mapr.rpc.wait-multiplier': 1000,   'ojai.mapr.rpc.wait-max-attempt': 18000,   'ojai.mapr.rpc.max-retries': 7 }</pre>	<pre>{   'ojai.mapr.rpc.wait-multiplier': 2,   'ojai.mapr.rpc.wait-max-attempt': 90,   'ojai.mapr.rpc.max-retries': 5 }</pre>
1	10	10
2	$10 \times 1000 = 10000$	$10 \times 2 = 20$
3	18000 $10000 \times 1000 = 10,000,000$ , which exceeds 18000	$20 \times 2 = 40$
4	18000	$40 \times 2 = 80$
5	18000	90 $80 \times 2 = 160$ , which exceeds 90
6	18000	Error
7	18000	N/A
8	Error	N/A

To set these retry options, you must pass them in the `ConnectionManager.getConnection` call:

```
const connectionString = 'localhost:5678?' +
  'auth=basic;' +
  'user=mapr;' +
  'password=mapr;' +
  'ssl=true;' +
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' +
  'sslTargetNameOverride=nodel.mapr.com';
const options = {
  'ojai.mapr.rpc.wait-multiplier': 5,
  'ojai.mapr.rpc.wait-max-attempt': 50,
  'ojai.mapr.rpc.max-retries': 3
}

let connection;
```

```

    ConnectionManager.getConnection(connectionString, options)
      .then((conn) => {
        connection = conn;
        // Get a store
        return connection.getStore('/demo_table');
      })
  
```

### Writing Node.js OJAI Applications

For information about writing a Node.js OJAI application, see the Node.js sections in the following topics:

[Querying in OJAI Applications on page 3364](#)

Provides an introduction to the basic flow of an OJAI application that queries a HPE Ezmeral Data Fabric Database JSON table

[Examples: Querying JSON Documents on page 3409](#)

Contains code samples of OJAI applications that query HPE Ezmeral Data Fabric Database JSON tables

[Managing JSON Documents on page 3326](#)

Describes how to perform CRUD (create, query, update, and delete) operations on JSON documents in HPE Ezmeral Data Fabric Database JSON tables

### Node.js OJAI Client Classes and Methods

This topic lists and describes the classes supported by the Node.js OJAI client and provides a link to document pages that describe the methods in each class.

Class Name	Description
ConnectionManager	Manages connections to HPE Ezmeral Data Fabric Database JSON.
Connection	Provides a logical connection to an OJAI data source: for example, HPE Ezmeral Data Fabric Database JSON.
DocumentStore	Encapsulates a store, typically persistent, of OJAI documents: for example, HPE Ezmeral Data Fabric Database JSON tables.
QueryResult	Encapsulates the stream of result sets for an OJAI query.
OTime	Encapsulates the OJAI TIME type.
OTimestamp	Encapsulates the OJAI TIMESTAMP type.
ODate	Encapsulates the OJAI DATE type.

See [Node.js OJAI Client API](#) for details about each class, including the methods available in each class.

### Setting Query Options in Node.js OJAI

There are two categories of options you can set in your Node.js OJAI application. This topic describes both and shows you how to set each.

#### Setting Query Options Using a Node.js OJAI Method Call

Option Name	Description
ojai.mapr.query.include-query-plan	Enables or disables availability of the query plan for retrieval Value: true false Default: false

Option Name	Description
<code>ojai.mapr.query.timeout-milliseconds</code>	Query timeout in milliseconds Maximum allowed value is 2147483647. Default: None; no timeout

To set any of these query options, you must pass the option as the second parameter in the `DocumentStore.find` method.

The following code snippet sets the query timeout to 3000 milliseconds:

```
const docStream = store.find(
  query,
  { 'ojai.mapr.query.timeout-milliseconds': 3000 }
);
```

### Setting Query Options in Node.js Using OJAI Query Syntax

[OJAI Query Options](#) on page 3372 describes query options that are available in all OJAI clients. To use these options in Node.js OJAI, you must construct your query in JSON format and use the `$options` keyword. See [OJAI Query Syntax](#) for details about the syntax, including an example.

### Using the Python OJAI Client

Starting with EEP 6.0, you can use the Python OJAI client to write HPE Ezmeral Data Fabric Database JSON applications. The client provides you with a lightweight library that supports the OJAI API. You can connect to HPE Ezmeral Data Fabric Database JSON, and add, update, and query documents in a HPE Ezmeral Data Fabric Database JSON table.

The client provides you with the following benefits:

- Easy installation and use
- Access to HPE Ezmeral Data Fabric Database JSON through the OJAI interface in Python
- An OJAI interface that is tailored to Python developers
- Use of Python types to manipulate HPE Ezmeral Data Fabric Database JSON documents
- Support for Python multiprocessing and multithreading modules
- Support for L3/L4 (transport level) and L7 (application level) proxy load balancing

To use the Python OJAI client, you must install the [Data FabricData Access Gateway](#) on your HPE Ezmeral Data Fabric cluster. The gateway serves as a proxy for translating requests between the Python client and the HPE Ezmeral Data Fabric cluster. The gateway also performs data processing to keep the client lightweight. See [Administering the Data Access Gateway](#) on page 1955 for information about how to administer the gateway and configure load balancing.

### Additional Resources

Examples: <https://github.com/mapr-demos/ojai-examples/tree/master/python>

Source Code: <https://github.com/mapr/maprdb-python-client>

### Getting Started with the Python OJAI Client

This section describes the software required to run the Python OJAI client, client/server security, and how to specify your connection string. It also provides links to documentation that shows you how to write Python OJAI applications.

The Python OJAI client is available starting with the EEP 6.0 release.

## Software Requirements

You must have the following software installed to run the client:

Client Software	Installation Notes
Python	Use Python 2.7 or later
pip	See <a href="https://pip.pypa.io/en/stable/installing/">https://pip.pypa.io/en/stable/installing/</a> for instructions specific to your environment.
Python OJAI client	Install the client by using the following command: <pre>pip install maprdb-python-client</pre>

You also must have access to the following software:

- MapR/Data Fabric cluster 6.1 or later
- [MapR Data Access Gateway 2.0](#) or later

To run a Python OJAI application, you simply need to install and configure the Data Access Gateway:

- [Installing the Data Access Gateway Service](#) on page 1955
- [Modifying Configuration Settings for the Data Access Gateway Service](#) on page 1956

### Python OJAI Client Security

The client supports username/password authentication. The initial connection (and token renewal) use these credentials. Subsequent communication uses JWT.

When connecting to a secure cluster, the client uses:

- X.509 certificates to authenticate with the Data Access Gateway
- TLS v1.2 to encrypt communication between the client and the Data Access Gateway

### Python OJAI Client Connection String

The string you use to connect your OJAI client to the cluster must have the following format:

```
"[ojai:mapr:thin:v1@]<hostname>[:<port>][?<option_name>=<option_value>;...]"
```

The prefix `ojai:mapr:thin:v1@` is optional.

<code>&lt;hostname&gt;</code>	Name of the Data Access Gateway host. For information about the host name, see <a href="#">Configuring SSL for OJAI Clients</a> on page 3481.
<code>&lt;port&gt;</code>	Port number (see <a href="#">Ports Used by HPE Ezmeral Data Fabric Software</a> on page 3084) that gRPC clients use to connect to the Data Access Gateway Default: 5678
<code>auth=&lt;scheme_name&gt;</code>	The authentication scheme for the current connection; currently, only <code>basic</code>
<code>user=&lt;username&gt;</code>	The user name for <code>basic</code> authentication
<code>password=&lt;password&gt;</code>	The password for <code>basic</code> authentication

**ssl=true|false**

Whether to establish a secure connection using SSL/TLS

An error is returned if there is a mismatch between your client and Data Access Gateway security settings. The default for this option is `true`, which is the required setting if connecting to a secure Data Access Gateway. If connecting to a non-secure Data Access Gateway, set it to `false`.

If set to `false`, the other SSL parameters are ignored.

Note that the `grpc.service.ssl.enabled` property controls the SSL setting for the Data Access Gateway. For more information, see [Administering the Data Access Gateway](#) on page 1955.

**sslCA=<path to PEM file containing CA certificate>**

Path to a local file containing Certificate Authority (CA) signed certificates in PEM format. For information about the PEM format, see [Configuring SSL for OJAI Clients](#) on page 3481.

Required when the `ssl` option is set to `true`.

**sslTargetNameOverride=<CA certificate common name>**

Fully qualified domain name specified in the SSL server certificate, which is different from the `<hostname>` in the connection string.

For example, imagine that you are using the following:

- Public network host name is `ec2-203-0-113-25.compute-1.amazonaws.com`.
- Internal DNS is `node1.mydomain.com`.
- CA signed certificate is issued to `node1.mydomain.com`.

Using these names, you must specify the following connection string:

```
"ec2-203-0-113-25.compute-1.amazonaws.com:5678?ssl=true;sslCA=/opt/app/conf/rootca.pem;sslTargetNameOverride=node1.mydomain.com"
```

Other examples of connection strings are the following:

```
"ojai:mapr:thin:v1@localhost:5678?auth=basic;user=fred;password=george;sslCA=/opt/app/conf/rootca.pem"
"localhost:5678?ssl=false;auth=basic;user=fred;password=george"
```

### Python OJAI Connection Retry Options

If your OJAI client cannot connect to your cluster, it waits 10 ms. After 10 ms, it makes a second connection attempt. If that fails, it continues the attempts up to a configurable number of retries. The following parameters control the number of retries and the wait time between attempts:

Connection Option Parameter	Description	Default Value
ojai.mapr.rpc.wait-multiplier	Multiplier that determines the wait time for subsequent attempts after the initial 10 ms wait. The previous wait time is multiplied by this parameter.	1000
ojai.mapr.rpc.wait-max-attempt	Maximum wait time between attempts regardless of the multiplier parameter	18000 ms
ojai.mapr.rpc.max-retries	Maximum number of retry attempts	7

The following examples demonstrate how these parameters work, including the default case:

Attempt #	Wait Time (in ms) for each Retry Attempt	
	Default Parameters:	
	<pre>{   'ojai.mapr.rpc.wait-multiplier': 1000,   'ojai.mapr.rpc.wait-max-attempt': 18000,   'ojai.mapr.rpc.max-retries': 7 }</pre>	<pre>{   'ojai.mapr.rpc.wait-multiplier': 2,   'ojai.mapr.rpc.wait-max-attempt': 90,   'ojai.mapr.rpc.max-retries': 5 }</pre>
1	10	10
2	10*1000 = 10000	10*2 = 20
3	18000 10000*1000 = 10,000,000, which exceeds 18000	20*2 = 40
4	18000	40*2 = 80
5	18000	90 80*2 = 160, which exceeds 90
6	18000	Error
7	18000	N/A
8	Error	N/A

To set these retry options, you must pass them in the `ConnectionFactory.get_connection` call:

```
connection_str = 'localhost:5678?auth=basic;user=mapr;password=mapr;' \
  'ssl=true;' \
  'sslCA=/opt/mapr/conf/ssl_truststore.pem;' \
  'sslTargetNameOverride=node1.mapr.com'
options = {
  'ojai.mapr.rpc.wait-multiplier': 5,
  'ojai.mapr.rpc.wait-max-attempt': 50,
  'ojai.mapr.rpc.max-retries': 3
}
connection =
ConnectionFactory.get_connection(connection_str=connection_str,options=options)
```

## Writing a Python OJAI Application

For information about writing a Python OJAI application, see the Python sections in the following topics:

[Querying in OJAI Applications](#) on page 3364

Provides an introduction to the basic flow of an OJAI application that queries a HPE Ezmeral Data Fabric Database JSON table

[Examples: Querying JSON Documents](#) on page 3409

Contains code samples of OJAI applications that query HPE Ezmeral Data Fabric Database JSON tables

[Managing JSON Documents](#) on page 3326

Describes how to perform CRUD (create, query, update, and delete) operations on JSON documents in HPE Ezmeral Data Fabric Database JSON tables

## Python OJAI Client Classes and Methods

This topic lists and describes the classes supported by the Python OJAI client and provides a link to document pages that describe the methods in each class.

Class Name	Description
Connection	Provides a logical connection to an OJAI data source: for example, HPE Ezmeral Data Fabric Database JSON.
ConnectionDriver	Provides a connection handler, which enables you to get and check connections
ConnectionManager	Manages connections to HPE Ezmeral Data Fabric Database JSON.
Document	Provides the primary, DOM-based interface for inspecting OJAI documents.
DocumentMutation	Encapsulates a mutation to an existing OJAI document in a store.
DocumentStore	Encapsulates a store, typically persistent, of OJAI documents: for example, HPE Ezmeral Data Fabric Database JSON tables.
DocumentStream	Encapsulates the result set of an OJAI query.
QueryResult	Encapsulates the result set of an OJAI query.
Query	Encapsulates an OJAI query.
QueryCondition	Encapsulates a query condition; similar to a SQL <code>where</code> clause.
Value	Encapsulates the value of a field, scalar, or complex type in an OJAI document.
OTime	Encapsulates the OJAI <code>TIME</code> type.
OTimestamp	Encapsulates the OJAI <code>TIMESTAMP</code> type.
ODate	Encapsulates the OJAI <code>DATE</code> type.
OInterval	Encapsulates the OJAI <code>INTERVAL</code> type.

See [Python OJAI Client API](#) for details about each class, including the methods available in each class.

## Multiprocessing and Multithreading in Python OJAI Applications

Python supports multiprocessing and multithreading modules that enable you to spawn either multiple processes or multiple threads in a Python program. This section contains examples that show you how to use these modules in your Python OJAI application.

## Multiprocessing in Python OJAI Applications

The following code example spawns multiple processes using the Python `multiprocessing` module. When you use the module, you must create a separate OJAI connection for each process.

The code example is available at [014\\_multiprocessing\\_example.py](#).

```

"""Following example works with Python Client"""

import multiprocessing
from mapr.ojai.storage.ConnectionFactory import ConnectionFactory

"""Create a connection, get store, insert_or_replace/update document in
store via multiprocessing"""

# Create a connection string using path:user@password
connection_str = "localhost:5678?auth=basic;user=mapr;password=mapr;" \
                "ssl=true;" \
                "sslCA=/opt/mapr/conf/ssl_truststore.pem;" \
                "sslTargetNameOverride=node1.mapr.com"

# Create method which will be used for multiprocessing
def sample():
    # Create connection from connection_url
    # Cannot share connection for processes,
    # so need to create connection for each process.
    connection =
ConnectionFactory().get_connection(connection_str=connection_str)

    # Get a store and assign it as a DocumentStore object
    store = connection.get_or_create_store('/tmp/store_name')

    # Insert 15 documents, represented as Python dictionaries,
    # into DocumentStore
    for i in range(15):
        store.insert_or_replace(doc={'_id': str(i), 'name': 'Greg'})

    # Create DocumentMutation object using the OJAIDocument object
    mutation = connection.new_mutation()

    # Set mutation value
    mutation.set_or_replace(field_path='name', value='T')

    # Update 15 Document in store
    for i in range(15):
        store.update(_id=str(i), mutation=mutation)

# Create simple method for run process from Pool
def run(UNUSED_VAR):
    pass

# Create data for multiprocessing
proces_count = 7
map_iterable = [1] # simple iterator

# Create Pool object using the function and process_count value
p = multiprocessing.Pool(proces_count, initializer=sample)

# Run processes from the Pool
p.map(run, map_iterable)

```

## Multithreading in Python OJAI Applications

You can use either the Python `thread` or `threading` module to spawn multiple threads in your Python application. When you use these modules, you can share an OJAI connection across threads.

### Thread Module

The following code example uses the `thread` module. It is available at [015\\_thread\\_example.py](#).

```

"""Following example works with
Python Client"""
import thread
import time
from
mapr.ojai.storage.ConnectionFactory
import ConnectionFactory

"""Create a connection, get store,
insert_or_replace/update document in
store via thread using same
connection"""

# Create method which will be used
for threads
def run_thread(name, conn):
    # Print that thread started with
threadName
    print('\n Start thread ', name)

    # Get a store and assign it as a
DocumentStore object
    store =
conn.get_or_create_store('/tmp/
store_name')

    # Insert 15 documents,
represented as Python dictionaries,
# into DocumentStore
    for index in range(15):

store.insert_or_replace(doc={'_id':
str(index), 'name': 'Greg'})

    # Create DocumentMutation object
using the OJAIconnection object
    mutation = conn.new_mutation()

    # Set mutation value

mutation.set_or_replace(field_path='na
me', value='T')

    # Update 15 Document in store
for index in range(15):
        store.update(_id=str(index),
mutation=mutation)

    # Print that thread done with
threadName
    print('\n Done thread ', name)

# Create a connection string using

```

```

path:user@password
connection_str = "localhost:5678?
auth=basic;user=mapr;password=mapr;" \
                "ssl=true;" \
                "sslCA=/opt/mapr/conf/
ssl_truststore.pem;" \

"sslTargetNameOverride=node1.mapr.com"

# Create connection from
connection_url
# Can share connection for processes,
# so need to only one connection
instance for all threads
connection =
ConnectionFactory.get_connection(connection_str)

# Create 10 threads using the same
connection instance
for i in range(10):
    thread_name =
    'Thread-{}'.format(str(i))

thread.start_new_thread(run_thread,
                        (thread_name, connection,))

# This thread implementation doesn't
return thread object
# so thread status cannot be checked
# Wait 10 seconds
time.sleep(10)

# Close connection
connection.close()

```

## Threading Module

The following code example uses the threading module. It is available at [016\\_threading\\_example.py](#).

```

"""Following example works with
Python Client"""
import threading
import time

from
mapr.ojai.storage.ConnectionFactory
import ConnectionFactory

"""Create a connection, get store,
insert_or_replace/update document in
store via thread using same
connection"""

# Create a connection string using
path:user@password
connection_str = "localhost:5678?
auth=basic;user=mapr;password=mapr;" \
                "ssl=true;" \
                "sslCA=/opt/mapr/conf/
ssl_truststore.pem;" \

```

```

"sslTargetNameOverride=node1.mapr.com"

# Create connection from
connection_url
# Can share connection for processes,
# so need to only one connection
instance for all threads
connection =
ConnectionFactory.get_connection(connection_str)

# Create child for sample threading
implementation
class MyThread(threading.Thread):
    # Implement __init__() method,
    which takes thread name and
    # connection object
    def __init__(self, name,
connection):

threading.Thread.__init__(self)
    self.name = name
    self.connection = connection

    # Implement run() method
    def run(self):
        # Print that thread started
with threadName
        print('\n Start thread ',
self.name)

        # Get a store and assign it
as a DocumentStore object
        store =
connection.get_or_create_store('/tmp/
store_name')

        # Insert 15 documents,
represented as Python dictionaries,
# into DocumentStore
        for index in range(15):

store.insert_or_replace(doc={'_id':
str(index), 'name': 'Greg'})

        # Create DocumentMutation
object using the OJAIConnection object
        mutation =
connection.new_mutation()

        # Set mutation value

mutation.set_or_replace(field_path='name', value='T')

        # Update 15 Document in store
for index in range(15):

store.update(_id=str(index),
mutation=mutation)

```

```

        # Print that thread done with
threadName
        print('\n Done thread ',
self.name)

# This thread implementation return
thread object
# so thread status can be checked via
native methods
# Simple thread waiter for thread
list:
def waiter(threads):
    for my_thread in threads:
        # Check that current thread
is alive
        if my_thread.is_alive():
            time.sleep(1)
            # Wait until current
thread finished
            waiter(threads)
        # Move to the next thread if
this is not alive
        elif not my_thread.is_alive():
            pass

# Create list instance for storing
created threads objects
thread_list = []

# Create and run 10 threads
for i in range(10):
    # Create thread instance using
MyThread and OJAIConnection object
    thread =
MyThread(name='Thread-{}'.format(str(
i)),
connection=connection)

    # Start current thread
    thread.start()

    # Append thread object into
thread_list
    thread_list.append(thread)

# Wait until all threads will finished
waiter(thread_list)

# Close connection
connection.close()

```

### Setting Query Options in Python OJAI

There are two categories of options you can set in your Python OJAI application. This topic describes both and shows you how to set each.

### Setting Query Options Using a Python OJAI Method Call

Option Name	Description
<code>ojai.mapr.query.include-query-plan</code>	Enables or disables availability of the query plan for retrieval Value: True False Default: False
<code>ojai.mapr.query.result-as-document</code>	Enables or disables returning the query result as an OJAI Document class object versus a Python dictionary Value: True False Default: False; returns query result as a Python dictionary
<code>ojai.mapr.query.timeout-milliseconds</code>	Query timeout in milliseconds Maximum allowed value is 2147483647. Default: None; no timeout

To set any of these query options, you must pass the option as the second parameter in the [DocumentStore.find](#) method.

The following code snippet sets the option to return the query result as a [Document](#) object:

```
options = {'ojai.mapr.query.result-as-document': True}
query_result = store.find(query, options=options)
```

### Setting Query Options in Python Using OJAI Query Syntax

[OJAI Query Options](#) on page 3372 describes query options that are available in all OJAI clients. To use these options in Python OJAI, you must construct your query in JSON format and use the `$options` keyword. See [OJAI Query Syntax](#) for details about the syntax, including an example.

### Using the C# OJAI Client

Starting with EEP 6.1.0, you can use the C# OJAI client to write HPE Ezmeral Data Fabric Database JSON applications. The client provides you with a lightweight library that supports the OJAI API. You can connect to HPE Ezmeral Data Fabric Database JSON, and add, update, and query documents in a HPE Ezmeral Data Fabric Database JSON table.

The client provides you with the following benefits:

- Easy installation and use
- Access to HPE Ezmeral Data Fabric Database JSON through the OJAI interface in C#
- An OJAI interface that is tailored to C# developers
- Use of C# types to manipulate HPE Ezmeral Data Fabric Database JSON documents
- Support for C# asynchronous programming and threading mechanism
- Support for L3/L4 (transport level) and L7 (application level) proxy load balancing

To use the C# OJAI client, you must install the [Data Fabric Data Access Gateway](#) on your HPE Ezmeral Data Fabric cluster. The gateway serves as a proxy for translating requests between the C# client and the HPE Ezmeral Data Fabric cluster. The gateway also performs data processing to keep the client

lightweight. See [Administering the Data Access Gateway](#) on page 1955 for information about how to administer the gateway and configure load balancing.

### Additional Resources

Examples: <https://github.com/mapr-demos/ojai-examples/tree/master/csharp>

### Getting Started with the C# OJAI Client

This section describes the software required to run the C# OJAI client, client/server security, and how to specify your connection string. It also provides links to documentation that shows you how to write C# OJAI applications.

The C# OJAI client is available starting in the EEP 6.0.0 release.

### Software Requirements

You must have the following software installed to run the client:

Client Software	Installation Notes
Visual Studio 2017	<a href="https://visualstudio.microsoft.com/vs/">https://visualstudio.microsoft.com/vs/</a>
C# OJAI client	<ul style="list-style-type: none"> <li>Install the client by using the <a href="#">NuGet Command Line Interface (CLI)</a>.</li> <li>Install the <code>MapRDB.Driver</code> using the <a href="#">NuGet Package Manager Console</a>:           <pre>Install-Package MapRDB.Driver -Version 1.0.0</pre> </li> <li>Use the <code>dotnet</code> command line interface:           <pre>dotnet add package MapRDB.Driver</pre> </li> <li>Use the NuGet Package Manager UI. For instructions, follow this <a href="#">link</a>.</li> </ul>

You also must have access to the following software:

- MapR cluster 6.1 or later
- [MapR Data Access Gateway](#) 2.0 or later

To run a C# OJAI application, you simply need to install and configure the MapR Data Access Gateway:

- [Installing the Data Access Gateway Service](#) on page 1955
- [Modifying Configuration Settings for the Data Access Gateway Service](#) on page 1956

### C# OJAI Client Security

The client supports username/password authentication. The initial connection (and token renewal) use these credentials. Subsequent communication uses JWT.

When connecting to a secure cluster, the client uses:

- X.509 certificates to authenticate with the Data Access Gateway
- TLS v1.2 to encrypt communication between the client and the Data Access Gateway

## C# OJAI Client Connection String

The string you use to connect your OJAI client to the cluster must have the following format:

```
"[ojai:mapr:thin:v1@]<hostname>[:<port>][?<option_name>=<option_value>;...]"
```

The prefix `ojai:mapr:thin:v1@` is optional.

<code>&lt;hostname&gt;</code>	Name of the Data Access Gateway host. For information about the host name, see <a href="#">Configuring SSL for OJAI Clients</a> on page 3481.
<code>&lt;port&gt;</code>	Port number (see <a href="#">Ports Used by HPE Ezmeral Data Fabric Software</a> on page 3084) that gRPC clients use to connect to the Data Access Gateway Default: 5678
<code>auth=&lt;scheme_name&gt;</code>	The authentication scheme for the current connection; currently, only <code>basic</code>
<code>user=&lt;username&gt;</code>	The user name for <code>basic</code> authentication
<code>password=&lt;password&gt;</code>	The password for <code>basic</code> authentication
<code>ssl=true false</code>	Whether to establish a secure connection using SSL/TLS  An error is returned if there is a mismatch between your client and Data Access Gateway security settings. The default for this option is <code>true</code> , which is the required setting if connecting to a secure Data Access Gateway. If connecting to a non-secure Data Access Gateway, set it to <code>false</code> .  If set to <code>false</code> , the other SSL parameters are ignored.  Note that the <code>grpc.service.ssl.enabled</code> property controls the SSL setting for the Data Access Gateway. For more information, see <a href="#">Administering the Data Access Gateway</a> on page 1955.
<code>sslCA=&lt;path to PEM file containing CA certificate&gt;</code>	Path to a local file containing Certificate Authority (CA) signed certificates in PEM format. For information about the PEM format, see <a href="#">Configuring SSL for OJAI Clients</a> on page 3481.  Required when the <code>ssl</code> option is set to <code>true</code> .
<code>sslTargetNameOverride=&lt;CA certificate common name&gt;</code>	Fully qualified domain name specified in the SSL server certificate, which is different from the <code>&lt;hostname&gt;</code> in the connection string.  For example, imagine that you are using the following: <ul style="list-style-type: none"> <li>Public network host name is <code>ec2-203-0-113-25.compute-1.amazonaws.com</code>.</li> <li>Internal DNS is <code>node1.mydomain.com</code>.</li> <li>CA signed certificate is issued to <code>node1.mydomain.com</code>.</li> </ul>

Using these names, you must specify the following connection string:

```
"ec2-203-0-113-25.compute-1.amazonaws.com:5678?ssl=true;sslCA=/opt/app/conf/rootca.pem;sslTargetNameOverride=node1.mydomain.com"
```

Other examples of connection strings are the following:

```
"ojai:mapr:thin:v1@localhost:5678?auth=basic;user=fred;password=george;sslCA=/opt/app/conf/rootca.pem"
"localhost:5678?ssl=false;auth=basic;user=fred;password=george"
```

### C# OJAI Connection Retry Options

If your OJAI client cannot connect to your MapR cluster, it waits 10 ms. After 10 ms, it makes a second connection attempt. If that fails, it continues the attempts up to a configurable number of retries. The following parameters control the number of retries and the wait time between attempts:

Connection Option Parameter	Description	Default Value
retryExponentialMultiplier	Multiplier that determines the wait time for subsequent attempts after the initial 10 ms wait. The previous wait time is multiplied by this parameter.	1000
retryCount	Maximum number of retry attempts	7

To set these retry options, you must pass them in the `ConnectionFactory.CreateConnection` call:

```
var connectionStr = $"localhost:5678?auth=basic;" +
    $"user=mapr;" +
    $"password=mapr;" +
    $"ssl=true;" +
    $"sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
    $"sslTargetNameOverride=node1.mapr.com";
var connection = ConnectionFactory.CreateConnection(connectionStr, 3, 5);
```

### Writing a C# OJAI Application

For information about writing a C# OJAI application, see the C# sections in the following topics:

[Querying in OJAI Applications on page 3364](#)

Provides an introduction to the basic flow of an OJAI application that queries a HPE Ezmeral Data Fabric Database JSON table

[Examples: Querying JSON Documents on page 3409](#)

Contains code samples of OJAI applications that query HPE Ezmeral Data Fabric Database JSON tables

[Managing JSON Documents on page 3326](#)

Describes how to perform CRUD (create, query, update, and delete) operations on JSON documents in HPE Ezmeral Data Fabric Database JSON tables

## C# OJAI Client Classes and Methods

This topic lists and describes the classes supported by the C# OJAI client and provides a link to document pages that describe the methods in each class.

Class Name	Description
<a href="#">Value</a>	Encapsulates the value of a field, scalar, or complex in an OJAI document.
<a href="#">OjaiDocument</a>	Provides the primary, DOM-based interface for inspecting OJAI documents
<a href="#">OjaiDocumentStream/QueryResult</a>	Encapsulates the result set of an OJAI query.
<a href="#">OjaiDocumentMutation</a>	Encapsulates a mutation to an existing OJAI document in a store.
<a href="#">Query</a>	Encapsulates an OJAI query.
<a href="#">QueryCondition</a>	Encapsulates a query condition; similar to a SQL <code>where</code> clause.
<a href="#">ConnectionFactory</a>	Provides a logical connection to an OJAI data source: for example, HPE Ezmeral Data Fabric Database JSON.
<a href="#">MapRDBConnection</a>	Provides a connection handler, which enables you to get and check connections.
<a href="#">OjaiDocumentStore</a>	Encapsulates a store, typically persistent, of OJAI documents: for example, HPE Ezmeral Data Fabric Database JSON tables.
<a href="#">OTime</a>	Encapsulates the OJAI <code>TIME</code> type.
<a href="#">OTimestamp</a>	Encapsulates the OJAI <code>TIMESTAMP</code> type.
<a href="#">ODate</a>	Encapsulates the OJAI <code>DATE</code> type.
<a href="#">OInterval</a>	Encapsulates the OJAI <code>INTERVAL</code> type.

See the [C# OJAI Client API](#) for details about each class, including the methods available in each class.

### Setting Query Options in C# OJAI

There are two categories of options you can set in your C# OJAI application. This topic describes both and shows you how to set each.

#### Setting Query Options Using a C# OJAI Method Call

Option Name	Description
<code>IncludeQueryPlan</code>	Enables or disables availability of the query plan for retrieval Value: <code>true false</code> Default: <code>false</code>
<code>Timeout</code>	Query timeout in milliseconds Maximum allowed value is 2147483647. Default: None; no timeout

To set any of these query options, you must pass the option as the second parameter in the `DocumentStore.Find` method.

The following code snippet sets the query timeout to 3000 milliseconds:

```
var queryResult = store.Find(query, new QueryOptions() { Timeout = 3000 });
var queryResult = store.Find(query, new QueryOptions(3000));
```

## Setting Query Options in C# Using OJAI Query Syntax

[OJAI Query Options](#) on page 3372 describes query options that are available in all OJAI clients. To use these options in C# OJAI, you must construct your query in JSON format and use the `$options` keyword. See [OJAI Query Syntax](#) for details about the syntax, including an example.

## Using the Go OJAI Client

Starting with EEP 6.0.0, you can use the Go OJAI client to write HPE Ezmeral Data Fabric Database JSON applications. The client provides you with a lightweight library that supports the OJAI API. You can connect to HPE Ezmeral Data Fabric Database JSON, and add, update, and query documents in a HPE Ezmeral Data Fabric Database JSON table.

The client provides you with the following benefits:

- Easy installation and use
- Access to HPE Ezmeral Data Fabric Database JSON through the OJAI interface in Go
- An OJAI interface that is tailored to Go developers
- Use of Go types to manipulate HPE Ezmeral Data Fabric Database JSON documents
- Support for Go multithreading using Goroutines
- Support for L3/L4 (transport level) and L7 (application level) proxy load balancing

To use the Go OJAI client, you must install the [Data Fabric Data Access Gateway](#) on your HPE Ezmeral Data Fabric cluster. The gateway serves as a proxy for translating requests between the Go client and the HPE Ezmeral Data Fabric cluster. The gateway also performs data processing to keep the client lightweight. To administer the gateway and configure load balancing, see [Administering the Data Access Gateway](#) on page 1955.

## Additional Resources

Examples: <https://github.com/mapr-demos/ojai-examples/tree/master/golang>

Source Code: <https://github.com/mapr/maprdb-go-client>

## Getting Started with the Go OJAI Client

This section describes the software required to run the Go OJAI client, client/server security, and how to specify your connection string. It also provides links to documentation that shows you how to write Go OJAI applications.

The Go OJAI client is available starting in the EEP 6.0.0 release.

## Software Requirements

You must have the following software installed to run the client:

Client Software	Installation Notes
Golang 1.10 (or later)	
Go OJAI client	Install the client using the following command: <pre>go get github.com/mapr/maprdb-go-client</pre>

You also must have access to the following software:

- MapR cluster 6.1 or cluster from later versions of Data Fabric
- [Data Access Gateway](#) 2.0 or later

To run a Go OJAI application, you must install and configure the Data Access Gateway:

- [Installing the Data Access Gateway Service](#) on page 1955
- [Modifying Configuration Settings for the Data Access Gateway Service](#) on page 1956

For some sample code, see [https://github.com/magpierre/mapr\\_go\\_client\\_mqtt](https://github.com/magpierre/mapr_go_client_mqtt). `main.go` shows a simple Go client that reads from an MQTT messaging protocol and writes to a data-fabric JSON database.

### Go OJAI Client Security

The client supports username/password authentication. The initial connection (and token renewal) use these credentials. Subsequent communication uses JWT.

When connecting to a secure cluster, the client uses:

- X.509 certificates to authenticate with the Data Access Gateway
- TLS v1.2 to encrypt communication between the client and the Data Access Gateway

### Go OJAI Client Connection String

The string you use to connect your OJAI client to the cluster must have the following format:

```
"[ojai:mapr:thin:v1@]<hostname>[:<port>][?<option_name>=<option_value>;...]"
```

The prefix `ojai:mapr:thin:v1@` is optional.

<code>&lt;hostname&gt;</code>	Name of the Data Access Gateway host
<code>&lt;port&gt;</code>	Port number (see <a href="#">Ports Used by HPE Ezmeral Data Fabric Software</a> on page 3084) that gRPC clients use to connect to the Data Access Gateway Default: 5678
<code>auth=&lt;scheme_name&gt;</code>	The authentication scheme for the current connection; currently, only <code>basic</code>
<code>user=&lt;username&gt;</code>	The user name for <code>basic</code> authentication
<code>password=&lt;password&gt;</code>	The password for <code>basic</code> authentication
<code>ssl=true   false</code>	Whether to establish a secure connection using SSL/TLS An error is returned if there is a mismatch between your client and Data Access Gateway security settings. The default for this option is <code>true</code> , which is the required setting if connecting to a secure Data Access Gateway. If connecting to a nonsecure Data Access Gateway, set it to <code>false</code> . If set to <code>false</code> , the other SSL parameters are ignored. Note that the <code>grpc.service.ssl.enabled</code> property controls the SSL setting for the Data Access Gateway. For more information, see <a href="#">Administering the Data Access Gateway</a> on page 1955.
<code>sslCA=&lt;path to PEM file containing CA certificate&gt;</code>	Path to a local file containing Certificate Authority (CA) signed certificates in PEM format. For information about the PEM format, see <a href="#">Configuring SSL for OJAI Clients</a> on page 3481.

**sslTargetNameOverride=<CA certificate common name>**

Must be set if the `ssl` option is `true`.

Fully qualified domain name specified in the SSL server certificate, which is different from the `<hostname>` in the connection string.

For example, imagine that you are using the following:

- Public network host name is `ec2-203-0-113-25.compute-1.amazonaws.com`.
- Internal DNS is `node1.mydomain.com`.
- CA signed certificate is issued to `node1.mydomain.com`.

Using these names, you must specify the following connection string:

```
"ec2-203-0-113-25.compute-1.amazonaws.com:5678?ssl=true;sslCA=/opt/app/conf/rootca.pem;sslTargetNameOverride=node1.mydomain.com"
```

Other examples of connection strings are the following:

```
"ojai:mapr:thin:v1@localhost:5678?auth=basic;user=fred;password=george;sslCA=/opt/app/conf/rootca.pem"
"localhost:5678?ssl=false;auth=basic;user=fred;password=george"
```

**sslValidate=true|false**

When `ssl=true`, indicates whether or not the client should validate the server certificate against a list of CA certificates. The default is `true`.

### Go OJAI Connection Retry Options

If your OJAI client cannot connect to your data-fabric cluster, it waits 10 ms. After 10 ms, it makes a second connection attempt. If that fails, it continues the attempts up to a configurable number of retries. The following parameters control the number of retries and the wait time between attempts:

Connection Option Parameter	Description	Default Value
MaxAttempt	Maximum number of retry attempts	9
WaitBetweenSeconds	Maximum wait time between attempts	12 s
CallTimeoutSeconds	Maximum call timeout	60 s

To set these retry options, you must pass them in the `client.MakeConnectionWithRetryOptions` call:

```
connectionString := "localhost:5678?" +
    "auth=basic;" +
    "user=mapr;" +
    "password=mapr;" +
    "ssl=true;" +
    "sslCA=/opt/mapr/conf/ssl_truststore.pem;" +
```

```

"sslTargetNameOverride=node1.cluster.com"
options := &client.ConnectionOptions{MaxAttempt:3,
WaitBetweenSeconds:10, CallTimeoutSeconds:60}
connection, _ :=
client.MakeConnectionWithRetryOptions(connectionString, options)

```

### Writing a Go OJAI Application

For information about writing a Go OJAI application, see the Go sections in the following topics:

[Querying in OJAI Applications on page 3364](#)

Provides an introduction to the basic flow of an OJAI application that queries a HPE Ezmeral Data Fabric Database JSON table

[Examples: Querying JSON Documents on page 3409](#)

Contains code samples of OJAI applications that query HPE Ezmeral Data Fabric Database JSON tables

[Managing JSON Documents on page 3326](#)

Describes how to perform CRUD (create, query, update, and delete) operations on JSON documents in HPE Ezmeral Data Fabric Database JSON tables

### Go OJAI Client Structures and Functions

This topic lists and describes the structures supported by the Go OJAI client and provides a link to document pages that describe the functions in each structure.

Structure Name	Description
<a href="#">Document</a>	Provides the primary, DOM-based interface for inspecting OJAI documents.
<a href="#">QueryResult</a>	Encapsulates the result set of an OJAI query.
<a href="#">DocumentMutation</a>	Encapsulates a mutation to an existing OJAI document in a store.
<a href="#">Query</a>	Encapsulates an OJAI query.
<a href="#">Condition</a>	Encapsulates a query condition; similar to a SQL <code>where</code> clause.
<a href="#">Connection</a>	Provides a logical connection to an OJAI data source: for example, HPE Ezmeral Data Fabric Database JSON.
<a href="#">DocumentStore</a>	Encapsulates a store, typically persistent, of OJAI documents: for example, HPE Ezmeral Data Fabric Database JSON tables.
<a href="#">OTime</a>	Encapsulates the OJAI <code>TIME</code> type.
<a href="#">OTimestamp</a>	Encapsulates the OJAI <code>TIMESTAMP</code> type.
<a href="#">ODate</a>	Encapsulates the OJAI <code>DATE</code> type.

For details about each structure, including the functions available in each structure, see the [Go OJAI Client API](#).

### Setting Query Options in Go OJAI

There are two categories of options you can set in your Go OJAI application. This topic describes both and shows you how to set each.

## Setting Query Options Using a Go OJAI Function Call

Option Name	Description
IncludeQueryPlan	Enables or disables availability of the query plan for retrieval. Value: true false Default: false
ResultAsDocument	Enables or disables returning the query result as an OJAI Document object list versus a Go map list. Value: True False Default: False: returns query result as a Go map list
Timeout	Query timeout in milliseconds. Maximum allowed value is 2147483647 Default: None; no timeout

To set any of these query options, you must pass the option as the second parameter in the `DocumentStore.FindQueryWithContext` function.

The following code snippet sets the query timeout to 3000 milliseconds:

```
timeoutCtx, cancel := context.WithTimeout(context.Background(),
time.Duration(3*time.Second))
result, err := suite.store.FindQueryWithContext(query, findOptions,
timeoutCtx)
cancel()
```

## Setting Query Options in Go Using OJAI Query Syntax

[OJAI Query Options](#) on page 3372 describes query options that are available in all OJAI clients. To use these options in Go OJAI, you must construct your query in JSON format and use the `$options` keyword. See [OJAI Query Syntax](#) for details about the syntax, including an example.

## Configuring SSL for OJAI Clients

Describes certificates and how to configure SSL for OJAI clients, including which PEM file to point to and how to determine which DAG host name to use.

The process of installing Data Fabric with security enabled automatically generates default `ssl_keystore` and `ssl_truststore` files on the first CLDB server used by all clients and servers. Data Access Gateway (DAG) and other cluster services use these certificates to perform authentication and encryption for websites that use the HTTPS protocol.

The certificates are generated in the `/opt/mapr/conf` directory under `ssl_truststore.*` and `ssl_keystore.*`. The `ssl_truststore.*` files contain the client side certificates (signer for the certificate in the `ssl_keystore`). The `ssl_keystore.*` files contain the server side certificates (a single self-signed certificate with a wildcard SubjectDN).

When you configure a client to connect to a cluster, you create a connection string. If the connection is SSL enabled, you must include the path to the certificate of trust. You can either configure the client to use the default certificates or you can point to custom certificates. However, if the certificate on the server side is signed using a real certificate signing authority, you do not need to include an `ssl_truststore` in the connection string because the default `ssl_truststore` will recognize the signed certificate.

For additional information, see [SSL Certificates](#) on page 830.

### Using the Default Certificates Generated by Data Fabric

For an application running on a cluster node, provide the path to the PEM file, as shown in the following example:

```
sslCA=/opt/mapr/conf/ssl_truststore.pem
```

For an application that is not running on a cluster node, copy the `ssl_truststore.pem` file from `/opt/mapr/conf/` to a location on the non-cluster node and then specify the path to the `ssl_truststore.pem` file:

```
sslCA=/path/to/certificate/ssl_truststore.pem
```

### Using Custom Certificates

If an administrator created custom certificates for the cluster (as described in [SSL Certificates](#) on page 830), the certificates must have an equivalent truststore in PEM format. Create a PEM version of the truststore file and use that PEM file with the clients. For example, `sslCA=/path/to/custom/certificates/ssl_truststore.pem`.

For additional information, see [Importing a Certificate Authority Signed \(CA Signed\) SSL Certificate Into a Cluster](#).

### Determining which DAG Host Name to Use

Open the `ssl_truststore.pem` file and locate the certificate with `Subject = C`. The certificate with `Subject = C` also has a CN host name. Use this CN host name.

If you see a wildcard character (\*) instead of a file name, you can use any host that is running DAG and suffix it with `.ec2.internal`, as shown:

```
*.ec2.internal
```

### Using the HPE Ezmeral Data Fabric Database JSON REST API

Starting in the EEP 5.0 release, you can use a REST API to access HPE Ezmeral Data Fabric Database JSON tables. The REST API allows you to use HTTP calls to perform basic operations on HPE Ezmeral Data Fabric Database JSON tables.

The API supports the following operations:

- Create and delete HPE Ezmeral Data Fabric Database JSON tables
- Insert, update, and delete documents from a table
- Retrieve documents while specifying filter conditions and projections

The REST API has the following characteristics:

- Operations are stateless
- Operations are synchronous
- Request responses are not buffered
- Web connections are secure when connecting to secure MapR clusters
- Supports the following methods of authentication:
  - Basic authentication

- Token-based authentication using [JSON Web Tokens \(JWT\)](#)
- [Supports user impersonation](#) - All data access calls are run on behalf of the authenticated user
- Returns HTTP error codes and detailed error responses in the response message body

When connecting to a MapR cluster, you must use HTTPS in your requests.

With basic authentication, you pass a username and password in your Web client. With token based authentication, you generate a token and then pass the token in the header of subsequent API requests.

The [MapR Data Access Gateway](#) is the service that supports this web API. You should configure multiple instances of this service across your MapR cluster to distribute request processing. To achieve load balancing, you must install an external load balancer. Using token based authentication and an external load balancer, you can achieve high availability and failover. Because the REST API is stateless, you do not have to regenerate your authentication token when different service instances process your API request. This applies even in the event of failovers and service restart. You must regenerate your token when it expires.

The API does not support the following features:

- HPE Ezmeral Data Fabric Database JSON administrative commands, except the commands noted earlier
- [Read Your Own Writes](#)

To modify properties that the HPE Ezmeral Data Fabric Database JSON REST API uses, see [Application Properties](#).

### Related concepts

[Understanding the HPE Ezmeral Data Fabric Data Access Gateway](#) on page 1016

The HPE Ezmeral Data Fabric Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the HPE Ezmeral Data Fabric cluster.

[Administering the Data Access Gateway](#) on page 1955

The HPE Ezmeral Data Fabric Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the HPE Ezmeral Data Fabric cluster. This section describes considerations when upgrading the service, how to modify configuration settings, and how to administer and manage the service.

### Getting Started with the HPE Ezmeral Data Fabric Database JSON REST API

A simple way to invoke the HPE Ezmeral Data Fabric Database JSON REST API is to use `cURL` commands. This section contains a sequence `cURL` commands that demonstrate the basic functionality of the API.

**NOTE:** The HPE Ezmeral Data Fabric Database JSON REST API is available starting in the EEP 5.0 release.

The operations shown are the following:

- Create a HPE Ezmeral Data Fabric Database JSON table
- Insert documents into the table
- Retrieve documents from the table, including retrievals that contain field projections and conditions
- Update individual documents and fields within a document

To learn about the complete API, see the reference material at [Understanding the HPE Ezmeral Data Fabric Database JSON REST API](#) on page 3489.

The examples in this section assume that you installed the Data Fabric Data Access Gateway on the host 10.10.100.42. The examples use HTTPS with the default HTTPS port of 8243. For information about installing the Data Access Gateway, see [Installing the Data Access Gateway Service](#) on page 1955.

 **NOTE:** The examples URL encode the slashes in the table path (%2F) to differentiate them from the slashes in the command API.

### Using Basic Authentication

The commands in this section use basic authentication. To use this form of authentication, you must pass the username and password in all commands, using the `-u` option.

1. Create a HPE Ezmeral Data Fabric Database JSON table in the path `/apps/employees`:

```
curl -X PUT \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees' \
  -u root:mapr
```

2. Insert 3 documents into the table:

```
curl -X POST \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees' \
  -u root:mapr \
  -H 'Content-Type: application/json' \
  -d ' [{"_id": "user001", "first_name": "John", "last_name": "Doe"},
  {"_id": "user002", "first_name": "Jane", "last_name": "Doe"},
  {"_id": "user003", "first_name": "Simon", "last_name": "Davis"} ]'
```

3. Retrieve all of the documents:

```
curl -X GET \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees%2F' \
  -u root:mapr
```

The command returns the following:

```
{
  "DocumentStream": [
    {
      "_id": "user001",
      "first_name": "John",
      "last_name": "Doe"
    },
    {
      "_id": "user002",
      "first_name": "Jane",
      "last_name": "Doe"
    },
    {
      "_id": "user003",
      "first_name": "Simon",
      "last_name": "Davis"
    }
  ]
}
```

**4.** Limit the GET request to 2 documents starting at offset 1:

```
curl -X GET \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees%2F?
  offset=1&limit=2' \
  -u root:mapr
```

The command returns the following:

```
{
  "DocumentStream": [
    {
      "_id": "user002",
      "first_name": "Jane",
      "last_name": "Doe"
    },
    {
      "_id": "user003",
      "first_name": "Simon",
      "last_name": "Davis"
    }
  ]
}
```

**5.** Retrieve only the first names in the documents:

```
curl -X GET \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees?
  fields=first_name' \
  -u root:mapr
```

The command returns the following:

```
{
  "DocumentStream": [
    {
      "first_name": "John"
    },
    {
      "first_name": "Jane"
    },
    {
      "first_name": "Simon"
    }
  ]
}
```

6. Retrieve all documents with a last name of 'Doe':

```
curl -g -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees?
condition={"$eq":{"last_name":"Doe"}}' \
-u root:mapr
```

**NOTE:** You must pass '-g' in the cURL command due to the nested braces in the condition.

The command returns 2 documents:

```
{
  "DocumentStream": [
    {
      "_id": "user001",
      "first_name": "John",
      "last_name": "Doe"
    },
    {
      "_id": "user002",
      "first_name": "Jane",
      "last_name": "Doe"
    }
  ]
}
```

7. Retrieve the id and first name of documents with a last name of 'Doe':

```
curl -g -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees?
condition={"$eq":{"last_name":"Doe"}}&fields=_id,first_name' \
-u root:mapr
```

**NOTE:** You must pass '-g' in the cURL command due to the nested braces in the condition.

The command returns the following:

```
{
  "DocumentStream": [
    {
      "_id": "user001",
      "first_name": "John"
    },
    {
      "_id": "user002",
      "first_name": "Jane"
    }
  ]
}
```

**8.** Run the same command, also retrieving the query plan:

```
curl -g -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees?
condition={"$eq":
{"last_name":"Doe"}}&fields=_id,first_name&getPlan=true' \
-u root:mapr
```

The output includes the query plan:

```
{
  "DocumentStream": [
    {
      "_id": "user001",
      "first_name": "John"
    },
    {
      "_id": "user002",
      "first_name": "Jane"
    }
  ],
  "QueryPlan": [
    {
      "streamName": "DBDocumentStream",
      "parameters": {
        "queryConditionPath": true,
        "projectionPath": [
          "_id",
          "first_name"
        ],
        "primaryTable": "/apps/employees"
      }
    }
  ]
}
```

**9.** Update the first name in one of the documents, specifying the id in the command:

```
curl -X POST \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees/document/
user001' \
-H 'Content-Type: application/json' \
-u root:mapr \
-d '{"$set":{"first_name":"Jay"}}'
```

- Retrieve the updated document, specifying the `id` in the command:

```
curl -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees/document/
user001' \
-u root:mapr
```

The document contains an updated first name:

```
{
  "_id": "user001",
  "first_name": "Jay",
  "last_name": "Doe"
}
```

- Replace the same document, but this time with a user who has only a first name:

```
curl -X PUT \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees/document/
user001' \
-H 'Content-Type: application/json' \
-u root:mapr \
-d '{"_id": "user001", "first_name": "Jonathan"}'
```

- Retrieve the new document by passing the `id` in the request:

```
curl -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees/document/
user001' \
-u root:mapr
```

The document contains only a first name:

```
{
  "_id": "user001",
  "first_name": "Jonathan"
}
```

## Using Token-Based Authentication

To use token-based authentication, you first create a token, authenticating with a username and password. You then pass the generated token in all subsequent commands.

- Generate a token using the following command:

```
curl -X POST \
'https://10.10.100.42:8243/auth/v2/token' \
-u root:mapr
```

The command returns the following token:

```
{
  "token":
  "eyJhbGciOiJIUzUxMiJ9.eyJzdWIiOiJyY290IiwiaWF0IjoiYXVkaWoid2ViIiwiaXNwIjojNTIwMjY5MjYwLWwlcjYyYXQ1OjE1MjYyNDB9.NT8L2deiA6v55bfbU_opiG1XXGPP0IwfSex3jw5A1Zs
oI1ar09it7-XwNtRqfL_I29IHLyfmuhcT5eSIpwq6ng"
}
```

2. Pass the token in your `cURL` command, as shown in the following `GET`:

```
curl -X GET \
  https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees \
  -H 'Authorization:
Bearer
eyJhbGciOiJIUzUxMiJ9.eyJzdWIiOiJyb290IiwiaXVkiOiJoid2ViIiwiaXhwIjoxNTIwMjY5
MTQwLCJpYXQiOiJlMjAyNjc5NDB9.NT8L2deiA6v55bfbU_opiG1XXGPP0IwfSex3jW5A1Zso
I1ar09it7-XwNtRqfL_I29IHLyfmUHcT5eSIpwq6ng'
```

### Understanding the HPE Ezmeral Data Fabric Database JSON REST API

The section describes the details of the HPE Ezmeral Data Fabric Database JSON REST API.

The following table summarizes the commands the API supports. Click on the command for details about the command parameters and examples.

Category	REST API Command	Description
Authentication	<a href="#">POST /auth/v2/token</a> on page 3489	Creates an authentication token
Table Operations	<a href="#">PUT /api/v2/table/{path}</a> on page 3490	Creates a HPE Ezmeral Data Fabric Database JSON table
	<a href="#">DELETE /api/v2/table/{path}</a> on page 3490	Drops a HPE Ezmeral Data Fabric Database JSON table
Table Document Operations	<a href="#">POST /api/v2/table/{path}</a> on page 3491	Adds one or more documents to a HPE Ezmeral Data Fabric Database JSON table
	<a href="#">PUT /api/v2/table/{path}/document/{id}</a> on page 3491	Updates a document by id in a HPE Ezmeral Data Fabric Database JSON table
	<a href="#">POST /api/v2/table/{path}/document/{id}</a> on page 3492	Updates a partial document by id in a HPE Ezmeral Data Fabric Database JSON table using mutations
	<a href="#">DELETE /api/v2/table/{path}/document/{id}</a> on page 3493	Deletes a single document by id in a HPE Ezmeral Data Fabric Database JSON table
	<a href="#">GET /api/v2/table/{path}</a> on page 3494	Retrieves one or more documents from a HPE Ezmeral Data Fabric Database JSON table
	<a href="#">GET /api/v2/table/{path}/document/{id}</a> on page 3497	Retrieves a single document by id from a HPE Ezmeral Data Fabric Database JSON table

#### *POST /auth/v2/token*

Authenticates a user. If successful, creates an authentication token that you use in subsequent API requests. By default, the token expires in 30 minutes. After a token expires, you must rerun this command to generate a new token.

#### Request Example

The following creates an authentication token for user `root`:

```
curl -X POST \
  'https://10.10.100.42:8243/auth/v2/token' \
  -u root:mapr
```

**Response Example**

```
200 OK

{
  "token":
  "eyJhbGciOiJIUzUxMiJ9.eyJzdWIiOiJtYXByIiwiaXVkiOiJoid2ViIiwiaXhwIjozNTE2NzQ2MDc4LCJpYXQiOiJlMTY3NDQyNzh9.6YXWX72UP9_U9DPmT8c-_DQRDwY_TL0DEdsBaBqoaLf8iK0qHNctyBTbFO5ktUJMTubVOj6D7pFOEyEuV8lhjA"
}
```

For an example that shows how to use the token returned by this API call in a subsequent GET command, see [Using Token-Based Authentication](#) on page 3488.

*PUT /api/v2/table/{path}*

Creates a HPE Ezmeral Data Fabric Database JSON table

**Parameters**

Name	Description
path string (path)	<b>Required:</b> Path to the new HPE Ezmeral Data Fabric Database JSON table

**Request Example**

The following creates a table with the path `/apps/employees`:

```
curl -X PUT \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps/employees' \
  -u root:mapr
```

**Response Example**

```
201 Created
```

*DELETE /api/v2/table/{path}*

Drops a HPE Ezmeral Data Fabric Database JSON table

**Parameters**

Name	Description
path string (path)	<b>Required:</b> Path to the HPE Ezmeral Data Fabric Database JSON table

**Request Example**

The following drops a table with the path `/apps/employees`:

```
curl -X DELETE \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees' \
  -u root:mapr
```

## Response Example

```
200 OK
```

*POST /api/v2/table/{path}*

Adds or replaces one or more documents in a HPE Ezmeral Data Fabric Database JSON table

## Parameters

Name	Description
path string (path)	<b>Required:</b> Path to the HPE Ezmeral Data Fabric Database JSON table
fieldAsKey string (query)	The name of the field that serves as the key in the JSON document
mode string (query)	<p>Defines the behavior of the operation.</p> <p>The following are the possible values:</p> <ul style="list-style-type: none"> <li><code>insertOrReplace</code> - Inserts new document if specified document ID does not exist; otherwise, replaces existing document specified by the ID.</li> <li><code>insert</code> - Inserts new document; if the specified document ID already exists, returns an error.</li> <li><code>replace</code> - Replaces document with specified ID; returns an error if document does not exist.</li> </ul> <p>Default: <code>insertOrReplace</code></p>
body (body)	The body of the documents to add or replace

## Request Example

The following inserts 3 documents into `/apps/employees`:

```
curl -X POST \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees' \
  -u root:mapr \
  -H 'Content-Type: application/json' \
  -d '[{"_id": "user001", "first_name": "John", "last_name": "Doe"},
{"_id": "user002", "first_name": "Jane", "last_name": "Doe"},
{"_id": "user003", "first_name": "Simon", "last_name": "Davis"}]'
```

## Response Example

```
200 OK
```

*PUT /api/v2/table/{path}/document/{id}*

Updates a single document by id in a HPE Ezmeral Data Fabric Database JSON table

**Parameters**

Name	Description
path string (path)	<b>Required:</b> Path to the HPE Ezmeral Data Fabric Database JSON table
id string (path)	<b>Required:</b> Id of the document to update. If the document with the specified id does not exist, the mode parameter determines the behavior.
condition string (query)	Query condition (in JSON format) used to perform OJAI <code>DocumentStore.checkAndReplace</code> evaluation. See <a href="#">OJAI Query Condition Syntax</a> on page 3391 for a description of the syntax.
mode string (query)	Defines the behavior of the operation. The following are the possible values: <ul style="list-style-type: none"> <li><code>insertOrReplace</code> - Inserts new document if specified document ID does not exist; otherwise, replaces existing document specified by the ID.</li> <li><code>insert</code> - Inserts new document; if the specified document ID already exists, returns an error.</li> <li><code>replace</code> - Replaces document with specified ID if it exists</li> </ul> Default: <code>insertOrReplace</code>
body (body)	<b>Required:</b> The body of the new document

**Request Example**

The following replaces the document with id `user001` in `/apps/employees` with an employee who has only a first name:

```
curl -X PUT \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees/document/
user001' \
-H 'Content-Type: application/json' \
-u root:mapr \
-d '{"_id":"user001","first_name":"Jonathan"}
```

**Response Example**

```
200 OK
```

`POST /api/v2/table/{path}/document/{id}`

Updates a partial document by id in a HPE Ezmeral Data Fabric Database JSON table using mutations

**Parameters**

Name	Description
path string (path)	<b>Required:</b> Path to the HPE Ezmeral Data Fabric Database JSON table
id string (path)	<b>Required:</b> Id of the document to update. If the document does not exist, inserts a new document.
condition string (query)	Query condition (in JSON format) used to perform OJAI <code>DocumentStore.checkAndUpdate</code> evaluation. See <a href="#">OJAI Query Condition Syntax</a> on page 3391 for a description of the syntax.
body (body)	<b>Required:</b> The mutation specifying updates to the document. See <a href="#">Using OJAI Mutation Syntax</a> on page 3346 for a description of the syntax.

**Request Example**

The following updates the `first_name` field the document in `/apps/employees` with id `user001`, replacing the field with the value `Jay`:

```
curl -X POST \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees/document/
user001' \
-H 'Content-Type: application/json' \
-u root:mapr \
-d '{"$set":{"first_name":"Jay"}}'
```

**Response Example**

```
200 OK
```

**DELETE** `/api/v2/table/{path}/document/{id}`

Deletes a single document by id in a HPE Ezmeral Data Fabric Database JSON table

**Parameters**

Name	Description
path string (path)	<b>Required:</b> Path to the HPE Ezmeral Data Fabric Database JSON table
id string (path)	<b>Required:</b> Id of the document to delete
condition string (query)	Query condition (in JSON format) used to perform OJAI <code>DocumentStore.checkAndDelete</code> evaluation. See <a href="#">OJAI Query Condition Syntax</a> on page 3391 for a description of the syntax.

## Request Example

The following deletes the document with id `user003` in `/apps/employees`:

```
curl -X DELETE \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees/document/
user003' \
  -u root:mapr
```

## Response Example

```
200 OK
```

`GET /api/v2/table/{path}`

Retrieves one or more documents from a HPE Ezmeral Data Fabric Database JSON table

## Parameters

Name	Description
path string (path)	<b>Required:</b> Path to the HPE Ezmeral Data Fabric Database JSON table
condition string (query)	Query condition (in JSON format) to evaluate on documents retrieved. See <a href="#">OJAI Query Condition Syntax</a> on page 3391 for a description of the syntax.
fields string (query)	The fields from the document to retrieve. See <a href="#">JSON Document Field Paths</a> on page 643 for details about how to specify field paths.
fromId string (query)	Starting id of the range of documents to retrieve (inclusive)
told string (query)	Ending id of the range of documents to retrieve (exclusive)
getPlan string (query)	If set to <code>true</code> , returns the query plan used to retrieve the documents Value: <code>True False</code> Default: <code>False</code>
limit integer (query)	The maximum number of documents to retrieve
offset integer (query)	The number of documents to skip past before returning results

Name	Description
orderBy string (query)	The fields on which to sort the result. Specify the fields in a comma separated list, in the format <field name>:<sort order> where <sort order> is either asc or desc. <sort order> is optional and defaults to asc.
query string (query)	Query string with predefined keywords that define the behavior of the query. See <a href="#">Query with --query</a> on page 5507 for syntax details.
withTags string (query)	Enables or disables output with extended type tags Value: True False Default: True

### Request Examples

1. The following retrieves all documents from /apps/employees:

```
curl -X GET \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees' \
  -u root:mapr
```

2. The following specifies an offset and limit in the GET request:

```
curl -X GET \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees%2F?
  offset=1&limit=2' \
  -u root:mapr
```

3. The following retrieves only the first names in the documents:

```
curl -X GET \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees?
  fields=first_name' \
  -u root:mapr
```

4. The following retrieves all documents with a last name of 'Doe':

```
curl -g -X GET \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees?
  condition={"$eq":{"last_name":"Doe"}}' \
  -u root:mapr
```

**NOTE:** You must pass '-g' in the cURL command due to the nested braces in the condition.

5. The following retrieves the id and first name of documents with a last name of 'Doe':

```
curl -g -X GET \
  'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees?
  condition={"$eq":{"last_name":"Doe"}}&fields=_id,first_name' \
  -u root:mapr
```

6. The following runs the same command and includes a request for the query plan:

```
curl -g -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees?
condition={"$eq":
{"last_name": "Doe"}}&fields=_id,first_name&getPlan=true' \
-u root:mapr
```

### Response Examples

```
200 OK
{
  "DocumentStream": [
    {
      "_id": "user001",
      "first_name": "John",
      "last_name": "Doe"
    },
    {
      "_id": "user002",
      "first_name": "Jane",
      "last_name": "Doe"
    },
    {
      "_id": "user003",
      "first_name": "Simon",
      "last_name": "Davis"
    }
  ]
}
```

If you have configured the MapR Data Access Gateway to limit the number of documents in retrieval requests, and your result set exceeds the limit, the API response includes a warning. In the following example, the limit is set to 2:

```
{
  "DocumentStream": [
    {
      "_id": "user001",
      "first_name": "John",
      "last_name": "Doe"
    },
    {
      "_id": "user002",
      "first_name": "Jane",
      "last_name": "Doe"
    }
  ],
  "WARNING": "result truncated due to limit set to 2."
}
```

The following shows an example of output that includes a query plan. It corresponds to the output from example #6 in the previous section:

```
{
  "DocumentStream": [
    {
      "_id": "user001",
      "first_name": "John"
```

```

    },
    {
      "_id": "user002",
      "first_name": "Jane"
    }
  ],
  "QueryPlan": [
    [
      {
        "streamName": "DBDocumentStream",
        "parameters": {
          "queryConditionPath": true,
          "projectionPath": [
            "_id",
            "first_name"
          ],
          "primaryTable": "/apps/employees"
        }
      }
    ]
  ]
}

```

**GET /api/v2/table/{path}/document/{id}**

Retrieves a single document by id from a HPE Ezmeral Data Fabric Database JSON table

### Parameters

Name	Description
path string (path)	<b>Required:</b> Path to the HPE Ezmeral Data Fabric Database JSON table
id string (path)	<b>Required:</b> Id of the document to retrieve
condition string (query)	Query condition (in JSON format) to evaluate on document retrieved. See <a href="#">OJAI Query Condition Syntax</a> on page 3391 for a description of the syntax.
fields string (query)	The fields from the document to retrieve. See <a href="#">JSON Document Field Paths</a> on page 643 for details about how to specify field paths.
withTags string (query)	Enables or disables output with extended type tags Value: True False Default: True

### Request Example

The following retrieves the document with id user003 from /apps/employees:

```

curl -X GET \
'https://10.10.100.42:8243/api/v2/table/%2Fapps%2Femployees/document/

```

```
user003' \
-u <username>:<password>
```

### Response Example

```
200 OK

{
  "_id": "user003",
  "first_name": "Simon",
  "last_name": "Davis"
}
```

### HPE Ezmeral Data Fabric Database JSON MapReduce API

This API library extends the Apache Hadoop MapReduce framework, so that you can write your own MapReduce applications to write data from one JSON table to another.

### Prerequisites to using this API Library

- Ensure that you have a firm grasp of MapReduce concepts and experience writing MapReduce applications.
- Before running a MapReduce application that uses this API, ensure that the destination JSON table or tables already exist and that any column families other than the default are already created on the destination tables.

### Classes

The following table summarizes the information that is in the [HPE Ezmeral Data Fabric Database JSON MapReduce API](#), which you can refer to for complete details of the classes.

Category	Class	Description
Utility	MapRDBMapReduceUtil	Simplifies the use of the API for most use cases.
Input formatters	TableInputFormat	Describes how to read documents from HPE Ezmeral Data Fabric Database JSON tables.
Record reader	TableRecordReader	Reads documents (records) from HPE Ezmeral Data Fabric Database JSON tables.
	TableRecordReaderImpl	Iterates over HPE Ezmeral Data Fabric Database JSON table data. Returns key-value pair as <code>ByteBufferWritableComparable</code> and <code>Document</code> respectively.
Record writers	BulkLoadRecordWriter	Bulk loads documents into HPE Ezmeral Data Fabric Database JSON tables.
	TableMutationRecordWriter	Modifies documents that are in HPE Ezmeral Data Fabric Database JSON tables.
	TableRecordWriter	Writes documents to HPE Ezmeral Data Fabric Database JSON tables.

Category	Class	Description
Output formatters	BulkLoadOutputFormat	Describes how to bulk load documents into HPE Ezmeral Data Fabric Database JSON tables.
	TableOutputFormat	Describes how to write documents to HPE Ezmeral Data Fabric Database JSON tables.
	TableMutationOutputFormat	Writes DocumentMutation from the MapReduce phase to JSON tables . The key is of type Value and the value is a DocumentMutation.
Serializers	DocumentSerialization	Defines the serializer and deserializer for passing data from Document objects between map and reduce phases.
	DBDocumentSerialization	Converts a JSON document from HPE Ezmeral Data Fabric Database format to binary SequenceFile format.
	ValueSerialization	Serializes a JSON key and passes it between MapReduce phases.
Partitioner	TablePartitioner	Specifies how to partition data from the source JSON table.
	TotalOrderPartitioner<K,V>	Globally sorts data according to row key and then partitions the sorted data. This class is useful when the destination table has been pre-split into two or more tablets.

### Using MapRDBMapReduceUtil to Set Default Values in Configurations and Jobs

The centerpiece of this API is the `MapRDBMapReduceUtil` class, which you can use in the `createSubmittableJob()` method of your applications to perform these actions:

- Set default values in the configuration for a MapReduce application and set the input and output format classes.
- Set default types for output keys and values.
- Configure a `TotalOrderPartitioner` and return the number of reduce tasks to use for a job.

To set default values in the configuration for a MapReduce application and set the input and output format classes, use the following methods:

```
configureTableInputFormat(org.apache.hadoop.mapreduce.Job job, String srcTable)
```

The `configureTableInputFormat` method performs the following actions:

- Set the serialization class for `Document` and `Value` objects. These interfaces are part of the OJAI (Open JSON Application Interface) API.
- Set the field `INPUT_TABLE` in `TableInputFormat` to the path and name of the source table, and pass this value to the configuration for the MapReduce application.

- Set the input format class for the job to [TableInputFormat](#).

```
configureTableOutputFormat(org.apache.hadoop.mapreduce.Job job, String
destTable)
```

The `configureTableOutputFormat` method performs the following actions:

- Set the field `OUTPUT_TABLE` in [TableOutputFormat](#) to the path and name of the destination table, and pass this value to the configuration for the MapReduce applications.
- Set the output format class for the job to [TableOutputFormat](#).

If you want to set values for other fields in `TableInputFormat` or `TableOutputFormat`, or write your own logic for them, you can pass field values to configurations and specify these classes for jobs as you would in common MapReduce applications.

To set default types for output keys and values, use the following methods:

```
setMapOutputKeyValueClass(org.apache.hadoop.mapreduce.Job job)
setOutputKeyValueClass(org.apache.hadoop.mapreduce.Job job)
```

**NOTE:** You can also set types for output keys and values from the map phase, if those types will differ from the final output types.

To configure `TotalOrderPartitioner` and return the number of reduce tasks to use for a job, you can use a code line similar to the following in your application's method for creating a job:

```
int numReduceTasks =
MapRDBMapReduceUtil.setPartitioner(org.apache.hadoop.mapreduce.Job job,
String destPath);
```

The `setPartitioner()` method finds out whether a table has been pre-split into two or more tablets, counts the number of tablets, writes the number to a partitioner file, and sends that file to an instance of `TotalOrderPartitioner`. This line also returns the number of tablets to `numReduceTasks`. Your code can then use that variable to set the number of reducers, like the following:

```
job.setNumReduceTasks(numReduceTasks);
```

**NOTE:** The sample application gives an example of how to use `MapRDBMapReduceUtil`.

## Mutating Rows in Destination Tables

Use the `TableMutationRecordWriter` class when you need to mutate rows.

For example, suppose that you are tracking the number of users who are performing various actions on your retail website. To do this, at intervals you run your MapReduce application and save the results in JSON documents in HPE Ezmeral Data Fabric Database. Suppose that you count the number of users who went through the order process but abandoned their orders. After every run of the application, you want to update an JSON document by adding the current count to the total count and by updating a field that tracks the date and time that the MapReduce application was last run.

You could do that by setting values in a `DocumentMutation` object (see the [OJAI \(Open JSON Application Interface\) Javadoc](#)). You would then serialize that and write it to the table with `TableMutationRecordWriter`.

## Compiling and Running Applications

You can compile applications that use the HPE Ezmeral Data Fabric Database Java API by using the required JAR file from the MapR installation. Run applications with the `mapr` command.

To compile an application, use the following command:

```
javac -cp 'mapr classpath' <Application jars>
```

To launch an application, use the following command

```
mapr <Main class jar> <commandline arguments>
```

**NOTE:** If you want to add JAR files to the classpath that the `mapr` command uses, add them with the environment variable `MAPR_CLASSPATH`. For example:

```
export MAPR_CLASSPATH=/home/apps/awesome-1.0.jar
mapr com.company.MyAwesomeApp
```

**IMPORTANT:** Turn off speculative execution

Speculative execution of MapReduce tasks is on by default. For custom applications that load HPE Ezmeral Data Fabric Database tables, it is recommended to turn speculative execution off. When it is on, the tasks that import data might run multiple times. Multiple tasks for an incremental bulkload could insert one or more versions of a record into a table. Multiple tasks for a full bulkload could cause loss of data if the source data continues to be updated during the load.

If your custom MapReduce application uses

`MapRDBMapReduceUtil.configureTableOutputFormat()`, you do not have to turn off speculative execution manually. This method turns it off automatically.

Turn off speculative execution by using either of these methods:

- Set the following MapReduce version 2 parameter to false: `mapreduce.map.speculative`
- Include the following line in the method in your application that sets parameters for jobs:

```
job.setSpeculativeExecution(false);
```

### HPE Ezmeral Data Fabric Database JSON MapReduce: Sample App

This sample application reads records (JSON documents) from a JSON table and inserts new documents into another JSON table.

After reading records from a JSON table, the application aggregates data within those records, creates new JSON documents that contain the aggregated records, and then inserts the new documents into another JSON table. Each record contains the name of an author and the name of a book that the author has written.

The JSON documents have this structure:

```
{
  "_id" : <string or binary>,
  "authorid": "<string>",
  "name": "<string>",
  "book": {
    "id": <int>,
    "title": "<string>"
  }
}
```

The structure of each aggregate record will look like this:

```
{
  "_id" : <string or binary>,
  "authorid" : "<string>",
  "book" : {
    [
      "title" : "<string>",
      "title" : "<string>",
      ...
    ]
  }
}
```

### Prerequisites

- Ensure that your user ID has the `-readAce` and `-writeAce` privileges on the volumes where you plan to create the source and destination tables.
- Create the source JSON table. You can create the source table and populate it with sample records by running [sample\\_dataset.txt](#) from the `mapr dbshell` utility.

```
$ mapr dbshell < sample_dataset.txt
```

- Create the destination JSON table. A simple way to create this table is to use the `create` command in the [HPE Ezmeral Data Fabric Database Shell \(JSON Tables\)](#) on page 5500 utility.

### Compiling and Running

To compile an application, use the following command:

```
javac -cp <classpath> <java source file(s)>
```

To launch an application, use the following command:

```
java -cp <classpath>:. -Djava.library.path=/opt/mapr/lib <main class>
<command line arguments>
```

To run the application, supply the paths and names of the source and destination tables as arguments:

```
CombineBookList <source_table> <destination_table>
```

### Code Walkthrough

```
private static Job createSubmittableJob(Configuration conf, String[]
otherArgs)
    throws IOException {

    srcTable = otherArgs[0];
    destTable = otherArgs[1];

    Job job = new Job(conf, NAME + "_" + destTable);
    job.setJarByClass(CombineBookList.class);
    MapRDBMapReduceUtil.configureTableInputFormat(job, srcTable);
    job.setMapperClass(CombineBookListMapper.class);
    MapRDBMapReduceUtil.setMapOutputKeyValueClass(job);
    MapRDBMapReduceUtil.configureTableOutputFormat(job, destTable);
    job.setReducerClass(CombineBookListReducer.class);
```

```

MapRDBMapReduceUtil.setOutputKeyValueClass(job);
job.setNumReduceTasks(1);
return job;
}

```

The `createSubmittableJob()` method uses methods that are in the `MapRDBMapReduceUtil` class to perform the following tasks:

#### Set the input format to the default table input format

You can call the `configureTableInputFormat()` method, passing in the job and also passing in the path and name of the source table:

```

MapRDBMapReduceUtil.configureTableInputFormat(job, srcTable);

```

The default behavior is to do the following:

- Set the serialization class for `Document` and `Value` objects. These interfaces are part of the OJAI (Open JSON Application Interface) API.
- Set the field `INPUT_TABLE` in `TableInputFormat` to the path and name of the source table, and pass this value to the configuration for the MapReduce application.
- Set the input format class for the job to `TableInputFormat`.

If you want to customize `TableInputFormat`, you can call it as you would normally set the input format for a job:

```

job.setInputFormatClass(TableInputFormat.class);

```

#### Set the type for keys and values that are output from the mapper

You can call the `setMapOutputKeyValueClass()` method to use the default type for keys and values:

```

MapRDBMapReduceUtil.setMapOutputKeyValueClass(job);

```

If you want to customize the output keys and values, you can call `Job.setMapOutputKeyClass()` and `Job.setMapOutputValueClass()` as you would normally for MapReduce applications.

#### Set the output format to the default table output format

You can call the `configureTableOutputFormat()` method, passing in the job and also passing in the path and name of the destination table, which must already exist at runtime:

```

MapRDBMapReduceUtil.configureTableOutputFormat(job, destTable);

```

The default behavior is to do the following:

- Set the field `OUTPUT_TABLE` in `TableOutputFormat` to the path and name of the destination table, and pass this value to the configuration for the MapReduce applications.

- Set the output format class for the job to `TableOutputFormat`.

If you want to customize `TableOutputFormat`, you can call it as you would normally set the output format for a job:

```
job.setOutputFormatClass(TableOutputFo
rmat.class);
```

You also have the option of using the `BulkLoadOutputFormat` class for bulk loading.

You can call the `setOutputKeyValueClass()` method to use the default type for keys and values:

```
MapRDBMapReduceUtil.setOutputKeyValuE
class(job);
```

If you want to customize the output keys and values, you can call `Job.setOutputKeyClass()` and `Job.setOutputValueClass()` as you would normally for MapReduce applications.

### Set the type of the keys and values that are output from the reducer

The `map()` method in the mapper class `CombineBookListMapper` takes the value of the `_id` field in a document as a key and the JSON document with that `_id` field value as a `Document`. The mapper does nothing with the `Value` object. For each `record`, the mapper writes the value of the `authorid` field and the full JSON document itself to the context.

```
public static class CombineBookListMapper extends Mapper<Value, Document,
Value, Document> {
    @Override
    public void map(Value key, Document record, Context context) throws
IOException, InterruptedException {
        context.write(record.getValue("authorid"), record);
    }
}
```

Both the `Value` and `Document` interfaces are part of the OJAI (Open JSON Application Interface) API. The javadoc for the OJAI API is [here](#).

The `reduce()` method in the reducer class `CombineBookListReducer` takes the map output key, which is the value of the `authorid` field, and the map output value, which is an iterator of `Document` objects that each contain a full record. For each author ID, the reducer creates a document. For each document in the iterator, the reducer extracts the value of the `book` field and adds that value to the list `books` within a new JSON document.

```
public static class CombineBookListReducer extends Reducer<Value,
Document, Value, Document> {

    @Override
    public void reduce(Value key, Iterable<Document> values,
Context context) throws IOException, InterruptedException {
        Document d = MapRDB.newDocument();
        List<Document> books = new ArrayList<Document>();

        for (Document b : values) {
            books.add((Document)b.getValue("book"));
        }

        d.setId(key);
    }
}
```

```
d.set("books", books);
context.write(key, d);
}
}
```

The [MapRDB](#) class is part of the HPE Ezmeral Data Fabric Database JSON API, not the HPE Ezmeral Data Fabric Database JSON MapReduce API.

## Apache Kafka Wire Protocol Service

---

HPE Ezmeral Data Fabric Streams supports Apache Kafka Wire Protocol Service. Apache Kafka Wire Protocol Service is a TCP/IP service that emulates a Kafka cluster backed by HPE Ezmeral Data Fabric Streams. The service makes it possible for Apache Kafka clients written in any programming language to access topics in HPE Ezmeral Data Fabric Streams.

Before Apache Kafka Wire Protocol Service was introduced, you had to use a modified version of the open-source libraries (`kafka-clients.jar` and `librdkafka.so`) for user applications to connect and publish/subscribe messages to topics in HPE Ezmeral Data Fabric Streams. With Apache Kafka Wire Protocol Service, you can simply use the Apache Kafka client libraries.

Apache Kafka Wire Protocol Service provides the following benefits:

- User applications can connect, publish, and subscribe to HPE Ezmeral Data Fabric Streams topics using standard Apache Kafka client libraries. Starting with data access gateway 6.0, only topics created through Apache Kafka Wire Protocol Service are supported.
- User applications developed using Apache Kafka clients do not require any modification to work with this new system, including recompilation, reconfiguration, or dependency management.
- Supports available Apache Kafka clients in multiple programming languages, both from the Apache Software Foundation and the community.

For more information, see [Getting Started with Apache Kafka Wire Protocol Service](#) on page 3507.

### Architecture

The Apache Kafka Wire Protocol Service works within DAG (data access gateway) to act as a Kafka Broker (server in an Apache Kafka cluster). For all application purposes, the HPE Ezmeral Data Fabric cluster (with DAG and Apache Kafka Wire Protocol Service) runs like an Apache Kafka cluster.

The following image shows the communication paths between Apache Kafka clients and HPE Ezmeral Data Fabric with DAG and Apache Kafka Wire Protocol Service acting as brokers:

### Monitoring

DAG is not a Kafka Broker; therefore, Broker metrics are not available. However, you can monitor Data Fabric core services, as described in [Using HPE Ezmeral Data Fabric Monitoring \(Spyglass Initiative\)](#) on page 1688.

### Limitations

The following list describes unsupported functionality in the initial release of Apache Kafka Wire Protocol Service:

- Quotas
- Transactions
- Idempotent Producer
- Kafka ACL-based security
- Topic-level security using ACEs.
- Group ACEs for Consumer Groups
- Delegation tokens
- Log directories

## Getting Started with Apache Kafka Wire Protocol Service

Describes the steps required to install, configure, and use Apache Kafka Wire Protocol Service.

The following sections describe the prerequisites and steps required to use Apache Kafka Wire Protocol Service.

### Prerequisites

Apache Kafka Wire Protocol Service has the following component version requirements:

- HPE Ezmeral Data Fabric 7.4.0
- DAG 6.1 (available in EEP 9.1.2)
- Apache Kafka clients 2.6.x

### 1 - Install Data Access Gateway

Apache Kafka Wire Protocol Service is included with the Data Access Gateway (DAG) package (`mapr-data-access-gateway`) and is installed when you install DAG.

You can install DAG on multiple Data Fabric [data nodes](#) alongside the `mfs` (file server) service through the Data Fabric Installer or manually using package managers. For more information about installing DAG, see [Installing Data Access Gateway](#) on page 254 and [Data Access Gateway Support Matrix](#) on page 5835.

#### High Availability

Apache Kafka Wire Protocol Service runs on all Data Fabric nodes that run DAG.

#### Port

The default DAG port for Apache Kafka Wire Protocol Service is 9092; however, you can change the port as described in [Configuring Apache Kafka Wire Protocol Service](#) on page 3511.

### 2 - Configure Apache Kafka Wire Protocol Service

Set cluster and node-specific settings, as described in [Configuring Apache Kafka Wire Protocol Service](#) on page 3511.

### 3 - Administer Kafka Topic

Use `maprccli` commands to administer Kafka topics as described in [kafkatopic](#) on page 2403.

### 4 - Secure Apache Kafka Wire Protocol Service

See [Securing Apache Kafka Wire Protocol Service](#) on page 3512.

### 5 - Use Apache Kafka Client Libraries to Connect to HPE Ezmeral Data Fabric Streams

For a list of available clients, see <https://cwiki.apache.org/confluence/display/KAFKA/Clients>.

### 6 - (Optional) - View Sample Applications

See [Sample Kafka Python Producer and Consumer](#) on page 3507.

#### Sample Kafka Python Producer and Consumer

This topic provides `kafka-python` examples with SASL and SSL client configurations for Apache Kafka Wire Protocol Service.

1. If you have not done so already, install `kafka-python`:

```
pip3 install kafka-python
$pip3 install kafka-python
$pip3 list | grep kafka-python
```

2. Save the [Sample Kafka Python Producer and Consumer](#) on page 3507 code in a file with the following name:

- SASL: `saslPlaintextKafkaPythonClient.py`
- SSL: `sslPlaintextKafkaPythonClient.py`

3. Run the sample code with the following command:

**NOTE:** When running the SASL sample code, you must fill in the username and password. When running the SSL sample code, you must fill the `ssl_password` from the file `/opt/mapr/conf/store-passwords.txt`.

#### SASL

```
python3
saslPlaintextKafkaPythonClient.py
<broker> <topicName>
```

For example:

```
python3
saslPlaintextKafkaPythonClient.py
localhost:9092
topicTestKafkaPythonClient_SASL
```

#### SSL

```
python3
sslPlaintextKafkaPythonClient.py
<broker> <topicName>
```

For example:

```
python3
sslPlaintextKafkaPythonClient.py
localhost:9092
topicTestKafkaPythonClient_SSL
```

### Sample Kafka Python Producer and Consumer

#### SASL

```
from kafka import KafkaProducer
from kafka import KafkaConsumer
import sys
import time

#Specify 'broker' and 'topic'
arguments. Example: 'python3
saslPlaintestKafkaPythonClient.py
localhost:9092
topicTestKafkaPythonClient_SASL'
server = sys.argv[1]

print("Messages consumed: " +
str(numMsgConsumed))

```

## Configuring Apache Kafka Wire Protocol Service

Describes the Apache Kafka Wire Protocol Service configuration files and instructions.

The following sections provide configuration information for DAG (Data Access Gateway) and Apache Kafka clients and applications:

### Configuring Apache Kafka Wire Protocol Service

DAG packages include the following configuration files for Apache Kafka Wire Protocol Service:

#### `kafka-server.conf`

- This file is stored in `/opt/mapr/data-access-gateway/conf` and loaded from the local file system.
- This file contains node-specific options, such as the port number and security protocol. Set the options in this file on a per-node basis.
- By default, the Apache Kafka Wire Protocol Service listens on port 9092.
- If the DAG service instances are behind a firewall, the firewall rules must be configured to allow this traffic.

For a list of configurable parameters, see [Apache Kafka Wire Protocol Service Settings](#) on page 3511.

### Configuring Apache Kafka Clients and Applications

Standard Apache Kafka client configurations are supported. For additional information on configuration, see [the official Apache Kafka documentation](#).

#### Apache Kafka Wire Protocol Service Settings

Lists and describes parameters that you can configure in `kafka-server.conf`.

You can configure the following parameters in `/opt/mapr/data-access-gateway/conf/kafka-server.conf`:

Parameter	Description
kafka.server.rpc.port	TCP port that Apache Kafka Wire Protocol Service listens to for incoming client requests. Default is 9092.
kafka.server.rpc.security-protocol	Configures authentication and encryption schemes. Supports PLAINTEXT or SASL_PLAINTEXT as the value. To enable authentication, set to SASL_PLAINTEXT. Note that DAG 5.0 does not support encryption.
kafka.server.rpc.sasl-mechanism	Configures the list of SASL authentication mechanisms. This parameter is only effective when <code>kafka.server.rpc.security-protocol</code> is set to SASL_PLAINTEXT. In DAG 5.0, only PLAIN is supported.

## Securing Apache Kafka Wire Protocol Service

Describes the security mechanisms that Apache Kafka Wire Protocol Service does and does not support.

### Authentication

Starting from Data Access Gateway 5.1, Apache Kafka Wire Protocol Service supports SASL/PLAIN and SSL authentication between clients and file servers.

### Authorization

Kafka Wire Protocol Service does not support [ACLs](#). The topic owner has all permissions.

### On-Wire Encryption

Starting from Data Access Gateway 5.1, on-wire encryption for Apache Kafka Wire Protocol Service is supported using SSL. See [Enabling SSL for Apache Kafka Wire Protocol Service](#) on page 3512.

## Enabling SSL for Apache Kafka Wire Protocol Service

Describes the security protocol values that are needed to enable SSL for Apache Kafka Wire Protocol Service.

Data Access Gateway 5.1 and later added SSL support for the Apache Kafka Wire Protocol Service. This section provides examples for configuring `/opt/mapr/data-access-gateway/conf/kafka-server.conf` to enable SASL\_SSL and SSL security in server-side and client-side configurations.

### New Security Protocol Values

Release 7.2.0 and later support two new values for the `security-protocol` parameter of `kafka-server.conf`:

- SASL\_SSL
- SSL

When you specify the `SASL_SSL` value, you must also specify the corresponding `sasl-mechanism` value as indicated in the following table:

Specifying <code>security-protocol</code> as ...	With <code>sasl-mechanism</code> as ...	Enables
SASL_SSL	PLAIN <sup>1</sup>	Username/password-based (PAM) client authentication with SSL encryption and one-way SSL server authentication.
SSL	(Unspecified)	SSL authentication (two-way mutual SSL authentication) and SSL encryption.

<sup>1</sup>PLAIN is the only mechanism currently supported.

### SASL\_SSL Server-Side Configuration Example

Here is a typical SASL\_SSL server-side configuration example:

```
kafka.server = {
  rpc = {
    # TCP port for the Kafka Wire protocol service. Default is 9092
    port = 9092

    # Configures authentication and encryption schemes
    # Supported values are PLAINTEXT|SASL_PLAINTEXT|SASL_SSL|SSL
    # To enable authentication, set to SASL_PLAINTEXT, SASL_SSL or SSL
    # Encryption is supported for SASL_SSL and SSL
    security-protocol = SASL_SSL

    # Configures list of SASL authentication mechanisms
    # The only supported mechanism in this release is PLAIN
    # Effective only if "security-protocol" is set to SASL_PLAINTEXT or
    SASL_SSL
    sasl-mechanism = PLAIN
  }
}
```

### SASL\_SSL Client-Side Configuration

You can configure the SASL\_SSL client-side configuration the same way it is configured in Apache Kafka. In this configuration, /opt/mapr/conf/ssl\_truststore performs the one-way SSL server authentication. For example:

```
security.protocol=SASL_SSL
ssl.truststore.location=/opt/mapr/conf/ssl_truststore
ssl.truststore.password=<some_password>
ssl.enabled.protocols=TLSv1.2,TLSv1.1,TLSv1
sasl.mechanism=PLAIN
sasl.jaas.config=org.apache.kafka.common.security.plain.PlainLoginModule
required username="user1" password="user1";
```

### SSL Server-Side Configuration

To make the SSL protocol work correctly in a server-side configuration, the cluster administrator MUST specify the `rpc.ssl.principal-mapping-rules` in the server config file. For example:

```
kafka.server = {
  rpc = {
    # TCP port for the Kafka Wire protocol service. Default is 9092
    port = 9092

    # Configures authentication and encryption schemes
    # Supported values are PLAINTEXT|SASL_PLAINTEXT|SASL_SSL|SSL
    # To enable authentication, set to SASL_PLAINTEXT, SASL_SSL or SSL
    # Encryption is supported for SASL_SSL and SSL
    security-protocol = SSL

    ssl.principal-mapping-rules = [
      "RULE:^CN=.*O=(.*) ,.*$/$1/L," ,
      "DEFAULT"
    ]
  }
}
```

```
}
}
```

The `ssl.principal-mapping-rules` parameter specifies a list of mapping rules. For information about how to configure the mapping rules, see [Customizing the SSL User Name](#) in the Kafka documentation.

### SSL Client-Side Configuration

You can configure the client-side configuration the same way it is configured in Apache Kafka. In this configuration, the `/opt/mapr/conf/ssl_truststore` performs the SSL server authentication. To perform client authentication by the server, you must add the CA of the client certificate to the `/opt/mapr/conf/ssl_truststore`. Both the server and the client use this trust store file.

```
security.protocol=SSL
ssl.truststore.location=/opt/mapr/conf/ssl_truststore
ssl.truststore.password=<some_password>
ssl.keystore.location=/<client_cert_path>/example_ssl_client_keystore
ssl.keystore.password=<some_password>
ssl.key.password=<some_password>
ssl.enabled.protocols=TLSv1.2,TLSv1.1,TLSv1
```

## Supported Apache Kafka RPCs

Lists the Apache Kafka RPCs that Apache Kafka Wire Protocol Service supports and provides links to the correlating API request documentation in the Kafka Protocol Guide.

## HPE Ezmeral Data Fabric Streams and Apps

---

HPE Ezmeral Data Fabric Streams brings integrated publish and subscribe messaging to HPE Ezmeral Data Fabric.

HPE Ezmeral Data Fabric Streams is built into the HPE Ezmeral Data Fabric. It requires no additional process to manage, leverages the same architecture as the rest of the platform, and requires minimal additional management.

1. [The Getting Started with HPE Ezmeral Data Fabric Streams section](#) provides overall instructions for setting up, producing, and consuming streams.
2. [The HPE Ezmeral Data Fabric Streams section](#) provides conceptual information.
3. [The Administering Streams section](#) provides information about creating and managing streams, topics, and stream replication.

**ATTENTION:** As of core version 6.1, the HPE Ezmeral Data Fabric Streams API enforces a maximum of 4096 partitions for a topic. If you create an application with the HPE Ezmeral Data Fabric Streams 6.1 API, the maximum number of partitions is 4096. If you previously created an application with HPE Ezmeral Data Fabric Streams 6.0.1 API (or older) and you have upgraded, the original number of partitions can be used. For example, if you were using more than 4096 partitions in core version 6.0.1 or earlier, you can continue with the same number of partitions after upgrading.

## Getting Started with HPE Ezmeral Data Fabric Streams

If you have a basic understanding of HPE Ezmeral Data Fabric Streams components and the typical flow of messages from producers to consumers, you can get started.

### Prerequisites

- Ensure that your Linux, Windows, or OS X system has Java SDK 7 or later installed.
- Install the latest version of HPE Ezmeral Data Fabric on a cluster.
- Install the core client (mapr-client) package, if you want to run the producer and consumer from a machine outside the cluster. See [Installing the Data Fabric Client \(Non-FIPS\)](#) on page 396 for more information.

### Procedure

1. On a node in the HPE Ezmeral Data Fabric cluster, follow these steps:

- a) Create a stream.

- Run this command if you plan to run the producer and consumer with the same user ID that you are using to create the stream:

```
maprcli stream create -path /<path to and name of the stream>
```

- Run this command if you plan to run the producer and consumer with user IDs that are different from the user ID that you are using to create the stream:

```
maprcli stream create -path /<path to and name of the stream> -consumeperm u:<user ID> -produceperm u:<user ID>
```

The two additional parameters grant security permissions. By default, these permissions are granted to the user ID that ran the `maprcli stream create` command.

<b>-consumeperm</b>	Grants permission to read messages from topics that are in the stream.
<b>-produceperm</b>	Grants permission to publish messages to topics that are in the stream.

- b) Create a topic.

Run this command to create the topic:

```
maprcli stream topic create -path <path and name of the stream> -topic <name of the topic>
```

2. On the system where the mapr-client is installed, compile and launch the Java consumer first and then launch the Java producer.

In both the consumer and producer, change this text to the path and name of your stream and to the name of the first of the topics:

```
/<path to and name of the stream>:<name of topic>
```

For the steps of compiling and launching, see [Compiling and Running HPE Ezmeral Data Fabric Streams Java Apps](#) on page 3574.

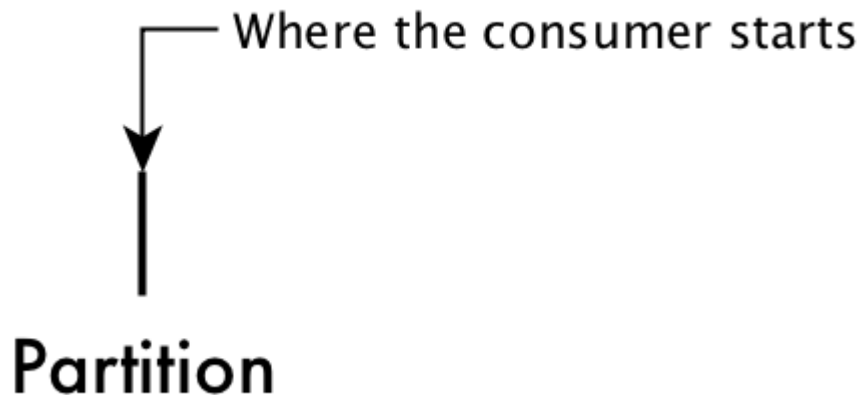

Launch the consumer first, and then launch the producer. If you launch the producer first and then the consumer, the producer publishes 50 messages, but the consumer (as consumers do by default) starts reading from the head of the partition, which is after the 50 messages.

**NOTE:** As of MapR 6.0, the message offset in a partition starts from zero (0). If you are upgrading and do not enable the HPE Ezmeral Data Fabric Database/HPE Ezmeral Data Fabric Streams feature, `mfs.feature.db.streams.v6.support`, the message offset in a partition starts from one (1).

**Figure 32: Result of starting the producer before starting the consumer for this step**

If you launch the consumer first, the partition is empty and the consumer continuously polls for new messages.

**Figure 33: The position of a consumer on an empty partition**

After you launch the producer, the fifty messages are published to the partition, and the consumer can move forward in the partition, reading the messages.

**Figure 34: Result of starting the consumer first and then starting the producer for this step**

**Sample Java Consumer**

You need to first add the following dependency to the POM file:

```
<dependency>
  <groupId>commons-logging</groupId>
  <artifactId>commons-logging</artifactId>
  <version>1.1.1</version>
</dependency>
```

```
/* This code is successfully tested for common-logging version 1.11 and
1.2. */

import org.apache.kafka.clients.consumer.ConsumerConfig;
import org.apache.kafka.clients.consumer.ConsumerRecords;
import org.apache.kafka.clients.consumer.KafkaConsumer;

import java.time.Duration;
import java.util.Collections;
import java.util.Properties;

public class SampleConsumer {
    // Set the stream and topic to read from
    public static String topic = "/<path to and name of the stream>:<name
of topic>";

    // Declare a new consumer.
    public static KafkaConsumer<Integer, String> consumer;

    public static void main(String[] args) {
        configureConsumer();

        // Subscribe to the topic.
        consumer.subscribe(Collections.singletonList(topic));

        // Set the timeout interval for requests for unread messages.
        Duration pollTimeout = Duration.ofMillis(1000);

        try {
            while (true) {
                ConsumerRecords<Integer, String> records =
consumer.poll(pollTimeout);
                records.forEach(record -> {
                    System.out.printf("%s %d %d %s %s \n", record.topic(),
record.partition(), record.offset(),
record.key(), record.value());
                });
            } finally {
                consumer.close();
            }
        }

        /* Set the value for a configuration parameter.
This configuration parameter specifies which
class to use to deserialize the value of each message. */
        public static void configureConsumer() {
            Properties props = new Properties();
            props.put(ConsumerConfig.GROUP_ID_CONFIG, "consumer-group");
            props.put(ConsumerConfig.AUTO_OFFSET_RESET_CONFIG, "earliest");
            props.put(ConsumerConfig.KEY_DESERIALIZER_CLASS_CONFIG,

"org.apache.kafka.common.serialization.IntegerDeserializer");
            props.put(ConsumerConfig.VALUE_DESERIALIZER_CLASS_CONFIG,
```

```

        "org.apache.kafka.common.serialization.StringDeserializer");
        consumer = new KafkaConsumer(props);
    }
}

```

### Sample Java Producer

```

import org.apache.kafka.clients.producer.KafkaProducer;
import org.apache.kafka.clients.producer.ProducerConfig;
import org.apache.kafka.clients.producer.ProducerRecord;

import java.util.Properties;

public class SampleProducer {
    // Set the stream and topic to publish to.
    public static String topic = "<path to and name of the stream>:<name
of topic>";
    // Set the number of messages to send.
    public static int numMessages = 50;

    // Declare a new producer.
    public static KafkaProducer<Integer, String> producer;

    public static void main(String[] args) {
        configureProducer();

        for(int i = 0; i < numMessages; i++) {
            // Set content of each message.
            String messageText = "Msg " + i;

            /* Add each message to a record. A ProducerRecord object
            identifies the topic or specific partition to publish
            a message to. */
            ProducerRecord<Integer, String> rec = new ProducerRecord(topic,
i, messageText);

            // Send the record to the producer client library.
            producer.send(rec);
            System.out.println("Sent message number " + i);
        }
        producer.close();
        System.out.println("All done.");
    }

    /* Set the value for a configuration parameter.
    This configuration parameter specifies which class
    to use to serialize the value of each message. */
    public static void configureProducer() {
        Properties props = new Properties();
        props.put(ProducerConfig.KEY_SERIALIZER_CLASS_CONFIG,
"org.apache.kafka.common.serialization.IntegerSerializer");
        props.put(ProducerConfig.VALUE_SERIALIZER_CLASS_CONFIG,
"org.apache.kafka.common.serialization.StringSerializer");
        producer = new KafkaProducer(props);
    }
}

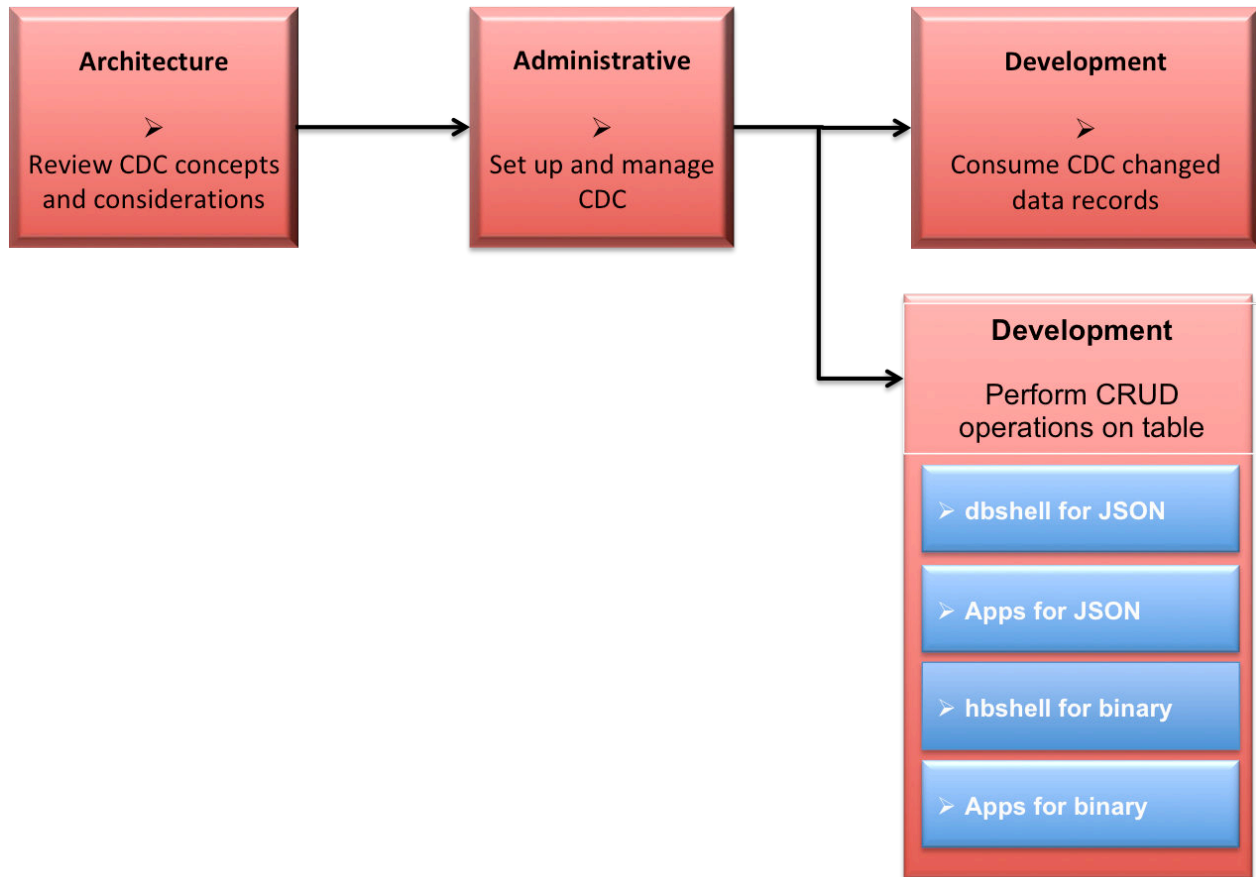

```

For additional information, see <https://github.com/mapr-demos/mapr-streams-sample-programs>.

### Consuming CDC Records

The OJAI changelog interfaces are used to consume changed data records (propagated by the Change Data Capture feature).

The general CDC flow of understanding architectural concepts, performing administrative tasks to set up and use CDC, performing CRUD operations on a database table, and developing applications for consuming CDC changed data records. This diagram provides hotspot links to help you navigate to the applicable documentation.

1. [Learning about CDC](#)
2. [Administering Change Data Capture](#)
3. [Building a consumer app for CDC](#)
4. [Using dbshell to perform CRUD operations on HPE Ezmeral Data Fabric Database JSON tables](#)
5. [Developing client applications for HPE Ezmeral Data Fabric Database JSON tables.](#)
6. [Using hbshell to perform CRUD operations on HPE Ezmeral Data Fabric Database binary tables.](#)
7. [Developing client applications for HPE Ezmeral Data Fabric Database binary tables.](#)

### Javadoc

See the following Java documentation for detailed information about CDC APIs.

[QueryResult](#)

### Deserializer for consuming CDC records

The deserializer converts stream messages into individual change data records. When your application creates a CDC consumer, you must also register the

ChangeData deserializer by setting the `value.deserializer` configuration parameter to `com.mapr.db.cdc.ChangeDataRecordDeserializer`.

**NOTE:** When applications consume from a CDC change topic, the record key retrieved from `poll()` is not deserialized. The record key is not equal to the `_id` field of the document. If you want to retrieve the exact `_id` of the document, you must call the `ChangeDataRecord.getId()` method.

## Interfaces for working with CDC records

The following OJAI interfaces and enumerations create consumers for CDC changed data.

### ChangeNode

Contains the change to a single field in a document.

### ChangeEvent

Identifies the change event associated with the current change node. The value of `ChangeEvent` can be one of the following:

- NULL (no event)
- NODE (a change with real value)
- START\_MAP (a node representing the beginning of a map)
- END\_MAP (a node representing the end of a map)
- START\_ARRAY (a node representing the beginning of an array)
- END\_ARRAY (a node representing the end of an array)

### ChangeOp

Identifies the type of the operation performed on the current field. The values of `ChangeOp` can be one of the following:

- NULL (no operation)
- SET (replace the current field with the given value)
- PUT (add an extra version of the value)
- MERGE (combine the given value with the existing values in the table)
- DELETE (delete all values older than or equal to the delete operation timestamp)
- DELETE\_EXACT (delete the version of the value with the given timestamp)

### ChangeDataRecord

Contains all the changes made on a single document/row in the source table.

### ChangeDataRecordType

Specifies the mode of change for the change data record. The following values are specified:

- RECORD\_INSERT
- RECORD\_UPDATE
- RECORD\_DELETE

### ChangeDataReader

Is a parser that traverses over the individual change tree nodes on a change data record. It provides

cursor-like semantics that can be moved, one tree node at a time, by invoking the `next` method. The APIs retrieve the properties of individual change nodes (for example: data type, field name, field value, and so on).

## Open Data Format

The CDC Open Format feature allows you to create applications in languages other than Java that consume CDC (Change Data Capture) changed data records. For example, C/C++, Python, and C#.NET) are supported.

This functionality is provided with an open format decoder/serializer in the HPE Ezmeral Data Fabric Streams C library. The decoder translates the internal format to the open data format, decodes/deserializes the data, and returns the value of the changed data record as a human readable JSON string.

All languages that are binding through the HPE Ezmeral Data Fabric Streams C library can retrieve the open data format and, with a simple JSON parser, consume changed data records.

## Building Consumers for CDC

HPE Ezmeral Data Fabric Streams consumers read and process CDC changed data records. The consumer is built with the OJAI API library.

## Description

When building a consumer, the general steps are to:

- Set the consumer properties using Apache Kafka and HPE Ezmeral Data Fabric configuration parameters.
- Subscribe to the stream topic.
- Consume the events and determine record type.
- Process the change data records.

The following examples refer to the [MapR CDC Sample](#). See the [QueryResult](#) for specific API information.

## Set Configuration

This code snippet configures the consumer properties using the Apache Kafka configuration parameters. See [HPE Ezmeral Data Fabric Streams Configuration Parameters](#) for Consumers. This could be externalized in a file or hard coded in the application code. The following code examples show both methods.

**NOTE:** CDC uses a optimized serialization format for all the events, so `value.deserializer` must be set to **`com.mapr.db.cdc.ChangeDataRecordDeserializer`**.

```
// Consumer configuration parameters specified in application

Properties consumerProperties = new Properties();
consumerProperties.setProperty("group.id",
"cdc.consumer.demo_table.fts_geo");
consumerProperties.setProperty("enable.auto.commit", "true");
consumerProperties.setProperty("auto.offset.reset", "latest");
consumerProperties.setProperty("key.deserializer",
"org.apache.kafka.common.serialization.ByteArrayDeserializer");
consumerProperties.setProperty("value.deserializer",
```

```
"com.mapr.db.cdc.ChangeDataRecordDeserializer");
```

```
// Consumer configuration parameters specified in an external file
```

```
key.deserializer=org.apache.kafka.common.serialization.ByteArrayDeserializer
value.deserializer=com.mapr.db.cdc.ChangeDataRecordDeserializer
enable.auto.commit=true
auto.offset.reset=latest
group.id=cdc.consumer.demo_table.fts_geo
```

### Subscribe to topic

This code snippet creates the consumer and subscribes to the HPE Ezmeral Data Fabric Streams topic that contains the change data records. The consumer is created using a key (bytes[]) and a ChangeDataRecord object for the value.

```
// Consumer used to consume MapR-DB CDC events
```

```
KafkaConsumer<byte[], ChangeDataRecord> consumer = new
KafkaConsumer<byte[], ChangeDataRecord>(consumerProperties);
consumer.subscribe(Arrays.asList("/demo_changelog:demo_table"));
```

### Consume the events and determine record type

This code snippet polls the topic to determine whether there are any changes and, if so, iterates through the change data records to retrieve the change data record IDs based on the change data record type. The ChangeDataRecordType interface is used to determine the type of record and the ChangeDataRecord interface is used to retrieve the record type and record ID.

```
while (true) {
    ConsumerRecords<byte[], ChangeDataRecord> changeRecords =
consumer.poll(500);
    Iterator<ConsumerRecord<byte[], ChangeDataRecord>> iter =
changeRecords.iterator();

    while (iter.hasNext()) {
        ConsumerRecord<byte[], ChangeDataRecord> crec = iter.next();
        // The ChangeDataRecord contains all the changes made to a document
        ChangeDataRecord changeDataRecord = crec.value();
        String documentId = changeDataRecord.getId().getString();

        if (changeDataRecord.getType() ==
ChangeDataRecordType.RECORD_INSERT) {
            System.out.println("\n\t Document Inserted " + documentId);
            insertAndUpdateDocument(changeDataRecord, producer);
        } else if (changeDataRecord.getType() ==
ChangeDataRecordType.RECORD_UPDATE) {
            System.out.println("\n\t Document Updated " + documentId);
            insertAndUpdateDocument(changeDataRecord, producer);
        } else if (changeDataRecord.getType() ==
ChangeDataRecordType.RECORD_DELETE) {
            System.out.println("\n\t Document Deleted " + documentId);
            deleteDocument(changeDataRecord, producer);
        }
    }
}
```

```
}
```

### Process the records

This code snippet processes the change data records and based on the type of event (insert, update, delete), using the `ChangeDataRecordType` class and the `changeDataRecord.getType()` method, checks and retrieves the record type.

```
// Use the ChangeNode Iterator to capture all the individual changes

Iterator<KeyValue<FieldPath, ChangeNode>> cdrItr =
changeDataRecord.iterator();

while (cdrItr.hasNext()) {
    Map.Entry<FieldPath, ChangeNode> changeNodeEntry = cdrItr.next();
    String fieldPathAsString = changeNodeEntry.getKey().asPathString();
    ChangeNode changeNode = changeNodeEntry.getValue();
    ...
    ...
}
```

To process and retrieve an inserted new document, you can check to see if the field path is NULL or empty. When *a new document is inserted*, all the changes are made in a single object represented as a Map. You then retrieve the map value by using the `changeNode.getMap()` or `changeNode.getString()` methods depending on the field value.

```
if (fieldPathAsString == null || fieldPathAsString.equals("")) { // Insert
    Map<String, Object> documentInserted = changeNode.getMap();

    if (documentInserted.containsKey("firstName")) {
        fieldToIndex.put("firstName", (String)
documentInserted.get("firstName"));
        sendIndexingMessage = true;
    }

    if (documentInserted.containsKey("lastName")) {
        fieldToIndex.put("lastName", (String)
documentInserted.get("lastName"));
        sendIndexingMessage = true;
    }

    if (documentInserted.containsKey("address")) {
        addressMessage.set("address",
jsonMapper.convertValue((Map)documentInserted.get("address"),
JsonNode.class));
        sendAddressMessage = true;
    }
}
```

To process and retrieve updated documents, you can check the field path and retrieve the value depending on the expected value type. When *a document is updated*, the iterator contains one `ChangeNode` by updated field. You can then access the field path and value directly. You then retrieve the map value by using the `changeNode.getMap()` or `changeNode.getString()` methods depending on the field value.

```
if (fieldPathAsString.equalsIgnoreCase("firstName")) {
    fieldToIndex.put("firstName", changeNode.getString());
    sendIndexingMessage = true;
}
```

```

    }
    else if (fieldPathAsString.equalsIgnoreCase("lastName")) {
        fieldToIndex.put("lastName", changeNode.getString());
        sendIndexingMessage = true;
    }
    else if (fieldPathAsString.equalsIgnoreCase("address")) {
        addressMessage.set("address",
            jsonMapper.convertValue( changeNode.getMap(), JsonNode.class) );
        sendAddressMessage = true;
    }
}

```

To process delete operations, you can directly retrieve the document ID using the `changeDataRecord.getId()` method and process the document deletion with the `deleteDocument` method. The delete operation is a single change data record.

### Consumer Application for CDC JSON Data

This example consumes changed data records from HPE Ezmeral Data Fabric Database JSON tables.

#### Example of Consuming JSON Changed Data Records

In this example, the following occurs:

- Initialize the consumer properties using Apache Kafka and MapR configuration parameters.
- Display the change data record properties.
- Iterate through the change nodes, determine the type of operation, and retrieve the operation value.
- Retrieve the properties of individual change node (for example: data type, field name, field value, and so on) by using various methods of the `ChangeDataReader` interface.
- Display the change data record values by using the `ChangeNode` interface.
- Subscribe to the stream topic, consume the events, and determine record type.

For changed data records from HPE Ezmeral Data Fabric Database JSON table data, the following are unique:

- There are multiple property values that can be retrieved through the `ChangeDataReader` interface. For example, `getDouble` or `getFloat`.
- There are multiple values for single fields in documents that can be retrieved through `ChangeNode` interface. See the code line: `Value value = changeNode.getValue();`

```

### Consumer Application for CDC Binary Data

This example consumes changed data records from HPE Ezmeral Data Fabric Database Binary tables.

### Example of Consuming Binary Changed Data Records

In this example, the following occurs:

- Initialize the consumer properties using Apache Kafka and HPE Ezmeral Data Fabric configuration parameters.
- Display the change data record properties.
- Iterate through the change nodes, determine the type of operation, and retrieve the operation value.
- Display the change data record values by using the `ChangeNode` interface.
- Subscribe to the stream topic, consume the events, and determine record type.

For changed data records from HPE Ezmeral Data Fabric Database Binary table data, the following are unique:

- An additional package must be imported: `java.nio.ByteBuffer`

- There is single value for single fields in documents that can be retrieved through ChangeNode interface. See the code line: `ByteBuffer value = changeNode.getBinary();`

```

package com.mapr.qa.cdc.tests.binary;

import org.apache.kafka.clients.consumer.ConsumerRecord;
import org.apache.kafka.clients.consumer.ConsumerRecords;
import org.apache.kafka.clients.consumer.KafkaConsumer;
import org.ojai.*;
import org.ojai.store.Connection;
import org.ojai.store.Driver;
import org.ojai.store.DriverManager;
import org.ojai.store.cdc.*;

import java.nio.ByteBuffer;
import java.util.*;

        List<String> topicList = new ArrayList<String>();
        topicList.add(topics);
        consumer.subscribe(topicList);
        consumer.seekToBeginning();

        // Get consumer records
        ConsumerRecords<String, ChangeDataRecord> consumerRecords =
consumer.poll(pollTimeout);

        // iterate over consumer records
        for (ConsumerRecord<String, ChangeDataRecord> consumerRecord :
consumerRecords) {

            String consumerRecordkey = consumerRecord.key().trim();
            ChangeDataRecord changeDataRecord = consumerRecord.value();

            // record key for the change
            Value id = changeDataRecord.getId();

            // record level op can be either RECORD_INSERT, RECORD_UPDATE,
RECORD_DELETE
            ChangeDataRecordType changeDataRecordType =
changeDataRecord.getType();

            // record level op-time & server op-time
            Long recordOpTime = changeDataRecord.getOpTimestamp();
            Long recordServerOpTime = changeDataRecord.getServerTimestamp();

            if (method) {
                // Method 1 - via iterator interface
                iteratorDisplay(id, changeDataRecordType,
                    recordOpTime, recordServerOpTime,
                    consumerRecordkey, changeDataRecord);
            } else {
                // Method 2 - via reader interface
                readerDisplay(id, changeDataRecordType,
                    recordOpTime, recordServerOpTime,
                    consumerRecordkey, changeDataRecord);
            }
        }
        consumer.close();
    }

    /**
     * Driver
     *
     * @param args
     */
    public static void main(String[] args) {
        Long pollTimeout = Long.parseLong(args[0]);
        String topic = args[1];
        boolean method = Boolean.parseBoolean(args[2]);
        CDCBinaryExample cdcBinaryExample = new CDCBinaryExample();
        cdcBinaryExample.consume(pollTimeout, topic, method);
    }

```

```
}
}
```

### Open Format

Describes the CDC open format.

### Open Format Mapping

The following shows the mapping between the HPE Ezmeral Data Fabric CDC data types and the JSON open format data types.

```
{
  "map": {
    "null": null,
    "boolean": true,
    "string": "eureka",
    "byte": {"$numberByte": 127},
    "short": {"$numberShort": 32767},
    "int": {"$numberInt": 2147483647},
    "long": {"$numberLong": 9223372036854775807},
    "float": {"$numberFloat": 3.4028235E38},
    "double": 1.7976931348623157e308,
    "decimal": {"$decimal":
"12345678901234567890189012345678901.23456789"},
    "date": {"$dateDay": "yyyy-mm-dd"},
    "time": {"$time": "HH:mm:ss[.sss]"},
    "timestamp": {"$date": "yyyy-MM-ddTHH:mm:ss.SSSXXX"},
    "interval": {"$interval": number_of_millisecods},
    "binary": {"$binary": "base64_encoded_binary_value"},
    "array": [42, "open sesame", 3.14, {"$dateDay": "2015-01-21"}]
  }
}
```

### JSON Record Format

When the consumer retrieves the changed data record (by the key-value pair), the record is returned as a string in JSON format (a readable open format). The information about the mutation is returned as an array where each array element is one (1) change.

**NOTE:** If you use the default print, the string returns float values of up to six (6) digits of precision and double values of up to fifteen (15) digits. If the data exceeds this default and you want the exact number returned, use the CDC API that returns a float or double value.

The following example changed data record shows two (2) mutations.

```
{
  "_id": "row1"
  "$opType": "$RECORD_UPDATE",
  "$opTime": 1518654391801,

  "$mutations": [
    {"$fieldPath": "arrayB",
    "$fieldOp": "$SET",
    "$fieldValue": [{"$numberInt": 100}, false, "set a map"]}
    {"$fieldPath": "arrayC",
    "$fieldOp": "$SET",
    "$fieldValue": [{"$numberInt": 200}, false, "set a map"]}
  ]
}
```

```
    ]
}
```

### Example

The following sample code initialized consumer properties for open format and consumes the changelog data from the topic.

```
/*
 * Initialize Basic Consumer Properties for Open Format
 * @return
 */

private Properties getOpenFormatListenerProperties() {
    Properties props = new Properties();
    props.put(ConsumerConfig.KEY_DESERIALIZER_CLASS_CONFIG,
"org.apache.kafka.common.serialization.StringDeserializer");
    props.put(ConsumerConfig.VALUE_DESERIALIZER_CLASS_CONFIG,
"org.apache.kafka.common.serialization.StringDeserializer");
    return props; }

/*
 * Consume from changelog topic
 */
public void startConsume(String topic) {
    KafkaConsumer<String, String> consumer = new KafkaConsumer<String,
String> (getOpenFormatListnerProperties());
    List<String> topicList = new ArrayList<>();
    topicList.add(topic);
    consumer.subscribe(topicList);

    ConsumerRecords<String, String> consumerRecords =
consumer.poll(pollTimeout);
    Iterator<ConsumerRecord<String, String>> iterator =
consumerRecords.iterator();
    while (iterator.hasNext())
        { ConsumerRecord<String, String> record = iterator.next(); String
cdcResult = record.value(); }
}
```

## Consuming Audit Logs

Audit Streaming (available from v6.0.1) provides a way to process the audit data in real-time.

When audit streaming is enabled, the HPE Ezmeral Data Fabric generates audit logs that are sent as an audit stream, opening the possibility of real-time processing of the audit data. See [Streaming Audit Logs](#) on page 844 for more information.

Use the sample consumer application, or build your custom consumer application, to consume the audit logs that are available as a stream topic, when audit streaming is enabled.

The sample application uses file system APIs to get the file path and name from the FID, and the volume name from the volume ID.

### Determine When to use Cached or Uncached Version of the File System API

Caching the file path and file name, along with the volume name at the initial API call, reduces the load on CLDB for subsequent API calls.

However, there could be cases when the uncached version of the application is more suitable for use. Consider the following example:

For the initial API call, File1 is returned as the file name for FID 1. The result is cached.

The file is then renamed to File2. For subsequent API calls, to get the file name for FID 1, the result from the cache is used. The cache, unaware of the rename operation, returns the name as File1, which is incorrect, as the file is already renamed to File2. For such a case, use the uncached version.

Evaluate your use case, and then use the cached, or the uncached version, as appropriate.

### Sample Cached Consumer Application for Audit Stream

The Consumer.java application demonstrates how to connect to the file system, and consume the messages in a stream topic.

### Sample Application

Before running this application, ensure that you have access to a cluster running file system. To build and run this application:

1. Set the classpath as shown below:

```
export CLASSPATH=`hadoop classpath`
```

2. Compile the Java file as shown below:

```
javac -cp .:`mapr classpath` Consumer.java
```

3. Run the final Consumer.class file. For example:

```
java -cp .:`mapr classpath` Consumer
```

This application requires the following imports:

- org.apache.kafka.clients.consumer.ConsumerRecord
- org.apache.kafka.clients.consumer.ConsumerRecords
- org.apache.kafka.clients.consumer.KafkaConsumer
- org.apache.hadoop.conf.Configuration
- com.mapr.fs.MapRFileSystem
- com.google.common.io.Resources
- java.net.URI
- java.io.IOException
- java.io.InputStream
- java.util.Iterator
- java.util.Properties
- java.util.Random

- `java.util.StringTokenizer`
- `java.util.regex.Pattern`

The application performs the actions described in the following sections.

#### Initializes the consumer properties

The [configuration parameters](#) for the consumer are stored in `consumer.props` file. This file should be present in the current directory or `mapr` classpath. For example, your `consumer.props` file could look similar to the following:

```
#bootstrap.servers=localhost:9092
group.id=test
enable.auto.commit=true
key.deserializer=org.apache.kafka.common.serialization.StringDeserializer
value.deserializer=org.apache.kafka.common.serialization.StringDeserializer
# fast session timeout makes it more fun to play with failover
## apps specific ?
session.timeout.ms=10000

# These buffer sizes are needed to avoid consumer switching to
# a mode where it processes one bufferful every 5 seconds with
multiple
# timeouts along the way.
fetch.min.bytes=50000
# receive.buffer.bytes=262144 // fixed size buffer
max.partition.fetch.bytes=2097152

auto.offset.reset=earliest
```

The application initializes the consumer properties stored in the `consumer.props` file.

```
public static void main(String[] args) throws
IOException, InterruptedException {
    KafkaConsumer<String, String>
    consumer;
    try (InputStream props =
Resources.getResource("consumer.props")
).openStream()) {
        Properties properties = new
Properties();
        properties.load(props);
        if
(properties.getProperty("group.id")
== null) {
            properties.setProperty("group.id",
"group-" + new
Random().nextInt(100000));
        }
        consumer = new
KafkaConsumer<>(properties);
```

```
}
}
```

### Subscribes to the topic to read from

The application initializes the file system object, with the last parameter as `true` so that the audit logs generated by the operations for converting fid to file path and valid to volume name are sent to the `ExpandAudit.json.log` file used by the [expandaudit](#) on page 2874 utility and not to the stream. It then selects the stream and subscribes to the topic to read at path `/var/mapr/auditstream/auditlogstream:<clustername>`.

```
Configuration conf = new
Configuration();
String uri = MAPRFS_URI;
uri = uri + "mapr/";
conf.set("fs.default.name", uri);
MapRFileSystem fs = new
MapRFileSystem();
fs.initialize(URI.create(uri), conf,
true);
Pattern pattern
= Pattern.compile("/var/
mapr/auditstream/
auditlogstream:<clustername>.+");
consumer.subscribe(pattern);
```

### Requests unread messages from the topic

The application requests to read unread messages in the subscribed topic. It then iterates through the returned records, extracts the value of each message, and prints the value to the standard output.

```
boolean stop = false;
int pollTimeout = 1000;
while (!stop) {
    ConsumerRecords<String,
String> consumerRecords =
consumer.poll(pollTimeout);
    Iterator<ConsumerRecord<String,
String>> iterator =
consumerRecords.iterator();
    if (iterator.hasNext()) {
        while (iterator.hasNext()) {
            ConsumerRecord<String,
String> record = iterator.next();
            String value = record.value();
            String rvalue =
value.replace("\\", "");
            String recordValue
= processRecord(fs, rvalue,
value);
            System.out.println(("
Consumed Record: " + recordValue));
        }
    } else {
        Thread.sleep(1000);
        //stop = true;
    }
}
```

**Gets the record and expands individual fields**

The application then takes the record and expands fid in the message to path to file using the `getMountPathFidCached()` API and `volid` in the message to volume name using the `getVolumeNameCached()` API.

```

while (st.hasMoreTokens()) {
    String field = st.nextToken();
    StringTokenizer st1 = new
StringTokenizer(field, ":");
    while (st1.hasMoreTokens()) {
        String token =
st1.nextToken();
        if (token.endsWith("Fid")) {
            String lfidStr =
st1.nextToken();
            String path= null;
            try {
                path =
fs.getMountPathFidCached(lfidStr); //
Expand FID to path
            } catch (IOException e){
            }
            lfidPath =
"\FidPath\":" + path + "\", ";
            // System.out.println("\nPath
for fid " + lfidStr + " is " + path);
        }
        if (token.endsWith("volumeId")) {
            String volid =
st1.nextToken();
            String name= null;
            try {
                int volumeId =
Integer.parseInt(volid);
                name =
fs.getVolumeNameCached(volumeId); //
Cached API to convert volume Id to
volume Name
            } catch (IOException e){
            }
            lvolName =
"\VolumeName\":" + name + "\", ";
            //
System.out.println("\nVolume Name for
volid " + volid + " is " + name);
        }
    }
}

```

**Returns the record**

The application finally returns the record after expanding the fid and volid to file path and volume name respectively.

```

String result = "";
StringTokenizer st2 = new
StringTokenizer(value, ",");
while (st2.hasMoreTokens()) {
    String tokens = st2.nextToken();
    result = result + tokens + ", ";
    if (tokens.contains("Fid")) {
        result = result + lfidPath;
    }
}

```

```

        if (tokens.contains("volumeId"))
        {
            result = result + lvolName;
        }
    }
    return result.substring(0,
        result.length() - 1);

```

## Consumer.java

```

import org.apache.kafka.clients.consumer.ConsumerRecord;
import org.apache.kafka.clients.consumer.ConsumerRecords;
import org.apache.kafka.clients.consumer.KafkaConsumer;
import org.apache.hadoop.conf.Configuration;
import com.mapr.fs.MapRFileSystem;
import com.google.common.io.Resources;
import java.net.URI;

**Sample Uncached Consumer Application for Audit Stream**

The ConsumerUncached.java application demonstrates how to connect to the HPE Ezmeral Data Fabric file system, and consume the messages in a stream topic.

**Sample Application**

Before running this application, ensure that you have access to a cluster running file system. To build and run this application:

1. Set the classpath as shown below:

```
export CLASSPATH=`hadoop classpath`
```

2. Compile the Java file as shown below:

```
javac -cp `mapr classpath` ConsumerUncached.java
```

### 3. Run the final `ConsumerUncached.class` file. For example:

```
java -cp .:\mapr classpath\ ConsumerUncached
```

This application requires the following:

- `org.apache.kafka.clients.consumer.ConsumerRecord`
- `org.apache.kafka.clients.consumer.ConsumerRecords`
- `org.apache.kafka.clients.consumer.KafkaConsumer`
- `org.apache.hadoop.conf.Configuration`
- `com.mapr.fs.MapRFileSystem`
- `com.google.common.io.Resources`
- `java.net.URI`
- `java.io.IOException`
- `java.io.InputStream`
- `java.util.Iterator`
- `java.util.Properties`
- `java.util.Random`
- `java.util.StringTokenizer`
- `java.util.regex.Pattern`

The application performs the actions described in the following sections.

#### Initializes the consumer properties

The [configuration parameters](#) for the consumer are stored in `consumer.props` file. This file should be present in the current directory or `mapr classpath`. For example, your `consumer.props` file could look similar to the following:

```
#bootstrap.servers=localhost:9092
group.id=test
enable.auto.commit=true
key.deserializer=org.apache.kafka.common.serialization.StringDeserializer
value.deserializer=org.apache.kafka.common.serialization.StringDeserializer

# fast session timeout makes it more fun to play with failover
## apps specific ?
session.timeout.ms=10000

# These buffer sizes are needed to avoid consumer switching to
# a mode where it processes one bufferful every 5 seconds with
multiple
```

```
# timeouts along the way.
fetch.min.bytes=50000
# receive.buffer.bytes=262144 //
fixed size buffer
max.partition.fetch.bytes=2097152

auto.offset.reset=earliest
```

The application initializes the consumer properties stored in the `consumer.props` file.

```
public static void main(String[]
args) throws
IOException, InterruptedException {
    KafkaConsumer<String, String>
consumer;
    try (InputStream props =
Resources.getResource("consumer.props"
).openStream()) {
        Properties properties = new
Properties();
        properties.load(props);
        if
(properties.getProperty("group.id")
== null) {

properties.setProperty("group.id",
"group-" + new
Random().nextInt(100000));
        }
        consumer = new
KafkaConsumer<>(properties);
    }
}
```

### Subscribes to the topic to read from

The application initializes the filesystem object, with the last parameter as `true` so that the audit logs generated by the operations for converting fid to file path and valid to volume name are sent to the `ExpandAudit.json.log` file used by the [expandaudit](#) on page 2874 utility and not to the stream. It then selects the stream and subscribes to the topic to read at path `/var/mapr/auditstream/auditlogstream:<clustername>`.

```
Configuration conf = new
Configuration();
String uri = MAPRFS_URI;
uri = uri + "mapr/";
conf.set("fs.default.name", uri);
MapRFileSystem fs = new
MapRFileSystem();
fs.initialize(URI.create(uri), conf,
true);

Pattern pattern =
Pattern.compile("/var/mapr/
auditstream/
auditlogstream:<clustername>.+");
consumer.subscribe(pattern);
```

**Requests unread messages from the topic**

The application requests to read unread messages in the subscribed topic. It then iterates through the returned records, extracts the value of each message, and prints the value to the standard output.

```
boolean stop = false;
int pollTimeout = 1000;
while (!stop) {
    ConsumerRecords<String,
String> consumerRecords =
consumer.poll(pollTimeout);
    Iterator<ConsumerRecord<String,
String>> iterator =
consumerRecords.iterator();
    if (iterator.hasNext()) {
        while (iterator.hasNext()) {
            ConsumerRecord<String,
String> record = iterator.next();
            String value =
record.value();
            String rvalue =
value.replace("\\", "");
            String recordValue =
processRecord(fs, rvalue, value);
            System.out.println(("
Consumed Record: " + recordValue));
        }
    } else {
        //stop = true;
    }
}
```

**Gets the record and expands individual fields**

The application then takes the record and expands fid in the message to path to file using the `getMountPathFid()` API and `valid` in the message to volume name using the `getVolumeName()` API.

```
public static String
processRecord(MapRFileSystem fs,
String rvalue, String value)
{
    StringTokenizer st = new
StringTokenizer(rvalue, ",");
    String lfidPath = "";
    String lvolName = "";

    while (st.hasMoreTokens()) {
        String field =
st.nextToken();
        StringTokenizer st1 = new
StringTokenizer(field, ":");
        while (st1.hasMoreTokens())
        {
            String token =
st1.nextToken();
            if
(token.endsWith("Fid")) {
                String lfidStr =
st1.nextToken();
                String path= null;
                try {
                    path =
```

```

fs.getMountPathFid(lfidStr);
        } catch (IOException e)
    { }
        lfidPath =
        "\"FidPath\\\":\\"+path+"\", ";
        if
        (token.endsWith("volumeId")) {
            String volid =
            st1.nextToken();
            String name= null;
            try {
                int volumeId =
                Integer.parseInt(volid);
                name =
                fs.getVolumeName(volumeId);
            }
            catch (IOException e){ }
            lvolName =
            "\"VolumeName\\\":\\"+name+"\", ";
        }
    }
}

```

### Returns the record

The application finally returns the record after expanding the fid and volid to file path and volume name respectively.

```

String result = "";
StringTokenizer st2 = new
StringTokenizer(value, ",");
while (st2.hasMoreTokens()) {
    String tokens = st2.nextToken();
    result = result + tokens + ",";
    if (tokens.contains("Fid")) {
        result = result + lfidPath;
    }
    if (tokens.contains("volumeId")) {
        result = result + lvolName;
    }
    return result.substring(0,
result.length() - 1);
}

```

### ConsumerUncached.java

**HPE Ezmeral Data Fabric Streams Java Applications**

This section contains information on developing client applications with Java including information about the HPE Ezmeral Data Fabric Streams and Apache Kafka Java APIs, configuration parameters, and compiling and running producers and consumers.

**Apache Kafka Support**

HPE Ezmeral Data Fabric supports the following Apache Kafka Java API versions:

Table

Core version	Apache Kafka API
7.8 and later	3.6.1
7.0 through 7.7	2.6.1
6.2 and later	2.1
6.1 and later	1.1
6.0.1 and later	1.0
6.0.0 and earlier	0.9.0

**Synchronous Consumer Partition Assignment**

As of HPE Ezmeral Data Fabric 7.8, synchronous consumer partition assignment is supported. For streams created with HPE Ezmeral Data Fabric 7.8 and later, this feature is enabled by default. To disable this feature, set `streams.async.subscription.enabled=true` in `core-site.xml`. By default, this value is set to `false`.

With this feature enabled, consumer assignment updates and the invocation of related callbacks (in [ConsumerRebalanceListener](#)) occur synchronously within the `consumer.poll()` call in the user thread.

When setting a new consumer partition assignment, `consumer.assignment()` does not update until you invoke `consumer.poll()`.

**NOTE:** For the call to update, you might have to invoke `consumer.poll()` multiple times, or with a long enough timeout for assignment to be completed.

**IMPORTANT:** If you have an application that is set to sleep until consumer partition assignment is updated, you must perform one of the following actions to ensure the application continues to work as intended:

- Disable synchronous consumer partition assignment with `streams.async.subscription.enabled=true` in `core-site.xml`.
- Enable the application to begin polling without the new user assignment. You can use [ConsumerRebalanceListener#onPartitionsAssigned\(\)](#) to notify of successful consumer partition assignment.

## Log Compaction

As of HPE Ezmeral Data Fabric 6.1, log compaction is supported. Log compaction can be enabled for streams created with HPE Ezmeral Data Fabric core 6.1 and later. In addition, clients older than HPE Ezmeral Data Fabric 6.1 are prevented from consuming from streams that have had log compaction enabled on them at least once in their lifetime.

When a stream on a source cluster has both log compaction and replication enabled, the replica cluster does not automatically have log compaction enabled. You must explicitly enable log compaction on the replica cluster.

- If a replica cluster has been upgraded and the stream data for a source cluster is compacted (that is, one or more messages have been deleted), then the source cluster replicates the compacted data to the replica cluster.
- If a replica cluster has **not** been upgraded, then the source cluster fails the replication and an error is generated that requests an replica cluster upgrade.

In the context of a scan by a client that is **not** upgraded, the (upgraded) server inspects the row header to check if it is serving a compacted row. If it is serving a compacted row, then the server fails the consumer request. This behavior applies both to a stream that is explicitly configured for compaction and a replica that has received a compacted row.

**IMPORTANT:** To perform log compaction on older streams, the `-force` option can be used. The `-force` option should only be used when ALL clients have been upgraded to HPE Ezmeral Data Fabric 6.1.

## Idempotent Producer

As of HPE Ezmeral Data Fabric 6.1, the idempotent producer (exactly once) feature is supported. You can implement the idempotent producer with HPE Ezmeral Data Fabric core 6.1 and later.

**NOTE:** For HPE Ezmeral Data Fabric 7.8 and later, the idempotent producer feature is implemented by default.

When creating a producer instance, use the following configuration:

```
props.put(ProducerConfig.ENABLE_IDEMPOTENCE_CONFIG, true)
```

The idempotent producer feature is supported by EEP HPE Ezmeral Data Fabric 6.0 clients and HPE Ezmeral Data Fabric 6.1.0 servers.

- You must upgrade all servers to v6.1.0 and enable all the v6.1.0 features, before you enable the idempotent producer.
- If you use a pre-HPE Ezmeral Data Fabric 6.1 client and a HPE Ezmeral Data Fabric 6.1 server, and if a group of messages are atomically persisted without a valid producer ID, the server treats the request as a non-idempotent producer.

- If you use a HPE Ezmeral Data Fabric 6.1 client and a pre-HPE Ezmeral Data Fabric 6.1 server, the idempotent producer is not supported. In this case, the idempotent producer fails to produce to the stream and the following exception is thrown:

```
Exception in thread "main" java.util.concurrent.ExecutionException:
org.apache.kafka.common.errors.UnknownTopicOrPartitionException:
Operation not permitted (1) null
    at
com.mapr.streams.impl.producer.MarlinFuture.valueOrError(MarlinFuture.java

com.mapr.streams.impl.producer.MarlinFuture.get(MarlinFuture.java:17)
    at
com.mapr.qa.marlin.common.StandaloneProducer.main(StandaloneProducer.java:
75)
Caused by:
org.apache.kafka.common.errors.UnknownTopicOrPartitionException:
Operation not permitted (1) null
```

### TimestampType Permissions

The following discussion describes the [ACE](#) permissions that you need when using the timestamp type parameter. See [Stream Security](#) on page 795 for general information about HPE Ezmeral Data Fabric Streams streams security.

A HPE Ezmeral Data Fabric Streams stream topic inherits the default timestamp type value from its stream. To override the stream's default value, set the timestamp type for the topic to a different value.

- Setting the value at the stream-level requires `adminperm` permissions. The stream-level timestamp type parameter is `defaulttimestamptype`. See [stream create](#) on page 2373 and [stream edit](#) on page 2380 for more information on setting this parameter using the `maprcli` command.
- Setting the `timestamptype` at the topic-level requires `topicperm` permissions. The topic-level timestamp type parameter is `timestamptype`. See [stream topic create](#) on page 2396 and [stream topic edit](#) on page 2399 for more information on setting this parameter using the `maprcli` command.

### User Impersonation

As of HPE Ezmeral Data Fabric 6.0, user impersonation is supported for HPE Ezmeral Data Fabric Streams.

You can set up user impersonation programmatically. To do so, use the `UserGroupInformation.doAs()` method in the Hadoop documentation. See [Class UserGroupInformation](#) for more information.

If you are setting up user impersonation in a secure cluster, you need to generate an impersonation ticket. See the [Generating and Printing Service with Impersonation Ticket](#) section in the [maprlogin Command Examples](#) on page 2922 topic.

After generating the ticket:

1. Ensure that user `mapruser1` has read permissions on the ticket.
2. If you moved the ticket file to a different location, set the `$MAPR_TICKETFILE_LOCATION` environment variable with the appropriate path.

For more information about impersonation, see:

- [How Impersonation Works](#) on page 1937

- [Generating a Service with Impersonation Ticket](#) on page 1827
- [Managing Impersonation](#) on page 1936

### Backward Compatibility

As of HPE Ezmeral Data Fabric 6.0.1, along with the support of Apache Kafka, the `java.util.Collection` interface is being used. This impacts applications using certain APIs. See [HPE Ezmeral Data Fabric Streams Java API Library](#) on page 3553 for detailed information.

### References

- [HPE Ezmeral Data Fabric Streams Sample Programs](#) on GitHub.

### HPE Ezmeral Data Fabric Streams Java API Library

Use the HPE Ezmeral Data Fabric Streams Admin Java API library as an alternative to `maprcli` commands and the REST APIs for performing administrative tasks on streams and topics. This library can also be used for analysis of the contents of streams.

### Javadoc

The following Apache Kafka Java API versions are supported:

Table

Core version	Apache Kafka API
7.8 and later	3.6.1
7.0 through 7.7	2.6.1
6.2 and later	2.1.1
6.1 and later	1.1
6.0.1 and later	1.0
6.0.0 and earlier	0.90

See the following APIs for detailed information:

### HPE Ezmeral Data Fabric Streams Java APIs (as of 7.8)

The following HPE Ezmeral Data Fabric Streams Java APIs are available as of HPE Ezmeral Data Fabric 7.8:

Table

Interface	Method	Description
StreamDescriptor	<code>void setCompact(boolean compact)</code>	Sets log compaction on a stream.
StreamDescriptor	<code>boolean getCompact()</code>	Gets the log compaction on a stream. Returns true if the stream has log compaction on the stream.
StreamDescriptor	<code>void setMinCompactionLagMS(long ts)</code>	Sets the time in (milliseconds) that a message should remain uncompact in the topic-partition. Applies only if log compaction is enabled on the stream.

Table (Continued)

Interface	Method	Description
StreamDescriptor	long getMinCompactionLagMS()	Returns the minimum time (in milliseconds) a message will remain uncompacted in the topic-partition. Applies only if log compaction is enabled on the stream.
StreamDescriptor	void setDeleteRetentionMS(long ts)	Sets the time (in milliseconds) for which deleted records are retained. Applies only if log compaction is enabled on the stream.
StreamDescriptor	long getDeleteRetentionMS()	Returns the time (in milliseconds) for which deleted records are retained. Applies only if log compaction is enabled on the stream.
Producer	ProducerConfig class	The idempotence producer option is set by setting the <code>enable.idempotence</code> value of <b>true</b> passed through the <code>ProducerConfig</code> class.

**NOTE:** For Apache Kafka 3.6.1, some methods are not supported.

**Admin methods:**

- Using Topic IDs:

- ```
DescribeTopicsResult describeTopics(TopicCollection topics,
DescribeTopicsOptions options)
```

- `DeleteTopicsResult deleteTopics(TopicCollection topics, DeleteTopicsOptions options)`

- With more than one group:

```
ListConsumerGroupOffsetsResult
listConsumerGroupOffsets(Map<String, ListConsumerGroupOffsetsSpec>
groupSpecs, ListConsumerGroupOffsetsOptions options)
```

- And the following additional methods:

```
public DescribeUserScramCredentialsResult
describeUserScramCredentials(List<String> users,
DescribeUserScramCredentialsOptions options) {
public AlterUserScramCredentialsResult
alterUserScramCredentials(List<UserScramCredentialAlteration>
alterations, AlterUserScramCredentialsOptions options) {
public DescribeFeaturesResult
describeFeatures(DescribeFeaturesOptions options) {
public UpdateFeaturesResult updateFeatures(Map<String, FeatureUpdate>
featureUpdates, UpdateFeaturesOptions options) {
public DescribeMetadataQuorumResult
describeMetadataQuorum(DescribeMetadataQuorumOptions options) {
public UnregisterBrokerResult unregisterBroker(int brokerId,
UnregisterBrokerOptions options) {
public DescribeProducersResult
describeProducers(Collection<TopicPartition> partitions,
DescribeProducersOptions options) {
public DescribeTransactionsResult
describeTransactions(Collection<String> transactionalIds,
DescribeTransactionsOptions options) {
public AbortTransactionResult abortTransaction(AbortTransactionSpec
spec, AbortTransactionOptions options) {
```

#### Consumer methods:

- `OptionalLong currentLag(TopicPartition topicPartition)`
- `void enforceRebalance(String reason)`

#### HPE Ezmeral Data Fabric Streams Java APIs (as of 6.0.1)

The following table lists the new Interfaces and APIs for HPE Ezmeral Data Fabric 6.0.1. They are the delta between HPE Ezmeral Data Fabric 6.0.1 and 6.0.0, meaning, they are applicable to HPE Ezmeral Data Fabric 6.0.1 but not HPE Ezmeral Data Fabric 6.0.0.

Table

| Interface and Methods    | Description                                 |
|--------------------------|---|
| Admin.close              | Long duration for TimeUnit.                 |
| Admin.createTopic        | TopicDescriptor array for topic attributes. |
| Admin.editTopic          | TopicDescriptor array for topic attributes. |
| Admin.getTopicDescriptor | Method for retrieving topic attributes.     |

**Table (Continued)**

| Interface and Methods                    | Description                                     |
|--|---|
| Admin.listTopic                          | Method for listing all the topics in a stream.  |
| Admin.streamExists                       | Method for determining whether a stream exists. |
| StreamDescriptor.getDefaultTimestampType | Method for retrieving the timestamp type.       |
| StreamDescriptor.setDefaultTimestampType | Method for setting the timestamp type.          |
| TopicDescriptor                          | New HPE Ezmeral Data Fabric interface.          |
| TopicDescriptor.getPartitions            | Method associated with the new interface.       |
| TopicDescriptor.setPartitions            | Method associated with the new interface.       |
| TopicDescriptor.getTimestampType         | Method associated with the new interface.       |
| TopicDescriptor.setTimestampType         | Method associated with the new interface.       |
| Enum TimestampType                       | New Enum class and associated methods.          |

**Backward Compatibility**

As of HPE Ezmeral Data Fabric 6.0.1, Apache Kafka 1.0 is supported. The following `pause`, `resume`, `seekToBeginning`, and `seekToEnd` APIs support the Collection Interface. The deprecated APIs will continue to run unchanged, however, they may be removed in a future release.

**Table**

| Replacement Collection APIs   | Deprecated APIs  |
|---|--|
| <code>void pause(Collection&lt;TopicPartition&gt; partitions);</code> | <code>void pause(TopicPartition... partitions);</code>           |
| <code>void resume(Collection&lt;TopicPartition&gt;partitions);</code> | <code>void resume(TopicPartition... partitions);</code>          |
| <code>void seekToBeginning(Collection&lt;TopicPartition&gt;);</code>  | <code>void seekToBeginning(TopicPartition... partitions);</code> |
| <code>void seekToEnd(Collection&lt;TopicPartition&gt;);</code>        | <code>void seekToEnd(TopicPartition... partitions);</code>       |

The following `subscribe` and `assign` APIs support the Collection Interface (which is more generalized) as well as the List Interface. Support for the List Interface has been retained for backward binary compatibility.

**Table**

| Replacement Collection APIs  | Retained APIs   |
|--|---|
| <code>void subscribe(Collection&lt;String&gt; topics);</code>                            | <code>void subscribe(java.util.List&lt;java.lang.String&gt; topics);</code>                                     |
| <code>void subscribe(Collection&lt;String&gt; topics, ConsumerRebalanceListener);</code> | <code>void subscribe(java.util.List&lt;java.lang.String&gt; topics, ConsumerRebalanceListener listener);</code> |
| <code>void assign(Collection&lt;TopicPartition&gt; partitions);</code>                   | <code>void assign(java.util.List&lt;TopicPartition&gt; partitions);</code>                                      |

**Stream and Topic Operations Summary**

Provides a summary of stream topic operations and the interface, class, or method used for the operation.

The following stream and topic operations is not an inclusive list, but a sampling. For detailed information, see the following libraries:

Table

| Operation   | Interface/Method Used   |
|---|---|
| Creating streams                                  | StreamDescriptor is used to set the attributes for streams that you plan to create.<br>Admin.createStream(String streamPathAndName, StreamDescriptor desc) - create the stream.   |
| Editing stream attributes                         | StreamDescriptor is used to edit the stream's attribute values.<br>Admin.editStream(String streamPathAndName, StreamDescriptor desc) - set or modify the stream's attribute values.   |

### Managing Streams with Java

Provides Java code snippets for performing CRUD operations on HPE Ezmeral Data Fabric Streams streams.

## Creating Streams

StreamDescriptor is used to set attributes for streams that you want to create.

```
public StreamDescriptor createStreamDescriptor(int numPartitions, String
adminUsers, String producerUsers, String consumerUsers, String copyUsers,
String topicUsers) {
    StreamDescriptor desc = Streams.newStreamDescriptor();
    desc.setDefaultPartitions(numPartitions);
    desc.setCompressionAlgo("zlib");
    desc.setAutoCreateTopics(false);
    desc.setAdminPerms(adminUsers);
    desc.setConsumePerms(consumerUsers);
    desc.setCopyPerms(copyUsers);
    desc.setTopicPerms(topicUsers);

    return desc;
}
```

Admin is used with the createStream method to create the stream with the pre-established attribute values.

```
public void createStreamUtilFunction(String streamPathAndName,
StreamDescriptor desc) throws IllegalArgumentException, IOException{
    Configuration conf = new Configuration();
    Admin streamAdmin = Streams.newAdmin(conf);
    streamAdmin.createStream(streamPathAndName, desc);
    streamAdmin.close();
}
```

## Editing Stream Attributes

StreamDescriptor is used to retrieve the stream's attribute values. Admin with the editStream method is used to set or modify the stream's attribute values.

```
Admin.editStream(String streamPathAndName, StreamDescriptor desc)
```

```
Configuration conf = new Configuration();
Admin streamAdmin = Streams.newAdmin(conf);
StreamDescriptor desc =
streamAdmin.getStreamDescriptor(streamPathAndName);
```

```
public void editStreamUtilFunction(String streamPathAndName,
StreamDescriptor desc) throws IllegalArgumentException, IOException{
    Configuration conf = new Configuration();
    Admin streamAdmin = Streams.newAdmin(conf);
    streamAdmin.editStream(streamPathAndName, desc);
    streamAdmin.close();
}
```

## Deleting Streams

```
public void deleteStreamUtilFunction(String streamPathAndName) throws
IllegalArgumentException, IOException{
    Configuration conf = new Configuration();
    Admin streamAdmin = Streams.newAdmin(conf);
    streamAdmin.deleteStream(streamPathAndName);
    streamAdmin.close();
}
```

## Managing Topics with Java

Provides Java code snippets for performing CRUD operations on HPE Ezmeral Data Fabric Streams stream topics.

### Creating Topics

The `createTopic` API is used to create a topic with the default number of partitions.

```
Admin.createTopic(String streamPathAndName, String topicName)
```

**NOTE:** If you do not specify the number of partitions for a stream topic, the default number of partitions is inherited from the stream.

```
public void createTopicUtilFunction(String streamPathAndName, String
topicName) throws IOException{
    Configuration conf = new Configuration();
    Admin streamAdmin = Streams.newAdmin(conf);
    streamAdmin.createTopic(streamPathAndName, topicName);
    streamAdmin.close();
}
```

The `createTopic` API is used to create a topic with a specific number of partitions.

```
Admin.createTopic(String streamPathAndName, String topicName, int
npartitions)
```

```
public void createTopicWithPartitionsUtilFunction(String streamPathAndName,
String topicName, int npartitions) throws IOException{
    Configuration conf = new Configuration();
    Admin streamAdmin = Streams.newAdmin(conf);
    streamAdmin.createTopic(streamPathAndName, topicName, npartitions);
    streamAdmin.close();
}
```

### Editing Topics

The `editTopic` API is used to change timestamp type and the number of partitions for a topic.

```
Admin.editTopic(String streamPathAndName, String topicName, int npartitions)
```

```
public void editTopicUtilFunction(String streamPathAndName, String
topicName, int npartitions) throws IOException{
    Configuration conf = new Configuration();
    Admin streamAdmin = Streams.newAdmin(conf);
    streamAdmin.editTopic(streamPathAndName, topicName, npartitions);
    streamAdmin.close();
}
```

### Retrieving Topic Attributes

The `getTopicDescriptor` API is used to get or set the topic's attribute values. `TopicDescriptor` is passed into methods to set and retrieve topic partitions and timestamp type. The Enum `TimestampType` values are `CREATE_TIME` and `LOG_APPEND_TIME`.

**NOTE:** `TopicDescriptor` is available as of MapR 6.0.1.

## Deleting Topics

The `deleteTopic` API is used to delete a topic from a stream.

```
Admin.deleteTopic(String streamPathAndName, String topicName)
```

```
public void deleteTopicUtilFunction(String streamPathAndName, String
topicName) throws IOException{
    Configuration conf = new Configuration();
    Admin streamAdmin = Streams.newAdmin(conf);
    streamAdmin.deleteTopic(streamPathAndName, topicName);
    streamAdmin.close();
}
```

## Counting Topics

The `countTopics` API is used to count the number of topics in a stream. See the [mapr streamanalyzer](#) on page 5563 utility for a sample application that counts and queries topic messages.

```
Admin.countTopics(String streamPathAndName)
```

```
public int countTopicsUtilFunction(String streamPathAndName){
    Configuration conf = new Configuration();
    Admin streamAdmin = Streams.newAdmin(conf);
    int count = streamAdmin.countTopics(streamPathAndName);
    streamAdmin.close();

    return count;
}
```

## Using Timestamps on Streams and Topics

Provides a code example for using timestamps on HPE Ezmeral Data Fabric Streams streams and topics.

### Passing Timestamp Value

The timestamp value can be passed as part of the `ProducerRecord`, for example:

```
ProducerRecord<String, String> producerRecord =
    new ProducerRecord<String, String>(topicName, partition, timestamp,
key, value);
```

**NOTE:** The timestamp value is retained if the timestamp type is `createtime`. If the timestamp type is `logappendtime`, then the timestamp value is ignored and instead the server timestamp is used.

### Retrieving Timestamp Type

This example sets and retrieves the timestamp type. The following code example performs the following:

- Creates a stream with a default timestamp type of `LogAppendTime`.
- Creates a topic with a specific timestamp type of `CreateTime`.
- Retrieves the topics's timestamp type.

```
// Create stream with default timestamp type as "LogAppendTime"
// Create a topic with timestamp type as "CreateTime"
Configuration conf = new Configuration();
Admin streamAdmin = Streams.newAdmin(conf);
```

```
// Create a stream
StreamDescriptor sDesc = Streams.newStreamDescriptor();
sDesc.setDefaultTimestampType(TimestampType.LOG_APPEND_TIME);
streamAdmin.createStream(streamName, sDesc);

// Create a topic
TopicDescriptor tDesc = Streams.newTopicDescriptor();
tDesc.setTimestampType(TimestampType.CREATE_TIME);
streamAdmin.createTopic(streamName, topicName, tDesc);

// Get topic timestamp type
TopicDescriptor rDesc = streamAdmin.getTopicDescriptor(streamName,
topicName);
System.out.println(rDesc.getTimestampType().name);
```

### Enabling Log Compaction

Provides a code example for using timestamps on HPE Ezmeral Data Fabric Streams streams and topics.

Log compaction is enabled through the HPE Ezmeral Data Fabric Streams `StreamDescriptor` interface with the `setCompact` method where the `compact` value is set to **true**. Additionally, use the `setDeleteRetentionMS` and `setMinCompactionLagMS` methods to set the time delay before compacting records and the time that deleted records are retained.

Configuration values include:

- `compact` - used to set log compaction at the stream-level.
- `min.compaction.lag.ms` - used to set a **minimum** time delay (milliseconds) before starting to compact records after they are written. Records won't get compacted until after this period. The setting gives consumers time to retrieve every record.
- `delete.retention.ms` - used to set the **minimum** time (milliseconds) that deleted records are retained.

**NOTE:** You can set not set log compaction when creating the stream; only when editing the stream configuration. The configuration parameters, `min.compaction.lag.ms` and `delete.retention.ms` can be set when both creating and editing streams.

### Enabling Log Compaction

The following code example performs the following:

- Enables log compaction at the stream-level.
- Sets the minimum time delay before log compaction starts
- Set the minimum time that deleted record are retained.

```
// Creates a stream
// Sets log compaction on the stream
// Sets the minimum time for a message to stay uncompactd
// Sets the time that deleted records are retained.

(Admin streamAdmin = Streams.newAdmin(conf))
StreamDescriptor streamDescriptor = Streams.newStreamDescriptor();
streamDescriptor.setCompact(true);
streamDescriptor.setDeleteRetentionMS(deleteRetentionMs);
streamDescriptor.setMinCompactionLagMS(minCompactionLagMs);
streamAdmin.editStream(streamName, streamDesc);
}
```

## For More Information

See the following topics for more information:

- [Log Compaction](#) on page 772
- `maprcli stream create` on page 2373 and `stream edit` on page 2380
- [Preparing Clusters for Log Compaction](#) on page 1507

## Enabling an Idempotent Producer

Describes how to enable an idempotent producer. Idempotence refers to exactly-once message delivery semantics.

To enable idempotence, the `enable.idempotence` configuration must be set to **true**. When set, the `retries` configuration defaults to `Integer.MAX_VALUE` and the `Acks` configuration defaults to `all`.

The idempotence producer option is set by setting the `enable.idempotence` value of `true` passed through the `ProducerConfig` class.

| Constant Field Values   |  |                                 |
|---|--|---------------------------------|
| <code>org.apache.kafka.clients.producer.ProducerConfig</code> |  |                                 |
| Modifier and Type   | Constant Field                         | Value                           |
| <code>public static final java.lang.String</code>             | <code>ENABLE_IDEMPOTENCE_CONFIG</code> | <code>enable.idempotence</code> |

Example Code Snippet:

```
props.put(ProducerConfig.ENABLE_IDEMPOTENCE_CONFIG, true);
```

**NOTE:** The default is `false`, which retains at-least-once message delivery semantics.

**TIP:** There are no API changes for the Idempotent Producer functionality, so existing applications do not need to be modified except to enable the producer configuration property.

## Example: Subscribing and Querying with Timestamps

This sample Java consumer application uses the `subscribe` API to subscribe to the input topics and queries offsets upon partition-assignment.

In the query, the `offsetsForTimes` API returns the earliest offset in a topic-partition with a timestamp greater than or equal to the input timestamp. The consumer then seeks to that offset if it is greater than the consumer's current position. Following this, the consumer polls for messages. If there are messages following that offset with timestamps earlier than the input timestamp, then those messages are skipped by the consumer.

```
import java.util.Arrays;
import java.util.Collection;
import java.util.HashMap;
import java.util.Map;
import java.util.Properties;

import org.apache.kafka.clients.consumer.Consumer;
import org.apache.kafka.clients.consumer.ConsumerConfig;
import org.apache.kafka.clients.consumer.ConsumerRebalanceListener;
import org.apache.kafka.clients.consumer.ConsumerRecord;
import org.apache.kafka.clients.consumer.ConsumerRecords;
import org.apache.kafka.clients.consumer.KafkaConsumer;
import org.apache.kafka.clients.consumer.OffsetAndTimestamp;
import org.apache.kafka.common.TopicPartition;
```

```

public class TimeBasedConsumer {
    private static long kPollTimeout = 100;
    private static int kNumRecordsToProcess = 10;

    public static void main(String[] args) {
        if (args.length < 2) {
            String usage = "Usage: Program <topicName> <startTimestamp>";
            System.err.println(usage);
            throw new IllegalArgumentException(usage);
        }
        String topic = args[0];
        Long startTimestamp = Long.parseLong(args[1]);
        Properties properties = new Properties();
        properties.put(ConsumerConfig.KEY_DESERIALIZER_CLASS_CONFIG,
"org.apache.kafka.common.serialization.StringDeserializer");
        properties.put(ConsumerConfig.VALUE_DESERIALIZER_CLASS_CONFIG,
"org.apache.kafka.common.serialization.StringDeserializer");
        properties.put(ConsumerConfig.GROUP_ID_CONFIG, "testgroup");
        properties.put(ConsumerConfig.AUTO_OFFSET_RESET_CONFIG, "earliest");
        KafkaConsumer<String, String> consumer = new KafkaConsumer<String,
String>(properties);
        SeekToTimeOnRebalance seekToTimeOnRebalance = new
SeekToTimeOnRebalance(consumer, startTimestamp);

        // subscribe to the input topic and listen for assignments.
        consumer.subscribe(Arrays.asList(topic), seekToTimeOnRebalance);

        int numRecords = 0;
        // poll and process the records.
        while (numRecords < kNumRecordsToProcess) {
            ConsumerRecords<String, String> records =
consumer.poll(kPollTimeout );
            for (ConsumerRecord<String, String> record : records) {
                // The offsetsForTimes API returns the earliest offset in a
topic-partition with a timestamp
                // greater than or equal to the input timestamp. There could be
messages following that offset
                // with timestamps lesser than the input timestamp. Let's skip such
messages.
                if (record.timestamp() < startTimestamp) {
                    System.out.println("Skipping out of order record with key " +
record.key() +
                                " timestamp " + record.timestamp());
                    continue;
                }
                numRecords++;
                System.out.println("record key " + record.key() +
                                "record timestamp " + record.timestamp() +
                                "record offset " + record.offset());
            }
        }
        consumer.close();
    }

    public static class SeekToTimeOnRebalance implements
ConsumerRebalanceListener {
        private Consumer<?, ?> consumer;
        private final Long startTimestamp;

        public SeekToTimeOnRebalance(Consumer<?, ?> consumer, Long
startTimestamp) {
            this.consumer = consumer;
            this.startTimestamp = startTimestamp;
        }
    }
}

```

```

    }

    @Override
    public void onPartitionsAssigned(Collection<TopicPartition> partitions)
    {
        Map<TopicPartition, Long> timestampsToSearch = new HashMap<>();
        for (TopicPartition partition : partitions) {
            timestampsToSearch.put(partition, startTimestamp);
        }
        // for each assigned partition, find the earliest offset in that
        partition with a timestamp
        // greater than or equal to the input timestamp
        Map<TopicPartition, OffsetAndTimestamp> outOffsets =
        consumer.offsetsForTimes(timestampsToSearch);
        for (TopicPartition partition : partitions) {
            Long seekOffset = outOffsets.get(partition).offset();
            Long currentPosition = consumer.position(partition);
            // seek to the offset returned by the offsetsForTimes API
            // if it is beyond the current position
            if (seekOffset.compareTo(currentPosition) > 0) {
                consumer.seek(partition, seekOffset);
            }
        }
    }

    @Override
    public void onPartitionsRevoked(Collection<TopicPartition> partitions) {
    }

}
}

```

### Querying Topic Messages

Describes how HPE Ezmeral Data Fabric Streams topic messages can be queried.

#### Time-based Querying

The **consumer.offsetsForTimes** API is used to get offsets in a topic-partition. This API takes in a `Map` of `TopicPartition` and timestamp. The offset is returned in an `OffsetAndTimestamp` object when `offsetsForTime` is called.

The following shows how the `Map` is constructed:

```

Long timestamp = 1522195205L;
TopicPartition topicPartition = new TopicPartition(topic,partition);

HashMap<TopicPartition, Long> offsetsForTimesMap = new
HashMap<TopicPartition, Long>();
offsetsForTimesMap.put(topicPartition, timestamp);

// Invocation to offsetsForTimes
Map<TopicPartition, OffsetAndTimestamp> offsetForTimesResultMap =
consumer.offsetsForTimes(offsetsForTimesMap);

```

#### Direct Querying

The `Streams` class is used to directly query topic messages. See the [mapr streamanalyzer](#) on page 5563 utility for a sample application that counts and queries topic messages.

- The `getMessageStore()` APIs are used to get the `DocumentStore` object which represents the underlying topic messages for a specified stream.

- The `DocumentStore.find()` APIs are used to query the messages that are in the `DocumentStore` object. While running `find()` on the returned `DocumentStore` object, message fields can be projected based on the specified field name.

 **NOTE:** `DocumentStore` is a part of the open-source OJAI API.

The logical schema of each message is the same, where analytics applications can run queries on these fields. See [Logical Schema of Messages](#) on page 766 for more information.

```
{
  "_id": <STRING>,
  "topic": <STRING>,
  "partition": <SHORT>,
  "offset": <LONG>,
  "timestamp": <LONG>,
  "producer": <VARCHAR>,
  "key": <BINARY>,
  "value": <VARBINARY>
}
```

### Apache Kafka Java APIs

HPE Ezmeral Data Fabric Streams supports these Apache Kafka Java APIs.

#### Javadoc

In HPE Ezmeral Data Fabric 7.0, Apache Kafka is supported.

EEP 8.1.0 supports Apache Kafka 2.6.1.

See the following APIs for detailed information:

- [HPE Ezmeral Data Fabric Streams Java API Library](#)
- [Apache Kafka 2.6.1 APIs used with HPE Ezmeral Data Fabric Streams](#)

 **NOTE:** The Apache Kafka 2.1 APIs are also supported in Apache Kafka 2.6.1.

#### Admin APIs

The following Admin APIs, `org.apache.kafka.clients.admin` package, are applicable to HPE Ezmeral Data Fabric support of Apache Kafka.

 **NOTE:** The AdminClient API options (`CreateTopicsOptions`, `DeleteTopicsOptions`, `DescribeTopicsOptions`, `ListTopicsOptions`, `CreatePartitionsOptions`, and `DescribeTopicsOptions`), are ignored. All of the methods assume that a topic belongs to the default stream unless a stream path is specified in the topic name.

If a default stream name is not specified and the topic path does not contain a stream name, then an exception is reported via the `Result` object. For example:

- If the topic name is specified as `topic1`, then the API assumes the full topic path as `/defaultStream:topic1`.
- If the topic name is specified as `/defaultStream:topic1`, then that will be the full topic path.

 **NOTE:** The AdminClient default stream configuration parameter is `streams.admin.default.stream`. See [Configuration Parameters](#) on page 3569 for more information.

**NOTE:** For a complete list of supported APIs, see [Apache Kafka 2.1 APIs used with HPE Ezmeral Data Fabric Event Data Streams](#)

### Consumer APIs

The following Consumer APIs, `org.apache.kafka.clients.consumer` package, are applicable to HPE Ezmeral Data Fabric support of Apache Kafka 2.1 and 2.6.1. .

Table

| Modifier and Type | Method          |
|-------------------|-----------------|
| long              | timestamp()     |
| long              | timestamptype() |

Table

| Modifier and Type                                 | Method  |
|---|---|
| void  | pause(Collection<TopicPartition> partitions)                                      |
| void  | resume(Collection<TopicPartition> partitions)                                     |
| void  | seekToBeginning(Collection<TopicPartition>)                                       |
| void  | seekToEnd(Collection<TopicPartition>)   |
| void  | subscribe(Collection<String> topics);   |
| void  | subscribe(Collection<String> topics, ConsumerRebalanceListener)                   |
| void  | assign(Collection<TopicPartition> partitions)                                     |
| java.util.Map<TopicPartition, OffsetAndTimestamp> | offsetsForTimes(java.util.Map<TopicPartition, java.lang.Long> timestampsToSearch) |
| java.util.Map<TopicPartition, java.lang.Long>     | beginningOffsets(Collection<TopicPartition>)                                      |
| java.util.Map<TopicPartition, java.lang.Long>     | endOffsets(Collection<TopicPartition> partitions)                                 |
| ConsumerRecords<K, V>                             | poll(long timeout)  |
| void  | commitSync()  |
| void  | commitAsync()   |

The following consumer interface and classes are applicable to HPE Ezmeral Data Fabric support of Apache Kafka.

- `org.apache.kafka.clients.consumer.ConsumerConfig`
- `org.apache.kafka.clients.consumer.ConsumerRebalanceCallback` (interface)
- `org.apache.kafka.clients.consumer.ConsumerRecord<K, V>`
- `org.apache.kafka.clients.consumer.ConsumerRecords<K, V>`
- `org.apache.kafka.clients.consumer.KafkaConsumer<K, V>` implements `Consumer<K, V>`

**NOTE:** For a complete list of supported APIs, see [Apache Kafka 2.1 APIs used with HPE Ezmeral Data Fabric Event Data Streams](#)

## Producer APIs

The following producer interface and classes, `org.apache.kafka.clients.producer` package, are applicable to HPE Ezmeral Data Fabric support of Apache Kafka 2.1. .

Table

| Modifier and Type  | Method  |
|--|---|
| <code>java.util.concurrent.Future&lt;RecordMetadata&gt;</code> | <code>send(ProducerRecord&lt;K,V&gt; record)</code> |
| <code>void</code>  | <code>flush()</code>                                |
| <code>void</code>  | <code>close()</code>                                |

The following producer interface and classes are applicable to HPE Ezmeral Data Fabric support of Apache Kafka.

- `org.apache.kafka.clients.producer.Callback` (Interface)
- `org.apache.kafka.clients.producer.KafkaProducer<K,V>`
- `org.apache.kafka.clients.producer.ProducerConfig`
- `org.apache.kafka.clients.producer.ProducerRecord<K,V>`
- `org.apache.kafka.clients.producer.RecordMetadata`

**NOTE:** For a complete list of supported APIs, see [Apache Kafka 2.1 APIs used with HPE Ezmeral Data Fabric Event Data Streams](#)

## Common APIs

The following common APIs, `org.apache.kafka.clients.common` packages, are applicable to HPE Ezmeral Data Fabric support of Apache Kafka 2.1. .

Table

| Modifier and Type             | Method               |
|-------------------------------|----------------------|
| <code>java.lang.String</code> | <code>key()</code>   |
| <code>byte[]</code>           | <code>value()</code> |

The following APIs are applicable to HPE Ezmeral Data Fabric support for Apache Kafka.

- `org.apache.kafka.common.PartitionInfo`  
Supported methods in `PartitionInfo`:
  - `int partition()`
  - `java.lang.String topic()`
  - `java.lang.String toString()`
- `org.apache.kafka.common.serialization.Serializer<T>` (Interface)
- `org.apache.kafka.common.serialization.Deserializer<T>` (interface)
- `org.apache.kafka.common.TopicPartition`

**NOTE:** For a complete list of supported APIs, see [Apache Kafka 2.1 APIs used with HPE Ezmeral Data Fabric Event Data Streams](#)

## Configuration Parameters

This topic describes configuration parameters that are either specific to HPE Ezmeral Data Fabric Streams or supported from Apache Kafka.

### AdminClient

Table

| Parameter                                 | Description   |
|---|---|
| <code>streams.admin.default.stream</code> | <p>This parameter, when set during creation of the AdminClient instance, ensures that the specified stream is using the the AdminClient instance for all administrative operations.</p> <p>Syntax:</p> <pre>/mapr/&lt;cluster name&gt;/&lt;volume name&gt;/&lt;stream name&gt;</pre>  |
| <code>streams.rpc.timeout.ms</code>       | <p>Specifies the length of time in milliseconds to wait for a response from the HPE Ezmeral Data Fabric Streams server if soft mount is configured (<code>fs.mapr.hardmount</code> is set to <code>false</code>). Default: 120000 Minimum: 30000</p> <p> <b>NOTE:</b> Applicable as of MapR 6.0.1, is used instead of <code>fs.mapr.rpc.timeout</code></p> <p>For producer and consumer applications, make sure the <code>streams.rpc.timeout.ms</code> configuration value for both producers and consumers is set to greater than 50000 to avoid Message Fetch RPC overload.</p>                                       |
| <code>use.brokers</code>                  | <p>A boolean flag that specifies whether or not the Apache Kafka clients (Producer, Consumer, Admin) should connect to Apache Kafka brokers or HPE Ezmeral Data Fabric Streams services. Default: <code>false</code></p> <p><b>false</b> To connect the Apache Kafka clients to HPE Ezmeral Data Fabric Streams services, set this flag as <code>false</code>.</p> <p>The <code>bootstrap.servers</code> property is optional and is ignored.</p> <p><b>true</b> To connect the Apache Kafka clients to Apache Kafka brokers, set this flag as <code>true</code>.</p> <p>The <code>bootstrap.servers</code> property is required, and must be filled in the client configuration and console scripts.</p> |

**Consumer****Table**

| <b>Parameter</b>                             | <b>Description</b>   |
|--|--|
| <code>streams.consumer.buffer.memory</code>  | Specifies how much memory to use for caching pre-fetched messages. Messages that are in subscribed topics and partitions are pre-fetched and cached to improve performance. Default 64MB   |
| <code>streams.consumer.default.stream</code> | Specifies the path and name of the stream that the consumer subscribes to if, when subscribing to a topic, the consumer does not specify a stream.   |
| <code>streams.rpc.timeout.ms</code>          | <p>Specifies the length of time in milliseconds to wait for a response from the HPE Ezmeral Data Fabric Streams server if a soft mount is configured (<code>fs.mapr.hardmount</code> is set to false). Default: 305000 Minimum: 300000</p> <p>For producer and consumer applications, make sure the <code>streams.rpc.timeout.ms</code> configuration value for both producers and consumers is set to greater than 50000 to avoid Message Fetch RPC overload.</p>   |
| <code>use.brokers</code>                     | <p>A boolean flag that specifies whether or not the Apache Kafka clients (Producer, Consumer, Admin) should connect to Apache Kafka brokers or HPE Ezmeral Data Fabric Streams services. Default: false</p> <p><b>false</b></p> <p>To connect the Apache Kafka clients to HPE Ezmeral Data Fabric Streams services, set this flag as false.</p> <p>The <code>bootstrap.servers</code> property is optional and is ignored.</p> <p><b>true</b></p> <p>To connect the Apache Kafka clients to Apache Kafka brokers, set this flag as true.</p> <p>The <code>bootstrap.servers</code> property is required, and must be filled in the client configuration and console scripts.</p> |

**Table**

| <b>Parameter</b>                     | <b>Description</b>  |
|--------------------------------------|---|
| <code>auto.commit.interval.ms</code> | The frequency in milliseconds that the offsets are committed. Default: 1000ms |

Table (Continued)

| Parameter                       | Description  |
|---------------------------------|--|
| <code>auto.offset.reset</code>  | <p>Specifies what HPE Ezmeral Data Fabric Streams should do when there is no initial offset, such as when a consumer starts reading from a partition. Default: latest</p> <p><b>earliest</b>                      Reset the offset to the offset of the earliest message in the partition.</p> <p><b>latest</b>                              Reset the offset to the offset of the latest message in the partition.</p>  |
| <code>enable.auto.commit</code> | <p>If true, periodically commits the highest offsets of the messages fetched by the consumer in all of the partitions for the topics that the consumer is subscribed to. Default: true</p>   |
| <code>fetch.min.bytes</code>    | <p>The minimum amount of data the server should return for a fetch request. If insufficient data is available, the server will wait for this minimum amount of data to accumulate before answering the request.</p> <p>This minimum applies to the totality of what a consumer has subscribed to.</p> <p>Works in conjunction with the timeout interval that is specified in the poll function. If the minimum number of bytes is not reached by the time that the interval expires, the poll returns with nothing.</p> <p>For example, suppose the value is set to 6 bytes and the timeout on a poll is set to 100ms. If there are 5 bytes available and no further bytes come in before the 100ms expire, the poll returns with nothing. Default: 1 byte</p> |
| <code>fetch.max.bytes</code>    | <p>The maximum amount of data the server should return for a fetch request. If the first record batch in the first non-empty partition of the fetch is larger than this configuration, the record batch is still returned to ensure that the consumer can make progress.</p> <p> <b>NOTE:</b> This parameter is new as of MapR 6.0.1.</p>   |
| <code>fetch.max.wait.ms</code>  | <p>The maximum amount of time the HPE Ezmeral Data Fabric Streams server will block before answering the fetch request if there isn't sufficient data to satisfy the requirement given by <code>fetch.min.bytes</code>.</p>  |
| <code>group.id</code>           | <p>A string 2457 up to bytes long that uniquely identifies the group of consumer processes to which this consumer belongs. By setting the same group ID, multiple consumer processes indicate that they are all part of the same consumer group. Putting consumers into groups provides benefits that are described in <a href="#">Consumer Groups</a>.</p> <p>It is possible for a single consumer to be in a group.</p>  |
| <code>max.poll.records</code>   | <p>Places an upper bound on the number of records returned from each call.</p> <p> <b>NOTE:</b> This parameter is new as of MapR 6.0.1.</p>   |

Table (Continued)

| Parameter                              | Description   |
|--|---|
| <code>max.partition.fetch.bytes</code> | <p>The number of bytes of message data to attempt to fetch for each partition in each poll request. These bytes will be read into memory for each partition, so this parameter helps control the memory that the consumer uses. Default: 64KB</p> <p>The size of the poll request must be at least as large as the maximum message size that the server allows or else it is possible for producers to send messages that are larger than the consumer can fetch.</p> <p>If the first record batch in the first non-empty partition of the fetch is larger than this configuration, the record batch is still returned to ensure that the consumer can make progress.</p> <p> <b>NOTE:</b> This is a behavior change as of MapR 6.0.1.</p> |

### Producer

Table

| Parameter  | Description  |
|--|--|
| <code>streams.buffer.max.time.ms</code>              | <p>Messages are buffered in the producer for at most the specified time. A thread will flush all the messages that have been buffered for more than the time specified. Default: 3 * 1000 msec create default stream</p>   |
| <code>streams.parallel.flushers.per.partition</code> | <p>If enabled, producer may have multiple parallel send requests to the server for each topic partition. If this setting is set to true, it is possible for messages to be sent out of order. Default: true create default stream</p>  |
| <code>streams.producer.default.stream</code>         | <p>Specifies the stream that the producer will use by default if the producer does not provide the name of a stream when specifying a topic to write to.</p> <p>Syntax:</p> <pre>/mapr/&lt;cluster name&gt;/&lt;volume name&gt;/&lt;stream name&gt;</pre> <p>create default stream</p>   |
| <code>fs.mapr.hardmount</code>                       | <p>Specifies whether to use a hard mount or a soft mount for connections to the MapR Streams server.</p> <p>The default is to use a hard mount and the value is <code>true</code>.</p> <p>If a value for this parameter is set in the <code>core-site.xml</code> file, the value in that file is ignored.</p> <p>create default stream</p> |

Table (Continued)

| Parameter              | Description   |
|------------------------|---|
| fs.mapr.rpc.timeout    | <p>Specifies the length of time in seconds to wait for a response from the HPE Ezmeral Data Fabric Streams server if the configuration parameter fs.mapr.hardmount is set to false. Default: 300. Minimum value: 30.</p> <p> <b>NOTE:</b> Applicable to MapR 6.0.0 and earlier. As of MapR 6.0.1, use streams.mapr.timeout.ms.</p> <p>If a soft mount is used, the time expires while a producer waits for a response from the HPE Ezmeral Data Fabric Streams server, and the producer used the <code>KafkaProducer.send(ProducerRecord&lt;K,V&gt; record, Callback callback)</code> method, the callback is invoked with the error <code>EAGAIN</code>, which means "Resource temporarily unavailable."</p> <p>create default stream</p> |
| streams.rpc.timeout.ms | <p>Specifies the length of time in milliseconds to wait for a response from the HPE Ezmeral Data Fabric Streams server if soft mount is configured (fs.mapr.hardmount is set to false). Default: 30000 Minimum: 30000</p> <p>For producer and consumer applications, make sure the streams.rpc.timeout.ms configuration value for both producers and consumers is set to greater than 50000 to avoid Message Fetch RPC overload.</p>  |
| use.brokers            | <p>A boolean flag that specifies whether or not the Apache Kafka clients (Producer, Consumer, Admin) should connect to Apache Kafka brokers or HPE Ezmeral Data Fabric Streams services. Default: false</p> <p><b>false</b></p> <p>To connect the Apache Kafka clients to HPE Ezmeral Data Fabric Streams services, set this flag as false.</p> <p>The bootstrap.servers property is optional and is ignored.</p> <p><b>true</b></p> <p>To connect the Apache Kafka clients to Apache Kafka brokers, set this flag as true.</p> <p>The bootstrap.servers property is required, and must be filled in the client configuration and console scripts.</p>  |

Table

| Parameter           | Description   |
|---------------------|---|
| buffer.memory       | The total bytes of memory the producer can use to buffer records waiting to be sent to the server. If records are generated faster than they can be delivered to the server the producer will block. Default: 33554432  |
| client.id           | Producers can tag records with a client ID that identifies the producer. Consumers can then be aware of which producer sent a message or set of messages. Apache Drill or other analytic tools querying messages can include this ID in the filters for their queries. Default: No client ID. |
| metadata.max.age.ms | The producer generally refreshes the topic metadata from the server when there is a failure. It will also poll for this data regularly. Default: 300 * 1000 msec  |

### Compiling and Running HPE Ezmeral Data Fabric Streams Java Apps

For producer and consumer applications that use the HPE Ezmeral Data Fabric Streams Java API, use Maven to compile and determine the application dependencies. Then, when you run the application, specify those dependencies in the application classpath.

### Compile and Determine Dependencies

For an example `pom.xml` file, see [HPE Ezmeral Data Fabric Streams Streams Sample Programs](#) on GitHub.

1. Add the HPE Maven repository to your `pom.xml` file, if it is not already added:

```
<repositories>
  <repository>
    <id>mapr-releases</id>
    <url>https://repository.mapr.com/nexus/content/repositories/
releases</url>
    <snapshots><enabled>true</enabled></snapshots>
    <releases><enabled>true</enabled></releases>
  </repository>
</repositories>
```

2. Add a dependency to the Data Fabric Streams Java client (`kafka-clients`) project:

```
<dependency>
  <groupId>org.apache.kafka</groupId>
  <artifactId>kafka-clients</artifactId>
  <version><version selected from the repository></version>
</dependency>
```

**NOTE:** The `kafka-clients` version mentioned above is an example. The actual version that your application requires is based on the current EEP and Data Fabric core version that you are running. The versions are listed in the following location: <https://repository.mapr.com/nexus/content/groups/mapr-public/org/apache/kafka/kafka-clients/>

### 3. Add a dependency to the Data Fabric Streams project:

```
<dependency>
  <groupId>com.mapr.streams</groupId>
  <artifactId>mapr-streams</artifactId>
  <version><version selected from the repository></version>
</dependency>
```

**NOTE:** The Data Fabric Streams project version mentioned above is an example. The actual version that your application requires is based on the current EEP and Data Fabric version that you are running. The versions are listed in the following location: <https://repository.mapr.com/nexus/content/groups/mapr-public/com/mapr/streams/mapr-streams/>

### 4. Use Maven to compile the application and resolve dependencies. For example, you can run `mvn clean package`.

## Run the Application

When you develop a Java application, you can use a dependency management tool such as Maven to compile your application. However, it is recommended that you do the following instead:

1. Compile the Java application without including dependencies
2. Specify the required classpath when you submit the application to the cluster

If you choose to bundle the JAR file, and there is a mismatch between the bundled JAR file and the version that your Data Fabric cluster expects, this can result in failures. The failures differ depending on the version of Data Fabric you are using. For more information, see [Using the File System JAR to Connect to the Cluster](#) on page 3155.

When the cluster is secure, the node must also have a Data Fabric ticket configured for the user that runs the application.

Use the following command to launch HPE Ezmeral Data Fabric Streams applications:

```
java -cp <classpath>:. -Djava.library.path=/opt/mapr/lib <main class JAR>
<command line arguments>
```

## Migrating Apache Kafka Java Applications to HPE Ezmeral Data Fabric Streams

There are only two steps that you need to follow to migrate applications written with the Apache Kafka Java API to HPE Ezmeral Data Fabric Streams.

### About this task

The following steps assume that migration is from either:

- Apache Kafka 2.6.1 to HPE Ezmeral Data Fabric Streams 6.2 or higher
- Apache Kafka 2.1.1 to HPE Ezmeral Data Fabric Streams 6.2 or higher
- Apache Kafka 1.1 to HPE Ezmeral Data Fabric Streams 6.1 or higher
- Apache Kafka 1.0 to HPE Ezmeral Data Fabric Streams 6.0.1 or higher

- Apache Kafka 0.9.0 to HPE Ezmeral Data Fabric Streams 6.0.0 or earlier

 **IMPORTANT:** For information on backward compatibility, see [HPE Ezmeral Data Fabric Streams Java API Library](#) on page 3553

### Procedure

1. Change the names of topics to include the path and name of the MapR Stream stream in which the topic is located.

Here is the syntax to use:

```
 /<path and name of stream>:<name of topic>
```

For example, you might have a stream in a MapR cluster that is named `stream_A`, and the stream might be in a volume named `IoT` and in a directory named `automobile_sensors`. You want to redirect a producer application to a topic in that stream. The syntax of the path to the topic might look like this:

```
 /mapr/IoT/automobile_sensors/stream_A:<name of topic>
```

2. If a producer application uses the Kafka interface `Partitioner` to compute which partitions to publish messages to, revise the application so that it uses the Kafka `StreamsPartitioner` interface instead.

### Differences between HPE Ezmeral Data Fabric Streams and Apache Kafka Configuration

Describes the HPE Ezmeral Data Fabric Streams supportability of Apache Kafka configuration parameters for producers and consumers.

#### Kafka Producer

Name	Description	Supported for producers in HPE Ezmeral Data Fabric Streams?
<code>bootstrap.servers</code>	A list of host/port pairs to use for establishing the initial connection to the Kafka cluster. The client will make use of all servers irrespective of which servers are specified here for bootstrapping—this list only impacts the initial hosts used to discover the full set of servers. This list should be in the form <code>host1:port1,host2:port2,.. ..</code> Since these servers are just used for the initial connection to discover the full cluster membership (which may change dynamically), this list need not contain the full set of servers (you may want more than one, though, in case a server is down).	No. Cluster details are discovered from the file <code>mapr-clusters.conf</code> .
<code>key.serializer</code>	Serializer class for key that implements the <code>Serializer</code> interface.	Yes
<code>value.serializer</code>	Serializer class for value that implements the <code>Serializer</code> interface.	Yes

Name	Description	Supported for producers in HPE Ezmeral Data Fabric Streams?
acks	<p>The number of acknowledgments the producer requires the leader to have received before considering a request complete. This controls the durability of records that are sent. The following settings are common:</p> <p><code>acks=0</code></p> <p>If set to zero then the producer will not wait for any acknowledgment from the server at all. The record will be immediately added to the socket buffer and considered sent. No guarantee can be made that the server has received the record in this case, and the retries configuration will not take effect (as the client won't generally know of any failures). The offset given back for each record will always be set to -1.</p> <p><code>acks=1</code></p> <p>This will mean the leader will write the record to its local log but will respond without awaiting full acknowledgement from all followers. In this case should the leader fail immediately after acknowledging the record but before the followers have replicated it then the record will be lost.</p> <p><code>acks=all</code></p> <p>This means the leader will wait for the full set of in-sync replicas to acknowledge the record. This guarantees that the record will not be lost as long as at least one in-sync replica remains alive. This is the strongest available guarantee.</p>	Ignored, all writes in HPE Ezmeral Data Fabric Streams are synchronous, and number of replicas is determined at the volume level, with a default of 3.
buffer.memory	<p>The total bytes of memory the producer can use to buffer records waiting to be sent to the server. If records are sent faster than they can be delivered to the server the producer will either block or throw an exception based on the preference specified by <code>block.on.buffer.full</code>.</p> <p>This setting should correspond roughly to the total memory the producer will use, but is not a hard bound since not all memory the producer uses is used for buffering. Some additional memory will be used for compression (if compression is enabled) as well as for maintaining in-flight requests.</p>	Yes

Name	Description	Supported for producers in HPE Ezmeral Data Fabric Streams?
<code>compression.type</code>	The compression type for all data generated by the producer. The default is none (i.e. no compression). Valid values are <code>none</code> , <code>gzip</code> , <code>snappy</code> , or <code>lz4</code> . Compression is of full batches of data, so the efficacy of batching will also impact the compression ratio (more batching means better compression).	Ignored. Compression is configured per stream.
<code>retries</code>	Setting a value greater than zero will cause the client to resend any record whose send fails with a potentially transient error. Note that this retry is no different than if the client resent the record upon receiving the error. Allowing retries will potentially change the ordering of records because if two records are sent to a single partition, and the first fails and is retried but the second succeeds, then the second record may appear first.	Ignored. HPE Ezmeral Data Fabric Streams always does automatic retries on transient errors.
<code>ssl.key.password</code>	The password of the private key in the key store file. This is optional for client.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
<code>ssl.keystore.location</code>	The location of the key store file. This is optional for client and can be used for two-way authentication for client.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
<code>ssl.keystore.password</code>	The store password for the key store file. This is optional for client and only needed if <code>ssl.keystore.location</code> is configured.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
<code>ssl.truststore.location</code>	The location of the trust store file.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
<code>ssl.truststore.password</code>	The password for the trust store file.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.

Name	Description	Supported for producers in HPE Ezmeral Data Fabric Streams?
batch.size	The producer will attempt to batch records together into fewer requests whenever multiple records are being sent to the same partition. This helps performance on both the client and the server. This configuration controls the default batch size in bytes.	Ignored. HPE Ezmeral Data Fabric always batches records for optimal performance.
	No attempt will be made to batch records larger than this size.	
	Requests sent to brokers will contain multiple batches, one for each partition with data available to be sent.	
	A small batch size will make batching less common and may reduce throughput (a batch size of zero will disable batching entirely). A very large batch size may use memory a bit more wastefully as we will always allocate a buffer of the specified batch size in anticipation of additional records.	
client.id	An id string to pass to the server when making requests. The purpose of this is to be able to track the source of requests beyond just ip/port by allowing a logical application name to be included in server-side request logging.	Yes
connections.max.idle.ms	Close idle connections after the number of milliseconds specified by this config.	Ignored.

Name	Description	Supported for producers in HPE Ezmeral Data Fabric Streams?
linger.ms	<p>The producer groups together any records that arrive in between request transmissions into a single batched request. Normally this occurs only under load when records arrive faster than they can be sent out. However in some circumstances the client may want to reduce the number of requests even under moderate load. This setting accomplishes this by adding a small amount of artificial delay—that is, rather than immediately sending out a record the producer will wait for up to the given delay to allow other records to be sent so that the sends can be batched together. This can be thought of as analogous to Nagle's algorithm in TCP. This setting gives the upper bound on the delay for batching; once we get batch.size worth of records for a partition it will be sent immediately regardless of this setting, however if we have fewer than this many bytes accumulated for this partition we will 'linger' for the specified time waiting for more records to show up. This setting defaults to 0 (i.e. no delay). Setting linger.ms=5, for example, would have the effect of reducing the number of requests sent but would add up to 5ms of latency to records sent in the absence of load.</p>	Ignored.
max.block.ms	<p>The configuration controls how long {@link KafkaProducer#send()} and {@link KafkaProducer#partitionsFor} will block. These methods can be blocked for multiple reasons. For e.g: buffer full, metadata unavailable. This configuration imposes maximum limit on the total time spent in fetching metadata, serialization of key and value, partitioning and allocation of buffer memory when doing a send(). In case of partitionsFor(), this configuration imposes a maximum time threshold on waiting for metadata</p>	Ignored. HPE Ezmeral Data Fabric Streams has a similar parameter: streams.rpc.timeout.ms
max.request.size	<p>The maximum size of a request. This is also effectively a cap on the maximum record size. Note that the server has its own cap on record size which may be different from this. This setting will limit the number of record batches the producer will send in a single request to avoid sending huge requests.</p>	Ignored.

Name	Description	Supported for producers in HPE Ezmeral Data Fabric Streams?
partitioner.class	Partitioner class that implements the Partitioner interface.	Use the Kafka StreamsPartitioner interface.
receive.buffer.bytes	The size of the TCP receive buffer (SO_RCVBUF) to use when reading data.	Ignored.
request.timeout.ms	The configuration controls the maximum amount of time the client will wait for the response of a request. If the response is not received before the timeout elapses the client will resend the request if necessary or fail the request if retries are exhausted.	Ignored. HPE Ezmeral Data Fabric Streams has a similar parameter: streams.rpc.timeout.ms
sasl.kerberos.service.name	The Kerberos principal name that Kafka runs as. This can be defined either in Kafka's JAAS config or in Kafka's config.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
security.protocol	Protocol used to communicate with brokers. Currently only PLAINTEXT and SSL are supported.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
send.buffer.bytes	The size of the TCP send buffer (SO_SNDBUF) to use when sending data.	Ignored.
ssl.enabled.protocols	The list of protocols enabled for SSL connections. TLSv1.2, TLSv1.1 and TLSv1 are enabled by default.	Ignored.
ssl.keystore.type	The file format of the key store file. This is optional for client. Default value is JKS	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.protocol	The SSL protocol used to generate the SSLContext. Default setting is TLS, which is fine for most cases. Allowed values in recent JVMs are TLS, TLSv1.1 and TLSv1.2. SSL, SSLv2 and SSLv3 may be supported in older JVMs, but their usage is discouraged due to known security vulnerabilities.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.provider	The name of the security provider used for SSL connections. Default value is the default security provider of the JVM.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.truststore.type	The file format of the trust store file. Default value is JKS.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.

Name	Description	Supported for producers in HPE Ezmeral Data Fabric Streams?
timeout.ms	The configuration controls the maximum amount of time the server will wait for acknowledgments from followers to meet the acknowledgment requirements the producer has specified with the acks configuration. If the requested number of acknowledgments are not met when the timeout elapses an error will be returned. This timeout is measured on the server side and does not include the network latency of the request.	Ignored. HPE Ezmeral Data Fabric Streams has a similar parameter: <code>streams.rpc.timeout.ms</code>
block.on.buffer.full	When our memory buffer is exhausted we must either stop accepting new records (block) or throw errors. By default this setting is true and we block, however in some scenarios blocking is not desirable and it is better to immediately give an error. Setting this to false will accomplish that: the producer will throw a <code>BufferExhaustedException</code> if a record is sent and the buffer space is full.	Ignored.
max.in.flight.requests.per.connection	The maximum number of unacknowledged requests the client will send on a single connection before blocking. Note that if this setting is set to be greater than 1 and there are failed sends, there is a risk of message re-ordering due to retries (i.e., if retries are enabled).	Ignored. HPE Ezmeral Data Fabric Streams has a similar parameter: <code>streams.parallel.flushers.per.partition</code>
metadata.fetch.timeout.ms	The first time data is sent to a topic we must fetch metadata about that topic to know which servers host the topic's partitions. This fetch to succeed before throwing an exception back to the client.	Ignored.
metadata.max.age.ms	The period of time in milliseconds after which we force a refresh of metadata even if we haven't seen any partition leadership changes to proactively discover any new brokers or partitions.	Yes
metric.reporters	A list of classes to use as metrics reporters. Implementing the <code>MetricReporter</code> interface allows plugging in classes that will be notified of new metric creation. The <code>JmxReporter</code> is always included to register JMX statistics.	No
metrics.num.samples	The number of samples maintained to compute metrics.	No.
metrics.sample.window.ms	The number of samples maintained to compute metrics.	No.

Name	Description	Supported for producers in HPE Ezmeral Data Fabric Streams?
reconnect.backoff.ms	The amount of time to wait before attempting to reconnect to a given host. This avoids repeatedly connecting to a host in a tight loop. This backoff applies to all requests sent by the consumer to the broker.	Ignored. HPE Ezmeral Data Fabric Streams has a similar parameter: <code>streams.rpc.timeout.ms</code>
retry.backoff.ms	The amount of time to wait before attempting to retry a failed fetch request to a given topic partition. This avoids repeated fetching-and-failing in a tight loop.	Ignored. HPE Ezmeral Data Fabric Streams has a similar parameter: <code>streams.rpc.timeout.ms</code>
sasl.kerberos.kinit.cmd	Kerberos kinit command path. Default is <code>/usr/bin/kinit</code>	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
sasl.kerberos.min.time.before.relogin	Login thread sleep time between refresh attempts.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
sasl.kerberos.ticket.renew.jitter	Percentage of random jitter added to the renewal time.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
sasl.kerberos.ticket.renew.window.factor	Login thread will sleep until the specified window factor of time from last refresh to ticket's expiry has been reached, at which time it will try to renew the ticket.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.cipher.suites	A list of cipher suites. This is a named combination of authentication, encryption, MAC and key exchange algorithm used to negotiate the security settings for a network connection using TLS or SSL network protocol. By default all the available cipher suites are supported.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.endpoint.identification.algorithm	The endpoint identification algorithm to validate server hostname using server certificate.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.keymanager.algorithm	The algorithm used by key manager factory for SSL connections. Default value is the key manager factory algorithm configured for the Java Virtual Machine.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.trustmanager.algorithm	The algorithm used by trust manager factory for SSL connections. Default value is the trust manager factory algorithm configured for the Java Virtual Machine.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.

**Kafka Consumer**

Name	Description	Supported for consumers in HPE Ezmeral Data Fabric Streams?
bootstrap.servers	A list of host/port pairs to use for establishing the initial connection to the Kafka cluster. The client will make use of all servers irrespective of which servers are specified here for bootstrapping—this list only impacts the initial hosts used to discover the full set of servers. This list should be in the form host1:port1,host2:port2,.... Since these servers are just used for the initial connection to discover the full cluster membership (which may change dynamically), this list need not contain the full set of servers (you may want more than one, though, in case a server is down).	No. Cluster details are discovered from the file <code>mapr-clusters.conf</code> .
key.deserializer	Deserializer class for key that implements the Deserializer interface.	Yes
value.deserializer	Deserializer class for value that implements the Deserializer interface.	Yes
fetch.min.bytes	The minimum amount of data the server should return for a fetch request. If insufficient data is available the request will wait for that much data to accumulate before answering the request. The default setting of 1 byte means that fetch requests are answered as soon as a single byte of data is available or the fetch request times out waiting for data to arrive. Setting this to something greater than 1 will cause the server to wait for larger amounts of data to accumulate which can improve server throughput a bit at the cost of some additional latency.	Yes
fetch.max.bytes	The maximum amount of data the server should return for a fetch request. If the first record batch in the first non-empty partition of the fetch is larger than this configuration, the record batch is still returned to ensure that the consumer can make progress.   <b>NOTE:</b> This is new as of MapR 6.0.1.	Yes, as of MapR 6.0.1.
group.id	A unique string that identifies the consumer group this consumer belongs to. This property is required if the consumer uses either the group management functionality by using <code>subscribe(topic)</code> or the Kafka-based offset management strategy.	Yes

Name	Description	Supported for consumers in HPE Ezmeral Data Fabric Streams?
heartbeat.interval.ms	The expected time between heartbeats to the consumer coordinator when using Kafka's group management facilities. Heartbeats are used to ensure that the consumer's session stays active and to facilitate rebalancing when new consumers join or leave the group. The value must be set lower than session.timeout.ms, but typically should be set no higher than 1/3 of that value. It can be adjusted even lower to control the expected time for normal rebalances.	No
max.poll.records	Places an upper bound on the number of records returned from each call.   <b>NOTE:</b> This parameter is new as of MapR 6.0.1.	Yes, as of MapR 6.0.1.
max.partition.fetch.bytes	The maximum amount of data per-partition the server will return. The maximum total memory used for a request will be #partitions * max.partition.fetch.bytes. This size must be at least as large as the maximum message size the server allows or else it is possible for the producer to send messages larger than the consumer can fetch. If that happens, the consumer can get stuck trying to fetch a large message on a certain partition.  If the first record batch in the first non-empty partition of the fetch is larger than this configuration, the record batch is still returned to ensure that the consumer can make progress.   <b>NOTE:</b> This is a behavior change as of MapR 6.0.1.	Yes
session.timeout.ms	The timeout used to detect failures when using Kafka's group management facilities.	Ignored
ssl.key.password	The password of the private key in the key store file. This is optional for client.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.keystore.location	The location of the key store file. This is optional for client and can be used for two-way authentication for client.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.

Name	Description	Supported for consumers in HPE Ezmeral Data Fabric Streams?
ssl.keystore.password	The store password for the key store file. This is optional for client and only needed if ssl.keystore.location is configured.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.truststore.location	The location of the trust store file.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.truststore.password	The password for the trust store file.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
auto.offset.reset	<p>What to do when there is no initial offset in Kafka or if the current offset does not exist any more on the server (e.g. because that data has been deleted):</p> <p><b>earliest</b>            automatically reset the offset to the earliest offset</p> <p><b>latest</b>                automatically reset the offset to the latest offset</p> <p><b>none</b>                    throw exception to the consumer if no previous offset is found for the consumer's group</p> <p><b>anything else</b>        throw exception to the consumer.</p>	Yes
connections.max.idle.ms	Close idle connections after the number of milliseconds specified by this config.	Ignored
enable.auto.commit	If true the consumer's offset will be periodically committed in the background.	Yes
partition.assignment.strategy	The class name of the partition assignment strategy that the client will use to distribute partition ownership amongst consumer instances when group management is used	Ignored. HPE Ezmeral Data Fabric Streams distributes partitions equally among the consumers in a group.
receive.buffer.bytes	The size of the TCP receive buffer (SO_RCVBUF) to use when reading data.	Ignored.

Name	Description	Supported for consumers in HPE Ezmeral Data Fabric Streams?
request.timeout.ms	The configuration controls the maximum amount of time the client will wait for the response of a request. If the response is not received before the timeout elapses the client will resend the request if necessary or fail the request if retries are exhausted.	Ignored. HPE Ezmeral Data Fabric Streams has a similar parameter: <code>streams.rpc.timeout.ms</code>
sasl.kerberos.service.name	The Kerberos principal name that Kafka runs as. This can be defined either in Kafka's JAAS config or in Kafka's config.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
security.protocol	Protocol used to communicate with brokers. Currently only PLAINTEXT and SSL are supported.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
send.buffer.bytes	The size of the TCP send buffer (SO_SNDBUF) to use when sending data.	Ignored.
ssl.enabled.protocols	The list of protocols enabled for SSL connections. TLSv1.2, TLSv1.1 and TLSv1 are enabled by default.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.keystore.type	The file format of the key store file. This is optional for client. Default value is JKS	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.protocol	The SSL protocol used to generate the SSLContext. Default setting is TLS, which is fine for most cases. Allowed values in recent JVMs are TLS, TLSv1.1 and TLSv1.2. SSL, SSLv2 and SSLv3 may be supported in older JVMs, but their usage is discouraged due to known security vulnerabilities.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.provider	The name of the security provider used for SSL connections. Default value is the default security provider of the JVM.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.truststore.type	The file format of the trust store file. Default value is JKS.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
auto.commit.interval.ms	The frequency in milliseconds that the consumer offsets are auto-committed to Kafka if <code>enable.auto.commit</code> is set to true.	Yes

Name	Description	Supported for consumers in HPE Ezmeral Data Fabric Streams?
check.crcs	Automatically check the CRC32 of the records consumed. This ensures no on-the-wire or on-disk corruption to the messages occurred. This check adds some overhead, so it may be disabled in cases seeking extreme performance.	Ignored. HPE Ezmeral Data Fabric Streams always does end-to-end crc computation and verification.
client.id	An id string to pass to the server when making requests. The purpose of this is to be able to track the source of requests beyond just ip/port by allowing a logical application name to be included in server-side request logging.	Yes
fetch.max.wait.ms	The maximum amount of time the server will block before answering the fetch request if there isn't sufficient data to immediately satisfy the requirement given by fetch.min.bytes.	No
metadata.max.age.ms	The period of time in milliseconds after which we force a refresh of metadata even if we haven't seen any partition leadership changes to proactively discover any new brokers or partitions.	Yes
metric.reporters	A list of classes to use as metrics reporters. Implementing the MetricReporter interface allows plugging in classes that will be notified of new metric creation. The JmxReporter is always included to register JMX statistics.	No
metrics.num.samples	The number of samples maintained to compute metrics.	No
metrics.sample.window.ms	The number of samples maintained to compute metrics.	No
reconnect.backoff.ms	The amount of time to wait before attempting to reconnect to a given host. This avoids repeatedly connecting to a host in a tight loop. This backoff applies to all requests sent by the consumer to the broker.	Ignored. HPE Ezmeral Data Fabric Streams has a similar parameter: <code>streams.rpc.timeout.ms</code>
retry.backoff.ms	The amount of time to wait before attempting to retry a failed fetch request to a given topic partition. This avoids repeated fetching-and-failing in a tight loop.	Ignored. HPE Ezmeral Data Fabric Streams has a similar parameter: <code>streams.rpc.timeout.ms</code>
sasl.kerberos.kinit.cmd	Kerberos kinit command path. Default is <code>/usr/bin/kinit</code>	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.

Name	Description	Supported for consumers in HPE Ezmeral Data Fabric Streams?
sasl.kerberos.min.time.before.relogin	Login thread sleep time between refresh attempts.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
sasl.kerberos.ticket.renew.jitter	Percentage of random jitter added to the renewal time.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
sasl.kerberos.ticket.renew.window.factor	Login thread will sleep until the specified window factor of time from last refresh to ticket's expiry has been reached, at which time it will try to renew the ticket.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.cipher.suites	A list of cipher suites. This is a named combination of authentication, encryption, MAC and key exchange algorithm used to negotiate the security settings for a network connection using TLS or SSL network protocol. By default all the available cipher suites are supported.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.endpoint.identification.algorithm	The endpoint identification algorithm to validate server hostname using server certificate.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.keymanager.algorithm	The algorithm used by key manager factory for SSL connections. Default value is the key manager factory algorithm configured for the Java Virtual Machine.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.
ssl.trustmanager.algorithm	The algorithm used by trust manager factory for SSL connections. Default value is the trust manager factory algorithm configured for the Java Virtual Machine.	Ignored. Authentication and authorization are handled through HPE Ezmeral Data Fabric security. See <a href="#">Security</a> on page 822 for more information.

### HPE Ezmeral Data Fabric Streams Parameters

The following HPE Ezmeral Data Fabric Streams parameters are for the Admin API.

Table

HPE Ezmeral Data Fabric Streams Parameter	Description	Kafka Parameter Replaced
<code>streams.rpc.timeout.ms</code>	<p>Specifies the length of time in milliseconds to wait for a response from the HPE Ezmeral Data Fabric Streams server if soft mount is configured (<code>fs.mapr.hardmount</code> is set to false). Default: 120000 Minimum: 30000</p> <p> <b>NOTE:</b> Applicable as of MapR 6.0.1, is used instead of <code>fs.mapr.rpc.timeout</code></p>	<p><code>request.timeout.ms</code>  <code>reconnect.backoff.ms</code>  <code>retry.backoff.ms</code></p>

The following HPE Ezmeral Data Fabric Streams parameter are for the Producer API:

Table

HPE Ezmeral Data Fabric Streams Parameter	Description	Kafka Parameter Replaced
<code>streams.buffer.max.time.ms</code>	<p>Messages are buffered in the producer for at most the specified time. A thread will flush all the messages that have been buffered for more than the time specified.</p> <p>Default: 3 * 1000 msec</p>	<code>linger.ms</code>
<code>streams.parallel.flushers.per.partition</code>	<p>If enabled, producer may have multiple parallel send requests to the server for each topic partition. If this setting is set to true, it is possible for messages to be sent out of order.</p> <p>Default: true</p>	<code>max.in.flight.requests.per.connection</code>
<code>streams.partition.class</code>	<p>The class that implements the <code>StreamsPartitioner</code> interface. This interface lets you write custom algorithms for determining which topic and partition to use for messages that match specific criteria. Use this configuration parameter only for producers that are written in Java.</p>	Not applicable.

Table (Continued)

HPE Ezmeral Data Fabric Streams Parameter	Description	Kafka Parameter Replaced
streams.producer.default.stream	<p>Specifies the stream that the producer will use by default if the producer does not provide the name of a stream when specifying a topic to write to.</p> <p>For example, the producer can specify the name of a stream together with the name of a topic to write to, like this:</p> <pre>&lt;stream&gt;/&lt;topic&gt;</pre> <p>However, if the stream is not specified, the value of this configuration parameter is assumed to be the stream in which the topic is located.</p> <p>If the producer specifies the name of a topic without also providing the path and name of the stream, and there is no value for this configuration parameter, HPE Ezmeral Data Fabric Streams assumes that the topic specified is in Apache Kafka and does nothing.</p>	Not applicable.
streams.rpc.timeout.ms	<p>Specifies the length of time in milliseconds to wait for a response from the HPE Ezmeral Data Fabric Streams server if soft mount is configured (fs.mapr.hardmount is set to false). Default: 30000 Minimum: 30000</p> <p>If the time expires while a producer waits for a response from the HPE Ezmeral Data Fabric Streams server, and the producer used the <code>KafkaProducer.send(ProducerRecord&lt;K,V&gt; record, Callback callback)</code> method, the callback is invoked with the error <code>EAGAIN</code>, which means "Resource temporarily unavailable."</p> <p> <b>NOTE:</b> Applicable as of MapR 6.0.1, is used instead of <code>fs.mapr.rpc.timeout</code></p>	<pre>max.block.ms request.timeout.ms timeout.ms reconnect.backoff.ms retry.backoff.ms</pre>

The following HPE Ezmeral Data Fabric Streams parameters are for the Consumer API:

Table

HPE Ezmeral Data Fabric Streams Parameter	Description	Kafka Parameter Replaced
<code>streams.consumer.default.stream</code>	Specifies the path and name of the stream that the consumer subscribes to if, when subscribing to a topic, the consumer does not specify a stream.  This default value is also used for the <code>KafkaConsumer.listTopics()</code> method.	Not applicable.
<code>streams.rpc.timeout.ms</code>	Specifies the length of time in milliseconds to wait for a response from the HPE Ezmeral Data Fabric Streams server if a soft mount is configured ( <code>fs.mapr.hardmount</code> is set to false). Default: 305000 Minimum: 300000   <b>NOTE:</b> Applicable as of MapR 6.0.1, is used instead of <code>fs.mapr.rpc.timeout</code>	<code>request.timeout.ms</code> <code>reconnect.backoff.ms</code> <code>retry.backoff.ms</code>

## HPE Ezmeral Data Fabric Streams C Applications

You can develop C applications for HPE Ezmeral Data Fabric Streams. The HPE Ezmeral Data Fabric Streams C Client is a distribution of `librdkafka` that works with HPE Ezmeral Data Fabric Streams. The HPE Ezmeral Data Fabric Streams C Client is available in Ecosystem Pack (EEP) 3.0 and later.

The following Apache Kafka `librdkafka` versions are supported:

Table

Core release	EEP Release	Kafka <code>librdkafka</code> version
As of 6.0.1	As of 5.0	0.11.3
As of 5.2.1 through 6.0.0	As of 3.0	0.9.0

The HPE Ezmeral Data Fabric Streams C Client supports a majority of the `librdkafka` C APIs plus additional [configuration properties](#) that are available only with HPE Ezmeral Data Fabric Streams. When developing applications for HPE Ezmeral Data Fabric Streams or migrating Kafka applications to HPE Ezmeral Data Fabric Streams, see the list of [librdkafka APIs Supported by HPE Ezmeral Data Fabric Streams C Client](#) on page 3608 which also describes API behavior. Reference [rdkafka.h](#) for API signatures.

When developing and running HPE Ezmeral Data Fabric Streams C applications, note the following:

- You can create producers and high-level consumers. Low-level consumers are not supported.
- Consuming or producing topics in a Kafka cluster is not supported.
- As of HPE Ezmeral Data Fabric 6.0, the HPE Ezmeral Data Fabric Streams offset values start at 0.
- HPE Ezmeral Data Fabric Security is supported. Kafka application-level security is not supported. See [Security](#) on page 822.
- User impersonation is not supported.

**CAUTION:** As of HPE Ezmeral Data Fabric 6.1, the `mapr-core` package has a dependency on `mapr-librdkafka`. If the `mapr-librdkafka` package is installed, do not remove it manually. Doing so could result in the removal of HPE Ezmeral Data Fabric core packages, rendering the node unusable.

## Configuring the HPE Ezmeral Data Fabric Streams C Client

After installing the HPE Ezmeral Data Fabric Client and before developing applications, you must configure your client C library by setting the library path.

### Linux

For Linux installations, add `/opt/mapr/lib` to the end of `LD_LIBRARY_PATH`.

```
export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:/opt/mapr/lib
```

**!** **IMPORTANT:** For HPE Ezmeral Data Fabric 6.0.1, the `libjvm.so` configuration is *not* required.

For HPE Ezmeral Data Fabric 6.0.0 and earlier, add the `/opt/mapr/lib` and the path to the directory that contains `libjvm.so` to the end of `LD_LIBRARY_PATH`.

```
export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:/opt/mapr/lib:<path_to_libjvm.so_directory>
```

The location of the `libjvm.so` differs based on where you installed Java. You can use `find / -name libjvm*` to determine the file location. For example, if the `libjvm.so` file is in the following location:

```
/usr/lib/jvm/java-7-openjdk-amd64/jre/lib/amd64/server/libjvm.so
```

Then, you set the library path like this:

```
export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:/opt/mapr/lib:/usr/lib/jvm/java-7-openjdk-amd64/jre/lib/amd64/server/
```

### Mac

For Mac installations, add `/opt/mapr/lib` to the end of `DYLD_LIBRARY_PATH`.

```
export DYLD_LIBRARY_PATH=$DYLD_LIBRARY_PATH:/opt/mapr/lib
```

**!** **IMPORTANT:** For HPE Ezmeral Data Fabric 6.0.1, the `libjvm.so` configuration is *not* required.

For HPE Ezmeral Data Fabric 6.0.0 and earlier, add `/opt/mapr/lib` and the path to the directory that contains `libjvm.dylib` to the end of `DYLD_LIBRARY_PATH`.

```
export DYLD_LIBRARY_PATH=$DYLD_LIBRARY_PATH:/opt/mapr/lib:<path_to_libjvm.dylib_directory>
```

The location of the `libjvm.dylib` differs based on where you installed Java. You can use `find / -name libjvm*` to determine the file location. For example, if the `libjvm.dylib` file is in the following location:

```
/Library/Java/JavaVirtualMachines/jdk1.8.0_121.jdk/Contents/Home/jre/lib/server/libjvm.dylib
```

Then, you set the library path like this:

```
export DYLD_LIBRARY_PATH=$DYLD_LIBRARY_PATH:/opt/mapr/lib:/Library/Java/JavaVirtualMachines/jdk1.8.0_121.jdk/Contents/Home/jre/lib/server
```

## Windows

**NOTE:** As of HPE Ezmeral Data Fabric 6.0.1, the HPE Ezmeral Data Fabric C client is available on Windows.

For Windows installations, no additional configuration is required. Link your application and run your programs against the HPE Ezmeral Data Fabric Client dynamic link libraries (dll) located at: `C:\opt\mapr\lib`. The corresponding `librdkafka` header is `C:\opt\mapr\include\librdkafka`.

### Developing a HPE Ezmeral Data Fabric Streams C Application

This topic includes basic information about how to develop a HPE Ezmeral Data Fabric Streams C application. Sample applications are provided.

#### Before you Begin

Confirm that your environment meets the following requirements:

- The HPE Ezmeral Data Fabric cluster version is 5.2.1 or greater.
- HPE Ezmeral Data Fabric core client (`mapr-client`) package is installed on the node and it is configured to access the cluster. Or, it is a HPE Ezmeral Data Fabric cluster node. See [Installing the Data Fabric Client \(Non-FIPS\)](#) on page 396 for more information.
- The HPE Ezmeral Data Fabric Streams C Client is installed and configured on the node. See [Configuring the HPE Ezmeral Data Fabric Streams C Client](#) on page 3593.
- GNU Compiler Collection (GCC) is installed on the node.

#### Creating, Compiling and Running C Apps

The following sections describes how to create a producer and consumer in C, compile the source code, generate executables, and run the applications.

##### Create Producer

This topic describes how to create a HPE Ezmeral Data Fabric Streams streams producer in C. While the code to generate a HPE Ezmeral Data Fabric Streams stream producer varies depending on the use case, in general, the producer code should contain the following:

1. Include the `rdkafka.h` header file (`/opt/mapr/include/librdkafka/rdkafka.h`)
2. Use `rd_kafka_conf_new()` to create the producer configuration.
3. Use `rd_kafka_new()` to create the producer handle.
4. Use `rd_kafka_topic_conf_new()` to create the topic configuration.
5. Use `rd_kafka_topic_new()` to create a topic handle for the producer.
6. Use `rd_kafka_produce()` to produce messages.
7. Optionally, use `rd_kafka_poll()` to poll for callbacks. This is useful to see if there are messages that have yet to be sent to the server.
8. Use `rd_kafka_topic_destroy()` to destroy the topic handle destroy
9. Use `rd_kafka_destroy()` to destroy the producer handle.

**NOTE:** For more details on the APIs, see [Supported APIs for HPE Ezmeral Data Fabric Streams C Client](#) and [rdkafka.h](#) on page 3689

For example, the following source code produces 5 messages to topic /MapR\_Streams:MapR-Topic1:

```

/*
 * This file contains the producer function.
 *
 */

#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <rdkafka.h>
#include <errno.h>

/* msgDeliveryCB: Is the delivery callback.
 * The delivery report callback will be called once for each message
 * accepted by rd_kafka_produce() with err set to indicate
 * the result of the produce request. An application must call
rd_kafka_poll()
 * at regular intervals to serve queued delivery report callbacks.
 */
static void msgDeliveryCB (rd_kafka_t *rk,
                          const rd_kafka_message_t *rkmessage, void
*opaque) {
    if (rkmessage->err != RD_KAFKA_RESP_ERR_NO_ERROR) {
        printf("FAILURE: Message not delivered to partition.\n");
        printf("ERROR: %s", rd_kafka_err2str(rkmessage->err));
    } else {
        printf("Produced: %.*s\n", (int)rkmessage->len, (const
char*)rkmessage->payload);
    }
}

/*
 * Method      : int producer(int nummsgs_p, const char *fullTopicName)
 * Description : This is a simple producer method. In this method the
producer
 *              produces messages to a topic.
 */

int producer(int nummsgs_p, const char *fullTopicName) {
    printf("***** PRODUCER *****\n");
    rd_kafka_t *prodHndle;
    rd_kafka_conf_t *prodCfg;
    char errstr[1000];
    int totalMsgs = nummsgs_p;

    printf("Create producer configuration object\n");
    /*
 * rd_kafka_conf_new(): This API creates default rd_kafka_conf_t object
to
 * be passed at the time of producer object creation using rd_kafka_new
call.
 */
    prodCfg = rd_kafka_conf_new();
    if (prodCfg == NULL) {
        printf("Failed to create conf\n");
        return (EXIT_FAILURE);
    }

}
}

```

### Create Consumer

This topic describes how to create a HPE Ezmeral Data Fabric Streams streams consumer in C. While the code to generate a HPE Ezmeral Data Fabric Streams stream consumer varies depends on the use case, in general, the consumer code should contain the following:

1. Include the rdkafka.h header file (/opt/mapr/include/librdkafka/rdkafka.h).

2. Use `rd_kafka_conf_new()` to create the consumer configuration.
3. Use `rd_kafka_conf_set()` to set the configuration parameters. For this API, you must set the "group.id."
4. Use `rd_kafka_new()` to create the consumer handle.
5. Use `rd_kafka_subscribe()` or `rd_kafka_assign()` to specify which topics to consume.
6. Use `rd_kafka_consumer_poll()` to poll for messages that are ready to be consumed.
7. Use `rd_kafka_consumer_close()` to perform auto commits and prepare to destroy the consumer handle.
8. Use `rd_kafka_destroy()` to destroy the consumer handle.

For example, the following source code consumes 5 messages from topic /MapR\_Streams:MapR-Topic1:

```

/*
 * This file contains the consumer function.
 *
 */

#include <stdio.h>
#include <stdlib.h>
#include <rdkafka.h>
#include <string.h>

/*
 * Method      : int consumer(int expected_nummsgs, const char
 *fullTopicName)
 * Description : This is a simple consumer method. In this method the
consumer
 *              consumes messages from a topic.
 */

int consumer(int expected_nummsgs, const char *fullTopicName) {
    printf("***** CONSUMER START *****\n");
    rd_kafka_t *consHndle;
    rd_kafka_conf_t *consCfg;
    rd_kafka_topic_conf_t *consTopicCfg;
    char errstr[1000];
    rd_kafka_resp_err_t errCode;

    printf("Create new consumer configuration object\n");
    /*
 * rd_kafka_conf_new(): This API creates default rd_kafka_conf_t object
to
 * be passed at the time of consumer object creation using rd_kafka_new
call.
 */
    consCfg = rd_kafka_conf_new();
    if(consCfg == NULL) {
        printf("Failed to create consumer conf\n");
        return(EXIT_FAILURE);
    }
    /*
 * rd_kafka_conf_set(): This API is used to set config parameters in the
 * rd_kafka_conf_t object. group.id Must be set for all the consumers.
 * All changes to the consCfg must be done before creating consumer
object.
 */

```

```

if(RD_KAFKA_CONF_OK != rd_kafka_conf_set(consCfg,
    "group.id", "consumerGroup",
    errstr, sizeof(errstr))) {
    printf("rd_kafka_conf_set() failed with error: %s\n", errstr);
    return (EXIT_FAILURE);
}
/*
 * rd_kafka_topic_conf_new(): This API Creates topic conf object
 * required to set the default topic configuration.
 */
printf("Set topic configurations\n");
consTopicCfg = rd_kafka_topic_conf_new();

/* rd_kafka_topic_conf_set(): This API sets the config property by name.
 * consTopicCfg should have been previously set up with
`rd_kafka_topic_conf_new()`
 * property set in this call is 'auto.offset.reset', when set to
 * earliest will return messages on rd_kafka_consumer_poll from
beginning of
 * time (for the very first time consumption) or from last committed
offset
 * for online consumer. If property is set to 'latest' it will return the
 * messages produced after consumer has started(for first time consumer)
or
 * from the last committed offset for online consumer
 */
if (RD_KAFKA_CONF_OK != rd_kafka_topic_conf_set(consTopicCfg,

}
}

```

**NOTE:** For more details on the APIs, see [Supported APIs for HPE Ezmeral Data Fabric Streams C Client](#) and [rdkafka.h](#) on page 3689

### Compile the Apps

This topic describes how to compile HPE Ezmeral Data Fabric Streams streams producers and consumers in C. When you compile a HPE Ezmeral Data Fabric Streams C application, you must link it with the `librdkafka` library in the `/opt/mapr/lib/` library path and include the header file directory to ensure that your application references the header file included with HPE Ezmeral Data Fabric Streams C Client.

**IMPORTANT:** For MapR 6.0.0 and earlier, When you compile a HPE Ezmeral Data Fabric Streams C application, you must link it with the `librdkafka` library in the `/opt/mapr/lib/` library path, *the `libjvm` library*, and include the header file directory to ensure that your application references the header file included with HPE Ezmeral Data Fabric Streams C Client.

The following steps compile the source code and generate executables in the same directory as the Makefile. For example, in the `librdkafka_example` directory, the `consumer` and `producer` executables are generated from the `producer.c` and `consumer.c` source files.

1. On your node, create a directory. For example: `librdkafka_example`.
2. In your directory (`librdkafka_example`), create a producer application. For example, if you are using the provided sample producer application:
  - a. Create a file named `producer.c`.
  - b. Copy the contents of the sample producer application into that file.
3. In your directory (`librdkafka_example`), create a consumer application. For example, if you are using the provided sample consumer application:
  - a. Create a file named `consumer.c`.
  - b. Copy the contents of the sample consumer application into that file.

4. In your directory (**librdkafka\_example**), create a file named Makefile with the following content:

```
CC= g++
HEADERDIR=/opt/mapr/include/librdkafka/
CCFLAGS= -Wall -I$(HEADERDIR) -g -std=c99

export LD_LIBRARY_PATH=/opt/mapr/lib

LIBDIR= /opt/mapr/lib/
%.o: %.c
    gcc $(CCFLAGS) -c $<

consumer: consumer.o
    gcc -o $@ $@.o -lrdkafka -L$(LIBDIR) $(CCFLAGS)

producer: producer.o
    gcc -o $@ $@.o -lrdkafka -L$(LIBDIR) $(CCFLAGS)

all: consumer producer

clean:
    /bin/rm -f *.o consumer producer
```

**IMPORTANT:** For MapR 6.0.0 and earlier, use the following Makefile:

```
CC= g++
HEADERDIR=/opt/mapr/include/librdkafka/
CCFLAGS= -Wall -I$(HEADERDIR) -g -std=c99

#Edit JAVA_HOME to be appropriate for your environment
JAVA_HOME=/usr/lib/jvm/java-7-openjdk-amd64/
export LD_LIBRARY_PATH=/opt/mapr/lib:$(JAVA_HOME)/jre/lib/amd64/
server

LIBDIR= /opt/mapr/lib/
%.o: %.c
    gcc $(CCFLAGS) -c $<

consumer: consumer.o
    gcc -o $@ $@.o -lrdkafka -L$(LIBDIR) $(CCFLAGS)

producer: producer.o
    gcc -o $@ $@.o -lrdkafka -L$(LIBDIR) $(CCFLAGS)

all: consumer producer

clean:
    /bin/rm -f *.o consumer producer
```

5. Complete the following edits to the Makefile:

For Mac users, locate the following line of code:

```
export LD_LIBRARY_PATH=/opt/mapr/lib
```

Then, replace this line with the following line of code:

```
export DYLD_LIBRARY_PATH=/opt/mapr/lib
```

**IMPORTANT:** For MapR 6.0.0 and earlier, the following steps apply:

- a. For Mac users, locate the following line of code:

```
export LD_LIBRARY_PATH=/opt/mapr/lib:$(JAVA_HOME)/jre/lib/amd64/
server
```

Then, replace this line with the following line of code:

```
export DYLD_LIBRARY_PATH=/opt/mapr/lib:$(JAVA_HOME)/jre/lib/server
```

- b. Based on your environment, edit `JAVA_HOME`. This ensures that `LD_LIBRARY_PATH` or `DYLD_LIBRARY_PATH` will include the full path to the directory containing the `libjvm` library.

**NOTE:** You can use `find / -name libjvm*` to determine the `JAVA_HOME` directory on your machine. However, note that the results of this command include the full path to the `libjvm` file not just the `JAVA_HOME` directory.

For example, `JAVA_HOME` may be set to `Library/Java/JavaVirtualMachines/jdk1.8.0_121.jdk/Contents/Home/` on a Mac and `JAVA_HOME` may be set to `/usr/lib/jvm/java-1.7.0-openjdk-1.7.0.79.x86_64/` on Linux.

6. From your directory (**librdkafka\_example**), run the following commands to compile the source code:

```
make clean
```

```
make all
```

## Run the Apps

Once you have the application executables, complete the following steps to run the application:

1. On a cluster node, use the `maprcli` to create a stream. For example, **MapR\_Streams**.

```
maprcli stream create -path /MapR_Streams
```

**NOTE:** As long as `autocreate` is enabled for the stream when you run `stream create`, the producer will create the topic. By default, `autocreate` is enabled. For more information, see [stream create](#) on page 2373.

2. At the command line, set the library path to include `/opt/mapr/lib` and the path to the directory that contains the `libjvm` library. For more information, see [Configuring the HPE Ezmeral Data Fabric Streams C Client](#) on page 3593.

**NOTE:** You must complete this step at the command line even though you already set the library path in the Makefile. If you do not complete the step, an error similar to the following displays when you run the application in the next step: `error while loading shared libraries: librdkafka.so.1: cannot open shared object file: No such file or directory`

- From your directory (**librdkafka\_example**), run the producer application from the command line. For example, if the application is called producer:

```
./producer
```

The following appears on the console assuming that the stream name is MapR\_Streams:

```
***** PRODUCER *****
Create producer configuration object
Create Producer Kafka handle
Create topic handle
Send/Produce message to topic: /MapR_Streams:MapR-Topic1
Wait for messages to be delivered
Produced: Welcome to MapR Streams CAPI
Produced: MapR Streams CAPI Message Payload 1
Produced: MapR Streams CAPI Message Payload 2
Produced: MapR Streams CAPI Message Payload 3
Produced: MapR Streams CAPI Message Payload 4

Destroy topic handle
Destroy producer handle

PASS: 5 messages produced and sent to topic partition /
MapR_Streams:MapR-Topic1
```

- From your directory (**librdkafka\_example**), run the consumer application from the command line. For example, if the application is called consumer:

```
./consumer
```

The following appears on the console assuming that the stream name is MapR\_Streams:

```
***** CONSUMER START *****
Create new consumer configuration object
Set topic configurations
Create consumer Kafka handle
Create topic partition list for topic: /MapR_Streams:MapR-Topic1
Subscribe consumer to the topic:
Destroy topic partition list:

Start message consumption:
1 Consumed: Welcome to MapR-ES CAPI
2 Consumed: MapR Streams CAPI Message Payload 1
3 Consumed: MapR Streams CAPI Message Payload 2
4 Consumed: MapR Streams CAPI Message Payload 3
5 Consumed: MapR Streams CAPI Message Payload 4

Commit the offsets before closing the consumer

Close and destroy consumer handle

PASS: 5 messages consumed from topic /MapR_Streams:MapR-Topic1
```

### Migrating Kafka C Applications to HPE Ezmeral Data Fabric Streams

With some modification, you can use existing Kafka C applications to consume and produce topics in HPE Ezmeral Data Fabric Streams. The HPE Ezmeral Data Fabric Streams C Client is a distribution of librdkafka that is compatible with HPE Ezmeral Data Fabric Streams.

- Install and [configure the MapR Streams C Client](#).

- When you refer to a topic in the application code, include the path and name of the stream in which the topic is located:

```
/<path and name of stream>:<name of topic>
```

For example, you might have a stream in a HPE Ezmeral Data Fabric cluster that is named `stream_A`, and the stream might be in a volume named `IoT` and in a directory named `automobile_sensors`. You want to redirect a producer application to a topic in that stream. The syntax of the path to the topic might look like this: `/mapr/IoT/automobile_sensors/stream_A:<name of topic>`.

**NOTE:** Optionally, use the `streams.consumer.default.stream` and `streams.producer.default.stream` configuration parameters. When you configure these parameters, applications can specify just the topic name to write or read from the default stream. To use these HPE Ezmeral Data Fabric-specific parameters in your application, compile your application with the `rdkafka.h` file (`/opt/mapr/include/librdkafka/rdkafka.h`) that was installed with the HPE Ezmeral Data Fabric Streams C Client. See the [Compile the Apps](#) on page 3603 section of [Developing a HPE Ezmeral Data Fabric Streams C Application](#) on page 3594.

- See [Configuration Properties for HPE Ezmeral Data Fabric Streams C Client](#) on page 3679 for the list of supported configuration parameters, including a few parameters that are HPE Ezmeral Data Fabric-specific. Make changes to your application, as needed.

**NOTE:** SSL-related configuration parameters are ignored. When you set these parameters, the HPE Ezmeral Data Fabric Streams Client issues a warning indicating that the parameters are not supported.

- Review the list of `librdkafka` APIs that are **not** supported by the HPE Ezmeral Data Fabric Streams C Client and make changes to your application, as needed.

**Simple/low level consumer APIs that are not supported**

- `rd_kafka_queue_new`
- `rd_kafka_queue_destroy`
- `rd_kafka_consume_start`
- `rd_kafka_consume_start_queue`
- `rd_kafka_consume_stop`
- `rd_kafka_consume`
- `rd_kafka_consume_batch`
- `rd_kafka_consume_callback`
- `rd_kafka_consume_queue`
- `rd_kafka_consume_batch_queue`
- `rd_kafka_consume_callback_queue`
- `rd_kafka_offset_store`
- `rd_kafka_pause_partitions`
- `rd_kafka_resume_partitions`

**Producer/Consumer common APIs that are not supported**

- `rd_kafka_conf_set_dr_cb`

- rd\_kafka\_conf\_set\_throttle\_cb
- rd\_kafka\_conf\_set\_stats\_cb
- rd\_kafka\_conf\_set\_socket\_cb
- rd\_kafka\_conf\_set\_open\_cb
- rd\_kafka\_conf\_dump
- rd\_kafka\_conf\_dump\_free
- rd\_kafka\_name
- rd\_kafka\_set\_log\_level
- rd\_kafka\_mem\_free
- rd\_kafka\_set\_log\_level
- rd\_kafka\_mem\_free

**Topic APIs that are not supported**

- rd\_kafka\_query\_watermark\_offsets  
 **NOTE:** As of HPE Ezmeral Data Fabric 6.0.1, this API is supported.
- rd\_kafka\_get\_watermark\_offsets  
 **NOTE:** As of HPE Ezmeral Data Fabric 6.0.1, this API is supported.

**Cluster APIs that are not supported**

- rd\_kafka\_memberid
- rd\_kafka\_metadata
- rd\_kafka\_metadata\_destroy

**Miscellaneous APIs that are not supported**

- rd\_kafka\_version
- rd\_kafka\_version\_str
- rd\_kafka\_get\_debug\_contexts
- rd\_kafka\_dump
- rd\_kafka\_thread\_cnt
- rd\_kafka\_message\_timestamp

**librdkafka APIs Supported by HPE Ezmeral Data Fabric Streams C Client**

This topic lists the librdkafka APIs supported by the HPE Ezmeral Data Fabric Streams C Client. It also describes behavior differences between librdkafka and the HPE Ezmeral Data Fabric Streams C Client.

**Table**

Core release	EEP Release	Kafka librdkafka version
As of HPE Ezmeral Data Fabric 6.0.1	As of 5.0	0.11.3
As of HPE Ezmeral Data Fabric 5.2.1 through 6.0.0	As of 3.0	0.9.0

This topic contains the following supported APIs:

- [Producer APIs](#) on page 3609
- [Consumer APIs](#) on page 3611
- [Producer/Consumer Common APIs](#) on page 3618
- [Topic APIs](#) on page 3625
- [Queue APIs](#) on page 3640
- [Event APIs](#) on page 3646
- [Timestamp APIs](#) on page 3651
- [Interceptors APIs](#) on page 3652
- [Cluster Configuration APIs](#) on page 3670
- [Miscellaneous API](#) on page 3671

**Producer APIs**

API Behavior
<p>Same as librdkafka. Available as of librdkafka 0.11.3. Supported as of HPE Ezmeral Data Fabric 6.0.1.</p>
<p>Same as librdkafka.</p>

<b>A P I Behavior</b>
<p>When this API is called with NULL payload, an invalid argument error is sent to the callback. librdkafka creates a message with NULL payload and key value instead.</p> <p>librdkafka produces</p>
<p>Same as librdkafka. This API should be used with either RD_KAFKA_V_TOPIC or RD_KAFKA_V_RKT. Available as of librdkafka 0.11.3. Supported as of HPE Ezmeral Data Fabric 6.0.1.</p> <p>librdkafka produces</p>
<p>When this API is called with NULL payload, an invalid argument error is sent to the callback. librdkafka creates a message with NULL payload and key value instead.</p> <p>librdkafka produces</p>

A P I Behavior
<p>This API returns a positive number to indicate that messages are waiting to be produced to a streams topic but the value does not indicate the actual number of messages. librdkafka returns the actual number of messages that are waiting to be sent to or acknowledged by the broker.</p>

### Consumer APIs

A P I Behavior
<p>If this API is called for a consumer that is already subscribed to topics, no operation is performed.</p>
<p>This API returns the number of topic partitions the consumer is assigned to. However, it returns 0 when topic partitions have yet to be created by the producer. librdkafka returns the number of partitions assigned to a consumer even when the partitions have not been created.</p> <p> <b>NOTE:</b> For this API to work, the argument <code>partitions</code> must be explicitly allocated or initialized with either <code>rd_kafka_topic_partition_list_t *parts = NULL</code> or <code>rd_kafka_topic_partition_list_new(0)</code>; For example:</p> <pre>RD_EXPORT rd_kafka_resp_err_t rd_kafka_assignment (rd_kafka_t *rk,                     rd_kafka_topic_partition_list_t **partitions);</pre>

A P Behavior
Same as librdkafka. d k a k a c o m m
Same as librdkafka. d k a k a c o m m e s s a g e
Same as librdkafka.  <b>NOTE:</b> The HPE Ezmeral Data Fabric Streams offset starts at 1. d k a k a c o m m e d

A P Behavior
Same as librdkafka.
Same as librdkafka.  <b>NOTE:</b> For librdkafka 0.9: If the consume callback was set and messages were polled using <code>rd_kafka_consumer_poll()</code> , then the consume callback gets called and the messages can be consumed in the callback. For librdkafka 0.11.3: If the consume callback is set and messages are polled using <code>rd_kafka_consumer_poll()</code> , the consume callback is not called. The result is that you cannot consume messages in the consume callback when using <code>rd_kafka_consumer_poll()</code> .

Same as librdkafka.

This API can only be used by consumers that are subscribed to at least one stream on the cluster and have a default stream configured with the streams.consumer.default.stream parameter. It returns the group list of subscribed consumers associated with the default stream. librdkafka returns all consumer groups from the cluster instead.

**NOTE:** This API returns RD\_KAFKA\_RESP\_ERR\_\_TIMED\_OUT when the querying consumer is not subscribed to any topic.

A P Behavior
Same as librdkafka. d k a k a m e s s a g e d e s t r o y
Same as librdkafka. d k a k a o o s e t c o n s u m e

A P Behavior
r This API returns 0 when the messages have not yet been consumed from partitions. librdkafka returns -1001 d n s t o n
r Same as librdkafka. d k a f k a s e e k
r Same as librdkafka. d k a f k a s u b s c r i b e

<p><b>A</b> <b>P</b> <b>I</b> <b>Behavior</b></p>	<p>This API allows either a list of topics from one or more streams or a regex expression for topics from a single stream. For example, regex expression <code>/streamA:^t*a,/streamA:^t*b</code> is supported but <code>/streamA:^t*a,/streamB:^t*a</code> is not supported. librdkafka accepts both options in the same call.</p> <p> <b>NOTE:</b> You cannot use the <code>rd_kafka_subscribe</code> API to subscribe a consumer to topics when that consumer is already assigned to topics. If you call this API for an assigned consumer, error <code>RD_KAFKA_RESP_ERR__CONFLICT</code> is returned.</p>
	<p>Same as librdkafka.</p>

A P Behavior
Same as librdkafka.
When you are querying or retrieving a topic that is non-existent topic/partition (using <code>rd_kafka_query_watermark_offsets()</code> and <code>rd_kafka_get_watermark_offsets()</code> APIs), the timeout is honored even though you still receive the correct error message. Supported as of HPE Ezmeral Data Fabric 6.0.1.

<b>A P Behavior</b>	<p>When you are querying or retrieving a topic that is non-existent topic/partition (using <code>rd_kafka_query_watermark_offsets()</code> and <code>rd_kafka_get_watermark_offsets()</code> APIs), the timeout is honored even though you still receive the correct error message.</p> <p>Supported as of HPE Ezmeral Data Fabric 6.0.1.</p>
-----------------------------	---

**Additional Information**

For more information and API signatures, see [rdkafka.h](#) on page 3689.

**librdkafka APIs NOT Supported by HPE Ezmeral Data Fabric Streams C Client**

This topic lists the librdkafka APIs that are *not* supported by the HPE Ezmeral Data Fabric Streams C Client.

These APIs are also documented in the [rdkafka.h](#) on page 3689 as not support by HPE Ezmeral Data Fabric Streams. If you want to see the list of supported librdkafka APIs, see [librdkafka APIs Supported by HPE Ezmeral Data Fabric Streams C Client](#) on page 3608.

**NOTE:** This list of librdkafka APIs *not* supported is applicable to HPE Ezmeral Data Fabric 6.0.1 and librdkafka 0.11.3.

**Configuration Properties for HPE Ezmeral Data Fabric Streams C Client**

This topic describes the configuration properties supported by the HPE Ezmeral Data Fabric Streams C Client. This includes librdkafka configuration properties that HPE Ezmeral Data Fabric Streams supports and additional properties that are specific to HPE Ezmeral Data Fabric Streams.

**Global Configuration Properties**

P r o p e r t y N a m e	Behavior
c	Same as librdkafka.
e n t r y n a m e	See <a href="#">Configuring Properties for Message Size</a> on page 3825.

P r o p e r t y N a m e	Behavior
r e c e i v e m e s s a g e m a x i m u m s	See <a href="#">Configuring Properties for Message Size</a> on page 3825.
t o c o n f i g u r e	Same as librdkafka.
e r r o r c o d e	Same as librdkafka.

<p><b>Behavior</b></p>
<p>Same as librdkafka.</p>
<p>Same as librdkafka.</p>
<p>Same as librdkafka. Available as of librdkafka 0.11.3. Supported as of HPE Ezmeral Data Fabric 6.0.1.</p>

P r o p e r t y N a m e	Behavior
u e e o u t e c o n t e n t s	Same as librdkafka. Available as of librdkafka 0.11.3. Supported as of HPE Ezmeral Data Fabric 6.0.1.

### Consumer Configuration Properties

P r o p e r t y N a m e	Behavior
d	Same as librdkafka.
g	Same as librdkafka.
e	Same as librdkafka.

<p><b>Behavior</b></p>
<p>Same as librdkafka.</p>
<p>Same as librdkafka.</p>
<p>Same as librdkafka.</p>

P r o p e r t y N a m e	Behavior
e v e r y o b j e c t	Same as librdkafka.
t m s g c b	Same as librdkafka.

## Topic Configuration

P r o p e r t y N a m e	Behavior
a r r t e r b	Same as librdkafka.
a u t o n o t e	Supports the following values: beginning, end, earliest, latest, none, smallest, and largest. As of HPE Ezmeral Data Fabric 6.0.1, beginning and end are supported.  <b>NOTE:</b> librdkafka additionally supports error.

## HPE Ezmeral Data Fabric-Specific Configurations

<p>Property Name</p>	
<p>Behavior</p>	<p>Specifies the path and name of the stream that the consumer subscribes to if, when subscribing to a topic, the consumer does not specify a stream. For example, the consumer can specify the name of a stream together with the name of a topic to write to, like this: /&lt;stream&gt;:&lt;topic&gt;.</p> <p> <b>NOTE:</b> rd_kafka_list groups API uses this consumer configuration to obtain the consumer groups.</p>

Property Name	
Behavior	<p>Enables the producer to have multiple parallel send requests to the server for each topic partition. When this property is set to true, the default value, it is possible for messages to be sent out of order.</p>

<b>Property Name Behavior</b>	<p>Specifies the stream that the producer will use by default if the producer does not provide the name of a stream when specifying a topic to write to. For example, the producer can specify the name of a stream together with the name of a topic to write to, like this: <code>/&lt;stream&gt;:&lt;topic&gt;</code>. However, if the stream is not specified, the value of this configuration parameter is assumed to be the stream in which the topic is located. If the producer specifies the name of a topic without also providing the path and name of the stream, and there is no value for this configuration parameter, HPE Ezmeral Data Fabric Streams assumes that the topic specified is in Apache Kafka and does nothing.</p>
-------------------------------	---

### Additional Information

For more information, see [rdkafka.h](#) on page 3689.

#### **rdkafka.h**

This rdkafka header file has been updated to be compatible with HPE Ezmeral Data Fabric Streams. After you install the HPE Ezmeral Data Fabric Streams C Client, this file is available in the following directory: `/opt/mapr/include/librdkafka/`

#### **librdkafka 0.11.3**

Apache librdkafka 0.11.3 is supported as of HPE Ezmeral Data Fabric 6.0.1/EEP5.0.

**IMPORTANT:** With this release, the `RD_KAFKA_MSG_F_BLOCK` call provides *blocking* behavior, whereas, the `RD_KAFKA_MSG_F_COPY` and `RD_KAFKA_MSG_F_FREE` calls are *non-blocking* (this is a behavior change from previous releases).

/**
 * @brief \b Consumer: Set rebalance callback for use with
 *
 * coordinated consumer group balancing.
 *
 * The \p err field is set to either RD_KAFKA_RESP_ERR__ASSIGN_PARTITIONS
 * or RD_KAFKA_RESP_ERR__REVOKE_PARTITIONS and 'partitions'
 * contains the full partition set that was either assigned or revoked.
 *
 * Registering a \p rebalance_cb turns off librdkafka's automatic
 * partition assignment/revocation and instead delegates that responsibility
 * to the application's \p rebalance_cb.
 *
 * The rebalance callback is responsible for updating librdkafka's
 * assignment set based on the two events:
RD_KAFKA_RESP_ERR__ASSIGN_PARTITIONS
 * and RD_KAFKA_RESP_ERR__REVOKE_PARTITIONS but should also be able to
handle
 * arbitrary rebalancing failures where \p err is neither of those.
 * @remark In this latter case (arbitrary error), the application must
 * call rd_kafka_assign(rk, NULL) to synchronize state.
 *
 * Without a rebalance callback this is done automatically by librdkafka
 * but registering a rebalance callback gives the application flexibility
 * in performing other operations along with the assigning/revocation,
 * such as fetching offsets from an alternate location (on assign)
 * or manually committing offsets (on revoke).
 *
 * @remark The \p partitions list is destroyed by librdkafka on return
 * return from the rebalance_cb and must not be freed or
 * saved by the application.
 *
 * The following example shows the application's responsibilities:
 * @code
 * static void rebalance_cb (rd_kafka_t *rk, rd_kafka_resp_err_t err,
 *                          rd_kafka_topic_partition_list_t *partitions,
 *                          void *opaque) {
 *
 *     switch (err)
 *     {
 *     case RD_KAFKA_RESP_ERR__ASSIGN_PARTITIONS:

```

```

*          // application may load offsets from arbitrary external
*          // storage here and update \p partitions
*
*          rd_kafka_assign(rk, partitions);
*          break;
*
*          case RD_KAFKA_RESP_ERR__REVOKE_PARTITIONS:
*              if (manual_commits) // Optional explicit manual commit
*                  rd_kafka_commit(rk, partitions, 0); // sync commit
*
*              rd_kafka_assign(rk, NULL);
*              break;
*
*          default:
*              handle_unlikely_error(err);
*              rd_kafka_assign(rk, NULL); // sync state
*              break;
*      }
*  }
* @endcode

*      message queue is full.
*/

/**
 * @brief Produce and send a single message to broker.
 *
 * \p rkt is the target topic which must have been previously created with
 * `rd_kafka_topic_new()`.
 *
 * `rd_kafka_produce()` is an asynch non-blocking API.
 *
 * \p partition is the target partition, either:
 * - RD_KAFKA_PARTITION_UA (unassigned) for
 *   automatic partitioning using the topic's partitioner function, or
 * - a fixed partition (0..N)
 *
 * \p msgflags is zero or more of the following flags OR'ed together:
 * RD_KAFKA_MSG_F_BLOCK - block \p produce*() call if
 * \p queue.buffering.max.messages or
 * \p queue.buffering.max.kbytes are exceeded.
 * Messages are considered in-queue from the
point they
 *
 * are accepted by produce() until their
corresponding
 *
 * delivery report callback/event returns.
 *
 * It is thus a requirement to call

```

```

*         rd_kafka_poll() (or equiv.) from a separate
*         thread when F_BLOCK is used.
*         See WARNING on \c RD_KAFKA_MSG_F_BLOCK above.
*
* RD_KAFKA_MSG_F_FREE - rdkafka will free(3) \p payload when it is done
* with it.
* RD_KAFKA_MSG_F_COPY - the \p payload data will be copied and the
* \p payload pointer will not be used by rdkafka
* after the call returns.
*
* .._F_FREE and .._F_COPY are mutually exclusive.
*
* If the function returns -1 and RD_KAFKA_MSG_F_FREE was specified, then
* the memory associated with the payload is still the caller's
* responsibility.
*
* \p payload is the message payload of size \p len bytes.
*
* \p key is an optional message key of size \p keylen bytes, if non-NULL it
* will be passed to the topic partitioner as well as be sent with the
* message to the broker and passed on to the consumer.
*
* \p msg_opaque is an optional application-provided per-message opaque
* pointer that will provided in the delivery report callback (`dr_cb`) for
* referencing this message.
*
* @remark on_send() and on_acknowledgement() interceptors may be called
* from this function. on_acknowledgement() will only be called if
the
* message fails partitioning.
*
* @returns 0 on success or -1 on error in which case errno is set
accordingly:
* - ENOBUFS - maximum number of outstanding messages has been reached:
*           "queue.buffering.max.messages"
*           (RD_KAFKA_RESP_ERR__QUEUE_FULL)
* - EMSGSIZE - message is larger than configured max size:
*           "messages.max.bytes".
*           (RD_KAFKA_RESP_ERR_MSG_SIZE_TOO_LARGE)
* - ESRCH - requested \p partition is unknown in the Kafka cluster.
*           (RD_KAFKA_RESP_ERR__UNKNOWN_PARTITION)
* - ENOENT - topic is unknown in the Kafka cluster.
*           (RD_KAFKA_RESP_ERR__UNKNOWN_TOPIC)
*

/**
 * @name Miscellaneous APIs
 * @{
 *
 */

/**
 * @brief Adds one or more brokers to the kafka handle's list of initial
 *        bootstrap brokers.
 *
 * Additional brokers will be discovered automatically as soon as rdkafka
 * connects to a broker by querying the broker metadata.
 *
 * If a broker name resolves to multiple addresses (and possibly
 * address families) all will be used for connection attempts in
 * round-robin fashion.
 *
 * \p brokerlist is a ,-separated list of brokers in the format:
 *   \c \<broker1\>,\<broker2\>,...
 * Where each broker is in either the host or URL based format:
 *   \c \<host\>[:\<port\>]
 *   \c \<proto\>://\<host\>[:port]
 * \c \<proto\> is either \c PLAINTEXT, \c SSL, \c SASL, \c SASL_PLAINTEXT
 * The two formats can be mixed but ultimately the value of the
 * `security.protocol` config property decides what brokers are allowed.
 *
 * Example:
 *   brokerlist = "broker1:10000,broker2"
 *   brokerlist = "SSL://broker3:9000,ssl://broker2"
 *
 * @returns the number of brokers successfully added.
 *
 * @remark Brokers may also be defined with the \c metadata.broker.list or
 *         \c bootstrap.servers configuration property (preferred method).

/**@}*/

/**
* @name Interceptors
*
* @{
*
* @brief A callback interface that allows message interception for both
*        producer and consumer data pipelines.
*
* Except for the on_new(), on_conf_set(), on_conf_dup() and
on_conf_destroy()
* interceptors, interceptors are added to the
* newly created rd_kafka_t client instance. These interceptors MUST only
* be added from on_new() and MUST NOT be added after rd_kafka_new()
returns.
*
* The on_new(), on_conf_set(), on_conf_dup() and on_conf_destroy()
interceptors
* are added to the configuration object which is later passed to
* rd_kafka_new() where on_new() is called to allow addition of
* other interceptors.
*
* Each interceptor reference consists of a display name (ic_name),
* a callback function, and an application-specified opaque value that is
* passed as-is to the callback.
* The ic_name must be unique for the interceptor implementation and is used
* to reject duplicate interceptor methods.
*
* Any number of interceptors can be added and they are called in the order
* they were added, unless otherwise noted.
* The list of registered interceptor methods are referred to as
* interceptor chains.
*
* @remark Contrary to the Java client the librdkafka interceptor interface
*         does not support message modification. Message mutability is
*         discouraged in the Java client and the combination of
*         serializers and headers cover most use-cases.
*
* @remark Interceptors are NOT copied to the new configuration on
*         rd_kafka_conf_dup() since it would be hard for interceptors to
*         track usage of the interceptor's opaque value.
*         An interceptor should rely on the plugin, which will be copied
*         in rd_kafka_conf_dup(), to set up the initial interceptors.
*         An interceptor should implement the on_conf_dup() method
*         to manually set up its internal configuration on the newly
created

```

```

* configuration object that is being copied-to based on the
* interceptor-specific configuration properties.
* conf_dup() should thus be treated the same as conf_init().
*
* @remark Interceptors are keyed by the interceptor type (on_..()), the
* interceptor name (ic_name) and the interceptor method function.
* Duplicates are not allowed and the ..add_on_..() method will
* return RD_KAFKA_RESP_ERR__CONFLICT if attempting to add a
duplicate
* method.
* The only exception is on_conf_destroy() which may be added
multiple
* times by the same interceptor to allow proper cleanup of

/**
 * @brief \b Consumer: Set rebalance callback for use with
 *
 * coordinated consumer group balancing.
 *
 * The \p err field is set to either RD_KAFKA_RESP_ERR_ASSIGN_PARTITIONS
 * or RD_KAFKA_RESP_ERR_REVOKE_PARTITIONS and 'partitions'
 * contains the full partition set that was either assigned or revoked.
 *
 * Registering a \p rebalance_cb turns off librdkafka's automatic
 * partition assignment/revocation and instead delegates that responsibility
 * to the application's \p rebalance_cb.
 *
 * The rebalance callback is responsible for updating librdkafka's
 * assignment set based on the two events:
 * RD_KAFKA_RESP_ERR_ASSIGN_PARTITIONS

```

```

* and RD_KAFKA_RESP_ERR__REVOKE_PARTITIONS but should also be able to
handle
* arbitrary rebalancing failures where \p err is neither of those.
* @remark In this latter case (arbitrary error), the application must
* call rd_kafka_assign(rk, NULL) to synchronize state.
*
* Without a rebalance callback this is done automatically by librdkafka
* but registering a rebalance callback gives the application flexibility
* in performing other operations along with the assigning/revocation,
* such as fetching offsets from an alternate location (on assign)
* or manually committing offsets (on revoke).
*
* @remark The \p partitions list is destroyed by librdkafka on return
* return from the rebalance_cb and must not be freed or
* saved by the application.
*
* The following example shows the application's responsibilities:
* @code
* static void rebalance_cb (rd_kafka_t *rk, rd_kafka_resp_err_t err,
* rd_kafka_topic_partition_list_t *partitions,
* void *opaque) {
*
*     switch (err)
*     {
*     case RD_KAFKA_RESP_ERR__ASSIGN_PARTITIONS:
*         // application may load offsets from arbitrary external
*         // storage here and update \p partitions
*
*         rd_kafka_assign(rk, partitions);
*         break;
*
*     case RD_KAFKA_RESP_ERR__REVOKE_PARTITIONS:
*         if (manual_commits) // Optional explicit manual commit

 * @name Miscellaneous APIs
 * @{
 *
 */

/**
 * @brief Adds one or more brokers to the kafka handle's list of initial
 * bootstrap brokers.
 *
 * Additional brokers will be discovered automatically as soon as rdkafka
 * connects to a broker by querying the broker metadata.
 *
 * If a broker name resolves to multiple addresses (and possibly
 * address families) all will be used for connection attempts in
 * round-robin fashion.
 *
 * \p brokerlist is a ,-separated list of brokers in the format:
 * \c \<broker1\>,\<broker2\>,...
 * Where each broker is in either the host or URL based format:
 * \c \<host\>[:\<port\>]
 * \c \<proto\>://\<host\>[:port]
 * \c \<proto\> is either \c PLAINTEXT, \c SSL, \c SASL, \c SASL_PLAINTEXT
 * The two formats can be mixed but ultimately the value of the
 * `security.protocol` config property decides what brokers are allowed.
 *
 * Example:
 * brokerlist = "broker1:10000,broker2"
 * brokerlist = "SSL://broker3:9000,ssl://broker2"
 *
 * @returns the number of brokers successfully added.
 *
 * @remark Brokers may also be defined with the \c metadata.broker.list or

## HPE Ezmeral Data Fabric Streams Python Applications

As of HPE Ezmeral Data Fabric 5.2.1, you can create python applications for HPE Ezmeral Data Fabric Streams using the HPE Ezmeral Data Fabric Streams Python client. The HPE Ezmeral Data Fabric Streams Python client is a binding for librdkafka and the HPE Ezmeral Data Fabric Streams C Client is a distribution of librdkafka that works with HPE Ezmeral Data Fabric Streams.

The HPE Ezmeral Data Fabric Streams Python client is available in a Ecosystem Pack (EEP) starting with EEP 3.0.

The following Apache Kafka librdkafka versions are supported:

**Table**

Core release	EEP Release	Kafka librdkafka version
As of HPE Ezmeral Data Fabric 6.0.1	As of 5.0	0.11.3
As of HPE Ezmeral Data Fabric 5.2.1 through 6.0.0	As of 3.0	0.9.0

**NOTE:** Because the HPE Ezmeral Data Fabric Streams Python Client is dependent on the HPE Ezmeral Data Fabric Streams C Client, the HPE Ezmeral Data Fabric Streams C Client must be configured before using the HPE Ezmeral Data Fabric Streams Python Client.

When developing and running HPE Ezmeral Data Fabric Streams Python applications, note the following points:

- You can create producers and high-level consumers. Low-level consumers are not supported.
- Consuming or producing topics in a Kafka cluster is not supported.
- HPE Ezmeral Data Fabric Streams offset values start at 1, not 0.
- HPE Ezmeral Data Fabric security is supported including ACLs and ACEs for authorization. The unique Kafka security features that are part of Apache Kafka are not supported. See [Security](#) on page 822 for more information about HPE Ezmeral Data Fabric security features.
- User impersonation is not supported.

### Developing HPE Ezmeral Data Fabric Streams Python Applications

This topic includes basic information about how to develop a HPE Ezmeral Data Fabric Streams Python application and an example program that you can run.

#### Before you Begin

Confirm that your environment meets the following requirements:

- HPE Ezmeral Data Fabric cluster version 5.2.1 or greater.
- HPE Ezmeral Data Fabric core client (mapr-client) package. See [Installing the Data Fabric Client \(Non-FIPS\)](#) on page 396 for more information.
- HPE Ezmeral Data Fabric Streams C Client (mapr-librdkafka) is installed and configured on the node. See [Configuring the HPE Ezmeral Data Fabric Streams C Client](#) on page 3593.
- HPE Ezmeral Data Fabric Streams Python Client (mapr-streams-python) is installed on the node. See [Installing HPE Ezmeral Data Fabric Streams Python Client](#) on page 248.
- Python installed on the node (Python version 2.7.x and above, up to version 3.6.x).

### Create a HPE Ezmeral Data Fabric Streams Producer Application

In general, you want to create a producer that performs the following steps:

1. Import the producer class.
2. Define the producer and its configuration.
3. Produce data.
4. Wait for all messages to be sent to consumer.

**As of EEP 5.0 HPE Ezmeral Data Fabric Streams Python Client:** In the following example code, three messages are produced to a topic named `mytopic` in a stream named `my_stream`.

```
from confluent_kafka import Producer
p = Producer({'streams.producer.default.stream': '/my_stream'})
some_data_source= ["msg1", "msg2", "msg3"]
for data in some_data_source:
    p.produce('mytopic', data.encode('utf-8'))
    p.flush()
```

### Create a HPE Ezmeral Data Fabric Streams Consumer Application

In general, you want to create a consumer that performs the following steps:

1. Import the consumer class.
2. Define the consumer and its configuration.
3. Consume data.
4. Wait for all messages to be consumed.

**As of EEP 5.0 HPE Ezmeral Data Fabric Streams Python Client:** In following example code, the HPE Ezmeral Data Fabric Streams consumer is subscribed to `my_stream/mytopic` and it prints the content of each message that it reads.

```
from confluent_kafka import Consumer, KafkaError
c = Consumer({'group.id': 'mygroup',
             'default.topic.config': {'auto.offset.reset': 'earliest'}})
c.subscribe(['/my_stream:mytopic'])
running = True
while running:
    msg = c.poll(timeout=1.0)
    if msg is None: continue
    if not msg.error():
        print('Received message: %s' % msg.value().decode('utf-8'))
    elif msg.error().code() != KafkaError._PARTITION_EOF:
        print(msg.error())
        running = False
c.close()
```

### Run the Example Applications

To run the sample producer and consumer applications:

1. Create a stream named `mystream`.
2. Create a file named `producer.py`.
3. Add the producer example code into the `producer.py` file.
4. Create a file named `consumer.py`.
5. Add the consumer example code into the `consumer.py` file.

- Verify that you have completed the steps to configure the HPE Ezmeral Data Fabric Streams C client or complete the steps now. See [Configuring the HPE Ezmeral Data Fabric Streams C Client](#) on page 3593.

**NOTE:** The HPE Ezmeral Data Fabric Streams Python Client is dependent on the HPE Ezmeral Data Fabric Streams C Client. Therefore, the HPE Ezmeral Data Fabric Streams C Client must be configured before you can run the application.

- Run `producer.py` from the command line to generate messages.

```
$ python producer.py
```

- Run `consumer.py` from the command line:

```
$ python consumer.py
```

### Migrating Kafka Python Applications to HPE Ezmeral Data Fabric Streams

With some modification, you can use existing `confluent-kafka` python applications to consume and produce topics in HPE Ezmeral Data Fabric Streams. The HPE Ezmeral Data Fabric Streams Python Client is a binding for Apache `librdkafka` that works with HPE Ezmeral Data Fabric Streams.

- Install the HPE Ezmeral Data Fabric Streams Python Client.

**NOTE:** This required that you also install and configure the HPE Ezmeral Data Fabric Streams C Client. See [Configuring the HPE Ezmeral Data Fabric Streams C Client](#) on page 3593.

- Do one of the following depending on whether you are using the EEP 5.0 (or higher) HPE Ezmeral Data Fabric Streams Python Client or the EEP 3.0 (or higher) HPE Ezmeral Data Fabric Streams Python Client.

- If you are using HPE Ezmeral Data Fabric Streams Python EEP 5.0 (or higher), skip this step. The references to `confluent_kafka` should be retained.
- If you are using HPE Ezmeral Data Fabric Streams Python EEP 3.0 (or higher), update import statements to refer to the MapR Stream Python API. References to `confluent_kafka` should be updated to `mapr_streams_python`.

**NOTE:** For example, update `from confluent_kafka import Consumer` to `from mapr_streams_python import Consumer`.

- When you refer to a topic in the application code, include the path and name of the stream in which the topic is located:

```
/<path and name of stream>:<name of topic>
```

For example, you might have a stream in a HPE Ezmeral Data Fabric cluster that is named `stream_A`, and the stream might be in a volume named `IoT` and in a directory named `automobile_sensors`. You want to redirect a producer application to a topic in that stream. The syntax of the path to the topic might look like this: `/mapr/IoT/automobile_sensors/stream_A:<name of topic>`.

**NOTE:** Optionally, use the `streams.consumer.default.stream` and `streams.producer.default.stream` configuration parameters. When you configure these parameters, applications can specify just the topic name to write or read from the default stream.

4. Review the APIs that are supported and make changes to your application, as needed. See [API for HPE Ezmeral Data Fabric Streams Python Client](#) on page 3799.
5. See [Configuration Properties for HPE Ezmeral Data Fabric Streams Python Client](#) on page 3805 for the list of supported configuration parameters and make changes to your application, as needed.

**NOTE:** SSL-related configuration parameters are ignored. When you set these parameters, the HPE Ezmeral Data Fabric Streams Client issues a warning indicating that the parameters are not supported.

### API for HPE Ezmeral Data Fabric Streams Python Client

HPE Ezmeral Data Fabric Streams Python Client is a binding for librdkafka and it supports the following APIs.

As of HPE Ezmeral Data Fabric 5.2.1, you can create python applications for HPE Ezmeral Data Fabric Streams using the HPE Ezmeral Data Fabric Streams Python client. The HPE Ezmeral Data Fabric Streams Python client is a binding for librdkafka and the HPE Ezmeral Data Fabric Streams C Client is a distribution of librdkafka that works with HPE Ezmeral Data Fabric Streams.

**Table**

Core release	EEP Release	Kafka librdkafka version
As of HPE Ezmeral Data Fabric 6.0.1	As of 5.0	0.11.3
As of HPE Ezmeral Data Fabric 5.2.1 through 6.0.0	As of 3.0	0.9.0

### class `mapr_streams_python.Consumer`

A high-level Kafka Consumer.

Method	Behavior
<code>Consumer(**kwargs)</code>	Create new Consumer instance using provided configuration dictionary.
<code>assign(partitions)</code>	Set consumer partition assignment to the provided list of TopicPartition and starts consuming. Parameters(s): <ul style="list-style-type: none"> <li>• <code>partitions (list(TopicPartition))</code> – List of topic+partitions and optionally initial offsets to start consuming</li> </ul>
<code>unassign()</code>	Unassign from all TopicPartitions that have been assigned with the <code>.assign(*topic_partition_list)</code> method. <b>NOTE:</b> This method is applicable as of HPE Ezmeral Data Fabric Streams Python Client EEP 5.0 which is associated with librdkafka 0.11.3.
<code>assignment()</code>	Return a list of assignments for a consumer object. <b>NOTE:</b> This method is applicable as of HPE Ezmeral Data Fabric Streams Python Client EEP 5.0 which is associated with librdkafka 0.11.3.

Method	Behavior
close()	Close down and terminate the Kafka Consumer. Actions(s): <ul style="list-style-type: none"> <li>• Stops consuming</li> <li>• Commits offsets</li> <li>• Leave consumer group</li> </ul>
commit([message=None][, offsets=None][, async=True])	Commit a message or a list of offsets. Message and offsets are mutually exclusive, if neither is set the current partition assignment's offsets are used instead. Parameters(s): <ul style="list-style-type: none"> <li>• message (confluent_kafka.Message) – Commit message's offset+1.</li> <li>• offsets (list(TopicPartition)) – List of topic+partitions+offsets to commit.</li> <li>• async (bool) – Asynchronous commit, return immediately.</li> </ul>
committed(partitions[, timeout=None])	Retrieve committed offsets for the list of partitions. Parameters(s): <ul style="list-style-type: none"> <li>• partitions (list(TopicPartition)) - List of topic+partitions to query for stored offsets.</li> <li>• timeout (float) – Request timeout</li> </ul> Returns: List of topic+partitions with offset and possibly error set. Return type: list(TopicPartition) Raises: KafkaException  <b>NOTE:</b> As of HPE Ezmeral Data Fabric 6.0, the message offset in a partition starts from zero (0). If you are upgrading and do not enable the HPE Ezmeral Data Fabric Database/HPE Ezmeral Data Fabric Streams feature, <b>mfs.feature.db.streams.v6.support</b> , the message offset in a partition starts from one (1).
on_commit(err, partitions)	A callback for Consumer.commit() that triggers custom actions when a commit request completes. Parameters(s): <ul style="list-style-type: none"> <li>• err (KafkaError) – Commit error object, or None on success.</li> <li>• Partitions (list(TopicPartition)) – List of partitions with their committed offsets or per-partition errors</li> </ul>

Method	Behavior
poll([timeout=None])	<p>Consume messages, calls callbacks and returns events.</p> <p>The application must check the returned Message object's Message.error() method to distinguish between proper messages (error() returns None), or an event or error (see error().code() for specifics).</p> <p>Parameter(s): timeout (<i>float</i>) – Maximum time to block waiting for message, event or callback</p> <p>Returns: A Message object or None on timeout</p> <p>Return type: Message or None</p>
position(partitions[, timeout=None])	<p>Retrieve current positions (offsets) for the list of partitions.</p> <p>Parameter(s): partitions (list(TopicPartition)) – List of topic+partitions to return current offsets for. The current offset is the offset of the last consumed message + 1</p> <p>Returns: List of topic+partitions with offset and possibly error set.</p> <p>Return type: list(TopicPartition)</p> <p>Raises: KafkaException</p> <p>This function returns 0 when the messages have not yet been consumed from partitions. librdkafka returns -1001 instead.</p>
subscribe(topics[, listener=None])	<p>Set subscription to supplied list of topics This replaces a previous subscription.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• topics (list(str)) – List of topics (strings) to subscribe to.</li> <li>• on_assign (callable) – callback to provide handling of customized offsets on completion of a successful partition re-assignment.</li> <li>• on_revoke (callable) – callback to provide handling of offset commits to a customized store on the start of a rebalance operation.</li> </ul> <p>Raises: KafkaException</p> <p> <b>NOTE:</b> You cannot use the rd_kafka_subscribe API to subscribe a consumer to topics when that consumer is already assigned to topics. If you call this API for an assigned consumer, error RD_KAFKA_RESP_ERR__CONFLICT is returned.</p>
on_assign(consumer, partitions)	Same as librdkafka.
unsubscribe()	Same as librdkafka.
on_revoke(consumer, partitions)	<p>Parameter(s):</p> <ul style="list-style-type: none"> <li>• consumer (Consumer) – Consumer instance.</li> <li>• partitions (list(TopicPartition)) – Absolute list of partitions being assigned or revoked.</li> </ul>

Method	Behavior
get_watermark_offsets(confluent_kafka.TopicPartition)	<p>Get WatermarkOffsets for a given Topic Partition.</p> <p>Parameter(s): TopicPartition - Gets the watermark offset</p> <p> <b>NOTE:</b> This method is applicable as of HPE Ezmeral Data Fabric Streams Python Client EEP 5.0 which is associated with librdkafka 0.11.3.</p>

### lass mapr\_streams\_python.Producer

Asynchronous Kafka Producer.

Method	Behavior
Producer(**kwargs)	Create new Producer instance using provided configuration dict.
len()	<p>This API returns a positive number to indicate that messages are waiting to be produced to a streams topic but the value does not indicate the actual number of messages. librdkafka returns the actual number of messages that are waiting to be sent to or acknowledged by the broker.</p> <p>Return type: int</p>
flush()	Wait for all messages in the Producer queue to be delivered. This is a convenience method that calls poll() until len() is zero.
poll([timeout])	<p>Polls the producer for events and calls the corresponding callbacks (if registered).</p> <p>Parameter(s):</p> <ul style="list-style-type: none"> <li>• timeout (float) – Maximum time to block waiting for events</li> </ul> <p>Returns: Number of events processed (callbacks served).</p> <p>Return type: int</p>

Method	Behavior
produce(topic[, value][, key][, partition][, callback])	<p>Produce message to topic. This is an asynchronous operation, an application may use the callback( alias on_delivery) argument to pass a function (or lambda) that will be called from poll() when the message has been successfully delivered or permanently fails delivery.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• topic (str) – Topic to produce message to</li> <li>• value (str bytes) – Message payload</li> <li>• key (str bytes) – Message key</li> <li>• partition (int) – Partition to produce to, else uses the configured partitioner.</li> <li>• on_delivery(err,msg) (func) – Delivery report callback to call (from poll() or flush()) on successful or failed deliver</li> </ul> <p>Raises:</p> <ul style="list-style-type: none"> <li>• BufferError – if the internal producer message queue is full (queue.buffering.max.messages exceeded)</li> <li>• KafkaException – for other errors, see exception code</li> </ul> <p> <b>NOTE:</b> When this function is called with NULL payload, an invalid argument error is sent to the callback. librdkafka creates a message with NULL payload and key value instead.</p>

### class mapr\_streams\_python.Message

The Message object represents either a single consumed or produced message, or an event . An application must check with error() to see if the object is a proper message (error() returns None) or an error/event. This class is not user-instantiable.

Method	Behavior
len()	Returns: Message value (payload) size in bytes. Return type: int
error()	The message object is also used to propagate errors and events. Applications must check error() to determine if the Message is a proper message (error() returns None) or an error or event (error() returns a KafkaError object) Return type: None or KafkaError
key()	Returns: message key or None if not available Return type: str bytes or None
offset()	Returns: message offset or None if not available Return type: int or None
partition()	Returns: partition number or None if not available Return type: int or None

Method	Behavior
topic()	Returns: topic name or None if not available Return type: str or None
value()	Returns: message value (payload) or None if not available Return type: str bytes or None
timestamp()	Returns: message timestamp  <b>NOTE:</b> This method is applicable as of HPE Ezmeral Data Fabric Streams Python Client EEP 5.0 which is associated with librdkafka 0.11.3.

### class `mapr_streams_python.TopicPartition`

`TopicPartition` is a generic type to hold a single partition and various information about it. It is typically used to provide a list of topics or partitions for various operations, such as `Consumer.assign()`.

Method	Behavior
<code>TopicPartition(topic[, partition][, offset])</code>	Instantiate a <code>TopicPartition</code> object. Parameter(s) <ul style="list-style-type: none"> <li>• <code>topic</code> (string) – Topic name</li> <li>• <code>partition</code> (int) – Partition id</li> <li>• <code>offset</code> (int) – Initial partition offset</li> </ul> Return type: <code>TopicPartition</code>
<code>error</code>	Attribute that indicates an error (with <code>KafkaError</code> ) unless <code>None</code> .
<code>offset</code>	Attribute for offset.
<code>partition</code>	Attribute for partition number.
<code>topic</code>	Attribute for topic name.

### class `mapr_streams_python.KafkaError`

Kafka error and event object.

The `KafkaError` class serves multiple purposes:

- Propagation of errors
- Propagation of events
- Exceptions

This class is not user-instantiable.

Method	Behavior
code()	Returns the error/event code for comparison to <code>KafkaError.&lt;ERR_CONSTANTS&gt;</code> . Returns: error/event code Return type: int
name()	Returns the enum name for error/event. Returns: error/event enum name string Return type: str
str()	Returns the human-readable error/event string. Returns: error/event enum message string Return type: str

### Configuration Properties for HPE Ezmeral Data Fabric Streams Python Client

In the instance constructor of a HPE Ezmeral Data Fabric Streams Python application, you can use a dictionary to set the following configuration properties. HPE Ezmeral Data Fabric Streams Python client supports a superset of the configuration properties supported by the HPE Ezmeral Data Fabric Streams C client.

#### Global Configuration Properties

Property Name	Behavior
client.id	Same as librdkafka
default.topic.config	A dictionary of topic-level configuration properties that are applied to all used topics for the instance.
message.max.bytes	Supports a value less than or equal to 10MB (10000000). If this property is set to a value that is higher than 10MB, the client issues a warning and sets the configuration to 10MB. Produce calls fail when the message size is greater than 10MB.
receive.message.max.bytes	Same as librdkafka
topic.blacklist	Same as librdkafka
error_cb	A callback for generic/global error events. This callback is served by <code>poll()</code> .
opaque	Same as librdkafka.

#### Consumer Configuration Properties

Property Name	Behavior
group.id	Same as librdkafka.
enable.auto.commit	Same as librdkafka.
auto.commit.interval.ms	Same as librdkafka.
rebalance_cb	Same as librdkafka.
offset_commit_cb	Same as librdkafka.
delivery.report.only.error	Same as librdkafka.
dr_msg_cb	Same as librdkafka.

Property Name	Behavior
on_commit	A callback used to indicate success or failure of commit requests.

### Topic Configuration Properties

Property Name	Behavior
partitioner_cb	Same as librdkafka.
auto.offset.reset	Supports the following values: earliest, latest, none, smallest, and largest. librdkafka also supports biggest, end and error.

### Producer Configuration Properties

Property Name	Behavior
on_delivery(kafka.KafkaError, kafka.Message)	A Python function reference that is called once for each produced message to indicate the final delivery result (success or failure). This property may also be set per-message by passing callback=callable (or on_delivery=callable) to the confluent_kafka.Producer.produce() function.

### HPE Ezmeral Data Fabric-Specific Configuration Properties

Property Name	Behavior
streams.consumer.default.stream	<p>Specifies the path and name of the stream that the consumer subscribes to if, when subscribing to a topic, the consumer does not specify a stream. For example, the consumer can specify the name of a stream together with the name of a topic to write to, like this: / &lt;stream&gt;:&lt;topic&gt;.</p> <p> <b>NOTE:</b> rd_kafka_list groups API uses this consumer configuration to obtain the consumer groups.</p>
streams.parallel.flushers.per.partition	Enables the producer may have multiple parallel send requests to the server for each topic partition. If this setting is set to true, it is possible for messages to be sent out of order.
streams.producer.default.stream	Specifies the stream that the producer will use by default if the producer does not provide the name of a stream when specifying a topic to write to. For example, the producer can specify the name of a stream together with the name of a topic to write to, like this: / <stream>:<topic>. However, if the stream is not specified, the value of this configuration parameter is assumed to be the stream in which the topic is located. If the producer specifies the name of a topic without also providing the path and name of the stream, and there is no value for this configuration parameter, HPE Ezmeral Data Fabric Streams assumes that the topic specified is in Apache Kafka and does nothing.

## Additional Information

Here is a consumer configuration example:

```
conf = {'group.id': 'mygroup',
'session.timeout.ms': 6000,
'on_commit': my_commit_callback,
'default.topic.config': {'auto.offset.reset': 'smallest'}}
consumer = mapr_streams_python.Consumer(**conf)
```

## HPE Ezmeral Data Fabric Streams C#.NET Applications

As of HPE Ezmeral Data Fabric 6.0.1/EEP5.0, you can create C#.NET applications for HPE Ezmeral Data Fabric Streams using the HPE Ezmeral Data Fabric Streams C#.NET client. The HPE Ezmeral Data Fabric Streams C#.NET client is a binding for librdkafka and the HPE Ezmeral Data Fabric Streams C Client is a distribution of librdkafka that works with HPE Ezmeral Data Fabric Streams.

## Requirements

- HPE Ezmeral Data Fabric Client on Windows 7 (or higher) x64 operating systems
- HPE Ezmeral Data Fabric cluster version 6.0.1 or greater
- Java 8 SDK and set Java HOME
- HPE Ezmeral Data Fabric Streams C Client (mapr-librdkafka 0.11.3)
- HPE Ezmeral Data Fabric Streams C#.NET Client (mapr-streams-dotnet)
- .NET SDK 4.5.x or 4.6.x or .NET Core SDK 1.1
- nuget.exe

See [Installing HPE Ezmeral Data Fabric Streams C#.NET Client](#) on page 250 for installation information.

## General Information

When developing and running HPE Ezmeral Data Fabric Streams C#.NET applications, note the following points:

- You can create producers and high-level consumers. Low-level consumers are not supported.
- Consuming or producing topics in a Kafka cluster is not supported.
- HPE Ezmeral Data Fabric Streams offset values start at 1, not 0.
- HPE Ezmeral Data Fabric security is supported including ACLs and ACEs for authorization. The unique Kafka security features that are part of Apache Kafka are not supported. See [Security](#) on page 822 for more information about HPE Ezmeral Data Fabric security features.

- User impersonation is not supported.

## Developing HPE Ezmeral Data Fabric Streams C#.NET Applications

Describes general tasks for developing C#.NET applications.

### Before Your Begin

Confirm that your environment meets the following requirements:

- HPE Ezmeral Data Fabric cluster version 6.0.1 or greater.
- HPE Ezmeral Data Fabric Streams C Client (mapr-librdkafka 0.11.3) is installed and configured on the node. See [Configuring the HPE Ezmeral Data Fabric Streams C Client](#) on page 3593.
- HPE Ezmeral Data Fabric Streams C#.NET Client (mapr-streams-dotnet) is installed on the node.
- .NET SKD 4.5.x or 4.6.x
- .NET Core SDK 1.1
- nuget.exe

### Create a Producer Application

In general, you want to create a producer that performs the following steps:

1. Import the producer class.
2. Define the producer and its configuration.
3. Produce data.
4. Wait for all messages to be sent to consumer.

In the following example code, three messages are produced to a topic named mytopic in a stream named my\_stream.

```
class Producer
{
    public static async void Produce()
    {
        string stream = "/my_stream";
        string topicName = "mytopic";

        var config = new Dictionary<string, object>
        { { "streams.producer.default.stream", stream } };
        var messages = new string[] { "Msg1", "Msg2", "Msg3" };

        using (var producer = new Producer<Null, string>(config, null,
        new StringSerializer(Encoding.UTF8)))
        {
            foreach (var msg in messages)
            {
                var deliveryReport = await
                producer.ProduceAsync(topicName, null, msg);
                Console.WriteLine($"Delivery report:
                {deliveryReport.TopicPartitionOffset}");
            }

            producer.Flush(TimeSpan.FromSeconds(1));
        }
    }
}
```

```

    }
}

```

### Create a Consumer Application

In general, you want to create a consumer that performs the following steps:

1. Import the consumer class.
2. Define the consumer and its configuration.
3. Consume data.
4. Wait for all messages to be consumed.

In following example code, the HPE Ezmeral Data Fabric Streams consumer is subscribed to `my_stream/mytopic` and it prints the content of each message that it reads.

```

using Confluent.Kafka;
using Confluent.Kafka.Serialization

class Consumer
{
    public static void Consume()
    {
        var stream = "/mystream";
        var topic = "mytopic";

        var config = new Dictionary<string, object>
        {
            { "group.id", "simple-csharp-consumer" },
            { "streams.consumer.default.stream", stream }
        };

        bool running = true;

        using (var consumer = new Consumer<Ignore, string>(config,
            null, new StringDeserializer(Encoding.UTF8)))
        {
            var l = new List<TopicPartitionOffset> { new
TopicPartitionOffset(topic, 0, 0) };
            consumer.Assign(l);

            // Raised on critical errors, e.g. connection failures.
            consumer.OnError += (_, error) =>
            {
                Console.WriteLine($"Error: {error}");
                running = false;
            };

            // Raised on deserialization errors or when a consumed
message has an error != NoError.
            consumer.OnConsumeError += (_, error) =>
            {
                Console.WriteLine($"Consume error: {error}");
                running = false;
            };

            while (running)
            {
                Message<Ignore, string> msg;

```

```

        if (consumer.Consume(out msg, TimeSpan.FromSeconds(10)))
        {
            Console.WriteLine($"Topic: {msg.Topic} Partition:
{msg.Partition} Offset: {msg.Offset} {msg.Value}");
        }
    }
}
}
}
}

```

### Run the Example Applications

To run the sample producer and consumer applications:

1. Create a stream named **mystream**.
2. Create a folder application.
3. Create a file named **example.cs**.
4. Add producer example code into the **example.cs** file.
5. Add consumer example code into the **example.cs** file.
6. Add an entry point for your application:

```

class Demo
{
    public static void Main(string[] args)
    {
        Producer.Produce();
        Consumer.Consume();
    }
}

```

7. Create a project file named **example.csproj**.

8. Add the following dependency properties into the **example.csproj** file:

```
<?xml version="1.0" encoding="utf-8"?>
<Project ToolsVersion="15.0" xmlns="http://schemas.microsoft.com/
developer/msbuild/2003">
  <Import Project="$(MSBuildExtensionsPath)\$(MSBuildToolsVersion)
\Microsoft.Common.props" Condition="Exists('$(MSBuildExtensionsPath)\$
(MSBuildToolsVersion)\Microsoft.Common.props')" />
  <PropertyGroup>
    <Configuration Condition=" '$(Configuration)' == '' " >Debug</
Configuration>
    <Platform Condition=" '$(Platform)' == '' " >AnyCPU</Platform>
    <ProjectGuid>{99EDBA4B-D7DA-48BB-8D0C-AF4B12387935}</ProjectGuid>
    <OutputType>Exe</OutputType>
    <RuntimeIdentifiers>win10-x64</RuntimeIdentifiers>
    <RootNamespace>app</RootNamespace>
    <AssemblyName>app</AssemblyName>
    <TargetFrameworkVersion>v4.6.1</TargetFrameworkVersion>
    <FileAlignment>512</FileAlignment>
    <AutoGenerateBindingRedirects>true</AutoGenerateBindingRedirects>
  </PropertyGroup>
  <PropertyGroup Condition=" '$(Configuration)|$(Platform)' == 'Debug|
AnyCPU' " >
    <PlatformTarget>AnyCPU</PlatformTarget>
    <DebugSymbols>true</DebugSymbols>
    <DebugType>full</DebugType>
    <Optimize>>false</Optimize>
    <OutputPath>bin\Debug\</OutputPath>
    <DefineConstants>DEBUG;TRACE</DefineConstants>
    <ErrorReport>prompt</ErrorReport>
    <WarningLevel>4</WarningLevel>
  </PropertyGroup>
  <ItemGroup>
    <Compile Include="app.cs" />
  </ItemGroup>
  <ItemGroup>
    <PackageReference Include="mapr-streams-dotnet" Version="0.11.3" />
  </ItemGroup>
  <Import Project="$(MSBuildToolsPath)\Microsoft.CSharp.targets" />
</Project>
```

9. Verify that you have completed the steps to configure the HPE Ezmeral Data Fabric Streams C client or complete the steps now. See [Configuring the HPE Ezmeral Data Fabric Streams C Client](#) on page 3593.

**NOTE:** The HPE Ezmeral Data Fabric Streams C#/.NET Client is dependent on the HPE Ezmeral Data Fabric Streams C Client. Therefore, the HPE Ezmeral Data Fabric Streams C Client must be configured before you can run the application.

10. Open your project folder on the command line and run:

```
dotnet run
```

### Migrating Kafka C#/.NET Applications to HPE Ezmeral Data Fabric Streams

With some modification, you can use existing confluent-kafka C#/.NET applications to consume and produce topics in HPE Ezmeral Data Fabric Streams. The HPE Ezmeral Data Fabric Streams C#/.NET Client is a binding for Apache librdkafka that works with HPE Ezmeral Data Fabric Streams.

### Migrating a .NET 4.5 or 4.6 Application

 **NOTE:** This migration information is applicable for Windows (Win7-x64) platform *only*.

To migrate an existing .NET 4.5 or 4.6 application:

1. Install and configure the HPE Ezmeral Data Fabric Streams C Client. See [Configuring the HPE Ezmeral Data Fabric Streams C Client](#) on page 3593.
2. Replace the librdkafka.dll with the HPE Ezmeral Data Fabric librdkafka 0.11.3 from **/bin/.../runtimes/<win7-x64>/<native folder>**.
3. Add a symlink from the **MapRClient.dll** to the **librdkafka.dll**.
4. Restart the application.

### Migrating a .NET Core Application1

 **NOTE:** This migration information is applicable for Windows (Win7-x64) and Linux platforms.

To migrate an existing .NET Core application:

1. Install and configure the HPE Ezmeral Data Fabric Streams C Client. See [Configuring the HPE Ezmeral Data Fabric Streams C Client](#) on page 3593.
2. Replace the librdkafka.dll with the MapR librdkafka 0.11.3 from **USER\_HOME/.NUGET/PACKAGES/LIBRDKAFKA.REDIST/0.11.3/runtimes/<platform>/<native folder>**.
3. Add a symlink from the **MapRClient.dll** to the **librdkafka.dll**.
4. Restart the application.

### Migrating a .NET Core Application2

 **NOTE:** This migration information is applicable for Linux platforms *only*.

To migrate an existing .NET Core application:

1. Remove all **.so** files from the **~/.NUGET/PACKAGES/LIBRDKAFKA.REDIST/0.11.3/runtimes/<platform>/<native folder>** directory.
2. Install and configure the HPE Ezmeral Data Fabric Streams C Client. See [Configuring the HPE Ezmeral Data Fabric Streams C Client](#) on page 3593.
3. Replace the librdkafka.dll with the MapR librdkafka 0.11.3 from **USER\_HOME/.NUGET/PACKAGES/LIBRDKAFKA.REDIST/0.11.3/runtimes/** directory.
4. If the MapR Client doesn't install into the LD search path, add a symlink from the **MapRClient.dll** to the **/usr/local/lib**.
5. Restart the application.

## General Migration Information

- When you refer to a topic in the application code, include the path and name of the stream in which the topic is located:

```
/<path and name of stream>:<name of topic>
```

For example, you might have a stream in a MapR cluster that is named `stream_A`, and the stream might be in a volume named `IoT` and in a directory named `automobile_sensors`. You want to redirect a producer application to a topic in that stream. The syntax of the path to the topic might look like this: `/mapr/IoT/automobile_sensors/stream_A:<name of topic>`.

**NOTE:** Optionally, use the `streams.consumer.default.stream` and `streams.producer.default.stream` configuration parameters. When you configure these parameters, applications can specify just the topic name to write or read from the default stream.

- Review the APIs that are supported and make changes to your application, as needed. See [API for HPE Ezmeral Data Fabric Streams C#.NET](#) on page 3813.
- See [Configuration Properties for HPE Ezmeral Data Fabric Streams C#.NET Client](#) on page 3815 for the list of supported configuration parameters and make changes to your application, as needed.

**NOTE:** SSL-related configuration parameters are ignored. When you set these parameters, the HPE Ezmeral Data Fabric Streams Client issues a warning indicating that the parameters are not supported.

### API for HPE Ezmeral Data Fabric Streams C#.NET

HPE Ezmeral Data Fabric Streams C#.NET Client is a binding for `librdkafka` and the HPE Ezmeral Data Fabric Streams C Client is a distribution of `librdkafka` that works with HPE Ezmeral Data Fabric Streams.

Table

Core release	EEP Release	Kafka librdkafka version
As of HPE Ezmeral Data Fabric 6.0.1	As of 5.0	0.11.3

### Classes

Classes	Description
<code>CommittedOffsets</code>	Encapsulates information provided to a Consumer's <code>OnOffsetsCommitted</code> event - per-partition offsets and success/error together with overall success/error of the commit operation.
<code>Consumer</code>	Implements a high-level Apache Kafka consumer (without deserialization).
<code>Consumer&lt;TKey, TValue&gt;</code>	Implements a high-level Apache Kafka consumer (with key and value deserialization).
<code>Error</code>	Represents an error that occurred when interacting with a Kafka broker or the <code>librdkafka</code> library.
<code>ErrorCodeExtensions</code>	Provides extension methods on the <code>ErrorCode</code> enumeration.
<code>GroupInfo</code>	Encapsulates information describing a particular Kafka group.
<code>GroupMemberInfo</code>	Encapsulates information describing a particular member of a Kafka group.

Classes	Description
Ignore	A type for use in conjunction with that enables message keys or values to be read as null, regardless of their value.
KafkaException	Represents an error that occurred during an interaction with Kafka.
Library	Methods that relate to the native librdkafka library itself (do not require a Producer or Consumer broker connection).
Loggers	OnLog callback event handler implementations.
LogMessage	Encapsulates information provided to the Producer/Consumer OnLog event.
Message	Represents a message stored in Kafka.
Message<TKey, TValue>	Represents a (deserialized) message stored in Kafka.
Metadata	Kafka cluster metadata.
Null	A type for use in conjunction with and that enables null key or values to be enforced when producing or consuming messages.
PartitionMetadata	Metadata pertaining to a single Kafka topic partition.
Producer	Implements a high-level Apache Kafka producer (without serialization).
Producer<TKey, TValue>	Implements a high-level Apache Kafka producer with key and value serialization.
TopicMetadata	Metadata pertaining to a single Kafka topic.
TopicPartition	Represents a Kafka (topic, partition) tuple.
TopicPartitionError	Represents a Kafka (topic, partition, error) tuple.
TopicPartitionOffset	Represents a Kafka (topic, partition, offset) tuple.
TopicPartitionOffsetError	Represents a Kafka (topic, partition, offset, error) tuple.
TopicPartitionTimestamp	Represents a Kafka (topic, partition, timestamp) tuple.
WatermarkOffsets	Represents the low and high watermark offsets of a Kafka topic/partition.

### Interfaces

Interface	Description
IDeliveryHandler	This interface is implemented by types that handle delivery report callbacks as a result of calls to <code>Producer.ProduceAsync()</code> .
IDeliveryHandler<TKey, TValue>	This interface is implemented by types that handle delivery report callbacks as a result of calls to <code>Producer&lt;TKey, TValue&gt;.ProduceAsync()</code> .
ISerializingProducer<TKey, TValue>	This interface describes the minimum functionality to be provided by a high level (serializing) Kafka producer.

### Structs

Struct	Description
Offset	Represents a Kafka partition offset value.
Timestamp	Encapsulates a Kafka timestamp and its type.

### Enums

Enum	Description
ErrorCode	Enumeration of local and broker generated error codes.
TimestampType	Enumerates the different meanings of a message timestamp value.

### Configuration Properties for HPE Ezmeral Data Fabric Streams C#/.NET Client

Describes the C#/.NET client configuration properties.

#### Global Configuration Properties

Property Name	
Behavior	Same as librdkafka.
MaximumMessageSize	Supports a value less than or equal to 10MB (10000000). If this property is set to a value that is higher than 10MB, the client issues a warning and sets the configuration to 10MB. Produce calls fail when the message size is greater than 10MB.

Property Name Behavior
Same as librdkafka.
Same as librdkafka.
Same as librdkafka.

<p><b>Behavior</b></p>
<p>Same as librdkafka.</p>
<p>Same as librdkafka. Available as of librdkafka 0.11.3. Supported as of HPE Ezmeral Data Fabric 6.0.1.</p>
<p>Same as librdkafka. Available as of librdkafka 0.11.3. Supported as of HPE Ezmeral Data Fabric 6.0.1.</p>

### Consumer Configuration Properties

Property Name	
Behavior	Same as librdkafka.
Property Name	Same as librdkafka.
Behavior	Same as librdkafka.

<p><b>Behavior</b></p>
<p>Same as librdkafka.</p>
<p>Same as librdkafka.</p>
<p>Same as librdkafka.</p>

<p><b>Behavior</b></p>
<p>Same as librdkafka.</p>
<p>Same as librdkafka.</p>

## Topic Configuration

<p>Property Name</p>	
<p>Behavior</p>	<p>Same as librdkafka.</p>
<p>Options</p>	<p>Supports the following values: beginning, end, earliest, latest, none, smallest, and largest. As of HPE Ezmeral Data Fabric 6.0.1, beginning and end are supported.</p> <p> <b>NOTE:</b> librdkafka additionally supports error.</p>

## HPE Ezmeral Data Fabric-Specific Configurations

P r o p e r t y N a m e	<b>Behavior</b>
e a m s c o p e r e d u c e d	<p>Specifies the path and name of the stream that the consumer subscribes to if, when subscribing to a topic, the consumer does not specify a stream. For example, the consumer can specify the name of a stream together with the name of a topic to write to, like this: <code>/&lt;stream&gt;:&lt;topic&gt;</code>.</p> <p> <b>NOTE:</b> <code>rd_kafka_list</code> groups API uses this consumer configuration to obtain the consumer groups.</p>

P r o p e r t y N a m e	
Behavior	<p>Enables the producer to have multiple parallel send requests to the server for each topic partition. When this property is set to true, the default value, it is possible for messages to be sent out of order.</p>

<b>Property Name</b>	<b>Behavior</b>
<b>Producer</b>	<p>Specifies the stream that the producer will use by default if the producer does not provide the name of a stream when specifying a topic to write to. For example, the producer can specify the name of a stream together with the name of a topic to write to, like this: /&lt;stream&gt;:&lt;topic&gt;. However, if the stream is not specified, the value of this configuration parameter is assumed to be the stream in which the topic is located. If the producer specifies the name of a topic without also providing the path and name of the stream, and there is no value for this configuration parameter, HPE Ezmeral Data Fabric Streams assumes that the topic specified is in Apache Kafka and does nothing.</p>

**Utilities for HPE Ezmeral Data Fabric Streams**

HPE Ezmeral Data Fabric Streams provides the utilities for operating on streams and topics.

**NOTE:** HPE Ezmeral Data Fabric Streams cannot use HPE Ezmeral Data Fabric Database Shell to perform operations on streams or topics.

`mapr copystream`

This utility copies data from one HPE Ezmeral Data Fabric Stream to another HPE Ezmeral Data Fabric Stream. You can use it, for example, if you want to set up replication manually from one stream to another.

`mapr diffstreams`

This utility compares the message IDs, metadata, and data in two HPE Ezmeral Data Fabric Streams. Then, generates two directories that contain sequence files

**mapr diffstreamswithcrc**

that you can use to merge the rows from the two HPE Ezmeral Data Fabric Streams.

This utility uses a cyclic redundancy check to detect differences between sets of messages in the specified HPE Ezmeral Data Fabric Streams. Then, for each set of non-identical messages, it performs a detailed comparison. Finally, it generates one or more directories of sequence files.

**mapr exportstream and mapr importstream**

Use these utilities together to export data from HPE Ezmeral Data Fabric Streams into binary sequence files, and then import the data from the binary sequence files into other HPE Ezmeral Data Fabric Streams. You can also use the `mapr importstream` utility to import changes that are specified in sequence files output by the `mapr diffstreams` utility.

**mapr perfconsumer**

This utility runs a consumer reading messages from topics in a HPE Ezmeral Data Fabric Stream. Use this utility to run consumers when you want to estimate the performance of consumers for your HPE Ezmeral Data Fabric Streams applications, given your network configuration.

**mapr perfproducer**

This utility runs a producer, generating messages and publishing them to a HPE Ezmeral Data Fabric Stream. Use this utility to run producers when you want to estimate the performance of producers for your HPE Ezmeral Data Fabric Streams applications, given your network configuration.

**mapr streamanalyzer**

This light-weight utility, which is a sample application for the `Streams` Java class for analytics on HPE Ezmeral Data Fabric Streams, lets you count the messages in a stream or a subset of the topics in a stream. The utility also lets you print either whole retrieved messages or a subset of the fields in each message.

## Configuring Properties for Message Size

Describes the `message.max.bytes` and `receive.message.max.bytes` properties for configuring message size.

**message.max.bytes**

For a C producer, the `message.max.bytes` value is 1000000 B by default.

The minimum value is 1000 B and maximum value is 32000000 B. The maximum message size produced by a C API is decided by the `message.max.bytes` value set on the C producer.

From C, Python, and C# APIs, the maximum message size that can be produced is 32000000 B. If a C consumer needs to consume a message that is greater than 32000000 B in size, which may be produced by a Java client, the consumer needs to update the `message.max.bytes` or `receive.message.max.bytes` properties to a higher value to consume it.

If the `message.max.bytes` property is set to greater than 32000000 B, it is by default capped at 32000000 B. Though a consumer can consume messages greater than 32000000 B (produced say by a Java client), only up to 32000000 B is produced from

the MapR C client. The maximum message size consumed by a C API is limited by the value that is higher among the `message.max.bytes` and `receive.message.max.bytes` values.

**receive.message.max.bytes**

For a C consumer, the `receive.message.max.bytes` is 1000000 B by default. The minimum value is 1000 B and maximum value is 1000000000 B.

Using a Java API, a larger message size can be produced if the cluster-side property is changed using the following `maprcli config save` command:

```
Cluster side:
maprcli config save -values
{"mfs.db.max.rowsize.kb":<value in KB>}
```

In this case, the row size is 32 MB by default and the maximum is a little less than 2 GB.

The `mfs.db.max.rowsize.kb` setting is a cluster-wide setting that applies to HPE Ezmeral Data Fabric Database (Binary+JSON) and MapR Event Store for Apache Kafka, and it is not configurable per stream or topic.

## MapReduce and Apps

This section contains information associated with developing YARN applications.

### External Applications and Classpath

Describes how to configure the class path for external applications.

MapReduce version 2 applications require the `hadoop 2.x` or the `yarn` classpath, and other applications that can run on YARN require the `yarn` classpath.

The method to specify the classpath differs based on how the job or application is submitted:

Method used to Submit the Job	Method to Specify Classpath
The external application uses the <code>hadoop jar</code> or the <code>yarn jar</code> command.	YARN applications (MapReduce or custom applications) that are submitted using the <code>yarn jar</code> command will automatically use the <code>yarn</code> classpath.  If the external application has a service that submits the job, you can set the <code>CLASSPATH</code> environment variable to point to a different classpath prior to starting the service. In this case, the <code>hadoop</code> classpath that you set in the <code>CLASSPATH</code> environment variable takes priority over the <code>hadoop</code> classpath for the <code>hadoop jar</code> command.

Method used to Submit the Job	Method to Specify Classpath
<p>The external application does not use the <code>hadoop jar</code> or the <code>yarn jar</code> command.</p>	<p>Set the classpath using one of the following options:</p> <ul style="list-style-type: none"> <li>If the external application has a service that submits the job or application, you can set the <code>CLASSPATH</code> environment variable to point to the hadoop or yarn classpath prior to starting the service.</li> <li>Set the classpath within the application.</li> </ul> <p>Use one of the following methods to get the classpath:</p> <ul style="list-style-type: none"> <li><code>hadoop2 classpath</code> or <code>hadoop -yarn classpath</code>: Gets the classpath for MRv2 applications.</li> <li><code>yarn classpath</code>: Gets the classpath for YARN applications (MRv2 or other applications that can run on YARN).</li> </ul>

**IMPORTANT:** When you launch a spring boot application, ensure that you prefix the classpath with `/opt/mapr/conf:/opt/mapr/hadoop/hadoop-2.7.0/etc/hadoop`. Alternatively, copy the `core-site.xml` file to the `/src/main/resources/` folder.

## Classpath Construction

This section describes how the MapReduce classpath is constructed.

The classpath that is used to run a MapReduce program is constructed based on how the program is submitted.

When you submit an application from the command line, the classpath used to process the program is based on the following items in this order of priority:

- JARs in the program's classpath, such as the hadoop 2.x or yarn classpath.
- JARs specified with the `-libjar` parameter which can be appended to `hadoop jar` or `yarn jar` commands.

If an external application submits the application, the classpath that is used to process the jar file is based on the following items in this order of priority:

- JARs in the classpath of the external application.
- JARs in the program's classpath, such as the hadoop 2.x or yarn classpath.
- JARs specified with `-libjar` parameter which can be appended to `hadoop jar` or `yarn jar` commands.

## Managing Third-Party Libraries

Any third-party library that is required by a MapReduce program must be accessible to the data node that processes the application.

A data node is a node in the cluster that includes the NodeManager role. You can provide the third-party libraries when you submit the program, or you can install the third-party libraries on each node that processes the application.

### Include the third-party libraries with each program

Including the third-party libraries with each program is the preferred method.

Perform one of the following operations to include the third-party jars when you submit the program:

- Package the third-party libraries with the MapReduce jar file. The benefit of this method is that the node from which you submit the program and the node that runs the program are not required to have the libraries files.
- Use the `-libjars` parameter to specify the third-party libraries on the command line. With this option, the library files are submitted to the data node along with the program. The benefit of this method is that the node that runs the program does not need to have the library files installed. However, the node that submits the program must have the library files installed.

### Install the third-party libraries on each node that runs the program

You can also install the third-party libraries on each data node. However, this may not be preferred as there could be conflicts between library versions or library files.

To install the third-party libraries on each data node, perform one of the following operations:

- Install the third-party libraries in the following directory on each Node Manager node: `/opt/mapr/hadoop/hadoop-2.x/share/hadoop/common`
- On each node with the NodeManager role, install the required third-party libraries and then specify the location(s) of the third-party libraries with the `HADOOP_CLASSPATH` env variable in the `env_override.sh` file. The `env_override.sh` file is located in the following directory: `/opt/mapr/conf`. For more information about the file, see [About env\\_override.sh](#) on page 3082.

## Kubernetes Interfaces for Data Fabric

---

This section describes how to leverage the capabilities of the Kubernetes Interfaces for Data Fabric.

### Container Storage Interface (CSI) Storage Plugin Configuration

This section describes how to use and troubleshoot the Container Storage Interface (CSI) Storage Plugin.

See [Container Storage Interface \(CSI\) Storage Plugin Overview](#) on page 797 for more information.

#### Using the Container Storage Interface (CSI) Storage Plugin

This section describes how to configure for static and dynamic provisioning and mounting using example configuration files.

For an overview of the Container Storage Interface (CSI) Storage Plugin, see [Container Storage Interface \(CSI\) Storage Plugin Overview](#) on page 797.

#### Before You Begin CSI Configuration

Before configuring the Container Storage Interface (CSI) Storage Plugin, be sure to review the following notes about supported and unsupported features and parameters. For an overview of the Container Storage Interface (CSI) Storage Plugin, see [Container Storage Interface \(CSI\) Storage Plugin Overview](#) on page 797.

#### Data Fabric Parameters for Static and Dynamic Provisioning

In dynamic provisioning, you can specify parameters for the Data Fabric volume to be created. For a list of the parameters that you can use, see [volume create](#) on page 2592. Note these considerations for using the parameters:

- Volume attributes must be represented as a string (enclosed within quotations). Using an integer or boolean is not supported. In the following example, the `aetype` attribute generates an error because the value (1) is not enclosed in quotations.

```
namePrefix: "pv"
mountPrefix: "/pv"
type: "rw"
advisoryquota: "100M"
aetype: 1
```

- The following parameters are ignored because they are redundant. The CSI Driver configures these parameters automatically during volume creation:
  - `mount`
  - `quota*`
  - `createparent`
  - `path`
  - `name`

\*Specifying `resources: requests: storage` in a PersistentVolumeClaim (PVC) makes it unnecessary to set the `quota` parameter. For an example, see [Example: Statically Provisioning a Volume Using the Container Storage Interface \(CSI\) Storage Plugin](#) on page 3835.

### Kubernetes Access Modes

Kubernetes access modes control how a PersistentVolume (PV) is mounted on the host. [Access modes](#) can be specified on both PVs and PVCs. Only Volumes with a matching Access Mode will be bound to a PVC. The Container Storage Interface (CSI) Storage Plugin supports the following access modes for the PV and PVC spec:

- ROX (ReadOnlyMany)
- RWO (ReadWriteOnce)
- RWX (ReadWriteMany)
- RWOP (ReadWriteOncePod)\*

\*Supported for the latest CSI drivers (FUSE 1.2.11 and Loopback NFS 1.0.11 or later) on Kubernetes 1.29. For more information, see the [Kubernetes CSI documentation](#).

### Reclaim Policy

The Kubernetes `reclaimPolicy` parameter controls what happens to a PersistentVolume if the corresponding PersistentVolumeClaim is deleted. The `Recycle` Reclaim Policy is not supported by Kubernetes CSI Drivers, so it cannot be used with the Kubernetes Interfaces for Data Fabric. You can specify the reclaim policy normally when you configure a persistent volume.

The following table shows the supported values for the reclaim policy:

Reclaim Policy Value	Description	Support
Delete (default value)	The PersistentVolume and the Data Fabric volume are deleted when	Supported

Reclaim Policy Value	Description	Support
	the user deletes the corresponding PersistentVolumeClaim.	
Retain	The PersistentVolume and the Data Fabric volume are not deleted when the user deletes the corresponding PersistentVolumeClaim.	Supported

For more information about the reclaim policy, see [Change the Reclaim Policy of a PersistentVolume](#).

### Kubernetes Mount Options

The `Kubernetes mountOptions` parameter is not supported for use with the Container Storage Interface (CSI) Storage Plugin.

### Configuring Static and Dynamic Provisioning Using Container Storage Interface (CSI) Storage Plugin

#### About this task

This page summarizes the high-level steps for configuring the Container Storage Interface (CSI) Storage Plugin after [installation](#) to provide static or dynamic provisioning. To learn more about static and dynamic provisioning, see [Static and Dynamic Volume Provisioning Using Container Storage Interface \(CSI\) Storage Plugin](#) on page 798.

#### *Static Provisioning*

#### Procedure

1. Create the ticket secret and deploy the secret in the Pod only if the volume is on a secure MapR cluster.  
See [Configuring a Secret](#) on page 3894 for more information.
2. Configure a PersistentVolume in your Pod spec or as part of a separate configuration file and provide information about the MapR volume.  
See [Example: Statically Provisioning a Volume Using the Container Storage Interface \(CSI\) Storage Plugin](#) on page 3835, [Persistent Volumes](#), and [Example: Mounting a PersistentVolume for Static Provisioning](#) on page 3838.
3. Configure a PersistentVolumeClaim in your Pod spec or as part of a separate configuration file.  
See [PersistentVolumeClaims](#).
4. Run the Pod spec using `kubect1` commands.  
See [Overview of kubect1](#).

#### *Dynamic Provisioning*

#### Procedure

1. Create the REST and ticket secrets and deploy the secrets in the Pod only if the volume is on a secure MapR cluster.  
See [Configuring a Secret](#) on page 3894 for more information.
2. Create a storage class in your Pod spec or in a separate configuration file.  
See [Storage Classes](#) and [Example: Mounting a PersistentVolume for Dynamic Provisioning Using Container Storage Interface \(CSI\) Storage Plugin](#) on page 3845.

3. Configure a PersistentVolumeClaim in your Pod spec or in a separate configuration file.  
See [Example: Mounting a PersistentVolume for Dynamic Provisioning Using Container Storage Interface \(CSI\) Storage Plugin](#) on page 3845.
4. Run the Pod spec using `kubectl` commands.  
See [Overview of kubectl](#).

### Configuring Static and Dynamic Provisioning for a Raw Block Volume

[Raw block volumes](#) are supported for both static and dynamic provisioning. To request a raw-block PersistentVolumeClaim, set `volumeMode: Block`. If not specified, `volumeMode` defaults to `Filesystem` in the PersistentVolumeClaimSpec. PersistentVolumes also have a `volumeMode` field in the PersistentVolumeSpec that is used for static provisioning. Block-type PVCs can only bind to Block-type PVs.

All the features supported on `Filesystem`-persistent volumes are supported on `Block` volumes. For example:

- Create and Delete Volumes
- Expand Volumes
- Clone Volumes
- Create and Delete Snapshot
- Snapshot Restore

Block volumes are supported only in single-node-writer access modes. At any given time, they can only be published once as read/write on a single node. For `Block` volumes, the CSI driver does not format the block device; it just binds the block device to the target path. The application pod can choose to format the block device to any required Linux file system, such as `ext4`, `xfs`, `btrfs`, and others.

Each block volume is stored in an HPE Ezmeral Data Fabric file. Statically provisioned block files are located at the path designated in the `volumePath` specified in the persistent volume definition. Dynamically provisioned block files are located at the path designated by the `mountPrefix` in the storage class. For fast, random block-write performance, these files should not be erasure coded (warm tiering) or tiered off to an objectstore (cold tiering).

### Static Provisioning Example

```
apiVersion: v1
kind: PersistentVolume
metadata:
  name: test-blockpv
  namespace: test-csi
spec:
  accessModes:
    - ReadWriteOnce
  volumeMode: Block
  persistentVolumeReclaimPolicy: Delete
  capacity:
    storage: 5G
  csi:
    driver: com.mapr.csi-kdf
    volumeHandle: test-simplepv
    volumeAttributes:
      volumePath: "/user/guest/myblockvolume"
      cluster: "clusterA"
      cldbHosts: "10.10.10.210"
      securityType: "secure"
```

```
platinum: "true"
capacityBytes: "5000000000"
```

 **NOTE:** For the Loopback NFS CSI driver, change `driver` to `com.mapr.csi-nfskdf`.

### Dynamic Provisioning Example

Note that no change in the StorageClass is required:

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: test-secure-block-pvc
  namespace: test-csi
spec:
  storageClassName: test-secure-sc
  accessModes:
    - ReadWriteOnce
  volumeMode: Block
  resources:
    requests:
      storage: 5G
```

### Pod Specification

In the pod specification, you must specify `volumeDevices` and `devicePath` for the block volume instead of `volumeMounts` and `mountPath`.

```
apiVersion: v1
kind: Pod
metadata:
  name: test-secure-block-pod
spec:
  containers:
    - name: fc-container
      image: fedora:26
      command: ["/bin/sh", "-c"]
      args: [ "tail -f /dev/null" ]
      volumeDevices:
        - name: data
          devicePath: /dev/xvda
  volumes:
    - name: data
      persistentVolumeClaim:
        claimName: test-secure-block-pvc
```

### Configuring a Secret

Kubernetes Secrets enable you to inject sensitive data into a pod. For more information about Secrets, see [Secrets](#) in the Kubernetes documentation.

The examples in this section show how Secrets can be used in static and dynamic provisioning. Secrets are not by themselves secure. For more information about security and Secrets, see [Security Properties](#). Specifically, it is important to turn on encryption at rest for Secrets. See [Encrypting Secret Data at Rest](#).

During installation of the Driver, the Kubernetes token that was moved into the pod is written to the host node so that the plugin can query a Secret to pull the ticket for mounting. This Kubernetes token is sensitive and should be protected. The token is placed in `/var/run/secrets/kubernetes.io/serviceaccount`.

Here is an example of a configuration file for a Kubernetes Secret:

```
apiVersion: v1
kind: Secret
metadata:
  name: mapr-provisioner-secrets
  namespace: test-driver
type: Opaque
data:
  ...
```

The following table describes the fields in the sample Secret file. For more information, see [Secrets](#) in the Kubernetes documentation.

Parameter	Description
apiVersion	The Kubernetes API version.
kind	The type of object being created.
name	A string to identify the Secret.
type	The type of Secret being created. For type <code>Opaque</code> , clients must treat these values as opaque and pass them unmodified back to the server.

### REST Secrets

For dynamic provisioning, you must use a Secret to pass the user name and password of a Data Fabric user to the provisioner. This user must have privileges to create and delete a Data Fabric volume. The credentials allow the provisioner to make REST calls to the Data Fabric webserver. Secrets are protected by the Kubernetes [RBAC](#).

The following example shows a REST secret in the Secret file:

```
apiVersion: v1
kind: Secret
metadata:
  name: mapr-provisioner-secrets
  namespace: test-driver
type: Opaque
data:
  MAPR_CLUSTER_USER: cm9vdA==
  MAPR_CLUSTER_PASSWORD: bWFwY2g==
```

The following table describes the REST secret fields in the REST Secret example:

Parameter	Description
MAPR_CLUSTER_CLIENTCERT	Parameter for specifying the client certificate.
MAPR_CLUSTER_CLIENTKEY	Parameter for specifying the client key for the client certificate.
MAPR_CLUSTER_USER	The base64 representation of a Data Fabric user that has the ability to create and delete Data Fabric volumes. See <a href="#">Converting a String to Base64</a> on page 3896.
MAPR_CLUSTER_PASSWORD	The base64 representation of the password for the user defined by the <code>MAPR_CLUSTER_USER</code> parameter. See <a href="#">Converting a String to Base64</a> on page 3896
MAPR_CLUSTER_TICKET	The base64 representation of the ticket contents generated on the data-fabric cluster using the <code>maprlogin</code> utility. For dynamic provisioning, with the latest CSI drivers, you can configure a data-fabric ticket to authenticate to the data-fabric webserver to make REST calls. This parameter is provided as a Beta feature.

Parameter	Description
MAPR_CLUSTER_TLSCERT	Parameter for providing the CA certificate. If MAPR_CLUSTER_TLSCERT is not specified, the CSI driver uses a nonsecure HTTP connection to the Data Fabric REST servers.

### Ticket Secrets

For static and dynamic provisioning, you must specify a Secret, which is the base64 representation of the ticket, to enable the POSIX client to communicate with a secure MapR cluster. The ticket for the POSIX client can be generated on the data-fabric cluster using the `maprlogin` on page 2918 utility.

The following example shows a ticket Secret:

```
apiVersion: v1
kind: Secret
metadata:
  name: mapr-ticket-secret
  namespace: mapr-examples
type: Opaque
data:
  CONTAINER_TICKET: CHANGETHIS!
```

The following table describes the CONTAINER\_TICKET field in the ticket Secret example:

Parameter	Description
CONTAINER_TICKET	Base64-encoded ticket value. See <a href="#">Converting a String to Base64</a> on page 3896.

To create the secret:

1. Run the following command to create the Secret file:

```
kubectl create -f <secret-file-name>.yaml
```

2. Convert sensitive data, such as a user name and password, to a base64 representation. See [Converting a String to Base64](#) on page 3896.
3. Add the base64 representation of sensitive data in the Secret file. For more information about the format of the Secret files, see [REST Secrets](#) on page 3833 and [Ticket Secrets](#) on page 3834 earlier in this section.
4. Deploy the secret on the pod by running the following command:

```
kubectl apply -f <secret-file-name>.yaml
```

### Converting a String to Base64

Sensitive data contained in a Secret must be represented in base64. Use these steps to convert such information to the base64 representation:

For example, in Linux:

```
echo -n 'mapr' | base64
```

The output shows the base64 representation of the user name `mapr` is `bWFwcg==`.

MapR tickets include a cluster name followed by a base64-encoded string. It is not sufficient to insert the base64-encoded string into a Kubernetes Secret. You must convert *both* the cluster name and string into base64 representation and then insert the result into the Secret.

The following command shows how to convert a MapR ticket to base64 representation:

```
echo -n "cluster-name <base64-encoded ticket-value>" | base64
```

For example:

```
echo -n "cluster2 PuG0lpuPXuDxj9ERgKCTXOqsXYPTnqRJl6/
mlWJjdVKvE5r46QS2Bh9nC+I4Rcu0GtnWRUOtKBG9gp65bsZN9Kphnr/
Wp15z8D3O2go951CANes/
7QQ1lYVP7l2BOPGR6I1zIrC3XGwI8OQWT6lqpsjSVZv8z05oQ5GDYQTKpttI/yAk/
uJBESlOhCz38n9HgYALLvMALVsBPtUtG+cNGclktUDDMR2q1EgVzdJbuYsOuHnZX3LO3euKDGl4C
4Mcmrv9DWiWJxwiZlyZu69GbZJlXxqLOQBlkdMoTXk=" | base64
```

```
Y2x1c3RlcjIgdUHVHMGxwdVBYdUR4ajlFUmdLQlRYT3FzWF1QVG5xUkpsNi9tbFdkamRWS3ZFNXI0
NlFTMkJoOW5DK0k0UmNlMED0bldSVU90S0JHOWdwNjviclPOUtwag5yLldwMTV6OEQzTzJnbzk1
MUNBTmVzLzdRUWxsWVZQN2wyQk9wRlI2STF6SXJDM1hHd0k4TlFXVDYxcXBzalNWWnY4ek81b1E1
R0RZUVRrUHR0SS95QWsvdUpCRVMxb2hDejM4bjlIZl1BTEEx2TUFMVnNCUHRVdEcrY05HYzFrdFVE
RElSMnExRwDwemRKYnVZc09lSG5aWDNMTzNldUtER2w0QzRNQ21ydjlEV2lXSnh3aVoxeVp1Nj1H
YlpKbFh4cUxPUUJsa2RNblRYaz0K
```

**NOTE:** Another method for converting values to base64 is to use an Internet tool such as <https://www.base64encode.org> to encode or decode data.

### Best Practices for Using Tickets

When using secure data-fabric clusters with the Kubernetes Interfaces for Data Fabric, you must generate tickets for your containers. Here are some best practices:

- Create a different user for each container.
- To avoid frequent renewals, use long-lived user tickets or servicewithimpersonation tickets. If you refresh or update a ticket, you must restart your containers.
- If you use an impersonation ticket, it is CRITICAL that you use security contexts in the pod definitions to avoid a misbehaving container impersonating all user IDs. For restrictions that apply to the use of impersonation tickets, see [How Impersonation Works](#) on page 1937 and [maprlogin](#) on page 2918.
- Match the security context `runAsUser`: ID and `fsGroup`: group to the ID or group used to create the ticket.

Here is an example of a pod spec that specifies a security context:

```
apiVersion: v1
kind: Pod
metadata:
  name: test-secure
  namespace: mapr-examples
spec:
  securityContext:
    runAsUser: 1000
    fsGroup: 2000
```

### Example: Statically Provisioning a Volume Using the Container Storage Interface (CSI) Storage Plugin

#### About this task

You can designate a volume for use with Kubernetes by specifying the volume parameters directly inside the PersistentVolume spec.

Suppose you want to get an application container up and running quickly in the HPE Ezmeral Data Fabric. You already have a file-system path that you want to use for the application. You only need the data accessible to read. To make this work, you must do the following:

### Procedure

1. Generate a service ticket and set the `securityType` parameter in the `PersistentVolume` spec to `secure` if the volume to mount is on a secure cluster.

See [Generating a Service Ticket](#) on page 1826 for more information. For example:

```
kind: PersistentVolume
metadata:
  name: pv-securepv-test
  namespace: test-csi
spec:
  accessModes:
  ...
  csi:
  ...
  volumeAttributes:
  ...
  securityType: "secure"
```

2. If the volume to mount is on a secure cluster, configure a Ticket Secret, and include the base64-encoded contents of the ticket file in the Ticket Secret.

For more information, see [Configuring a Secret](#) on page 3894. The following table describes the properties of the Secret file:

Property	Notes
<code>apiVersion</code>	The Kubernetes API version.
<code>kind</code>	The type of object being created.
<code>name</code>	A string to identify the Secret.
<code>namespace</code>	The namespace in which the Secret runs.
<code>type</code>	The type of Secret being created. For type <code>Opaque</code> , clients must treat these values as opaque and pass them unmodified back to the server.
<code>CONTAINER_TICKET</code>	The contents of the ticket encoded in base64. If you specified <code>secure</code> for the <code>securityType</code> , you must provide the ticket. To encode the ticket, see <a href="#">Converting a String to Base64</a> on page 3896. You may remove the ticket if the cluster is not secure.

3. Set the `runAsUser` and the `fsGroup` parameters in the pod spec to the UID and GID of the user that created the ticket.

For example:

```
apiVersion: v1
kind: Pod
metadata:
  name: test-pv1
  namespace: test-csi
spec:
  ...
  securityContext:
    runAsUser: 1000
    fsGroup: 2000
  ...
```

The following table lists the properties specified in the sample pod spec:

Parameter	Notes
apiVersion	The Kubernetes API version for the pod spec.
kind	The kind of object being created. For clarity, the example uses a naked pod. Generally, it is better to use a Deployment, DaemonSet, or StatefulSet for high availability (HA) and ease of upgrade.
metadata: name	The pod name.
metadata: namespace	The namespace in which the pod runs.
securityContext: runAsUser	The user ID to run the container under. This user ID must be the same as the user ID for which the ticket was generated.
securityContext: fsGroup	The group ID to run the container under. This group ID must be the same as the group ID of the user for which the ticket was generated.

- Point the `volumePath` in the CSI driver setting to the desired path, and fill in the `cldbHosts` and `cluster` information.

For the complete list of volume attributes, see [volume create](#) on page 2592; however, note that volume attributes like `mount`, `quota`, `createparent`, `path`, and `name` are ignored when provisioning a volume. For more information, see [Data Fabric Parameters for Static and Dynamic Provisioning](#) on page 3828.

For example:

#### FUSE

```
apiVersion: v1
kind: PersistentVolume
metadata:
  name: test-simplepv
  namespace: test-csi
spec:
  accessModes:
  - ReadWriteOnce
  persistentVolumeReclaimPolicy: Delete
  capacity:
    storage: 5Gi
  csi:
    driver: com.mapr.csi-kdf
    volumeHandle: test-simplepv
    volumeAttributes:
      volumePath: "/"
      cluster: "clusterA"
      cldbHosts: "10.10.10.210"
      securityType: "secure"
      platinum: "true"
```

#### Loopback NFS

```
apiVersion: v1
kind: PersistentVolume
metadata:
  name: test-simplepv
  namespace: test-csi
spec:
  accessModes:
  - ReadWriteOnce
  persistentVolumeReclaimPolicy: Delete
  capacity:
```

```

storage: 5Gi
csi:
  driver: com.mapr.csi-nfskdf
  volumeHandle: test-simplepv
  volumeAttributes:
    volumePath: "/"
    cluster: "clusterA"
    cldbHosts: "10.10.10.210"
    securityType: "secure"

```

The following table lists the properties shown in the sample PersistentVolume spec:

Parameter	Notes
apiVersion	The Kubernetes API version for the Pod spec.
kind	The kind of object being created.
metadata: name	The Pod name.
metadata: namespace	The namespace in which the Pod runs.
accessModes	How the PersistentVolume is mounted on the host. All modes work the same.  <b>NOTE:</b> The PV and PVC modes must be the same so that they can bind. For more information, see <a href="#">Access Modes</a> .
csi: driver	The CSI Driver being used. Call it using one of these drivers: <ul style="list-style-type: none"> <li>FUSE driver: <code>com.mapr.csi-kdf</code></li> <li>Loopback NFS driver: <code>com.mapr.csi-nfskdf</code></li> </ul>
csi: volumeHandle	The existing volume name or unique volume name for static provisioning.
volumePath	The mount point within the filesystem. This parameter specifies an existing MapR path.
cluster	The cluster name.
clbdbHosts	The DNS names or IP addresses of the CLDB hosts for the cluster. You must provide at least one CLDB host. For fault-tolerance, providing multiple CLDB hosts is recommended. To specify multiple hosts, separate each name or IP address by a space.
securityType	A parameter that indicates whether tickets are used or not used. If tickets are used, specify <code>secure</code> . Otherwise, specify <code>unsecure</code> .

### Example: Mounting a PersistentVolume for Static Provisioning

#### About this task

The information on this page is valid for both FUSE POSIX and Loopback NFS plugins. Examples or tables that mention the FUSE POSIX driver (`com.mapr.csi-kdf`) are equally valid for the Loopback NFS driver (`com.mapr.csi-nfskdf`).

For static provisioning, configuring a PersistentVolume has some advantages over annotating Kubernetes volume information in a pod spec:

- The configuration file can be shared for use by multiple pod specs.
- The configuration file enables the PersistentVolume to be mounted and available even when the pod spec that references it is removed.

For example, suppose a marketing volume exists in the secure file system under the path `/Departments/Marketing`. An administrator wants to statically provision this volume and make it available to multiple users. It is critical that data access is as fast as possible. To make this work, the administrator must do the following:

### Procedure

1. Create a PersistentVolume (PV) (if you have already not statically provisioned a volume as described in this [example](#)) and set the following volumeAttributes:
  - `accessMode` of the PV to `ReadWriteOnce`
  - `securityType` parameter to `secure` because the volume is on a secure cluster
  - `volumePath` in the CSI driver setting to the desired path, and fill in the `cldbHosts` and `cluster` information
  - `platinum` parameter to use the POSIX platinum client or the `license` parameter to select from three POSIX clients

For example:

```
apiVersion: v1
kind: PersistentVolume
metadata:
  name: test-simplepv
  namespace: test-csi
  labels:
    name: pv-simplepv-test
spec:
  accessModes:
    - ReadWriteOnce
  persistentVolumeReclaimPolicy: Delete
  capacity:
    storage: 5Gi
  csi:
    nodePublishSecretRef:
      name: "mapr-ticket-secret"
      namespace: "test-csi"
    driver: com.mapr.csi-kdf
    volumeHandle: test-simplepv
    volumeAttributes:
      volumePath: "/"
      cluster: "clusterA"
      cldbHosts: "10.10.102.96"
      securityType: "secure"
      platinum: "true"
```

The preceding example specifies the high-performance Platinum POSIX license by including `platinum: "true"` in the `volumeAttributes`.

If you have a Platinum FUSE POSIX license, Release 1.0.2 and later provide another way to control the POSIX client. Instead of specifying `platinum: "true"`, you can specify `license: "<license-name>"` and select one of three POSIX licenses (Basic, Container, or Platinum). Release 1.0.2 also adds support for a `startupConfig` line that lets you pass custom startup parameters to the FUSE process. The following example shows these options:

```
apiVersion: v1
kind: PersistentVolume
metadata:
```

```

name: test-simplepv
namespace: test-csi
labels:
  name: pv-simplepv-test
spec:
  accessModes:
  - ReadWriteMany
  persistentVolumeReclaimPolicy: Delete
  capacity:
    storage: 5Gi
  csi:
    nodePublishSecretRef:
      name: "mapr-ticket-secret"
      namespace: "test-csi"
    driver: com.mapr.csi-kdf
    volumeHandle: test-simplepv
    volumeAttributes:
      volumePath: "/"
      cluster: "clusterB"
      cldbHosts: "10.10.10.210"
      securityType: "secure"
      license: "container"
      startupConfig: "-o allow_other -o big_writes -o auto_unmount -o
async_dio -o max_background=24 -o auto_inval_data --disable_writeback"

```

The following table shows the properties defined in the sample PersistentVolume:

Parameter	Notes
metadata: name	The PersistentVolume name.
metadata: namespace	The namespace in which the PersistentVolume is stored.
accessModes	How the PersistentVolume is mounted on the host.  <b>NOTE:</b> The accessMode is not used to set the access mode bit on the volume. The accessMode of the PV and PVC should be the same so that they can bind. For more information, see <a href="#">Kubernetes Access Modes</a> and <a href="#">Access Modes</a> .
persistentVolume ReclaimPolicy	Specifies what happens to the volume when it is released by its claim. The Retain value keeps the PVC around for manual cleanup. Delete deletes the PV from Kubernetes.  <b>NOTE:</b> If this volume was created using dynamic provisioning, Delete causes the underlying volume to be deleted. For more information, see <a href="#">Reclaiming</a> .
capacity	Specifies how big the allocated storage should be. This value is not validated against the quota or advisory quota. It is up to the person creating the PV to specify this value accurately.
csi: nodePublishSecretRef	The Ticket Secret for the CSI driver.
nodePublishSecretRef: name	The name of the Ticket Secret that contains the ticket to use when mounting to the cluster. See <a href="#">Configuring a Secret</a> on page 3894.
nodePublishSecretRef: namespace	The namespace that contains the Ticket Secret. Use the same namespace as the namespace used by the PersistentVolume.
csi: driver	The CSI driver being used. Call it by specifying driver: mapr.com/maprfs.
volumeHandle	The existing volume name or unique volume name for static provisioning.

volumePath	The mount point within the file system. This parameter specifies an existing path. For example, you can specify the root volume as "/", providing access to the entire filesystem.
cluster	The data-fabric cluster name.
cldbHosts	The hostname or IP addresses of the CLDB hosts for the cluster. You must provide at least one CLDB host. For fault-tolerance, providing multiple CLDB hosts is recommended. To specify multiple hosts, separate each name or IP address by a space.
securityType	A parameter that indicates whether tickets are used or not used. If tickets are used, specify <code>secure</code> . Otherwise, specify <code>unsecure</code> .
platinum	If set to <code>platinum: "true"</code> , the POSIX client uses the platinum driver for better performance. Note that the platinum driver consumes more host resources and Platinum licenses.
license (FUSE POSIX)	<p>Release 1.0.2 and later support the <code>license: "&lt;license-name&gt;"</code> parameter in addition to the <code>platinum: "&lt;true   false&gt;"</code> parameter for the FUSE POSIX plugin. The <code>license: "&lt;license-name&gt;"</code> parameter can have one of three values that control the number of host resources that are consumed:</p> <ul style="list-style-type: none"> <li>"container" for the Container driver (one binary, 8 threads)</li> <li>"basic" for the Basic driver (one binary, 64 threads)</li> <li>"platinum" for the Platinum driver (multiple binaries, each running 64 threads)</li> </ul> <p>Note the following considerations for using the <code>license: "&lt;license-name&gt;"</code> parameter:</p> <ul style="list-style-type: none"> <li>To use the <code>license: "&lt;license-name&gt;"</code> parameter, you must have a Platinum license.</li> <li>If you specify both the <code>platinum: "&lt;true   false&gt;"</code> parameter and the <code>license: "&lt;license-name&gt;"</code> parameter, the <code>platinum: "&lt;true   false&gt;"</code> parameter overrides the <code>license: "&lt;license-name&gt;"</code> parameter.</li> <li>If neither the <code>platinum: "&lt;true   false&gt;"</code> nor the <code>license: "</code>parameter is specified, the <code>container</code> driver is implemented.</li> </ul>
startupConfig (FUSE POSIX)	<p>Release 1.0.2 and later support specifying the <code>startupConfig</code> line. The <code>startupConfig</code> line allows you to specify FUSE configuration parameters that are passed to the <code>fuse.conf</code> file. For the parameters that can be passed, see <a href="#">Configuring the HPE Ezmeral Data Fabric FUSE-Based POSIX Client</a> on page 1608.</p> <p>If no <code>startupConfig</code> line is specified, these default startup settings are used:</p> <pre style="background-color: #f0f0f0; padding: 5px;">"-o allow_other -o big_writes -o auto_unmount"</pre> <p>The default settings allow other users to access the mount point, enable writes larger than 4 KB, and automatically unmount the filesystem when the process is terminated.</p> <p>The following example includes the three default settings and adds some additional settings (shown in <b>bold</b>):</p> <pre style="background-color: #f0f0f0; padding: 5px;">startupConfig: "-o allow_other -o big_writes -o auto_unmount -o <b>async_dio</b> -o <b>max_background=24</b> -o <b>auto_inval_data</b> --<b>disable_writeback</b>"</pre> <p>The additional settings enable asynchronous direct I/O, set the maximum number of asynchronous requests to 24, automatically invalidate the kernel FUSE cache for any data change that causes a change in the files, and disable the writeback cache.</p>

startupConfig (Loopback NFS)	<p>The <code>startupConfig</code> line allows you to specify configuration parameters that are passed to the <code>nfsserver.conf</code> file. For the parameters that can be passed, see <a href="#">nfsserver.conf</a> on page 2994. The <code>startupConfig</code> values supported for Loopback NFS are all the configs supported in the <code>nfsserver.conf</code> file. Values must be separated by a space. If no <code>startupConfig</code> line is specified, these default startup settings are used:</p> <pre>startupConfig: "NFS_HEAPSIZE=1024 DrCacheSize=1024000"</pre>
numrpcthreads	Sets the number of RPC threads for the data-fabric client. The default value is 1. The maximum value is 4. Use this option to increase throughput with FUSE basic or container licenses or with the Loopback NFS driver.
trackMemory	Enables memory profiling to debug memory leaks in the FUSE or Loopback NFS process. To be enabled after direction from the DF support team. The default value is <code>false</code> .
logLevel	Sets the log level to one of the following values: <code>error</code> , <code>warn</code> , <code>info</code> , or <code>debug</code> . For the FUSE POSIX driver ( <code>com.mapr.csi-kdf</code> ), the default value is <code>error</code> . For the Loopback NFS driver ( <code>com.mapr.csi-nfskdf</code> ), the default value is <code>info</code> .
retainLogs	Retains the logs for the pod on the host machine. The default value is <code>false</code> .
startDelay	<p>Sets the wait time after launching the FUSE or Loopback NFS processes and before making the mount available to the application pod. The default value is 5.</p> <p> <b>CAUTION:</b> Setting the value below 2 to 3 seconds may affect the availability of the mount.</p>

See [Example: Statically Provisioning a Volume Using the Container Storage Interface \(CSI\) Storage Plugin](#) on page 3835 for more information.

2. Create a PersistentVolumeClaim (PVC) spec and set the `accessMode` of the PVC to `ReadWriteOnce`.

For example:

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: test-simplepvc
  namespace: test-csi
spec:
  accessModes:
    - ReadWriteOnce
  resources:
    requests:
      storage: 5G
```

The following table shows the properties used in the sample PersistentVolumeClaim:

Parameter	Notes
<code>metadata: name</code>	The PersistentVolumeClaim name.
<code>metadata: namespace</code>	The namespace in which the PersistentVolumeClaim is configured.
<code>accessMode</code>	<p>How the requested PersistentVolume is mounted on the host.</p> <p> <b>NOTE:</b> The PV and PVC modes should be the same so that they can bind.</p> <p>For more information, see <a href="#">Kubernetes Access Modes</a> and <a href="#">Access Modes</a>.</p>

3. Generate a service ticket, and create and deploy a ticket secret on the pod (if you have already not done it as described in steps 1 and 2 of this [example](#)).  
See [maprlogin](#) on page 2918 for information on generating a ticket and [Configuring a Secret](#) on page 3894 for information on creating and deploying a ticket secret.
4. Create the pod spec and set the `runAsUser` and the `fsGroup` parameters to the UID and GID of the user that created the ticket.

For example:

```
apiVersion: v1
kind: Pod
metadata:
  name: test-pv
  namespace: test-csi
spec:
  securityContext:
    runAsUser: 1000
    fsGroup: 2000
  containers:
  - name: busybox
    image: busybox
    args:
    - sleep
    - "1000000"
  resources:
    requests:
      memory: "2Gi"
      cpu: "500m"
  volumeMounts:
  - mountPath: /mapr
    name: maprflex
  volumes:
  - name: maprflex
    persistentVolumeClaim:
      claimName: test-simplepvc
```

The following table shows the properties defined in the sample pod spec:

Parameter	Notes
<code>apiVersion</code>	The Kubernetes API version for the pod spec.
<code>kind</code>	The kind of object being created. The example uses a naked pod for clarity. Generally, it is better to use a Deployment, DaemonSet, or StatefulSet for high availability and ease of upgrade.
<code>metadata: name</code>	The pod name.
<code>metadata: namespace</code>	The namespace in which the pod runs.
<code>securityContext: runAsUser</code>	The user ID to run the container under. This user ID must be the same as the user ID for which the ticket was generated.
<code>securityContext: fsGroup</code>	The group ID to run the container under. This group ID must be the same as the group ID of the user for which the ticket was generated.
<code>volumeMounts: mountPath</code>	A directory inside the container that is designated as the mount path.
<code>volumeMounts: name</code>	A name that you assign to the Kubernetes <code>volumeMounts</code> resource. Matches with <code>Volumes: name</code> .

Volumes: name	A string to identify the name of the Kubernetes <code>volumes</code> resource. The value should match <code>volumeMounts: name</code> .
persistentVolumeClaim: claimName	The name of the PersistentVolumeClaim (PVC). For more information, see <a href="#">PersistentVolumeClaims</a> .

5. Deploy the `.yaml` file on the pod by running the following command:

```
kubectl apply -f <filename>.yaml
```

For each Pod mount request, the POSIX client starts with the pod's hostname and new generated `hostid`, which is tracked on the data-fabric cluster. You can run the [node list](#) on page 2270 command on the data-fabric cluster to determine the number of POSIX clients. For example:

#### FUSE POSIX

```
# maprcli node list -clientonly true
clienttype      clienthealth hostname
ip              lasthb id
posixclientbasic Inactive      4f3d34fe-2007-11e9-8980-0cc47ab39644
10.10.102.94,172.17.0.1,192.168.28.0 11225 7407394893618656436
posixclientbasic Inactive      7906d011-200f-11e9-84c0-0cc47ab39644
10.10.102.94,172.17.0.1,192.168.28.0 8174 7544602061076655421
posixclientbasic Inactive      9ed61912-2004-11e9-8980-0cc47ab39644
10.10.102.92,172.17.0.1,192.168.184.128 11224 2540810767207593086
posixclientbasic Inactive      c35ab639-2010-11e9-84c0-0cc47ab39644
10.10.102.94,172.17.0.1,192.168.28.0 7568 7947067275504513691
posixclientbasic Active       e5dc10e8-2012-11e9-84c0-0cc47ab39644
10.10.102.94,172.17.0.1,192.168.28.0 18 5849529086453778130
```

#### Loopback NFS

```
# maprcli node list -clientonly true
clienttype      clienthealth hostname
ip              lasthb id
LOOPBACK_NFS   Active       3ae5bb79-0aa1-431d-a17b-2cf0ef692060
10.163.160.104,192.168.252.65 1 3740102597316282880
LOOPBACK_NFS   Active       8c096a3c-0424-466a-8eda-6a61999ac3e4
10.163.160.103,192.168.19.192 1 6892565781040807680
LOOPBACK_NFS   Active       ae92fe4b-a3c9-4cb3-8858-c688dd6e0bdc
10.163.160.103,192.168.19.192 1 1038944668644089888
LOOPBACK_NFS   Active       fe855a47-bf66-4b72-8f28-c713b5ec4004
10.163.160.105,192.168.153.128 1 5958455784535826944
```

### Example

#### Full example, which includes PV, PVC, and pod configuration

```
apiVersion: v1
kind: PersistentVolume
metadata:
  name: test-simplepv
  namespace: test-csi
  labels:
    name: pv-simplepv-test
spec:
  accessModes:
    - ReadWriteOnce
  persistentVolumeReclaimPolicy: Delete
  capacity:
```

```

storage: 5Gi
csi:
  nodePublishSecretRef:
    name: "mapr-ticket-secret"
    namespace: "test-csi"
  driver: com.mapr.csi-kdf
  volumeHandle: test-simplepv
  volumeAttributes:
    volumePath: "/"
    cluster: "clusterA"
    cldbHosts: "10.10.102.96"
    securityType: "secure"
    platinum: "true"
---
apiVersion: v1
kind: Pod
metadata:
  name: test-pv
  namespace: test-csi
spec:
  securityContext:
    runAsUser: 1000
    fsGroup: 2000
  containers:
  - name: busybox
    image: busybox
    args:
    - sleep
    - "1000000"
  resources:
    requests:
      memory: "2Gi"
      cpu: "500m"
    volumeMounts:
    - mountPath: /mapr
      name: maprflex
  volumes:
  - name: maprflex
    persistentVolumeClaim:
      claimName: test-simplepvc
---
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: test-simplepvc
  namespace: test-csi
spec:
  accessModes:
  - ReadWriteOnce
  resources:
    requests:
      storage: 5G

```

### Example: Mounting a PersistentVolume for Dynamic Provisioning Using Container Storage Interface (CSI) Storage Plugin

#### About this task

This example also uses a PersistentVolume. However, unlike the previous example, when you use the dynamic provisioner, you do not need to create a PersistentVolume manually. The PersistentVolume is created automatically based on the parameters specified in the referenced StorageClass.

Dynamic provisioning is useful in cases where you do not want Data Fabric and Kubernetes cluster administrators to create storage manually to store the pod storage state.

The following example uses a PersistentVolumeClaim that references a Storage Class. In this example, a Kubernetes administrator has created a storage class called `test-secure-sc` for pod creators to use when they want to create persistent storage for their pods. In this example, it is important for the created pod storage to survive the deletion of a pod.

The information on this page is valid for both FUSE POSIX and Loopback NFS plugins. Examples or tables that mention the FUSE POSIX provisioner (`com.mapr.csi-kdf`) are equally valid for the Loopback NFS provisioner (`com.mapr.csi-nfskdf`).

To dynamically provision a volume, you must do the following:

### Procedure

1. Generate a user ticket, and create and deploy a ticket secret on the pod. See:
  - [Best Practices for Using Tickets](#) on page 3897 to select the right ticket
  - [maprlogin](#) on page 2918 for information about generating a ticket
  - [Configuring a Secret](#) on page 3894 for information about creating and deploying a ticket secret
2. Create the REST secret and deploy the secret on the pod.  
See [Configuring a Secret](#) on page 3894 for information about creating and deploying a ticket secret.
3. Create a StorageClass similar to the following:

```
apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: test-secure-sc
  namespace: test-csi
provisioner: com.mapr.csi-kdf
allowVolumeExpansion: true
reclaimPolicy: Delete
parameters:
  csiProvisionerSecretName: "mapr-provisioner-secrets"
  csiProvisionerSecretNamespace: "test-csi"
  csiNodePublishSecretName: "mapr-ticket-secret"
  csiNodePublishSecretNamespace: "test-csi"
  restServers: "10.10.10.210:8443"
  cldbHosts: "10.10.10.210:7222"
  cluster: "clusterA"
  securityType: "secure"
  namePrefix: "csi-pv"
  mountPrefix: "/csi"
  advisoryquota: "100M"
  trackMemory: "false"
  logLevel: "error"
  retainLogs: "false"
  startupConfig: "-o allow_other -o big_writes -o auto_unmount -o
  async_dio -o max_background=24 -o auto_inval_data --disable_writeback"
```

For more information, see [Storage Classes](#). The following table shows the properties defined in the sample StorageClass:

Property	Description
<code>apiVersion</code>	The Kubernetes API version for the StorageClass spec.

Property	Description
<code>kind</code>	The kind of object being created. This is a StorageClass.
<code>metadata: name</code>	The name of the StorageClass. Administrators should specify the name carefully because it will be used by pod authors to help select the right StorageClass for their needs.
<code>metadata: namespace</code>	The namespace in which the StorageClass runs. This namespace can be different from the namespace used by the PVC and pod, since the StorageClass namespace can be a cross-namespace resource.
<code>provisioner</code>	The provisioner being used. For the FUSE POSIX provisioner, specify <code>com.mapr.csi-kdf</code> . For the Loopback NFS provisioner, specify <code>com.mapr.csi-nfskdf</code> .
<code>csiNodePublishSecret Name</code>	The name of the Secret that contains the ticket to use when mounting to the HPE Ezmeral Data Fabric cluster. See <a href="#">Configuring a Secret</a> on page 3894.
<code>csiNodePublishSecret Namespace</code>	The namespace that contains the Secret. Use the same namespace as the namespace used by the pod.
<code>csiProvisionerSecret Name (deprecated)</code> <code>csi.storage.k8s.io/provisioner-secret-name</code>	The name of the Kubernetes Secret that is used to store Data Fabric administrative credentials (user, password, and ticket information for the Data Fabric webserver). To use the provisioner, you must configure a Secret. See <a href="#">Configuring a Secret</a> on page 3894.
<code>csiProvisionerSecret Namespace (deprecated)</code> <code>csi.storage.k8s.io/provisioner-secret-namespace</code>	The namespace for the Secret containing the Data Fabric administrative credentials (user name and password information for a Data Fabric user that has the privileges to create volumes). This namespace can be different from the namespace used by the pod, since a pod author or namespace admin might not be trusted to create administration Secrets for the Data Fabric cluster.
<code>restServers</code>	A space-separated list of Data Fabric webserver. Specify the hostname or IP address and port number of each REST server for the cluster. For fault tolerance, providing multiple REST server hosts is recommended.
<code>cldbHosts</code>	The hostname or IP addresses of the CLDB hosts for the Data Fabric cluster. You must provide at least one CLDB host. For fault-tolerance, providing multiple CLDB hosts is recommended. To specify multiple hosts, separate each name or IP address by a space.
<code>cluster</code>	The Data Fabric cluster name.
<code>securityType</code>	A parameter that indicates whether Data Fabric tickets are used or not used. If Data Fabric tickets are used, specify <code>secure</code> . Otherwise, specify <code>unsecure</code> .
<code>namePrefix</code>	A prefix for the Data Fabric volume to be created. For example, if you specify <code>PV</code> as the <code>namePrefix</code> , the first dynamically created volume might be named <code>PV.bevefsesr</code> . The provisioner generates random names using lower-case letters. If you do not specify a prefix, the provisioner uses <code>maprprovisioner</code> as a prefix.
<code>mountPrefix</code>	The parent path of the mount in the Data Fabric file system. If you do not specify a mount prefix, the provisioner mounts your volume under the Data Fabric root.   <b>NOTE:</b> User provisioning a volume under this <code>mountPrefix</code> requires read-write permissions to mount the newly created volume; otherwise, the volume provision will fail.
<code>advisoryquota</code>	The advisory storage quota for the volume. The <code>advisoryquota</code> is one of the Data Fabric parameters that you can specify for dynamic provisioning. For more information, see <a href="#">Before You Begin</a> on page 3877.

Property	Description
trackMemory	Enables memory profiling to debug memory leaks in the FUSE or Loopback NFS process. To be enabled after direction from the DF support team. The default value is false.
logLevel	Sets the log level to one of the following values: error, warn, info, or debug. For the FUSE POSIX driver (com.mapr.csi-kdf), the default value is error. For the Loopback NFS driver (com.mapr.csi-nfskdf), the default value is info.
retainLogs	Retains the logs for the pod on the host machine. The default value is false.
startupConfig (FUSE POSIX)	<p>Release 1.0.2 and later support specifying the startupConfig line. The startupConfig line allows you to specify FUSE configuration parameters that are passed to the fuse.conf file. For the parameters that can be passed, see <a href="#">Configuring the HPE Ezmeral Data Fabric FUSE-Based POSIX Client</a> on page 1608.</p> <p>If no startupConfig line is specified, these default startup settings are used:</p> <pre>"-o allow_other -o big_writes -o auto_unmount"</pre> <p>The default settings allow other users to access the mount point, enable writes larger than 4 KB, and automatically unmount the file system when the process is terminated.</p> <p>The following example includes the three default settings and adds some additional settings (shown in <b>bold</b>):</p> <pre>startupConfig: "-o allow_other -o big_writes -o auto_unmount -o <b>async_dio</b> -o <b>max_background=24</b> -o <b>auto_inval_data</b> --<b>disable_writeback</b>"</pre> <p>The additional settings enable asynchronous direct I/O, set the maximum number of asynchronous requests to 24, automatically invalidate the kernel FUSE cache for any data change that causes a change in the files, and disable the writeback cache.</p>
startupConfig (Loopback NFS)	<p>The startupConfig line allows you to specify configuration parameters that are passed to the nfserver.conf file. For the parameters that can be passed, see <a href="#">nfserver.conf</a> on page 2994. The startupConfig values supported for Loopback NFS are all the configs supported in the nfserver.conf file. Values must be separated by a space. If no startupConfig line is specified, these default startup settings are used:</p> <pre>startupConfig: "NFS_HEAPSIZE=1024 DrCacheSize=1024000"</pre>
numrpthreads	Sets the number of RPC threads for the Data Fabric client. The default value is 1. The maximum value is 4. Use this option to increase throughput with FUSE basic or container licenses or with the Loopback NFS driver.
startDelay	<p>Sets the wait time after launching the FUSE or Loopback NFS processes and before making the mount available to the application pod. The default value is 5.</p> <p> <b>CAUTION:</b> Setting the value below 2 to 3 seconds may affect the availability of the mount.</p>

#### 4. Configure a PersistentVolumeClaim similar to the following:

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: test-secure-pvc
  namespace: test-csi
spec:
  storageClassName: test-secure-sc
```

```

accessModes:
  - ReadWriteOnce
resources:
  requests:
    storage: 5G

```

The following table shows the properties defined in the sample PersistentVolumeClaim:

Property	Description
apiVersion	The Kubernetes API version for the pod spec.
kind	The kind of object being created. This is a PersistentVolumeClaim (PVC).
metadata: name	The PVC name.
metadata: namespace	The namespace in which the PVC runs. This should be the same namespace used by the pod.
storageClassName	The name of the storage class requested by the PersistentVolumeClaim. For more information, see <a href="#">Dynamic Provisioning and Storage Classes</a> .
accessModes	How the PersistentVolume is mounted on the host. For more information, see <a href="#">Access Modes</a> .
requests: storage	The storage resources being requested, or that were requested and have been allocated. The pod author can use this parameter to specify how much quota is needed for the Data Fabric volume. For the units, see <a href="#">Resource Model</a> .

#### 5. Create the pod spec similar to the following:

```

apiVersion: v1
kind: Pod
metadata:
  name: test-secure-pod
  namespace: test-csi
spec:
  containers:
    - name: busybox
      image: busybox
      args:
        - sleep
        - "1000000"
      resources:
        requests:
          memory: "2Gi"
          cpu: "500m"
      volumeMounts:
        - mountPath: /mapr
          name: maprflex
  volumes:
    - name: maprflex
      persistentVolumeClaim:
        claimName: test-secure-pvc

```

The following table shows the properties defined in the sample pod spec:

Property	Description
apiVersion	The Kubernetes API version for the pod spec.
kind	The kind of object being created. For clarity, this example uses a naked Pod. Generally, it is better to use a Deployment, DaemonSet, or StatefulSet for high availability and ease of upgrade.

Property	Description
metadata: name	The pod name.
metadata: namespace	The namespace in which the pod runs. It should be the same namespace in which the PVC runs.
volumeMounts: mountPath	A directory inside the container that is designated as the mount path.
volumeMounts: name	A name that you assign to the Kubernetes volumeMounts resource. The value should match Volumes: name.
Volumes: name	A string to identify the name of the Kubernetes volumes resource. The value should match volumeMounts: name.
persistentVolumeClaim: claimName	The name of the PersistentVolumeClaim (PVC). For more information, see <a href="#">PersistentVolumeClaims</a> .

**6.** Deploy the .yaml file on the pod by running the following command:

```
kubectl apply -f <filename>.yaml
```

For each pod mount request, the POSIX client starts with the pod's hostname and new generated hostid, which is tracked on the Data Fabric cluster. You can run the [node list](#) on page 2270 command on the cluster to determine the number of POSIX clients. For example:

**FUSE POSIX**

```
# maprcli node list -clientonly true
clienttype clienthealth hostname ip lasthb id
posixclientbasic Inactive 4f3d34fe-2007-11e9-8980-0cc47ab39644

```

### Example: Volume Cloning for Dynamic Provisioning

**About this task**

You can clone a volume from an existing volume by configuring a PersistentVolumeClaim that specifies the volume PVC as the data source. In the following example, the PVC named `testcsi-secure-pvc` serves as the data source for creating a new volume named `testcsi-secure-pvc-clone`:

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: testcsi-secure-pvc-clone
  namespace: test-csi
spec:
  storageClassName: testcsi-secure-sc
  accessModes:
    - ReadWriteOnce
  resources:
    requests:
      storage: 10G
  dataSource:
    kind: PersistentVolumeClaim
    name: testcsi-secure-pvc
```

When cloning extra large volumes (volumes measuring hundreds of GB), you might experience timeouts or a failure to clone the volume. To prevent timeouts with extra large volumes, increase the retry timeout setting for the `csi-provisioner` sidecar container. See the `--timeout` argument in the latest `csi-maprkd-<version>.yaml`.

For more information, see [CSI Volume Cloning](#).

**Example: Volume Expansion for Dynamic Provisioning Using Container Storage Interface (CSI) Storage Plugin****About this task**

The following versions of the Container Storage Interface (CSI) Storage Plugin support a volume expansion feature for dynamically provisioned volumes:

- FUSE POSIX plugin versions [1.1.0](#) and later
- Loopback NFS plugin versions [1.0.0](#) and later

Volume expansion means you can increase the storage quota of volumes created by the CSI driver. Note that the `StorageClass` must have `allowVolumeExpansion` set to `true` for volume expansion to succeed. For more information about volume expansion, see [Expanding Persistent Volume Claims](#).

To use volume expansion, increase the storage value and reapply the PersistentVolumeClaim configuration. For example, in the following PVC configuration, to increase the storage quota for the volume from 5G to 10G, change `storage: 5G` to `storage: 10G`, and run the `kubectl apply -f <path_to_pvc>.yaml` command:

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: test-secure-pvc
  namespace: test-csi
spec:
  storageClassName: test-secure-sc
  accessModes:
    - ReadWriteOnce
  resources:
```

```
requests:
  storage: 5G
```

## Verifying Creation of a Kubernetes PersistentVolumeClaim and Persistent Volume

### About this task

Once the pod spec is installed, you can verify the status of a PersistentVolumeClaim and/or a PersistentVolume by using the `kubectl` command. For example:

### Procedure

1. Run the Kubernetes `get` command to verify the status of the PersistentVolumeClaim:

**NOTE:** The information on this page is valid for both FUSE POSIX and Loopback NFS plugins. Examples or tables that mention the FUSE POSIX driver (`com.mapr.csi-kdf`) are equally valid for the Loopback NFS driver (`com.mapr.csi-nfskdf`).

### Static Provisioning

```
# kubectl describe pvc -n test-csi

### Managing Snapshots Using the Container Storage Interface (CSI) Storage Plugin

This section describes how to create and delete one or more snapshots of volumes dynamically provisioned by the Container Storage Interface (CSI) Storage Plugin on the data-fabric cluster.

The Container Storage Interface (CSI) Storage Plugin v1.x.x uses the `csi-snapshotter` to support snapshot provisioning.

CSI now supports snapshot restore, which allows you to create a new volume from the snapshot data of another volume. See [Creating a Volume from a Snapshot](#) on page 3873. To manually restore a volume, see [Copying From a Snapshot Using the CLI](#) on page 1268.

*Creating a Snapshot Using the Container Storage Interface (CSI) Storage Plugin*

### **About this task**

You can create one or more snapshots of a dynamically provisioned volume using the Container Storage Interface (CSI) Storage Plugin.

Creating a Snapshot of a Dynamically Provisioned Volume on the Cluster

**Procedure**

1. Verify that the volume was successfully provisioned by checking the PersistentVolume (PV) and PersistentVolumeClaim (PVC) for the volume.

For example, run the `kubectl describe` command to verify the PV and then the PVC.

```
# kubectl describe pv -n test-csi
Name:                mapr-pv-e46a50cd-2012-11e9-84c0-0cc47ab39644
Labels:                <none>
Annotations:          pv.kubernetes.io/provisioned-by: com.mapr.csi-kdf
Finalizers:           [kubernetes.io/pv-protection]
StorageClass:         test-secure-sc
Status:             Bound
Claim:                test-csi/test-secure-pvc
Reclaim Policy:       Delete
Access Modes:         RWO
VolumeMode:           Filesystem
Capacity:             5Gi
Node Affinity:        <none>
Message:

```

-----
Normal      ExternalProvisioning    3m43s
persistentvolume-controller
  waiting for a volume to be created, either by external provisioner
  "com.mapr.csi-kdf" or manually created by system administrator
Normal      Provisioning                3m43s
com.mapr.csi-kdf_csi-controller-kdf-0_69805ad1-2010-11e9-88dc-d610076b9fb
3 External provisioner is provisioning volume for claim "test-csi/
test-secure-pvc"
Normal      ProvisioningSucceeded       3m40s
com.mapr.csi-kdf_csi-controller-kdf-0_69805ad1-2010-11e9-88dc-d610076b9fb
3 Successfully provisioned volume
mapr-pv-e46a50cd-2012-11e9-84c0-0cc47ab39644
Mounted By: test-secure-pod

```

2. Deploy the REST secret .yaml file by running the following command:

```
kubectl apply -f <secret filename>.yaml
```

The Secret file should look similar to the following:

```

# Copyright (c) 2009 & onwards. MapR Tech, Inc., All rights reserved
apiVersion: v1
kind: Secret
metadata:
  name: mapr-snapshot-secrets
  namespace: test-csi
type: Opaque
data:
  MAPR_CLUSTER_USER: cm9vdA==
  MAPR_CLUSTER_PASSWORD: bWFwY2g==

```

For more information, see [Configuring a Secret](#) on page 3894.

3. Create a snapshot class for provisioning a snapshot of the volume. For example, the snapshot class file should look similar to the following:

FUSE

```

apiVersion: snapshot.storage.k8s.io/v1
kind: VolumeSnapshotClass
metadata:
  name: testcsi-snapshotclass
  namespace: test-csi
driver: com.mapr.csi-kdf
deletionPolicy: Delete
parameters:
  restServers: "10.10.102.95:8443"
  cluster: "mycluster"
  csi.storage.k8s.io/snapshotter-secret-name: mapr-snapshot-secrets
  csi.storage.k8s.io/snapshotter-secret-namespace: test-csi

```

Loopback NFS

```

apiVersion: snapshot.storage.k8s.io/v1
kind: VolumeSnapshotClass
metadata:
  name: testcsi-snapshotclass
  namespace: test-csi
driver: com.mapr.csi-nfskdf

```

```

deletionPolicy: Delete
parameters:
  restServers: "10.10.102.95:8443"
  cluster: "mycluster"
  csi.storage.k8s.io/snapshotter-secret-name: mapr-snapshot-secrets
  csi.storage.k8s.io/snapshotter-secret-namespace: test-csi

```

The sample snapshot class file shown above contains the following properties:

Property	Description
apiVersion	The Kubernetes API version for the StorageClass spec.
kind	The kind of object being created. This is a StorageClass.
metadata: name	The name of the snapshot class. Administrators should specify the name carefully because it will be used by Pod authors to help select the right snapshot class for their needs.
metadata: namespace	The namespace in which the snapshot class runs.
driver	The CSI volume plugin to use for provisioning the volume snapshots. For example: <code>com.mapr.csi-kdf</code> .
restServers	A space-separated list of webservers. Specify the hostname or IP address and port number of each REST server for the cluster. For fault tolerance, providing multiple REST server hosts is recommended.
cluster	The cluster name.
csiSnapshotterSecret Name (deprecated) csi.storage.k8s.io/ snapshotter-secret-name	The name of the Kubernetes Secret that is used to store administrative credentials (user, password, and ticket information for the webserver). To use the provisioner, you must configure a Secret. See <a href="#">Configuring a Secret</a> on page 3894.
csiSnapshotterSecret Namespace (deprecated) csi.storage.k8s.io/ snapshotter-secret-namespace	The namespace for the Secret containing the administrative credentials (user name and password information for a user that has the privileges to create volumes). This namespace can be different from the namespace used by the Pod, since a Pod author or namespace admin might not be trusted to create administration Secrets for the cluster.

**4.** Deploy the snapshot class by running the following command:

```
kubectl apply -f <snapshot class>.yaml
```

5. Verify whether the snapshot class was successfully deployed by running one of the following commands:

```
# kubectl get volumesnapshotclass -n test-csi
NAME                AGE
test-snapshotclass  41s
root@qa102-92:~/csi-kdf-3/csi-kdf/examples/snapshot# kubectl describe
volumesnapshotclass -n test-csi
Name:                test-snapshotclass
Namespace:
Labels:              <none>
Annotations:         kubectl.kubernetes.io/last-applied-configuration:
                    {"apiVersion":"snapshot.storage.k8s.io/v1",
                    "kind":"VolumeSnapshotClass",
                    "metadata":{"annotations":{"name":"test-snapshotclass"}},
                    "parameters":{"cluster":"clusterA",
                    "csiSnapshotterSecretName":"mapr-snapshot-secrets",
                    "csiSnapshotterSecretNamespace":"test-csi",
                    "namePrefix":"test-snapshot",
                    "restServers":"10.10.10.210:8443"}},
                    "snapshotter":"com.mapr.csi-kdf"}
API Version:         snapshot.storage.k8s.io/v1
Kind:                VolumeSnapshotClass
Metadata:
  Creation Timestamp: 2019-01-24T21:13:35Z
  Generation:        1
  Resource Version:   1039219
  Self Link:         /apis/snapshot.storage.k8s.io/v1/volumesnapshotclasses/test-snapshotclass
  UID:               e94a1fc8-201c-11e9-84c0-0cc47ab39644
Parameters:
  Cluster:            clusterA
  Csi Snapshotter Secret Name: mapr-snapshot-secrets
  Csi Snapshotter Secret Namespace: test-csi
  Name Prefix:        test-snapshot
  Rest Servers:       10.10.10.210:8443
Snapshotter:         com.mapr.csi-kdf
Events:              <none>
```

```
# kubectl get volumesnapshotclass -n test-csi -o yaml
apiVersion: v1
items:
- apiVersion: snapshot.storage.k8s.io/v1
  kind: VolumeSnapshotClass
  metadata:
    annotations:
      kubectl.kubernetes.io/last-applied-configuration: |
        {"apiVersion":"snapshot.storage.k8s.io/v1",
        "kind":"VolumeSnapshotClass",
        "metadata":{"annotations":{"name":"test-snapshotclass"}},
        "parameters":{"cluster":"clusterA",
        "csiSnapshotterSecretName":"mapr-snapshot-secrets",
        "csiSnapshotterSecretNamespace":"test-csi",
        "namePrefix":"test-snapshot",
        "restServers":"10.10.10.210:8443"}},
        "snapshotter":"com.mapr.csi-kdf"}
    creationTimestamp: "2019-01-24T21:13:35Z"
    generation: 1
    name: test-snapshotclass
    resourceVersion: "1039219"
    selfLink: /apis/snapshot.storage.k8s.io/v1/volumesnapshotclasses/test-snapshotclass
    uid: e94a1fc8-201c-11e9-84c0-0cc47ab39644
  parameters:
    cluster: clusterA
    csiSnapshotterSecretName: mapr-snapshot-secrets
    csiSnapshotterSecretNamespace: test-csi
    namePrefix: test-snapshot
    restServers: 10.10.10.210:8443
    snapshotter: com.mapr.csi-kdf
  kind: List
```

```

metadata:
  resourceVersion: ""
  selfLink: ""

```

- Associate the snapshot class with the PersistentVolumeClaim (for the volume to take a snapshot of) by creating a VolumeSnapshot. For example, the VolumeSnapshot file should look similar to the following:

```

apiVersion: snapshot.storage.k8s.io/v1
kind: VolumeSnapshot
metadata:
  name: testcsi-secure-snapshot
  namespace: test-csi
spec:
  volumeSnapshotClassName: testcsi-snapshotclass
  source:
    persistentVolumeClaimName: testcsi-secure-pvc

```

The sample VolumeSnapshot file shown above contains the following properties:

Property	Description
metadata: name	The VolumeSnapshot name.
metadata: namespace	The namespace in which the VolumeSnapshot runs.
snapshotClassName	The volumeSnapshotClassName.
source: name	The persistentVolumeClaimName.

- Deploy the VolumeSnapshot by running the following command:

```
kubectl apply -f <volume snapshot>.yaml
```

- Verify whether VolumeSnapshot was successfully deployed by doing the following:

- a) Run one of the following commands to retrieve the VolumeSnapshot:

```
# kubectl get volumesnapshot -n test-csi -o yaml
apiVersion: v1
items:
- apiVersion: snapshot.storage.k8s.io/v1
  kind: VolumeSnapshot
  metadata:
    annotations:
      kubectl.kubernetes.io/last-applied-configuration: |
        {"apiVersion":"snapshot.storage.k8s.io/
v1","kind":"VolumeSnapshot","metadata":{"annotations":
{},"name":"test-snapshot","namespace":"test-csi"},"spec":
{"snapshotClassName":"test-snapshotclass","source":
{"kind":"PersistentVolumeClaim","name":"test-secure-pvc"}}}
  creationTimestamp: "2019-01-24T21:16:21Z"

9. Log in to the cluster and verify by running the `volume snapshot list` on page 2710 command. For example:

```

# maprcli volume snapshot list -path /csisc/
csisc-securesc-txiqvsdxwu -cluster clusterA -json
{
  "timestamp":1548365090744,
  "timeofday":"2019-01-24 01:24:50.744 GMT-0800 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "ownername":"root",
      "ownertype":"l",
      "volumeid":"234021649",
      "volumename":"csisc-securesc.txiqvsdxwu",
      "volumepath":"/csisc/csisc-securesc-txiqvsdxwu",
      "snapshotid":"256000051",

      "snapshotname": "mapr-snapshot-4c5293bc-201d-11e9-84c0-0cc47ab39644",
      "creationtime":"Thu Jan 24 13:16:22 PST 2019",
      "cumulativeReclaimSizeMB":"0",
      "ownedsize":"0",
      "sharedSize":"0",
      "volumeSnapshotAces":{
        "readAce":"p",
        "writeAce":"p"
      }
    }
  ]
}

```

## Creating Multiple Snapshots of a Dynamically Provisioned Volume

## Procedure

1. Perform steps 1 - 5 described in the [Creating a Snapshot of a Dynamically Provisioned Volume on the Cluster](#) on page 3861 section.
2. Create a VolumeSnapshot similar to the one shown in step 6 of the [Creating a Snapshot of a Dynamically Provisioned Volume on the Cluster](#) on page 3861 section for each additional snapshot to create for the volume.

For example:

```
apiVersion: snapshot.storage.k8s.io/v1
kind: VolumeSnapshot
metadata:
  name: test-snapshot1
  namespace: test-csi
spec:
  snapshotClassName: test-snapshotclass
  source:
    name: test-secure-pvc
    kind: PersistentVolumeClaim
```

3. Repeat step 7 in [Creating a Snapshot of a Dynamically Provisioned Volume on the Cluster](#) on page 3861 for each additional volume snapshots you have created.

4. Log in to the cluster and verify by running the `volume snapshot list` on page 2710 command. For example:

```
# maprcli volume snapshot list -path /csisc/
csisc-securesc-txiqvsdxwu -cluster clusterA -json
{
  "timestamp":1548365359138,
  "timeofday":"2019-01-24 01:29:19.138 GMT-0800 PM",
  "status":"OK",
  "total":2,
  "data":[
    {
      "ownername":"root",
      "ownertype":"l",
      "volumeid":"234021649",
      "volumename":"csisc-securesc.txiqvsdxwu",
      "volumepath":"/csisc/csisc-securesc-txiqvsdxwu",
      "snapshotid":"256000051",

      "snapshotname":"mapr-snapshot-4c5293bc-201d-11e9-84c0-0cc47ab39644",
      "creationtime":"Thu Jan 24 13:16:22 PST 2019",
      "cumulativeReclaimSizeMB":"0",
      "ownedsize":"0",
      "sharedSize":"0",
      "volumeSnapshotAces":{
        "readAce":"p",
        "writeAce":"p"
      }
    },
    {
      "ownername":"root",
      "ownertype":"l",
      "volumeid":"234021649",
      "volumename":"csisc-securesc.txiqvsdxwu",
      "volumepath":"/csisc/csisc-securesc-txiqvsdxwu",
      "snapshotid":"256000052",

      "snapshotname":"mapr-snapshot-19282d27-201f-11e9-84c0-0cc47ab39644",
      "creationtime":"Thu Jan 24 13:29:15 PST 2019",
      "cumulativeReclaimSizeMB":"0",
      "ownedsize":"0",
      "sharedSize":"0",
      "volumeSnapshotAces":{
        "readAce":"p",
        "writeAce":"p"
      }
    }
  ]
}
```

### *Deleting a Snapshot of a Dynamically Provisioned Volume*

#### **About this task**

You can delete snapshots you created using Container Storage Interface (CSI) Storage Plugin. To delete:

**Procedure**

1. Run the following command:

```
kubectl delete -f <volume snapshot>.yaml
```

For example:

```
# kubectl delete -f test-snapshot1.yaml
volumesnapshot.snapshot.storage.k8s.io "test-snapshot1" deleted
```

2. Log in to the cluster and verify that the snapshot was deleted by running the [volume snapshot list](#) on page 2710 command.

For example:

```
# maprcli volume snapshot list -path /csisc/
csisc-securesc-txiqvsdxwu -cluster clusterA -json
{
  "timestamp":1548365417772,
  "timeofday":"2019-01-24 01:30:17.772 GMT-0800 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "ownername":"root",
      "ownertype":"1",
      "volumeid":"234021649",
      "volumename":"csisc-securesc.txiqvsdxwu",
      "volumepath":"/csisc/csisc-securesc-txiqvsdxwu",
      "snapshotid":"256000051",

      "snapshotname":"mapr-snapshot-4c5293bc-201d-11e9-84c0-0cc47ab39644",
      "creationtime":"Thu Jan 24 13:16:22 PST 2019",
      "cumulativeReclaimSizeMB":"0",
      "ownedsize":"0",
      "sharedSize":"0",
      "volumeSnapshotAces":{
        "readAce":"p",
        "writeAce":"p"
      }
    }
  ]
}
```

**Creating a Volume from a Snapshot**

You can restore a volume from a volume snapshot by configuring a PersistentVolumeClaim that specifies the volume snapshot as the data source.

In the following example, the snapshot named `testcsi-secure-snapshot` serves as the data source for creating a new volume named `testcsi-secure-pvc-restore`:

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: testcsi-secure-pvc-restore
  namespace: test-csi
spec:
  storageClassName: testcsi-secure-sc
  accessModes:
```

```

- ReadWriteOnce
resources:
  requests:
    storage: 10G
dataSource:
  kind: VolumeSnapshot
  apiGroup: snapshot.storage.k8s.io
  name: testcsi-secure-snapshot

```

When creating a volume from snapshots of extra large volumes (volumes measuring hundreds of GB), you might experience timeouts or a failure to create the volume. To prevent timeouts with extra large volumes, increase the retry timeout setting of the `csi-snapshotter` sidecar container. See the `--timeout` argument in the latest `csi-maprkd-<version>.yaml`.

For more information, see [Persistent Volumes](#).

### Enabling the Platinum POSIX Client for Container Storage Interface (CSI) Storage Plugin

When you install the Container Storage Interface (CSI) Storage Plugin, the Container FUSE-based POSIX client package is installed on the CSI Driver container. The CSI Driver also supports the use of the Basic, Container, and Platinum FUSE-based POSIX client. For a comparison of the POSIX client packages, see [Preparing for Installation \(HPE Ezmeral Data Fabric POSIX Client\)](#) on page 424.

**NOTE:** Enabling the Platinum POSIX client is not required for the Loopback NFS plug-in.

To install the Platinum POSIX client, include the `platinum` parameter in your pod spec. For example:

```

volumeAttributes:
  volumePath: "/"
  cluster: "clusterA"
  cldbHosts: "10.10.102.96"
  securityType: "secure"
  platinum: "true"

```

Release 1.0.2 and later support another method for specifying the POSIX client. You can use the `license` parameter and specify the Container, Basic, or Platinum driver. For example:

```

volumeAttributes:
  volumePath: "/"
  cluster: "clusterA"
  cldbHosts: "10.10.102.96"
  securityType: "secure"
  license: "platinum"

```

For more information, see [Example: Mounting a PersistentVolume for Static Provisioning](#) on page 3838.

### Logging for the CSI Driver and Provisioner

Describes the event logs for the CSI driver and provisioner for both FUSE and Loopback NFS plugins.

Logs for the Container Storage Interface (CSI) Storage Plugin can be found in `/var/log/csi-maprkd/`. The following table shows the new log-file format. Before the FUSE 1.2.2 and Loopback NFS 1.0.2 drivers were introduced, the log files included a version in the file name.

Log File Type	FUSE or Loopback NFS	Log File	Description	Which Nodes
Driver events log	FUSE	<code>csi-plugin.log</code>	Captures CSI Driver events such as registering the driver and CSI Driver logs for node mount and unmount operations.	All Kubernetes nodes.
	Loopback NFS	<code>csi-nfsplugin.log</code>		

Log File Type	FUSE or Loopback NFS	Log File	Description	Which Nodes
Provisioner events log	FUSE	csi-provisioner.log	Captures provisioner events such as registering the CSI provisioner and CSI Controller events such as Create/Delete volumes, Create/Delete Snapshots etc.	The Kubernetes node where the provisioner StatefulSet pod is running.
	Loopback NFS	csi-nfsprovisioner.log		

**NOTE:** The directory must grant `rw` permissions for creating the logs and must grant write/append permissions to the plug-in and provisioner.

### Troubleshooting the Container Storage Interface (CSI) Storage Plugin

This section describes how to resolve common problems you might encounter when installing and using the Container Storage Interface (CSI) Storage Plugin.

#### Troubleshooting CSI Driver installation

Run the following commands to display information about the pods that are deployed for the CSI plugin and provisioner:

##### FUSE

```
kubectl get pods -n mapr-csi
```

##### Loopback NFS

```
kubectl get pods -n mapr-nfscsi
```

The installation is considered successful if the `get pods` command shows the pods in the `Running` state. For example, your output should look similar to the following when the CSI plugin is deployed on three worker nodes:

##### FUSE

```
mapr-csi          csi-controller-kdf-0          5/5      Running    0
4h25m
mapr-csi          csi-nodeplugin-kdf-2kfrf      3/3      Running    0
4h25m
mapr-csi          csi-nodeplugin-kdf-lq5nw      3/3      Running    0
4h25m
mapr-csi          csi-nodeplugin-kdf-pkrzt      3/3      Running    0
4h25m
```

##### Loopback NFS

```
csi-controller-nfskdf-0          7/7      Running    0          22h
csi-nodeplugin-nfskdf-5rjt2      3/3      Running    0          18h
csi-nodeplugin-nfskdf-7d9cs      3/3      Running    0          22h
csi-nodeplugin-nfskdf-qw7kg      3/3      Running    0          22h
```

The preceding output shows the following:

##### FUSE

- `csi-nodeplugin-kdf-*`: Daemonset pods are deployed on all the Kubernetes worker nodes.
- `csi-controller-kdf-0`: A StatefulSet pod is deployed on a single Kubernetes worker node.

### Loopback NFS

- `csi-nodeplugin-nfskdf-*`: Daemonset pods are deployed on all the Kubernetes worker nodes.
- `csi-controller-nfskdf-0`: A StatefulSet pod is deployed on a single Kubernetes worker node.

### Troubleshoot CSI Plugin Deployment Failures

If the pods show a failure in the deployment, run the following `kubectl` commands to see the container logs:

#### FUSE

```
kubectl logs <csi-nodeplugin-*> -n mapr-csi -c <nodeplugin-pod-container>
```

#### Loopback NFS

```
kubectl logs csi-controller-nfskdf-0 -n mapr-nfscsi -c
<controller-pod-container>
```

Here, replace `<nodeplugin-pod-container>` with the container that is failing. You can also run the following `kubectl` command to see the controller logs:

```
kubectl logs csi-controller-kdf-0 -n mapr-csi -c <controller-pod-container>
```

Here, replace `<controller-pod-container>` with the container that is failing.

### Troubleshooting Volume Provisioning

To check for provisioner errors, check the provisioner log:

#### FUSE

```
tail -100f /var/log/csi-maprkdf/csi-provisioner.log
```

#### Loopback NFS

```
tail -100f /var/log/csi-maprkdf/csi-nfsprovisioner.log
```

### Troubleshooting Mount Operation

Check the CSI Storage plug-in log for mount or unmount errors:

#### FUSE

```
tail -100f /var/log/csi-maprkdf/csi-plugin.log
```

#### Loopback NFS

```
tail -100f /var/log/csi-maprkdf/csi-nfsplugin.log
```

If you don't see any errors, see the kubelet logs on the node where the pod is scheduled to run. For specific errors, check the CSI Storage plugin logs.

### Troubleshooting CSI Storage Plugin Discovery with kubelet

Check the kubelet path for Kubernetes deployment from the kubelet process running with `--root-dir`. The `--root-dir` is a string that contains the directory path for managing kubelet files (such as volume mounts, etc.,) and defaults to `/var/lib/kubelet`. If the Kubernetes environment has a different kubelet

path, modify the CSI driver deployment `.yaml` file with the new path, and redeploy the CSI Storage Plugin again.

### Troubleshooting Snapshot Provisioning

See the provisioner log and check for any provisioner errors:

```
tail -100f /var/log/csi-maprkdir/csi-provisioner.log
```

If there are no errors, run the following `kubectl` command to check the snapshot:

```
kubectl describe volumesnapshot.snapshot.storage.k8s.io <snapshot-name> -n <namespace-name>
```

Here:

- `<snapshot-name>`: Name of the VolumeSnapshot Object defined in `yaml`.
- `<namespace-name>`: Namespace where the VolumeSnapshot object is created.

### Troubleshooting No Space on Disk Error

The `devicemapper` storage driver used for Docker allows only 10 GB by default, resulting in "no space left on device" errors when writing to new directories for a new volume mount request. If `--maxvolumespernode` is configured to be greater than 20 and the underlying Docker is using the `devicemapper` storage driver, do the following to increase the storage size:

1. Change the storage driver to a value other than `devicemapper`, which restricts container storage to 10 GB by default.
2. Increase the default container storage to more than the default of 10 GB for the `devicemapper` storage driver for the Docker container running on a Kubernetes worker node.

For example, do the following to increase the storage size to 50 GB:

1. In the `/etc/sysconfig/docker-storage` file, add `--storage-opt dm.basesize=50G` under `DOCKER_STORAGE_OPTIONS` section.
2. Restart Docker.
3. Run the following command to confirm that the setting is correctly applied:

```
docker info | grep "Base Device Size"
```

## Kubernetes FlexVolume Driver Configuration

This section describes how to use and troubleshoot the HPE Ezmeral Data Fabric for Kubernetes FlexVolume Driver.

For more information about the HPE Ezmeral Data Fabric for Kubernetes, see [Kubernetes Interfaces for Data Fabric FlexVolume Driver Overview](#) on page 801.

### Using Data Fabric for Kubernetes FlexVolume Driver

This section describes how to configure Kubernetes objects to enable persistent storage and includes example configuration files for static and dynamic provisioning.

#### Before You Begin

Before configuration, be sure to review the following notes about supported and unsupported features and parameters:

## Data Fabric Parameters for Dynamic Provisioning

In dynamic provisioning, you can specify Data Fabric parameters for the Data Fabric volume to be created. For a list of the Data Fabric parameters that you can use, see [volume create](#) on page 2592. Note these considerations for using the Data Fabric parameters:

- Volume attributes must be represented as a string (enclosed within quotations). Using an integer or boolean is not supported. In the following example, the `aetype` attribute will generate an error because the value (`1`) is not enclosed in quotations.

```
namePrefix: "pv"
mountPrefix: "/pv"
type: "rw"
advisoryquota: "100M"
aetype: 1
```

- The following Data Fabric parameters are ignored because they are redundant or not supported in the Kubernetes implementation:
  - `mount`
  - `quota*`
  - `createparent`
  - `path`
  - `name`

\*Specifying `resources: requests: storage` in a PersistentVolumeClaim (PVC) (see [Example: Mounting a PersistentVolume for Static Provisioning Using the FlexVolume Driver](#) on page 3882) makes it unnecessary to set the Data Fabric `quota` parameter.

## Kubernetes Access Modes

Kubernetes access modes control how a PersistentVolume (PV) is mounted on the host. [Access modes](#) can be specified on both PVs and PVCs. Only Volumes with a matching Access Mode will be bound to a PVC. Unfortunately, beyond the PVC/PV binding behavior, PVs using FlexVolume drivers ignore these access modes in the current version of Kubernetes. All access modes will work with the MapR Data Fabric for Kubernetes. However, they will appear the same. This means the ROX mode will not make the volume read only. If you want read-only behavior, specify `readOnly:` in the FlexVolume driver flags.

## PersistentVolumeClaim Protection

PVC protection is a Kubernetes 1.9 alpha feature that restricts the user from deleting a PVC while it is being used by an active Pod. Alpha features are not tested for use with the volume plug-in and provisioner. However, without PVC protection, you should not delete a PVC that is still attached to Pods. If you have not turned on PVC protection, ensure that you do not delete PVC's that are in use. In the current release of the Data Fabric for Kubernetes, deleting a PVC causes undefined behavior.

## Reclaim Policy

The Kubernetes `reclaimPolicy` parameter controls what happens to a PersistentVolume if the corresponding PersistentVolumeClaim is deleted. The `Recycle` Reclaim Policy is not supported by Kubernetes FlexVolume Drivers, so it cannot be used with KDF. The `Retain` Policy is currently broken in Kubernetes 1.9 StoragePolicies but not in static PersistentVolumes. The Data Fabric for Kubernetes has a workaround that allows `Retain` policy on dynamically provisioned volumes by passing the

`reclaimPolicy`: in the parameters rather than in the standard place that FlexVolumes ignore. You can specify the reclaim policy normally when you configure a persistent volume.

The following table shows the supported values for the reclaim policy:

Reclaim Policy Value	Description	Support
Delete (default value)	The PersistentVolume and the MapR volume are deleted when the user deletes the corresponding PersistentVolumeClaim.	Supported
Retain	The PersistentVolume and the MapR volume are not deleted when the user deletes the corresponding PersistentVolumeClaim.	Supported*
Recycle	Performs a basic scrub on a PersistentVolume and makes it available for a new PersistentVolumeClaim.	Not Supported by Kubernetes Flexvolumes

\*Not supported for dynamic provision without a workaround.

For more information about the reclaim policy, see [Change the Reclaim Policy of a PersistentVolume](#).

### Kubernetes Mount Options

The Kubernetes `mountOptions` parameter is not supported for use with the Data Fabric for Kubernetes because it is not supported for use with the FlexVolume plug-in.

### Steps for Configuring the Data Fabric for Kubernetes FlexVolume Driver

This page summarizes the high-level steps for configuring the Data Fabric for Kubernetes FlexVolume Driver to provide static or dynamic provisioning. To learn more about static and dynamic provisioning, see [Static and Dynamic Provisioning Using FlexVolume Driver](#) on page 803.

#### Static Provisioning

1. Install the Data Fabric for Kubernetes.

See [Installing the Data Fabric for Kubernetes FlexVolume Driver](#) on page 284.

2. In your Pod spec or as part of a separate configuration file, configure a PersistentVolume.

See [Example: Mounting a PersistentVolume for Static Provisioning Using the FlexVolume Driver](#) on page 3882 and [Persistent Volumes](#).

3. Do *one* of the following:

- Annotate the Pod spec to provide information about the Data Fabric volume.

See [Example: Statically Provisioning a Data Fabric Volume Using the FlexVolume Plug-in](#) on page 3880.

- In your Pod spec or as part of a separate configuration file, configure a PersistentVolumeClaim.

See [PersistentVolumeClaims](#).

4. Run the Pod spec by using `kubectl` commands. See [Overview of kubectl](#).

#### Dynamic Provisioning

1. Install the Data Fabric for Kubernetes.

See [Installing the Data Fabric for Kubernetes FlexVolume Driver](#) on page 284.

2. In your Pod spec or in a separate configuration file, create a storage class.  
See [Example: Mounting a PersistentVolume for Dynamic Provisioning Using the FlexVolume Driver](#) on page 3886 and [Storage Classes](#).
3. In your Pod spec or in a separate configuration file, configure a PersistentVolumeClaim.  
See [Example: Mounting a PersistentVolume for Dynamic Provisioning Using the FlexVolume Driver](#) on page 3886.
4. Run the Pod spec by using `kubectl` commands. See [Overview of kubectl](#).

### Example: Statically Provisioning a Data Fabric Volume Using the FlexVolume Plug-in

You can designate a Data Fabric volume for use with Kubernetes by specifying the Data Fabric FlexVolume parameters directly inside the Pod spec. In the Pod spec, you define a Kubernetes volume and add the Data Fabric FlexVolume information to it. You can supply path information by using the `volumePath` parameter. The Kubernetes volume is only as persistent as the Pod. By defining the volume this way, when the Pod is removed, the Kubernetes volume is also immediately unmounted and removed. This approach to static provisioning is most appropriate when you want to get up and running quickly or when you want the Pod and Kubernetes volume lifecycle to be the same.

For example, a developer wants to get her application container up and running quickly with Data Fabric. She already has a Data Fabric path that she wants to use for the application. She only needs the data accessible to read. To make this work, she must:

1. Generate a Data Fabric service ticket, and set the `securityType` parameter in the Pod spec to `secure`. See [Generating a Service Ticket](#) on page 1826.
2. Configure a Ticket Secret, and include the base64-encoded contents of the ticket file in the Ticket Secret. See [Configuring a Secret](#) on page 3894.
3. Set the `runAsUser` and the `fsGroup` parameters to the UID and GID of the user that created the ticket.
4. Point the `volumePath` in the `flexVolume` setting to the desired path, and fill in the `cldbHosts` and `cluster` information.

**NOTE:** The following example works for on-premise deployments. For GKE and AWS deployments, you must set a default StorageClass to the `maprfs` StorageClass. If a default StorageClass is not provided for GKE and AWS deployments, the volume is created using your default StorageClass, which might not be a good fit. For information about changing the default StorageClass, see [Change the default StorageClass](#).

```
apiVersion: v1
kind: Pod
metadata:
  name: test-secure
  namespace: mapr-examples
spec:
  securityContext:
    runAsUser: 1000
    fsGroup: 2000
  containers:
  - name: mycontainer
    image: myrepo/myorg/mycontainer
    args:
    - sleep
    - "1000000"
    imagePullPolicy: Always
  resources:

apiVersion: v1
kind: Secret
metadata:
  name: mapr-ticket-secret
  namespace: mapr-examples
type: Opaque
data:
  CONTAINER_TICKET: <BASE64 ENCODED VERSION OF CONTENTS OF TICKET FILE>

```

The following tables describe the parameters in the example:

#### Pod

Parameter	Notes
apiVersion	The Kubernetes API version for the Pod spec.
kind	The kind of object being created. For clarity, the example uses a naked Pod. Generally, it is better to use a Deployment, DaemonSet, or StatefulSet for high availability (HA) and ease of upgrade.
metadata: name	The Pod name.
metadata: namespace	The namespace in which the Pod runs.
securityContext: runAsUser	The user ID to run the container under. This user ID must be the same as the user ID for which the ticket was generated.
securityContext: fsGroup	The group ID to run the container under. This group ID must be the same as the group ID of the user for which the ticket was generated.
volumeMounts: mountPath	A directory inside the container that is designated as the mount path.
volumeMounts: name	A name that you assign to the Kubernetes volumeMounts resource. Matches with Volumes: name.
Volumes: name	A string to identify the name of the Kubernetes volumes resource. Matches with volumeMounts: name.
flexVolume: driver	The Data Fabric FlexVolume driver being used. Call it using this driver: mapr.com/maprfs.

<code>flexVolume: readOnly</code>	Specifies that the FlexVolume driver should tell the Data Fabric POSIX Client to mount the volume with the read-only flag.
<code>volumePath</code>	The mount point within the Data Fabric file system. This parameter specifies an existing Data Fabric path. For example, you can specify the root volume as <code>"/"</code> , providing access to the entire filesystem.
<code>cluster</code>	The Data Fabric cluster name.
<code>cldbHosts</code>	The DNS names or IP addresses of the CLDB hosts for the Data Fabric cluster. You must provide at least one CLDB host. For fault-tolerance, providing multiple CLDB hosts is recommended. To specify multiple hosts, separate each name or IP address by a space.
<code>securityType</code>	A parameter that indicates whether Data Fabric tickets are used or not used. If Data Fabric tickets are used, specify <code>secure</code> . Otherwise, specify <code>unsecure</code> .
<code>ticketSecretName</code>	The name of the Secret that contains the ticket to use when mounting to the Data Fabric cluster. See <a href="#">Configuring a Secret</a> on page 3894.
<code>ticketSecretNamespace</code>	The namespace that contains the Secret. See <a href="#">Configuring a Secret</a> on page 3894.

### Secret

Parameter	Notes
<code>apiVersion</code>	The Kubernetes API version.
<code>kind</code>	The type of object being created.
<code>name</code>	A string to identify the Secret.
<code>namespace</code>	The namespace in which the Secret runs.
<code>type</code>	The type of Secret being created. For type <code>Opaque</code> , clients must treat these values as opaque and pass them unmodified back to the server.
<code>CONTAINER_TICKET</code>	The contents of the Data Fabric ticket encoded in base64. If you specified <code>secure</code> for the <code>securityType</code> , you must provide the ticket. To encode the ticket, see <a href="#">Converting a String to Base64</a> on page 3896. You may remove the ticket if the Data Fabric cluster is not secure.

### Example: Mounting a PersistentVolume for Static Provisioning Using the FlexVolume Driver

For static provisioning, configuring a PersistentVolume has some advantages over annotating Kubernetes volume information in a Pod spec:

- The configuration file can be shared for use by multiple Pod specs.
- The configuration file enables the PersistentVolume to be mounted and available even when the Pod spec that references it is removed.

For example: A marketing volume exists in the Data Fabric file system under the path `/Departments/Marketing`. An administrator wants to statically provision this volume and make it available to multiple users. It is critical that data access is as fast as possible. To make this work, the administrator must:

1. Create a PersistentVolume (PV).
2. Set the `AccessMode` of the PV to `ReadWriteOnce`.

3. Create a PersistentVolumeClaim (PVC) spec.
4. Set the `AccessMode` of the PVC to `ReadWriteOnce`.
5. Create the Pod spec.
6. Generate a Data Fabric service ticket, and set the `flexVolume securityType` parameter to `secure`. For information about generating a service ticket, see [Generating a Service Ticket](#) on page 1826.
7. Configure a Ticket Secret, and include the base64-encoded contents of the ticket file in the Ticket Secret. See [Configuring a Secret](#) on page 3894.
8. Set the `runAsUser` and the `fsGroup` parameters to the UID and GID of the user that created the ticket.
9. Set the `platinum` parameter in the Pod spec to `platinum: "true"`. See [Enabling the Platinum Posix Client for Kubernetes Interfaces for Data Fabric FlexVolume Driver](#) on page 3893.
10. Point the `volumePath` in the `flexVolume` setting to the desired Data Fabric path.
11. Fill in the `cldbHosts` and `cluster` information.

```

apiVersion: v1
kind: PersistentVolume
metadata:
  name: pv-testsecure1
  namespace: mapr-examples
spec:
  capacity:
    storage: 5Gi
  accessModes:
    - ReadWriteOnce
  persistentVolumeReclaimPolicy: Retain
  claimRef:
    namespace: mapr-examples
    name: pvc-testsecure1
  flexVolume:
    driver: "mapr.com/maprfs"
    options:
      platinum: "true"
      cluster: "mycluster"
      cldbHosts: "cldb1 cldb2 cldb3"
      volumePath: "/path/in/mapr"
      securityType: "secure"
      ticketSecretName: "mapr-ticket-secret"
      ticketSecretNamespace: "mapr-examples"
---
apiVersion: v1

type: Opaque
data:
  CONTAINER_TICKET: <BASE64-ENCODED VERSION OF TICKET-FILE CONTENTS>

```

### PersistentVolume (PV)

Parameter	Notes
Capacity	Specifies how big the allocated storage should be. This value is not validated against the Data Fabric quota or advisory quota. It is up to the person creating the PV to specify this value accurately.
accessModes	How the PersistentVolume is mounted on the host. It's important that the PV and PVC modes are the same so that they can bind. For more information, see <a href="#">Kubernetes Access Modes</a> and <a href="#">Access Modes</a> .
persistentVolumeReclaimPolicy	Specifies what happens to the volume when it is released by its claim. The <code>Retain</code> value keeps the PVC around for manual cleanup. <code>Delete</code> deletes the PV from Kubernetes.   <b>NOTE:</b> If this volume was created using dynamic provisioning, <code>Delete</code> causes the underlying volume to be deleted. <code>Recycle</code> is not supported by Kubernetes FlexVolumes. For more information, see <a href="#">Reclaiming</a> .
claimRef	Specifies a default PVC to bind to. If unspecified, the PV selected for a PVC is randomly allocated based on the access mode and provides at least as much storage capacity as requested by the PVC.
flexVolume: driver	The Data Fabric FlexVolume driver being used. Call it by specifying <code>driver: mapr.com/maprfs</code> .

platinum	If set to <code>platinum: "true"</code> , the POSIX client uses the platinum driver for better performance. Note that the platinum driver consumes more host resources and Data Fabric Platinum licenses.
cluster	The Data Fabric cluster name.
cldbHosts	The hostname or IP addresses of the CLDB hosts for the Data Fabric cluster. You must provide at least one CLDB host. For fault-tolerance, providing multiple CLDB hosts is recommended. To specify multiple hosts, separate each name or IP address by a space.
volumePath	The mount point within the Data Fabric file system. This parameter specifies an existing Data Fabric path. For example, you can specify the root volume as <code>"/"</code> , providing access to the entire filesystem.
securityType	A parameter that indicates whether Data Fabric tickets are used or not used. If Data Fabric tickets are used, specify <code>secure</code> . Otherwise, specify <code>unsecure</code> .
ticketSecretName	The name of the Ticket Secret that contains the ticket to use when mounting to the Data Fabric cluster. See <a href="#">Configuring a Secret</a> on page 3894.
ticketSecretNamespace	The namespace that contains the Ticket Secret. Use the same namespace as the namespace used by the Pod.

### Pod

Parameter	Notes
<code>apiVersion</code>	The Kubernetes API version for the Pod spec.
<code>kind</code>	The kind of object being created. The example uses a naked Pod for clarity. Generally, it is better to use a Deployment, DaemonSet, or StatefulSet for high availability and ease of upgrade.
<code>metadata: name</code>	The Pod name.
<code>metadata: namespace</code>	The namespace in which the Pod runs.
<code>volumeMounts: mountPath</code>	A directory inside the container that is designated as the mount path.
<code>volumeMounts: name</code>	A name that you assign to the Kubernetes <code>volumeMounts</code> resource. This value should match <code>Volumes: name</code> .
<code>Volumes: name</code>	A string to identify the name of the Kubernetes <code>volumes</code> resource. This value should match <code>volumeMounts: name</code> .

### PersistentVolumeClaim (PVC)

Parameter	Notes
<code>AccessMode</code>	How the requested PersistentVolume is mounted on the host. It's important that the PV and PVC modes are the same so that they can bind. For more information, see <a href="#">Kubernetes Access Modes</a> and <a href="#">Access Modes</a> .

### Secret

Parameter	Notes
metadata: name	The name of the Ticket Secret. See <a href="#">Configuring a Secret</a> on page 3894
metadata: namespace	The namespace in which the Ticket Secret runs.
CONTAINER_TICKET	The contents of the Data Fabric ticket encoded in base64. If you specified <code>secure</code> for the <code>securityType</code> , you must provide the ticket. To encode the ticket, see <a href="#">Converting a String to Base64</a> on page 3896. You may remove the ticket if the Data Fabric cluster is not secure.

### Example: Mounting a PersistentVolume for Dynamic Provisioning Using the FlexVolume Driver

This example also uses a PersistentVolume. However, unlike the previous example, when you use the Data Fabric dynamic provisioner, you do not need to create a PersistentVolume manually. The PersistentVolume is created automatically based on the parameters specified in the referenced StorageClass.

Dynamic provisioning is useful in cases where you do not want Data Fabric and Kubernetes administrators to create storage manually to store the Pod storage state.

The following example uses a PersistentVolumeClaim that references a Storage Class. In this example, a Kubernetes Administrator has created a storage class called `secure-maprfs` for Pod creators to use when they want to create persistent storage for their Pods. In this example, it is important for the created Pod storage to survive the deletion of a Pod.

```

apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: secure-maprfs
  namespace: mapr-examples
provisioner: mapr.com/maprfs
parameters:
  restServers: "rest1:8443"
  cldbHosts: "cldb1 cldb2 cldb3"
  cluster: "mysecurecluster"
  securityType: "secure"
  ticketSecretName: "mapr-ticket-secret"
  ticketSecretNamespace: "mapr-examples"
  maprSecretName: "mapr-provisioner-secrets"
  maprSecretNamespace: "mapr-examples"
  namePrefix: "pv"
  mountPrefix: "/pv"
  readOnly: "true"
  reclaimPolicy: "Retain"
  advisoryquota: "100M"
  readonly: "1"

---

kind: Pod
apiVersion: v1
metadata:
  name: test-secure-provisioner
  namespace: mapr-examples
spec:
  containers:
  - name: busybox
    image: busybox
    args:
    - sleep
    - "1000000"

```

```

    imagePullPolicy: Always
    volumeMounts:
      - name: maprfs-pvc
        mountPath: "/dynvolume"
    restartPolicy: "Never"
    volumes:
      - name: maprfs-pvc
        persistentVolumeClaim:
          claimName: maprfs-secure-pvc
  ---

kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: maprfs-secure-pvc
  namespace: mapr-examples
spec:
  accessModes:
    - ReadWriteOnce
  storageClassName: secure-maprfs
  resources:
    requests:
      storage: 300M
  ---

apiVersion: v1
kind: Secret
metadata:
  name: mapr-provisioner-secrets
  namespace: mapr-examples
type: Opaque
data:
  MAPR_CLUSTER_USER: CHANGETHIS!
  MAPR_CLUSTER_PASSWORD: CHANGETHIS!
  ---

apiVersion: v1
kind: Secret
metadata:
  name: mapr-ticket-secret
  namespace: mapr-examples
type: Opaque
data:
  CONTAINER_TICKET: <BASE64 ENCODED VERSION OF CONTENTS OF TICKET FILE>

```

The following tables describe the parameters in the example:

### StorageClass

Parameter	Notes
apiVersion	The Kubernetes API version for the StorageClass spec.
kind	The kind of object being created. This is a StorageClass.
metadata: name	The name of the StorageClass. Administrators should specify the name carefully because it will be used by Pod authors to help select the right StorageClass for their needs.

Parameter	Notes
metadata: namespace	The namespace in which the StorageClass runs. This namespace can be different from the namespace used by the PVC and Pod, since the StorageClass namespace can be a cross-namespace resource.
provisioner	The provisioner being used. for the Data Fabric provisioner, specify <code>mapr.com/maprfs</code> .
restServers	A space-separated list of Data Fabric webservers. Specify the hostname or IP address and port number of each REST server for the Data Fabric cluster. For fault tolerance, providing multiple REST server hosts is recommended.
cldbHosts	The hostname or IP addresses of the CLDB hosts for the Data Fabric cluster. You must provide at least one CLDB host. For fault-tolerance, providing multiple CLDB hosts is recommended. To specify multiple hosts, separate each name or IP address by a space.
cluster	The Data Fabric cluster name.
securityType	A parameter that indicates whether Data Fabric tickets are used or not used. If Data Fabric tickets are used, specify <code>secure</code> . Otherwise, specify <code>unsecure</code> .
ticketSecretName	The name of the Secret that contains the ticket to use when mounting to the Data Fabric cluster. See <a href="#">Configuring a Secret</a> on page 3894.
ticketSecretNamespace	The namespace that contains the Secret. Use the same namespace as the namespace used by the Pod.
maprSecretName	The name of the Kubernetes Secret that is used to store Data Fabric administrative credentials (user, password, and ticket information for the Data Fabric webserver). To use the provisioner, you must configure a Secret. See <a href="#">Configuring a Secret</a> on page 3894.
maprSecretNamespace	The namespace for the Secret containing the Data Fabric administrative credentials (user name and password information for a Data Fabric user that has the privileges to create Data Fabric volumes). This namespace can be different from the namespace used by the Pod, since a Pod author or namespace admin might not be trusted to create administration Secrets for the Data Fabric cluster.
namePrefix	A prefix for the Data Fabric volume to be created. For example, if you specify <code>PV</code> as the <code>namePrefix</code> , the first dynamically created volume might be named <code>PV.bevefsesqr</code> . The provisioner generates random names using lower-case letters. If you do not specify a prefix, the provisioner uses <code>maprprovisioner</code> as a prefix.
mountPrefix	The parent path of the mount in Data Fabric file system. If you do not specify a mount prefix, the provisioner mounts your volume under the Data Fabric root.
readOnly	This parameter specifies that the POSIX driver should mount the Data Fabric path as read only. This is different from the <code>readOnly</code> parameter for volume creation that creates the volume as read only.

Parameter	Notes
<code>reclaimPolicy</code>	Kubernetes does not currently support passing a non-delete reclaim policy to the StorageClass. This parameter allows you to specify <code>Retain</code> . This ensures that provisioned volumes are not automatically deleted when their calling Pods are deleted. If you specify <code>Retain</code> , you must clean up your provisioned volumes manually.
<code>advisoryquota</code>	The advisory storage quota for the Data Fabric volume. <code>advisoryquota</code> is one of the Data Fabric parameters that you can specify for dynamic provisioning. For more information, see <a href="#">Before You Begin</a> on page 3877.
<code>readonly</code>	When the value is 1, this parameter specifies that the Data Fabric volume should be created as read-only. This is different from the <code>readOnly</code> parameter that mounts the Data Fabric path as read only.

## Pod

Parameter	Notes
<code>apiVersion</code>	The Kubernetes API version for the Pod spec.
<code>kind</code>	The kind of object being created. For clarity, this example uses a naked Pod. Generally, it is better to use a Deployment, DaemonSet, or StatefulSet for high availability and ease of upgrade.
<code>metadata: name</code>	The Pod name.
<code>metadata: namespace</code>	The namespace in which the Pod runs. It should be the same namespace in which the PVC runs.
<code>volumeMounts: mountPath</code>	A directory inside the container that is designated as the mount path.
<code>volumeMounts: name</code>	A name that you assign to the Kubernetes <code>volumeMounts</code> resource. The value should match <code>Volumes: name</code> .
<code>Volumes: name</code>	A string to identify the name of the Kubernetes <code>volumes</code> resource. The value should match <code>volumeMounts: name</code> .
<code>persistentVolumeClaim: claimName</code>	The name of the PersistentVolumeClaim (PVC). For more information, see <a href="#">PersistentVolumeClaims</a> .

## PVC

Parameter	Notes
<code>apiVersion</code>	The Kubernetes API version for the Pod spec.
<code>kind</code>	The kind of object being created. This is a PersistentVolumeClaim (PVC).
<code>metadata: name</code>	The PVC name.
<code>metadata: namespace</code>	The namespace in which the PVC runs. This should be the same namespace used by the Pod.

Parameter	Notes
<code>accessModes</code>	How the PersistentVolume is mounted on the host. (This is a limitation of the FlexVolume driver.) For more information, see <a href="#">Access Modes</a> .
<code>storageClassName</code>	The name of the storage class requested by the PersistentVolumeClaim. For more information, see <a href="#">Dynamic Provisioning and Storage Classes</a> .
<code>requests: storage</code>	The storage resources being requested, or that were requested and have been allocated. The Pod author can use this parameter to tell Data Fabric how much quota is needed for the Data Fabric volume. For the units, see <a href="#">Resource Model</a> .

### Provisioner Secret

In the `mapr-provisioner-secrets` Secret:

Parameter	Notes
<code>MAPR_CLUSTER_USER</code>	This is the base64-encoded user ID used to log in to the Data Fabric REST server and create or delete volumes. See <a href="#">Converting a String to Base64</a> on page 3896. For more information about Secrets, see <a href="#">Secrets</a> .
<code>MAPR_CLUSTER_PASSWORD</code>	This is the base64-encoded password for the <code>MAPR_CLUSTER_USER</code> . See <a href="#">Converting a String to Base64</a> on page 3896. For more information about Secrets, see <a href="#">Secrets</a> .

### Ticket Secret

In the `mapr-ticket-secret` Secret:

Parameter	Notes
<code>CONTAINER_TICKET</code>	The contents of the Data Fabric ticket encoded in base64. If you specified <code>secure</code> for the <code>securityType</code> , you must provide the ticket. To encode the ticket, see <a href="#">Converting a String to Base64</a> on page 3896. You may remove the ticket if the Data Fabric cluster is not secure. For more information about Secrets, see <a href="#">Secrets</a> .

### Identifying the Data Fabric Volume Created During Dynamic Provisioning

Describes how to find the name of the Data Fabric volume created during dynamic provisioning.

In dynamic provisioning, the provisioner creates a new Data Fabric volume with a name that is randomly generated using lower-case letters. For example, if you specify `PV` as the `namePrefix` in the `StorageClass`, the first dynamically created volume might be named `PV.bevefsesqr`. If you do not specify a prefix, the provisioner uses `maprprovisioner` as a prefix.

To find the name of the new Data Fabric volume and the path to the volume:

1. Use the `kubectl describe` command to get information about the PVC:

```
kubectl describe pvc -n <namespace> <pvc-name>
```

The command output shows the name of the PersistentVolume (PV) that was created: For example:

```
kubectl describe pvc -n mapr-examples maprfs-secure-pvc109
Name:          maprfs-secure-pvc109
Namespace:    mapr-examples
StorageClass: secure-maprfs
Status:       Bound
Volume:    pv-ikmqxfwtjh
Labels:       <none>
Annotations:  control-plane.alpha.kubernetes.io/
leader={holderIdentity:"ed60e649-0c68-11e8-acd5-36117e0e7e02", "leaseDurationSeconds":15, "acquireTime":"2018-02-09T22:09:43Z"
              pv.kubernetes.io/bind-competed=yes
              pv.kubernetes.io/bound-by-controller=yes
              volume.beta.kubernetes.io/storage-provisioner=mapr.com/
maprfs
Finalizers:   []
Capacity:     300M
Access Modes: RWO
Events:
```

2. Use the `kubectl get` command and the PersistentVolume (PV) name to obtain a description of the PersistentVolume:

```
kubectl get pv <pv-name> -o yaml
```

The command output shows the path to the Data Fabric volume. For example:

```
kubectl get pv pv-ikmqxfwtjh -o yaml
apiVersion: v1
kind: PersistentVolume
metadata:
  annotations:
    mapr.com/description: 'Dynamically provisioned PV for MapR-FS:
pv.ikmqxfwtjh'
    mapr.com/maprProvisionerIdentity: mapr.com/maprfs
    mapr.com/provisionerVersion: v1.0.0
    mapr.com/restServers: 10.10.88.214:8443
    mapr.com/secretName: mapr-provisioner-secrets
    mapr.com/secretNamespace: mapr-examples
    mapr.com/volumeName: pv.ikmqxfwtjh
    pv.kubernetes.io/provisioned-by: mapr.com/maprfs
  creationTimestamp: 2018-02-09T22:21:22Z
  name: pv-ikmqxfwtjh
  resourceVersion: "2875820"
  selfLink: /api/v1/persistentvolumes/pv-ikmqxfwtjh
  uid: 8f11aall-0de7-11e8-bdd6-84a9c4fbf7cb
spec:
  accessModes:
    - ReadWriteOnce
  capacity:
    storage: 300M
  claimRef:
    apiVersion: v1
    kind: PersistentVolumeClaim
    name: maprfs-secure-pvc109
    namespace: mapr-examples
    resourceVersion: "2842548"
    uid: ce5555e4-0de5-11e8-bdd6-84a9c4fbf7cb
  flexVolume:
    driver: mapr.com/maprfs
    options:
      cldbHosts: xx.xx.xx.xxx yy.yy.yy.yyy zz.zz.zz.zzz
      cluster: Test5
      mountOptions: ""
      platinum: "true"
      readOnly: "false"
      securityType: secure
      ticketSecretName: mapr-ticket-secret
      ticetSecretNamespace: mapr-examples
      volumePath: /pv/pv-ikmqxfwtjh
  persistentVolumeReclaimPolicy: Delete
  storageClassName: secure-maprfs
status:
  phase: Bound
```

### Creating a Default StorageClass

As noted in [Example: Statically Provisioning a Data Fabric Volume Using the FlexVolume Plug-in](#) on page 3880, some deployments can require a default StorageClass. A default StorageClass can reduce the effort it takes to create Pods. For example, you could use a default StorageClass to provision storage dynamically to a MapR location for any PersistentVolumeClaim that you create.

If you set the `DefaultStorageClass` admission controller (see [PodSecurityPolicy](#)), and you wish to enable a MapR StorageClass as the default, follow the instructions in [Change the default StorageClass](#).

### Verifying Creation of a Kubernetes PersistentVolumeClaim and Persistent Volume

Once the Pod spec is installed, you can verify the status of a PersistentVolumeClaim or a PersistentVolume by using the Kubernetes `get` command. For example:

```
$ kubectl get pvc
NAME          STATUS    VOLUME          CAPACITY   ACCESS MODES   STORAGECLASS   AGE
maprfs-pvc   Bound    pv-rsojpoapxy   8Mi        RWO             simple-maprfs  3d
$ kubectl get pv
NAME          CAPACITY   ACCESS MODES   RECLAIM POLICY   STATUS
CLAIM
Pv-rsojpoapxy 8Mi        RWO             Delete            Bound    mapr-demo/
maprfs-pvc
```

For an example of creating a PersistentVolumeClaim and a PersistentVolume, see [Example: Mounting a PersistentVolume for Static Provisioning Using the FlexVolume Driver](#) on page 3882.

### Enabling the Platinum Posix Client for Kubernetes Interfaces for Data Fabric FlexVolume Driver

When you install the Kubernetes Interfaces for Data Fabric FlexVolume Driver, the Basic FUSE-based POSIX client package is installed on all nodes by default. The FlexVolume Driver also supports the use of the Platinum FUSE-based POSIX client. For a comparison of the two POSIX client packages, see [Preparing for Installation \(HPE Ezmeral Data Fabric POSIX Client\)](#) on page 424.

To install the Platinum POSIX client, include the `platinum` parameter in your Pod spec. For example:

```
options:
cluster: "cluster2"
platinum: "true"
cldbHosts: "10.10.102.96"
```

### Mounting a Read-Only Volume

This page describes how to specify a volume that should be mounted as read-only.

The following example specifies a volume that should be mounted as read-only in a Data Fabric path or PersistentVolume during static provisioning:

```
flexVolume:
  driver: "mapr.com/maprfs"
  readOnly: true
  options:
    volumePath: "/path/to/data/in/mapr"
    cluster: "mycluster"
    cldbHosts: "cldb1 cldb2 cldb3"
    securityType: "secure"
    ticketSecretName: "mapr-ticket-secret"
    ticketSecretNamespace: "mapr-examples"
```

The following example shows how to specify that the volume should be mounted read-only in a StorageClass for dynamic provisioning. The example specifies that the POSIX driver should mount the Data Fabric path as read only. This is different from the `readOnly` parameter for volume creation that creates the volume as `readonly`.

```
apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: secure-maprfs
  namespace: mapr-examples
```

```

provisioner: mapr.com/maprfs
parameters:
  restServers: "rest1:8443"
  cldbHosts: "cldb1 cldb2 cldb3"
  cluster: "mysecurecluster"
  securityType: "secure"
  ticketSecretName: "mapr-ticket-secret"
  ticketSecretNamespace: "mapr-examples"
  maprSecretName: "mapr-provisioner-secrets"
  maprSecretNamespace: "mapr-examples"
  namePrefix: "pv"
  mountPrefix: "/pv"
  readOnly: "true"
  reclaimPolicy: "Retain"
  advisoryquota: "100M"

```

The following example specifies that the volume should be created as `readOnly` in a `StorageClass` for dynamic provisioning:

```

apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: secure-maprfs
  namespace: mapr-examples
provisioner: mapr.com/maprfs
parameters:
  restServers: "rest1:8443"
  cldbHosts: "cldb1 cldb2 cldb3"
  cluster: "mysecurecluster"
  securityType: "secure"
  ticketSecretName: "mapr-ticket-secret"
  ticketSecretNamespace: "mapr-examples"
  maprSecretName: "mapr-provisioner-secrets"
  maprSecretNamespace: "mapr-examples"
  namePrefix: "pv"
  mountPrefix: "/pv"
  reclaimPolicy: "Retain"
  advisoryquota: "100M"
  readOnly: "1"

```

### Configuring a Secret

Kubernetes Secrets enable you to inject sensitive data into a pod. For more information about Secrets, see [Secrets](#) in the Kubernetes documentation.

The examples in this section show how Secrets can be used in static and dynamic provisioning. Secrets are not by themselves secure. For more information about security and Secrets, see [Security Properties](#). Specifically, it is important to turn on encryption at rest for Secrets. See [Encrypting Secret Data at Rest](#).

During installation of the Driver, the Kubernetes token that was moved into the pod is written to the host node so that the plugin can query a Secret to pull the ticket for mounting. This Kubernetes token is sensitive and should be protected. The token is placed in `/var/run/secrets/kubernetes.io/serviceaccount`.

Here is an example of a configuration file for a Kubernetes Secret:

```

apiVersion: v1
kind: Secret
metadata:
  name: mapr-provisioner-secrets
  namespace: test-driver
type: Opaque

```

```
data:
  ...
```

The following table describes the fields in the sample Secret file. For more information, see [Secrets](#) in the Kubernetes documentation.

Parameter	Description
apiVersion	The Kubernetes API version.
kind	The type of object being created.
name	A string to identify the Secret.
type	The type of Secret being created. For type <code>Opaque</code> , clients must treat these values as opaque and pass them unmodified back to the server.

### REST Secrets

For dynamic provisioning, you must use a Secret to pass the user name and password of a Data Fabric user to the provisioner. This user must have privileges to create and delete a Data Fabric volume. The credentials allow the provisioner to make REST calls to the Data Fabric webserver. Secrets are protected by the Kubernetes [RBAC](#).

The following example shows a REST secret in the Secret file:

```
apiVersion: v1
kind: Secret
metadata:
  name: mapr-provisioner-secrets
  namespace: test-driver
type: Opaque
data:
  MAPR_CLUSTER_USER: cm9vdA==
  MAPR_CLUSTER_PASSWORD: bWFwcmg==
```

The following table describes the REST secret fields in the REST Secret example:

Parameter	Description
MAPR_CLUSTER_CLIENTCERT	Parameter for specifying the client certificate.
MAPR_CLUSTER_CLIENTKEY	Parameter for specifying the client key for the client certificate.
MAPR_CLUSTER_USER	The base64 representation of a Data Fabric user that has the ability to create and delete Data Fabric volumes. See <a href="#">Converting a String to Base64</a> on page 3896.
MAPR_CLUSTER_PASSWORD	The base64 representation of the password for the user defined by the <code>MAPR_CLUSTER_USER</code> parameter. See <a href="#">Converting a String to Base64</a> on page 3896.
MAPR_CLUSTER_TICKET	The base64 representation of the ticket contents generated on the data-fabric cluster using the <code>maprlogin</code> utility. For dynamic provisioning, with the latest CSI drivers, you can configure a data-fabric ticket to authenticate to the data-fabric webserver to make REST calls. This parameter is provided as a Beta feature.
MAPR_CLUSTER_TLSCERT	Parameter for providing the CA certificate. If <code>MAPR_CLUSTER_TLSCERT</code> is not specified, the CSI driver uses a nonsecure HTTP connection to the Data Fabric REST servers.

### Ticket Secrets

For static and dynamic provisioning, you must specify a Secret, which is the base64 representation of the ticket, to enable the POSIX client to communicate with a secure MapR cluster. The ticket for the POSIX client can be generated on the data-fabric cluster using the `maprlogin` on page 2918 utility.

The following example shows a ticket Secret:

```
apiVersion: v1
kind: Secret
metadata:
  name: mapr-ticket-secret
  namespace: mapr-examples
type: Opaque
data:
  CONTAINER_TICKET: CHANGETHIS!
```

The following table describes the CONTAINER\_TICKET field in the ticket Secret example:

Parameter	Description
CONTAINER_TICKET	Base64-encoded ticket value. See <a href="#">Converting a String to Base64</a> on page 3896.

To create the secret:

1. Run the following command to create the Secret file:

```
kubectl create -f <secret-file-name>.yaml
```

2. Convert sensitive data, such as a user name and password, to a base64 representation. See [Converting a String to Base64](#) on page 3896.
3. Add the base64 representation of sensitive data in the Secret file. For more information about the format of the Secret files, see [REST Secrets](#) on page 3895 and [Ticket Secrets](#) on page 3895 earlier in this section.
4. Deploy the secret on the pod by running the following command:

```
kubectl apply -f <secret-file-name>.yaml
```

### *Converting a String to Base64*

Sensitive data contained in a Secret must be represented in base64. Use these steps to convert such information to the base64 representation:

For example, in Linux:

```
echo -n 'mapr' | base64
```

The output shows the base64 representation of the user name `mapr` is `bWFwY291`.

MapR tickets include a cluster name followed by a base64-encoded string. It is not sufficient to insert the base64-encoded string into a Kubernetes Secret. You must convert *both* the cluster name and string into base64 representation and then insert the result into the Secret.

The following command shows how to convert a MapR ticket to base64 representation:

```
echo -n "cluster-name <base64-encoded ticket-value>" | base64
```

For example:

```
echo -n "cluster2 PuG0lpuPXuDxj9ERgKCTXOqsXYPTnqRJl6/
mlWJjdVKvE5r46QS2Bh9nC+I4Rcu0GtnWRUOtKBG9gp65bsZN9Kphnr/
Wp15z8D3O2go951CANes/
7QQ1lYVP7l2BOPGR6I1zIrc3XGwI8OQWT6lqpsjSVZv8z05oQ5GDYQTKpttI/yAk/
uJBESl0hCz38n9HgYALLvMALVsBPtUtG+cNGclktUDDMR2q1EgVzdJbuYsOuHnZX3LO3euKDGL4C"
```

```
4MCMrv9DWiWJxwiZ1yZu69GbZJlXxqLQQB1kdMoTXk=" | base64
```

```
Y2x1c3RlcjIgdUHVHMgxdVBYdUR4ajlFUmdLQ1RYT3FzWF1QVG5xUkpsNi9tbFdKamRWS3ZFNXI0
NlFTMkJoOW5DK0k0UmNlMED0bldSVU90S0JHOWdwNjVic1pOOUtwaG5yL1dwMTV6OEQzTzJnbzk1
MUNBTmVzLzdRUWxsWVZQN2wyQk9wR1I2STF6SXJDM1hHd0k4T1FXVDYxcXBza1NWWnY4ek81b1E1
R0RZUVRrUHR0SS95QWsvdUpCRVMxb2hDejm4bjlIZ1lBTeX2TUFMVnNCUHRVdEcrY05HYzFrdfVE
RE1SMnExRwdWemRKYnVZc091SG5aWDNMTzNldUtER2w0QzRNQ21ydj1EV2lXSnh3aVoxeVp1Nj1H
Y1pKbFh4cUxPUUJsa2RNb1RYaz0K
```

**NOTE:** Another method for converting values to base64 is to use an Internet tool such as <https://www.base64encode.org> to encode or decode data.

### Best Practices for Using Tickets

When using secure data-fabric clusters with the Kubernetes Interfaces for Data Fabric, you must generate tickets for your containers. Here are some best practices:

- Create a different user for each container.
- To avoid frequent renewals, use long-lived user tickets or servicewithimpersonation tickets. If you refresh or update a ticket, you must restart your containers.
- If you use an impersonation ticket, it is CRITICAL that you use security contexts in the pod definitions to avoid a misbehaving container impersonating all user IDs. For restrictions that apply to the use of impersonation tickets, see [How Impersonation Works](#) on page 1937 and [maplogin](#) on page 2918.
- Match the security context `runAsUser`: ID and `fsGroup`: group to the ID or group used to create the ticket.

Here is an example of a pod spec that specifies a security context:

```
apiVersion: v1
kind: Pod
metadata:
  name: test-secure
  namespace: mapr-examples
spec:
  securityContext:
    runAsUser: 1000
    fsGroup: 2000
```

## Troubleshooting the Kubernetes Interfaces for Data Fabric FlexVolume Driver

This section describes how to resolve common problems you might encounter when using the Kubernetes Interfaces for Data Fabric FlexVolume driver.

### Shared Memory Lock Causes POSIX Failure

#### Problem

On an upgrade from a previous version of the volume plug-in, POSIX can fail with the following error in the POSIX log file: Create/Attach to stats shared memory failed.

#### Possible Cause

A shared-memory segment lock can prevent the mount from becoming available to the requested pod.

#### Resolution

Follow the steps in [Troubleshooting loopbacknfs POSIX Client Upgrades](#) on page 331 to remove the lock. Then retry the operation.

## Unable to Access file system

<b>Problem</b>	Storage is not mounted and no errors are generated in the plugin or provisioner <a href="#">logs</a> .
<b>Possible Cause</b>	The fusermount symlink might be broken.
<b>Resolution</b>	If the symlink points to a location other than <code>/opt/mapr/k8s/bin/fusermount</code> , unlink it using the following command from the command line on the host: <pre>unlink /bin/fusermount</pre> Then re-create the Kubernetes Pod.

## Pod Container Stuck in Container Creation State During Installation

<b>Problem</b>	During installation, the Pod container can become stuck in the container creation state on a node, and the <code>/opt/mapr/k8s</code> directory is not created. As a result, the plug-in does not get copied to the node.
<b>Possible Cause</b>	Unknown.
<b>Resolution</b>	Check the installation <a href="#">logs</a> for an indication that the installation is not completed or the <code>/opt/mapr/k8s</code> directory is not created. Restart the kubelet service in the node: <pre>systemctl restart kubelet</pre>

## Logs for the Data Fabric for Kubernetes FlexVolume Driver

Logs for the Data Fabric for Kubernetes can be found in:

```
/opt/mapr/logs
```

Log File	Description	Which Nodes
<code>install-k8s-plugin.log</code>	Captures events related to the copying of files from the plug-in container to each Kubernetes host node.	All Kubernetes nodes.
<code>plugin-k8s.log</code>	Captures events from the FlexVolume plug-in.	All Kubernetes nodes.  <b>NOTE:</b> In Azure deployments, this log is hidden in the container. See <a href="#">Azure AKS Considerations</a> on page 289.
<code>provisioner-k8s.log</code>	Captures events from the provisioner.	The Kubernetes node where the provisioner Pod is running.

## Useful Troubleshooting Commands

The following Kubernetes commands can help you gather information about the resources used by Data Fabric for Kubernetes:

- `kubectl describe <resourcetype> <resource> -n <namespace>`
- `kubectl get <resourcetype> <resource> -n <namespace> -o yaml`
- `kubectl logs <pod-name> -n <namespace>`
- `journalctl -u kubelet -r` (on the relevant node)

### kubectl describe command

In this example, the `kubectl describe` command displays information about the `mapr-kdfprovisioner-5dff68656-ln6vh` Pod. Note that the `kubectl describe` output includes an event section.

```
kubectl describe pod mapr-kdfprovisioner-5dff68656-ln6vh -n mapr-system
Name:          mapr-kdfprovisioner-5dff68656-ln6vh
Namespace:    mapr-system
Node:         qa101-139/10.10.101.139
Start Time:   Fri, 09 Feb 2018 12:58:36 -0800
Labels:       app=mapr-kdfprovisioner
              pod-template-hash=189924212
Annotations:  openshift.ix/scc-maprkdf-scc
Status:       Running
IP:          172.17.0.3
.
.
.
Node-Selectors:  <none>
Tolerations:    <none>
Events:
  Type            Reason              Age   From              Message
  ----            -
  Normal          Scheduled            8m    default-scheduler Successfully
assigned mapr-kdfprovisioner-5dff68656-ln6vh to qa101-139
  Normal          SuccessfulMountVolume 8m    kubelet, qa101-139 MountVolume,SetUp
succeeded for volume "logs"
  Normal          SuccessfulMountVolume 8m    kubelet, qa101-139 MountVolume,SetUp
succeeded for volume "timezone"
  Normal          SuccessfulMountVolume 8m    kubelet, qa101-139 MountVolume,SetUp
succeeded for volume "maprkdf-token-drqtt"
  Normal          Pulling              8m    kubelet, qa101-139 pulling image

  Normal          Pulled                8m    kubelet, qa101-139 Successfully
pulled image "maprtech/kdf-provisioner:1.0.0.006_centos7"
  Normal          Created              8m    kubelet, qa101-139 Created container
  Normal          Started              8m    kubelet, qa101-139 Started container
```

### kubectl get command

In this example, the `kubectl get` returns the `.yaml` parameters for the `test-secure-provisioner86` Pod:

```
kubectl get pods test-secure-provisioner86 -n mapr-examples -o yaml
apiVersion: v1
kind: Pod
metadata:
  creationTimestamp: 2018-02-09T00:42:06Z
  name: test-secure-provisioner86
  namespace: mapr-examples
  resourceVersion: "721689"
  selfLink: /api/v1/namespaces/mapr-examples/pods/test-secure-provisioner86
```

```

uid: 0dd21274-0d32-11e8-bdd6-84a9c4fbf7cb
spec:
  containers:
  - args:
    - sleep
    - "1000000"
    image: busybox
    imagePullPolicy: Always
    name: busybox
    resources: {}
    terminationMessagePath: /dev/termination-log
    terminationMessagePolicy: file
    volumeMounts:
    - mountPath: /dynvolume
      name: maprfs-pvc
    - mountPath: /var/run/secrets/kubernetes.io/serviceaccount
      name: default-token-zpv69
      readOnly: true
  dnsPolicy: ClusterFirst
  nodeName: qa108-165.qa.lab
  restartPolicy: Never
  schedulerName: default-scheduler
  securityContext: {}
  serviceAccount: default
  serviceAccountName: default
  terminationGracePeriodSeconds: 30
  tolerations:
  - effect: NoExecute
    key: node.kubernetes.io/not-ready
    operator: Exists
    tolerationSeconds: 300
  - effect: NoExecute
    key: node.kubernetes.io/unreachable
    operator: Exists
    tolerationSeconds: 300
  volumes:
  -name: maprfs-pvc

```

Running the `kubectl get` command without the `-o yaml` parameter generates less output:

```

kubectl get pods test-secure-provisioner86 -n mapr-examples
NAME                                READY   STATUS    RESTARTS   AGE
test-secure-provisioner86           1/1     Running   0           14m

```

### kubectl logs command

In this example, the `kubectl logs` command returns logged output for the `mapr-kdfprovisioner-5dff68656-ln6vh` Pod:

```

kubectl logs mapr-kdfprovisioner-5dff68656-ln6vh -n mapr-system
I0209 12:58:39.956822    1 controller.go:407] Starting provisioner
controller 013d58b3-0ddc-11e8-b0dd-0242acl10003!

```

### journalctl -u command

In this example, the `journalctl` command returns events for the kubelet service for the node:

```

journalctl -u kubelet -r
-- Logs begin at Thu 2017-12-28 06:24:47 PST, end at Thu 2018-02-08
17:01:49 PST. --
Feb 08 17:01:49 k8s-master kubelet[26521]: E0206 17:01:49,047595 26521

```

```

dns.go:121] Search Line limits were exceeded, some search paths have been
omitted, the applied search line
Feb 08 17:01:45 k8s-master kubelet[26521]: E0206 17:01:45,396253 26521

```

## Ecosystem Components

---

The following sections provide information about each open-source project that is supported by the HPE Ezmeral Data Fabric.

This section contains documentation for each open-source project. You can learn how to configure, use, and integrate each project within the context of a data-fabric cluster.

### Documentation Covers All Component Versions

Unless noted, the ecosystem-component information in this content hierarchy applies to all component versions included in EEPs that are supported on the core software. For a list of the supported EEPs, see [EEP Support and Lifecycle Status](#) on page 5760. For deprecated and discontinued components, see [Discontinued Ecosystem Components](#) on page 5781.

## Ecosystem Packs

An Ecosystem Pack (EEP) provides a set of ecosystem components that work together on one or more data-fabric cluster versions. Each EEP contains only one version of an ecosystem component. For example, each EEP supports only one version of Hive and one version of Spark.

HPE creates a new EEP version when a new ecosystem component is available or a patch is applied to an ecosystem component that is already in a released EEP.

A single version of core can support multiple EEPs, but only one at a time. For detailed information about each EEP, see [Ecosystem Pack \(EEP\) Reference](#) on page 6173. For a list of currently supported EEPs, see [EEP Support and Lifecycle Status](#) on page 5760.

### Hadoop Ecosystem and Monitoring Components

Hadoop ecosystem components within an EEP undergo extensive interoperability testing to validate that the components can work together. Examples of Hadoop ecosystem components include Hive, Pig, Spark, and Oozie.

The following open-source components are included in the EEP for monitoring and logging use cases, but NOT for third-party use cases:

- Collectd
- Elasticsearch
- Fluentd
- Grafana

- Kibana
- OpenTSDB

 **NOTE:** Developer previews for fast-moving ecosystem components continue to be available in addition to EEPs. However, developer preview releases of ecosystem components are not tested for production environments, and they do not undergo the same interoperability testing.

For more information, see the [EEP Release Notes](#) on page 5838.

## Apache Airflow

This topic provides an overview of Apache Airflow on HPE Ezmeral Data Fabric.

Starting from EEP 8.1.0, HPE Ezmeral Data Fabric supports Apache Airflow on core 6.2.x and core 7.0.0.

You can use Airflow to author, schedule, or monitor workflows or data pipelines.

The following image shows the Apache Airflow workflow:

A workflow is a Directed Acyclic Graph (DAG) of tasks used to handle big data processing pipelines. The workflows are started on a schedule or triggered by an event. DAGs define the order to run the tasks or rerun in case of failures. The tasks define the actions to be performed, like ingest, monitor, report, and others.

## Airflow Architecture

The following image shows the Apache Airflow Architecture:

## Airflow Components

Airflow consists of the following components:

<b>Scheduler</b>	Triggers the scheduled workflows and submits the tasks to an executor to run.
<b>Executor</b>	Executes the tasks or delegates the tasks to workers for execution.
<b>Worker</b>	Executes the tasks.

<b>Web Server</b>	Provides a user interface to analyze, schedule, monitor, and visualize the tasks and DAG. The Web Server enables you to manage users, roles, and set configuration options.
<b>DAG Directory</b>	Contains DAG files read by Scheduler, Executor, and Web Server.
<b>Metadata Database</b>	Stores the metadata about DAGs' state, runs, and Airflow configuration options.

To learn more about Airflow, see [Airflow Concepts](#).

### Starting, Stopping, and Restarting Airflow Services

This topic describes how to start, stop, and restart Airflow services on HPE Ezmeral Data Fabric.

#### About this task

The Warden daemon starts the Airflow server (airflow-webserver and airflow-scheduler) automatically at installation time.

You can start and stop Airflow from the command line or from the Control System. You can use the `maprcli node services` command to start Airflow on multiple nodes at one time.

Perform the following steps to start or stop or restart Airflow from the command line:

#### Procedure

1. Make a list of nodes on which Airflow is configured.
2. Run the `maprcli node services` command with either `start`, `restart`, or `stop`, and specify the nodes on which Airflow is configured, separated by spaces.

```
maprcli node services -name airflow-webserver -action start|stop|
restart -nodes <nodes list>
```

```
maprcli node services -name airflow-scheduler -action start|stop|
restart -nodes <nodes list>
```

#### Considerations for Using Airflow CLI Commands

Describes security considerations for using Airflow CLI commands.

EEP 9.2.2 and higher, and Airflow 2.8.3 has four types of security options related to the use of Airflow CLI commands. In `opt/mapr/airflow/airflow-<version>/conf/airflow.cfgfile`, you can set one of the following four options:

**Option 1:** This is default option. When `admin_only_cli_access = false` and `admin_cli_with_impersonation = false`:

- Only users with Data Fabric tickets can use Airflow CLI commands.

- If a user that has no ticket issues a CLI command, the command line returns an error. For example:

```
$ airflow users create --username mapr1 --firstname mapr1 --lastname
mapr1 -p mapr1 --role Admin --email admin3@example.org
Traceback (most recent call last):
  File "/opt/mapr/airflow/airflow-2.6.1/bin/airflow", line 8, in <module>
    sys.exit(main())
  File "/opt/mapr/airflow/airflow-2.6.1/build/env/lib/python3.9/
site-packages/airflow/__main__.py", line 45, in main
    resp = security_client.start("maprsasl")[2]
  File "/opt/mapr/airflow/airflow-2.6.1/build/env/lib/python3.9/
site-packages/airflow/security/maprsasl.py", line 73, in start
    return True, mechanism, self.get_init_response()
  File "/opt/mapr/airflow/airflow-2.6.1/build/env/lib/python3.9/
site-packages/airflow/security/maprsasl.py", line 55, in get_init_response
    server_key_bytes =
maprsecurity.GetTicketAndKeyForClusterInternal(MAPR_CLUSTER_NAME, 1)
SystemError: <built-in function GetTicketAndKeyForClusterInternal>
returned NULL without setting an error
```

- Only the cluster administrator (typically the mapr user) can issue commands related to Airflow users. For example, only the cluster admin can issue the `airflow users list` command or create the admin user role. An exception is generated if a non-cluster-admin user issues a command such as `airflow users list`. For example:

```
$ airflow users list
Traceback (most recent call last):
  File "/opt/mapr/airflow/airflow-2.6.1/bin/airflow", line 8, in <module>
    sys.exit(main())
.....
.....
  File "/opt/mapr/airflow/airflow-2.6.1/build/env/lib/python3.9/
site-packages/airflow/cli/commands/user_command.py", line 38, in <module>
    class UserSchema(Schema):
  File "/opt/mapr/airflow/airflow-2.6.1/build/env/lib/python3.9/
site-packages/airflow/cli/commands/user_command.py", line 42, in
UserSchema
    raise Exception("Only admin cluster user can manage Airflow users
list")
Exception: Only admin cluster user can manage Airflow users list
```

**Option 2:** When `admin_only_cli_access = true` and `admin_cli_with_impersonation = true`:

- This option is same as **Option 1**. In addition, `admin_only_cli_access = true` has more priority.

**Option 3:** When `admin_only_cli_access = true` and `admin_cli_with_impersonation = false`:

- Only cluster administrator can access ALL Airflow CLI commands.
- Impersonation is disabled.

**Option 4:** When `admin_only_cli_access = false` and `admin_cli_with_impersonation = true`:

- Cluster administrator can access ALL Airflow CLI commands.
- Users with Data Fabric tickets have access only to **Airflow Task** command.

- Impersonation is enabled.

### Configuring a Remote MySQL Database for Airflow

This topic describes how to configure a remote MySQL database for Airflow on the HPE Ezmeral Data Fabric.

#### Prerequisites

To connect to MySQL from Airflow, install the **mysqlclient** by using these steps:

1. Run `. <airflow_home>/build/env/bin/activate`
2. Run `pip install mysqlclient==2.2.0`
3. Run `deactivate`

#### About this task

Airflow uses SQLAlchemy to connect to the metadata database. The metadata database stores the information about Airflow configurations, user information, roles and policies, and statistics of each DAG state, run, and task.

Airflow supports MySQL database engine versions 5.7 and 8. For a list of the supported databases, see [Choosing database backend](#).

#### Procedure

1. To configure the remote MySQL Database for Airflow, see [Setting Up a MYSQL Database](#).
2. After you have configured a database user that Airflow can use to access the database and `<AIRFLOW-HOME>/conf/airflow.cfg` is updated with your SQLAlchemy connection string, run this command:

```
sql_alchemy_conn = mysql+mysqldb://
<airflow-user>:<airflow-password>@<host>[:<port>]/<airflow-dbname>
```

3. Create the database schema using the steps that apply to the currently-installed EEP. To identify the EEP that is installed, see [Checking the EEP Version](#) on page 5629:

- EEP 9.2.0 and later:

- a. Run the `airflow db migrate` command:

```
airflow db migrate
```

- b. Run the `airflow connections create-default-connections` command:

```
airflow connections create-default-connections
```

- EEP 9.1.x and earlier:

```
airflow db init
```

4. After MySQL configuration is completed, create a user by following the steps in the [Command Line Interface and Environment Variables Reference](#). For example:

```
airflow users create --username mapr --firstname mapr --lastname mapr -p
mapr --role Admin --email admin@example.org
```

5. Restart Airflow services as described in [Starting, Stopping, and Restarting Airflow Services](#) on page 3903.

### Configuring SSL Security for Airflow

This topic describes the security configurations for Airflow on HPE Ezmeral Data Fabric.

Airflow enables SSL by default on secure clusters and you can manually configure SSL for nonsecure clusters in HPE Ezmeral Data Fabric.

#### Enabling SSL on Secure Clusters

Airflow enables SSL by default on secure clusters and uses the standard Data-Fabric SSL configuration.

#### Enabling SSL on Nonsecure Clusters

To enable SSL on non-secure clusters, provide a certificate and a key to the webserver.

Add the following configuration options at `<airflow_home>/conf/airflow.cfg`.

```
[webserver]
web_server_ssl_cert = <path to certificate>
web_server_ssl_key = <path to private key>
```

Once you enable the SSL, you must use `https://` in the browser for secure connection.

### Configuring MapR-SASL and SSL for Hooks Connections

This topic describes configuration options for MapR-SASL and SSL for hook connections in Airflow.

Using Airflow, you can import and export data to multiple systems. Airflow provides a high-level interface called Hooks to connect to these systems by integrating with Connections.

A connection is an object that stores credentials such as your username, password and hostname, the type of system you are connecting to, and other configuration options.

HPE Ezmeral Data Fabric 7.0.0 supports MapR-SASL authentication for Airflow.

To support MapR-SASL authentication for HPE Ezmeral Data Fabric 6.2.x, see [Applying a Patch](#) on page 465.

Airflow authenticates with MapR-SASL in the following ways:

#### Using the Ecosystem Component Client

To authenticate with MapR-SASL, Airflow uses the clients of ecosystem component installed on the node. To submit the tasks, configure a Data Fabric User Ticket on a secure cluster. See [Generating a HPE Ezmeral Data Fabric User Ticket](#) on page 1825.

#### Using the REST API or Thrift protocol

To authenticate with MapR-SASL, you can use REST API or Thrift protocol by setting the additional configuration options.

<b>WebEZFSHook (webezfs_default connection id)</b>	To connect with file system, set the following configuration options on <code>extra</code> section of connection configuration.
	<b>MapR-SASL:</b> Set <code>{"auth": "maprsasl"}</code> . <b>SSL:</b> On secure clusters, set <code>{"use_ssl": "true"}</code> option. For nondefault SSL configuration, set <code>{"cert": "/path_to_truststore.pem"}</code> .
<b>EzHiveCliHook (hive_cli_default connection_id, auth authenticationMethod)</b>	To connect with Hive, set the following configuration options on connection configuration.
	<b>MapR-SASL:</b> Set <code>{"use_beeline": true, "ssl": "true"}</code> . Add <code>auth</code> parameter to <code>EzHiveCliHook</code> . For example: <code>hive = EzHiveCliHook(auth="maprsasl")</code> .
<b>EzHiveMetastoreHook (metastore_default connection id)</b>	To connect with Hive Metastore, set the following configuration options on <code>extra</code> section of connection configuration.
	<b>MapR-SASL:</b> Set <code>{"authMechanism": "MAPRSASL"}</code> .
<b>EzHiveServer2Hook (hiveserver2_default connection id)</b>	To connect with HiveServer2, set the following configuration options on <code>extra</code> section of connection configuration.
	<b>MapR-SASL:</b> Set <code>{"authMechanism": "MAPRSASL"}</code> . <b>SSL:</b> On secure clusters, set <code>{"ssl": "true"}</code> option. For nondefault SSL configuration, set <code>{"certificate": "/path_to_truststore.pem"}</code> .
<b>EzLivyHook (livy_default connection id)</b>	To connect with Livy, set the following configuration options on <code>extra</code> section of connection configuration.
	<b>MapR-SASL:</b> Set <code>{"auth": "maprsasl"}</code> . <b>SSL:</b> On secure clusters, set <code>{"use_ssl": "true"}</code> option. For nondefault SSL configuration, set <code>{"cert": "/path_to_truststore.pem"}</code> .
<b>EzS3Hook (aws_default connection id)</b>	To connect with S3, set the following configuration options on the <code>extra</code> section of connection configuration.
	<b>SSL:</b> On secure clusters, set the <code>{"cert": "/path_to_truststore.pem"}</code> option for nondefault SSL configuration. To connect with the HPE Ezmeral Data Fabric Object Store and AWS, you must also add the endpoint URL to the <code>extra</code> section of the connection configuration. For example:

```
{"endpoint_url": "https://  
<hostname>:9000" }
```

## Airflow Providers

This topic describes the Apache Airflow Provider packages available in HPE Ezmeral Data Fabric.

Providers contains operators, hooks, sensors, and transfer operators that enhances the core Airflow scheduling capabilities. To learn more about Providers, see [Airflow Providers](#).

Airflow provides an interface to Ecosystem Pack components, databases, and filesystem by using the providers.

The classes on Providers package in HPE Ezmeral Data Fabric are located inside `airflow.providers.ezmeral` Python package.

The following topics describes interfaces on Airflow Providers in HPE Ezmeral Data Fabric.

### Interface to HPE Ezmeral Data Fabric Database

Airflow provides an interface to HPE Ezmeral Data Fabric Database by using the Providers.

See Provider examples of HPE Ezmeral Data Fabric Database at `<airflow_home>/build/env/lib/python3.9/site-packages/airflow/providers/ezmeral/database/example_dags/`.

### Hooks

#### BinaryDbCliHook

*Python path:*

`airflow.providers.ezmeral.database.hooks.binary_shell`

*Description:* This hook is a wrapper around the `hbase shell` command that must have `hbase` binary in the `PATH`.

#### JsonDbCliHook

*Python path:*

`airflow.providers.ezmeral.database.hooks.json_shell`

*Description:* This hook is a wrapper around the `mapr dbshell` command.

#### EzTableHook

*Python path:*

`airflow.providers.ezmeral.database.hooks.table`

*Description:* This hook is a wrapper around the `maprccli table` command.

### Operators

#### BinaryDbCliOperator

*Python path:*

`airflow.providers.ezmeral.database.operators.binary_shell`

*Description:* Executes HPE Ezmeral Data Fabric Database Binary `hbase shell` command.

#### JsonDbCliOperator

*Python path:*

`airflow.providers.ezmeral.database.operators.json_shell`

*Description:* Executes HPE Ezmeral Data Fabric Database Binary `mapr dbshell` command.

#### CreateEzTableOperator

*Python path:*

`airflow.providers.ezmeral.database.operators.table`

*Description:* Creates HPE Ezmeral Data Fabric Database table.

#### DropEzTableOperator

*Python path:*

`airflow.providers.ezmeral.database.operators.table`

*Description:* Drops HPE Ezmeral Data Fabric Database table.

#### ImportJsonEzTableOperator

*Python path:*

`airflow.providers.ezmeral.database.operators.table`

*Description:* Imports HPE Ezmeral Data Fabric Database JSON table.

**ExportJsonEzTableOperator**

*Python path:*  
 airflow.providers.ezmeral.database.operators.table

*Description:* Exports HPE Ezmeral Data Fabric Database JSON table.

**ImportBinaryEzTableOperator**

*Python path:*  
 airflow.providers.ezmeral.database.operators.table

*Description:* Imports HPE Ezmeral Data Fabric Database Binary table.

**ExportBinaryEzTableOperator**

*Python path:*  
 airflow.providers.ezmeral.database.operators.table

*Description:* Exports HPE Ezmeral Data Fabric Database Binary table.

**Sensors****EzTableSensor**

*Python path:*  
 airflow.providers.ezmeral.database.sensors.table

*Description:* Waits for the table to show up in HPE Ezmeral Data Fabric Database.

**Interface to the File System**

Airflow provides an interface to the file system by using the Providers.

See Provider examples of the file system at `<airflow_home>/build/env/lib/python3.9/site-packages/airflow/providers/ezmeral/fs/example_dag/`.

**Hooks****EZFSHook**

*Python path:*  
 airflow.providers.ezmeral.fs.hooks.ezfs.EZFSHook

*Description:* Interacts with file system.

*API::class*  
 airflow.providers.ezmeral.fs.hooks.ezfs.EZFSHook(classpath: list = '/opt/mapr/lib/\*')

The *classpath* parameter provides a path for Java and binaries libraries to access the file system Java client.

**WebEZFSHook**

*Python path:*  
 airflow.providers.ezmeral.fs.hooks.web\_ezfs.WebEZFSHook

*Description:* Interacts with file system through HttpFS.

*API:* The same API as [Apache Web HDFS](#).

**Sensors****EzfsSensor**

*Python path:*  
 airflow.providers.ezmeral.fs.sensors.ezfs.EzfsSensor

*Description:* Waits for a file or folder to show up in the file system.

*API:* The same API as [Apache HDFS Sensor](#).

**EzfsRegexSensor**

*Python path:*  
 airflow.providers.ezmeral.fs.sensors.ezfs.EzfsRegexSensor

*Description:* Waits for matching files by matching on regex.

*API:* The same API as [Apache HDFS Regex sensor](#).

### **EzfsFolderSensor**

*Python path:*  
airflow.providers.ezmeral.fs.sensors.ezfs.EzfsFolderSensor

*Description:* Waits for a non-empty directory.

*API:* The same API as [Apache HDFSFolder sensor](#).

### **WebEzfsSensor**

*Python path:*  
airflow.providers.ezmeral.fs.sensors.web\_ezfs.WebEzfsSensor

*Description:* Waits for a file or folder to show up in the file system.

*API:* The same API as [Apache WebHDFS sensor](#).

## **Interface to Hive**

Airflow provides an interface to Hive by using the Providers.

See Provider examples of Hive at `<airflow_home>/build/env/lib/python3.9/site-packages/airflow/providers/ezmeral/hive/example_dags/`.

## **Hooks**

All hooks have the same API as [Apache Hive Hooks](#).

### **EzHiveCliHook**

*Python path:*  
airflow.providers.ezmeral.hive.hooks.ezhive.EzHiveCliHook

*Description:* Provides access to Hive using Hive client.

### **EzHiveMetastoreHook**

*Python path:*  
airflow.providers.ezmeral.hive.hooks.ezhive.EzHiveMetastoreHook

*Description:* Provides access to Hive Metastore using HMSClient.

### **EzHiveServer2Hook**

*Python path:*  
airflow.providers.ezmeral.hive.hooks.ezhive.EzHiveServer2Hook

*Description:* Provides access to HiveServer using PyHive.

## **Operators**

### **EzHiveOperator**

*Python path:*  
airflow.providers.ezmeral.hive.operators.ezhive.EzHiveOperator

*Description:* Executes HiveQL code or Hive script in a specific Hive database.

*API:* The same API as [Apache Hive Operator](#).

### **EzHiveStatsCollectionOperator**

*Python path:*  
airflow.providers.ezmeral.hive.operators.ezhive\_stats.EzHiveStatsCollectionOperator

*Description:* Gathers partition statistics using a dynamically generated Presto query and inserts the statistics into a MySQL table.

*API:* The same API as [Apache Hive Stats Operator](#).

## Sensors

### **EzHivePartitionSensor**

*Python path:*  
airflow.providers.ezmeral.hive.sensors.ezhive\_partition.EzHivePartitionSensor

*Description:* Waits for a partition to show up in Hive.

*API:* The same API as [Apache Hive Partition Sensor](#).

### **EzMetastorePartitionSensor**

*Python path:*  
airflow.providers.ezmeral.hive.sensors.ezmetastore\_partition.EzMetastorePartitionSensor

*Description:* An alternative to the HivePartitionSensor that talks directly to the MySQL database.

*API:* The same API as [Apache Hive Metastore Partition Sensor](#).

### **EzNamedHivePartitionSensor**

*Python path:*  
airflow.providers.ezmeral.hive.sensors.eznamed\_hive\_partition.EzNamedHivePartitionSensor

*Description:* Waits for a set of partitions to show up in Hive.

*API:* The same API as [Apache Hive Named Partition Sensor](#).

## Transfers

### **EzHiveToMySQLOperator**

*Python path:*  
airflow.providers.ezmeral.hive.transfers.ez\_hive\_to\_mysql.EzHiveToMySQLOperator

*Description:* Moves data from Hive to MySQL. Use this operator to move small amount of data as data first loads into the memory and then into the MySQL.

*API:* The same API as [Apache HiveToMySQLOperator](#).

### **EzHiveToSambaOperator**

*Python path:*  
airflow.providers.ezmeral.hive.transfers.ez\_hive\_to\_samba.EzHiveToSambaOperator

*Description:* Moves data from Hive to Samba. Executes HiveQL code in a specific Hive database and loads the results of the query as a CSV to a Samba location.

*API:* The same API as [Apache HiveToSambaOperator](#).

### **EzMsSqlToHiveOperator**

*Python path:*  
airflow.providers.ezmeral.hive.transfers.ez\_mssql\_to\_hive.EzMsSqlToHiveOperator

*Description:* Moves data from Microsoft SQL Server to Hive.

*API:* The same API as [Apache MsSqlToHiveOperator](#).

### **EzMySqlToHiveOperator**

*Python path:*  
airflow.providers.ezmeral.hive.transfers.ez\_mysql\_to\_hive.EzMySqlToHiveOperator

*Description:* Moves data from MySQL to Hive.

*API:* The same API as [Apache MySqlToHiveOperator](#).

**EzS3ToHiveOperator**

*Python path:*  
 airflow.providers.ezmeral.hive.transfers.ez\_s3\_to\_hive.  
 EzS3ToHiveOperato

*Description:* Moves data from Amazon S3 to Hive.

*API:* The same API as [Apache S3ToHiveOperator](#).

**EzVerticaToHiveOperator**

*Python path:*  
 airflow.providers.ezmeral.hive.transfers.ez\_vertica\_to\_hive.  
 EzVerticaToHiveOperator

*Description:* Moves data from Vertica to Hive.

*API:* The same API as [Apache VerticaToHiveOperator](#).

*Configuring a HiveCliHook*

Describes the properties that must be added to configure a HiveCliHook for Airflow on a secure cluster.

The HiveCliHook is a simple wrapper around the Hive CLI. To configure the HiveCliHook for Airflow:

1. Use the following connection properties:

Property	Value
use_beeline	true
auth	maprsasl
ssl	true

2. Add the following property to the `hive-site.xml` file:

```
<property>
  <name>hive.security.authorization.sqlstd.confwhitelist.append</name>
  <value>mapred.job.name|airflow.ctx.*</value>
</property>
```

*Configuring Hook Connections for Hive High Availability*

Describes how to configure the EZHiveServer2Hook, the EzHiveCLIHook, and the EzHiveMetastoreHook to connect to Hive with High Availability (HA) enabled.

EEP 9.2.1 and later include hook connection support in Airflow to connect to HiveServer2 with High Availability (HA) enabled. When any of the hooks are configured, if one of the HS2 servers is unreachable, Airflow connects to another server in the list of hosts that you specify.

**Configuring the EzHiveServer2Hook for Hive HA**

The EZHiveServer2Hook supports a `pyhive` connection to HiveServer 2 HA. To configure the `pyhive` connection with HiveServer 2 HA:

1. Add the `hive_ha` property to the `extra` section of the connection configuration. For example:

```
{
  "authMechanism": "MAPRSASL",
  "ssl": "true",
  "hive_ha": "true"
}
```

2. Add the list of your active HS2 instances in the `host` section using this format:

```
<hs2_hostname1>:<port1>,<hs2_hostname2>:<port2>,<hs2_hostname3>:<port3>...
```

For example:

```
myhost-48-n2.storage.mycorp.net:10000,myhost-23-n2.storage.mycorp.net:10000
```

In the following example, one of the HS2 servers is unusable, so Airflow reconnects to another server:

```
{ezhive.py:196} INFO - Trying to connect to
myhost-23-n2.storage.mycorp.net:10000
{TSocket.py:142} INFO - Could not connect to ('<ip_address>', 10000)
Traceback (most recent call last):
  File "/opt/mapr/airflow/airflow-2.7.3/build/env/lib/python3.9/
site-packages/thrift/transport/TSocket.py", line 137, in open
    handle.connect(sockaddr)
  File "/opt/mapr/airflow/airflow-2.7.3/build/python/lib/python3.9/ssl.py",
line 1343, in connect
    self._real_connect(addr, False)
  File "/opt/mapr/airflow/airflow-2.7.3/build/python/lib/python3.9/ssl.py",

[2023-12-15, 09:06:32 UTC] {ezhive.py:210} WARNING - Failed to connect to
myhost-23-n2.storage.mycorp.net:10000
{ezhive.py:196} INFO - Trying to connect to
myhost-48-n2.storage.mycorp.net:10000
{hive.py:475} INFO - USE 'default'
```

### Configuring the EzHiveCliHook for Hive HA

The EzHiveCliHook supports a beeline connection to HiveServer 2 HA. To configure the beeline connection with HiveServer 2 HA:

1. Add the following properties to the `extra` section of the connection configuration:

```
{
  "use_beeline": true,
  "ssl": "true",
  "hive_ha": "true",
  "serviceDiscoveryMode": "zooKeeper",
  "zooKeeperNamespace": "hiveserver2"
}
```

2. Add the list of your active ZooKeeper instances in the `host` section using this format:

```
<ZK_FQDN1>:5181,<ZK_FQDN2>:5181,<ZK_FQDN3>:5181
```

### Configuring the EzHiveMetastoreHook for Hive HA

The EzHiveMetastoreHook supports an `hmsclient` connection to HiveServer 2 HA. To configure the `hmsclient` connection with HiveServer 2 HA:

1. Configure Hive Metastore HA as described in [Enabling High Availability for Hive Metastore](#) on page 4308.
2. Add the following properties to the `extra` section of the connection configuration:

```
{ "authMechanism": "MAPRSASL" }
```

3. In the `host` section, specify the list of active Hive metastore hosts using the following format:

```
<hive_metastore1>,<hive_metastore2>,<hive_metastore3>
```

With this configuration, if one Hive metastore host is unavailable, a connection will be made to another host in the list. For example:

```
[2023-12-15, 12:57:54 UTC] {base.py:73} INFO - Using connection ID
'metastore_default' for task execution.
[2023-12-15, 12:57:54 UTC] {hive.py:576} INFO - Trying to connect to
myhost-23-n2.storage.mycorp.net:9083
[2023-12-15, 12:57:54 UTC] {hive.py:582} ERROR - Could not connect to
myhost-23-n2.storage.mycorp.net:9083
[2023-12-15, 12:57:54 UTC] {hive.py:576} INFO - Trying to connect to
myhost-48-n2.storage.mycorp.net:9083
[2023-12-15, 12:57:54 UTC] {hive.py:578} INFO - Connected to
myhost-48-n2.storage.mycorp.net:9083
```

### Related reference

[EEP Support and Lifecycle Status](#) on page 5760

This page shows the EEPs that are supported for different core releases and the current lifecycle status for each EEP.

### More information

[Enabling High Availability for Hive](#) on page 4305

This section describes how to enable High Availability for HiveServer2 and HiveMetastore.

### Interface to Livy

Airflow provides an interface to Livy by using the Providers.

See Provider examples of Livy at `<airflow_home>/build/env/lib/python3.9/site-packages/airflow/providers/ezmeral/livy/example_dags/`.

### Hooks

#### EzLivyHook

*Python path:*  
`airflow.providers.ezmeral.livy.hooks.ezlivy.EzLivyHook`

*Description:* Apache Livy hook on HPE Ezmeral Data Fabric through the REST API.

*API:* The same API as [Apache LivyHook](#).

### Operators

#### EzLivyOperator

*Python path:*  
`airflow.providers.ezmeral.livy.operators.ezlivy.EzLivyOperator`

*Description:* Wraps the Livy batch REST API, enabling to submit a Spark application to the underlying cluster.

*API:* The same API as [Apache LivyOperator](#).

## Sensors

### EzLivySensor

*Python path:*  
airflow.providers.ezmeral.livy.sensors.ezlivy.EzLivySensor

*Description:* Monitors Livy sessions for termination.

*API:* The same API as [Apache LivySensor](#).

## Interface to Amazon S3

Airflow provides an interface to Amazon S3 by using the Providers.

See Provider examples of Amazon S3 at `<airflow_home>/build/env/lib/python3.9/site-packages/airflow/providers/ezmeral/s3/example_dags/`.

## Hooks

### EzS3Hook

*Python path:* airflow.providers.ezmeral.s3.hooks.s3

*Description:* Interacts with Amazon S3 using Boto3 library.

## Operators

### EzS3CreateBucketOperator

*Python path:*  
airflow.providers.ezmeral.s3.operators.s3\_bucket

*Description:* Creates an S3 bucket.

### EzS3DeleteBucketOperator

*Python path:*  
airflow.providers.ezmeral.s3.operators.s3\_bucket

*Description:* Deletes an S3 bucket.

### EzS3GetBucketTaggingOperator

*Python path:*  
airflow.providers.ezmeral.s3.operators.s3\_bucket\_tagging

*Description:* Gets tagging from an S3 bucket.

### EzS3PutBucketTaggingOperator

*Python path:*  
airflow.providers.ezmeral.s3.operators.s3\_bucket\_tagging

*Description:* Puts tagging for an S3 bucket.

### EzS3DeleteBucketTaggingOperator

*Python path:*  
airflow.providers.ezmeral.s3.operators.s3\_bucket\_tagging

*Description:* Deletes tagging from an S3 bucket.

### EzS3CopyObjectOperator

*Python path:*  
airflow.providers.ezmeral.s3.operators.s3\_copy\_object

*Description:* Creates a copy of the stored S3 object.

### EzS3DeleteObjectsOperator

*Python path:*  
airflow.providers.ezmeral.s3.operators.s3\_delete\_objects

*Description:* Deletes single or multiple objects from a bucket using a single HTTP request.

### EzS3ListOperator

*Python path:*  
airflow.providers.ezmeral.s3.operators.s3\_list

*Description:* List all objects from the bucket with the given string prefix in name.

## Sensors

### EzS3KeySensor

*Python path:*  
airflow.providers.ezmeral.s3.sensors.s3\_key

*Description:* Waits for a key to show up in a S3 bucket. S3 is a key-value store and key uniquely identifies the object in the bucket. S3 does not support folders and the path is just a key of resource.

### EzS3KeyUnchangedSensor

*Python path:*  
airflow.providers.ezmeral.s3.sensors.s3\_keys\_unchanged

*Description:* Checks for changes in the number of objects at prefix in S3 bucket. This sensor returns `True` if the inactivity period has passed with no increase in the number of objects. This sensor might give an error when you use it in reschedule mode. Between rescheduled invocations, S3 bucket loses the state of the listed objects.

## Transfers

### EzGCSToS3Operator

*Python path:*  
airflow.providers.ezmeral.s3.transfers.gcs\_to\_s3

*Description:* Synchronizes a Google Cloud Storage bucket with an Amazon S3 bucket.

### EzLocalFilesystemToS3Operator

*Python path:*  
airflow.providers.ezmeral.s3.transfers.local\_to\_s3

*Description:* Uploads a file from a local filesystem to S3.

### EzMongoToS3Operator

*Python path:*  
airflow.providers.ezmeral.s3.transfers.mongo\_to\_s3

*Description:* Moves data from MongoDB using PyMongo to Amazon S3 using Boto.

### EzSQLToS3Operator

*Python path:*  
airflow.providers.ezmeral.s3.transfers.sql\_to\_s3

*Description:* Saves data from a specific SQL query into a file in S3.

### EzS3ToFTPOperator

*Python path:*  
airflow.providers.ezmeral.s3.transfers.s3\_to\_ftp

*Description:* Enables the transfer of files from S3 to a FTP server.

### EzS3ToSFTPOperator

*Python path:*  
airflow.providers.ezmeral.s3.transfers.s3\_to\_sftp

*Description:* Enables the transfer of files from S3 to a SFTP server.

### EzSFTPToS3Operator

*Python path:*  
airflow.providers.ezmeral.s3.transfers.sftp\_to\_s3

*Description:* Enables the transfer of files from a SFTP server to S3.

## Interface to Spark

Airflow provides an interface to Spark by using the Providers.

See Provider examples of Spark at `<airflow_home>/build/env/lib/python3.9/site-packages/airflow/providers/ezmeral/spark/example_dags/`.

## Hooks

### EzSparkSubmitHook

*Python path:*

`airflow.providers.ezmeral.spark.hooks.ezspark_submit`

*Description:* Launches Spark applications. This hook is a wrapper around the `spark-submit` binary to run a `spark-submit` job.

### EzSparkSqlHook

*Python path:*

`airflow.providers.ezmeral.spark.hooks.ezspark_sql`

*Description:* Enables interaction with binary tables through `spark-sql`. This hook is a wrapper around the `spark-sql` binary.

### EzSparkJDBCHook

*Python path:*

`airflow.providers.ezmeral.spark.hooks.ezspark_jdbc`

*Description:* Enables data transfers between JDBC databases and Apache Spark.

## Operators

### EzSparkSubmitOperator

*Python path:*

`airflow.providers.ezmeral.spark.operators.ezspark_submit`

*Description:* This operator is a wrapper around the `spark-submit` binary to run a `spark-submit` job.

### EzSparkSqlOperator

*Python path:*

`airflow.providers.ezmeral.spark.operators.ezspark_sql`

*Description:* Executes Spark SQL query.

### EzSparkJDBCOperator

*Python path:*

`airflow.providers.ezmeral.spark.operators.ezspark_jdbc`

*Description:* Extends the `SparkSubmitOperator` to enable data transfers between JDBC databases and Apache Spark.

## AsyncHBase

Data Fabric provides a version of AsyncHBase that is modified to work with HPE Ezmeral Data Fabric Database binary tables. The Data Fabric version of AsyncHBase is based on the AsyncHBase library provides asynchronous Java APIs to access HPE Ezmeral Data Fabric Database binary tables. The HBase Client version is based on the current EEP and Data Fabric version you are running. For more information, see the [Interoperability Matrices](#) on page 5747.

### Configuring the Default Database for AsyncHBase

For AsyncHBase 1.7 and later, you can configure whether AsyncHBase accesses HBase tables or MapR-DB tables by default. If this value is not configured, AsyncHBase will determine the table type.

You can configure the default database in the `asynchbase.conf` file and the client application. A default database setting in the client application overrides the default database configuration in the `asynchbase.conf` file.

The process that AsyncHBase uses to access tables differs based on the default database configuration.

- When the default database is HBase, AsyncHBase accesses the table using the HBase port that was used to initialize the AsyncHBase client and the table name provided to the application.
- When the default database is MapR-DB, the table name provided to the application is translated to the MapR-DB table path, and then AsyncHBase accesses the table.

- When a default database is not configured, AsyncHBase first tries to access the table as a MapR-DB table. If that fails, it tries to access the table as an HBase table.

### Set the Default Database using `asynchbase.conf`

To specify if AsyncHBase accesses HBase tables or MapR-DB tables:

1. Add the `mapr.hbase.default.db` parameter in the `asynchbase.conf (/opt/mapr/asynchbase/asynchbase-<version>/conf/asynchbase.conf)` file.
2. Set the value of `mapr.hbase.default.db` to one of the following values which will indicate the default database:
  - `hbase`
  - `maprdb`

### Set the Default Database in the Client Application

Based on the database that you want as the default, add the following code in the client application:

- To access MapR-DB tables:

```
Config config = new Config();
String dbString = "maprdb";
config.overrideConfig(HBaseClient.CONFIG_PARAM_DEFAULT_DB,dbString);
HBaseClient client = new
HBaseClient(config);
```

- To access HBase tables:

```
Config config = new Config();
String dbString = "hbase";
config.overrideConfig(HBaseClient.CONFIG_PARAM_DEFAULT_DB,dbString);
HBaseClient client = new
HBaseClient(config);
```

### Compiling and Running AsyncHBase Applications

When you compile or run AsyncHBase applications, you need to include the required AsyncHBase libraries.

#### To compile the application:

```
javac -cp `asynchbase
classpath`:$APP_CLASSPATH
<ProgramName>
```

#### To run the application, use one of the following commands:

- ```
java -cp `asynchbase
classpath`:$APP_CLASSPATH
<ProgramName>
```

- ```
asynchbase $APP_CLASSPATH
<ProgramName>
```

To include the AsyncHBase library in your maven project:

1. Add MapR's maven repository to the list of repositories in your project's pom.xml:

```
<repository>
<id>mapr-releases</id>
<url>https://repository.mapr.com/maven/</url>
<snapshots><enabled>true</enabled></snapshots>
<releases><enabled>true</enabled></releases>
</repository>
```

2. Add the following dependency to the list of dependencies:

```
<dependency> <groupId>org.hbase</groupId>
<artifactId>asynchbase</artifactId>
<version><AsyncHBaseVersion>-mapr-<MapREcoVersion></version> </dependency>
```

**NOTE:** For example, if you are using AsyncHBase 1.7-1603, configure the following for the version dependency:  
`<version>1.7.0-mapr-1603</version>`

### AsyncHBase Script

Data Fabric provides an AsyncHBase script that you can use to run applications and generate the AsyncHBase classpath.

The asynchbase script has the following syntax:

```
asynchbase <command> [<args>]
Commands:
classpath Dump AsyncHBase CLASSPATH
CLASSNAME Run the class named CLASSNAME
```

Parameters	Description
classpath	Dumps the AsyncHBase classpath. For example, you can use <code>asynchbase classpath</code> when you compile an application:  <pre>javac -cp `asynchbase classpath`:\$APP_CLASSPATH &lt;ProgramName&gt;</pre>
CLASSNAME	Runs the named class. For example:  <pre>asynchbase &lt;path to application&gt; CLASSNAME</pre>

**AsyncHBase Behavior with HPE Ezmeral Data Fabric Database Binary Tables**

After you install AsyncHBase, you can use the AsyncHBase libraries to provide asynchronous access to HPE Ezmeral Data Fabric Database binary tables. However, it is important to note the behavior that is specific to using AsyncHBase with HPE Ezmeral Data Fabric Database.

**The Scanner .setMaxNumKeyValues method, when run against HPE Ezmeral Data Fabric Database binary tables, does not behave as documented.**

According to the AsyncHBase documentation, this [method](#) sets “the maximum number of KeyValues the server is allowed to return in a single RPC response.”

When you use this method with HPE Ezmeral Data Fabric Database binary tables, the value for the maximum number of key values is ignored and the full set of KeyValues is always returned.

**List<RegionClientStats> regionStats() is not supported**

As of AsyncHBase 1.7-1603, `List<RegionClientStats> regionStats()` is not supported and when it is used the API does not return statistics.

**HPE Ezmeral Data Fabric Database ignores HBase configurations in the asynchbase.conf file**

As of AsyncHBase 1.7-1603, the [conf object](#) can be used to override Hbase properties that were previously only configured in the `asynchbase.conf` file. The `asynchbase.conf` file is located in the `asynchbase` installation directory. HPE Ezmeral Data Fabric Database does not use these Hbase configurations and therefore they are ignored by HPE Ezmeral Data Fabric Database

**Using OpenTSDB with AsyncHBase**

OpenTSDB can use Data Fabric’s AsyncHBase to perform time-series data-plots on HPE Ezmeral Data Fabric Database binary tables.

The [OpenTSDB](#) software package provides a time-series database that collects user-specified data.

To use OpenTSDB with AsyncHBase, install and configure OpenTSDB from source files or from a package.

**Installing OpenTSDB from Source Files**

The following steps describe how to install OpenTSDB from source files.

**Prerequisites**

Be sure to install the OpenTSDB version that is required for your AsyncHBase version. AsyncHBase 1.6 requires OpenTSDB 2.0. AsyncHBase 1.7 requires OpenTSDB 2.2.

**Procedure**

1. Clone the `opentsdb.git` project and check out the OpenTSDB branch that you require.

**NOTE:**

For example:

```
$ git clone https://github.com/OpenTSDB/opentsdb.git
Cloning into 'opentsdb'...
remote: Counting objects: 5625, done.
remote: Compressing objects: 100% (76/76), done.
remote: Total 5625 (delta 51), reused 64 (delta 30)
Receiving objects: 100% (5625/5625), 27.15 MiB | 2.67 MiB/s, done.
Resolving deltas: 100% (3755/3755), done.
Checking connectivity... done.
$ cd opentsdb
$ git tag -l
mapr-1.1.0-release+5
v1.0.0
v2.0.0
...
$ git checkout v2.0.0
Switched to a new branch 'v2.0.0'
```

2. Install dependencies for graph generation:

```
$ yum install autoconf automake gnuplot
```

3. Replace the `asynchbase.jar` file with the MapR version of that file:

```
$ yum install mapr-asynchbase
```

4. Run the build script:

```
./build.sh
```

5. If you want to use OpenTSDB with HPE Ezmeral Data Fabric Database tables, open the `create_table.sh` file (`<OPENTSDB_ROOT_INSTALL_DIR>/src/create_table.sh`) and add `/"` before the table names so that MapR recognizes them as HPE Ezmeral Data Fabric Database tables: See [Example: create\\_table.sh](#) on page 3922.

6. Create tables:

```
env COMPRESSION=NONE;HBASE_HOME=/opt/mapr/hbase/hbase-<version>
<OPENTSDB_ROOT_INSTALL_DIR>/src/create_table.sh
```

7. Run the following command to verify that the tables are created successfully:

```
hadoop fs -ls /
```

8. Create a simple metric to store, such as “`sys.cpu.user`”:

```
./build/tsdb mkmetric sys.cpu.user --table=/tsdb --uidtable=/tsdb-uid
```

## 9. Run the OpenTSDB daemon (tsd).

```
./build/tsdb tsd --port=4242 --staticroot=build/staticroot
--cachedir=/tmp/opentsdb_tmp --zkquorum=10.10.101.50:5181 --table=/tsdb
--uidtable=/tsdb-uid
```

**NOTE:** Instead of providing these options on command line, you can configure the values in the `opentsdb.conf` file. This file must be in the root folder so the option settings are read when `tsd` is run. Also note that the `staticroot` argument points to the static UI files. You do not need to create `cachedir` because `opentsdb` creates it automatically. Specifying the destination `cachedir` argument is enough. You do need to explicitly specify `tsdb` tables (`tsdb`, `tsdb-uid`) and Zookeeper quorum nodes.

## 10. Log into the web UI: `http://<TSD_Installed_Node_IP>:<Port>`

For example: `http://10.10.10.230:4242/`

## 11. Run a simple test program that generates data and sends repeated puts for the metric over a socket connection: `<UI-IP>:<UI-Port>`. See [Data Generator Program](#) on page 3923.

## 12. Check the plot in the UI.

a) Select **From date** and check **autoreload**.

b) Fill in the metric (in this case, `sys.cpu.user`) and the Tag keys (`cpu`, `host`) values (`webserver 0`, `webserver 1`). You should see a graph with a random plot.

### Example: `create_table.sh`

`create_table.sh` is used to set up HPE Ezmeral Data Fabric Database to accept `puts` from OpenTSDB. This example `create_table.sh` script was updated to work with HPE Ezmeral Data Fabric Database tables.

Note the changed sections for the `*_TABLE` variables.

```
#!/bin/sh
# Small script to setup the HBase tables used by OpenTSDB.

test -n "$HBASE_HOME" || {
    echo >&2 'The environment variable HBASE_HOME must be set'
    exit 1
}
test -d "$HBASE_HOME" || {
    echo >&2 "No such directory: HBASE_HOME=$HBASE_HOME"
    exit 1
}

TSDB_TABLE=${TSDB_TABLE-'/tsdb'}
UID_TABLE=${UID_TABLE-'/tsdb-uid'}
TREE_TABLE=${TREE_TABLE-'/tsdb-tree'}
META_TABLE=${META_TABLE-'/tsdb-meta'}
BLOOMFILTER=${BLOOMFILTER-'ROW'}
# LZO requires lzo2 64bit to be installed + the hadoop-gpl-compression jar.

=> '$BLOOMFILTER'}

create '$TREE_TABLE',
  {NAME => 't', VERSIONS => 1, COMPRESSION => '$COMPRESSION', BLOOMFILTER
=> '$BLOOMFILTER'}

create '$META_TABLE',
  {NAME => 'name', COMPRESSION => '$COMPRESSION', BLOOMFILTER =>
  '$BLOOMFILTER'}
EOF

```

### Data Generator Program

This simple test program generates data and sends repeated puts for the metric over a socket connection.

```

import java.io.PrintWriter;
import java.net.Socket;
import java.util.Date;
import java.util.Random;

public class TestOpenTsdBAPI {
    public static Random random = new Random();
    public static long timeStamp = new Date().getTime()/1000; //in secs
    public static void testTSDBConnection() throws Exception {
        Socket sock = null;
        PrintWriter pw = null;
        String hostname = "10.10.10.230";
        int port = 4242;
        int count=1;
        while(true) {
            if(null==sock) {
                sock = new Socket(hostname, port);
                pw = new PrintWriter(sock.getOutputStream(), true);
            }
            pw.println(dataGen(0, 0, count));
            pw.flush();
            pw.println(dataGen(0, 1, count));
            pw.flush();
            pw.println(dataGen(1, 0, count));
            pw.flush();
            pw.println(dataGen(1, 1, count));
            pw.flush();

            if(++count==Integer.MAX_VALUE) break;
            Thread.sleep(60000);
        }
    }
    public static void main(String [] args) {

```

```

        try {
            testTSDBConnection();
        } catch (Exception ex) {
            ex.printStackTrace();
        }
    }

    public static String dataGen(int web, int cpu, int count) {
        int Low = 1;
        int High = 99;
        int val = random.nextInt(High-Low) + Low;
        long timeStamp1 = new Date().getTime()/1000;
        String dat = "put sys.cpu.user "+(timeStamp1)+" "+val+"
host=webserver"+ web +" cpu="+cpu;//(timeStamp+count)
        System.out.println(dat);
        return dat;
    }
}

```

For example, this program tries to put metrics for 2 hosts (webserver 0 and webserver 1). Each host has 2 CPUs (cpu 0 and cpu 1). Sample puts look like this:

```

put sys.cpu.user 1415300810 87 host=webserver0 cpu=0
put sys.cpu.user 1415300810 66 host=webserver0 cpu=1
put sys.cpu.user 1415300810 18 host=webserver1 cpu=0
put sys.cpu.user 1415300810 26 host=webserver1 cpu=1

put <metric> <timestamp> <value> <tag1>=<> <tag2>=<>

```

When you run the program, you should see entries that indicate that the tags for the metric were created, and they should auto-complete on the UI.

```

UniqueId: Creating an ID for kind='tagv' name='webserver0'

```

You can also verify this from command line instead of the UI:

```

<OpenTSDB-Root>/build/tsdb query 1y-ago sum sys.cpu.user

```

### Installing OpenTSDB with a Package

The following steps describe how to install OpenTSDB from a package.

#### About this task

Be sure to install the OpenTSDB version that is required for your AsyncHBase version. AsyncHBase 1.6 requires OpenTSDB 2.0. AsyncHBase 1.7 requires OpenTSDB 2.2.

#### Procedure

##### 1. Install the OpenTSDB RPM:

a) `mkdir /root/opentsdbrpm`

b) `cd /root/opentsdbrpm`

c) Download the version of OpenTSDB that you required.

For OpenTSDB 2.0: `wget https://github.com/OpenTSDB/opentsdb/releases/download/v2.0.0/opentsdb-2.0.0.noarch.rpm -O opentsdb-2.0.0.noarch.rpm`

For OpenTSDB 2.2: `wget https://github.com/OpenTSDB/opentsdb/releases/download/v2.2.0/opentsdb-2.2.0.noarch.rpm -O opentsdb-2.2.0.noarch.rpm`

d) `rpm -ivh opentsdb-<version>.noarch.rpm`

## 2. Configure OpenTSDB to work with Data Fabric:

a) Edit the following `tsdb` scripts to cover Data Fabric-specific dependencies: `/usr/share/opentsdb/bin/tsdb` and `/usr/bin/tsdb`

```
# Base of Data Fabric installation
BASEMAPR=${MAPR_HOME:-/opt/mapr}

# Add Data Fabric hadoop jars to classpath
if test -d "$BASEMAPR/hadoop/hadoop-0.20.2/lib"; then
# hadoop conf directory to beginning of classpath (for core-site.xml)
CLASSPATH="$BASEMAPR/hadoop/hadoop-0.20.2/conf:$CLASSPATH"

for jar in "$BASEMAPR"/hadoop/hadoop-0.20.2/lib/*.jar; do
  if [ "`echo $jar | grep slf4j`" != "" ]; then
    continue
  fi
  CLASSPATH="$CLASSPATH:$jar"
done
fi
```

b) Replace the `asynchbase` jar file (provide the current jar file name in the `cp` command):

```
cp
/opt/mapr/asynchbase/asynchbase-<version>/
asynchbase-<version>-mapr-*.jar
/usr/share/opentsdb/lib/
rm -f /usr/share/opentsdb/lib/asynchbase-<previous_version>.jar
```

c) Configure the `opentsdb.conf` files: These files must have the following settings:

```
/usr/share/opentsdb/etc/opentsdb/opentsdb.conf
/etc/opentsdb/opentsdb.conf
```

```
tsd.network.port = 4242
tsd.http.staticroot = /usr/share/opentsdb/static/
tsd.core.auto_create_metrics = false (for testing purposes only)
tsd.storage.hbase.data_table = /tsdb
tsd.storage.hbase.uid_table = /tsdb-uid
tsd.storage.hbase.zk_quorum = <zookeeperNode>:<zookeeperP>
```

d) Edit the `<OPENTSDB_ROOT_INSTALL_DIR>/src/create_table.sh` file and add `"/"` before the table names so that Data Fabric recognizes them as HPE Ezmeral Data Fabric Database tables. Then, create tables in HPE Ezmeral Data Fabric Database: .

```
export COMPRESSION=NONE; export HBASE_HOME=/opt/mapr/hbase/
hbase-<version>; /usr/share/opentsdb/tools/create_table.sh
```

See [Example: create\\_table.sh](#) on page 3922

- e) Confirm that the tables are created:

```
hadoop fs -ls /
tr----- 3 root root          2 2014-12-12 01:47 /tsdb
tr----- 3 root root          2 2014-12-12 01:47 /tsdb-meta
tr----- 3 root root          2 2014-12-12 01:47 /tsdb-tree
tr----- 3 root root          2 2014-12-12 01:47 /tsdb-uid
```

3. Start the `tsd` daemon. You can give executable permissions to the `tsdb` script in `/usr/share/opentsdb/bin`, or you can directly use `tsdb` (because of the dependencies you added earlier).

```
chmod +x /usr/share/opentsdb/bin/tsdb
/usr/share/opentsdb/bin/tsdb tsd --port=4242
--staticroot="/usr/share/opentsdb/static/"
--cachedir="/tmp/opentsdb" --auto-metric
```

4. Create a metric: `/usr/share/opentsdb/bin/tsdb mkmetric mymetric.stock`

5. Test the metric:

- a) Run a [Test Program for OpenTSDB](#) on page 3927 that reads from the `tmp_input` on page 3926 file and sends put requests to `opentsdb`, which saves the data to a HPE Ezmeral Data Fabric Database table (`tsdb/tsdb-uid`).
- b) Run aggregation queries (such as SUM) from the command line: `/usr/share/opentsdb/bin/tsdb query 1y-ago sum mymetric.stock` or `tsdb query 1y-ago sum mymetric.stock`
- c) When you run the SUM command, the results should look like the following:

```
====
mymetric.stock 1407165399000 680.500015 {}
mymetric.stock 1407165401000 904.625000 {}
mymetric.stock 1407165402000 904.612495 {}

```

### Test Program for OpenTSDB

```

public static void testTSDBConnection() throws Exception {
    Socket sock = null;
    PrintWriter pw = null;
    String hostname = "10.10.10.220"; //replace with the node where tsd
runs
    int port = 4242; //replace with your port
    sock = new Socket(hostname, port);
    pw = new PrintWriter(sock.getOutputStream(), true);
    File dir = new File(".");
    File fin = new File(dir.getCanonicalPath() + File.separator +
"tmp_input");
    BufferedReader br = new BufferedReader(new FileReader(fin));
    String line = null;
    while ((line = br.readLine()) != null) {
        System.out.println(line);
        pw.println(line);
        pw.flush();
    }
    br.close();
}

```

### GetRequest API

MapR includes an additional constructor for the GetRequest class which takes an extra qualifier.

This additional constructor allows you to use one GetRequest to retrieve the key and value for tables that consist of multiple column families with different qualifiers:

```

public GetRequest(final byte[] table,
                 final byte[] key,
                 final byte[][] families,
                 final byte[][][] qualifiers) {
    super(table, key);
}

```

```

this.families(families);
this.qualifiers(qualifiers);
}

```

## Cascading

Cascading™ is a Java application framework produced by Concurrent, Inc. that enables developers to quickly and easily build rich enterprise-grade Data Processing and Machine Learning applications that can be deployed and managed across private or cloud-based Hadoop clusters.

 **NOTE:** Cascading is *not* part of the HPE Ezmeral Data Fabric distribution and not supported by HPE. However, like many other open source technologies, it can be used with HPE Ezmeral Data Fabric. The following information provides relevant details about using Cascading with HPE Ezmeral Data Fabric.

The `mt` command is the wrapper around Cascading. Multitool, a command line tool for processing large text files and datasets (like `sed` and `grep` on unix). The `mt` command is located in the `/opt/mapr/contrib/multitool/bin` directory.

### Related Links

For information about working with Cascading, see:

- [Cascading project at Concurrent, Inc.](#)
- [Forum posts related to Cascading](#)
- [Search HPE Blog for Cascading topics](#)

## Apache Drill

Drill is a low-latency distributed query engine for large-scale datasets, including structured and semi-structured/nested data. Inspired by Google's Dremel, Drill is designed to scale to several thousands of nodes and query petabytes of data at interactive speeds that BI/Analytics environments require.

Drill includes a distributed environment, purpose built for large-scale data processing. At the core of Drill is the "Drillbit" service which is responsible for accepting requests from the client, processing the queries, and returning results to the client.

## Installing Drill

You can install Drill on one node or multiple nodes in a cluster. When Drill runs on each data node in a cluster, Drill can maximize data locality without moving data over the network or between nodes. Drill uses ZooKeeper to maintain cluster membership and health check information.

See [Installing Drill](#) on page 228 for instructions and additional information.

## Configuring Data Source Connections

Drill connects to data sources through storage plugins. Drill can connect to several types of data sources including databases, local or distributed filesystems, and Hive metastores.

See [Connecting Drill to Data Sources](#) on page 4001 and [Connect a Data Source](#) for instructions and additional information.

## Accessing Drill

After you install Drill and configure connections to your data sources, you can access Drill from any of the following user interfaces:

- [Drill shell \(SQLLine\)](#)
- [Drill Web Console](#)
- [ODBC](#)
- [JDBC](#)
- C++ API
- [REST API](#)

## Additional Resources

Drill documentation is accessible from following the locations:

- [Drill Release Notes](#) on page 5886
- [Apache Drill](#)

## Drill Tutorial

Drill is included as part of the Hadoop distribution. Refer to the [Drill web site](#) and [Drill documentation](#) for more details.

Hadoop is not a prerequisite for Drill and users can start learning Drill by running SQL queries directly on the local filesystem.

## Getting to Know the Drill Setup

This section describes the configuration of the Drill system that you have installed and introduces the overall use case for the tutorial.

### *Storage Plugins Overview*

The Hadoop cluster is set up with file system, HPE Ezmeral Data Fabric Database, and Hive, which all serve as data sources for Drill in this tutorial. Before you can run queries against these data sources, you need to connect to the data source through an interface called a storage plugin. A storage plugin defines interfaces to read/write and get metadata from the data source. Each storage plugin also exposes optimization rules for Drill to leverage for efficient query execution.

Jump directly to the queries in [Lesson 1: Learn About the Data Set](#), or first, get some important background information about pre-configured storage plugins by following these steps:

1. [Start the Drill Web Console.](#)
2. Go to the Storage tab.
3. Open the configured storage plugins one at a time by clicking Update. You will see the following plugins configured.

### dfs

This is a storage plugin configuration for the file system. The connection attribute indicates the type of distributed filesystem: in this case, file system. Drill can work with any distributed system, including HDFS, S3, and so on.

The configuration also includes a set of workspaces; each one represents a location in file system:

- root: access to the root filesystem location
- clicks: access to nested JSON log data
- logs: access to flat (non-nested) JSON log data in the logs directory and its subdirectories
- views: a workspace for creating views

A workspace in Drill is a location where users can easily access a specific set of data and collaborate with each other by sharing artifacts. Users can create as many workspaces as they need within Drill.

Each workspace can also be configured as “writable” or not, which indicates whether users can write data to this location and defines the storage format in which the data will be written (parquet, csv, json). These attributes become relevant when you explore Drill SQL commands, especially CREATE TABLE AS (CTAS) and CREATE VIEW.

Drill can query files and directories directly and can detect the file formats based on the file extension or the first few bits of data within the file. However, additional information around formats is required for Drill, such as delimiters for text files, which are specified in the “formats” section as follows.

```
{
  "type": "file",
  "enabled": true,
  "connection": "maprfs://",
  "workspaces": {
    "root": {
      "location": "/mapr/demo.mapr.com/data",
      "writable": false,
      "storageformat": null
    },
    "clicks": {
      "location": "/mapr/demo.mapr.com/data/nested",
      "writable": true,
      "storageformat": "parquet"
    },
    "logs": {
      "location": "/mapr/demo.mapr.com/data/flat",
      "writable": true,
      "storageformat": "parquet"
    },
    "views": {
      "location": "/mapr/demo.mapr.com/data/views",
      "writable": true,
      "storageformat": "parquet"
    }
  },
  "formats": {
    "psv": {
      "type": "text",
```

```

    "extensions": [
      "tbl"
    ],
    "delimiter": "|",
  },
  "csv": {
    "type": "text",
    "extensions": [
      "csv"
    ],
    "delimiter": ",",
  },
  "tsv": {
    "type": "text",
    "extensions": [
      "tsv"
    ],
    "delimiter": "\t"
  },
  "parquet": {
    "type": "parquet"
  },
  "json": {
    "type": "json"
  }
}

```

## hive

A storage plugin configuration for a Hive data warehouse. Drill connects to the Hive metastore by using the configured metastore thrift URI. Metadata for Hive tables is automatically available for users to query.

```

{
  "type": "hive",
  "enabled": true,
  "configProps": {
    "hive.metastore.uris": "thrift://localhost:9083",
    "hive.metastore.sasl.enabled": "false"
  }
}

```

### *Client Application Interfaces*

Drill also provides additional application interfaces for the client tools to connect and access from Drill. The interfaces include the following.

#### **ODBC/JDBC drivers**

Drill provides ODBC/JDBC drivers to connect from BI tools such as Tableau, MicroStrategy, SQUIRREL, and Jaspersoft; refer to [Drill Interfaces Introduction](#) to learn more.

#### **SQLLine**

SQLLine is a JDBC application that comes packaged with Drill. In order to start working with it, you can use the command line on the demo cluster to log in as root, then enter `sqlline`. Use `mapr` as the login password. For example:

```

$ ssh root@localhost -p 2222
Password:
Last login: Mon Sep 15 13:46:08 2014 from 10.250.0.28

```

```
Welcome to your Mapr Demo virtual machine.
[root@maprdemo ~]# sqlline
sqlline version 1.1.6
0: jdbc:drill:>
```

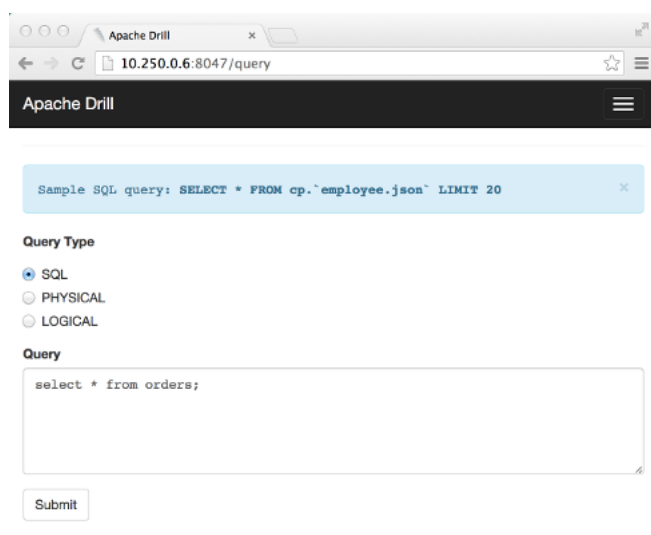

## Drill Web UI

The Drill Web UI is a simple user interface for configuring and manage Drill. This UI can be launched from any of the nodes in the Drill cluster. The configuration for Drill includes setting up storage plugins that represent the data sources on which Drill performs queries. .

Users and developers can get the necessary information for tuning and performing diagnostics on queries, such as the list of queries executed in a session and detailed query plan profiles for each.

Detailed configuration and management of Drill is out of scope for this tutorial.

The following Web Console for Drill also provides a query UI where users can submit queries to Drill and observe results.

## What's Next

Start running queries by going to [Lesson 1: Learn About the Data Set](#).

### Lesson 1: Learn About the Data Set

#### Goal

This lesson is simply about discovering what data is available, in what format, using simple SQL SELECT statements. Drill is capable of analyzing data without prior knowledge or definition of its schema. This means that you can start querying data immediately (and even as it changes), regardless of its format.

The data set for the tutorial consists of:

- Transactional data: stored as a Hive table
- Product catalog and primary customer data: stored as HPE Ezmeral Data Fabric Database binary tables
- Clickstream and logs data: stored in the file system as JSON files

#### Queries in This Lesson

This lesson consists of select \* queries on each data source.

## Before You Begin

### Start sqlline

If sqlline is not already started, use a Terminal or Command window to log into the demo VM as root, then enter sqlline:

```
$ ssh root@10.250.0.6
Password:
Last login: Mon Sep 15 13:46:08 2014 from 10.250.0.28
Welcome to your Mapr Demo virtual machine.
[root@maprdemo ~]# sqlline
sqlline version 1.1.6
0: jdbc:drill:>
```

You can run queries from this prompt to complete the tutorial. To exit from sqlline, type:

```
0: jdbc:drill:> !quit
```

Note that though this tutorial demonstrates the queries using SQLLine, you can also execute queries using the Drill Web UI.

### Enable the DECIMAL Data Type

This tutorial uses the DECIMAL data type in some examples. The DECIMAL data type is disabled by default in this release, so enable the DECIMAL data type before proceeding:

```
alter session set `planner.enable_decimal_data_type`=true;
```

```
+-----+-----+
| ok      | summary |
+-----+-----+
| true    | planner.enable_decimal_data_type updated. |
+-----+-----+
1 row selected
```

### List the available workspaces and databases:

```
0: jdbc:drill:> show databases;
+-----+
| SCHEMA_NAME |
+-----+
| hive.default |
| dfs.default  |
| dfs.logs     |
| dfs.root     |
| dfs.views    |
| dfs.clicks   |
| dfs.data     |
| dfs.tmp      |
| sys          |
| maprdb       |
| cp.default   |
| INFORMATION_SCHEMA |
+-----+
12 rows selected
```

Note that this command exposes all the metadata available from the storage plugins configured with Drill as a set of schemas. This includes the Hive and HPE Ezmeral Data Fabric Database databases as well as the workspaces configured in the file system. As you run queries in the tutorial, you will switch among

these schemas by submitting the USE command. This behavior resembles the ability to use different database schemas (namespaces) in a relational database system.

### Query Hive Tables

The orders table is a six-column Hive table defined in the Hive metastore. This is a Hive external table pointing to the data stored in flat files on the file system. The orders table contains 122,000 rows.

#### Set the schema to hive:

```
0: jdbc:drill:> use hive;
+-----+
| ok | summary |
+-----+
| true | Default schema changed to 'hive' |
+-----+
```

You will run the USE command throughout this tutorial. The USE command sets the schema for the current session.

#### Describe the table:

You can use the DESCRIBE command to show the columns and data types for a Hive table:

```
0: jdbc:drill:> describe orders;
+-----+-----+-----+
| COLUMN_NAME | DATA_TYPE | IS_NULLABLE |
+-----+-----+-----+
| order_id    | BIGINT    | YES         |
| month       | VARCHAR   | YES         |
| cust_id     | BIGINT    | YES         |
| state       | VARCHAR   | YES         |
| prod_id     | BIGINT    | YES         |
| order_total | INTEGER   | YES         |
+-----+-----+-----+
```

The DESCRIBE command returns complete schema information for Hive tables based on the metadata available in the Hive metastore.

#### Select 5 rows from the orders table:

```
0: jdbc:drill:> select * from orders limit 5;
+-----+-----+-----+-----+-----+-----+
| order_id | month | cust_id | state | prod_id | order_total |
+-----+-----+-----+-----+-----+-----+
| 67212    | June  | 10001   | ca    | 909     | 13          |
| 70302    | June  | 10004   | ga    | 420     | 11          |
| 69090    | June  | 10011   | fl    | 44      | 76          |
| 68834    | June  | 10012   | ar    | 0       | 81          |
| 71220    | June  | 10018   | az    | 411     | 24          |
+-----+-----+-----+-----+-----+-----+
```

Because orders is a Hive table, you can query the data in the same way that you would query the columns in a relational database table. Note the use of the standard LIMIT clause, which limits the result set to the specified number of rows. You can use LIMIT with or without an ORDER BY clause.

Drill provides seamless integration with Hive by allowing queries on Hive tables defined in the metastore with no extra configuration. Note that Hive is not a prerequisite for Drill, but simply serves as a storage

plugin or data source for Drill. Drill also lets users query all Hive file formats (including custom serdes). Additionally, any UDFs defined in Hive can be leveraged as part of Drill queries.

Because Drill has its own low-latency SQL query execution engine, you can query Hive tables with high performance and support for interactive and ad-hoc data exploration.

### Query HPE Ezmeral Data Fabric Database Binary Tables

The customers and products tables are HPE Ezmeral Data Fabric Database binary tables. HPE Ezmeral Data Fabric Database is an enterprise in-Hadoop NoSQL database. It exposes the HBase API to support application development. Every HPE Ezmeral Data Fabric Database binary table has a `row_key`, in addition to one or more column families. Each column family contains one or more specific columns. The `row_key` value is a primary key that uniquely identifies each row.

Drill allows direct queries on HPE Ezmeral Data Fabric Database binary tables. Unlike other SQL on Hadoop options, Drill requires no overlay schema definitions in Hive to work with this data. Think about a HPE Ezmeral Data Fabric Database table with thousands of columns, such as a time-series database, and the pain of having to management duplicate schemas for it in Hive!

#### Products Table

The products table has two column families.

Column Family	Columns
details	name category
pricing	price

The products table contains 965 rows.

#### Customers Table

The Customers table has three column families.

Column Family	Columns
address	state
loyalty	agg_rev membership
personal	age gender

The customers table contains 993 rows.

#### Set the workspace to maprdb:

```
0: jdbc:drill:> use maprdb;
+-----+-----+
| ok | summary |
+-----+-----+
| true | Default schema changed to 'maprdb' |
+-----+-----+
```

**Describe the tables:**

```

0: jdbc:drill:> describe customers;
+-----+-----+-----+
| COLUMN_NAME | DATA_TYPE | IS_NULLABLE |
+-----+-----+-----+
| row_key     | ANY        | NO          |
| address     | (VARCHAR(1), ANY) MAP | NO          |
| loyalty     | (VARCHAR(1), ANY) MAP | NO          |
| personal    | (VARCHAR(1), ANY) MAP | NO          |
+-----+-----+-----+

0: jdbc:drill:> describe products;
+-----+-----+-----+
| COLUMN_NAME | DATA_TYPE | IS_NULLABLE |
+-----+-----+-----+
| row_key     | ANY        | NO          |
| details     | (VARCHAR(1), ANY) MAP | NO          |
| pricing     | (VARCHAR(1), ANY) MAP | NO          |
+-----+-----+-----+

```

Unlike the Hive example, the DESCRIBE command does not return the full schema up to the column level. Column-oriented NoSQL databases such as HPE Ezmeral Data Fabric Database can be schema-less by design; every row has its own set of column name-value pairs in a given column family, and the column value can be of any data type, as determined by the application inserting the data.

A “MAP” complex type in Drill represents this variable column name-value structure, and “ANY” represents the fact that the column value can be of any data type. Observe the row\_key, which is also simply bytes and has the type ANY.

**Select 5 rows from the products table:**

```

0: jdbc:drill:> select * from products limit 5;
+-----+-----+-----+
| row_key | details | pricing |
+-----+-----+-----+
| [B@ala3e25 | {"category": "bGFwdG9w", "name": "I1Nvbnkgbm90ZWJvb2si"} |
| {"price": "OTU5"} |
| [B@103a43af |
| {"category": "RW52ZWxvcGVz", "name": "IzEwLTQgMS84IHggOSAxLzIgUHJlbW11bSBEaWFnb |
| 25hbCBTZWFtIEVudmVsb3Blcw==" } | {"price": "MT |
| [B@61319e7b |
| {"category": "U3RvcnFmZSAmIE9yZ2FuaXphdGlvbG==" , "name": "MjQgQ2FwYWNPdHkgTWF4a |
| SBeyXRhIEJpbmRlciBSYWNRclBlYXJs"} | {"price" |
| [B@9bcf17 | {"category": "TGFiZWxz", "name": "QXZlcnkgNDk4"} |
| {"price": "Mw==" } |
| [B@7538ef50 | {"category": "TGFiZWxz", "name": "QXZlcnkgNDk=" } |
| {"price": "Mw==" } |

```

Given that Drill requires no up front schema definitions indicating data types, the query returns the raw byte arrays for column values, just as they are stored in HPE Ezmeral Data Fabric Database. Observe that the column families (details and pricing) have the map data type and appear as JSON strings.

In Lesson 2, you will use CAST functions to return typed data for each column.

**Select 5 rows from the customers table:**

```

0: jdbc:drill:> select * from customers limit 5;
+-----+-----+-----+
| row_key | address | loyalty | personal |
+-----+-----+-----+

```

```

| [B@284bae62 | {"state": "Imt5Ig==" } |
{"agg_rev": "IjEwMDEtMzAwMCI=", "membership": "ImJhc2ljIg==" } |
{"age": "IjI2LTMlIg==" , "gender": "Ik1B |
| [B@7ffa4523 | {"state": "ImNhIg==" }
| {"agg_rev": "IjAtMTAwIg==" , "membership": "ImdvdGQi" } |
{"age": "IjI2LTMlIg==" , "gender": "IkZFTUFMRSI= |
| [B@7d13e79 | {"state": "Im9rIg==" } |
{"agg_rev": "IjUwMS0xMDAwIg==" , "membership": "InNpbHZlciI=" } |
{"age": "IjI2LTMlIg==" , "gender": "IkZFT |
| [B@3a5c7df1 | {"state": "ImtzIg==" } |
{"agg_rev": "IjMwMDEtMTAwMDAwIg==" , "membership": "ImdvdGQi" } |
{"age": "IjUxLTEwMCI=" , "gender": "IkZF |
| [B@e507726 | {"state": "Im5qIg==" }
| {"agg_rev": "IjAtMTAwIg==" , "membership": "ImJhc2ljIg==" } |
{"age": "IjIxLTI1Ig==" , "gender": "Ik1BTEUi" |
+-----+-----+-----+-----+

```

Again the table returns byte data that needs to be cast to readable data types.

### Query the File System

Along with querying a data source with full schemas (such as Hive) and partial schemas (such as HPE Ezmeral Data Fabric Database), Drill offers the unique capability to perform SQL queries directly on file system. The file system could be a local file system, or a distributed file system such as file system, HDFS, or S3.

In the context of Drill, a file or a directory is considered as synonymous to a relational database “table.” Therefore, you can perform SQL operations directly on files and directories without the need for up-front schema definitions or schema management for any model changes. The schema is discovered on the fly based on the query. Drill supports queries on a variety of file formats including text, CSV, Parquet, and JSON in the 0.5 release.

In this example, the clickstream data coming from the mobile/web applications is in JSON format. The JSON files have the following structure:

```

{"trans_id":31920,"date":"2014-04-26","time":"12:17:12","user_info":
{"cust_id":22526,"device":"IOS5","state":"il"},"trans_info":{"prod_id":
[174,2],"purch_flag":"false"}}
{"trans_id":31026,"date":"2014-04-20","time":"13:50:29","user_info":
{"cust_id":16368,"device":"AOS4.2","state":"nc"},"trans_info":{"prod_id":
[],"purch_flag":"false"}}
{"trans_id":33848,"date":"2014-04-10","time":"04:44:42","user_info":
{"cust_id":21449,"device":"IOS6","state":"oh"},"trans_info":{"prod_id":
[582],"purch_flag":"false"}}

```

The clicks.json and clicks.campaign.json files contain metadata as part of the data itself (referred to as “self-describing” data). Also note that the data elements are complex, or nested. The initial queries below do not show how to unpack the nested data, but they show that easy access to the data requires no setup beyond the definition of a workspace.

### Query nested clickstream data

#### Set the workspace to dfs.clicks:

```

0: jdbc:drill:> use dfs.clicks;
+-----+-----+
| ok | summary |
+-----+-----+
| true | Default schema changed to 'dfs.clicks' |
+-----+-----+

```

In this case, setting the workspace is a mechanism for making queries easier to write. When you specify a file system workspace, you can shorten references to files in the FROM clause of your queries. Instead of having to provide the complete path to a file, you can provide the path relative to a directory location specified in the workspace. For example:

```
"location": "/mapr/demo.mapr.com/data/nested"
```

Any file or directory that you want to query in this path can be referenced relative to this path. The clicks directory referred to in the following query is directly below the nested directory.

#### Select 2 rows from the clicks.json file:

```
0: jdbc:drill:> select * from `clicks/clicks.json` limit 2;
+-----+-----+-----+-----+-----+
| trans_id | date       | time       | user_info | trans_info |
+-----+-----+-----+-----+-----+
| 31920    | 2014-04-26 | 12:17:12   |           |             |
| {"cust_id":22526,"device":"IOS5","state":"il"} | {"prod_id": |
| [174,2],"purch_flag":"false"} |             |
| 31026    | 2014-04-20 | 13:50:29   |           |             |
| {"cust_id":16368,"device":"AOS4.2","state":"nc"} | {"prod_id": |
| [],"purch_flag":"false"} |             |
+-----+-----+-----+-----+-----+
2 rows selected
```

Note that the FROM clause reference points to a specific file. Drill expands the traditional concept of a “table reference” in a standard SQL FROM clause to refer to a file in a local or distributed file system.

The only special requirement is the use of back ticks to enclose the file path. This is necessary whenever the file path contains Drill reserved words or characters.

#### Select 2 rows from the campaign.json file:

```
0: jdbc:drill:> select * from `clicks/clicks.campaign.json` limit 2;
+-----+-----+-----+-----+-----+-----+
| trans_id | date       | time       | user_info | ad_info     |
| trans_info |
+-----+-----+-----+-----+-----+-----+
| 35232    | 2014-05-10 | 00:13:03   |           |             |
| {"cust_id":18520,"device":"AOS4.3","state":"tx"} | {"camp_id":"null"} |
| {"prod_id":[7,7],"purch_flag":"true"} |             |
| 31995    | 2014-05-22 | 16:06:38   |           |             |
| {"cust_id":17182,"device":"IOS6","state":"fl"} | {"camp_id":"null"} |
| {"prod_id":[],"purch_flag":"false"} |             |
+-----+-----+-----+-----+-----+-----+
2 rows selected
```

Notice that with a select \* query, any complex data types such as maps and arrays return as JSON strings. You will see how to unpack this data using various SQL functions and operators in the next lesson.

#### Query Logs Data

Unlike the previous example where we performed queries against clicks data in one file, logs data is stored as partitioned directories on the file system. The logs directory has three subdirectories:

- 2012

- 2013
- 2014

Each of these year directories fans out to a set of numbered month directories, and each month directory contains a JSON file with log records for that month. The total number of records in all log files is 48000.

The files in the logs directory and its subdirectories are JSON files. There are many of these files, but you can use Drill to query them all as a single data source, or to query a subset of the files.

### Set the workspace to dfs.logs:

```
0: jdbc:drill:> use dfs.logs;
+-----+
| ok | summary |
+-----+
| true | Default schema changed to 'dfs.logs' |
+-----+
```

### Select 2 rows from the logs directory:

```
0: jdbc:drill:> select * from logs limit 2;
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| dir0 | dir1 | trans_id | date | time | cust_id | device | state | camp_id |
| keywords | prod_id | purch_fl |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 2014 | 8 | 24181 | 08/02/2014 | 09:23:52 | 0 | IOS5 | il | 2 | wait | 128 |
| false |
| 2014 | 8 | 24195 | 08/02/2014 | 07:58:19 | 243 | IOS5 | mo | 6 | hmm |
107 | false |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
```

Note that this is flat JSON data. The dfs.clicks workspace location property points to a directory that contains the logs directory, making the FROM clause reference for this query very simple. You do not have to refer to the complete directory path on the file system.

The column names dir0 and dir1 are special Drill variables that identify subdirectories below the logs directory. In Lesson 3, you will do more complex queries that leverage these dynamic variables.

### Find the total number of rows in the logs directory (all files):

```
0: jdbc:drill:> select count(*) from logs;
+-----+
| EXPR$0 |
+-----+
| 48000 |
+-----+
```

This query traverses all of the files in the logs directory and its subdirectories to return the total number of rows in those files.

### What's Next

Go to Lesson 2: [Run Queries with ANSI SQL](#).

## Lesson 2: Run Queries with ANSI SQL

### Goal

This lesson shows how to do some standard SQL analysis in Drill: for example, summarizing data by using simple aggregate functions and connecting data sources by using joins. Note that Drill provides ANSI SQL support, not a “SQL-like” interface.

### Queries in This Lesson

Now that you know what the data sources look like in their raw form, using select \* queries, try running some simple but more useful queries on each data source. These queries demonstrate how Drill supports ANSI SQL constructs and also how you can combine data from different data sources in a single SELECT statement.

- Show an aggregate query on a single file or table. Use GROUP BY, WHERE, HAVING, and ORDER BY clauses.
- Perform joins between Hive, HPE Ezmeral Data Fabric Database, and filesystem data sources.
- Use table and column aliases.
- Create a Drill view.

### Aggregation

#### Set the schema to hive:

```
0: jdbc:drill:> use hive;
+-----+-----+
|      ok      | summary |
+-----+-----+
| true         | Default schema changed to 'hive' |
+-----+-----+
1 row selected
```

#### Return sales totals by month:

```
0: jdbc:drill:> select `month`, sum(order_total)
from orders group by `month` order by 2 desc;
+-----+-----+
| month | EXPR$1 |
+-----+-----+
| June  | 950481 |
| May   | 947796 |
| March | 836809 |
| April | 807291 |
| July  | 757395 |
| October | 676236 |
| August | 572269 |
| February | 532901 |
| September | 373100 |
| January | 346536 |
+-----+-----+
```

Drill supports SQL aggregate functions such as SUM, MAX, AVG, and MIN. Standard SQL clauses work in the same way in Drill queries as in relational database queries.

Note that back ticks are required for the “month” column only because “month” is a reserved word in SQL.

**Return the top 20 sales totals by month and state:**

```
0: jdbc:drill:> select `month`, state, sum(order_total) as sales from
orders group by `month`, state
order by 3 desc limit 20;
```

month	state	sales
May	ca	119586
June	ca	116322
April	ca	101363
March	ca	99540
July	ca	90285
October	ca	80090
June	tx	78363
May	tx	77247
March	tx	73815
August	ca	71255
April	tx	68385
July	tx	63858
February	ca	63527
June	fl	62199
June	ny	62052
May	fl	61651
May	ny	59369
October	tx	55076
March	fl	54867
March	ny	52101

```
20 rows selected
```

Note the alias for the result of the SUM function. Drill supports column aliases and table aliases.

**HAVING Clause**

This query uses the HAVING clause to constrain an aggregate result.

**Set the workspace to dfs.clicks**

```
0: jdbc:drill:> use dfs.clicks;
+-----+
|      ok      | summary |
+-----+
| true         | Default schema changed to 'dfs.clicks' |
+-----+
1 row selected
```

**Return total number of clicks for devices that indicate high click-throughs:**

```
0: jdbc:drill:> select t.user_info.device, count(*) from `clicks/
clicks.json` t
group by t.user_info.device
having count(*) > 1000;
```

EXPR\$0	EXPR\$1
IOS5	11814
AOS4.2	5986
IOS6	4464
IOS7	3135
AOS4.4	1562

AOS4.3	3039
--------	------

The aggregate is a count of the records for each different mobile device in the clickstream data. Only the activity for the devices that registered more than 1000 transactions qualify for the result set.

## UNION Operator

Use the same workspace as before (dfs.clicks).

### Combine clicks activity from before and after the marketing campaign

```
0: jdbc:drill:> select t.trans_id transaction, t.user_info.cust_id customer
from `clicks/clicks.campaign.json` t
union all
select u.trans_id, u.user_info.cust_id from `clicks/clicks.json` u limit 5;
```

transaction	customer
35232	18520
31995	17182
35760	18228
37090	17015
37838	18737

This UNION ALL query returns rows that exist in two files (and includes any duplicate rows from those files): `clicks.campaign.json` and `clicks.json`.

## Subqueries

### Set the workspace to hive:

```
0: jdbc:drill:> use hive;
```

ok	summary
----	---------

```
| true          | Default schema changed to 'hive' |
```

### Compare order totals across states:

```
0: jdbc:drill:> select ny_sales.cust_id, ny_sales.total_orders,
ca_sales.total_orders
from
(select o.cust_id, sum(o.order_total) as total_orders
from hive.orders o where state = 'ny' group by o.cust_id) ny_sales
left outer join
(select o.cust_id, sum(o.order_total) as total_orders
from
hive.orders o where state = 'ca' group by o.cust_id) ca_sales
on ny_sales.cust_id = ca_sales.cust_id
order by ny_sales.cust_id
limit 20;
```

cust_id	ny_sales	ca_sales
1001	72	47
1002	108	198

1003	83	null
1004	86	210
1005	168	153
1006	29	326
1008	105	168
1009	443	127
1010	75	18
1012	110	null
1013	19	null
1014	106	162
1015	220	153
1016	85	159
1017	82	56
1019	37	196
1020	193	165
1022	124	null
1023	166	149
1024	233	null

This example demonstrates Drill support for correlated subqueries. This query uses a subquery in the select list and correlates the result of the subquery with the outer query, using the `cust_id` column reference. The subquery returns the sum of order totals for California, and the outer query returns the equivalent sum, for the same `cust_id`, for New York.

The result set is sorted by the `cust_id` and presents the sales totals side by side for easy comparison. Null values indicate customer IDs that did not register any sales in that state.

## CAST Function

### Use the maprdb workspace:

```
0: jdbc:drill:> use maprdb;
+-----+-----+
|      ok      | summary |
+-----+-----+
| true         | Default schema changed to 'maprdb' |
+-----+-----+
1 row selected
```

### Return customer data with appropriate data types

```
0: jdbc:drill:> select cast(row_key as int) as cust_id,
cast(t.personal.name as varchar(20)) as name,
cast(t.personal.gender as varchar(10)) as gender, cast(t.personal.age as
varchar(10)) as age,
cast(t.address.state as varchar(4)) as state, cast(t.loyalty.agg_rev as
dec(7,2)) as agg_rev,
cast(t.loyalty.membership as varchar(20)) as membership
from customers t limit 5;
```

```
+-----+-----+-----+-----+-----+-----+
|  cust_id  |  name  |  gender  |  age  |  state  |
+-----+-----+-----+-----+-----+
| 10001    | "Corrine Mecham" | "FEMALE" | "15-20" | "va"    |
| 197.00   | "silver" |          |          |          |
| 10005    | "Brittany Park" | "MALE"   | "26-35" | "in"    |
| 230.00   | "silver" |          |          |          |
| 10006    | "Rose Lokey" | "MALE"   | "26-35" | "ca"    |
```

```

250.00 | "silver" |
| 10007 | "James Fowler" | "FEMALE" | "51-100" | "me" |
263.00 | "silver" |
| 10010 | "Guillermo Koehler" | "OTHER" | "51-100" | "mn" |
202.00 | "silver" |
+-----+-----+-----+-----+-----+-----+
5 rows selected

```

Note the following features of this query:

- The CAST function is required for every column in the table. This function returns the HPE Ezmeral Data Fabric Database/HBase binary data as readable integers and strings. Depending on what encoding is used while populating the HPE Ezmeral Data Fabric Database binary tables/HBase tables, you might have to use CONVERT\_TO/CONVERT\_FROM functions to decode them.
- The row\_key column functions as the primary key of the table (a customer ID in this case).
- The table alias t is required; otherwise the column family names would be parsed as table names and the query would return an error.

### Remove the quotes from the strings:

You can use the regexp\_replace function to remove the quotes around the strings in the query results. For example, to return a state name va instead of "va":

```

0: jdbc:drill:> select cast(row_key as int),
regexp_replace(cast(t.address.state as varchar(10)),'"', '')
from customers t limit 1;
+-----+-----+
|  EXPR$0  |  EXPR$1  |
+-----+-----+
| 10001    | va       |
+-----+-----+
1 row selected

```

### CREATE VIEW Command

#### Use a mutable workspace:

```

0: jdbc:drill:> use dfs.views;
+-----+-----+
| ok | summary |
+-----+-----+
| true | Default schema changed to 'dfs.views' |
+-----+-----+

```

A mutable (or writable) workspace is a workspace that is enabled for “write” operations. This attribute is part of the storage plugin configuration. You can create Drill views and tables in mutable workspaces.

#### Create a view on a HPE Ezmeral Data Fabric Database binary table

```

0: jdbc:drill:> create or replace view custview as select cast(row_key as
int) as cust_id,
cast(t.personal.name as varchar(20)) as name,
cast(t.personal.gender as varchar(10)) as gender,
cast(t.personal.age as varchar(10)) as age,
cast(t.address.state as varchar(4)) as state,
cast(t.loyalty.agg_rev as dec(7,2)) as agg_rev,
cast(t.loyalty.membership as varchar(20)) as membership

```

```

from maprdb.customers t;
+-----+-----+
|      ok      |  summary  |
+-----+-----+
| true         | View 'custview' replaced successfully in 'dfs.views' schema |
+-----+-----+
1 row selected

```

Drill provides CREATE OR REPLACE VIEW syntax similar to relational databases to create views. Use the OR REPLACE option to make it easier to update the view later without having to remove it first. Note that the FROM clause in this example must refer to maprdb.customers. The HPE Ezmeral Data Fabric Database binary tables are not directly visible to the dfs.views workspace.

Unlike a traditional database where views typically are DBA/developer-driven operations, filesystem-based views in Drill are very lightweight. A view is simply a special file with a specific extension (.drill). You can store views even in your local filesystem or point to a specific workspace. You can specify any query against any Drill data source in the body of the CREATE VIEW statement.

Drill provides a decentralized metadata model. Drill is able to query metadata defined in data sources such as Hive, HBase, and the filesystem. Drill also supports the creation of metadata in the filesystem.

### Query data from the view:

```

0: jdbc:drill:> select * from custview limit 1;
+-----+-----+-----+-----+-----+-----+
|  cust_id  |  name  |  gender  |  age  |  state  |
+-----+-----+-----+-----+-----+-----+
| 10001     | "Corrine Mecham" | "FEMALE" | "15-20" | "va"    |
+-----+-----+-----+-----+-----+-----+
197.00     | "silver" |
+-----+-----+-----+-----+-----+-----+

```

Once the users know what data is available by exploring it directly from the file system, views can be used as a way to read the data into downstream tools such as Tableau and MicroStrategy for analysis and visualization. For these tools, a view appears simply as a “table” with selectable “columns” in it.

### Query Across Data Sources

Continue using dfs.views for this query.

### Join the customers view and the orders table:

```

0: jdbc:drill:> select membership, sum(order_total) as sales from
hive.orders, custview
where orders.cust_id=custview.cust_id
group by membership order by 2;
+-----+-----+
| membership |  sales  |
+-----+-----+
| "basic"    | 380665  |
| "silver"   | 708438  |
| "gold"     | 2787682 |
+-----+-----+
3 rows selected

```

In this query, we are reading data from a HPE Ezmeral Data Fabric Database binary table (represented by custview) and combining it with the order information in Hive. When doing cross data source queries such as this, you need to use fully qualified table/view names. For example, the orders table is prefixed by “hive,”

which is the storage plugin name registered with Drill. We are not using any prefix for “custview” because we explicitly switched the dfs.views workspace where custview is stored.

**NOTE:** Note: If the results of any of your queries appear to be truncated because the rows are wide, set the maximum width of the display to 10000:

```
0: jdbc:drill:> !set maxwidth 10000
```

Do not use a semicolon for this SET command.

### Join the customers, orders, and clickstream data:

```
0: jdbc:drill:> select custview.membership, sum(orders.order_total) as
sales from hive.orders, custview,
dfs.`/mapr/demo.mapr.com/data/nested/clicks/clicks.json` c
where orders.cust_id=custview.cust_id and
orders.cust_id=c.user_info.cust_id
group by custview.membership order by 2;
+-----+-----+
| membership | sales |
+-----+-----+
| "basic"    | 372866 |
| "silver"   | 728424 |
| "gold"     | 7050198 |
+-----+-----+
3 rows selected
```

This three-way join selects from three different data sources in one query:

- hive.orders table
- custview (a view of the HBase customers table)
- clicks.json file

The join column for both sets of join conditions is the cust\_id column. The views workspace is used for this query so that custview can be accessed. The hive.orders table is also visible to the query.

However, note that the JSON file is not directly visible from the views workspace, so the query specifies the full path to the file:

```
dfs.`/mapr/demo.mapr.com/data/nested/clicks/clicks.json`
```

### What's Next

Go to Lesson 3: [Run Queries on Complex Data Types](#)

### Lesson 3: Run Queries on Complex Data Types

#### Goal

This lesson focuses on queries that exercise functions and operators on self-describing data and complex data types. Drill offers intuitive SQL extensions to work with such data and offers high query performance with an architecture built from the ground up for complex data.

#### Queries in This Lesson

Now that you have run ANSI SQL queries against different tables and files with relational data, you can try some examples including complex types.

- Access directories and subdirectories of files in a single SELECT statement.
- Demonstrate simple ways to access complex data in JSON files.
- Demonstrate the `repeated_count` function to aggregate values in an array.

### Query Partitioned Directories

You can use special variables in Drill to refer to subdirectories in your workspace path:

- `dir0`
- `dir1`
- ...

Note that these variables are dynamically determined based on the partitioning of the file system. No up-front definitions are required on what partitions exist.

### Set workspace to `dfs.logs`

```
0: jdbc:drill:> use dfs.logs;
+-----+-----+
| ok | summary |
+-----+-----+
| true | Default schema changed to 'dfs.logs' |
+-----+-----+
```

### Query logs data for a specific year

```
0: jdbc:drill:> select * from logs where dir0='2013' limit 10;
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| dir0 | dir1 | trans_id | date | time | cust_id | device | state | camp_id |
| keywords | prod_id | purch_flag |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 2013 | 11 | 12119 | 11/09/2013 | 02:24:51 | 262 | IOS5 | ny | 0 | chamber |
| 198 | false |
| 2013 | 11 | 12120 | 11/19/2013 | 09:37:43 | 0 | AOS4.4 | il | 2 | outside |
| 511 | false |
| 2013 | 11 | 12134 | 11/10/2013 | 23:42:47 | 60343 | IOS5 | ma | 4 | and |
| 421 | false |
| 2013 | 11 | 12135 | 11/16/2013 | 01:42:13 | 46762 | AOS4.3 | ca | 4 |
| here's | 349 | false |
| 2013 | 11 | 12165 | 11/26/2013 | 21:58:09 | 41987 | AOS4.2 | mn | 4 | he |
| 271 | false |
| 2013 | 11 | 12168 | 11/09/2013 | 23:41:48 | 8600 | IOS5 | in | 6 | i |
| 459 | false |
| 2013 | 11 | 12196 | 11/20/2013 | 02:23:06 | 15603 | IOS5 | tn | 1 | like |
| 324 | false |
| 2013 | 11 | 12203 | 11/25/2013 | 23:50:29 | 221 | IOS6 | tx | 10 | if |
| 323 | false |
| 2013 | 11 | 12206 | 11/09/2013 | 23:53:01 | 2488 | AOS4.2 | tx | 14 |
| unlike | 296 | false |
| 2013 | 11 | 12217 | 11/06/2013 | 23:51:56 | 0 | AOS4.2 | tx | 9 | can't |
| 54 | false |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
```

This query constrains files inside the subdirectory named 2013. The variable `dir0` refers to the first level down from logs, `dir1` to the next level, and so on. So this query returned 10 of the rows for February 2013.

**Further constrain the results using multiple predicates in the query**

```
0: jdbc:drill:> select dir0 as yr, dir1 as mth, cust_id from logs
where dir0='2013' and dir1='8' and device='IOS5' and purch_flag='true'
order by `date`;
```

```
+-----+-----+-----+
| yr | mth | cust_id |
+-----+-----+-----+
| 2013 | 8 | 4 |
| 2013 | 8 | 521 |
| 2013 | 8 | 1 |
| 2013 | 8 | 2 |
| 2013 | 8 | 4 |
| 2013 | 8 | 549 |
| 2013 | 8 | 72827 |
| 2013 | 8 | 38127 |
...

```

This query returns a list of customer IDs for people who made a purchase via an IOS5 device in August 2013.

**Return monthly counts per customer for a given year**

```
0: jdbc:drill:> select cust_id, dir1 month_no, count(*) month_count from
logs
where dir0=2014 group by cust_id, dir1 order by cust_id, month_no limit 10;
```

```
+-----+-----+-----+
| cust_id | month_no | month_count |
+-----+-----+-----+
| 0 | 1 | 143 |
| 0 | 2 | 118 |
| 0 | 3 | 117 |
| 0 | 4 | 115 |
| 0 | 5 | 137 |
| 0 | 6 | 117 |
| 0 | 7 | 142 |
| 0 | 8 | 19 |
| 1 | 1 | 66 |
| 1 | 2 | 59 |
+-----+-----+-----+
10 rows selected
```

This query groups the aggregate function by customer ID and month for one year: 2014.

**Query Complex Data**

Drill provides some specialized operators and functions that you can use to analyze nested data natively without transformation. If you are familiar with JavaScript notation, you will already know how some of these extensions work.

**Set the workspace to dfs.clicks**

```
0: jdbc:drill:> use dfs.clicks;
+-----+-----+
| ok | summary |
+-----+-----+
| true | Default schema changed to 'dfs.clicks' |
+-----+-----+
```

## Explore clickstream data

```
0: jdbc:drill:> select * from `clicks/clicks.json` limit 5;
+-----+-----+-----+-----+-----+
| trans_id | date | time | user_info | trans_info |
+-----+-----+-----+-----+
| 31920 | 2014-04-26 | 12:17:12 | {"cust_id":22526,"device":"IOS5","state":"il"} | {"prod_id":
[174,2],"purch_flag":"false"} |
| 31026 | 2014-04-20 | 13:50:29 | {"cust_id":16368,"device":"AOS4.2","state":"nc"} | {"prod_id":
[],"purch_flag":"false"} |
| 33848 | 2014-04-10 | 04:44:42 | {"cust_id":21449,"device":"IOS6","state":"oh"} | {"prod_id":
[582],"purch_flag":"false"} |
| 32383 | 2014-04-18 | 06:27:47 | {"cust_id":20323,"device":"IOS5","state":"oh"} | {"prod_id":
[710,47],"purch_flag":"false"} |
| 32359 | 2014-04-19 | 23:13:25 | {"cust_id":15360,"device":"IOS5","state":"ca"} | {"prod_id":
[0,8,170,173,1,124,46,764,30,711,0,3,25],"purch_flag":"true"} |
+-----+-----+-----+-----+-----+
```

Note that the `user_info` and `trans_info` columns contain nested data: arrays and arrays within arrays. The following queries show how to access this complex data.

## Unpack the user\_info column

```
0: jdbc:drill:> select t.user_info.cust_id as custid, t.user_info.device as
device,
t.user_info.state as state
from `clicks/clicks.json` t limit 5;
+-----+-----+-----+
| custid | device | state |
+-----+-----+-----+
| 22526 | IOS5 | il |
| 16368 | AOS4.2 | nc |
| 21449 | IOS6 | oh |
| 20323 | IOS5 | oh |
| 15360 | IOS5 | ca |
+-----+-----+-----+
```

This query uses a simple `table.column.column` notation to extract nested column data. For example:

```
t.user_info.cust_id
```

where `t` is the table alias provided in the query, `user_info` is a top-level column name, and `cust_id` is a nested column name.

The table alias is required; otherwise column names such as `user_info` are parsed as table names by the SQL parser.

## Unpack the trans\_info column

```
0: jdbc:drill:> select t.trans_info.prod_id as prodid,
t.trans_info.purch_flag as
purchased
from `clicks/clicks.json` t limit 5;
+-----+-----+
| prodid | purchased |
+-----+-----+
```

```

| [174,2] | false |
| [] | false |
| [582] | false |
| [710,47] | false |
| [0,8,170,173,1,124,46,764,30,711,0,3,25] | true |
+-----+
5 rows selected

```

Note that this result reveals that the `prod_id` column contains an array of IDs (one or more product ID values per row, separated by commas). The next step shows how you to access this kind of data.

### Query Arrays

Now use the `[ n ]` notation, where `n` is the position of the value in an array, starting from position 0 (not 1) for the first value. You can use this notation to write interesting queries against nested array data.

For example:

```
trans_info.prod_id[0]
```

refers to the first value in the nested `prod_id` column and

```
trans_info.prod_id[20]
```

refers to the 21st value, assuming one exists.

### Find the first product that is searched for in each transaction:

```

0: jdbc:drill:> select t.trans_id, t.trans_info.prod_id[0] from `clicks/
clicks.json` t limit 5;
+-----+
| trans_id |  EXPR$1  |
+-----+
| 31920    | 174      |
| 31026    | null     |
| 33848    | 582      |
| 32383    | 710      |
| 32359    | 0        |
+-----+
5 rows selected

```

### For which transactions did customers search on at least 21 products?

```

0: jdbc:drill:> select t.trans_id, t.trans_info.prod_id[20]
from `clicks/clicks.json` t
where t.trans_info.prod_id[20] is not null
order by trans_id limit 5;
+-----+
| trans_id |  EXPR$1  |
+-----+
| 10328    | 0        |
| 10380    | 23       |
| 10701    | 1        |
| 11100    | 0        |
| 11219    | 46       |
+-----+
5 rows selected

```

This query returns transaction IDs and product IDs for records that contain a non-null product ID at the 21st position in the array.

**Return clicks for a specific product range:**

```
0: jdbc:drill:> select * from (select t.trans_id, t.trans_info.prod_id[0]
as prodid,
t.trans_info.purch_flag as purchased
from `clicks/clicks.json` t) sq
where sq.prodid between 700 and 750 and sq.purchased='true' order by
sq.prodid;
+-----+-----+-----+
| trans_id | prodid | purchased |
+-----+-----+-----+
| 21886 | 704 | true |
| 20674 | 708 | true |
| 22158 | 709 | true |
| 34089 | 714 | true |
| 22545 | 714 | true |
| 37500 | 717 | true |
| 36595 | 718 | true |
...

```

This query assumes that there is some meaning to the array (that it is an ordered list of products purchased rather than a random list).

**Perform Operations on Arrays****Rank successful click conversions and count product searches for each session:**

```
0: jdbc:drill:> select t.trans_id, t.`date` as session_date,
t.user_info.cust_id as
cust_id, t.user_info.device as device, repeated_count(t.trans_info.prod_id)
as
prod_count, t.trans_info.purch_flag as purch_flag
from `clicks/clicks.json` t
where t.trans_info.purch_flag = 'true' order by prod_count desc;
+-----+-----+-----+-----+-----+-----+
| trans_id | session_date | cust_id | device | prod_count | purch_flag |
+-----+-----+-----+-----+-----+-----+
| 37426 | 2014-04-06 | 18709 | IOS5 | 34 | true |
| 31589 | 2014-04-16 | 18576 | IOS6 | 31 | true |
| 11600 | 2014-04-07 | 4260 | AOS4.2 | 28 | true |
| 35074 | 2014-04-03 | 16697 | AOS4.3 | 27 | true |
| 17192 | 2014-04-22 | 2501 | AOS4.2 | 26 | true |
...

```

This query uses a Drill SQL extension, the `repeated_count` function, to get an aggregated count of the array values. The query returns the number of products searched for each session that converted into a purchase and ranks the counts in descending order. Only clicks that have resulted in a purchase are counted.

**Store a Result Set in a Table for Reuse and Analysis**

To facilitate additional analysis on this result set, you can easily and quickly create a Drill table from the results of the query.

**Continue to use the `dfs.clicks` workspace**

```
0: jdbc:drill:> use dfs.clicks;
+-----+-----+

```

```
| ok | summary |
+-----+
| true | Default schema changed to 'dfs.clicks' |
+-----+
```

### Return product searches for high-value customers:

```
0: jdbc:drill:~> 0: jdbc:drill:~> select o.cust_id, o.order_total,
t.trans_info.prod_id[0] as prod_id
from
hive.orders as o
join `clicks/clicks.json` t
on o.cust_id=t.user_info.cust_id
where o.order_total > (select avg(inord.order_total)
                        from hive.orders inord
                        where inord.state = o.state);

+-----+-----+-----+
| cust_id | order_total | prod_id |
+-----+-----+-----+
| 1328    | 73         | 26      |
| 1328    | 146        | 26      |
| 1328    | 56         | 26      |
| 1328    | 91         | 26      |
| 1328    | 74         | 26      |
...
+-----+-----+-----+
107,482 rows selected (14.863 seconds)
```

This query returns a list of products that are being searched for by customers who have made transactions that are above the average in their states.

### Materialize the result of the previous query:

```
0: jdbc:drill:~> 0: jdbc:drill:~> create table product_search as select
o.cust_id, o.order_total, t.trans_info.prod_id[0] as prod_id
from
hive.orders as o
join `clicks/clicks.json` t
on o.cust_id=t.user_info.cust_id
where o.order_total > (select avg(inord.order_total)
                        from hive.orders inord
                        where inord.state = o.state);

+-----+-----+-----+
| Fragment | Number of records written |
+-----+-----+-----+
| 0_0      | 107482                    |
+-----+-----+-----+
1 row selected
```

This example uses a CTAS statement to create a table based on a correlated subquery that you ran previously. This table contains all of the rows that the query returns (107,482) and stores them in the format specified by the storage plugin (Parquet format in this example). You can create tables that store data in csv, parquet, and json formats.

### Query the new table to verify the row count

```
0: jdbc:drill:~> select count(*) from product_search;
+-----+
|  EXPR$0  |
+-----+
```

```
| 107482 |
+-----+
1 row selected
```

This example simply checks that the CTAS statement worked by verifying the number of rows in the table.

### Find the storage file for the table

```
[root@maprdemo product_search]# cd /mapr/demo.mapr.com/data/nested/
product_search
[root@maprdemo product_search]# ls -la
total 451
drwxr-xr-x. 2 mapr mapr      1 Sep 15 13:41 .
drwxr-xr-x. 4 root root      2 Sep 15 13:41 ..
-rwxr-xr-x. 1 mapr mapr 460715 Sep 15 13:41 0_0_0.parquet
```

Note that the table is stored in a file called `0_0_0.parquet`. This file is stored in the location defined by the `dfs.clicks` workspace:

```
"location": "/mapr/demo.mapr.com/data/nested"
```

with a subdirectory that has the same name as the table you created.

### Summary

This tutorial introduced Drill and its ability to run ANSI SQL queries against various data sources, including Hive tables, HPE Ezmeral Data Fabric Database binary tables, and file system directories. The tutorial also showed how to work with and manipulate complex and multi-structured data commonly found in Hadoop/NoSQL systems.

Now that you are familiar with different ways to access the sample data with Drill, you can try writing your own queries against your own data sources. Refer to the [Apache Drill documentation](#) for more information.

### Drill-on-YARN

You can install and run Drill under Warden or you can install and run Drill under YARN. [YARN \(Yet Another Resource Negotiator\)](#) is a cluster management tool that automates the resource sharing process in a cluster.

**NOTE:** The [MapR default security feature](#) introduced in 6.0 is not supported with Drill-on-YARN.

The following sections provide information about Drill-on-YARN, including overview material, installation and configuration instructions, and additional information related to Drill-on-YARN:

#### Drill-on-YARN Overview

Running Drill as a YARN application (Drill-on-YARN) enables Drill to work alongside other applications, such as Hadoop and Spark, in a YARN-managed cluster. If you are currently running Drill under Warden, you can upgrade Drill and continue to run Drill under Warden, or you can migrate Drill to run under YARN. See [Migrate Drill to Run Under YARN](#) for instructions.

YARN assigns resources, such as memory and CPU, to applications in the cluster and eliminates the manual steps associated with installation and resource allocation for stand-alone applications in a multi-tenant environment. YARN automatically deploys (localizes) the Drill software onto each Drill node and manages the Drill cluster. Drill becomes a long-running application with YARN. You can monitor the Drill-on-YARN cluster using the Application Master web UI.

#### Resource Usage

By design, Drill aggressively uses all of the resources available to run queries at optimal speed. When Drill runs under YARN, you must inform YARN of the resources that Drill needs. The resource settings

are descriptive, not proscriptive. Drill does not limit itself to the YARN settings, instead the YARN settings inform YARN of the resources that Drill will consume so that YARN does not over-allocate those resources to other tasks.

YARN manages CPU, memory, and disks. YARN calls settings for memory and CPU “vcores.” You configure Drill’s memory and then inform YARN of the Drill configuration. Drill uses all available disk I/O and CPU.

## Components

Several software components work together to run Drill as a YARN application. Drill, YARN, and the Drill-on-YARN application collectively provide the components required to run Drill under YARN.

The following table lists the software components with their descriptions:

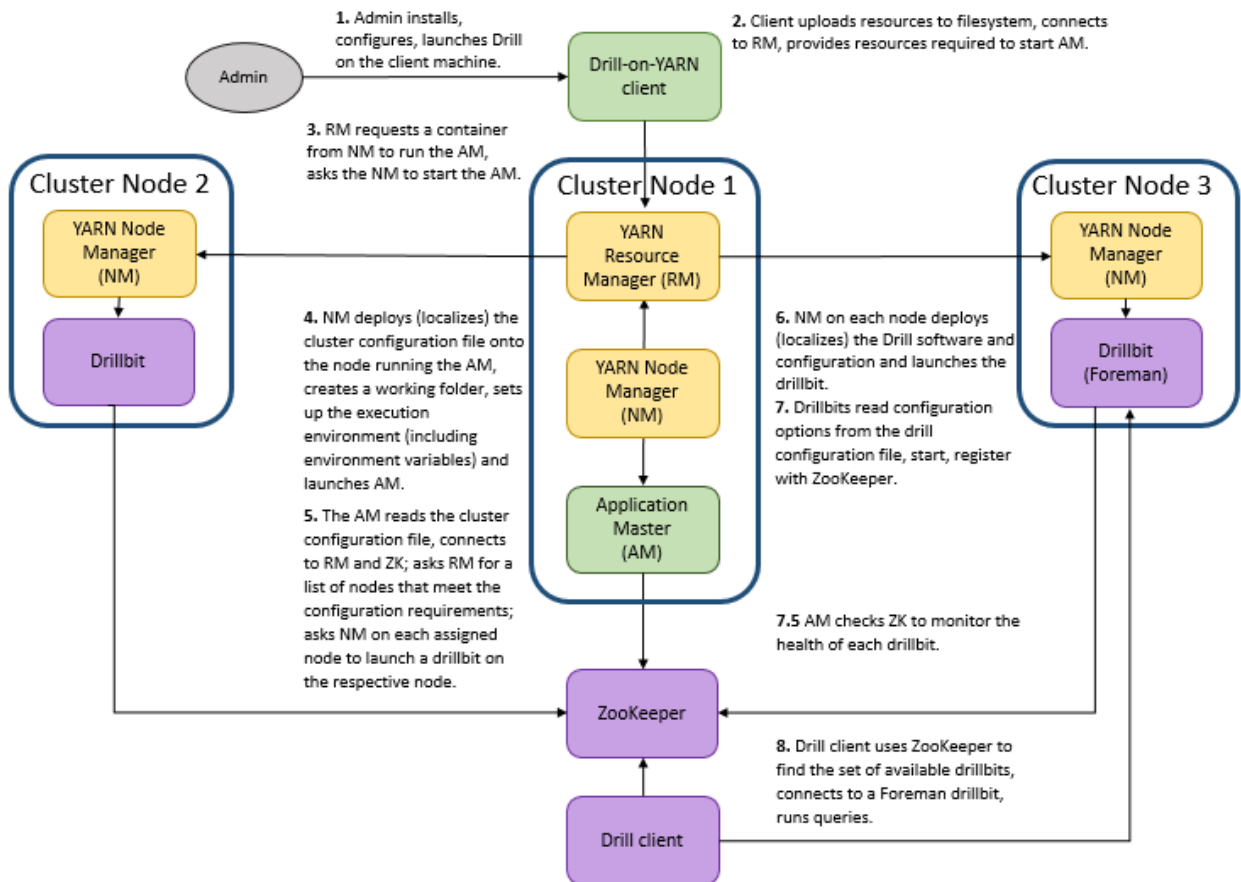

Software	Component	Description
YARN	Resource Manager	The Resource Manager manages the set of applications running on the cluster. Each cluster must have one Resource Manager.
	Node Manager	The Node Manager manages the application tasks running on a particular node. Each node in a cluster must have one Node Manager.
Drill	Drillbit	A Drillbit is the Drill daemon software that YARN runs on each node in the cluster. See <a href="#">Drill Query Execution</a> . The Drillbit process on the node acts as the application task.
	Client	A client, such as JDBC, ODBC, or SQLLine sends queries to a Drillbit. The client uses ZooKeeper to discover a Drillbit that the client treats as the Foreman. See <a href="#">Drill Clients</a> .
	Drill distribution archive	The Drill distribution archive is a Drill distribution .tar.gz file included with the Drill installation. Drill-on-YARN uploads this archive to the distributed filesystem (DFS). YARN downloads (localizes) the file to each worker node.
ZooKeeper	ZooKeeper	ZooKeeper is the service that tracks the available set of Drillbit processes. The Foreman for a query uses ZooKeeper to identify the set of available drill nodes that can run the query. See <a href="#">Drill Query Execution</a> .
Drill-on-YARN Application	Application Master (AM)	The Application Manager requests containers from the Resource Manager and launches Drillbits using those containers. The AM monitors Drillbits, detects failures, and restarts failed Drillbits. The AM also provides a web UI to manage the Drill cluster.

	Drill-on-YARN client	The Drill-on-YARN client is a command-line program that starts, stops, and monitors the Drill cluster. The client provides the information that YARN needs to start the Application Master. The client can run on any machine that has both the Drill and YARN client software. The client does not have to be part of the YARN cluster.
	drill-on-yarn.conf	The drill-on-yarn.conf configuration file provides the information that Drill-on-YARN needs to manage the Drill cluster. This file is separate from the configuration files for Drill itself.

### Component Workflow

Running Drill as a YARN application is mostly an automated process carried out by the Drill and YARN components. After an administrator installs, configures, and launches Drill from the Drill-on-YARN client, YARN deploys (localizes) Drill on to designated nodes and starts the Drill process on each node.

The following diagram shows the workflow between the components in a cluster with the steps that Drill and YARN complete to deploy and run Drill as a YARN application:

### Configuring Drill to Run Under YARN

To run Drill under YARN, you must have the YARN version of Drill installed on the node designated as the Drill-on-YARN client. If you have not already planned your cluster and installed the YARN-ready version of

Drill, see [Install Drill to Run Under YARN](#) and then return to this topic to configure Drill to run as a YARN application.

Configuring Drill to run under YARN requires modifications to Drill, Drill-on-YARN, and YARN configuration files. The following sections provide the information needed to make the changes to the configuration files, as well as information about how to launch Drill under YARN and validate the cluster configuration and status of the Drill nodes.

Complete the following steps to configure Drill to run under YARN, launch Drill as a YARN application, and validate the cluster:

*Before You Configure Drill to Run Under YARN*

Provides the steps required to repackage the Drill-on-YARN archive.

During Drill-on-YARN installation, the system fails to upload the Drill archive because JNI finds a mismatch for Java and native libraries. If you install and try to start Drill-on-YARN using the `mapr-drill-yarn` package, the system returns an error.

To prevent this issue from occurring, complete the following steps to repackage the Drill-on-YARN archive:

1. Install Drill-on-YARN, as described in [Installing Drill to Run Under YARN](#) on page 232, but do not configure or start Drill-on-YARN.

2. Create a file named `recreate_archive.sh` with the following information:

**TIP:** You can create and run this file in any location you choose.

```
read -p "This operation will recreate drill.tar.gz in drill home
directory. Continue? " -n 1 -r
echo
if [[ ! $REPLY =~ ^[Yy]$ ]]
then
    exit 1
fi

drillHome="/opt/mapr/drill/drill-$(cat /opt/mapr/drill/drillversion)"
hadoopHome="/opt/mapr/hadoop/hadoop-$(cat /opt/mapr/hadoop/
hadoopversion)"

hbaseJar="$(ls /opt/mapr/lib/mapr-hbase-*-mapr.jar)"
maprWebJar="$(ls /opt/mapr/lib/mapr-security*-mapr.jar)"
maprdbJar="$(ls /opt/mapr/lib/maprdb-[0-9].[0-9].[0-9].[0-9]-mapr.jar)"
mapredJar="$(ls /opt/mapr/lib/maprdb-mapreduce-*-mapr.jar)"
maprfsJar="$(ls /opt/mapr/lib/maprfs-[0-9].[0-9].[0-9].[0-9]-mapr.jar)"
jerseyClientJar="$(ls ${hadoopHome}/share/hadoop/yarn/lib/
jersey-client-*.jar)"
jerseyCoreJar="$(ls ${hadoopHome}/share/hadoop/yarn/lib/
jersey-core-*.jar)"

echo "Drop old mapr jars from ${drillHome}/jars/3rdparty/"
rm -f ${drillHome}/jars/3rdparty/mapr-hbase*
rm -f ${drillHome}/jars/3rdparty/mapr-security-web-*
rm -f ${drillHome}/jars/3rdparty/maprdb-*
rm -f ${drillHome}/jars/3rdparty/maprfs-*

echo "Copy new jars from /opt/mapr/lib/"
cp ${hbaseJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${hbaseJar} has been copied"
cp ${maprWebJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${maprWebJar} has been copied"
cp ${maprdbJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${maprdbJar} has been copied"
cp ${mapredJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${mapredJar} has been copied"
cp ${maprfsJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${maprfsJar} has been copied"

echo "Copy jersey jars from hadoop for timeline client"
cp ${jerseyClientJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${jerseyClientJar} has been copied"
cp ${jerseyCoreJar} ${drillHome}/jars/3rdparty/
[ $? == 0 ] && echo "${jerseyCoreJar} has been copied"

if [ -f ${drillHome}/drill.tar.gz ]; then
    rm -f ${drillHome}/drill.tar.gz
    echo "${drillHome}/drill.tar.gz has been dropped"
fi

tempDir=drill-$(date +%s)

mkdir /tmp/${tempDir}
[ $? == 0 ] && echo "Created temporary directory ${tempDir}"

cd /tmp/${tempDir}

mkdir drill
```

```
[ $? == 0 ] && echo "Created drill directory"

cp -r ${drillHome}/* ./drill/
echo "${drillHome} copied to drill directory"

tar -czf drill.tar.gz ./drill
echo "Created new drill archive"

cp drill.tar.gz ${drillHome}/
echo "drill.tar.gz copied to ${drillHome}"

rm -rf /tmp/$tempDir
echo -e "\033[0;32mDONE.\033[0m"
```

3. Issue the following command to run the script:

```
sh recreate_archive.sh
```

When the script runs, a prompt appears:

```
This operation will recreate drill.tar.gz in drill home directory.
Continue?
```

Reply with `y` to allow the script to update the JAR files in Drill-on-YARN.

You should see output similar to the following (versions may differ):

```
Drop old mapr jars from /opt/mapr/drill/drill-1.16.1/jars/3rdparty/
Copy new jars from /opt/mapr/lib/
/opt/mapr/lib/mapr-hbase-6.2.0.0-mapr.jar has been copied
/opt/mapr/lib/mapr-security-web-6.2.0.0-mapr.jar has been copied
/opt/mapr/lib/maprdb-6.2.0.0-mapr.jar has been copied
/opt/mapr/lib/maprdb-mapreduce-6.2.0.0-mapr.jar has been copied
/opt/mapr/lib/maprfs-6.2.0.0-mapr.jar has been copied
Copy jersey jars from hadoop for timeline client
/opt/mapr/hadoop/hadoop-2.7.6/share/hadoop/yarn/lib/
jersey-client-1.19.jar has been copied
/opt/mapr/hadoop/hadoop-2.7.6/share/hadoop/yarn/lib/jersey-core-1.19.jar
has been copied
/opt/mapr/drill/drill-1.16.1/drill.tar.gz has been dropped
Created temporary directory drill-1656424210
Created drill directory
/opt/mapr/drill/drill-1.16.1 copied to drill directory
Created new drill archive
drill.tar.gz copied to /opt/mapr/drill/drill-1.16.1
DONE.
```

4. Continue to [Step 1: Configure Drill](#) on page 3958.

*Step 1: Configure Drill*

Drill configuration under Drill-on-YARN differs from Drill configuration under Warden. You must create a site directory to contain the site-specific files for Drill. Drill-on-YARN copies the site directory to every node so that each node has the configuration settings. Having a site directory also simplifies upgrades because you can just delete the old Drill distribution and install the new one while the site-specific files remain unchanged in the site directory.

The `drill-env.sh` file contains only custom configurations. Data Fabric-specific configuration settings reside in `distrib-env.sh`, a file separate from the site-specific settings. When you migrate an existing Drill

installation to run under YARN, you must modify the `drill-env.sh` to remove the Drill and Data Fabric settings, leaving only your site-specific settings.

When you finish configuring Drill, use the site directory to test Drill, including starting, checking status, and stopping Drill.

**NOTE:** If you installed the `mapr-drill-yarn` package on nodes other than the Drill-on-YARN client in order to make SQLLine accessible to users, the site directory must be accessible from all nodes. You can copy the configurations across all the nodes, as you did when you ran Drill under the Warden service. Alternatively, you can put the site directory in a shared filesystem `nfs` mount to extend the configuration. When users launch SQLLine, they should provide the ZooKeeper connection string to launch Drill.

## Create the Site Directory

To create the `site` directory, complete the following steps as the user that installed Drill and will run the Drill-on-YARN client application:

1. Create the site directory and an environment variable for the directory:

```
export DRILL_SITE=/opt/mapr/drill/site
mkdir $DRILL_SITE
```

**NOTE:** The variable is not required. It is used for convenience in the documentation.

2. Change the owner of `$DRILL_SITE` and of the parent directory `/opt/mapr/drill` to the cluster admin user (`mapr` by default).

```
sudo chown mapr:mapr /opt/mapr/drill
sudo chown mapr:mapr /opt/mapr/drill/site
```

3. Copy the `drill-env.sh`, `drill-override.conf`, `drill-on-yarn.conf`, and `distrib-env.sh` files from `$DRILL_HOME/conf/` into the `site` directory. In the following example, `$DRILL_HOME` is the location of the new Drill installation (usually `/opt/mapr/drill/drill-<version>`).

```
cp $DRILL_HOME/conf/drill-override.conf $DRILL_SITE
cp $DRILL_HOME/conf/drill-env.sh $DRILL_SITE
cp $DRILL_HOME/conf/drill-on-yarn.conf $DRILL_SITE
cp $DRILL_HOME/conf/distrib-env.sh $DRILL_SITE
```

**NOTE:** Copy any configuration changes from `drill-env.sh` file in the previous Drill installation over to the `drill-env.sh` file in the `site` directory. Do not include the memory settings when you copy over your previous configurations. These changes must be made in the `drill-on-yarn.conf` file described in Step 3: Configure YARN to Run Drill.

**NOTE:** Never modify `distrib-env.sh`. The `distrib-env.sh` script contains Data Fabric settings that you should not change. You copy this file to the `site` directory because it often contains values set during Drill installation. When you upgrade Drill, replace the file with the latest version from `$DRILL_HOME/conf`.

- If you developed custom code (data sources or user-defined functions), place the Java JAR files in `$DRILL_SITE/jars`. If you have code from your prior Drill installation, copy the JAR files from `$PREV_DRILL/jars/3rdparty` to `$DRILL_SITE/jars`.

```
cp $PREV_DRILL/jars/3rdparty/yourJarName.jar $DRILL_SITE/jars
```

**NOTE:** Only copy the JAR files that you added. Do not copy JAR files that shipped with the prior Drill version.

- Add native libraries to the `site` directory. If you used a native library, such as the JPAM library in prior versions of Drill, place the native libraries in `$DRILL_SITE/lib` to enable YARN to automatically copy (localize) them to each node that runs Drill.

```
cp native_libraries $DRILL_SITE/lib
```

### Modify the drill-env.sh File

Copy any configuration changes from the `drill-env.sh` file in the previous Drill installation over to the `drill-env.sh` file in the `site` directory. Memory settings under Drill-on-YARN are now part of the `drill-on-yarn.conf` file. Modify the memory settings in `$DRILL_SITE/drill-env.sh`, as shown below, to ensure that the Drill memory settings match the amount of memory that Drill-on-YARN requires.

To modify `drill-env.sh`, complete the following steps:

- Review each line in `$PREV_DRILL/conf/drill-env.sh` for settings you added, and copy them into the new `$DRILL_SITE/drill-env.sh` file.

**NOTE:** If you do not recall whether you customized settings, you can compare your file with the original version of `drill-env.sh` that shipped with the prior Drill version.

- Locate the following lines in `drill-env.sh` and note the values:

```
DRILL_MAX_DIRECT_MEMORY="<value>"
DRILL_HEAP="<value>"
```

Replace those lines with the following lines, substituting the values in the new lines with the values from the old lines:

```
export DRILL_MAX_DIRECT_MEMORY=${DRILL_MAX_DIRECT_MEMORY:-"<value>"}
export DRILL_HEAP=${DRILL_HEAP:-"<value>"}
```

**NOTE:** If you do not intend to run Drill outside of YARN, you can remove the two lines shown above from `drill-env.sh`.

**NOTE:** If you do not make this change, Drill ignores the memory settings in the `drill-on-yarn.conf` file. If you are installing Drill fresh, and do not have an existing file, you can skip this step. Files in Drill 1.8 and later have the correct format.

**NOTE:** When you install Drill, the Installer automatically adds the `HADOOP_HOME` variable, which points the current Data Fabric-provided Hadoop to your `distrib-env.sh`. If `HADOOP_HOME` is located elsewhere, change this location in `drill-env.sh`

## Use the Site Directory to Test Drill

You will use the `site` directory each time you start Drill using the `--site` or `--config` option. Use the option to verify that the configuration works by starting Drill as a stand-alone service on a single node.

```
drillbit.sh --site $DRILL_SITE start
```

Wait a few seconds and then verify that Drill continues to run:

```
drillbit.sh --site $DRILL_SITE status
```

You can also use the Drill Web Console for the Drillbit to verify that Drill has the proper settings. Once satisfied that the configuration is connect, stop Drill:

```
drillbit.sh --site $DRILL_SITE stop
```

**NOTE:** If you run a Drillbit with the `--site` (`--config`) option and you want to use SQLLine, you must add the option to SQLLine:

```
sqlline --site $DRILL_SITE
```

**TIP:** If you find that specifying the `--site` option becomes tedious, you can set the `DRILL_CONF_DIR` variable in your environment:

```
export DRILL_CONF_DIR="$DRILL_SITE"
drillbit.sh start
```

### Step 2: Configure Drill-on-YARN

To configure Drill to run as a YARN application, modify the `$DRILL_SITE/drill-on-yarn.conf` cluster configuration file to suit the needs of your cluster. This file is a “starter” configuration file that corresponds to the simplest Drill cluster. The `drill-on-yarn.conf` file is in the same [HOCON](#) format as `drill-override.conf`.

Consult the `$DRILL_HOME/conf/drill-on-yarn-example.conf` file as an example. However, do not just copy the example file. Instead, copy only the specific configuration settings that you need; the others will automatically take the Drill-defined default values.

**NOTE:** Make sure that resources can accommodate the Drill memory, CPU, and disk requirements.

The following sections list the configuration settings required to run Drill under YARN:

### Drill Memory Settings

The following configuration sets the Java heap size and amount of direct memory the node can allocate to Drill:

```
drillbit: { heap: "<value>" max-direct-memory: "<value>" }
```

When you add the configuration, use the same values set in the following parameters of the `drill-env.sh` file, if you did not remove these lines when you modified `drill-env.sh`:

```
export DRILL_MAX_DIRECT_MEMORY=${DRILL_MAX_DIRECT_MEMORY:-"<value>"}
export DRILL_HEAP=${DRILL_HEAP:-"<value>"}
```

Drill-on-YARN copies these values into the environment variables when launching each Drillbit. Drill also uses additional JVM memory. For example, Drill uses a code cache to hold classes generated at runtime. The default size of the cache is 1 GB:

```
drillbit: { code-cache: "1G" }
```

Typically, you do not need to change the code cache size, but you must account for it when computing the YARN container size.

### YARN Container Size

The following configuration sets the YARN container size required to run Drill as a YARN application.

```
drillbit: {
  memory-mb: 14336
}
```

The default value is 14GB. Typically, this size is the sum of the heap and direct memory. However, if you use custom libraries that perform their own memory allocation, or launch sub-processes, you must account for that memory usage as well. Note that YARN memory is expressed in MB. To compute the container size, start with the values used for the heap, direct memory, and code cache settings, as shown in the following example:

```
drillbit: {
  heap: "4G"
  max-direct-memory: "8G"
  code-cache: "1G"
  memory-mb: 14336
}
```

The values shown above are the Drill defaults. You may use larger values. Although the three values account for the bulk of Drill memory, the JVM itself also has a certain overhead. Assume that the overhead is about 1 GB, though the amount varies depending on the workload.

Add the four values together to get a memory requirement in GB.

```
Total memory = 8G + 4G + 1G + 1G = 14G
```

YARN sizes containers in megabytes. Convert GB to MB:

```
Container size = 14G * 1024 = 14336 MB
```

Set this size in drill-on-yarn.conf:

```
drillbit: { memory-mb: 14336 }
```

### CPU

The following configuration sets the CPU to allocate to Drill:

```
drillbit: { vcores: <value> }
```

Drill is a CPU-intensive operation and greatly benefits from each additional core. YARN does not limit the number of cores used by an application. Rather, this number reports to YARN the average CPU usage of Drill so that YARN can use the number when deciding how many other applications to run on the same node.

## Drillbit Cluster Configuration

The following configuration sets the cluster group:

```
cluster: [ { name: "drillbits" type: "basic" count: 1 } ]
```

Drill-on-YARN uses the concept of a “cluster group” of Drillbits to describe the set of drillbits to launch. Currently, only the “basic” type of group is supported. A basic group launches drillbits anywhere in the YARN cluster where a container is available. For a basic group, specify the group type and the number of drillbits to launch.

**NOTE:** The syntax says that cluster is a list that contains cluster group objects contained in braces. Drill currently supports just one group.

The name is optional. It appears in the Application Master web UI. Type must be set to “basic.” Set the count to the number of hosts on which Drill is to run at launch time. You can resize the Drill cluster after the cluster is launched.

## YARN Queue Labels

The following configuration sets the YARN queue labels that identify the cluster nodes that run Drill:

```
yarn: { queue: "<queue_name>" }
```

The distribution of YARN provides queue labels for assigning YARN applications to specific queues. See [Label-Based Scheduling for YARN Applications](#). You can use queue labels with Drill to identify the YARN queue that should run Drill.

To use queue labels, complete the following steps:

1. Create a node label.
2. Assign the label to the nodes that are to run Drill.
3. Create a Drill-specific queue that uses the node label.
4. Configure Drill-on-YARN to use the queue.

Suppose you create a queue called “drill.” Setting the following configuration causes Drill-on-YARN to launch through the drill queue:

```
yarn: { queue: "drill" }
```

Set queue to the name a name of your choice. When Drill-on-YARN launches, both the Application Master and drillbits run only on nodes with the same node label as the queue.

## DFS Location

The following configuration sets the dfs location:

```
dfs: { app-dir: "/user/drill" }
```

Drill copies the archive in to the filesystem in a location you provide. The default is /user/drill, however you can specify a different location. You do not have to specify the file system connection information; this information is automatically defined.

### *Step 3: Configure YARN to Run Drill*

YARN default settings are optimized for MapReduce applications. MapReduce applications use a limited amount of memory; however, Drill is long-running and consumes a significant amount of resources. Adjust the YARN memory configuration to allow YARN to allocate containers large enough to run Drill. Exclude the

YARN container directory from `systemd-tmpfiles` to prevent `systemd-tmpfiles` from removing Drill's container files while Drill runs.

### Increase Maximum Container Size

YARN provides a number of parameters to control the amount of resources available to applications. The data-fabric distribution of YARN sets most of these parameters automatically, except for the maximum container size, which is left at the Apache YARN default of 8 GB. Typical Drill configurations use significantly more memory. Therefore, you must increase the YARN maximum container size on each node to suit the needs of Drill. You can use the YARN Resource Manager web UI to determine the amount of memory available on each node.

 **NOTE:** YARN resource requirements match the Drill resource requirements.

To increase the maximum container size, determine the required container size from the Drill setting in `drill-on-yarn.conf`, which you previously set in step 2:

```
drillbit: {
  memory-mb: 14336
}
```

Use this number to set the `yarn.scheduler.maximum-allocation-mb` parameter in `/opt/mapr/hadoop/hadoop-<version>/etc/hadoop.<version>`, substituting the number of the version you have installed.

Edit `yarn-site.xml` to add the following:

```
<property>
  <name>yarn.scheduler.maximum-allocation-mb</name>
  <value>14336</value>
  <description>Set to allow Drill containers 14G.</description>
</property>
```

 **NOTE:** You must update this configuration on every YARN node.

Restart the YARN Resource Manager to pick up change, and use the YARN Resource Manager UI to verify that the maximum container size shows the new value.

### Exclude the YARN Container Directory from systemd-tmpfiles

The system puts the YARN Node Manager container files in the `/tmp` directory. Most system administrators configure `systemd-tmpfiles` to periodically remove files in `/tmp`. Since Drill-on-YARN is a long-running YARN application, `systemd-tmpfiles` can remove Drill's container files while Drill runs. If this occurs, you must manually shut down the Drill cluster because `systemd-tmpfiles` will have removed the `pid` file that YARN needs to manage Drill.

You can prevent `systemd-tmpfiles` from cleaning up Drill's container files by adding a new configuration file to `/etc/tmpfiles.d/`, for example `/etc/tmpfiles.d/exclude-nm-local-dir.conf`, with the following configuration:

```
x /tmp/hadoop-mapr/nm-local-dir/*
```

 **NOTE:** This configuration prevents `systemd-tmpfiles` from cleaning the `/nm-local-dir` directory when cleaning `/tmp`.

## Example

```
$ cat /etc/tmpfiles.d/exclude-nm-local-dir.conf
x /tmp/hadoop-mapr/nm-local-dir/*
```

### Step 4: Launch Drill Under YARN

Now that the Drill and YARN configuration is complete, you can issue the `start` command from the Drill-on-YARN client to launch Drill under YARN. Launching Drill-on-YARN from the client starts Drill and brings Drill up on other nodes.

Issuing the `start` command starts the YARN Application Master, which then works with YARN to start the Drillbits. The Application Master provides a web UI to monitor the cluster.

**NOTE:** To simplify debugging, you can set the cluster size to a single node. Once you confirm that a single node works, increase the node count.

Launch Drill under YARN as the `mapr` user. For example, if you installed Drill as `mapr` launch Drill as the `mapr` user.

**NOTE:** If you launch Drill as `root` and the system returns an error failing the launch attempt, launch Drill as a user with permissions, such as `mapr`.

Issue the following command to start Drill under YARN:

```
$DRILL_HOME/bin/drill-on-yarn.sh --site $DRILL_SITE start
```

**NOTE:** To run SQLLine, you must also add the `--site` option:

```
$DRILL_HOME/bin/sqlline --site $DRILL_SITE
```

**TIP:** To avoid typing the `site` argument each time you launch Drill under YARN, set an environment variable:

```
export DRILL_CONF_DIR=$DRILL_SITE
$DRILL_HOME/bin/drill-on-yarn.sh start
```

After you issue the `start` command, a number of lines describing the start-up process print. The tool automatically archives and uploads the site directory, which YARN copies (along with the Drill software) onto each node. A URL that includes both the host and the port number displays. Enter the URL in a web browser to access the Application Master web UI.

**NOTE:** When you launch Drill from the Drill-on-YARN client, the Application Master can come up on any node. Save the provided URL to share with other users so they can also access the Application Master. Alternatively, you can run the `status` command to see the URL or go to the YARN Resource Manager UI to get the link.

See [Drill-on-YARN Command Line Tool](#) for additional commands, including `stop`, `status`, and `resize`. See [Application Master Web UI](#) for cluster monitoring information.

### Step 5: Validate Cluster Configuration and Status

The Drill-on-YARN command line tool prints a URL, for the Drill Application Master process, that you can use to monitor the cluster. The Drillbits should be up and running, unless the upload or launch failed.

#### Failed upload

If the upload fails, the most likely reason is that the `HADOOP_HOME` variable is not set, or the user launching Drill-on-YARN does not have permission

**Failed launch**

to create or write to the DFS location set in the Drill-on-YARN configuration file.

If the launch fails, verify that the YARN maximum container size was set to be at least as large as the Drill container size and that YARN can provide the number of vcores and disks you have requested for Drill.

**Monitor Cluster Activity**

When the cluster launches successfully, you can verify the status of the components in the Drill cluster from the command line or you can copy the Application Master URL into your browser to use the Application Master web UI.

To check the status from the command line, issue the following command:

```
$DRILL_HOME/bin/drill-on-yarn.sh --site $DRILL_SITE status
```

- Verify that the Drillbits are in the Running state (or transition to that state after a few moments.) If the Drillbits remain in the Requesting state, the likely cause is that YARN cannot provide a container of the requested size. You can access this information on the Drillbits page in the Application Master web UI.
- Verify that the Application Master has correctly picked up the YARN-related configuration from `drill-override.conf` and `drill-on-yarn.conf`. You can access this information on the Configuration page in the Application Master web UI.
- Verify that the Application Master is running. The Drill Application Master uses ZooKeeper to verify that only one Application Master runs per Drill cluster. The Application Master fails if ZooKeeper is down, is configured incorrectly in `drill-override.conf`, or if another Application Master is running for the same cluster.
- Verify that the configurations in are correct in `drill-override.conf` if there are Drillbit failures. Drill-on-YARN detects Drillbit failures and retries each Drillbit a few times. If the Drillbit continues to fail, the node is black-listed for that run of Drill-on-YARN. You can see failures in the History page of the web UI. If your Drillbits fail, the most likely reason is misconfiguration within `drill-override.conf`. Use YARN to locate and view the Drill logs for the failed container.

**Resize the Cluster**

If the cluster works well for a single node, you can increase the number of nodes.

**NOTE:** In the Drill 1.8 release, adding nodes can be done while users run queries. However, removing nodes from the cluster causes queries to fail, and so should only be done when the cluster is idle.

To make a permanent change, modify the cluster size in `drill-on-yarn.conf`:

```
cluster: [
  {
    ...
    count: 5
  }
]
```

You can also resize the cluster dynamically. To add two nodes from the command line:

```
$DRILL_HOME/bin/drill-on-yarn.sh --site $DRILL_SITE resize +2
```

To set the cluster size to a total of five nodes:

```
$DRILL_HOME/bin/drill-on-yarn.sh --site $DRILL_SITE resize 5
```

To remove one of the nodes:

```
$DRILL_HOME/bin/drill-on-yarn.sh --site $DRILL_SITE resize -1
```

You can also resize your cluster using the Manage page of the Application Master web UI, by entering the number of desired nodes and clicking **Go**.

## Stop the Cluster

You can stop the cluster from the command line or from the Manage page in the Application Master web UI.

To stop the cluster from the command line, issue the following command:

```
$DRILL_HOME/bin/drill-on-yarn.sh --site $DRILL_SITE stop
```

## Migrate Drill to Run Under YARN

Explains how to migrate Drill to run under YARN instead of the Warden service.

When you migrate Drill to run under YARN, you must back up configurations, including files and storage plugins, shutdown the Drill cluster running under Warden, and uninstall Drill on all Drill nodes in the cluster. You may also want to determine which system settings have been changed from the Drill defaults.

**NOTE:** Drill-on-YARN is an advanced feature used to manage a production Drill cluster. Only skilled administrators, familiar with YARN, should configure Drill to run under YARN. If you are new to Drill, consider running Drill under the Warden service until you are familiar with Drill and Drill cluster management.

The sections below provide the tasks required to migrate Drill under YARN:

### Tasks

Complete the following tasks when you want to migrate Drill to run under YARN:

#### Backup configurations and UDFs

Back up configuration files, storage plugin configurations, and UDFs (user-defined functions) or custom JAR files. Back up the configuration files located in `/opt/mapr/drill/drill-<version>/conf`, including `drill-override.conf` and `drill-env.sh`, to preserve your ZooKeeper configuration and any options or custom configurations specified in the files. Also back up `logback.xml` if you configured the file for the Lilith software.

- To back up configuration files, go to `/opt/mapr/drill/drill-<version>/conf`, and copy the files to a location outside of the Drill installation directory.

```
cp <file_name> drill-env.sh /
path/to/directory
```

- To back up custom JARs or UDFs, go to `/opt/mapr/drill/drill-<version>/jars/3rdparty` and copy the JARs or UDFs to a location outside of the Drill installation directory.
- To back up storage plugin configurations, complete the following steps:
  1. [Start the Web Console](#). The Drill node that you use to access the Web Console must be a node that is currently running the Drillbit process.
  2. Click **Storage**.
  3. Click **Update** next to a storage plugin.
  4. Copy the configuration to a text file, and save the file.
  5. Repeat steps 3 and 4 for each storage plugin configuration that you want to save.

### Verify system option settings

Drill should save set system options when you migrate Drill. However, you may want to verify which system options were changed from the default settings beforehand. You can run the following query to see which system options were changed from the defaults:

```
select * from sys.options where
status = 'CHANGED';
```

Example:

```
select * from sys.options where
status = 'CHANGED';
+-----+
|          name          |
| kind | type | status |
| num_val | string_val | bool_val |
| float_val |          |          |
+-----+
| exec.errors.verbose   |
| BOOLEAN | SYSTEM | CHANGED |
| null | null | true |
| null |          |          |
| new_view_default_permissions |
| STRING | SYSTEM | CHANGED |
| null | 777 | null |
| null |          |          |
| planner.enable_decimal_data_type |
| BOOLEAN | SYSTEM | CHANGED |
| null | null | true |
| null |          |          |
| planner.enable_limit0_optimization |
| BOOLEAN | SYSTEM | CHANGED |
| null | null | true |
| null |          |          |
+-----+
4 rows selected (0.541 seconds)
```

### Shutdown the Drill cluster

After you migrate, run the query again to verify that the system options are still set. If not, set the options.

Issue the following command to shutdown the existing Warden-managed Drill cluster:

```
maprcli node services -name
drill-bits -action stop -nodes <node
host names separated by a space>
```

**NOTE:** Do not shutdown nodes when queries are in progress.

### Verify that Drillbits stopped

Run the following command to verify that the Drillbit service is no longer running on each node:

```
ps -ef | grep -i drill
```

No Drill processes should print to screen when you run this command.

You can also log in to the Control System at <https://<host name>:8443> to verify the status of the Drillbit service. You should not see Drillbit as a listed service.

### Uninstall Drill

Uninstall Drill and then run `configure.sh -R` to refresh the configuration.

Issue the command appropriate for your system as root or using `sudo` to uninstall the `mapr-drill` package:

Operating System	Command
RedHat/CentOS	<code>yum remove mapr-drill</code>
Ubuntu	<code>apt-get remove mapr-drill</code>

**NOTE:** Verify that Drillbit processes stopped.

### Additional Drill-on-YARN Configuration Options

You can include additional configuration options in the `DRILL_SITE/drill-on-yarn.conf` file for specialized cases. For example, you can customize the Application Master web UI port or Application Master settings.

Refer to the `drill-on-yarn-example.conf` file in `DRILL_HOME/conf` to see examples of the additional options. Do not use the example file.

The following list describes the changes that you can make for several of the Drill-on-YARN components:

#### Application Name

You can customize the application name that appears when starting or stopping the Drill cluster and in the Drill-on-YARN web UI. Change the value of the following option to a name you prefer:

```
app-name: "My Drill Cluster"
```

#### Application Master Web UI Port

If you run multiple Drill clusters in a YARN cluster, YARN may assign two Drill Application Master processes on the same node. To avoid port conflicts, change the HTTP port for one or both of the Drill

clusters. Change the value of the following option to a different port number:

```
drill.yarn:
  http: {
    port: 12345
  }
}
```

## Application Master Settings

You can customize certain Application Master properties. All of the Application Master properties are prefixed with `drill.yarn.am`, for example `drill.yarn.am.heap`.

The following table lists the Application Master properties with their default settings:

Name	Description	Default
memory-mb	Memory, in MB, to allocate to the Application Master.	14336
vcores	Number of CPUS to allocate to the Application Master.	1
heap	Java heap for the Application Master.	450M

## Drillbit

You can customize certain properties that control the Drillbit processes. All of the Drillbit properties are prefixed with `drill.yarn.drillbit`, for example `drill.yarn.drillbit.disks`.

**NOTE:** You can specify Drill disk usage to YARN, however Drill uses all disks regardless of the setting.

The following table lists the Drillbit properties with their default settings:

Name	Description	Default
code-cache	Code cache that holds classes generated at runtime.	1G
memory-mb	Memory, in MB, to allocate to the Drillbit.	13000
vcores	Number of CPUS to allocate to the AM.	4

disks	Number of disk equivalents consumed by Drill (on versions of YARN that support disk resources.)	1
heap	Java heap memory.	4G
max-direct-memory	Direct (off-heap) memory for the Drillbit.	4G
log-gc	Enables Java garbage collector logging.	false
class-path	Additional class-path entries.	blank

#### *Mapping of drill-env.sh to drill-on-yarn.conf Options*

When you run Drill as a standalone application, you set startup options, such as Drillbit memory, in the \$DRILL\_HOME/conf/drill-env.sh start up script. Under YARN, Drill still reads \$DRILL\_SITE/drill-env.sh for configuration options, however Drill-on-YARN provides the \$DRILL\_SITE/drill-on-yarn.conf file to configure options that were formerly set in drill-env.sh.

The following table maps the drill-env.sh environment variables to their equivalent configuration parameters in drill-on-yarn.conf:

<b>drill-env.sh Environment Variable</b>	<b>drill-on-yarn.conf Configuration Parameter</b>
DRILL_MAX_DIRECT_MEMORY *	drill.yarn.drillbit.max-direct-memory
DRILL_HEAP *	drill.yarn.drillbit.heap
DRILL_JAVA_OPTS	drill.yarn.drillbit.vm-args (Added to those in drill-env.sh.)
SERVER_GC_OPTS (to add GC logging)	Drill.yarn.drillbit.log-gc (To enable GC logging)
DRILL_HOME	Set automatically when files are localized (drill.yarn.drill-install. localize is true), else drill.yarn.drill-install. drill-home.
DRILL_CONF_DIR	Set automatically when files are localized, else uses the normal defaults.
DRILL_LOG_DIR	Set automatically to point to YARN's log directory unless disabled by setting drill.yarn.drillbit. disable-yarn-logs to false. If disabled, uses the normal Drill defaults.
DRILL_CLASSPATH_PREFIX *	Drill.yarn.drillbit. prefix-class-path
HADOOP_CLASSPATH *	drill.yarn.hadoop.class-path (or, better drill.yarn.drillbit. extn-class-path.)
HBASE_CLASSPATH *	Drill.yarn.hadoop. hbase-class-path (or, better drill.yarn.drillbit. extn-class-path.)
EXTN_CLASSPATH * (New in Drill 1.8.)	Drill.yarn.drillbit. extn-class-path
DRILL_CLASSPATH *	drill.yarn.drillbit.class-path

## Multiple Drill Clusters within YARN

You can define multiple Drill clusters within a single YARN cluster. Each Drill cluster is a collection of Drillbits that work as an independent unit. For example, you might define one test Drill cluster that consists of a few machines on the same physical cluster that runs larger Drill clusters for development and marketing.

You must assign each Drill cluster a distinct ZooKeeper entry. Drill uses ZooKeeper to coordinate activities. Each Drill cluster also needs a distinct set of ports because YARN may launch Drillbits from different clusters on the same physical node.

The following steps summarize the process for defining multiple Drill clusters on a single YARN cluster:

1. Create a new site directory.
2. Configure Drill.
3. Configure Drill-on-YARN.
4. Start the cluster.

The following task provides instructions for each of the steps required to configure and run multiple Drill clusters under YARN:

### *Defining Multiple Drill Clusters within YARN*

#### **About this task**

Complete the following steps to define multiple Drill clusters under YARN:

#### **Procedure**

1. Create a new "site" directory under \$DRILL\_HOME, and create an environment variable for the directory.

```
mkdir $DRILL_HOME/<site_name>
export $<SITE_NAME>_SITE=$DRILL_HOME/<site_name>
```

2. Copy the following configuration files from the existing "site" directory into the new "site" directory:
  - drill-override.conf
  - drill-env.sh
  - drill-on-yarn.conf
  - distrib-env.sh

3. Modify the settings in the `drill.exec` section of `$(DRILL_SITE)/drill-override.conf` to configure the new Drill cluster to act independently of the other Drill cluster(s), or share settings, such as storage plugin configurations. For the new Drill cluster to act independently, give `zk.root` a distinct name from the existing clusters. In the more advanced scenario where the clusters share configurations, give `zk.root` the same name as the existing Drill clusters. When the clusters share the same root, they must have distinct cluster-id values. The user, bit, and http ports must have values distinct from all the other Drill clusters.

The following example shows a number 1 added to the first digit of the default port numbers, however you can choose any available ports.

```
drill.exec: {
  cluster-id: "drillbits",
  zk: {
    root: "<site_name>"
    connect: "zk-host:5181"
  }

  rpc {
    user.server.port: 41010
    bit.server.port: 41011
  }
  http.port: 9047
}
```

4. Modify the `drill-on-yarn.conf` configuration file for the new cluster. The new cluster must have a distinct name, a distinct upload directory in the filesystem, and a distinct port number.

The following settings in the `drill.yarn` section must have distinct values for the new cluster:

```
drill.yarn: {
  app-name: "Distinct Cluster Name"

  dfs: {
    app-dir: "/upload/directory"
  }

  http : {
    port: <distinct port number>
  }
}
```

5. Start the new cluster from the "site" directory that correlates with the new cluster.

```
$(DRILL_HOME)/bin/drill-on-yarn.sh --site $NEW_SITE start
```

### Drill-on-YARN Command Line Tool

Run the Drill-on-YARN command line tool from the Drill-on-YARN client and use it to start, stop, resize, and check the status of the Drill cluster. When you launch Drill from the command line, the tool automatically archives and uploads the "site" directory, which YARN deploys (along with Drill) onto each node.

You can access the Drill-on-YARN command line tool in the following directory:

```
$(DRILL_HOME)/bin/drill-on-yarn.sh --site $(DRILL_SITE) command
```

where *command* is the operation you want to perform, such as `start`.

To avoid having to type the site argument for each command, set an environment variable:

```
export DRILL_CONF_DIR=$DRILL_SITE
```

The following example shows the start command after setting the environment variable:

```
$DRILL_HOME/bin/drill-on-yarn.sh start
```

## Command Summary

The following table lists the commands and provides a brief summary for each:

Command	Description
start	Starts the Drill cluster. Prints the startup status followed by a summary of the application.
status	Retrieves basic information about the Drill cluster.
stop	Stops the Drill cluster.
resize <value> resize + <increase_node_count_by> resize - <decrease_node_count_by>	Adds or removes nodes in the Drill cluster while the cluster runs. You can specify the exact number of nodes you want to run, or you can use +/- to increase or decrease the current node count by a certain amount.
clean	Removes the cached Drill archive from the designated DFS directory.

## Commands

The following sections provide detailed information and examples for each of the commands listed in the command summary:

### start

The start command launches Drill and provides a startup status followed by a summary of the application.

The first line in the summary displays the cluster name from the configuration file to confirm which cluster is starting.

```
Launching Drill-on-YARN...
```

The next line shows the YARN application ID and tracks the job status from Accepted to Running.

```
Application ID:
application_1462842354064_0001
Application State: ACCEPTED
Starting.....
Application State: RUNNING
```

Once the job starts, you see the YARN job tracking URL with the Drill-on-YARN web UI URL.

```
Application Master URL: http://
<YARN_Job_Tracking_URL>:8048/
```

Once the application starts, the Drill-on-YARN writes an “appid” file into the Drill installation directory:

```
ls /opt/mapr/drill/drill-<version>
...
drillbits1.appid
```

The file name is the same as the Drill cluster ID. The file contains the ID of the Drill-on-YARN application. The other commands use this ID. You can run only one Drill application at a time. If you attempt to start a second from the same client machine on which you started the first, the client command complains that the appid file already exists. If you attempt to start the cluster from a different node, the second application detects a conflict and shuts down again.

### Example

```
$DRILL_HOME/bin/drill-on-yarn.sh start

Launching Drill-on-YARN...
Application ID:
application_1462842354064_0001
Application State: ACCEPTED
Starting.....
Application State: RUNNING
Tracking
URL: http://10.250.50.31:8088/proxy/
application_1462842354064_0001/
Application Master URL: http://
10.250.50.31:8048/
```

### status

The status command retrieves basic information about the Drill cluster and provides a status summary.

The first several lines of the status summary provide information about the state of YARN, which includes the application ID, the application state, and YARN’s tracking URL for the application.

```
Application ID:
application_1462842354064_0001
Application State: RUNNING
Host: yosemite/10.250.50.31
Tracking URL:
```

Following the state of YARN information is the host on which the Drill application is running, the queue on which the application was placed, and the user who submitted the application. The start time tells you when YARN started the application.

```
http://10.250.50.31:8088/proxy/
application_1462842354064_0001/
Queue: default
User: drilluser
Start Time: 2016-05-09 16:56:40
```

The next few lines are specific to Drill, including the name of the application (which you configured in the drill-on-yarn.conf configuration file), the Drill

Application Master URL, the number of Drillbits you requested to run, and the number actually running.

```
Application Name: Drill-on-YARN
AM State: LIVE
Target Drillbit Count: 1
Live Drillbit Count: 1
```

Finally, the last line provides the URL for the Drill-on-YARN web UI.

```
For more information, visit: http://
10.250.50.31:8048/
```

### Example

```
$DRILL_HOME/bin/drill-on-yarn.sh
status

Application ID:
application_1462842354064_0001
Application State: RUNNING
Host: yosemite/10.250.50.31
Tracking
URL: http://10.250.50.31:8088/proxy/
application_1462842354064_0001/
Queue: default
User: drilluser
Start Time: 2016-05-09 16:56:40
Application Name: Drill-on-YARN
AM State: LIVE
Target Drillbit Count: 1
Live Drillbit Count: 1
For more information, visit: http://
10.250.50.31:8048/
```

### stop

The stop command stops the Drill cluster. This command is forceful and kills any in-flight queries. The output tracks the shutdown and displays the final YARN application status.

### Example

```
$DRILL_HOME/bin/drill-on-yarn.sh stop

Stopping Application ID:
application_1462842354064_0001
Stopping...
Stopped.
Final status: SUCCEEDED
```

### resize

The resize command changes the number of nodes in the cluster. You can use this command to add or remove nodes in the Drill cluster as it runs. You can specify the change either by giving the number of nodes you want to run, or by using the + or - to specify the change in node count.

Drill adds nodes only if additional nodes are available from YARN. If you request to stop more nodes than are running, Drill stops all of the running nodes.

**Example**

```
$DRILL_HOME/bin/drill-on-yarn.sh
resize 10
$DRILL_HOME/bin/drill-on-yarn.sh
resize +2
$DRILL_HOME/bin/drill-on-yarn.sh
resize -3
```

**clean**

The clean command removes the cached Drill archive from the designated DFS directory. If you run Drill-on-YARN for a temporary cluster, Drill leaves the Drill software archive in your designated DFS directory. Specifically, the first start uploads the Drill archive to DFS. Stop leaves the archive in DFS. Subsequent start commands reuse the cached archive if it is the same size as the version on the local disk. Clean removes the cached file, forcing Drill to upload a fresh copy if you again restart the Drill cluster.

**Example**

```
$DRILL_HOME/bin/drill-on-yarn.sh clean
```

**Application Master Web UI**

Drill, running as a YARN application, provides the Drill-on-YARN Application Master (AM) process to manage the Drill cluster. The Drill AM provides a web UI where you can monitor cluster status and perform simple operations, such as increasing or decreasing cluster size, or stopping the cluster.

When you launch Drill using the Drill-on-YARN command line tool, the tool signals YARN to launch the AM, which in turn launches the Drillbits in the cluster. When Drill starts, you can access the web UI using the URL provided at startup.

The following sections describe the information that the Application Master web UI provides:

**Main**

The main page provides the following information about the Drill cluster:

**Drill Cluster Status**

The Drill cluster status show the state of the Drill cluster, which is one of the following:

- **LIVE:** This is the normal state and shows that the Drill cluster is running.
- **ENDING:** The cluster is in the process of shutting down

There is no “ENDED.” state. When the cluster shuts down, the web UI is no longer available.

**Target Drillbit Count**

The target Drillbit count is the number of Drillbits to run in the cluster. The actual number may be less if Drillbits have not yet started, or if YARN cannot allocate enough containers.

**Live Drillbit Count**

The live Drillbit count is the number of Drillbits that are ready for use. These have successfully started, have registered with ZooKeeper, and are ready for use. You can see the detail of all Drillbits (including those in the process of starting or stopping) using the Drillbits page. Each Drillbit must run on a separate node, so

	this is also the number of nodes in the cluster running Drill.
<b>Total Drillbit Memory and Virtual Cores</b>	The total number of YARN resources currently allocated to running Drillbits.
<b>YARN Node Count, Memory, and Virtual Cores</b>	Reports general information about YARN itself including the number of nodes, the total cluster memory, and total number of virtual cores.
<b>Groups</b>	Lists the cluster groups defined in the configuration file (only one is currently supported), along with the target and actual number of Drillbits in that group.

## Configuration

The configuration page shows the complete set of configuration values used for the current run. The values come from the configurations you set and the Drill-provided defaults. Use this page to diagnose configuration-related issues. Names are shown in fully-expanded form. That is the name “drill.yarn.http.port” refers to the parameter defined, as follows, in your configuration file:

```
drill.yarn:
  http: {
    port: 8048
  }
}
```

## Drillbits

The Drillbits page provides the following information about each of the Drillbits:

<b>ID</b>	A sequential number assigned to each new Drillbit. Numbers may not start with 1 if you have previously shut down some Drillbits.
<b>Group</b>	The cluster group that started the Drillbit. Cluster groups configured in drill-on-yarn.conf.
<b>Host</b>	The host name or IP address on which the Drillbit runs. If the Drillbit is in a normal operating state, this field is also a hyperlink to the Web UI for the Drillbit.
<b>State</b>	The operating state of the Drillbit. The normal state is “Running.” The Drillbit passes through a number of states as YARN allocates a container and launches a process, as the AM waits for the Drillbit to become registered in ZooKeeper, and so on. Similarly, the Drillbit passes through a different set of states during shutdown. Use this value to diagnose problems. If the Drillbit is in a live state, this field shows an “[X]” link that you can use to kill this particular Drillbit. Use this if the Drillbit has startup problems or seems unresponsive. During the shut-down process, the kill link disappears and is replaced with a “Cancelled” note.
<b>ZK State</b>	The ZooKeeper handshake state. Normal state is “START_ACK”, meaning that the Drillbit has registered with ZooKeeper. This state is useful when diagnosing problems.
<b>Container ID</b>	The YARN-assigned container ID for the Drillbit task. The ID is a link that takes you to the YARN Node Manager UI for the Drillbit task.

**Memory and Virtual Cores (vcores)**

The amount of resources actually allocated to the Drillbit by YARN.

**Start Time**

The date and time (in your local time-zone, displayed in ISO format) when the Drillbit launch started. This page also displays unmanaged Drillbits, if present. An unmanage Drillbit is one that is running, has registered with ZooKeeper, but was not started by the Application Master. Likely, the Drillbit was launched using the Drillbit.sh script directly. Use the host name to locate the machine running the Drillbit if you want to convert the Drillbit to run under YARN.

**Manage**

The Manage page provides options to resize or stop the Drill cluster. You can resize the cluster by adding or removing Drillbits or setting the cluster to a specific size.

Drill is a long-running application. Typically, Drill runs indefinitely, and you would only shut down the Drill cluster to perform an upgrade of the Drill software or to change configuration options. When you terminate the Drill cluster, any in-progress queries fail. Therefore, best practice is to perform the shutdown with users so that Drill is not processing any queries at the time of the shut-down.

When removing or shutting-down the cluster, you receive a confirmation page asking if you really do want to stop Drillbit processes. Click **Confirm** to continue.

**History**

The History page lists all failed, killed, and restarted Drillbits. You can detect failures and diagnose problems using the information on this page. Use the YARN container ID listed on this page to locate the log files for the Drillbit.

*Enabling Application Master Web UI Security*

By default, the Application Master Web UI is not secure and open to everyone. You can configure user authentication or implement a simple, predefined user name and password to secure the UI. Modify the drill-on-yarn.conf configuration file to enable Drill-on-YARN security.

The following sections describe how to enable security for the Application Master web UI.

**User Authentication**

You must enable [user authentication](#) in Drill if you want Drill-on-YARN to use this feature for security purposes. When user authentication is enabled, the user name and password must match that of the user that started the Drill-on-YARN application.

To secure the Application Master web UI by way of user authentication, modify `drill-on-yarn.conf` to include the following section with the `auth-type` set to `drill`:

```
drill.yarn.http: {
  auth-type: "drill"
}
```

**Simple Security**

Define a username and password in `drill-on-yarn.conf` and then restart the Drill-on-YARN Application Master to implement simple security for the Application Master web UI.

Modify the `drill-on-yarn.conf` configuration file to include the following section, replacing the user-name and password settings with yours, and then restart the Drill-on-YARN Application Master:

```
drill.yarn.http: {
  auth-type: "simple"
  user-name: "tsmith"
  password: "secret"
}
```

When you visit the web UI, a login page prompts you for the username and password that you configured. These are the only valid credentials.

### Drill-on-YARN Limitations

Drill-on-YARN has the following limitations:

#### Hanging requests

Drill-on-YARN and YARN “hang” if YARN cannot fulfill a container request. YARN provides no information about why a request “hangs.”

#### /tmp directory

The default YARN settings cause Drillbits to become unmanaged within a short amount of time due to a /tmp directory issue. See the Exclude the YARN Container Directory from tmpwatch section in [Step 3: Configure YARN to Run Drill](#) for information on how to resolve the issue.

#### Container size

The default YARN settings do not allow a default Drill cluster to run due to the default YARN container size. See the Increase Maximum Container Size section in [Step 3: Configure YARN to Run Drill](#) for information on how to resolve the issue.

#### Drill disk usage

You can specify Drill disk usage to YARN, but Drill will use all disks regardless of the setting. There is no effective way to manage a Drill cluster that:

- resizes based on load.
- is rack-aware in its smaller state.

YARN chooses arbitrary nodes perhaps resulting in large network reads. (MD-1028, MD-1089)

#### Node Labels

Although the Apache YARN documentation states that you can associate node labels with YARN container requests, some people have noticed that the feature does not work in practice. While Drill-on-YARN configuration has settings to associate Drillbit container requests with node labels, doing so is not supported. To use node labels, associate node labels with YARN queues as described in the YARN configuration step in the [Migrate Drill to Run Under YARN](#) documentation.

### Configuring Drill-on-Yarn on a Secure Cluster

Describes how to enable SASL for Drill and SQLLine to run Drill-on-YARN in a secure cluster.

#### About this task

Update the `drill_home/conf/distrib-env.sh` file with the required options. If you use `--site`, then use your site directory.

The following options are required for Drill and SQLLine to work with SASL security:

```
-Ddrill.customAuthFactories=org.apache.drill.exec.rpc.security.maprsasl.MapRSaslFactory
-Dzookeeper.sasl.client=true
-Djava.security.auth.login.config=/opt/mapr/conf/mapr.login.conf
-Dzookeeper.saslprovider=com.mapr.security.maprsasl.MapRSaslProvider
-Dhadoop.login=hybrid_keytab
```

The following sections describe how to update the `drill_home/conf/distrib-env.sh` file with the options to ensure that Drill and SQLLine work with SASL for security.

### Drill

To make Drill work with SASL, set `DRILL_JAVA_OPTS` as shown:

```
export DRILL_JAVA_OPTS="$
{DRILL_JAVA_OPTS} -Ddrill.customAuthFactories=org.apache.drill.exec.rpc.security.maprsasl.MapRSaslFactory -Dzookeeper.sasl.client=true -Djava.security.auth.login.config=/opt/mapr/conf/mapr.login.conf -Dzookeeper.saslprovider=com.mapr.security.maprsasl.MapRSaslProvider -Dhadoop.login=hybrid_keytab"
```

### SQLLine

To make SQLLine work with SASL, set `SQLLINE_JAVA_OPTS` as shown:

```
export SQLLINE_JAVA_OPTS="$
{SQLLINE_JAVA_OPTS} -Ddrill.customAuthFactories=org.apache.drill.exec.rpc.security.maprsasl.MapRSaslFactory -Dzookeeper.sasl.client=true -Djava.security.auth.login.config=/opt/mapr/conf/mapr.login.conf -Dzookeeper.saslprovider=com.mapr.security.maprsasl.MapRSaslProvider"
```

**TIP:** The following table describes each of the options:

Option	Description
drill.customAuthFactories	Required to make Drill and SQLLine work with SASL. It points to the authentication factories used for authentication. Provides a full classpath to the SASL implementation.
zookeeper.sasl.client	Required to make Drill and SQLLine work with Zookeeper in a SASL-enabled environment and ZooKeeper client authentication. It enables or disables SASL authentication in Drill and SQLLine for ZooKeeper connections.
zookeeper.saslprovider	Required to make Drill and SQLLine work with ZooKeeper in a SASL-enabled environment and ZooKeeper client authentication. It points to the authentication factories used for authentication in Drill and SQLLine for ZooKeeper connections. Provides a full classpath to the SASL implementation.
java.security.auth.login.config	Required to make Drill and SQLLine work with security. It points to a file with JAAS configurations. In the HPE environment it is <code>/opt/mapr/conf/mapr.login.conf</code> .
hadoop.login=hybrid_keytab	Required to make Drill work with SASL security. It points to the required JAAS configuration name.

## Configuring Drill

Lists the data-fabric-specific configuration for Drill.

Drill is highly configurable. This document focuses on data-fabric-related configurations and refers to the open source [Apache Drill documentation](#) for generic information. Key things to configure are:

### Drill memory

Determine the amount of heap and direct memory allocated to a Drillbit for query processing in a Drill cluster. See [Configuring Drill Memory](#) on page 3984.

### Parquet block size

Change the Parquet block size to match the filesystem chunk size. See [Configuring the Parquet Block Size](#) on page 3986.

### Resources for a shared Drillbit

Configure queues and parallelization for supporting multiple users sharing a Drillbit. Support separate Drillbits running on different nodes in the cluster. See [Configuring Resources for a Shared Drillbit](#).

### Multitenancy

Configure a multitenant cluster to account for resources required for Drill. See [Configuring a Multitenant Cluster](#) on page 3991.

### User Impersonation

Configure impersonation to allow a service to act on behalf of a client while performing the action requested by the client. See [User Impersonation](#) on page 4033.

### User authentication and encryption

Configure user authentication when you want the identity of a user, before permitting the user access to a process running on a system. See [Default Security \(Tickets\)](#) on page 4045.

### SSL/TLS for Encryption

Enable and configure SSL/TLS for encryption when you need to use Plain authentication. See [SSL/TLS for Encryption](#) on page 4065.

### Drill impersonation with Hive authorization

Configure Drill impersonation to work with Hive impersonation to authorize access to metadata in the Hive metastore repository and data in the Hive warehouse. See [User Impersonation with Hive](#) on page 4039.

**Volumes to use for spooling**

Use the [drill.exec.spill.directories](#) option to set MapReduce volumes or local volumes for spooling to improve performance and stripe data across as many disks as possible.

**Persistent configuration storage**

See [Persistent Configuration Storage](#) and [Configuring the ZooKeeper PStore Location](#) on page 3992.

**Access rights**

Configure access rights if you have 777 file-level permissions to a table, and a query returns no results. See [Configuring Access Rights](#).

Drill typically runs along side other workloads, including the following:

- MapReduce
- Yarn
- Hive and Pig
- Spark

You need to plan and configure these resources for use with Drill and other workloads:

- Memory
- CPU
- Disk

**Configuring Access Rights**

If the security in your organization limits access to HPE Ezmeral Data Fabric Database tables, you might experience a problem querying the tables. If you have 777 file-level permissions to a table, yet a query returns no results, you might need to add your user name to the maprccli [ACL](#).

**Adding a Drill Node to a Cluster****About this task**

To add a new node to a cluster that provides the Drillbit service, add the node to the cluster first, and then install Drill on the new node. If you install Drill first, and then add the node to the cluster, the cluster cannot detect ZooKeeper information and the cluster is misnamed. These problems require some work to resolve. You need to edit the `drill-override.conf` file in the `mapr/drill` directory and modify the name of the cluster. Avoid this extra work, and install Drill only after adding the node to the cluster by performing steps in the following order:

**Procedure**

1. Follow instructions for [adding a node to a cluster](#).
2. Reconfigure the cluster as described in the same instructions.
3. Verify that the new node is up and running.
4. Stop Warden, as shown:

```
$ service mapr-warden stop
```

5. Stop ZooKeeper service, as shown:

```
$ service mapr-zookeeper stop
```

6. [Configure the repository](#) to add the ecosystem repository.
7. [Install Drill](#) on the new node.
8. Reconfigure the node.

```
$ /opt/mapr/server/configure.sh -R
```

9. Start ZooKeeper if the node is a ZooKeeper node.
10. Start warden to make configuration changes effective.

## Results

Verify that the Drillbit service is running on the node. It might take a minute or so for the Drillbit to start after starting warden.

### Configuring Drill Memory

A system administrator can modify the amount of system memory that Warden allocates to the Drill service on each node in the `warden.drill-bits.conf` file. Drill users, with file permissions, can modify the amount of heap and direct memory allocated to the Drill service on each node in the `drill-env.sh` file.

**NOTE:** The cumulative memory allocation in `drill-env.sh` cannot exceed the memory allocation in `warden.drill-bits.conf`.

After modifying `drill-env.sh`, restart Drill:

```
$ maprcli node services -name drill-bits -action restart -nodes
<space-separated-list-of-drill-hostnames>
```

After modifying `warden.drill-bits.conf`, run the configuration script, [configure.sh](#), to update the node configuration and then restart Drill:

```
/opt/mapr/server/configure.sh -R
$ maprcli node services -name drill-bits -action restart -nodes
<space-separated-list-of-drill-hostnames>
```

The following sections describe the `warden.drill-bits.conf` and `drill-env.sh` files in detail.

### Drill Memory Allocation in a Warden-Managed Cluster

If you install and run Drill under the Warden service, Warden manages the amount of system memory that Drill can use. By default, Warden allocates 20% of the system memory on a node to the Drill service. For example, if a node has 50GB of memory, Warden allocates 10GB (20% of 50GB) to the Drill service.

A system administrator can define the amount of memory that Warden allocates to Drill by changing the value of the `DRILLBIT_MAX_PROC_MEM` variable in `/opt/mapr/drill/drill-<version>/conf/warden.drill-bits.conf`.

When starting, Drill verifies that the amount of memory configured in `drill-env.sh` does not exceed the limit set by the `service.env=DRILLBIT_MAX_PROC_MEM` variable in `warden.drill-bits.conf`. If the settings in `drill-env.sh` exceed the setting in Warden, the system prints a message stating the issue; Warden does not start the Drill service on the node.

The `warden.drill-bits.conf` file contains the following settings:

 **NOTE:** Drill automatically configures the `service.heapsize` parameters. Do not modify them.

```
#Default Drill Mem Distrib: 20% of System memory
service.env=DRILLBIT_MAX_PROC_MEM=20%
//Specifies the maximum amount of memory that Warden will allocate to the
Drill service on the node. You can set this value as a percentage of system
memory or as an absolute value in GB. Memory configured in drill-env.sh
cannot exceed this memory setting.

service.heapsize.min=5120
//Minimum heap size. Do not change this value. The value is auto-populated
and represents the minimum memory that the Drillbit process will take.

service.heapsize.max=13312
//Maximum heap size. Do not change this value. The value is auto-populated
and represents the maximum memory that the Drillbit process will take.

#Warden will allocate 20% of memory for Drill
service.heapsize.percent=20
//Do not change this value. Total heap size available based on the value
set for the DRILLBIT_MAX_PROC_MEM variable. If the variable is defined in
absolute values, it is represented as a percent of the system memory.
```

### Drill Memory Allocation in drill-env.sh

You can configure the amount of heap and direct memory allocated to Drill on each node in the `/opt/mapr/conf/conf.d/drill-env.sh` file. If you do not manually configure the heap and direct memory, Drill calculates these values based on the amount of system memory that Warden allocates to Drill and auto-populates the settings for the variables.

The cumulative amount of memory allocated to Drill in `drill-env.sh` cannot exceed the amount of memory that Warden allocates to Drill, which is set by the `DRILLBIT_MAX_PROC_MEM` variable in `warden.drill-bits.conf`.

 **NOTE:** The values in `drill-env.sh`, such as 13G, are examples and do not indicate the default memory limits for Drill. By default, Warden allocates 20% of the system memory on a node to Drill.

The `drill-env.sh` file contains the following memory variables that you can uncomment and modify:

```
#export DRILLBIT_MAX_PROC_MEM=${DRILLBIT_MAX_PROC_MEM:-"13G"}
//Specifies the maximum amount of system memory that the Drill service
can use on a node. Must be equal to or less than the value set for
DRILLBIT_MAX_PROC_MEM in warden.drill-bits.conf. You can set this value as
a percentage of system memory or as an absolute value in GB. If you define
this variable, without defining the heap and direct memory variables, Drill
automatically calculates the heap and direct memory values.

#export DRILL_HEAP=${DRILL_HEAP:-"4G"}
//Maximum theoretical heap limit for the JVM per node.

#export DRILL_MAX_DIRECT_MEMORY=${DRILL_MAX_DIRECT_MEMORY:-"8G"}
//Java direct memory limit per node.

#export DRILLBIT_CODE_CACHE_SIZE=${DRILLBIT_CODE_CACHE_SIZE:-"1G"}
//The memory limit for the compiled code generated by the JVM JIT compiler.
Do not modify. The value for this parameter is auto-computed based on the
heap size and cannot exceed 1GB.
```

 **NOTE:** If performance is an issue, add `-Dbounds=false`, as shown:

```
export DRILL_JAVA_OPTS="$DRILL_JAVA_OPTS -Dbounds=false"
```

### Configuring the Parquet Block Size

The default value for the `store.parquet.block-size` parameter is 268435456 (256 MB), the same size as file system chunk sizes. In previous versions of Drill, the default value was 536870912 (512 MB).

If you change the file system chunk size, change the Parquet block size to match using the [ALTER SYSTEM](#) or [SET](#) commands, as shown:

```
ALTER SYSTEM SET `store.parquet.block-size` = <value>;
[ALTER SESSION] SET `store.parquet.block-size` = <value>
```

Alternatively, you can override the default setting in the `<DRILL_HOME>/conf/drill-override.conf` file, as shown:

```
drill.exec: {
  ...
  options.store.parquet.block-size = 268435456
}
```

For information about setting the file system chunk size, see [Setting Chunk Size](#).

### Configuring Multiple Drill Clusters and Designating One Cluster as an OJAI Distributed Query Service

As of Core 6.0 and Drill 1.11, you can run operational queries through the OJAI Distributed Query Service, as well as analytical queries through Drill. If you want to run operational and analytical workloads in your cluster, you must configure multiple Drill clusters within the cluster and then configure a Drill cluster as the OJAI Distributed Query Service. Restricting each workload to its own cluster improves query performance.

 **NOTE:** Installing Drill and the OJAI Distributed Query Service together through the Installer is not currently supported. Only one of these services running in the cluster is supported unless you manually install and configure multiple Drill clusters, as instructed here.

### Data Distribution

If you install both Drill and the OJAI Distributed Query Service through the Installer, both workloads get processed across the entire cluster. When both services run together in the cluster, the system replicates data across the entire cluster, causing remote reads and impairing performance, which can lead to missed SLAs and memory issues.

### Memory Allocation

The amount of memory allocated to Drill and the OJAI Distributed Query Service differ. By default, when you install Drill, 13 GB of memory is allocated to the Drillbit service running on a node:

- 8 GB direct
- 4 GB heap
- 1 GB core cache

The OJAI Distributed Query Service less memory than Drill. By default, the OJAI Distributed Query Service is allocated ~ 5 GB of memory:

- 1 GB direct
- 3 GB heap

- 512 MB core cache

If you use the Installer and select both Drill and the OJAI Distributed Query Service, memory is configured for Drill. If you only run operational queries, which do not use as much memory as analytical queries, you unnecessarily lose an additional 8 GB of memory.

### How to Run Drill and the OJAI Distributed Query Service Together in a Cluster

You can manually install Drill on several nodes and divide the nodes into multiple topologies (Drill clusters). For each of the topologies, create and mount a volume. Then, create directories within each volume to store your data. Configure these directories as workspaces in the Drill dsf storage plugin. Finally, configure a Drill cluster to run as an OJAI Distributed Query Service.

The following topics provide instructions for each of the required steps:

#### Step 1: Plan the Clusters

Decide which nodes in the cluster you want to run Drill and which nodes you want to run the OJAI Distributed Query Service.

The nodes you select to run Drill can form one or more Drill clusters, while the nodes you select to run the OJAI Distributed Query Service can form another Drill cluster. You can configure multiple Drill clusters.

For example, if you have a ten node cluster, you can configure one Drill cluster to run analytical queries and one OJAI Distributed Query Service cluster to run OJAI operational queries, as shown:

Track the nodes that you want to group into a cluster, as this information is needed to configure node topology and volumes. Also note the memory requirements of each service. Only non-overlapping Drill clusters are supported. You cannot install more than one Drillbit on a server node.

#### Step 2: Manually Install Drill on All Nodes

Manually install Drill on all nodes, including the nodes designated to run the OJAI Distributed Query Service.

For Drill installation instructions, see [Installing Drill](#). You can install Drill to run under Warden or YARN, as described in the following following topics:

- [Install Drill to Run Under Warden](#)
- [Install Drill to Run Under YARN](#)

#### Step 3: Define Node Topologies

Node topologies restrict data to a designated set of nodes.

When you define a topology, data is only replicated on the nodes within the topology. Node topologies improve query performance because data is localized to the nodes specified in the topology instead of being distributed across the entire cluster.

You can create node topologies for the Drill clusters in the UI or from the CLI. See [Changing Topology for One or More Nodes](#) for instructions.

When you create a topology, you define the nodes that form a Drill cluster, as shown in the following image:

The image shows two node topologies, T1 and T2. T1 is the Drill cluster to be configured as the OJAI Distributed Query Service. T2 is the Drill cluster that will remain a Drill service cluster.

**Step 4: Create Volumes**

Volumes organize data and manage cluster performance. Create and mount a volume to each of the topologies (Drill clusters) you created.

For example, you can create a volume named "operational" and mount it to the T1 topology and then create a volume named "analytical" and mount it to the T2 topology.

See [Administering Volumes](#) for volume information and [Creating a Volume](#) on page 1169 for instructions.

Once you create the volumes, you have a place where you can create directories and store data. For example, you can create and store operational data in the `/operational/data/here` directory and analytical data in the `/analytical/data/here` directory.

Use these directories to configure the workspaces in the Drill dfs storage plugin configuration.

**Step 5: Configure Multiple Drill Clusters**

Update the `/opt/mapr/drill/drill-<version>/conf/drill-override.conf` file on each Drill node that is part of a cluster with the cluster ID and a ZooKeeper entry to define the Drill cluster. Each Drill cluster should have a unique cluster ID and ZooKeeper entry to separate the clusters.

**NOTE:** Each Drill node in a cluster must have the same configuration.

The Drillbit process reads the configuration file and communicates with ZooKeeper to see if the cluster it belongs to exists. If the cluster exists, ZooKeeper says to join the cluster. If the cluster does not exist, the Drillbit initiates a new Drill cluster based on the cluster ID.

The following table provides an example of unique cluster IDs and ZooKeeper entries based on the topologies in the image shown in step 3, Define Node Topologies:

Cluster	Nodes	Cluster ID	ZooKeeper Entry
QS1	10.10.100.1 10.10.100.2	cluster-id: "drillbits"	zk.root: "drill"

D1	10.10.100.3	cluster-id: "drillbits2"	zk.root: "drill2"
	10.10.100.4		
	10.10.100.5		
	10.10.100.6		
	10.10.100.7		
	10.10.100.8		
	10.10.100.9		
	10.10.100.10		

For QS1, drill-override.conf must include the following configuration:

```
drill.exec: {
  zk.root: "drill",
  cluster-id: "drillbits",
  zk.connect: "<zk-node-ip-address>:5181",
}
```

For D1, drill-override.conf must include the following configuration:

```
drill.exec: {
  zk.root: "drill2",
  cluster-id: "drillbits2",
  zk.connect: "<zk-node-ip-address>:5181",
}
```

**NOTE:** If you installed Drill to run under YARN, follow the steps in [Defining Multiple Drill Clusters Under YARN](#) for each Drill node. Drill running under YARN requires some additional steps, such as changing ZooKeeper ports.

#### Step 6: Configure Workspaces

You must configure a workspace on one Drill node in each Drill cluster that points to the volume directory where data is stored. When you create a workspace, you must include the volume mount point.

For example, if you created a volume with the mount point `/operational` for the OJAI Distributed Query Service cluster and stored your data in `/data/here/` within that volume, you would configure the workspace, as shown:

```
{
  "type": "file",
  "enabled": true,
  "connection": "file:///",
  "workspaces": {
    "root": {
      "location": "/",
      "writable": false,
      "defaultInputFormat": null
    },
    "tmp": {
      "location": "/tmp",
      "writable": true,
      "defaultInputFormat": null
    },
    "operational": {
      "location": "/operational/data/here",
      "writable": true,
      "defaultInputFormat": null
    }
  }
}
```

```
    }
}
```

Likewise, if you also created a volume with a mount point `/analytical` for the other Drill cluster that runs analytical queries and stored your data in `/data/here/` within that volume, you would configure the workspace, as shown:

```
{
  "type": "file",
  "enabled": true,
  "connection": "file://",
  "workspaces": {
    "root": {
      "location": "/",
      "writable": false,
      "defaultInputFormat": null
    },
    "tmp": {
      "location": "/tmp",
      "writable": true,
      "defaultInputFormat": null
    },
    "analytical": {
      "location": "/analytical/data/here",
      "writable": true,
      "defaultInputFormat": null
    }
  }
}
```

You can define a workspace in the Drill dfs storage plugin configuration on the Storage page in the Drill Web UI at `https://<drill-node-ip-address>:8047`. You only need to configure the workspace on one Drill node in each Drill cluster.

See [Plugin Configuration Basics](#) and [Workspaces](#) for more information.

#### *Step 7: Register a Drill Cluster as an OJAI Distributed Query Service*

You can select any of the configured Drill clusters to act as the OJAI Distributed Query Service provider for operational queries, by running the `queryservice setconfig` command.

When you register the Drill cluster as the OJAI Distributed Query Service, adjust the memory setting on each node. The default Drill memory setting of 13 GB is unnecessarily high for the OJAI Distributed Query Service, which only requires ~ 5 GB. You must restart the Drillbits after you update the memory settings.

### Registering a Drill Cluster as the OJAI Distributed Query Service

To register a Drill Cluster as an OJAI Distributed Query Service, run the following command:

```
maprcli cluster queryservice setconfig -enabled true -clusterid
<name_of_cluster> -storageplugin dfs -znode <zk_setting>
```

For example, `drillbits2` and `drill2` are the cluster ID and ZooKeeper settings used in examples in previous steps. For these configurations, the command is:

```
maprcli cluster queryservice setconfig -enabled true -clusterid
drillbits2 -storageplugin dfs -znode drill2
```

See [queryservice setconfig](#) for more information about the command.

## Configuring Memory for the OJAI Distributed Query Service

Modify the memory settings on each node in the OJAI Distributed Query Service cluster and then restart Drill. See [Configuring Drill Memory](#) on page 3984 for instructions.

## Configuring a Multitenant Cluster

Drill operations are memory and CPU-intensive. Currently, Drill resources are managed outside of any cluster management service, such as the Warden service. In a multi-tenant or any other type of cluster, YARN-enabled or not, you configure memory and memory usage limits for Drill by modifying `drill-env.sh` as described in the section, "[Configuring Drill Memory](#)" in Apache Drill documentation.

Configure a multitenant cluster to account for resources required for Drill. For example, on a cluster, ensure warden accounts for resources required for Drill. Configuring `drill-env.sh` allocates resources for Drill to use during query execution, while configuring the following properties in `warden-drill-bits.conf` prevents warden from committing the resources to other processes.

```
service.heapsize.min=<some value in MB>
service.heapsize.max=<some value in MB>
service.heapsize.percent=<a whole number>
```

Set the `service.heapsize` properties in `warden.drill-bits.conf` regardless of whether you changed defaults in `drill-env.sh` or not.

"[Configuring Drill in a YARN-enabled MapR Cluster](#)" shows an example of setting the `service.heapsize` properties. The `service.heapsize.percent` is the percentage of memory for the service bounded by minimum and maximum values. Typically, users change `service.heapsize.percent` because using a percentage setting increases or decreases resources according to different node configurations. For more information about the `service.heapsize` properties, see the section, "[warden.<servicename>.conf](#)."

You need to statically partition the cluster to designate which partition handles which workload. To configure resources for Drill in a cluster, modify one or more of the files created by the installation process in `/opt/mapr/conf/conf.d`:

```
warden.drill-bits.conf
warden.nodemanager.conf
warden.resourcemanager.conf
```

Configure Drill memory by modifying `warden.drill-bits.conf` in YARN and non-YARN clusters. Configure other resources by modifying `warden.nodemanager.conf` and `warden.resourcemanager.conf` in a YARN-enabled cluster.

## Configuring Drill in a YARN-enabled Cluster

To add Drill to a YARN-enabled cluster, change memory resources to suit your application. For example, you have 120G of available memory that you allocate to following workloads in a Yarn-enabled cluster:

File system = 20G Yarn = 20G OS = 8G

If Yarn does most of the work, give Drill 20G, for example, and give Yarn 60G. If you expect a heavy query load, give Drill 60G and Yarn 20G.

YARN consists of two main services:

- ResourceManager: There is at least one instance in a cluster, more if you configure high availability.
- NodeManager: There is one instance per node.

The `warden.resourcemanager.conf` and `warden.nodemanager.conf` files set ResourceManager and NodeManager memory to the following defaults:

```
service.heapsize.min=64
service.heapsize.max=325
service.heapsize.percent=2
```

Change these settings for NodeManager and ResourceManager to reconfigure the total memory required for YARN services to run. If you want to place an upper limit on memory, set the `YARN_NODEMANAGER_HEAPSIZE` or `YARN_RESOURCEMANAGER_HEAPSIZE` environment variable in

```
/opt/mapr/hadoop/hadoop-2.5.1/etc/hadoop/yarn-env.sh
```

You do not set the `-Xmx` option, allowing memory to grow as needed.

### MapReduce Version 2 and other Resources

You configure memory for each service by setting three values in `warden.conf`.

```
service.command.<servicename>.heapsize.percent
service.command.<servicename>.heapsize.max
service.command.<servicename>.heapsize.min
```

[Configure memory](#) for other services in the same manner. For more information about managing memory in a cluster, see the following sections:

- [Memory Allocation for Nodes](#)
- [Cluster Resource Allocation](#)

### How to Manage Drill CPU Resources

Currently, you do not manage CPU resources within Drill. Use Linux [cgroups](#) to manage the CPU resources.

### Configuring the ZooKeeper PStore Location

By default, the ZooKeeper PStore offloads query profile data to `maprfs:///apps/drill/profiles`. You can override the default location in the `drill-override.conf` file.

When query profile data is stored on a distributed system, like the data-fabric filesystem, you can see a [global query list](#) (view of query profiles coordinated by all Drill nodes in one Web UI).

To change the [ZooKeeper PStore](#) location, update the `drill.exec` block in `/opt/mapr/drill/drill-<version>/conf/drill-override.conf` with the following configuration, as shown:

```
drill.exec: {
  cluster-id: "my_cluster_com-drillbits",
  zk.connect: "<zkhostname>:5181",
  sys.store.provider.zk.blobroot: "maprfs:///new/storage/location/"
}
```

**NOTE:** By default, the filesystem replicates the data three times. If you are concerned about storage consumption, you can create a new volume specifically for query profile data, and set the replication value to 1 for that volume. After you create the volume, update `sys.store.provider.zk.blobroot` to point to the volume. See [Creating a Volume](#) on page 1169 for additional information.

After you modify `drill-override.conf`, restart Drill:

```
maprcli node services -name drill-bits -action restart -nodes
<drill-hostnames-separated-by-a-space>
```

### Configuring HBase Persistent Storage Tables

Describes how to configure Drill to persist query profile data to a table that is unaffected by the TTL duration.

You can configure HBase persistent storage tables that do not have a TTL in the following versions of Drill:

- Drill 1.16.0.500 (EEP-8.1.1)
- Drill 1.20.2 (EEP 9.0.0 on Core 7.1.0) and later

By default, the Drill HBase persistent store persists the following information in one HBase table:

- Query profile data
- State information for storage plugins
- State information for ALTER SYSTEM settings

Data persists in the HBase table for the duration of the configured TTL, after which the data is automatically removed to free up space.

You can configure the system to persist query profiles to another table that does or does not have a TTL configured. Query profiles persist in the table until the query profiles are deleted or the TTL expires.

The following section describes how to configure HBase persistent storage.

### Persistent Storage Configurations

Configure HBase persistent storage through the `sys.store.provider.hbase.table` option in the `/opt/mapr/drill/drill-<version>/conf/drill-override.conf` or `/opt/mapr/drill/drill-<version>/conf/drill-distrib.conf` file.

The following sections provide HBase persistent storage configuration options.

 **IMPORTANT:** For insecure Data Fabric clusters (maprsasl disabled), exclude the `hbase.security.authentication` property from the configuration.

#### Default Persistent Storage Configuration

The following example configuration shows the default persistent storage configuration:

```
drill.exec.sys.store.provider: {
  class:
  "org.apache.drill.exec.store.hbase.con
fig.HBasePStoreProvider",
  hbase: {
    table: "drill_store",
    config: {
      "hbase.zookeeper.quorum":
"node1.com,node2.com,node3.com",

      "hbase.zookeeper.property.clientPort":
"5181",

      "hbase.security.authentication":
"maprsasl"
    }
  }
}
```

```
}
}
```

With this configuration, the HBase table `drill_store` stores query profile data and state information for storage plugins and ALTER SYSTEM settings until they expire based on the set TTL.

### Query Profile Persistent Storage Configuration

If you want to store query profile data in a separate table, add the `drill.exec.sys.store.provider.hbase.blob.table` property to the persistent storage configuration, as shown in the following example:

```
drill.exec.sys.store.provider: {
  class:
  "org.apache.drill.exec.store.hbase.config.HBasePStoreProvider",
  hbase: {
    blob.table: "drill_blob_store",
    table: "drill_store",
    config: {
      "hbase.zookeeper.quorum":
      "node1.com,node2.com,node3.com",
      "hbase.zookeeper.property.clientPort":
      "5181",
      "hbase.security.authentication":
      "maprsasl"
    }
  }
}
```

With this configuration, the Hbase table `drill_blob_store` stores query profiles only. The HBase table `drill_store` stores storage plugins and ALTER SYSTEM settings.

 **IMPORTANT:** Drill cannot access query profile data stored in `hbase.table` (`drill_store`) after you configure `blob.table` (`drill_blob_store`).

### Configuring cgroups to Control CPU Usage

Starting in Drill 1.13, you can configure a Linux cgroup (control group) to enforce CPU limits on the Drillbit service running on a node. Linux cgroups enable you to limit system resources to defined user groups or processes. You can use the `cgconfig` service to configure a Drill cgroup to control CPU usage and then set the CPU limits for the Drill cgroup on each Drill node in the `/etc/cgconfig.conf` file.

 **NOTE:** Cgroups V2 is recommended.

### Before You Begin

Each Drill node must have the `libcgroup` package installed to configure CPU limits for a Drill cgroup. The `libcgroup` package installs the `cgconfig` service required to configure and manage the Drill cgroup.

Install the `libcgroup` package using the `yum install` command, as shown:

```
yum install libcgroup
```

## Enable Drill to Directly Manage CPU Resources

Starting in Drill 1.14, Drill can directly manage CPU resources through the start-up script, `drill-env.sh`, which means that you no longer have to manually add the PID (Drill process ID) to the `cgroup.procs` file each time a Drillbit restarts. This step occurs automatically upon restart. The start-up script checks for the specified cgroup, such as `drillcpu`, and then applies the cgroup to the launched Drillbit JVM. The Drillbit CPU resource usage is then managed under the cgroup, `drillcpu`.

For Drill to directly manage CPU resources, you must enable (uncomment) the following variables in the `drill-env.sh` script:

Variable	Description
<code>export DRILLBIT_CGROUP=\$ {DRILLBIT_CGROUP:-"drillcpu"}</code>	Sets the cgroup to which the Drillbit belongs when running as a daemon using <code>drillbit.sh start</code> . Drill uses the cgroup for CPU enforcement only.
<code>export SYS_CGROUP_DIR=\$ {SYS_CGROUP_DIR:-"/sys/fs/cgroup"}</code>	Drill assumes the default cgroup mount location set by <code>systemd</code> (the system and service manager for Linux operating systems). If your cgroup mount location is in a different location, change the setting to match your location.
<code>export DRILL_PID_DIR=\$ {DRILL_PID_DIR:-\$DRILL_HOME}</code>	The location of the Drillbit PID file when Drill is running as a daemon using <code>drillbit.sh start</code> . By default, this location is set to <code>\$DRILL_HOME</code> .

**!** **IMPORTANT:** If you have Drill 1.13 running on the node, or you have Drill 1.14 running on the node and you do not want to enable Drill to directly manage the CPU resources through `drill-env.sh`, you must manually update the `/cgroup/cpu/drillcpu/cgroup.procs` file with the PID (Drill process ID), as shown, each time a Drillbit restarts to enforce the CPU limit for the Drillbit service:

```
echo 25809 > /cgroup/cpu/drillcpu/cgroup.procs
```

## Set the CPU Limit for the Drillbit Service

You can set the CPU limit as a soft or hard limit, or both. You set the limits with parameters in the `/etc/cgconfig.conf` file. The hard limit takes precedence over the soft limit. When Drill hits the hard limit, in-progress queries may not complete. Review the following sections that describe the soft and hard limit parameters and then configure CPU limits.

### Soft Limit Parameter

You set the soft limit with the `cpu.shares` parameter. This parameter takes an integer value, which specifies a relative share of CPU time available to the tasks in a cgroup. For example, if there are two tasks and `cpu.shares` is set to 100, each task receives half of the CPU time. The value must be 2 or greater. When you set a soft limit, Drill can exceed the CPU allocated if extra CPU is available for use on the system. Drill can continue to use CPU until there is contention with other processes over the CPU or Drill hits the hard limit.

### Hard Limit Parameters

You set the hard limit on the amount of CPU time that the Drill process can use through the `cpu.cfs_period_us` and `cpu.cfs_quota_us` parameters.

- `cpu.cfs_period_us`

Specifies a period in microseconds (represented by `us` for  $\mu\text{s}$ ) to indicate how often a cgroup's access to CPU resources should be reallocated. For example, if you want tasks in a cgroup to have access to a single CPU for 0.2 seconds in a 1 second window, set `cpu.cfs_quota_us` to 200000 and `cpu.cfs_period_us` to 1000000. The upper limit of the `cpu.cfs_quota_us` parameter is 1 second and the lower limit is 1000 microseconds.

- `cpu.cfs_quota_us`

Specifies the total amount of runtime in microseconds (represented by `us` for  $\mu\text{s}$ ), for which all tasks in the Drill cgroup can run during one period (as defined by `cpu.cfs_period_us`). When tasks in the Drill cgroup use up all the time specified by the quota, the tasks are throttled for the remainder of the time specified by the period and they cannot run until the next period. For example, if tasks in the Drill cgroup can access a single CPU for 0.2 seconds out of every 1 second, set `cpu.cfs_quota_us` to 200000 and `cpu.cfs_period_us` to 1000000. Setting the `cpu.cfs_quota_us` value to -1 indicates that the group does not have any restrictions on CPU. This is the default value for every cgroup, except for the root cgroup.

### Configuring CPU Limits

Complete the following steps to set a hard and/or soft CPU limit for the Drill process running on the node:

1. Start the `cgconfig` service:

```
service cgconfig start
```

2. Add a cgroup for Drill in the `/etc/cgconfig.conf` file:

```
group drillcpu {
    cpu {
        cpu.shares = 320;
        cpu.cfs_quota_us = 400000;
        cpu.cfs_period_us = 100000;
    }
}
```

In the configuration example above, the `cpu.shares` parameter sets the soft limit. The other two parameters, `cpu.cfs_quota_us` and `cpu.cfs_period_us`, set the hard limit. If you prefer to set only one type of limit, remove the parameters that do not apply. When setting a soft limit, allocate a specific number of CPU shares to the Drill cgroup in the configuration. Calculate the CPU shares as:

```
1024 (CPU allocated to Drill/Total available CPU)
```

In the example, CPU shares is calculated as:

```
1024 (10/32) = 320
```

When setting a hard limit, add limits to the `cpu.cfs_quota_us` and `cpu.cfs_period_us` parameters. In the example, the Drill process can fully utilize 4 CPU.

**TIP:**

The hard limit parameter settings persist after each cgroup service restart. Alternatively, you can set the parameters at the session level using the following commands:

```
echo 400000 > /cgroup/cpu/drillcpu/cpu.cfs_quota_us
echo 100000 > /cgroup/cpu/drillcpu/cpu.cfs_period_us
```

3. (Optional) If you want the `cgconfig` service to automatically restart upon system reboots, run the following command:

```
chkconfig cgconfig on
```

**More information**

[https://access.redhat.com/documentation/en-us/red\\_hat\\_enterprise\\_linux/6/html/resource\\_management\\_guide/sec-cpu](https://access.redhat.com/documentation/en-us/red_hat_enterprise_linux/6/html/resource_management_guide/sec-cpu)

**Drill Properties**

Describes how to use Drill properties and options.

**Boot Options**

Drill has a flexible system of configuration with a property-source hierarchy. This hierarchy allows Drill to seek further for a property even if a prioritized property source does not have the property.

The following table shows the order of loading Drill properties in a Drillbit. These properties are also known as start-up options or boot options.

Drill searches for a property from top to bottom:

Options source	User Modifiable?	Description
drill-override.conf	Yes	<b>HOCON</b> -formatted configuration file stored in the Drill configuration directory. This file is intended to be populated with user properties.
Java System Properties	Yes	<b>Java System Properties</b> use <a href="#">java options</a> to set a boot option: -Doption=value. Java options can be added to the <code>drill-env.sh</code> config to the <code>DRILLBIT_JAVA_OPTS</code> variable. For example: <pre>export DRILLBIT_JAVA_OPTS="\$DRILLBIT_JAVA_OPTS -Dproperty=value"</pre>
drill-distrib.conf	No*	<b>HOCON</b> -formatted configuration file stored in the Drill configuration directory. This file contains distribution-specific options and is populated automatically based on the cluster configuration. The file contents can change after you run the <a href="#">configure.sh</a> on page 2826 utility.
drill-module.conf	No*	<b>HOCON</b> -formatted configuration file stored in Drill jars, one per single jar. These configuration files have default values for various Drill modules. It can be a storage plugin jar, UDF jar, Drill execution module, or other module. Developers set the default values. This configuration file can change from release to release.
drill-default.conf	No*	<b>HOCON</b> -formatted configuration file stored in drill-common jar. Developers set the default values. This configuration file can change from release to release.

\*Users should not modify the options source.

Drill has a wide list of options. To understand the possible options that can be set, check the `drill-override-example.conf` file in the `<Drill home>/conf` directory.

To see all set Drill boot options, you can query the `boot` [system table](#). For example:

```
apache drill> select * from sys.boot;
```

```
+-----+-----+-----+-----+-----+-----+-----+-----+
|               name               | kind  | | |

null
| false        | null          |
...

```

### Configuration Options

Drill configuration options are boot options that have the `drill.exec.options.*` prefix. The main difference between configuration options and boot options is that configuration options can be modified at runtime. Configuration options are used to tune performance or change functionality.

Configuration options have two additional layers of properties source on top of boot options:

Options source	Description
Session level	Options modified during runtime and stored in Drill memory until the user session ends. Not all Drill configuration options can be set at the session level. Check the <code>accessibleScopes</code> of the option in the system table options.
System level	Options modified during runtime, shared across all the Drill cluster, and persisted between restart of the Drillbits. System-level options are stored in <a href="#">persistent storage</a> . By default, ZooKeeper stores the options.  System-level options can only be set by admins. System-level options are bonded to the Drill cluster ID and preserved even after Drill is uninstalled from a node.

Configuration options are divided into two types: `internal` and `public`. Internal options are intended to be used by Drill developers and are not expected to be used in production.

You can find the complete list of internal configuration options in the `internal_options` [system table](#). For example:

```

apache drill> select * from sys.internal_options limit 10;
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|          name          | kind |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| accessibleScopes      | val  | status | optionScope |
| description          |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| drill.exec.hashjoin.mem_limit          | BIGINT |
SYSTEM | 0          | DEFAULT | BOOT    | Enforces the maximum
memory limit for the Hash Join operator (if non-zero); used for testing
purposes. Defa... |
| drill.exec.rpc.fragrunner.timeout      | BIGINT |
SYSTEM | 10000     | DEFAULT | BOOT    |
|
| drill.exec.stats.logging.batch_size    | BIT    |
SYSTEM_AND_SESSION | false    | DEFAULT | BOOT    | Enables batch size
statistics logging. |
| drill.exec.stats.logging.enabled_operators | VARCHAR |

```

```

SYSTEM_AND_SESSION | all | DEFAULT | BOOT | Controls the list of
operators for which batch sizing statistics should be enabled. |
| drill.exec.stats.logging.fine_grained.batch_size | BIT |
SYSTEM_AND_SESSION | false | DEFAULT | BOOT | Enables fine-grained
batch size statistics logging. |
...

```

You can find the complete list of public configuration options in the `options` system table or in the Drill Web UI. For example:

```

apache drill> select * from sys.options;
+-----+-----+-----+-----+-----+-----+
|          name          | kind | accessibleScopes |
| val | status | optionScope | description |
+-----+-----+-----+-----+
| debug.validate_iterators | BIT | ALL |
| false | DEFAULT | BOOT |
|
| debug.validate_vectors | BIT | ALL |
| false | DEFAULT | BOOT |
|
| drill.exec.functions.cast_empty_string_to_null | BIT | ALL |
| false | DEFAULT | BOOT | In a text file, treat empty fields as
NULL values instead of empty string. |
| drill.exec.hashagg.fallback.enabled | BIT | ALL |
| false | DEFAULT | BOOT | Hash Aggregates ignore memory limits when
enabled (true). When disabled (false), Hash Aggregates fail when ... |
| drill.exec.hashjoin.fallback.enabled | BIT | ALL |
| false | DEFAULT | BOOT | Hash Joins ignore memory limits when this
option is enabled (true). When disabled (false), Hash Joins fail ... |
...

```

**!** **IMPORTANT:** If a Drill option has the `DEFAULT` status, it means the value is set in boot options and was not overridden in the system or session level.

### Setting the Configuration Option in the Boot Scope

Be careful if you want to set a configuration option in the boot options (`BOOT` scope). To set the option in boot options, you need to add the `drill.exec.options` suffix to the name of the configuration option you see in the name column of the `options` system table. For example:

```
alter system set 'planner.enable_nljoin_for_scalar_only' = false;
```

But use the following entry in the `drill-override.conf` file:

```
drill.exec.options.planner.enable_nljoin_for_scalar_only=false
```

### Setting System Options

You can set system options by using the SQL `alter system` command in the Drill Web UI or by using the REST API. For example:

```
apache drill> alter system set 'planner.enable_nljoin_for_scalar_only' =
false;
```

```

+-----+-----+
| ok | summary |
+-----+-----+
| true | planner.enable_nljoin_for_scalar_only updated. |
+-----+-----+

```

## Setting Session Options

You can set session options by using the SQL `alter session` command. The syntax is similar to `alter system`. For example:

```

apache drill> alter session set 'store.parquet.flat.reader.bulk' = false;
+-----+-----+
| ok | summary |
+-----+-----+
| true | store.parquet.flat.reader.bulk updated. |
+-----+-----+

```

Starting from EEP 9.3.0, you can set the session option by adding the option to either the JDBC connection string or JDBC connection properties.

To add a session option to the JDBC connection string, add a parameter in the format `session.option.name=value` separated with a semicolon. For example:

```

jdbc:drill:drillbit=localhost;auth=maprsasl;planner.enable_join_optimization=false

```

To add a session option to the JDBC Connection properties, put the option to the properties, using the option name as a key, and a `String` value as a value. Here is an example code snippet:

```

String connectionString = "jdbc:drill:zk=node1.cluster.com:5181/drill/drill-cluster.com;auth=maprsasl;";
Properties connectionProperties = new Properties();
connectionProperties.put("planner.enable_join_optimization", "false");
Connection connection = DriverManager.getConnection(connectionString, connectionProperties);

```

## Working with Drill

For general information about working with Drill, refer to the following key topics:

### Connecting Drill to Data Sources

Choose and configure storage plugins to enable Drill to connect to a data source.

Drill serves as a query layer that connects to data sources through storage plugins. A storage plugin is a software module for connecting Drill to data sources. A storage plugin typically optimizes execution of Drill queries, provides the location of the data, and configures the workspace and file formats for reading data.

### What you can do with Storage Plugins

Several storage plugins are installed with Drill that you can configure to suit your environment. Through a storage plugin, Drill connects to a data source, such as a database, a file on a local or distributed filesystem, or a Hive metastore. See the [Drill Storage and Format Plugin Support Matrix](#).

You can modify the default configuration of a storage plugin and give the new configuration a unique name. This document refers to Y as a different storage plugin, although it is actually just a reconfiguration of original interface.

On the Storage tab of the Web Console, you can view and reconfigure a storage plugin if you have permission. You can access each node running a Drillbit by starting the Drill Web Console. The way you [start the Drill Web Console](#) depends on your security setup.

When you install Drill using the `mapr-drill` package, storage plugin configurations are available for the following data sources:

- file system
- [HPE Ezmeral Data Fabric Database](#)

**NOTE:** To access HPE Ezmeral Data Fabric Database tables, use the `dfs` storage plugin with the `maprdb` format plugin.

- [Hive](#)
- [Kafka](#)

### Connecting Drill to HBase

As of the Core 6.0 and Drill 1.11, HBase is no longer supported, therefore the communication path between Drill and HBase is also not supported. If you have an `hbase` storage plugin configured in Drill, you should disable it.

### Default Storage Plugin Configurations

The Drill documentation describes the [attributes and definitions](#) that you can configure for storage plugins, except for the HPE Ezmeral Data Fabric Database format. See [HPE Ezmeral Data Fabric Database Format Plugin for Drill](#).

The Drill Web Console includes some default storage plugin configurations. The following table lists the default configurations and their descriptions:

Instance	Description
<code>cp</code>	Points to a JAR file in the Drill classpath that contains the Transaction Processing Performance Council (TPC) benchmark schema TPC-H that you can query.
<code>dfs</code>	Points to file system by default. Drill automatically configures this instance when you install Drill in a the cluster. Includes a <code>maprdb</code> format plugin for HPE Ezmeral Data Fabric Database.
<code>hive</code>	Integrates Drill with the Hive metadata abstraction of files, HPE Ezmeral Data Fabric Database, and libraries to read data and operate on SerDes and UDFs.

When you add or update a storage plugin configuration on one Drill node in a Drill cluster, Drill broadcasts the information to all of the other Drill nodes. All nodes have identical storage plugin configurations. You do not need to restart any Drillbits when you add or update a storage plugin configuration.

### Configuring Storage Plugin Instances

You can add, remove, or update Drill storage plugin configurations using the Web Console. The following image shows the default storage plugin configurations in the Drill Web UI:

Apache Drill
☰

---

### Enabled Storage Plugins

cp	<a href="#">Update</a>	<a href="#">Disable</a>
dfs	<a href="#">Update</a>	<a href="#">Disable</a>

---

### Disabled Storage Plugins

hbase	<a href="#">Update</a>	<a href="#">Enable</a>
hive	<a href="#">Update</a>	<a href="#">Enable</a>
mongo	<a href="#">Update</a>	<a href="#">Enable</a>

---

### New Storage Plugin

[Create](#)

If you click **Update** next to `dfs`, the following default configuration appears :

```
{
  "type": "file",
  "enabled": true,
  "connection": "maprfs:///",
  "workspaces": {
    "root": {
      "location": "/",
      "writable": false,
      "defaultInputFormat": null
    },
    "tmp": {
      "location": "/tmp",
      "writable": true,
      "defaultInputFormat": null
    }
  }
},
```

```

"formats": {
  "psv": {
    "type": "text",
    "extensions": [
      "tbl"
    ],
    "delimiter": "|"
  },
  "csv": {
    "type": "text",
    "extensions": [
      "csv"
    ],
    "delimiter": ","
  },
  "tsv": {
    "type": "text",
    "extensions": [
      "tsv"
    ],
    "delimiter": "\t"
  },
  "parquet": {
    "type": "parquet"
  },
  "json": {
    "type": "json"
  },
  "maprdb": {
    "type": "maprdb"
  }
}

```

The `dfs` configuration includes the storage plugin type, connection information, default workspaces, and file formats that the data source supports. You can add and remove workspaces and file formats.

### Changing the Connection Attribute

You can also change the connection if you want the configuration to point to a different cluster.

By default, Drill connects to the cluster that the Drill node belongs to. You do not need to modify the connection unless you want to connect Drill to a different cluster. To connect to a different cluster, edit the connection to include the name of the cluster that you want to connect to.

Example:

```
"connection": "maprfs://<cluster_name>/"
```

### Drill Storage and Format Plugin Support Matrix

You can deploy Drill without Hadoop in a standalone configuration on a single node, however multi-node standalone cluster deployments of Drill are not supported. Note that Drill itself does not require Hadoop.

The following table lists the supported and unsupported data sources and formats in Drill:

Data Source	Storage Plugin Type	Formats	Supported
file system	dfs	Text (CSV, TSV, PSV)	Yes
		Parquet	Yes
		JSON	Yes

		Avro	No
HPE Ezmeral Data Fabric Database	dfs	Binary	Yes
		JSON	Yes
HBase	hbase	Binary	Yes
Hive	hive	Text (CSV, TSV, PSV)	Yes
		Parquet	Yes
		JSON	Yes
		Avro	Yes
		Other Hive built-in SerDes	Yes (Not recommended due to the memory overhead and performance implications.)
S3	s3	Supports the same formats as the dfs storage plugin.	Yes
MongoDB	mongodb	N/A	No
RDBMS	jdbc	N/A	No
Kudu	kudu	N/A	No
Kafka	kafka	JSON	Yes
OpenTSDB	openTSDB	N/A	 <b>NOTE:</b> The openTSDB storage plugin is not officially supported. See <a href="#">OpenTSDB Storage Plugin</a> for more information.

#### *maprdb Format Plugin for Drill*

Drill supports access to HPE Ezmeral Data Fabric Database JSON and binary tables through the maprdb format plugin.

When you install Drill, the maprdb format is automatically defined within the default dfs storage plugin configuration to make HPE Ezmeral Data Fabric Database a consumable data source for Drill. You can access the dfs storage plugin configuration from the Storage page in the [Drill Web UI](#).

When you install Drill, you will see some options specific to the maprdb format plugin that you can change or configure. You can modify these options in the following places:

- [dfs storage plugin configuration](#)
- [drill-override.conf file](#)
- [SET command](#)

For additional information about storage plugins, see [Plugin Configuration Basics](#).

#### Modifying the maprdb Format Settings within the dfs Storage Plugin Configuration

You can add or modify certain maprdb format plugin settings within the dfs storage plugin configuration on the Storage page in the Drill Web UI.

The following table lists the maprdb format options that you can set within the dfs storage plugin configuration:

Option	Description	Value
allTextMode	When enabled, Drill reads all values as type varchar. Useful when the underlying data set has type values of mixed scalar types, such as integers, floating point, varchars, date, time, and timestamp. Disabled by default.	true false
disableCountOptimization	When enabled, this option disables optimization for queries with the COUNT (*) aggregate function. Disabled by default.	true false
enablePushdown	When enabled, Drill pushes down filters to HPE Ezmeral Data Fabric Database. Disabling this option is not recommended unless you intend to use it for troubleshooting purposes. Enabled by default.	true false
ignoreSchemaChange	When enabled, Drill ignores schema changes. Disabled by default.	true false
nonExistentColumnsProjection	When enabled, Drill can distinguish between null and non-existent fields. Disabled by default.	true false
readNumbersAsDouble	When enabled, Drill reads all numeric values as type double. Useful when the underlying data set has type values of mixed numeric types, such as integers and floating point. Disabled by default.	true false
readTimestampWithZoneOffset	When enabled (set to 'true'), Drill converts timestamp values from UTC to local time zone when reading the values from MapR Database. Disabled (set to 'false') by default. Does not impact the <code>store.hive.maprdb_json.read_timestamp_with_timezone_of_fset</code> setting.	true false

The following example configuration shows you how to include the options in the maprdb format configuration within the dfs storage plugin configuration:

```
{
  "type": "file",
  "enabled": true,
  "connection": "maprfs:///",
  "config": null,
  "workspaces": {
    "root": {
      "location": "/",
      "writable": false,
      "defaultInputFormat": "maprdb",
      "allowAccessOutsideWorkspace": false
    }
  },
  "formats": {
    "maprdb": {
      "type": "maprdb",
      "allTextMode": true,
      "disableCountOptimization": true,

```

```

    "enablePushdown": false
  },
  "parquet": {
    "type": "parquet"
  },
  "json": {
    "type": "json",
    "extensions": [
      "json"
    ]
  }
}

```

See [Plugin Configuration Basics](#) and [File System Storage Plugin](#) for more information.

### Overriding Default maprdb Format Plugin Settings in drill-override.conf

You can override the default maprdb format plugin settings that control the level of parallelism in Drill and the media type in the `drill-override.conf` file.

To override the default maprdb format plugin settings, add the options to the `format-maprdb.json` configuration in the `/opt/mapr/drill/drill-<version>/conf/drill-override.conf` file, as shown:

```

format-maprdb: {
  json: {
    scanSizeMB: 512,
    restrictedScanSizeMB: 4096
    mediaType: HDD
  }
}

```

The following sections describe how to modify the options in the configuration shown above:

### Configuring the Level of Parallelism in Drill

The size of data chunks and number of minor fragments affect the level of parallelism in Drill. When querying JSON tables, Drill creates minor fragments that scan the chunks of data that HPE Ezmeral Data Fabric Database passes to Drill. Minor fragments are logical units of work that determine the level of parallelism in Drill. The level of parallelism increases with the number of minor fragments. See [Drill Query Execution](#) for more information about how Drill executes a query.

### Modifying the Size of Data Chunks

The `format-maprdb.json.scanSizeMB` option changes the size of data chunks that HPE Ezmeral Data Fabric Database passes to Drill when querying JSON tables. Drill creates approximately one minor fragment per data chunk when querying JSON tables. For example, if a table has 4 GB of data and the chunk size is set to 128 MB, Drill creates approximately 32 minor fragments to scan the data chunks.

The default setting for data chunks is 128 MB, however you can override this default in the `drill-override.conf` file. The value of the `format-maprdb.json.scanSizeMB` option can range from 32 MB to 8192 MB (8 GB). Adjust the setting based on the size of your tables. Use a higher setting for larger tables and a lower setting for smaller tables. The right setting can reduce latency and increase throughput.

### Modifying the Number of Minor Fragments Created

The `format-maprdb.json.restrictedScanSizeMB` option determines the number of minor fragments that Drill creates to scan the data and do the join-back to a JSON table when executing a non-covering index plan.

The default setting for this option is 4096 MB, however you can override this setting in the `drill-override.conf` file. The value of this option can range from 32 MB to 8192 MB (8 GB). Adjust the setting based on the

size of your tables, keeping in mind that due to the random I/O nature of the join-back, a smaller setting (increased parallelism) may not necessarily increase throughput.

**NOTE:** The `planner.slice_target` option in Drill determines the number of minor fragments that can run in parallel. See [Modifying Query Planning Options](#) for more information.

### Configuring the Media Type

Drill is optimized for SSDs, however HPE Ezmeral Data Fabric Database and Drill can run on HDDs. If you run Drill and HPE Ezmeral Data Fabric Database on HDDs, use the `mediaType` option in the `drill-override.conf` file to override the default setting. The `mediaType` option accepts HDD or SSD (default) as the value. Specify SSD or HDD in upper case as the value in the `drill-override.conf` file.

#### Drill Options for the maprdb Format Plugin

You can enable certain Drill options for the maprdb format plugin from the Options page in the Drill Web UI or from the command line using the SET and ALTER SYSTEM commands.

To enable the options from the Drill Web UI, go to `http(s)://<drill-hostname-or-ip-address>:8047`, and select **Options** in the menu bar. Alternatively, enable options from the command line using the [SET](#) or [ALTER SYSTEM](#) commands, as shown:

```
SET `store.hive.maprdb_json.optimize_scan_with_native_reader` = true;
```

You can enable the following Drill options for the maprdb format plugin:

<code>store.hive.maprdb_json.optimize_scan_with_native_reader</code>	Starting in Drill 1.14 (EEP 6.0), enable the <code>store.hive.maprdb_json.optimize_scan_with_native_reader</code> option if you want Drill to use the native Drill reader to read <a href="#">Hive MapR-DB JSON tables</a> . When you enable the native Drill reader, Drill typically performs faster reads of data and applies filter pushdown optimizations.
<code>store.hive.maprdb_json.read_timestamp_with_timezone_offset</code>	Starting in Drill 1.16, you can enable Drill to read timestamp values with a timezone offset when the hive plugin is used and the Drill native MapRDB JSON reader is enabled through the <code>store.hive.maprdb_json.optimize_scan_with_native_reader</code> option.

**IMPORTANT:** Internally, Drill stores timestamp values in UTC format, for example 2018-01-01T20:12:12.123Z. When you enable the timezone offset option, select on a table returns different timestamp values. If you filter on timestamp values when this option is enabled, you must include the new timestamp value in the filter condition. For example, look at the timestamp values when the `store.hive.maprdb_json.read_timestamp_with_timezone_offset` option is disabled (set to 'false'):

```
select * from dfs.`/tmp/timestamp`;
-----
_id      datestring          datetimestamp
-----
1        2018-01-01 12:12:12.123    2018-01-01 20:12:12.123
2        9999-12-31 23:59:59.999      10000-01-01 07:59:59.999
-----
```

When the option is enabled (set to 'true'), you can see the difference in the timestamp values returned:

```
select * from dfs.`/tmp/timestamp`;
-----
_id      datestring          datetimestamp
-----
1        2018-01-01 12:12:12.123    2018-01-01 12:12:12.123
2        9999-12-31 23:59:59.999      9999-12-31 23:59:59.999
-----
```

When the option is enabled, queries that filter on timestamp values must include the new timestamp value in the filter condition, as shown:

```
select * from dfs.`/tmp/timestamp` where datetimestamp=timestamp
'2018-01-01 12:12:12.123';
-----
_id      datestring          datetimestamp
-----
1        2018-01-01 12:12:12.123    2018-01-01 12:12:12.123
-----
```

Notice that the WHERE clause uses the ``2018-01-01 12:12:12.123`` format versus the ``2018-01-01 20:12:12.123`` format.

## HPE Ezmeral Data Fabric Database Tables

The `maprdb` format plugin enables you to query binary and JSON tables like you would query files in a file system because HPE Ezmeral Data Fabric Database and the file system share the same namespace.

Binary tables differ from JSON tables in that they store a multi-dimensional map in which both keys and values are a sequence of bytes. JSON tables store [OJAI documents](#). JSON tables support rich data types, including complex and repeated types, that enable database servers to evaluate filter conditions for optimized query execution. Binary tables can pose performance limitations because the table columns do not contain the necessary type information.

You can query tables stored in any directory in HPE Ezmeral Data Fabric Database using the same syntax that you use to select from files in the file system. Instead of including the path of a file in a query, you include the table path. The user running the query must have [read permission](#) to access the table.

**NOTE:** HPE Ezmeral Data Fabric Database is a case sensitive data source. To ensure that your queries return results, use the case that corresponds to the column names in the JSON tables and views that you query. For example, if you query the “age” column in a JSON table, the query must reference the column as “age” and cannot reference the column as “AGE” or the query will not return results. If you have a dataset where a column name has mixed cases, such as “age” and “AGE,” cleanse the data set so column names consist of one case and then reimport the data into the table to ensure a complete result set when you query the column.

The following sections describe the types of tables that HPE Ezmeral Data Fabric Database supports, provide examples of Drill queries on each type of table, and show you how to load data into a JSON table from JSON files.

## JSON Tables

A JSON table is a collection of JSON documents stored in an optimized format in HPE Ezmeral Data Fabric Database. JSON tables support complex schema, like JSON files including nested and repeated types, but with additional support for more [data types](#).

JSON tables leverage the [OJAI API](#) to natively support [Drill data types](#) making it possible for HPE Ezmeral Data Fabric Database to recognize, store, and interpret each of the Drill data types. This alleviates the need to encode data when an application writes to tables or use conversion functions when running queries against tables. For example, if a number or date is stored in a JSON table, you do not need to use the `CAST` or `CONVERT` functions for the query to return the actual values.

HPE Ezmeral Data Fabric Database's native support for Drill data types enables Drill to push down filters and projections to HPE Ezmeral Data Fabric Database which optimizes performance.

## Querying a JSON Table

Querying JSON tables is simpler than querying binary tables because you do not have to include conversion functions in the queries to change the byte sequences into specific data types, and you do not have to include column families.

The following query examples show query results on a JSON table named “students” in HPE Ezmeral Data Fabric Database. Note that Drill returns human readable values without having to include the `CAST` or `CONVERT` functions in the queries.

### Example 1

```
SELECT * FROM dfs.`/user/root/json/students`;
```

_id	date	name	state	street	zipcode
student1	2016-01-15	Alice	CA	123 Ballmer Av	12345
student2	2016-03-08	Bob	CA	1 Infinite Loop	12345
student3	2015-12-22	Frank	CA	435 Walker Ct	12345
student4	2015-09-15	Mary	CA	56 Southern Pkwy	12345

4 rows selected (0.233 seconds)

### Example 2

```
SELECT _id, `date`, name, state, street, zipcode FROM dfs.`/user/root/json/students`;
```

_id	date	name	state	street	zipcode
student1	2016-01-15	Alice	CA	123 Ballmer Av	12345.0
student2	2016-03-08	Bob	CA	1 Infinite Loop	12345.0
student3	2015-12-22	Frank	CA	435 Walker Ct	12345.0
student4	2015-09-15	Mary	CA	56 Southern Pkwy	12345.0

```
+-----+-----+-----+-----+-----+
4 rows selected (1.033 seconds)
```

### Loading JSON Documents into a HPE Ezmeral Data Fabric Database Table with dbshell Commands

You can use the INSERT command in the `mapr dbshell` to load JSON documents into a HPE Ezmeral Data Fabric Database table.

The INSERT command is useful when inserting a small number of JSON documents into a JSON table.

 **NOTE:** Alternatively, you can put JSON documents in a flat text file and use the `mapr importJSON` command to import the JSON documents into a table. The `mapr importJSON` command is useful when you need to insert many documents into a table. Refer to [HPE Ezmeral Data Fabric Database JSON ImportJSON](#) on page 5537 for instruction.

 **NOTE:** The examples in this document use the student data in the [Querying HBase Tutorial](#) to recreate the binary “students” table as a JSON table in HPE Ezmeral Data Fabric Database.

To load JSON documents into a HPE Ezmeral Data Fabric Database table through the `mapr dbshell`, complete the following steps:

1. Run the following command to start the `mapr dbshell`:

```
mapr dbshell
```

2. Run the following command to create a table:

```
create <table-name>
```

**Example:**

```
create students
```

 **NOTE:** By default, the table is stored in the default directory. The default directory is the current directory on the Data Fabric file system, which is set to the user's home directory when the `mapr dbshell` starts. Include a file path, as shown, if you do not want the table stored in the default directory:

```
create /file/path/table-name
```

3. Load the JSON documents into the table using the INSERT command, as shown:

```
insert <table-name> --value '{JSON-document}'
```

**Example:**

```
insert students --value '{"_id":"student1", "name":"Alice",
"street":"123 Ballmer Av", "zipcode":12345, "state":"CA"}'
insert students --value '{"_id":"student2", "name":"Bob", "street":"1
Infinite Loop", "zipcode":12345, "state":"CA"}'
insert students --value '{"_id":"student3", "name":"Frank",
"street":"435 Walker Ct", "zipcode":12345, "state":"CA"}'
insert students --value '{"_id":"student4", "name":"Mary", "street":"56
Southern Pkwy", "zipcode":12345, "state":"CA"}'
```

4. Run the following command to verify that the table was created:

```
find <table-name>
```

**Example:**

```
find students
```

5. Run the following command to close the `mapr dbshell`:

```
exit
```

6. If you need to start or restart Drill, run the following command:

```
maprcli node services -name drill-bits -action start|restart -nodes  
<space-separated-list-of-drill-hostnames>
```

7. Run the following command to start the Drill shell (SQLLine):

```
sqlline
```

You can query the HPE Ezmeral Data Fabric Database JSON table from the Drill shell. If you did not include a file path when you created the table, the table was created in the current directory on the Data Fabric File system, which is set to the user's home directory. For example, the following query specifies the default directory if the root user created the table without indicating a file path:

```
SELECT * FROM dfs.`/user/root/table-name`;
```

**Example:**

```
SELECT * FROM dfs.`/user/root/students`;
```

If the user created the table in a specific directory, the query must include the directory in which the table was created, as shown:

```
SELECT * FROM dfs.`/file/path/table-name`;
```

## Binary Tables

[Binary tables](#) store data in a flat table structure where the table consists of columns and column values. Every field in a binary table is stored as a sequence of bytes.

[Binary tables](#) do not store data type information. You manage the encoding for binary tables when storing data and then convert the sequence of bytes into a specific data type using the `CAST` or [CONVERT functions](#) when you run queries against the tables.

For example, if a string is stored in binary format, such as a UTF-8 encoded string, you must use the `CAST` function for the query to return a string type. If an integer is stored in binary format, such as 4-byte little endian encoding, you must use the `CONVERT` function for the query to return the integer value instead of the 4-byte sequence.

### Querying a Binary Table

The following examples, from the [Querying HBase Tutorial](#), display query results when the binary table `/user/root/binary/students` with two column families, `account` and `address`, is queried without using a conversion function to convert the binary table data into specific data types.

#### Example 1

```
SELECT * FROM `/user/root/binary/students` students;
```

row_key	account
address	
[B@78dfaled	{"date": "MjAxNi0wMS0xNQ==", "name": "QWxpY2U="}
{ "state": "Q0E=", "street": "MTIzIEJhbGxtZXIgcXV=", "zipcode": "MTIzNDU=" }	
[B@22000c9a	{"date": "MjAxNi0wMy0wOA==", "name": "Qm9i"}
{ "state": "Q0E=", "street": "MSBJbmZpbml0ZSBMb29w", "zipcode": "MTIzNDU=" }	
[B@313b63e6	{"date": "MjAxNS0xMi0yMg==", "name": "RnJhbms="}
{ "state": "Q0E=", "street": "NDMlIFdhdG91ciBDdA==", "zipcode": "MTIzNDU=" }	
[B@321baa4a	{"date": "MjAxNS0wOS0xNQ==", "name": "TWYyeQ="}
{ "state": "Q0E=", "street": "NTYgU291dGhlcm4gUGt3eQ==", "zipcode": "MTIzNDU=" }	

4 rows selected (0.612 seconds)

In example 2, using the CONVERT\_FROM and CAST functions in a query on the same table converts the binary table data to typed data.

### Example 2

```
SELECT CONVERT_FROM(row_key, 'UTF8') AS studentid,
CONVERT_FROM(students.account.name, 'UTF8') AS name,
CONVERT_FROM(students.address.state, 'UTF8') AS state,
CONVERT_FROM(students.address.street, 'UTF8') AS street,
CONVERT_FROM(students.address.zipcode, 'UTF8') AS zipcode,
CAST(students.account.`date` as date) AS `date` FROM dfs.`/user/root/binary/
students` students;
```

studentid	name	state	street	zipcode	date
student1	Alice	CA	123 Ballmer Av	12345	2016-01-15
student2	Bob	CA	1 Infinite Loop	12345	2016-03-08
student3	Frank	CA	435 Walker Ct	12345	2015-12-22
student4	Mary	CA	56 Southern Pkwy	12345	2015-09-15

4 rows selected (0.702 seconds)

### Working with Joda-Time Format

Describes queries on Joda-Time formatted columns and how to include annotations for successful queries.

Drill cannot read timestamp values in a maprdb column if the column is formatted in Joda-Time. You cannot CAST Joda-Time columns or values to another type unless you annotate the Joda-Time column with "\$date" for timestamp values or "\$dateDay" for date values, as shown:

```
"order_received_ts" : { "$date": "1992-04-05T02:15:16Z" }
```

**NOTE:** The following set of annotations were used for internal purposes, but they do not provide any additional SQL benefits in Drill. Instead of using these annotations, you can CAST the data types.

```
$binary
$numberByte
$decimal
$numberFloat
$numberInt
$interval
$numberLong
$numberShort
$time
```

### Querying Joda-Time Formatted Columns without Annotation

The following examples show you the results of two queries on a JSON database table (t2) with a Joda-Time formatted column, `order_received_ts`, that does not have the "\$date" or "\$dateDay" annotation. Table t2 contains the following data:

```
maprdb mapr:> find /test01/t2
{"_id": "472271675972670", "amount": 10433.28, "delivery_method": "TRUCK", "discount_rate": 10.03, "instructions": "DELIVER IN PERSON", "notes": "ccording to the foo", "order_date": "1993-09-11", "order_received_ts": "1992-04-05T02:15:16Z", "product_category_id": 6, "quantity": 6, "ship_date": "1993-09-21", "store_id": "8134660", "tax_rate": 10.06, "type_code": "F"}
1 document(s) found.
```

The following query filters on `order_received_ts` and casts the value to the timestamp data type:

```
apache drill> select _id, order_received_ts from dfs.`/test01/t2` where
order_received_ts > cast('1992-04-05 01:15:16' as timestamp);
+++
| |
+++
+++
No rows selected (0.402 seconds)
```

The following query casts the `order_received_ts` column to timestamp:

```
apache drill> select _id, cast(order_received_ts as
timestamp), customer_id, order_date from dfs.`/test01/t2`;
Error: SYSTEM ERROR: DateTimeParseException: Text '1992-04-05T02:15:16Z'
could not be parsed, unparsed text found at index 10

Fragment 0:0

Please, refer to logs for more information.

[Error Id: 039a92d4-43d6-4561-80b5-d87a588f5b10 on mycluster:31010]
(state=,code=0)
apache drill>
```

Both queries return unexpected results; however, adding an annotation can resolve the issue.

### Adding an Annotation to Joda-Time Formatted Columns

You will need to update the table or recreate the table to add the annotation. You can do this through the maprdb shell or you can update the data in a JSON file and then import the JSON file into a maprdb JSON table. In this example, the annotation is added to a JSON file and then imported into a JSON table.

To add the annotation to the `order_received_ts` column:

1. Update the JSON file with the annotation:

```
{
  "_id" : "472271675972670",
  "store_id" : "8134660",
  "quantity" : 6,
  "product_category_id" : 6,
  "amount" : 10433.28,
  "discount_rate" : 10.03,
  "tax_rate" : 10.06,
  "type_code" : "F",
  "order_date" : {"$dateDay": "1993-09-11"},
  "ship_date" : "1993-09-21",
  "order_received_ts" : {"$date": "1992-04-05T02:15:16Z"},
  "instructions" : "DELIVER IN PERSON",
  "delivery_method" : "TRUCK",
  "notes" : "ccording to the foo"
}
```

2. Put the JSON file in a `mapr` directory:

```
hadoop fs -put t2.json /user/mapr/.
```

3. Create the JSON database table:

```
maprcli table create -path /test01/t2 -tabletype json
```

4. Import the JSON file into the JSON table:

```
mapr importJSON -src /user/mapr/t2.json -dst /test01/t2 -mapreduce false
```

Now that the annotation is added, Drill queries against the table (`t2`) run successfully and return the expected results:

```
apache drill> select _id, order_received_ts from dfs.`/test01/t2` where
order_received_ts > cast('1992-04-05 01:15:16' as timestamp);
```

```
+-----+-----+
|      _id      | order_received_ts |
+-----+-----+
| 472271675972670 | 1992-04-05T02:15:16.000Z |
+-----+-----+
```

```
1 row selected (0.334 seconds)
```

```
apache drill> select _id, order_date from dfs.`/test01/t2` where
order_date > cast('1993-08-10' as date);
```

```
+-----+-----+
|      _id      | order_date |
+-----+-----+
| 472271675972670 | 1993-09-11 |
+-----+-----+
```

```
1 row selected (0.156 seconds)
```

```
apache drill>
```

## Configuring the Hive Storage Plugin

### About this task

You can connect Drill to a Hive data source through the hive storage plugin configuration in the Drill Web UI. After configuration, use Drill to query data stored in Hive.

Drill can work with only one version of Hive in a given cluster. To access Hive tables using custom SerDes or InputFormat/OutputFormat, all nodes running Drill must have the SerDes or InputFormat/OutputFormat JAR files in the `<drill_installation_directory>/jars/3rdparty` location.

To query across multiple versions of Hive, install each version of Hive on a separate Drill cluster. You must define separate storage plugins, each corresponding to the specific Hive version of the metastore.

**NOTE:** In [EEP 6.0](#), Drill requires Hive version 2.3.3-mapr or later to successfully query Hive data sources.

### Configuring a Hive Remote Metastore

A remote Hive metastore configuration runs as a separate service outside of Hive. The metastore service communicates with the Hive database over JDBC. Point Drill to the Hive metastore service address, and provide the connection parameters in the Hive storage plugin configuration to configure a connection to Drill. The Hive storage plugin (located on the **Storage** tab in the Drill Web UI) has the following default configuration if you install Drill:

```

{
  "type": "hive",
  "enabled": true,
  "configProps": {
    "hive.metastore.uris": "",
    "javax.jdo.option.ConnectionURL": "jdbc:derby:;databaseName=../
sample-data/drill_hive_db;create=true",
    "hive.metastore.warehouse.dir": "/tmp/drill_hive_wh",
    "fs.default.name": "file:///",
    "hive.metastore.sasl.enabled": "false",
    "datanucleus.schema.autoCreateAll": "true"
  }
}

```

Complete the following steps to modify the default Hive storage plugin configuration for your file system environment:

### Procedure

1. Verify that Hive is running.
2. Issue the following command to start the Hive metastore service on the system specified in the `hive.metastore.uris`: `hive --service metastore`
3. [Start the Drill Web UI](#).
4. Select the **Storage** tab. If [Web UI security](#) is enabled, you must have administrator privileges to perform this step.
5. In the list of disabled storage plugins in the Drill Web UI, click **Update** next to Hive.
6. Update the following Hive storage plugin parameters to match the system environment:
  - `"hive.metastore.uris"`
  - `"jdbc:<database>://<host:port>/<metastore database>"`

- Change the default location of files to suit your environment. For example, change `"fs.default.name": "file:///"` to the file system location: `maprfs:///`
- To run Drill and Hive in a secure cluster, change the `"hive.metastore.sasl.enabled"` parameter to `"true"`.
- Change the `"datanucleus.schema.autoCreateAll"` property setting for your system environment. After it is enabled, `"datanucleus.schema.autoCreateAll"` initializes the Hive metastore schema.
  - In a production environment, remove the `"datanucleus.schema.autoCreateAll"` property from the Hive storage plugin configuration; the property is not required because the preferred schema information is already created for the Hive metastore service.
  - In a test environment with an embedded Hive metastore, you can disable (set to `false`) this property after the first query on the Hive data source that you submit from Drill. Alternatively, use the [Hive schema tool](#) to initialize or upgrade the Hive metastore schema. Using the Hive schema tool is recommended for queries on transactional tables. Run the `schematool` command as an initialization step:

```
/opt/mapr/hive/hive-<version>/bin/schematool -dbType
<databaseType> -initSchema
```

7. Click **Enable** in the Web UI to enable the Hive storage plugin configuration.

#### *Configuring the Kafka Storage Plugin*

To configure Kafka as a data source in Drill, update the `<drill_home>/jars/3rdParty` directory with the required JAR files, restart Drill, and configure the `kafka` storage plugin in the Drill Web UI.

Verify that the nodes in your cluster meet the requirements and then complete the steps listed.

#### **Requirements**

The Kafka storage plugin requires:

- HPE Ezmeral Data Fabric 7.0 or later cluster
- Drill 1.16.1 or later installed on nodes
- The HPE Ezmeral Data Fabric Kafka client package (`kafka-2.1.1`, `2.6.1`, or later) installed on at least one node. The Kafka client installation provides the following `kafka` JAR files that you copy into the `<drill_home>/jars/3rdParty` directory (step 4):

**NOTE:** Kafka 2.1.1 is used as an example. The version of your Kafka JAR files may differ.

- Kafka-2.1.1
  - `kafka_2.11-2.1.1.200-mapr-710.jar`
  - `kafka-clients-2.1.1.200-mapr-710.jar`
- Kafka-2.6.1 (if you have `eep-800` or later installed)
  - `kafka_2.13-2.6.1.0-eep-800.jar`
  - `kafka-clients-2.6.1.0-eep-800.jar`
  - `kafka-eventstreams-0.1.0.0-eep-800.jar`

## Steps

Complete the following steps to query Kafka Streams from Drill:

**NOTE:** Do not perform step 2 if you installed Drill using the RPM or Debian packages. Step 2 is only required if you installed Drill using a TAR file.

1. Remove the specified JAR files from the `<drill_home>/jars/3rdParty` directory based on the Drill installation method:
  - If you installed Drill using RPM or Debian packages, only remove JAR files that start with `kafka`, such as `kafka-clients-<version>.jar` and `kafka-<version>.jar`, from the `<drill_home>/jars/3rdParty` directory.
  - If you installed Drill using a TAR file, remove all the JAR files that start with `mapr` and `kafka`, such as `maprdb-<version>-mapr.jar`, `maprfs-<version>-mapr.jar`, `kafka-<version>-mapr.jar`, and `kafka-clients-<version>.jar`, from the `<drill_home>/jars/3rdParty` directory.
2. (Only perform this step if you installed Drill using a TAR file.) Copy the following JAR files from the `/opt/mapr/lib` directory into `<drill_home>/jars/3rdParty` directory:
3. Copy the `mapr-streams-6.2.0.0-mapr.jar` file from the `/opt/mapr/lib` directory into the `<drill_home>/jars/3rdParty` directory.
4. Copy the following kafka JAR files from the `/opt/mapr/kafka/kafka-*/libs` directory into the `<drill_home>/jars/3rdParty` directory:

**NOTE:** Kafka 2.1.1 is used as an example. The version of your Kafka JAR files may differ.

- Kafka-2.1.1
    - `kafka_2.11-2.1.1.200-mapr-710.jar`
    - `kafka-clients-2.1.1.200-mapr-710.jar`
  - Kafka-2.6.1 (if you have eep-800 or later installed)
    - `kafka_2.13-2.6.1.0-eep-800.jar`
    - `kafka-clients-2.6.1.0-eep-800.jar`
    - `kafka-eventstreams-0.1.0.0-eep-800.jar`
5. Issue the following command to restart Drill:

```
$ maprcli node services -name drill-bits -action restart -nodes <node
hostnames separated by a space>
```

6. Log in to the [Drill Web UI](#), and configure the kafka storage plugin. See [Kafka Storage Plugin](#) for instructions.

**NOTE:** When configuring the kafka storage plugin, you must also include the following parameter in the storage plugin configuration:

```
"streams.consumer.default.stream": "<path-to-stream>"
```

## Usage Example

This example shows a Drill query on a Streams data set, which was made accessible to Drill through the kafka storage plugin.

For this example, tables that contain Yelp stream topics reside in a directory named /YelpStream. The kafka storage plugin is configured with the `streams.consumer.default.stream` parameter pointing to the /YelpStream directory, as shown:

```
"streams.consumer.default.stream" : "/YelpStream"
```

The USE command tells Drill to access data from only the kafka data source:

```
use kafka;
+-----+
| ok | summary |
+-----+
| true | Default schema changed to [kafka] |
+-----+
```

The SHOW TABLES command lists the tables in the /YelpStream directory configured for the kafka data source:

```
show tables;
+-----+
| TABLE_SCHEMA | TABLE_NAME |
+-----+
| kafka | /YelpStream:UserTable |
| kafka | /YelpStream:ReviewTable |
| kafka | /YelpStream:BusinessTable |
+-----+
```

The query selects all the data from the BusinessTable in the /YelpStream directory, limiting the results to one row data:

```
select * from `/YelpStream:BusinessTable` limit 1;
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| _id | attributes | business_id | categories | city | full_address | hours |
| latitude | longitude | name | neighborhoods | open | review_count | stars |
| state | type | kafkaTopic | kafkaPartitionId | kafkaMsgOffset |
kafkaMsgTimestamp | kafkaMsgKey |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+

### Configuring the HBase Storage Plugin

As a Hadoop database, Apache HBase is a distributed, scalable, and big data store. Use and configure the HBase storage plugin to connect with Apache Drill.

## Prerequisites

Before configuring the HBase storage plugin, make sure that you have:

- HBase up and running.
- ZooKeeper installed.
- Administrator privileges.

### About this task

This task outlines how to configure the HBase storage plugin.

### Procedure

1. Verify that HBase is running.
2. [Start the Drill Web UI](#).
3. Select the **Storage** tab.
4. Click **Update** to begin the configuration process.

The following shows a typical HBase configuration:

```
{
  "type": "hbase",
  "config": {
    "hbase.zookeeper.quorum": "10.10.100.62,10.10.10.52,10.10.10.53",
    "hbase.zookeeper.property.clientPort": "2181"
  },
  "size.calculator.enabled": false,
  "enabled": true
}
```

The following shows a secure cluster configuration:

```
{
  "type": "hbase",
  "config": {
    "hbase.zookeeper.quorum": "node1.cluster.com",
    "hbase.zookeeper.property.clientPort": "5181",
    "hbase.security.authentication": "MAPRSASL"
  },
  "size.calculator.enabled": false,
  "enabled": true
}
```

### Related concepts

[HBase Configuration Properties](#) on page 4144

This section describes and shows examples of the configuration properties used in the `hbase-site.xml` file.

### Related tasks

[Getting Started with Hive](#) on page 4165

[Install and Configure Hive and HBase](#) on page 4253

### Start the Drill Web UI

The Drill Web UI is one of several client interfaces that you can use to access Drill.

### Accessing the Drill Web UI

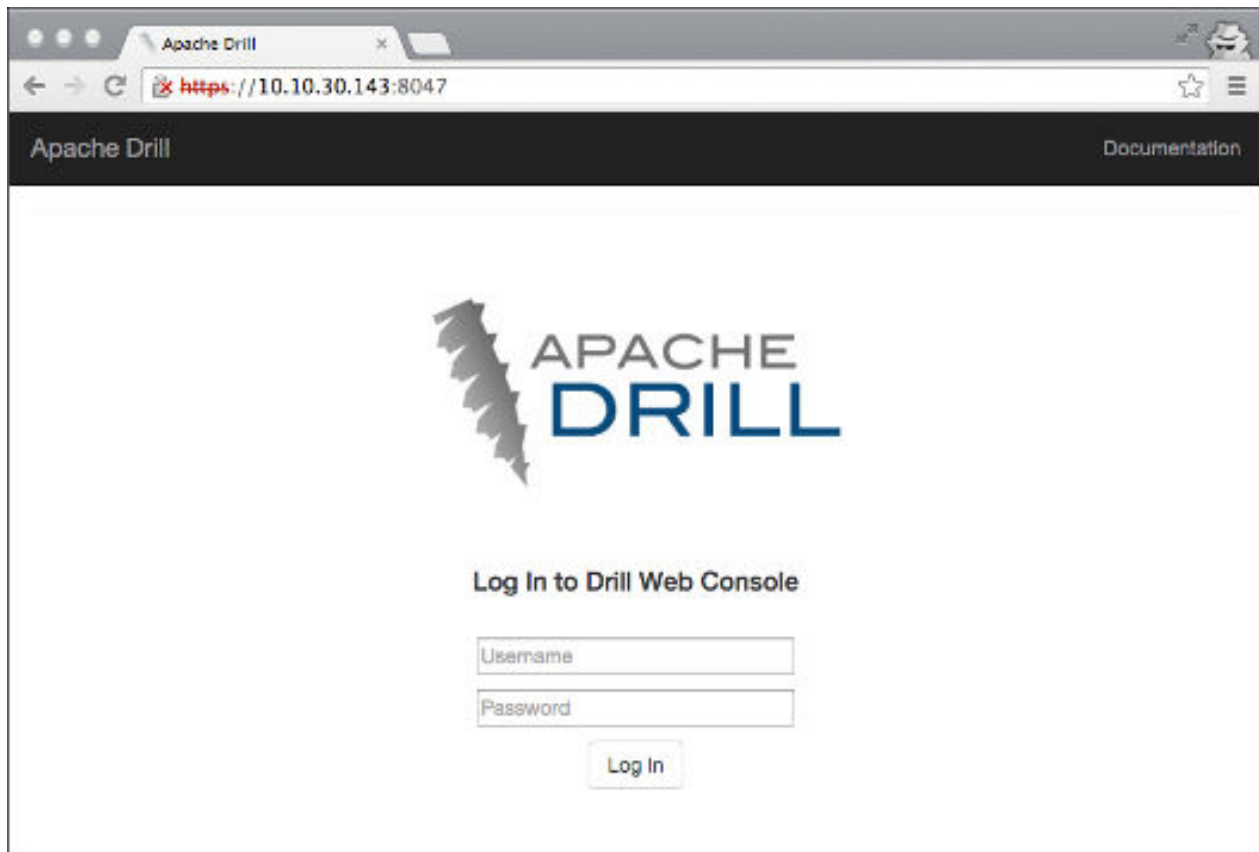

To open the Drill Web UI, launch a web browser, and go to one of the following URLs:

- If HTTPS support is disabled, use the default URL: `http://<IP address or host name>:8047`
- If HTTPS support is enabled, use this URL: `https://<IP address or host name>:8047`

If user authentication is *not* enabled, all the Drill Web UI controls appear to users and administrators, including Query, Profiles, Storage, Metrics, and Threads:

If user authentication is enabled, Drill prompts you for a user name and password:

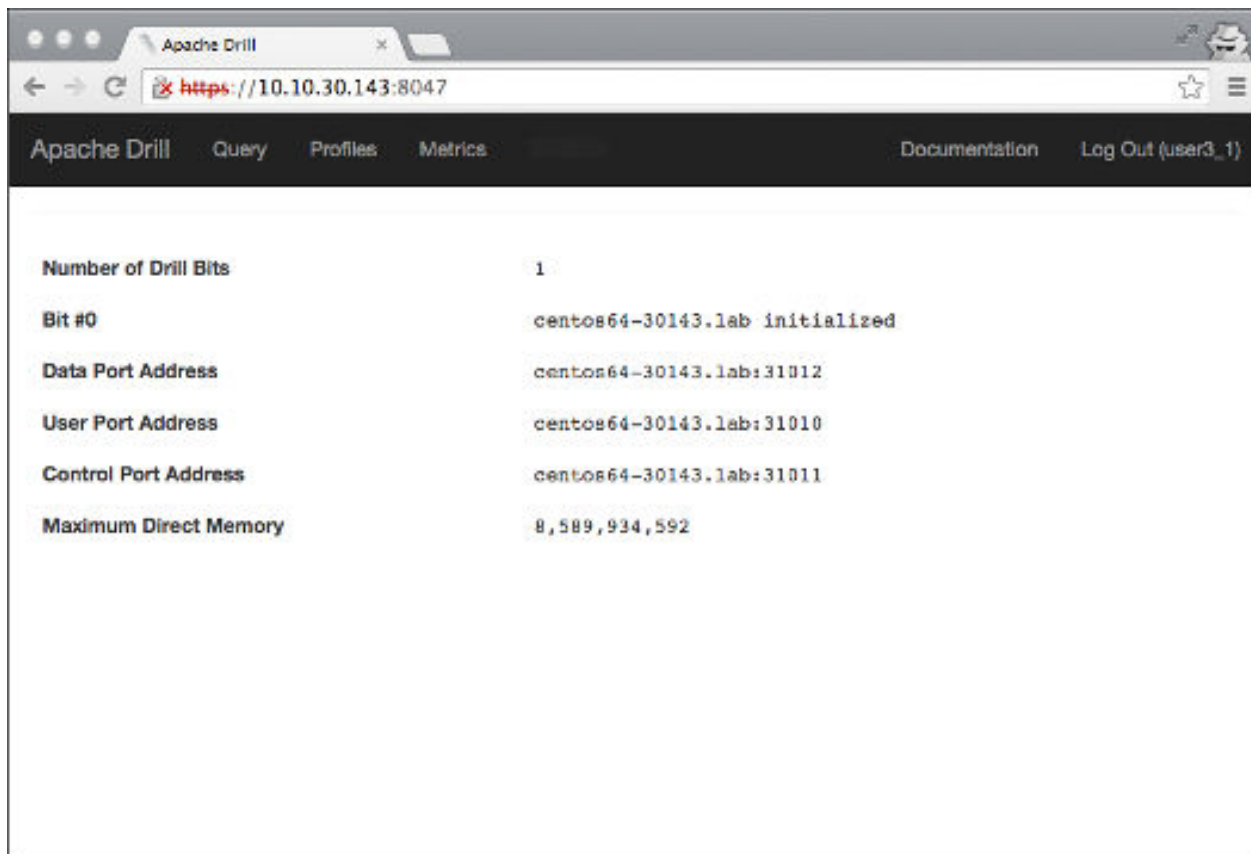

If an administrator logs in, all the Drill Web UI controls appear, including Query, Profiles, Storage, Metrics, Threads, and Options. For administrators, the Profiles page contains the profiles of all queries executed

on a cluster. Only administrators can see and use the Storage tab to view, update, or add a new storage plugin configuration. Only administrators can see and use the Threads tab, which provides information about threads running in Drill.

If a non-administrative user logs in, the Drill Web UI controls are limited to Query, Metrics, and Profiles. The Profiles tab for a non-administrative user contains the profiles of all queries the user issued either through ODBC, JDBC, or the Drill Web UI.

#### More information

<https://drill.apache.org/docs/architecture-introduction/#drill-clients>

<https://drill.apache.org/docs/securing-drill/>

### Start the Drill Shell (SQLLine)

SQLLine is a JDBC application packaged with Drill that serves as the Drill shell. When you issue queries from the SQLLine, the SQLLine client sends the queries to the connected Drillbit (Drill node).

You can connect to Drill through SQLLine directly or through a connection-property file. If want to avoid exposing credentials, connecting through the connection-property file is recommended.

A JDBC connection string supplies the connection information to a Drill node or ZooKeeper cluster. When connecting to a ZooKeeper cluster, ZooKeeper selects the Drillbit that SQLLine connects to.

### JDBC Connection String

This is an example of a JDBC connection string that connects SQLLine to drillnode1:

```
jdbc:drill:drillbit=drillnode1:31010
```

The default port on any Drill node is 31010.

### Starting SQLLine

You start SQLLine from the Drill installation directory, as shown in the following example where SQLLine connects directly to a Drill node named drillnode1:

```
/opt/mapr/drill/drill-<version>/bin/sqlline -u  
jdbc:drill:drillbit=drillnode1:31010
```

### Connection Parameters

You can include SQLLine connection parameters in the connection string and run various shell commands, as described in [Configuring the Drill Shell](#).

In the following example, `-u` is the connection parameter for the JDBC connection string, `-n` is the parameter for the username, and `-p` is the parameter for the password:

```
/opt/mapr/drill/drill-<version>/bin/sqlline -u  
"jdbc:drill:drillbit=drillnode1:31010" -n mapr -p mapr
```

In the following example, the `!connect` shell command is used to hide the password when making an authenticated connection:

```
//From /opt/mapr/drill/drill-<version>/, run:  
  
bin/sqlline  
  
//The sqlline prompt appears. At the prompt, provide the connection string  
with the !connect property:  
  
sqlline> !connect jdbc:drill:drillbit=drillnode1:31010  
//The system prompts you for the username and password.  
Enter username for jdbc:drill:drillbit=drillnode1:31010: mapr  
Enter password for jdbc:drill:drillbit=drillnode1:31010: *****
```

**NOTICE:** In Drill 1.15, the SQLLine `!connect` command incorrectly requests a username and password when connecting to a secure cluster via MAPRSASL or KERBEROS authentication:

```
sqlline> !connect jdbc:drill:drillbit=drillnode1:31010;auth=MAPRSASL

//!connect usage: connect <url> <username> <password> [driver]
//Driver is optional. Driver is the Apache Drill driver class,
org.apache.drill.jdbc.Driver.
```

To workaroud this issue, provide your username when you connect and press Enter when prompted for the password:

```
sqlline> !connect jdbc:drill:drillbit=drillnode1:31010;auth=MAPRSASL
mapr
Enter password for jdbc:drill:drillbit=drillnode1:31010;auth=MAPRSASL:
```

Alternatively, you can use an empty quote in place of a username:

```
sqlline> !connect jdbc:drill:drillbit=drillnode1:31010;auth=MAPRSASL ""
```

## Configuration Options

You can also include configuration options, such as `schema` and `auth` (if authentication is enabled):

```
/opt/mapr/drill/drill-<version>/bin/sqlline -u "jdbc:drill:drillbit
drillnode1:31010;schema=dfs;auth=MAPRSASL"
```

### Schema

The `schema` is the name of a [storage plugin](#) configuration to use as the default for queries. If you indicate the schema in the connection string, you do not have to run the `USE <schema>;` query to switch to the schema you want to use. All queries run against the schema indicated in the JDBC connection string.

### Authentication

If authentication is enabled (Plain, MAPRSASL, Kerberos), include the `auth` option in the connection string. If Drill is installed on a cluster secured by the default security, set `auth=MAPRSASL`. If using Plain authentication, include the username and password, as shown:

```
/opt/mapr/drill/drill-<version>/bin/
sqlline -u "jdbc:drill:drillbit
drillnode1:31010;schema=dfs;auth=MAPRS
ASL"
```

## Connecting to a Specific Drill Node

Indicate which Drill node you want SQLLine to connect to in the JDBC connection string, using the following JDBC connection string format:

```
jdbc:drill:drillbit=<host>:<port>
```

Note that properties are case-sensitive. The `host` is the DNS or IP address of the server (Drill node). The default connection port is 31010.

### Example

The following example shows you how to start SQLLine with a JDBC connection string that includes the username, password, and auth parameters to authenticate to the server with Plain authentication:

```
/opt/mapr/drill/drill-<version>/bin/sqlline -u
"jdbc:drill:drillbit=<ip-address>:<port>;auth=PLAIN" -n <username> -p
<password>
```

If you installed Drill on a cluster secured by default security, set the auth type to `maprsasl`:

```
/opt/mapr/drill/drill-<version>/bin/sqlline -u
"jdbc:drill:drillbit=<ip-address>:<port>;auth=MAPRSASL"
```

## Connecting to ZooKeeper

When you include the ZooKeeper nodes in the JDBC connection string, ZooKeeper selects an available Drill node for SQLLine to connect to.

Indicate the ZooKeeper cluster you want SQLLine to connect to in the JDBC connection string, using the following JDBC connection string format:

```
jdbc:drill:zk=<zk-server-list>/drill/<clustername>
```

The `zk-server-list` is a comma-separated list of the ZooKeeper nodes in the cluster. The `clustername` is the unique name of the Drillbit cluster that you want to connect to.

You can locate the name of the Drillbit cluster in `/opt/mapr/drill/drill-<version>/conf/drill-distrib.conf`. The default name of the Drillbit cluster is `drillbits1`. The name is set by the `cluster-id` property. If you have multiple Drill clusters, you may want to override the Drillbit cluster name in `drill-override.conf`. However, first [back-up your storage plugin configurations](#), as they may reset to the defaults when you change the cluster name. Restart Drill after you edit `drill-override.conf`.

### Example

The following example shows you how to configure the JDBC connection string to connect SQLLine to the ZooKeeper cluster:

```
/opt/mapr/drill/drill-<version>/bin/sqlline
jdbc:drill:zk=<node-ip>:<port>,<node-ip>:<port>,<node-ip>:<port>/drill/
drillbits1;auth=PLAIN -n <username> -p <password>
```

The default port for ZooKeeper nodes is 5181.

If you installed Drill on a secure cluster, set the auth type to `MAPRSASL`:

```
/opt/mapr/drill/drill-<version>/bin/sqlline
jdbc:drill:zk=<node-ip>:<port>,<node-ip>:<port>,<node-ip>:<port>/drill/
drillbits1;auth=MAPRSASL
```

## Using a Connection-Property File with SQLLine

Make sure you restrict access to the connection-property file to specific users.

Create a connection-property file named `login.properties`, as shown:

```
url:<jdbc-connection-url>
user:<username>
password:<password>

//Example
cat login.properties
```

```
url:jdbc:drill:schema=dfs;drillbit=drill-lab-node01
user:drilluser
password:letsdrill
```

To connect to Drill, run SQLLine as shown:

```
sqlline <sqlline args> <path/to/login.properties file>
```

The following examples show you how you can use the connection-property file to connect to Drill:

**Example 1: Connecting to Drill via the connection-property file**

Run SQLLine from /opt/mapr/drill/  
drill-<version>/bin:

```
sqlline login.properties

//List the active connection:
0: jdbc:drill:schema=dfs> !list
1 active connection:
  #0 open
  jdbc:drill:schema=dfs;drillbit=drill-l
  ab-node01

//Exit SQLLine:
0: jdbc:drill:schema=dfs>!q
```

**Example 2: Submitting a query when connecting to Drill via the connection-property file**

Run SQLLine from /opt/mapr/drill/  
drill-<version>/bin:

```
sqlline -q "SELECT version FROM
sys.version" login.properties

//Run query:
0: jdbc:drill:schema=dfs> select
version from sys.version;
+-----+
| version |
+-----+
| 1.16.0  |
+-----+
1 row selected (0.295 seconds)
```

**Example 3: Use the properties command to connect to Drill via the connection-property**

Run SQLLine from /opt/mapr/drill/  
drill-<version>/bin:

```
sqlline

//At sqlline the prompt, run:
sqlline> !properties /home/drilluser/
login.properties
0: jdbc:drill:schema=dfs>
0: jdbc:drill:schema=dfs> !list
1 active connection:
  #0 open
  jdbc:drill:schema=dfs;drillbit=drill-l
  ab-node01
0: jdbc:drill:schema=dfs>
```

**Verify that Login Details are Secure**

Run the following command to verify that login details are not exposed to other users:

```
ps -ef | grep sqlline

drilluser      18938 21924 99 14:14
pts/0          00:00:03 /opt/
jdk1.8.0_141/bin/
java -XX:MaxPermSize=512M -Djava.secur
ity.auth.login.config=/opt/mapr/conf/
mapr.login.conf \
-Dzookeeper.sasl.client=false -Dhadoop
.login=simple -Dlog.path=/opt/mapr/
drill/drill-1.10.0/logs/
sqlline.log -Dlog.query.path=/opt/
mapr/drill/drill-1.16.0/logs/
sqlline_queries.json \
-cp /opt/mapr/drill/drill-1.10.0/
conf:/opt/mapr/drill/drill-1.16.0/
jars/*:/opt/mapr/drill/drill-1.16.0/
jars/ext/*:/opt/mapr/drill/
drill-1.16.0/jars/3rdparty/*:/opt/
mapr/drill/drill-1.16.0/jars/classb/*
sqlline.SqlLine -d
org.apache.drill.jdbc.Driver --maxWidt
h=10000 --color=true login.properties
drilluser      20119 1691 0 14:14
pts/1          00:00:00 grep sqlline
```

**Exit SQLLine**

To exit SQLLine, run `!quit`.

**Start|Stop the Drill Process**

You can start|stop|restart the Drill process on one or more nodes using the Control System or the following command:

```
maprcli node services -name drill-bits -action start|restart|stop -nodes
<node host names separated by a space>
```

Use the host name if possible. Using host names instead of IP addresses is a best practice.

**Related concepts**

[Drill Drivers](#) on page 4087

HPE Ezmeral Data Fabric provides Drill ODBC and JDBC drivers that you can download and use to connect Drill to BI tools. The drivers are updated periodically to include support for new functionality in Drill.

[Drill JDBC Drivers](#) on page 4087

Download the Drill JDBC driver and use it on all platforms to connect BI tools, such as SquirrelL and Spotfire, to Drill. Drill also includes an embedded, open-source JDBC driver.

**Hive to Drill Type Mapping**

Using Drill you can read tables created in Hive that use data types in the [Hive-to-Drill type mapping table](#). Currently, the Apache Hive version used by Drill does not support the timestamp in Unix Epoch format. The workaround is to use the JDBC format for the timestamp, which Hive accepts and Drill uses, as shown in the [type mapping example](#).

For more information about connecting Drill to data sources, refer to [Connect to Data Sources](#) on the [Apache Drill documentation web site](#). For information about workspaces, refer to [Workspaces](#).

## Securing Drill

An administrator can install Drill with the default security configuration or manually configure custom security for Drill.

Drill supports several security features that secure the communication paths between Drill clients (such as [ODBC/JDBC](#)) and Drillbits and also between Drillbits. The following sections briefly describe the security configuration options for Drill and provide links to additional information and instructions.

### Default Security Configuration

Starting in Core 6.0 and Drill 1.11 (EEP 4.0), Drill is automatically secured when you install Drill on a cluster that was installed with the default security configuration. The default security configuration provides authentication, authorization, and encryption through the data-fabric-SASL mechanism, except for HTTPS, which uses [SSL/TLS](#) with form-based authentication. See [Drill Default Security](#) and [SSL/TLS for Encryption](#) for more information. You may also want to reference the following topics:

- [Installing Drill](#), which describes some Drill installation security scenarios.
- [Drill Drivers](#) on page 4087, where you can access the JDBC and ODBC driver information and downloads required to connect to Drill when using the default security configuration.

**NOTE:** The default security configuration does not include Kerberos or Plain authentication; however, you can manually configure these security mechanisms in addition to the default security configuration.

### Security Features Supported in a Custom Configuration

Drill supports several security features that an [administrator](#) can manually configure to secure the communication paths between the Drill client and Drillbit and also between Drillbits.

The following table lists the security features and mechanisms supported by Drill, as well as the communication paths secured by each mechanism:

**NOTE:** In the following table, Drill client refers to the Drill ODBC and JDBC clients. See [Drill Drivers](#) for ODBC and JDBC driver information.

Security Features	Supported Mechanisms	Communication Paths Secured
Authentication	<a href="#">MapR Security</a> (data-fabric-SASL/Tickets)	<ul style="list-style-type: none"> <li>• Drill client to Drillbit</li> <li>• Drillbit to Drillbit</li> <li>• Drillbit to ZooKeeper</li> </ul> <p> <b>NOTE:</b> The Drillbit creates znodes, for which ZooKeeper ACLs provide security. See <a href="#">Security Between ZooKeeper and Drillbits</a> for more information.</p>
	<a href="#">Kerberos</a>	<ul style="list-style-type: none"> <li>• Drill client to Drillbit</li> <li>• Drillbit to Drillbit</li> </ul>
	<a href="#">Plain</a> (username and password)	<ul style="list-style-type: none"> <li>• Drill client to Drillbit</li> </ul>

Security Features	Supported Mechanisms	Communication Paths Secured
	<a href="#">Form-based</a>	<ul style="list-style-type: none"> <li>Web client/REST API to Drillbit</li> </ul>  <b>NOTE:</b> You can configure SSL/TLS for encryption.
	<a href="#">SPNEGO for HTTP</a>	<ul style="list-style-type: none"> <li>Web client/REST API to Drillbit</li> </ul>  <b>NOTE:</b> You can configure SSL/TLS for encryption.
Encryption	<a href="#">MapR Security</a> (data-fabric/Tickets)	<ul style="list-style-type: none"> <li>Drill client to Drillbit</li> <li>Drillbit to Drillbit</li> </ul>
	<a href="#">Kerberos</a>	<ul style="list-style-type: none"> <li>Drill client to Drillbit</li> <li>Drillbit to Drillbit</li> </ul>
	<a href="#">SSL/TLS</a>	<ul style="list-style-type: none"> <li>Drill client to Drillbit</li> <li>Web client/REST API to Drillbit</li> </ul>
Authorization	Based on filesystem permissions.	<ul style="list-style-type: none"> <li>Drill client to Drillbit</li> </ul>
Impersonation	<a href="#">User Impersonation</a>	<ul style="list-style-type: none"> <li>Drill client to Drillbit</li> </ul>  <b>NOTE:</b> Drill supports user impersonation, inbound impersonation, and user impersonation with Hive authorization.
	<a href="#">Inbound impersonation</a>	<ul style="list-style-type: none"> <li>Drill client to Drillbit</li> </ul>  <b>NOTE:</b> Supports setting inbound impersonation policies, which are used to verify whether the user (set as the DelegationUID parameter passed in the client connection URL) can be impersonated by the connection user or not.

### Views and File ACEs

In addition to the listed security features, you can [create views](#) on data to limit access to the data. You can also create [file ACEs](#) on the view definition files to protect the views.

### Related concepts

[Drill Drivers](#) on page 4087

HPE Ezmeral Data Fabric provides Drill ODBC and JDBC drivers that you can download and use to connect Drill to BI tools. The drivers are updated periodically to include support for new functionality in Drill.

[Start the Drill Shell \(SQLLine\)](#) on page 4023

SQLLine is a JDBC application packaged with Drill that serves as the Drill shell. When you issue queries from the SQLLine, the SQLLine client sends the queries to the connected Drillbit (Drill node).

[Connection URLs for Kerberos using JDBC Drivers to connect via SQLLine](#) on page 4057

You can use client-side connection URL parameters for Kerberos authentication in multiple combinations to authenticate a client with Drill.

[Connection URL for Plain Authentication using the Apache JDBC Driver to connect via SQLLine](#) on page 4064

When Plain authentication is enabled, each user that accesses the Drillbit process through a client, must provide username and password credentials for access.

[SSL/TLS for Encryption](#) on page 4065

You can enable SSL for Drill in a secure cluster. SSL (Secure Sockets Layer), more recently called TLS, is a security mechanism that encrypts data passed between the Drill client and Drillbit (server). SSL also provides one-way authentication through which the Drill client verifies the identity of the Drillbit.

[Configuring Drill Web UI and Web API Security](#) on page 4076

The Drill web client and web API communicate with web browsers or web tools, like curl, through the HTTP or HTTPS. Drill uses HTTP by default.

[SPNEGO for HTTP Authentication](#) on page 4081

Drill 1.13 and later supports the Simple and Protected GSS-API Negotiation mechanism (SPNEGO) to extend the Kerberos-based single sign-on authentication mechanism to HTTP. An administrator configures the web server (Drillbit) to use SPNEGO for authentication. Depending on the system, either the administrator or the user configures the client (web browser or web client tool) to use SPNEGO for authentication.

## Roles and Privileges

Drill has USER and ADMIN roles. Each role can perform different functions in Drill.

Access in the Drill Web UI differs between users and administrators. Certain pages are exposed based on privilege. For example, only administrators can see the Storage tab and edit a storage plugin configuration.

The following sections describe a few additional differences between a user and an administrator in Drill.

### USER Role

The following list notes the functions that a user can perform in Drill:

- Users can run queries on data to which they have access.
- Users can view and cancel their own queries in the Profiles tab of the Drill Web UI.
- Users can create views on data to provide granular access to that data.

**NOTE:** Each data source manages the read/write permissions.

### ADMIN Role

When authentication is enabled, only Drill users assigned the administrator (ADMIN) role can perform the following tasks:

- Change system-level options by issuing the ALTER SYSTEM command or through the options tab in the Drill Web UI.
- Update a storage plugin configuration through the REST API or Drill Web UI.
- View the profiles of all queries run by all users.
- Cancel running queries that were launched by any user in the cluster.
- Shut down the Drillbit in the Drill Web UI.

### Configuring USER and ADMIN Roles

You can define administrative users through the `security.admin.user_groups` and `security.admin.users` options.

The default value for `admin.users` is the `drill_process_user`. The default value for `admin.user_groups` is `drill_process_user_groups`. These options accept a comma-separated list of users or user groups.

To edit these options, use the SET command, as shown in the following examples:

```
ALTER SYSTEM SET `security.admin.user_groups` = 'drill,
%drill_process_user_groups%';
ALTER SYSTEM SET `security.admin.users` = 'user1, %drill_process_user%';
ALTER SYSTEM SET `security.admin.users` = 'user1, user2';
```

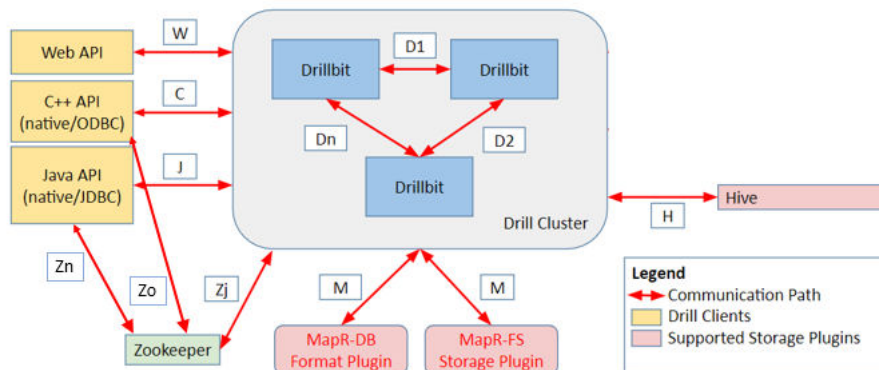

### Drill Default Security

The default security configuration uses MapR-SASL (tickets) for authentication, authorization, and encryption to automatically secure the cluster and ecosystem components when you install them manually or using the Installer.

The default security configuration automatically secures all Drill communication paths with the following exceptions:

- The path between the web client and web server (W) uses [SSL/TLS](#) with form-based authentication.
- The path between the ODBC/JDBC client and ZooKeeper (Zn, Zo) is unsecure.

The following diagram shows the secured communication paths:

The following table describes the security support for each communication path in the diagram, along with the components involved in the communication:

Type of Security Supported	Communication Path	Component Communication
Authentication and encryption using MapR-SASL (tickets)	C	ODBC client/C++ API to Drillbits
	J	JDBC client/Java API to Drillbits
	D1, D2, Dn	Drillbit to Drillbit
	M	Drillbit to HPE Ezmeral Data Fabric Database/file system

	H	Drillbit to Hive  <b>NOTE:</b> The Hive storage plugin is not secured by default and requires that you manually modify the configuration to enable security. See <a href="#">Configuring the Hive Storage Plugin</a> on page 4016.
Plain authentication with SSL encryption (HTTPS enabled)	W	Web client/Web API to Web server  <b>NOTE:</b> The HTTPS channel (Web client) uses Plain authentication to authenticate a Web client with SSL/TLS for encryption. This is configured by default in a secure 6.x cluster with Drill 1.11 or later installed. Plain authentication does not support encryption. You must enable SSL to encrypt the communication channels when using Plain authentication. See <a href="#">Configuring Drill Web UI and Web API Security</a> on page 4076.
Authentication with security (no encryption)	Zj	Drillbit to ZooKeeper  <b>NOTE:</b> The Drillbit creates znodes, for which ZooKeeper <a href="#">ACLs</a> provide security. See <a href="#">Security Between ZooKeeper and Drillbits</a> on page 4075 for more information.
No security support	Zo, Zn	ODBC/JDBC client to ZooKeeper  <b>NOTE:</b> Only znodes created for Drillbit endpoints in Zookeeper are readable by the client. All other znodes (not required by the client) are secured using ZooKeeper <a href="#">ACLs</a> , and are only readable by Drillbits.

Note the following information:

- [Kerberos](#) and [Plain authentication](#) are not enabled or configured as part of the default security configuration. However, you can manually configure these security mechanisms in addition to the defaults. If you enable Plain authentication, you must use [SSL/TLS](#) for encryption.
- Drill clients running Drill 1.10 and earlier do not support encryption and cannot connect to Drillbits installed with the default security configuration.

### Connecting Drill

See [Drill Drivers](#) on page 4087. Alternatively, you can use [SQLLine](#), [the Drill shell](#), as shown:

### Additional Notes

#### Performance

The default security configuration enables encryption for all network channels, which can affect Drill performance. If performance is your highest priority, install the data-fabric and Drill without security enabled and have your security expert manually configure cluster security. Alternatively, you can install the data-fabric and Drill with security enabled, and then disable individual Drill security settings. For example, you can edit the `drill-override.conf` file and disable encryption, leaving authentication enabled.

**NOTE:** Manually configuring security settings when default security is enabled is not recommended.

### Drill Configuration Files

The default security configuration introduces new Drill configuration files. In addition to `drill-override.conf`, `distrib-env.sh`, and `drill-env.sh`, Drill includes a `drill-distrib.conf` file. See [Drill Configuration Files](#) on page 4107 for more information. Note that modifying drill distribution-specific files is highly discouraged. To customize any Drill configuration, use `drill-override.conf` and `drill-env.sh`.

### HBase

As of Core 6.0 and Drill 1.11, HBase is no longer supported; therefore, the communication path between Drill and HBase is also not supported.

### User Impersonation

Impersonation allows a service to act on behalf of a client while performing the action requested by the client. By default, user impersonation is disabled in Drill. You can configure user impersonation in the `/opt/mapr/drill/drill-<version>/drill-override.conf` file.

When you enable impersonation, Drill executes all the client requests as the user logged in to the client. Drill passes the user credentials to the file system, and the file system checks to see if the user has permission to access the data. When you enable authentication, Drill uses the pluggable authentication module (PAM) to authenticate a user's identity before the user can access the Drillbit process.

If impersonation is disabled, Drill executes all of the client requests against the file system as the user that started the Drillbit service on the node. This is typically a privileged user. The file system verifies that the system user has permission to access the data.

### User Impersonation Example

When impersonation is disabled and user Bob issues a query through the SQLLine client, SQLLine passes the query to the connecting Drillbit. The Drillbit executes the query as the system user that started the Drill process on the node. For the purpose of this example, we will assume that the system user has full access to the file system. Drill executes the query and returns the results back to the client.

When impersonation is enabled and user Bob issues a query through the SQLLine client, the Drillbit uses Bob's credentials to access data in the file system. The file system checks to see if Bob has permission to access the data. If Bob has permission, Drill returns the query results to the client. If Bob does not have permission, Drill returns an error.

### Impersonation Support

Drill supports impersonation with the following clients, storage plugins, and types of queries:

- **Clients**
  - ODBC

- JDBC
- REST API
- Drill Web UI
- **Storage plugins**
  - file system
  - HPE Ezmeral Data Fabric Database
  - Hive
- **Types of queries**

**NOTE:** When you enable impersonation, the setting applies to queries on data and metadata. For example, if you issue the `SHOW SCHEMAS` command, Drill impersonates the user logged into the client to access the requested metadata. If you issue a `SELECT` query on a workspace, Drill impersonates the user logged in to the client to access the requested data.

Drill applies impersonation to queries issued using the following commands:

- `SHOW SCHEMAS`
- `SHOW DATABASES`
- `SHOW TABLES`
- `CTAS`
- `SELECT`
- `CREATE VIEW`
- `DROP VIEW`
- `SHOW FILES.`

**NOTE:** To successfully run the `CTAS` and `CREATE VIEW` commands, a user must have write permissions on the directory where the table or view will exist. Running these commands creates artifacts on the file system.

### *Impersonation and Views*

You can use views with impersonation to provide granular access to data and protect sensitive information.

When you create a view, Drill stores the view definition in a file and suffixes the file with `view.drill`. For example, if you create a view named `myview`, Drill creates a view file named `myview.view.drill` and saves it in the current workspace or the workspace specified, such as `dfs.views.myview`. See [CREATE VIEW](#).

You can create a view and grant read permissions on the view to give other users access to the data that the view references. When a user queries a view on which s/he has read access, Drill impersonates the view owner to access the underlying data. If the user tries to query the data directly (instead of using the view), Drill returns a permission denied error. A user with read access to a view can create new views from the originating view to further restrict access on data.

### **View Permissions**

A user must have write permission on a directory or workspace to create a view, as well as read access on the table(s) and/or view(s) that the view references. When a user creates a view, permission on the view is

set to owner by default. Users can query an existing view or create new views from the view if they have read permissions on the view file and the directory or workspace where the view file is stored.

When users query a view, Drill accesses the underlying data as the user that created the view. If a user does not have permission to access a view, the query fails and Drill returns an error. Only the view owner or a superuser can modify view permissions to change them from owner to group or world.

The view owner or a superuser can modify permissions on the view file directly or they can set view permissions at the system or session level prior to creating any views. Any user that alters view permissions must have write access on the directory or workspace in which they are working.

### Modifying Permissions on a View File

Only a view owner or a super user can modify permissions on a view file to change them from owner to group or world readable. Before you grant permission to users to access a view, verify that they have access to the directory or workspace in which the view file is stored.

Use the `chmod` and `chown` commands with the appropriate octal code to change permissions on a view file:

```
hadoop fs -chmod <octal code> <file_name>
hadoop fs -chown <user>:<group> <file_name>
//hadoop fs -chmod 750 employees.view.drill
```

### Modifying SYSTEM|SESSION Level View Permissions

Use the `ALTER SESSION|SYSTEM` command with the `new_view_default_permissions` parameter and the appropriate octal code to set view permissions at the system or session level prior to creating a view.

```
ALTER SESSION SET `new_view_default_permissions` = '<octal_code>';
ALTER SYSTEM SET `new_view_default_permissions` = '<octal_code>';
//ALTER SESSION SET `new_view_default_permissions` = '777';
```

After you set this parameter, Drill applies the same permissions on each view created during the session or across all sessions if set at the system level.

#### *Chained Impersonation*

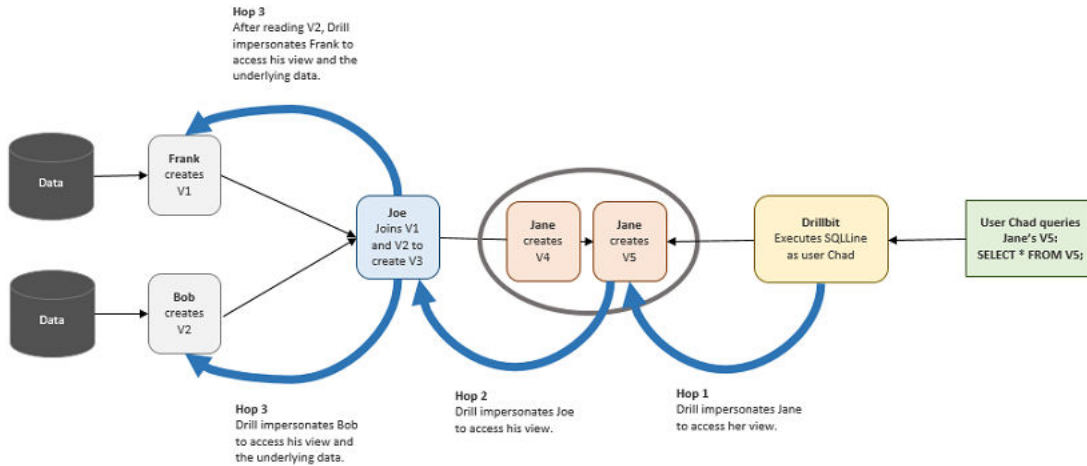

You can configure Drill to allow chained impersonation on views when you enable impersonation in the `drill-override.conf` file. Chained impersonation controls the number of identity transitions that Drill can make when a user queries a view. Each identity transition is equal to one hop.

An administrator can set the maximum number of hops for impersonation to limit the number of times that Drill can impersonate a different user when other users query a view. The default maximum number of hops is set at 3. When the maximum number of hops is set to 0, Drill does not allow impersonation chaining, and a user can only read data for which they have direct permission to access. An administrator may set the chain length to 0 to protect highly sensitive data.

The following diagram depicts a scenario where the maximum hop number is set to 3, and Drill must impersonate three users to access data when Chad queries a view that Jane created:

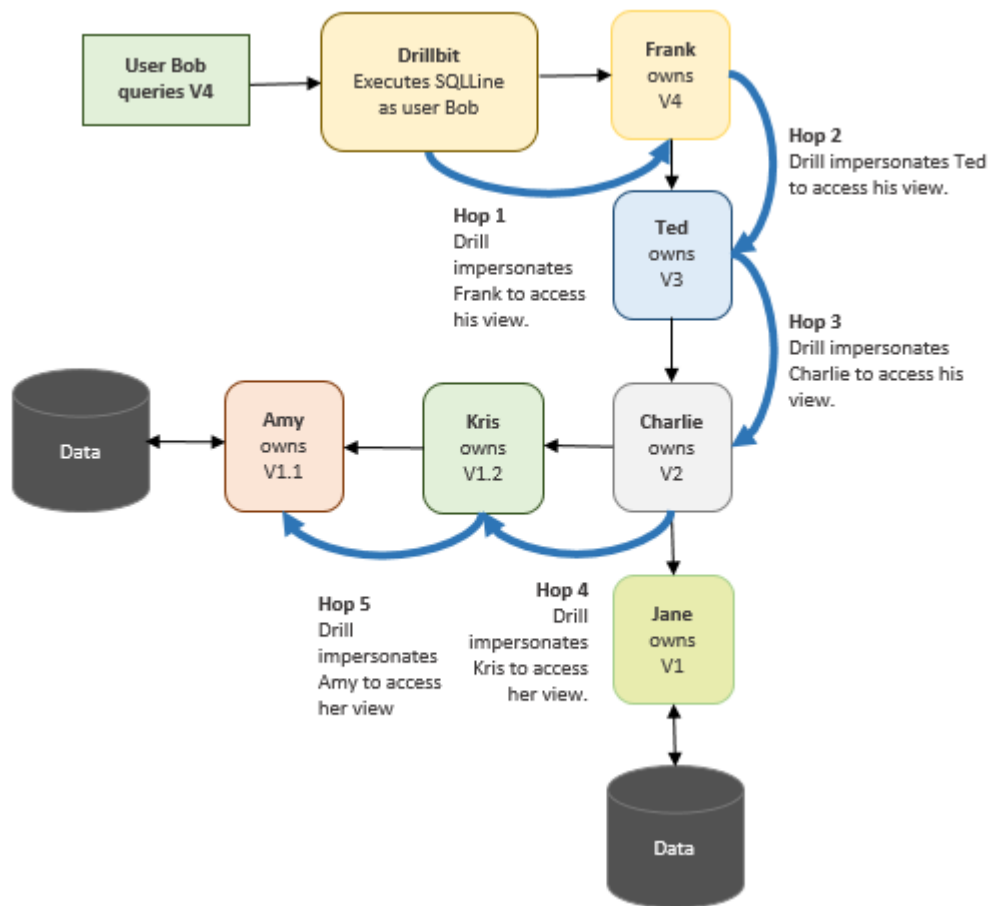

In the previous example, Joe created V2 from the view that user Frank created. In the following example, Joe created V3 by joining a view that Frank created with a view that Bob created.

Although V3 was created by joining two different views, the number of hops remains at 3 because Drill does not read the views at the same time. Drill reads V2 first and then reads V1.

In the next example, Bob queries V4 which was created by Frank. Frank's view was created from several underlying views. Charlie created V2 by joining Jane's V1 with Kris's V1.2. Kris's V1.2 was created from Amy's V1.1, increasing the complexity of the chaining. Assuming that the hop limit is set at 4, this scenario exceeds the limit.

When Bob queries Franks's view, Drill returns an error stating that the query cannot complete because the number of hops required to access the data exceeds the maximum hop setting of 4.

If users encounter this error, the administrator can increase the maximum hop setting to accommodate users running queries on views.

### ***Configuring Impersonation and Chaining***

Impersonation allows a service to act on behalf of a client while performing the action requested by the client. Chaining is a system-wide setting that applies to all views. Currently, Drill does not provide an option to allow different chain lengths for different views.

Complete the following steps on each Drillbit node to enable user impersonation, and set the maximum number of chained user hops that Drill allows:

1. Navigate to `<drill_installation_directory>/conf/` and edit `drill-override.conf`.

2. Under `drill.exec`, add the following:

```
drill.exec.impersonation: {
    enabled: true,
    max_chained_user_hops: 3
}
```

Alternatively, you can nest `impersonation` within the `drill.exec` block, as shown in the following example:

```
drill.exec: {
    cluster-id: "cluster_name",
    zk.connect:
"<hostname>:<port>,<hostname>:<port>,<hostname>:<port>",
    sys.store.provider.zk.blobroot: "hdfs://",
    impersonation: {
        enabled: true,
        max_chained_user_hops: 3
    }
}
```

3. Set the maximum number of chained user hops.

4. In `<drill_installation_directory>/conf/drill-env.sh`, add one of the following lines:

- If the underlying filesystem has security enabled, add the following line: `export MAPR_TICKETFILE_LOCATION=/opt/mapr/conf/mapruserticket`
- If the underlying filesystem is not secure, add the following line: `export MAPR_IMPERSONATION_ENABLED=true`

5. Restart the Drillbit process on each Drill node.

```
maprcli node services -name drill-bits -action restart -nodes
<node-hostnames-separated-by-a-space> -f
```

*Example: Impersonation and Chaining*

This example demonstrates how to use impersonation and chaining to limit access to data. Impersonation allows a service to act on behalf of a client while performing the action requested by the client. Chaining controls the number of identity transitions that Drill can make when a user queries a view.

**NOTE:** The number of identity transitions is controlled by the `max_chained_user_hops` option in the `drill-override.conf` file. See [Chained Impersonation](#) and [Configuring Impersonation and Chaining](#) for more information.

Frank is a senior HR manager at a company. Frank has access to all of the employee data because he is a member of the `hr` group. Frank created a table named “employees” in his home directory to store the employee data he uses. Only Frank has access to this table.

```
drwx----- frank:hr /user/frank/employees
```

Each record in the `employees` table consists of the following information: `emp_id`, `emp_name`, `emp_ssn`, `emp_salary`, `emp_addr`, `emp_phone`, `emp_mgr`

Frank needs to share a subset of this information with Joe who is an HR manager reporting to Frank. To share the employee data, Frank creates a view called `emp_mgr_view` that accesses a subset of the data. The `emp_mgr_view` filters out sensitive employee information, such as the employee social security

numbers, and only shows data for the employees that report directly to Joe. Frank and Joe both belong to the mgr group. Managers have read permission on Frank's directory.

```
rwxr----- frank:mgr /user/frank/emp_mgr_view.view.drill
```

The emp\_mgr\_view.view.drill file contains the following view definition:

```
(view definition: SELECT emp_id, emp_name, emp_salary, emp_addr, emp_phone
FROM `/user/frank/employee` WHERE emp_mgr = 'Joe')
```

When Joe issues `SELECT * FROM emp_mgr_view`, Drill impersonates Frank when accessing the employee data, and the query returns the data that Joe has permission to see based on the view definition. The query results do not include any sensitive data because the view protects that information. If Joe tries to query the employees table directly, Drill returns an error or null values.

Because Joe has read permissions on the emp\_mgr\_view, he can create new views from it to give other users access to the employee data even though he does not own the employees table and cannot access the employees table directly.

Joe needs to share employee contact data with his direct reports, so he creates a special view called emp\_team\_view to share the employee contact information with his team. Joe creates the view and writes it to his home directory. Joe and his reports belong to a group named joeteam. The joeteam group has read permissions on Joe's home directory so they can query the view and create new views from it.

```
rwxr----- joe:joeteam /user/joe/emp_team_view.view.drill
```

The emp\_team\_view.view.drill file contains the following view definition:

```
(view definition: SELECT emp_id, emp_name, emp_phone FROM `/user/frank/
emp_mgr_view.drill`);
```

When anyone on Joe's team issues `SELECT * FROM emp_team_view`, Drill impersonates Joe to access the emp\_team\_view and then impersonates Frank to access the emp\_mgr\_view and the employee data. Drill returns the data that Joe's team has can see based on the view definition. If anyone on Joe's team tries to query the emp\_mgr\_view or employees table directly, Drill returns an error or null values.

Because Joe's team has read permissions on the emp\_team\_view, they can create new views from it and write the views to any directory for which they have write access. Creating views can continue until Drill reaches the maximum number of impersonation hops (chained impersonation).

### *User Impersonation with Hive*

You can configure Drill impersonation with Hive impersonation to authorize access to metadata in the Hive metastore repository and data in the Hive warehouse. [Drill impersonation](#) works with Hive when Hive has impersonation enabled and optionally, storage based or SQL standard based authorization enabled. Drill impersonation can also work with Hive when the Hive metastore has Kerberos enabled on a secure cluster. Currently, Drill does not support Hive configured with Sentry authorization.

## **Storage Based Authorization**

Hive storage based authorization is a remote metastore server security feature that uses the underlying filesystem permissions to determine permissions on databases, tables, and partitions. The permissions a user or group has on directories in the filesystem determines access to data. Because the filesystem controls access at the directory and file level, storage based authorization cannot control access to data at the column or view level.

You manage user and group privileges through permissions and access controls in the distributed filesystem. DDL statements that manage permissions, such as GRANT and REVOKE, do not have any effect on permissions in the storage based authorization model.

For more information, see [Storage Based Authorization in the Metastore Server](#).

## SQL Standard Based Authorization

The SQL standard based authorization model can control which users have access to columns, rows, and views. SQL standard based authorization is configured in HiverServer2 and enforced during query processing. Users with the appropriate permissions can issue the GRANT and REVOKE statements to manage privileges from Hive.

For more information, see [SQL Standard Based Hive Authorization](#).

## Prerequisites

To configure user impersonation with Hive, the system must meet the following requirements:

- Core version 4.1 or later
- Drill installed with Drillbits running as the `mapr` user
- Supported version of Hive installed with the following:
  - [User impersonation](#) enabled
  - Configured Hive remote metastore repository
  - (Optional) [SQL standard based authorization](#) or [storage based authorization](#) configured

**NOTE:** See [EEP Components and OS Support](#) on page 5766 for supported versions of Hive.

## Configuration

Complete the steps listed in [Configuring User Impersonation with Hive](#).

### Configuring User Impersonation with Hive

Complete the following steps on a secure or insecure cluster to configure user impersonation with Hive:

#### Step 1: Modify `drill-env.sh`

Modify `<DRILL_HOME>/conf/drill-env.sh` to include the required environment variables on each Drill node.

#### Insecure Cluster

On an insecure cluster, include the following environment variable:

```
export MAPR_IMPERSONATION_ENABLED=true
```

#### Secure Cluster

On a secure cluster, include the following environment variables:

```
export
DRILL_JAVA_OPTS="$DRILL_JAVA_OPTS -Djava.security.auth.login.config=/opt/mapr/conf/mapr.login.conf -Dzookeeper.sasl.client=true"
export
DRILL_JAVA_OPTS="$DRILL_JAVA_OPTS -Dmapr_sec_enabled=true -Dhadoop.login=maprsasl_keytab -Dzookeeper.saslprovider=com.mapr.security.maprsasl.MaprSaslProvider -Dmapr.library.flatclass"
export MAPR_TICKETFILE_LOCATION=/opt/mapr/conf/mapruserticket
```

**Step 2: Modify drill-override.conf**

For secure and insecure clusters, modify `<DRILL_HOME>/conf/drill-override.conf` on each Drill node to enable impersonation in Drill, and set the [maximum number of chained user hops](#) that Drill allows.

Add the following configuration properties to the `drill.exec` block in `drill-override.conf`:

```
drill.exec: {
  cluster-id: "<drill_cluster_name>",
  zk.connect: "<hostname>:5181,<hostname>:5181,<hostname>:5181"
  impersonation: {
    enabled: true,
    max_chained_user_hops: 3
  }
}
```

**Step 3: Modify the Hive Storage Plugin in Drill**

Modify the Hive storage plugin configuration in the Drill Web UI based on the authorization and security scenario for the cluster. You can only access the Drill Web UI for a running Drillbit.

Complete the following steps to modify the Hive storage plugin configuration:

1. Navigate to `http://<drillbit_hostname>:8047`, and select the **Storage** tab.
2. Click **Update** next to the hive option.
3. In the configuration window, add the required properties based on the authorization type and security scenario:

**Storage Based Authorization or No Authorization Enabled**

For a *insecure cluster*, add the following properties to the configuration:

```
{
  type:"hive",
  enabled: true,
  configProps : {

    "hive.metastore.uris" : "thrift://
<metastore_hostname>:9083",
    "fs.default.name" : "maprfs:///",
    "hive.metastore.sasl.enabled" :
    "false",
    "hive.server2.enable.doAs" :
    "true",

    "hive.metastore.execute.setugi" :
    "true"
  }
}
```

For a *secure cluster*, add the following properties to the configuration:

```
{
  "type": "hive",
  "enabled": true,
  "configProps": {
    "hive.metastore.uris": "thrift://
<metastore_hostname>:9083",
    "fs.default.name": "maprfs:///",
    "hive.server2.enable.doAs": "true"
  }
}
```

```
}
}
```

Add the following additional properties if the Hive metastore is configured with Kerberos in a secure cluster; include a comma after each line except for the last:

```
"hive.metastore.kerberos.principal":
"hive/<metastore_thrift_server>"
"hive.metastore.sasl.enabled":
"true"
```

### SQL Standard Based Authorization

For an *insecure cluster*, add the following properties to the configuration:

```
{
  type:"hive",
  enabled: true,
  configProps : {
    "hive.metastore.uris" :
"thrift://
<metastore_hostname>:9083",
    "fs.default.name" : "maprfs:///",
    "hive.security.authorization.enabled
" : "true",
    "hive.security.authenticator.manager
" :
"org.apache.hadoop.hive.ql.security.
SessionStateUserAuthenticator",
    "hive.security.authorization.manager
" :
"org.apache.hadoop.hive.ql.security.
authorization.plugin.sqlstd.SQLStdHi
veAuthorizerFactory",
    "hive.metastore.sasl.enabled" :
"false",
    "hive.server2.enable.doAs" :
"false",
    "hive.metastore.execute.setugi" :
"false"
  }
}
```

For a *secure cluster*, add the following properties to the configuration:

```
{
  "type": "hive",
  "enabled": true,
  "configProps": {
    "hive.metastore.uris": " thrift://
<metastore_hostname>:9083",
    "fs.default.name": "maprfs:///",
    "hive.security.authorization.enabled
```

```

": "true" ,

"hive.security.authenticator.manager
":
"org.apache.hadoop.hive ql.security.
SessionStateUserAuthenticator" ,

"hive.security.authorization.manager
":
"org.apache.hadoop.hive ql.security.
authorization.plugin.sqlstd.SQLStdHi
veAuthorizerFactory" ,
  "hive.server2.enable.doAs" :
  "false" ,
  "hive.metastore.execute.setugi" :
  "true"
}
}

```

Add the following additional properties if the Hive metastore is configured with Kerberos in a secure cluster; include a comma after each line except for the last:

```

"hive.metastore.kerberos.principal" :
  "hive/<metastore_thrift_server>"
"hive.metastore.sasl.enabled" :
  "true"

```

#### Step 4: Restart Warden

Run the following command on all nodes to restart the Warden service:

```
service mapr-warden restart
```

If you have `clush` installed, you can run the following command to restart Warden on all nodes at once:

```
clush -a "service mapr-warden restart"
```

#### *Inbound Impersonation*

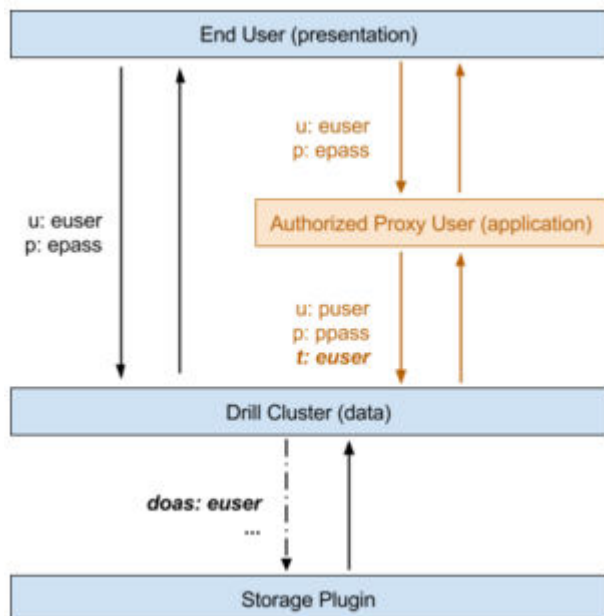

An administrator can define inbound impersonation policies to impersonate the end user.

Drill supports user impersonation where queries run as the user that created a connection. However, this user is not necessarily the end user who submits the queries. For example, in a classic three-tier architecture, the end user interacts with Tableau Desktop, which communicates with a Tableau Server, which in turn communicates with a Drill cluster. In this scenario, a proxy user creates a connection, and the queries are submitted to Drill by the proxy user on behalf of the end user, and not by the end user directly. In this particular case, the query needs run run as the end user.

The proxy user must be authorized to submit queries on behalf of the specified end user. Otherwise, any user can impersonate another user. The query runs as the end user, and data authorization is based on this user's access permissions. Note that without authentication enabled in both communication channels, a user can impersonate any other user.

Drill trusts proxy users to provide the correct end user identity information. Drill does not authenticate the end user. The proxy user (application) is responsible for end user authentication, which is usually enabled.

The following diagram shows how identity is propagated through various layers (with authentication enabled). The flow on the left is Drill with user impersonation enabled. The flow on the right is Drill with user impersonation and inbound impersonation enabled. `t:ouser` is a property on the connection (`u` is `username`, `pis` `password`, `t` is `impersonation_target`).

The following topic provides instructions for configuring inbound impersonation:

### Configuring Inbound Impersonation

Administrators can configure inbound impersonation in the `drill-override.conf` file.

Complete the following steps to enable inbound impersonation:

1. If user impersonation is not enabled, you must enable it before configuring inbound impersonation. To enable user impersonation, edit `/opt/mapr/drill/drill-<version>/drill-override.conf` and set the option to `true`, as shown:

```
{
  drill.exec.impersonation.enabled: true,
  ...
}
```

2. Define inbound impersonation policies. For example, the following `ALTER SYSTEM` statement authorizes:

- `puser1` to impersonate any user (use `*` as a wildcard character)
- `puser2` to impersonate `euser1` and all users in `egroup2`
- all users in `pgroup3` to impersonate all users in `egroup3`

```
ALTER SYSTEM SET `exec.impersonation.inbound_policies`='[
  { proxy_principals : { users: ["puser1"] },
    target_principals: { users: ["*"] } },
  { proxy_principals : { users: ["puser2"] },
    target_principals: { users: ["euser1"], groups : ["egroup2"] } },
  { proxy_principals : { groups: ["pgroup3"] },
    target_principals: { groups: ["egroup3"] } } ]';
```

Policy format:

```
{ proxy_principals : { users : ["...", "..."], groups : ["...", "..."] },
  target_principals: { users : ["...", "..."], groups : ["...",
  "..."] } }
```

- Ensure that the proxy user (application) passes the username of the impersonation target user to Drill when creating a connection through the `impersonation_target` connection property. For example, through `sqlline`:

```
bin/sqlline -u
"jdbc:drill:schema=dfs;zk=myclusterzk;impersonation_target=euser1" -n
puser1 -p ppass1
```

 **NOTE:** In this example, `puser1` is the user submitting the queries. This user is authenticated. Since this user is authorized to impersonate any user, queries through the established connection are run as `euser1`.

### More information

<https://drill.apache.org/docs/configuration-options-introduction/#system-options>

### Default Security (Tickets)

Drill supports authentication and encryption through the Default (tickets) security mechanism. Authentication is the process of establishing confidence of authenticity. Encryption is the process of converting information or data from plain text into ciphertext to prevent unauthorized access. An administrator can manually configure Drill to use Default Security. When Default Security is enabled, all Drill clients, such as JDBC and ODBC, must connect to Drillbits through Default Security.

The Default Security mechanism secures the communication path between the Drill client, such as JDBC/ODBC and Drillbit, Drillbit and ZooKeeper, and also between Drillbits.

 **NOTE:** The Drill web communication path (web client to web server) does not support Default Security-based authentication and encryption.

 **NOTE:** The Apache JDBC driver packaged with Drill does not support Default Security.

Configuration parameters in the Drill startup configuration file, `/opt/mapr/drill/drill-<version>/conf/drill-override.conf`, enable or disable authentication and encryption.

### Prerequisites

- Ensure that your cluster is secure. To manually configure secure clusters with Default Security, see [Enable Wire-Level Security](#).
- When you configure Drill to use encryption, authentication must also be configured and enabled with the encryption-specific configurations.
- For encryption and authentication to work together, the Drill client and Drillbits must all run Drill 1.11 or later. Drill clients running earlier versions of Drill cannot connect to Drillbits when encryption is enabled.
- The client-side should have created a user `mapr` ticket for the authenticating user. See [maprlogin](#) for more information.

### Post-requisite

You must restart the Drillbit process on each node after you enable security and/or modify the configuration options, as shown:

```
$ maprcli node services -name drill-bits -action restart -nodes <node host
names separated by a space>
```

Download and configure the JDBC or ODBC Drill drivers. See [Drill Drivers](#) for more information.

The following topics provide configuration information to enable authentication and encryption in Drill:

### Configuring Authentication

An administrator can enable Default Security as the only authentication mechanism, or in addition to other mechanisms, such as Kerberos and Plain authentication in `drill-override.conf`.

 **NOTE:** When Drill is installed on the MapR Data Platform, Drill distribution defaults are stored in the `drill-distrib.conf` file. To override the defaults, you must explicitly disable them in the `drill-override.conf` file.

The following sections provide configuration examples for several configuration scenarios:

 **NOTE:** For client-side configuration, see [Drill Drivers](#).

#### Example 1: Drill Client to Drillbit Authentication using Default Security Only

```
drill.exec:{
    security: {
        user.auth.enabled: true,
        auth.mechanisms : ["MAPRSASL"]
    }
}
```

 **NOTE:** Drill executes all queries as a service or process user when impersonation is disabled.

#### Example 2: Drill Client to Drillbit Authentication with User Impersonation using Default

```
drill.exec:{
    security: {
        user.auth.enabled: true,
        auth.mechanisms : ["MAPRSASL"],
    }
    impersonation: {
        enabled: true,
        max_chained_user_hops: 3
    }
}
```

 **NOTE:** Drill executes all queries as the authenticated (ticket) user when impersonation is enabled. The client to Drillbit communication path will not be encrypted.

#### Example 3: Drill Client to Drillbit using Multiple Authentication Mechanisms

```
drill.exec:{
    security: {
        user.auth.enabled: true,
        user.auth.impl: "pam4j",
        security.user.auth.packages +=
"org.apache.drill.exec.rpc.user.security",
        user.auth.pam_profiles: ["sudo", "login",
"mapr-admin"],
        auth.mechanisms : ["MAPRSASL", "KERBEROS", "PLAIN"],
        auth.principal : "mapr/_host@REALM.COM",
        auth.keytab : "/opt/mapr/conf/mapr.keytab"
    },
    impersonation: {
        enabled: true,
        max_chained_user_hops: 3
    }
}
```

```
}
```

#### Example 4: Drillbit to Drillbit Authentication using Default Security

```
drill.exec:{
  security: {
    auth.mechanisms : ["MAPRSASL"],
    bit.auth.enabled : true
    bit.auth.mechanism : "MAPRSASL"
  }
}
```

#### Example 5: Drill Client to Drillbit and Drillbit to Drillbit Authentication using Default Security

```
drill.exec {
  security: {
    user.auth.enabled: true,
    auth.mechanisms : ["MAPRSASL"],
    bit.auth.enabled : true,
    bit.auth.mechanism : "MAPRSASL"
  },
  impersonation: {
    enabled: true,
    max_chained_user_hops: 3
  }
}
```

#### Configuring Encryption

An administrator can enable encryption with Default Security (tickets).

 **NOTE:** When the `sasl_encrypt` (for JDBC) or `EnforceSaslEncrypt` (for ODBC) connection parameter is set to "true" or 1, the Drill client only accepts encrypted connections. If the client tries connecting to a Drillbit with encryption disabled, the connection fails.

 **NOTE:** For client-side configuration, see [Drill Drivers](#).

Set the encryption options to "true" in `/opt/mapr/drill/drill-<version>/conf/drill-override.conf`.

The following table lists the encryption configuration options with their descriptions and default values:

 **NOTE:** If you installed Drill on a cluster that was installed with the default security configuration, the following options are set to "true" by default.

Option	Description	Default
<code>drill.exec.security.user.encryption.sasl.enabled</code>	Determines if encryption on the server is enabled for negotiating privacy with the Drill client.	false
<code>drill.exec.security.bit.encryption.sasl.enabled</code>	Determines if the server is enabled for negotiating privacy with another Drillbit.	false

The following sections provide configuration examples for Drill client to Drillbit encryption and Drillbit to Drillbit encryption.

**Example 1: Drill Client to Drillbit Connection with Default Security Authentication and Encryption**

In the following server configuration, the Drill client connection to the Drillbit is encrypted using the Default Security mechanism when the client is running with encryption support.

 **NOTE:** Drill clients running Drill 1.10 and earlier cannot connect to the Drillbit through Default Security with encryption enabled.

```
drill.exec {
  security: {
    user.auth.enabled: true,
    auth.mechanisms : ["MAPRSASL"]
    user.encryption.sasl.enabled : true
  }
}
```

 **NOTE:** Drill executes all queries as a service or process user when impersonation is disabled.

**Example 2: Drillbit to Drillbit Connection with Default Security Authentication and Encryption**

The following configuration authenticates and encrypts the path between Drillbits using the Default Security mechanism.

```
drill.exec {
  security: {
    auth.mechanisms : ["MAPRSASL"],
    bit.auth.enabled : true
    bit.auth.mechanisms : "MAPRSASL"
    bit.encryption.sasl.enabled : true
  }
}
```

**Example 3: Drill Client to Drillbit and Drillbit to Drillbit Connection with Default Security Authentication and Encryption**

The following configuration authenticates and encrypts the path between the Drill client and Drillbit, and between Drillbits using the Default Security mechanism.

```
drill.exec {
  security: {
    user.auth.enabled: true,
    auth.mechanisms : ["MAPRSASL"],
    user.encryption.sasl.enabled : true

    bit.auth.enabled : true
    bit.auth.mechanism : "MAPRSASL"
    bit.encryption.sasl.enabled : true
  }
}
```

 **NOTE:** Drill executes all queries as a service or process user when impersonation is disabled.

**Example 4: Drill Client to Drillbit and Drillbit to Drillbit Connection with Default Security Authentication and Encryption and Impersonation Enabled**

The following configuration authenticates and encrypts the path between the Drill client and Drillbit, and between Drillbits using the Default Security mechanism.

```
drill.exec {
  security: {
    user.auth.enabled: true,
```

```

    auth.mechanisms : ["MAPRSASL"],
    user.encryption.sasl.enabled : true

    bit.auth.enabled : true
    bit.auth.mechanism : "MAPRSASL"
    bit.encryption.sasl.enabled : true
  },
  impersonation: {
    enabled: true,
    max_chained_user_hops: 3
  }
}

```

 **NOTE:** Drill executes all queries as the authenticated (ticket) user when impersonation is enabled.

### Example 5: Drill Client to Drillbit Authentication and Encryption Enabled using Multiple Mechanisms and Drillbit to Drillbit Authentication using Default Security

The following configuration authenticates and encrypts the connection between the Drill client and Drillbit using multiple authentication mechanisms, and also authenticates and encrypts the connection between Drillbits using the Default security mechanism.

 **NOTE:** Plain authentication not supported in this configuration.

```

drill.exec {
  security: {
    user.auth.enabled: true,
    auth.mechanisms : ["MAPRSASL", "KERBEROS"],
    auth.principal : "mapr/_host@REALM.COM",
    auth.keytab : "/opt/mapr/conf/mapr.keytab",
    user.encryption.sasl.enabled : true,
    bit.auth.enabled : true,
    bit.auth.mechanism : "MAPRSASL",
    bit.encryption.sasl.enabled : true
  }
  impersonation: {
    enabled: true,
    max_chained_user_hops: 3
  }
}

```

 **NOTE:** Drill executes all queries as a service or process user when impersonation is disabled.

### Kerberos

Drill supports Kerberos v5 network security authentication and encryption. Kerberos is a network authentication protocol built on symmetric-key cryptography. Kerberos eliminates the need to store passwords locally or send them over the network and reduces the risk of impersonation.

Kerberos provides a security infrastructure called a Kerberos Realm. A Kerberos Realm is comprised of clients, services or hosts, and a KDC (key-distribution center). The KDC is a trusted third-party service that generates tickets to coordinate authentication between a client and server or host. Tickets are cached on the client machine, which allows for single sign-on.

Clients use a password or a special file called a “keytab” to get tickets from the KDC. Clients exchange the tickets and secret keys with the KDC and service or host to prove their identity for access to the requested service. This authentication process of exchanging tickets and secret keys runs in the background, unseen by the user trying to access the service. When a client request to access a service is granted, a unique session key is established between the client and service. The unique session key proves the authenticity of the user. The session key is used for all communication between the client and service. Kerberos also

supports encryption between the client and server to prevent data theft from a man-in-the-middle attack during communication.

A KDC administrator must create the password or keytab for the clients and servers, as well as a principal (a name for the user or server identity) to securely authenticate using the Kerberos infrastructure.

**NOTE:** Proper setup, configuration, administration, and usage of a Kerberos environment is beyond the scope of this documentation. See the [MIT Kerberos](#) documentation for more detailed information about Kerberos.

The following sections list the prerequisites for using Kerberos with Drill and describe the authentication process.

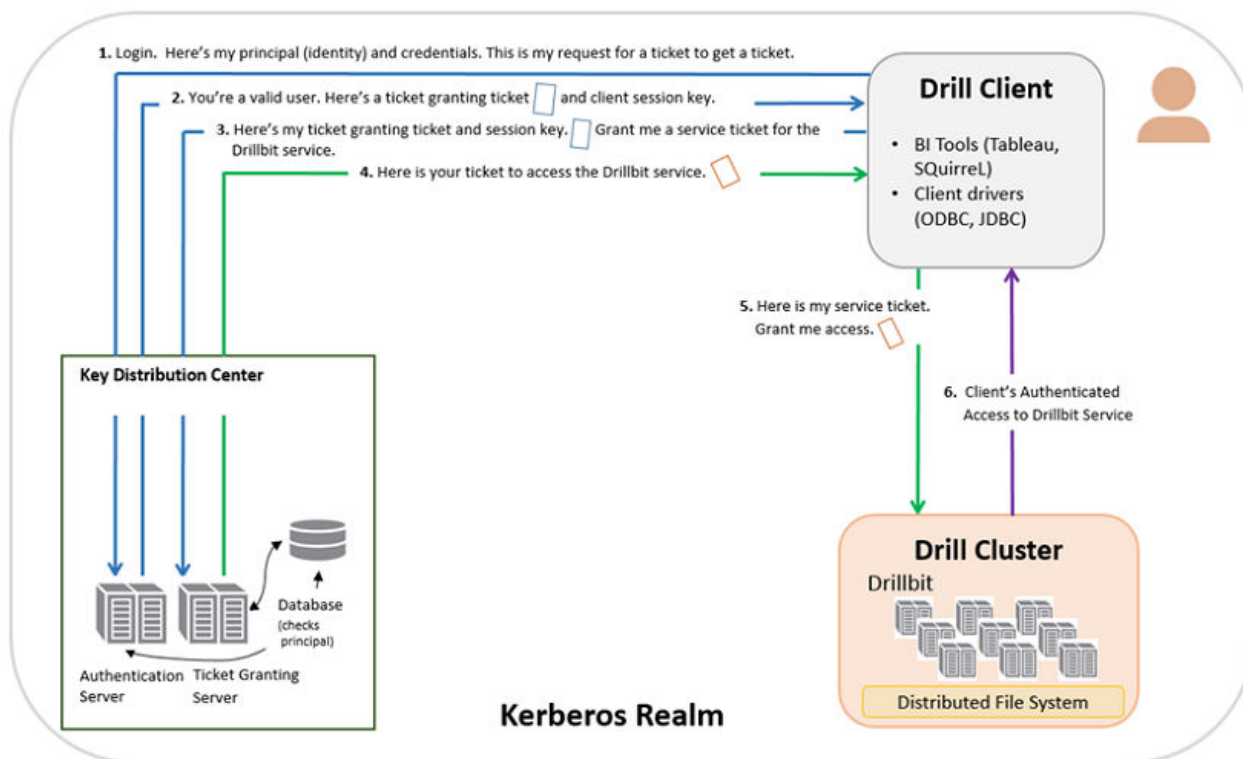

### Prerequisites

- The [MapR Drill driver](#) includes the required Kerberos plugin to authenticate to secure Kerberos Drill clusters. To use Kerberos with Drill, you must have a working Kerberos infrastructure, which Drill does not provide.
- Either a ticket granting ticket (TGT) is pre-generated on the client node, or a keytab file and the client principal is available to provide in the connection URL for Kerberos authentication between the Drill client and Drill server. Drill does not generate the TGT.
- You must be working in a Linux-based or Windows Active Directory (AD) Kerberos environment with secure clusters and have a Drill server configured for Kerberos.

### Client Authentication Process

This section provides a high-level overview of the Kerberos client authentication process. For this overview, assume that Kerberos credentials are present in the client.

The following diagram shows the process of authenticating a client:

1. The client sends a request for a ticket granting ticket that contains the user principal to the Kerberos KDC, a network service that supplies tickets and temporary session keys.
2. The authentication server validates the principal's identity and sends the client a ticket granting ticket and session key encrypted with a secret key. A session key is a temporary encryption key used for one login session.
3. Using the ticket granting ticket, the principal requests access to a Drillbit service from the ticket granting server.
4. The ticket granting server checks for a valid ticket granting ticket and the principal identity. If the request is valid, the ticket granting server returns a ticket granting service ticket.
5. The client uses the service ticket to request access to the Drillbit.
6. The Drillbit service has access to the keytab, a file that contains a list of keys for principals. The key allows the service to decrypt the client's ticket granting service ticket, identify the principal, and grant access.

### Server Authentication Process

For Kerberos server authentication information, see the [MIT Kerberos](#) administration documentation.

### Configuring Drill with Kerberos

The topics listed below provide configuration and connection information.

#### *Configuring Authentication and Encryption*

To enable authentication and encryption, you must create a Kerberos principal identity and a keytab file. You add the principal and keytab file to `<DRILLINSTALL_HOME>/conf/drill-override.conf` with the specified configuration parameters. In addition, you can configure a mapping from a Kerberos principal to a Drill user account. This mapping is used by a Drillbit to convert an authenticated client principal to a corresponding Kerberos short name, which is used to determine administrator privileges for the client principal. After you complete the configuration steps, restart the Drillbit.

To enable authentication and encryption using the Kerberos mechanism, configure the following Kerberos-specific parameters in `drill-override.conf`:

 **NOTE:** Only Drill 1.11 and later supports encryption.

 **NOTE:** For client-side configuration, see [Drill Drivers](#).

Parameters	Communication Path	Description	Default
<code>drill.exec.security.auth.principal</code>	Drill client (ODBC/JDBC) to Drillbit	String representation of the Kerberos principal used by the Drillbit service.	N/A
<code>drill.exec.security.auth.keytab</code>	Drill client (ODBC/JDBC) to Drillbit	Location of the keytab file for the configured Drillbit service principal.   <b>NOTE:</b> The Kerberos keytab file that contains the encrypted key for the Drillbit service principal. The file should be readable by the Drillbit process user.	N/A

Parameters	Communication Path	Description	Default
drill.exec.security.auth.auth_to_local	Drill client (ODBC/JDBC) to Drillbit	<p>Custom rules to convert the Kerberos principal to the Kerberos short name.</p> <p> <b>NOTE:</b> Drill uses a Hadoop Kerberos name and rules to transform the Kerberos principal provided by client to the one it will use internally as the client's identity. This client identity is used to determine administrator privileges. See <a href="#">Mapping from Kerberos Principal to OS user account</a> in the <a href="#">Hadoop in Secure Mode</a> documentation for details about how the rule works.</p>	The primary name of the Kerberos principal. By default, this mapping rule extracts the first part from the provided principal. For example, if the principal format is <Name1>/<Name2>@realm, the default rule extracts only Name1 from the principal and Name1 as the client's identity on server side.
drill.exec.security.user.encryption.sasl.enabled	Drill client (ODBC/JDBC) to Drillbit	Enables/disables encryption for the communication path between the Drill client and Drillbit.	false
drill.exec.security.bit.auth.use_login_principal	Drillbit to Drillbit	When set to true, the Drillbit uses the same logged in service principal configured with drill.exec.security.auth.principal for the Drillbit to Drillbit communication paths. When this parameter is set to false, a principal is constructed using the hostname from ZooKeeper for the remote Drillbit and keeping the primary and realm information the same as the logged in principal set by drill.exec.security.auth.principal .	false
drill.exec.security.bit.encryption.sasl.enabled	Drillbit to Drillbit	Enables/disables encryption for the communication path between the Drillbits.	false

### Steps to Enable Kerberos Authentication and Encryption

Complete the following steps to enable Drill to use Kerberos for authentication and encryption:

1. Create a Kerberos principal identity and a keytab file. You can create one principal for each Drill node or one principal for all Drill nodes in a cluster.

**For one principal per Drill node in the cluster:**

```
# kadmin
: addprinc -randkey <username>/
<FQDN>@<REALM>.COM
: ktadd -k /opt/mapr/
conf/drill.keytab <username>/
<FQDN>@<REALM>.COM
```

**For one principal for all Drill nodes in the cluster:**

Use <clustername> instead of <FQDN>:

```
# kadmin
: addprinc -randkey <username>/
```

```
<clustername>@<REALM>.COM
: ktadd -k /opt/mapr/
conf/drill.keytab <username>/
<clustername>@<REALM>.COM
```

**IMPORTANT:** When creating the Kerberos principal identity and keytab file, note the following requirements:

- The administrator must own the `drill.keytab` file and have the ability to read the file.
- The instance name must be lowercase. If `_HOST` is set as the instance name in the principal, it is replaced with the fully qualified domain name of that host for the instance name. For example, if Drill running on `host01.aws.labuses drill/_HOST@<EXAMPLE>.COM` as the principal, the canonicalized principal is `drill/host01.aws.lab@<EXAMPLE>.COM`.
- When Drill runs on a secure cluster (maprsasl enabled), the username in the Drill service principal must correspond with the user running the Drill process. By default, the user is `mapr`:

```
mapr/_HOST@<EXAMPLE>.COM
```

2. Add the Kerberos principal identity, keytab file, and parameters specific to Kerberos to the `drill-override.conf` file. You can use the following configuration examples for enabling authentication, encryption, or both between the Drill client and Drillbit and between Drillbits.

#### Example 1: Enabling Kerberos Authentication Between the Drill Client and Drillbit

```
drill.exec: {
  cluster-id: "drillbits1",
  zk.connect:
"qa102-81.qa.lab:5181,qa102-82.qa.la
b:5181,qa102-83.qa.lab:5181",
  impersonation: {
    enabled: true,
    max_chained_user_hops: 3
  },
  security: {

user.auth.enabled:true,
      auth.mechanisms:
["KERBEROS"],

auth.principal:"drill/
<clustername>@<REALM>.COM",
      auth.keytab:"/etc/
drill/conf/drill.keytab"
    }
  }
}
```

#### Example 2: Enabling Kerberos Authentication and Encryption Between the Drill Client and Drillbit

```
drill.exec: {
  cluster-id: "drillbits1",
  zk.connect:
"qa102-81.qa.lab:5181,qa102-82.qa.la
b:5181,qa102-83.qa.lab:5181",
  impersonation: {
    enabled: true,
    max_chained_user_hops: 3
  },
  security: {
```

**Example 3: Enabling Kerberos Authentication Between Drill Client and Drillbits and Between Drillbits**

```

user.auth.enabled:true,
      auth.mechanisms:
["KERBEROS"],

auth.principal:"drill/
<clustername>@<REALM>.COM",
      auth.keytab:"/etc/
drill/conf/drill.keytab",

user.encryption.sasl.enabled: true
    }
  }
}

```

```

drill.exec: {
  cluster-id: "drillbits1",
  zk.connect:
"qa102-81.qa.lab:5181,qa102-82.qa.la
b:5181,qa102-83.qa.lab:5181",
  impersonation: {
    enabled: true,
    max_chained_user_hops: 3
  },
  security: {

user.auth.enabled:true,
      auth.mechanisms:
["KERBEROS"],

auth.principal:"drill/
<clustername>@<REALM>.COM",
      auth.keytab:"/etc/
drill/conf/drill.keytab"
    }
    security.bit: {
      auth.enabled: true,
      auth.mechanism:
"Kerberos",

auth.use_login_principal: true
    }
  }
}

```

**Example 4: Enabling Kerberos Authentication and Encryption Between Drill Client and Drillbits and Between Drillbits**

```

drill.exec: {
  cluster-id: "drillbits1",
  zk.connect:
"qa102-81.qa.lab:5181,qa102-82.qa.la
b:5181,qa102-83.qa.lab:5181",
  impersonation: {
    enabled: true,
    max_chained_user_hops: 3
  },
  security: {

user.auth.enabled:true,
      auth.mechanisms:
["KERBEROS"],

auth.principal:"drill/

```

```
<clustername>@<REALM>.COM",
    auth.keytab: "/etc/
drill/conf/drill.keytab",

user.encryption.sasl.enabled: true
    }
    security.bit: {
        auth.enabled: true,
        auth.mechanism:
"Kerberos",

auth.use_login_principal: true,

encryption.sasl.enabled: true
    }
}
```

**NOTE:** In examples 3 and 4 above, the Drillbit will use the same logged in service principal as configured in `drill.exec.security.auth.principal`.

**Example 5: Enabling Kerberos Authentication and Encryption Between Drill Client and Drillbits and Between Drillbits. For Drillbit to Drillbit authentication, where the service principal is created using the hostname from ZooKeeper for a remote Drillbit as an instance name. The primary and the realm component of the service principal is used from the `drill.exec.security.auth.principal` parameter.**

```
drill.exec: {
    cluster-id: "drillbits1",
    zk.connect:
"qa102-81.qa.lab:5181,qa102-82.qa.la
b:5181,qa102-83.qa.lab:5181",
    impersonation: {
        enabled: true,
        max_chained_user_hops: 3
    },
    security: {

user.auth.enabled: true,
    auth.mechanisms:
["KERBEROS"],

auth.principal: "drill/
<clustername>@<REALM>.COM",
    auth.keytab: "/etc/
drill/conf/drill.keytab",

user.encryption.sasl.enabled: true
    }
    security.bit: {
        auth.enabled: true,
        auth.mechanism:
"Kerberos",

encryption.sasl.enabled: true
    }
}
```

**NOTE:** For the configuration in example 5, if the hostname of the remote Drillbit known to ZooKeeper is `host01.aws.lab`, then the service principal used by a Drillbit to authenticate with the remote Drillbit will be `drill/host01.aws.lab@<REALM>.COM`.

### 3. Restart the Drillbit process on each Drill node.

```
$ maprcli node services -name drill-bits -action restart -nodes <node
host names separated by a space>
```

#### Related concepts

[Plain Authentication](#) on page 4062

An administrator can configure Drill to use the Linux pluggable authentication module (PAM) for Plain (username and password) authentication. PAM provides an authentication module that interfaces with any installed PAM authentication entity, such as the local operating system password file (`/etc/passwd`) or LDAP.

#### *Configuring Drill to Use Kerberos with Hive Metastore*

To configure Drill to use Kerberos with the Hive metastore, modify the hive storage plugin in the Drill Web UI and then restart the Warden service.

**NOTE:** When you configure Drill to use Kerberos with the Hive metastore, Drill submits requests to the Hive metastore as the `mapr` superuser. If you want Drill to submit requests to the Hive metastore as any other user, configure [Drill impersonation with Hive](#) instead of performing this task. Drill impersonation works with or without Kerberos configured for the Hive metastore.

#### Prerequisites

The configurations described in this document have the following dependencies:

- Data Fabric cluster.
- Drill installed with Drillbits running as the `mapr` user.
- Supported version of Hive installed with the following:
  - Hive Metastore configured to use Kerberos authentication
  - Configured Hive remote metastore repository

**NOTE:** See the [Drill Support Matrix](#) on page 5827 for supported versions of Hive.

#### Modify the Hive Storage Plugin in Drill

Modify the Hive storage plugin configuration in the Drill Web UI based on the authorization and security scenario for the cluster. You can only access the Drill Web UI for a running Drillbit.

Complete the following steps to configure Drill to use Kerberos with Hive Metastore:

1. Navigate to `http://<drillbit_hostname>:8047`, and select the **Storage** tab.

**NOTE:** You can only access the Drill Web UI for a running Drillbit.

2. Click **Update** next to the hive option.

3. In the configuration window, add the `hive.metastore.sasl.enabled`, `hive.metastore.kerberos.principal`, and `hive.security.authorization.enabled` properties, as shown below, if configuration does not contain them already. Note that other properties shown may or may not be required in your environment:

```
{
  "type": "hive",
  "enabled": true,
  "configProps": {
    "hive.metastore.uris": "thrift://<metastore_hostname>:9083",
    "fs.default.name": "maprfs:///",
    "hive.server2.enable.doAs": "false",
    "hive.metastore.sasl.enabled": "true",
    "hive.metastore.kerberos.principal":
    "<metastore_server_principal_name>",
    "hive.security.authorization.enabled": "true"
  }
}
```

### Restart Warden

Issue the following command on all nodes to restart the Warden service:

```
service mapr-warden restart
```

If you have `clush` installed, you can run the following command to restart Warden on all nodes at once:

```
clush -a "service mapr-warden restart"
```

### Connection URLs for Kerberos using JDBC Drivers to connect via SQLLine

You can use client-side connection URL parameters for Kerberos authentication in multiple combinations to authenticate a client with Drill.

### Client Credentials

A client can provide its credentials in two ways:

- With a ticket granting ticket (TGT) generated on client side. The TGT must be present on client node; Drill does not generate the TGT.
- With a keytab file and the client principal provided in the user property of the connection URL.

### Configuration Options

The following table lists configuration options for connection URLs. See the Connection URL Examples section for sample URLs.

Connection Parameter (Apache Drill JDBC Driver)	Description	Mandatory/Optional	Default Value
auth	<p>Authentication mechanism. The value is deduced if not specified. Kerberos if principal is provided. Plain if a user and password is provided. A Drill client can also explicitly specify a particular authentication mechanism to use using this parameter. For example, for Kerberos along with service_name, service_host or principal and for the Plain authentication with username and password.</p>	Optional	The preference order is Kerberos and Plain.
principal	<p>Drillbit service principal. The format of the principal is primary/instance@realm. For Kerberos, the Drill service principal is derived if the value is not provided using this configuration. service_name (primary) and service_host (instance) are used to generate a valid principal. Since the ticket or keytab contains the realm information, the realm is optional.</p>	Optional	

keytab	For Kerberos authentication, if the client chooses to use a keytab rather than a ticket, set the keytab parameter to the location of the keytab file. The client principal must be provided through the user parameter. A Kerberos ticket is used as the default credential (It is assumed to be present on client-side. The Drill client does not generate the required credentials.)	Optional	
sasl_encryption	When set to true, ensures that a client connects to a server with encryption capabilities. For example, Drill 1.11 Drillbits, which support client-to-drillbit encryption.	Optional	FALSE
service_principal_name	Key name of the Drillbit service principal.	Optional	drill
service_instance_name	Key of the Drillbit service principal.	Optional	Since this value is usually the hostname of the node where a Drillbit is running, the default value is the Drillbit hostname is provided either through ZooKeeper or through a direct connection string.
realm	Kerberos realm name for the Drillbit service principal. The ticket or keytab contains the realm information.	Optional	

### Client Encryption

A client can specify that it requires a server with encryption capabilities only by setting the

`sasl_encrypt` connection parameter to "true." If the cluster to which client is connecting has encryption disabled, the client will fail to connect to that server.

```
drill.exec {
  security: {
    user.auth.enabled: true,
    auth.mechanisms: [ "KERBEROS" ],
    auth.principal: "drill/serverhostname@REALM.COM",
    auth.keytab: "/etc/drill/conf/drill.keytab",
    user.encryption.sasl.enabled: true
  }
}
```

## Connection URL Examples

The following five examples show the JDBC connection URL that the embedded JDBC client uses for Kerberos authentication. The first section, Example of a Simple Connection URL, includes a simple connection string and the second section, Examples of Connection URLs Used with Previously Generated TGTs, includes examples to use with previously generated TGTs.

### Example of a Simple Connection URL

#### Example 1: TGT for Client Credentials

The simplest way to connect using Kerberos is to generate a TGT on the client side. Only specify the service principal in the JDBC connection string for the Drillbit the user wants to connect to.

```
jdbc:drill:drillbit=10.10.10.10;principal=<principal for host 10.10.10.10>
```

In this example, the Drill client uses the:

- Default `service_name`, which is `drill`.
- `service_host` from the Drillbit name provided in the connection URL, which is `10.10.10.10`.

The service principal format is `<primary>/<instance>@<realm from TGT>`. The service principal is `principal for host 10.10.10.10`.

### Examples of Connection URLs Used with Previously Generated TGTs

If you do not provide a service principal in the connection string when using Kerberos authentication, then use the `service_name` or `service_host` parameters. Since these parameters are optional, their default values will be used internally (if not provided) to create a valid principal.

Examples 2 through 4 show a valid connection string for Kerberos authentication if a client has previously generated a TGT. Realm information will be extracted from the TGT if it is not provided.

**NOTE:** For end-to-end authentication to function, it is assumed that the proper principal for the Drillbit service is configured in the KDC.

#### Example 2: Drillbit Provided by Direct Connection String and Configured with a Unique Service Principal

This type of connection string is used when:

- Each Drillbit in the cluster is configured with its own service principal.
- The instance component is the host address of the Drillbit.

```
jdbc:drill:drillbit=host1;auth=kerberos
```

In this example, the Drill client uses the:

- Default `service_name`, which is `drill`.

- `service_host`, which is the Drillbit name provided in the connection URL (`host1`).

The internally created service principal will be `drill/host1@<realm from TGT>`.

### Example 3: Drillbit Selected by ZooKeeper and Configured with Unique Service Principal

This type of connection string is used when the Drillbit is chosen by ZooKeeper instead of directly from the connection string.

```
jdbc:drill:zk=host01.aws.lab:5181;auth=kerberos;service_name=myDrill
```

In this example, the Drill client uses the:

- Provided `service_name`, which is `myDrill` as the primary name of the principal.
- `service_host` as the address of the Drillbit, which is chosen from the list of active drillbits that ZooKeeper provides (`host01.aws.lab:5181`).

The internally created service principal will be `myDrill/<host address from zk>@<realm from TGT>`.

### Example 4: Drillbit Selected by Zookeeper and Configured with a Common Service Principal

This type of connection string is used when all Drillbits in a cluster use the same principal.

```
jdbc:drill:zk=host01.aws.lab:5181;auth=kerberos;service_name=myDrill;service_host=myDrillCluster
```

In this example, the Drill client uses the:

- Provided `service_name`, which is `myDrill`.
- `service_host`, which is `myDrillCluster`.

The internally created service principal, which will be `myDrill/myDrillCluster@<realm from TGT>`.

### Example 5: Keytab for Client Credentials

If a client chooses to provide its credentials in a keytab instead of a TGT, it must also provide a principal in the user parameter. In this case, realm information will be extracted from the `/etc/krb5.conf` file on the node if it is not provided in the connection URL. All other parameters can be used as shown in the preceding examples (1-4). This connection string is for the case when all Drillbits in a cluster use the same principal.

```
jdbc:drill:zk=host01.aws.lab:5181;auth=kerberos;service_name=myDrill;service_host=myDrillCluster;keytab=<path to keytab file>;user=<client principal>
```

In this example, the Drill client:

- Will authenticate itself with the:
  - Keytab (`path to keytab file`) and
  - Principal provided in the user parameter (`client principal`)
- Uses the:
  - Provided `service_name`, which is `myDrill`.
  - `service_host`, which is `myDrillCluster`.

The internally created service principal will be `myDrill/myDrillCluster@<realm from krb5.conf>`.

## Plain Authentication

An administrator can configure Drill to use the Linux pluggable authentication module (PAM) for Plain (username and password) authentication. PAM provides an authentication module that interfaces with any installed PAM authentication entity, such as the local operating system password file (`/etc/passwd`) or LDAP.

**NOTE:** Starting in EEP 5.0, Drill supports form-based authentication between the web client and Drillbit. Form-based authentication is like Plain authentication in that a user is presented with a web form where s/he enters a username and password to access restricted web pages. [Configuring Drill to Use libpam4j](#) includes configuration details. When using form-based authentication, you can also configure Drill to use SPNEGO. See [SPNEGO for HTTP Authentication](#).

When using PAM for authentication, each user with permission to run Drill queries must exist in the list of users that resides on each Drill node in the cluster. The username (including uid) and password for each user must be identical across all Drill nodes.

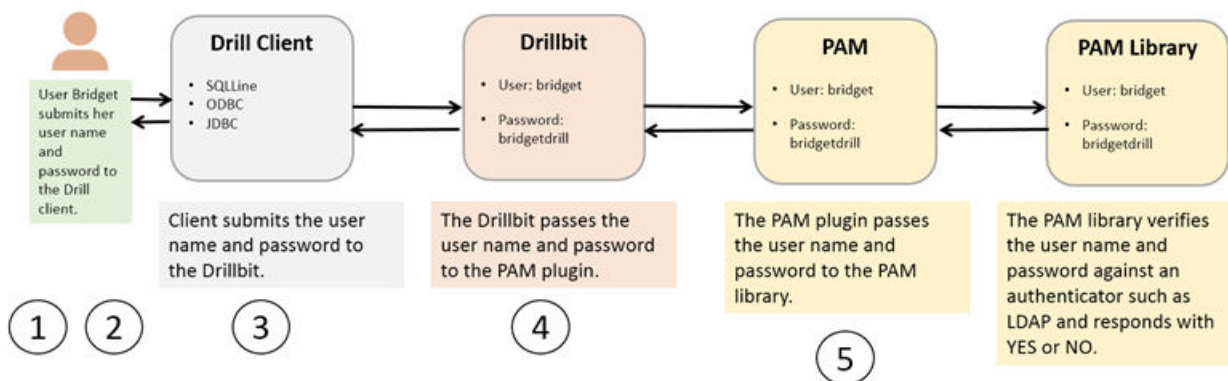

If you use PAM with `/etc/passwd` for authentication, verify that the users permitted to start the Drill process are part of the shadow user group on all nodes in the cluster. This enables Drill to read the `/etc/shadow` file for authentication.

**NOTE:** Plain authentication does not support SASL encryption. You can use [SSL/TLS for encryption](#) when Plain authentication is enabled. You can also enable [user impersonation](#) and create views to limit user access to data.

## Authentication Process Overview

During the authentication process, the client passes a username and password to the Drillbit as part of the connection request, which then passes the credentials to PAM. If PAM authenticates the user, the connection request passes the authentication phase, and the connection is established. The user will be authorized to access Drill and issue queries against the filesystem or other storage plugins, such as Hive.

The following image illustrates the PAM user authentication process in Drill:

Plain (Username and Password) Authentication Process

If PAM cannot authenticate the user, the connection request does not pass the authentication phase and the user will not be authorized to access Drill. The connection is terminated as `AUTH_FAILED`.

For more PAM information (including a JPAM User Guide), see [JPAM](#).

## Configuring Plain Authentication in Drill

Drill supports the `libpam` and `libpam4j` libraries. In Drill 1.12 and later, the `libpam4j` library is packaged with Drill. There is no download or external dependency required to use `libpam4j`. Using `libpam4j` is recommended for Drill 1.12 and later.

**NOTE:** You can configure Drill to use multiple types of authentication mechanisms. For example, you can configure Drill to use Plain, Kerberos, and data-fabric-SASL; however, only [SSL/TLS](#) is supported for encryption when Plain authentication is configured with other authentication mechanisms.

The following sections provide information for configuring Drill to use libpam4j or libpam, as well as instructions for connecting to Drill from SQLLine and BI tools when Plain authentication is enabled:

#### *Configuring Drill to Use libpam4j*

You can configure Drill to use libpam4j for Plain authentication between a client, such as ODBC, and the Drillbit.

Starting in EEP 5.0, you can configure Drill to use libpam4j for form-based authentication between a web client and Drillbit (web server). Form-based authentication is like Plain authentication in that a user is presented with a web form where s/he enters a username and password to access restricted web pages. When using form-based authentication, you can also configure Drill to use SPNEGO. See [SPNEGO for HTTP Authentication](#).

Complete the following steps to configure Plain authentication (for JDBC/ODBC clients) and form-based authentication (for the web client) in Drill:

1. Add the following configurations to the `/opt/mapr/drill/drill-<version>/conf/drill-override.conf` file:

```
drill.exec:{
  cluster-id:"drillbits1",

  zk.connect:"<zk-node-hostname>:5181,<zk-node-hostname>:5181,<zk-node-hostname>:5181",
  security:{
    auth.mechanisms:[ "PLAIN" ],
  },
  security.user.auth:{
    enabled:true,
    packages += "org.apache.drill.exec.rpc.user.security",
    impl:"pam4j",
    pam_profiles:[ "sudo", "login" ]
  },
  http.auth.mechanisms:[ "FORM" ]
}
```

2. (Optional) To add or remove different PAM profiles, add or delete the profile names in the `pam_profiles` array portion of the configuration:

```
pam_profiles: [ "sudo", "login" ]
```

3. Restart the Drillbit process on each Drill node, as shown:

```
/opt/mapr/drill/drill-<version>/bin/drillbit.sh restart
```

#### *Configuring Drill to Use libpam*

You can configure Drill to use libpam for Plain authentication between a client, such as ODBC, and the Drillbit.

To configure Drill to use libpam, complete the following steps:

1. Copy the `libpam.so` file from `/opt/mapr/lib` to a directory that does not contain other Hadoop components, for example `/opt/pam/`.

2. Add the following line to `/opt/mapr/drill/drill-<version>/conf/drill-env.sh`, including the directory where the `libpam.so` file is located, as shown:

```
export
DRILLBIT_JAVA_OPTS="$DRILLBIT_JAVA_OPTS -Djava.library.path=<directory>"
Example: export
DRILLBIT_JAVA_OPTS="$DRILLBIT_JAVA_OPTS -Djava.library.path=/opt/pam/"
```

3. Add the following configuration to the `drill.exec` block in `/opt/mapr/drill/drill-<version>/conf/drill-override.conf`:

```
drill.exec: {
  cluster-id: "drillbits1",
  zk.connect:
  "qa102-81.qa.lab:5181,qa102-82.qa.lab:5181,qa102-83.qa.lab:5181",
  impersonation: {
    enabled: true,
    max_chained_user_hops: 3
  },
  security: {
    auth.mechanisms : ["PLAIN"],
  },
  security.user.auth: {
    enabled: true,
    packages += "org.apache.drill.exec.rpc.user.security",
    impl: "pam",
    pam_profiles: [ "sudo", "login", "mapr-admin" ]
  }
}
```

4. (Optional) To add or remove different PAM profiles, add or delete the profile names in the `pam_profiles` array portion of the configuration:

```
pam_profiles: [ "sudo", "login" ]
```

5. Restart the Drillbit process on each Drill node, as shown:

```
/opt/mapr/drill/drill-<version>/bin/drillbit.sh restart
```

#### *Connection URL for Plain Authentication using the Apache JDBC Driver to connect via SQLLine*

When Plain authentication is enabled, each user that accesses the Drillbit process through a client, must provide username and password credentials for access.

### Connecting to Drill from SQLLine

Include the `-n` and `-p` parameters with your username and password when launching SQLLine, as shown in the following example:

```
sqlline -u jdbc:drill:zk=10.10.11.112:5181 -n <username> -p <password>
```

Alternatively, you can launch SQLLine and then issue the `!connect` command to hide the password.

Complete the following steps to hide the password:

1. Run the `sqlline` script, as shown:

```
$ /etc/drill/bin/sqlline
```

- At the prompt, enter the `!connect` command followed by

```
jdbc:drill:zk=zk=<zk name>[:<port>][,<zk name2>[:<port>]...]
```

, as shown:

```
`sqlline> !connect jdbc:drill:zk=localhost:5181 scan complete in 1385m`s
```

- When prompted, enter a username and password; the password is hidden as it is typed, as shown:

```
Enter username for jdbc:drill:zk=localhost:5181: yourusername
Enter password for jdbc:drill:zk=localhost:5181: *****
```

### Connecting to Drill from BI Tools

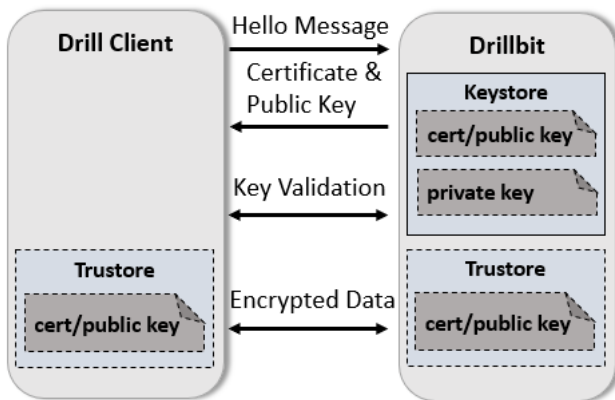

When you connect to Drill from a BI tool, such as Tableau, the ODBC driver prompts you for the authentication type, username, and password. For PAM, select **Basic Authentication** in the Authentication Type drop-down menu.

### SSL/TLS for Encryption

You can enable SSL for Drill in a secure cluster. SSL (Secure Sockets Layer), more recently called TLS, is a security mechanism that encrypts data passed between the Drill client and Drillbit (server). SSL also provides one-way authentication through which the Drill client verifies the identity of the Drillbit.

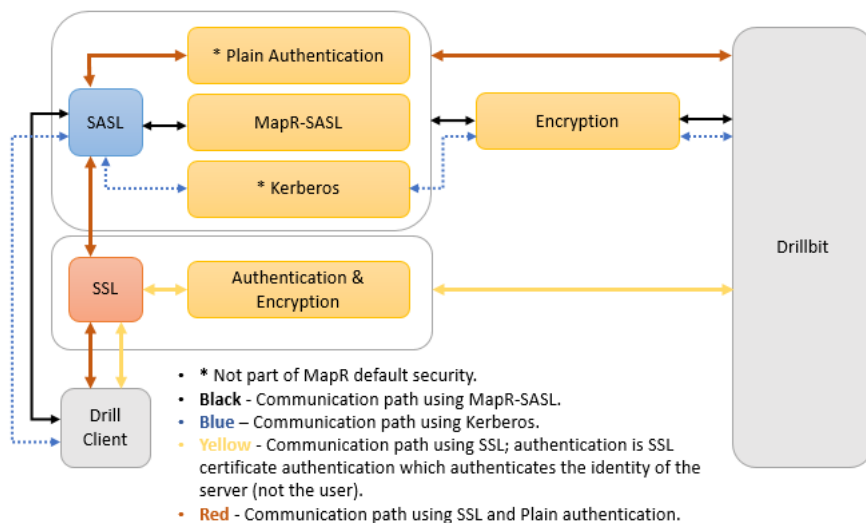

Authentication occurs during the SSL handshake when the Drillbit (server) presents its certificate to the client, and the client checks if the certificate exists in its truststore or if the certificate is signed by a trusted CA (Certificate Authority) that exists in its truststore.

The following diagram depicts the communication between the Drill client and the Drillbit (server):

The SASL feature in Drill provides authentication and an option to encrypt data, however the encryption feature is not available when using Plain authentication. If you need to use Plain authentication (certain BI tools only use Plain authentication), you can enable SSL to encrypt data. Using SSL and SASL encryption together is strongly discouraged.

The following diagram depicts the SSL communication paths between the Drill client and Drillbit (server), including the scenario where Plain authentication is used:

**NOTE:** The REST API supports HTTPS. SSL is not supported for communication between Drillbits.

The following sections provide information about how to use certificates in secure clusters, enabling and configuring SSL, connection parameters, and common SSL issues.

### Related concepts

[SSL Certificates](#) on page 830

Describes how certificates are used to perform authentication and encryption for websites that use the HTTPS protocol.

### SSL Certificates in Clusters

The Drill server requires an SSL certificate. The certificate can be self-signed or signed by a CA (Certificate Authority).

The sections below describe how to use SSL certificates in Data Fabric clusters.

### SSL in a Cluster

In a secure Data Fabric cluster, SSL is configured by default but not enabled. In a secure cluster, the keystore is configured for you. The security in a Data Fabric cluster uses a self-signed certificate. If you have a certificate signed by a certificate authority, follow the instructions for [How to Import CA \(Certificate Authority\) Signed Certificates to Ezmeral Data Fabric 7](#), and then enable and configure SSL.

To use SSL, enable the SSL option and then modify any of the available configuration options as needed.

- To enable SSL for the ODBC/JDBC client to Drillbit communication path, you must enable SSL on the client side and Drillbit. See [Drill Drivers](#) for client instructions. See [Configuring SSL/TLS](#) for the Drillbit.
- To enable SSL for the Drill Web UI, see [Configuring the Drill Web UI and Web API Security](#).

After you modify the configuration options, restart Drill, as shown:

```
$ maprcli node services -name drill-bits -action restart -nodes <node host names separated by a space>
```

### Configuring SSL/TLS

Enable SSL in `<DRILL_INSTALL_HOME>/conf/drill-override.conf`. You can use several configuration options to customize SSL/TLS.

You must restart the Drillbit process on each node after you modify the configuration options, as shown:

```
$ maprcli node services -name drill-bits -action restart -nodes <node host
names separated by a space>
```

The following sections provide information and instructions for enabling and configuring SSL:

### Enabling SSL

If SSL is enabled, all Drill clients, such as JDBC and ODBC, must connect to Drill servers using SSL. Enable SSL in the Drill startup configuration file, `drill-override.conf` located in `/opt/mapr/drill/drill-<version>/conf`.

To enable SSL for Drill, set the `drill.exec.security.user.encryption.ssl.enabled` option in `drill-override.conf` to `"true."`

### Configuring SSL

You can customize SSL on a Drillbit through the SSL configuration options. You can set the options from the command line (using Java system properties) in the `drill-override.conf` file or in the property file to which the Hadoop parameter `hadoop.ssl.server.conf` points (recommended).

**NOTE:** Specifying values in `drill-override.conf` can expose the security parameters to end users. Administrators should set these values in the Hadoop security file and restrict permissions on that file.

If a parameter is specified in multiple places, the value in the Hadoop configuration takes precedence over the Drill configuration which takes precedence over the system property.

The Hadoop configuration is specified in the file pointed to by the `hadoop.ssl.server.conf` parameter in the Hadoop `core-site.xml` file. Typically, this parameter points to `$HADOOP_CONF/ssl-server.xml` which contains the property names to configure SSL. Both the `core-site.xml` file and the `ssl-server.xml` file must exist in the Drill classpath. The Drill SSL configuration picks up the Hadoop SSL configuration.

**NOTE:** Since the Drillbit implementation is based on JSSE, several standard parameters that apply to JSSE also apply to the Drillbit. However, you typically do not need to configure JSSE parameters.

The following are the SSL configuration options with their descriptions and default values.

**drill.exec.security.user.encryption.ssl.enabled**

*Hadoop Property Name:* N/A

*System Property Name:* N/A

*Description:* Enable or disable TLS for Drill client - Drill Server communication. You must set this option in `drill-override.conf`.

*Allowed Values:* true or false

*Drill Default:* false

**drill.exec.ssl.protocol**

*Hadoop Property Name:* N/A

*System Property Name:* N/A

*Description:* The version of the TLS protocol to use.

*Allowed Values:* TLS, TLSV1, TLSv1.1, TLSv1.2

*Drill Default:* TLSv1.2 (recommended)

**drill.exec.ssl.keyStoreType**

*Hadoop Property Name:* `ssl.server.keystore.type`

*System Property Name:* `javax.net.ssl.keyStoreType`

*Description:* Format of the keystore file

<b>drill.exec.ssl.keyStorePath</b>	<p><i>Allowed Values:</i> jks, jceks, pkcs12</p> <p><i>Drill Default:</i> jks</p> <p><i>Hadoop Property Name:</i> ssl.server.keystore.location</p> <p><i>System Property Name:</i> javax.net.ssl.keyStore</p> <p><i>Description:</i> Location of the Java keystore file containing the Drillbit's own certificate and private key. On Windows, the specified pathname must use forward slashes, /, in place of backslashes.</p> <p><i>Allowed Values:</i> Not Applicable</p> <p><i>Drill Default:</i> Not Applicable</p>
<b>drill.exec.ssl.keyStorePassword</b>	<p><i>Hadoop Property Name:</i> ssl.server.keystore.password</p> <p><i>System Property Name:</i> javax.net.ssl.keyStorePassword</p> <p><i>Description:</i> Password to access the private key from the keystore file. This password is used twice: To unlock the keystore file (store password), and to decrypt the private key stored in the keystore (key password) unless a key password is specified separately.</p> <p><i>Allowed Values:</i> Not Applicable</p> <p><i>Drill Default:</i> Not Applicable</p>
<b>drill.exec.ssl.keyPassword</b>	<p><i>Hadoop Property Name:</i> ssl.server.keystore.keypassword</p> <p><i>System Property Name:</i> Not Applicable</p> <p><i>Description:</i> Password to access the private key from the keystore file. May be different from the keystore password.</p> <p><i>Allowed Values:</i> Not Applicable</p> <p><i>Drill Default:</i> Not Applicable</p>
<b>drill.exec.ssl.trustStoreType</b>	<p><i>Hadoop Property Name:</i> ssl.server.truststore.type</p> <p><i>System Property Name:</i> javax.net.ssl.trustStoreType</p> <p><i>Description:</i> Format of the truststore file</p> <p><i>Allowed Values:</i> jks, jceks, pkcs12</p> <p><i>Drill Default:</i> jks</p>
<b>drill.exec.ssl.trustStorePath</b>	<p><i>Hadoop Property Name:</i> ssl.server.truststore.location</p> <p><i>System Property Name:</i> javax.net.ssl.trustStore</p> <p><i>Description:</i> Location of the Java keystore file containing the collection of CA certificates trusted by the Drill client. On Windows, the specified pathname must use forward slashes, /, in place of backslashes.</p>

**NOTE:** If the `trustStorePath` is not provided, Drill ignores the `trustStorePassword` parameter and gets the default Java truststore instead. This operation causes issues if the Java truststore has a non-default password. The Java APIs used to load the default keystore assume the default password. The only way to use the default keystore with a non-default password is to specify both the path and the password to the keystore. To work around this issue, pass the default Java truststore to the `trustStorePath` parameter.

<b>drill.exec.ssl.trustStorePassword</b>	<p><i>Allowed Values:</i> Not Applicable</p> <p><i>Drill Default:</i> Not Applicable</p> <p><i>Hadoop Property Name:</i> ssl.server.truststore.password</p> <p><i>System Property Name:</i> javax.net.ssl.trustStorePassword</p> <p><i>Description:</i> Password to access the private key from the keystore file specified as the truststore.</p> <p><i>Allowed Values:</i> Not Applicable</p> <p><i>Drill Default:</i> Not Applicable</p>
<b>drill.exec.ssl.provider</b>	<p><i>Hadoop Property Name:</i> Not Applicable</p> <p><i>System Property Name:</i> Not Applicable</p> <p><i>Description:</i> Changes the underlying implementation to the chosen value.</p> <p><i>Allowed Values:</i> OpenSSL or JDK</p> <p><i>Drill Default:</i> JDK</p>
<b>drill.exec.ssl.useHadoopConfig</b>	<p><i>Hadoop Property Name:</i> Not Applicable</p> <p><i>System Property Name:</i> Not Applicable</p> <p><i>Description:</i> Use the setting in the Hadoop configuration file.</p> <p>The Hadoop configuration is specified in the file pointed to by the <code>hadoop.ssl.server.conf</code> parameter in the <code>core-site.xml</code> file. Typically, this parameter points to <code>\$HADOOP_CONF/ssl-server.xml</code> which contains the property names to configure TLS.</p> <p><i>Allowed Values:</i> true or false</p> <p><i>Drill Default:</i> true</p>

### Configuring SSL on Drill on Yarn (DOY)

Starting with EEP 8.1.0, you can enable SSL on Drill on Yarn through SSL configuration options. In the `drill-on-yarn.conf` file, add the `drill.yarn.http.ssl-enabled` parameter. See [Drill-on-YARN Limitations](#) on page 3980 for additional information on related limitations.

<b>drill.yarn.http.ssl-enabled</b>	<p><i>Hadoop Property Name:</i> Not Applicable</p> <p><i>System Property Name:</i> Not Applicable</p> <p><i>Description:</i> Use the setting in the Hadoop configuration file with the required <code>drill.yarn.ssl.useHadoopConfig</code> parameter.</p> <p><i>Allowed Values:</i> true or false</p> <p><i>Drill Default:</i> false</p>
<b>drill.yarn.ssl.useHadoopConfig</b>	<p><i>Hadoop Property Name:</i> Not Applicable</p> <p><i>System Property Name:</i> Not Applicable</p> <p><i>Description:</i> Use this setting in the Hadoop configuration file.</p> <p>The Hadoop configuration is specified in the file pointed to by the <code>hadoop.ssl.server.conf</code> parameter in the <code>core-site.xml</code> file. Typically, this parameter points to <code>\$HADOOP_CONF/</code></p>

`ssl-server.xml` which contains the property names for configuring the TLS.

*Allowed Values:* true or false

*Drill Default:* false

#### JDBC Connection Parameters

Use the SSL JDBC connection parameters and fully qualified host name to configure the JDBC connection string in SQLLine and connect to Drill.

The following table lists the parameters that you can include in the `jdbc` connection string using SQLLine:

**NOTE:** Examples are provided after the table. For additional instructions, see the [Drill JDBC Driver](#) documentation.

Parameter	Value	Required
enableTLS	true/false	[Optional] If true, TLS is enabled. If not set or set to false, TLS is not enabled.
trustStoreType	string	[Optional] Default: JKS The trustStore type. Allowed values are : JKS PKCS12 If the useSystemTrustStore option is set to true (on Windows only), the allowed values are: Windows-MY Windows-ROOT Import the certificate into the "Trusted Root Certificate Authorities" and set trustStoreType=Windows-ROOT. Also import the certificate into "Trusted Root Certificate Authorities" or "Personal" and set trustStoreType=Windows-MY.
trustStorePath	string	[Optional] Path to the truststore. If not provided the default Java truststore will be used. If this is not provided the trustStorePassword parameter will be ignored.  Note that the order for looking for the default trustStore java-home/lib/security/jssecacerts then java-home/lib/security/cacerts
trustStorePassword	string	[Optional] Password to the truststore.

disableHostVerification	true/false	[Optional] If true, we will not verify that the host in the certificate is the host we are connecting to. False by default (Hostname verification follows the specification in RFC2818).
disableCertificateVerification	true/false	[Optional] If true we will not validate the certificate against the truststore. False by default.
TLSProtocol	TLS, TLSV1, TLSv1.1, TLSv1.2, TLSv1.3	[Optional] Default: TLSv1.3 (recommended)
TLSHandshakeTimeout	Time in milliseconds	[Optional] Default: 10 seconds In some cases, the TLS handshake may fail and leave the client hanging. This option sets the time for the client to timeout.
TLSProvider	JDK/OPENSSL	[Optional] Default: JDK Changes the underlying implementation to the chosen value.
useSystemTrustStore	true/false	[Optional, Windows only] Default: false If provided, the client will read certificates from the Windows truststore. In this case, trustStorePath and trustStorePassword, if specified, will be ignored.  The user should set the default provider in \$JRE_HOME/lib/security/java.security to SunMSCAPI.  The trustStoreType should be set to either Windows-MY or Windows-ROOT.

## Examples

The following examples show you how to connect to Drill through SQLLine with the `jdbc` connection string when SSL is not enabled and when SSL is enabled with and without a truststore.

### No SSL/TLS

```
./sqlline -u
"jdbc:drill:schema=dfs.work;drillbit=1
ocalhost:31010;enableTLS=false"
```

### SSL/TLS Enabled - No truststore

The default JSSE truststore will be tried with default password; the provided password will be ignored. If the default truststore password has been changed, this gives an error. To use the default truststore with

a different password, pass the path to the default truststore with the password.

```
./sqlline -u
"jdbc:drill:schema=dfs.work;drillbit=1
ocalhost:31010;enableTLS=true;trustSto
rePassword=drill123"
```

#### SSL/TLS enabled - With truststore

```
./sqlline -u
"jdbc:drill:schema=dfs.work;drillbit=1
ocalhost:31010;enableTLS=true;trustSto
rePath=~/.ssl/
truststore.ks;trustStorePassword=drill
123"
```

#### ODBC Connection Parameters

Use the SSL ODBC connection parameters to configure a connection to Drill through an ODBC tool.

The following table lists the ODBC connection parameters:

**NOTE:** The Drill ODBC driver does not support password protected PEM/CRT files or multiple CRT certificates in a single PEM/CRT file. For additional instructions, see the [Drill ODBC Driver](#) documentation.

Name	Value	Required	Description
SSL	Clear (0)	No.	<p>This option specifies whether the client uses an SSL encrypted connection to communicate with Drill.</p> <ul style="list-style-type: none"> <li>Enabled(1):The client communicates with Drill using SSL.</li> <li>Disabled(0):SSL is disabled.</li> </ul> <p>SSL is configured independently of authentication.</p> <p>When authentication and SSL are both enabled, the driver performs the specified authentication method over an SSL connection.</p>
TLSProtocol	Empty, which defaults to tlsv12.	No	<p>This property specifies the TLS protocol version used.</p> <p>Accepted values are:</p> <ul style="list-style-type: none"> <li>tlsv1</li> <li>tlsv11</li> <li>tlsv12</li> </ul>

TrustedCerts	The cacerts.pem file in the \lib subfolder within the Driver's installation directory. The exact file path varies depending on the version of the driver that is installed.  For example, the path for the Windows driver is different from the path for the Mac OS driver.	No	The full path of the PEM file containing Trusted CA certificates, for verifying the server. If this option is not set, then the driver defaults to using the trusted CA certificates PEM file installed by the driver.
UseSystemTrustStore	Clear (0)	No	This option specifies whether to use a CA certificate from the system truststore, or from a specified PEM file. <ul style="list-style-type: none"> <li>• Enabled (1): The driver verifies the connection using a certificate in the system truststore</li> <li>• Disabled (0): The driver verifies the connection using a specified PEM file.</li> </ul> <p><b>Note:</b> This option is only available on Windows. If using this option, import the certificate into the "Trusted Root Certificate Authorities" certificate store.</p>
DisableCertificateVerification	0	No	This property specifies that the driver verifies the host certificate against the truststore. Accepted values are: <ul style="list-style-type: none"> <li>• 0: The driver verifies the certificate against the truststore.</li> <li>• 1: The driver does not verify the certificate against the truststore.</li> </ul>
DisableHostVerification	0	No	This property specifies if the driver verifies that the host in the certificate is the host being connected to. Accepted values are: <ul style="list-style-type: none"> <li>• 0: The driver verifies the certificate against the host being connected to.</li> <li>• 1: The driver does not verify the certificate against the host.</li> </ul>

### Avoiding Common SSL Issues

The following sections provide insight to some common error messages that you may encounter with SSL.

**ERROR: No Cipher suites in common.**

This is a general purpose error message that may have many reasons. The most common reason is that in order to use certain cipher suites, JSSE needs to use the private key stored in the Keystore. If this key is not accessible, JSSE filters out all cipher suites that need a private key. This effectively prunes out all available cipher suites so that no cipher suites match between the client and the server.

The private key from the keystore may be inaccessible for the following reasons:

- Missing Keystore file
- Invalid Keystore password
- Empty key password or a key password that is different from the keystore password

JSSE does not allow a key password that is null or an empty string even though it is possible to create a keystore with such a key password. Also, JSSE does not provide a system property to specify the key password. Drill provides a way to set the key password, but if you are using only system properties to configure JSSE, Drill will use the \*keystore\* password. If the keystore password is not the same as the key password, the key will again be inaccessible.

- Corrupt keystore

You can validate the keystore using keytool.

**ERROR: SSL is enabled, but cannot be initialized due to the ‘Cannot recover key’ exception.**

The key is protected with a password and the provided password is not correct.

**ERROR: Client connection timeout.**

A client connection can timeout because of networking issues or if there is a mismatch between the TLS/SSL configuration on the client and server.

Before trying to debug the TLS/SSL configuration, check if the server is reachable from the client.

If there is a mismatch between the TLS/SSL configuration, the TLS/SSL handshake between the client and server will fail. The server will silently drop the connection and the client will eventually time out. The handshake may fail due to many reasons, including:

1. The server is configured to enableTLS and the client is not (and vice versa).
  - a. If the client is not configured to use TLS and the server is, the error message will be similar to the following:

```
Error: Failure in connecting to Drill:
org.apache.drill.exec.rpc.RpcException: HANDSHAKE_COMMUNICATION :
Channel closed /10.10.10.11:49907 <--> hostname/10.10.10.11:31010.
(state=,code=0)
java.sql.SQLNonTransientConnectionException: Failure in
connecting to Drill: org.apache.drill.exec.rpc.RpcException:
HANDSHAKE_COMMUNICATION : Channel closed /10.10.10.11:49907
<-->hostname/10.10.10.11:31010.
```

- b. If the server is not configured to use TLS and the client tries to connect using TLS, the error message will be similar to the following:

```
Error: Failure in connecting to Drill:
org.apache.drill.exec.rpc.NonTransientRpcException: Connecting to the
server timed out. This is sometimes due to a mismatch in the SSL
configuration between client and server. [ Exception: Timeout waiting
for task.] (state=,code=0)
```

2. The server presents a certificate to the client containing a hostname that is not valid. When the client connects to a server, the hostname the client used to connect to the server must match the name of the host the certificate was assigned to. Certificates can contain wildcards for the hostname, so if you're connecting to a Drill cluster via ZooKeeper, it would be best to have a certificate that contains wildcards that cover all the hosts on which Drill might be running. It is also important to ensure that the DNS and the hostnames of the machines in the cluster are set up consistently so that the Drillbits are registered with ZooKeeper using the same name as the name assigned in the certificate. The error message in this case is the same as the previous case:

```
Error: Failure in connecting to Drill:
org.apache.drill.exec.rpc.NonTransientRpcException: Connecting to the
server timed out. This is sometimes due to a mismatch in the SSL
configuration between client and server. [ Exception: Timeout waiting
for task.] (state=,code=0)
```

Hostname verification can be turned off if there is no way to change the host configuration or the certificate. This is generally not recommended.

### Security Between ZooKeeper and Drillbits

When Drill is installed on clusters with the default security enabled, authentication is enabled between the Drillbits and ZooKeeper. The ZooKeeper znode information is secured automatically through authentication and znode ACLs. Communication between the Drillbits and Zookeeper is not encrypted.

**NOTE:** If you installed Drill on a cluster that does not have the default security configuration, and you are configuring custom security, you must enable authentication and manually set ACLs on the znodes.

Drill uses ZooKeeper to store certain cluster-level configuration and query profile information in znodes. A znode is an internal data tree in ZooKeeper that stores coordination and execution related information. If information in the znodes is not properly secured, cluster privacy and/or security is compromised.

ZooKeeper uses ACLs to control access to znodes and secure the information they store. Starting in Drill 1.15, you can create a custom ACL (Access Control List) on the znodes to secure data. ACLs specify sets of ids and permissions that are associated with the ids.

Starting in Drill 1.15, ACLs in secure clusters are set to `[authid: all]`, which provides full access to the authenticated user that created the znode only. Discovery znodes (znodes with the list of Drillbits) have an additional ACL set to `[world:read]` making the list of Drillbits readable by any user.

**NOTE:** View the [drill-override-example.conf](#) file to see example ACL configurations.

### Securing znodes

Complete the following steps to create a custom ACL and secure znodes:

1. Write a class that implements the `ZKACLProvider` interface. This class will contain the ACLs that need to be set on the znodes. You can use the [ZKSecureACLProvider class](#) as a sample reference.

2. Add the following dependency to the `pom` file of the project module created:

```
<groupId>org.apache.drill.exec</groupId>
<artifactId>drill-java-exec</artifactId>
```

3. Refer to the steps listed at <https://drill.apache.org/docs/manually-adding-custom-functions-to-drill/> to create a JAR and then add the JAR to Drill's classpath.
4. In `/opt/mapr/drill/drill-<version>/conf/drill-override.conf`, set `zk.acl_provider` to the `ZKACLProviderTemplate` type.
5. Restart Drill. When you restart Drill, the ACL, as mentioned in your custom class, is applied to the `znode` created when Drill starts.

**NOTE:** Existing ACLs for persistent `znodes` will not be affected if a Drillbit is restarted with a different ACL setting. ACLs are applied only at `znode` creation time. Drill does not recreate any `znode` that is already present. If you want to change an ACL for existing `znodes`, connect to the ZooKeeper server using `zkCli` and then use option a or b, as described:

- a) Shutdown Drillbits, delete the persistent `znodes`, change the ACL settings, and restart the Drillbit.
- b) Manually change the ACLs on the existing `znodes` to reflect the new ACL settings, using the `setAcl` command in the `zkCli`.

For either option to work, an authenticated connection between the `zkCli` and ZooKeeper Server must be established.

For additional information, refer to:

- [ZooKeeper access control using ACLs](#)
- [ZooKeeper and SASL](#)

### Configuring Drill Web UI and Web API Security

The Drill web client and web API communicate with web browsers or web tools, like `curl`, through the HTTP or HTTPS. Drill uses HTTP by default.

Drill supports [form-based \(similar to Plain authentication\)](#) and [SPNEGO](#) authentication mechanisms to authenticate the communication between the web client and web browser or web tools. Drill supports SSL/TLS for encryption with form-based and SPNEGO authentication.

An administrator can configure security mechanisms and [set up Drill Web UI administrators and administrator-user groups](#) to control access to the Drill Web UI and Web API client applications. For example, limiting user access to Drill Web UI functionality, such as viewing or canceling queries submitted by other users.

**NOTE:**

- The Drill web server does not support data-fabric-SASL (tickets).
- With Drill Web UI security in place, users without administrator privileges must execute the `SHOW SCHEMAS` command in the Drill Web UI Query page to see storage plugin configuration information.

## Form-Based Authentication

In EEP 5.0 and later, Drill supports form-based authentication between the web client and Drillbit. Form-based authentication is like [Plain Authentication](#) in that a user is presented with a web form where s/he enters a username and password to access restricted web pages. Form-based authentication also uses the Linux PAM (Pluggable Authentication Module).

[Configuring Drill to Use libpam4j](#) provides configuration details. When using form-based authentication, you can also configure Drill to use [SPNEGO for HTTP Authentication](#) and SSL/TLS for encryption.

## HTTPS Support

The Drill Web UI supports the HTTPS protocol for encryption. With the default security configuration, HTTPS is enabled for Drill and it uses SSL trust- and keystore, which comes with cluster installation.

To use custom certificates, see [SSL Certificates in Secure and Unsecure MapR Clusters](#).

The following example shows the default HTTPS configuration in `<DRILL_INSTALL_HOME>/conf/drill-distrib.conf` for a secure cluster installation:

```
drill.exec: {
    http.ssl_enabled: true,
    ssl.useHadoopConfig: true
}
```

You can configure additional parameters:

Drill Property Name	Hadoop Property Name	System Property Name	Description
drill.exec.http.ssl_enabled:			Enable or disable communication.
drill.exec.ssl.keyStorePath	ssl.server.keystore.location	javax.net.ssl.keyStore	Location of the Java own certificate and keystore. The pathname must use forward slashes.
drill.exec.ssl.keyStorePassword	ssl.server.keystore.password	javax.net.ssl.keyStorePassword	Password to access the keystore. This password is used for the keystore (key password) and the truststore (trust password).
drill.exec.ssl.keyPassword	ssl.server.keystore.keypassword		Password to access the keystore. This password must be different from the key password.
drill.exec.ssl.trustStorePath	ssl.server.truststore.location	javax.net.ssl.trustStore	Location of the Java certificates truststore. The pathname must use forward slashes.
drill.exec.ssl.trustStorePassword	ssl.server.truststore.password	javax.net.ssl.trustStorePassword	Password to access the truststore. This password is specified as the trust password.

drill.exec.ssl.useHadoopConfig			<p>Use the setting in the hadoop configuration file. Typically, this is the <code>hadoop.ssl.server.xml</code> file. Typically, this is the <code>ssl-server.xml</code> file.</p> <p><b>NOTE:</b> Verify the location of the symbolic link for example <code>&lt;DRILL_</code></p>
--------------------------------	--	--	--

### Setting up Web UI Administrators and Administrator-User Groups

The `security.admin.user_groups` and `security.admin.users` options set the administrative users when authentication is enabled.

Users listed in `security.admin.users` and the users belonging to the groups listed in `security.admin.user_groups` get administrative privileges. By default, these options are set to the username and groups of the user who started the Drill process. You can modify these options from the Drill Web UI or using the [ALTER SYSTEM](#) command.

An administrative user that authenticates to a Drillbit through data-fabric-SASL, Kerberos, Plain mechanism or through the HTTPS web interface can modify the `security.admin.user_groups` and `security.admin.users` options. The administrator can add or remove user names or user groups.

The `security.admin.user_groups` and `security.admin.users` options allow a single user/group name or a comma separated list of user/group names. When you view these options in the Drill Web UI, dummy default strings appear until the user explicitly changes the values.

Authenticated administrative users can view the current administrative user and administrative user groups on the Drill Web UI landing page (<https://<node-ip-address>:8047>) in the *Encryption Info* section.

### Drill REST API and Web UI

This topic provides information about the Drill REST API and Web UI, including permission requirements.

If Drill has authentication enabled, you must supply credentials when using the Drill REST API.

Although Drill (in HPE Ezmeral Data Fabric) does not support HTTP basic authentication, you can work around this if your HTTP client saves cookies between requests. As a workaround, save the authenticated cookie to a file and then use the cookie in subsequent requests, as shown in the following example:

```
//Log in and save the authenticated cookie to a file:
curl -X POST \
  -H "Content-Type: application/x-www-form-urlencoded" \
  -k -c cookies.txt -s \
  -d "j_username=DRILL_USER" \
  -d "j_password=DRILL_PASSWORD" \
  https://HOSTNAME:8047/j_security_check

//In subsequent requests, use the cookie from that request:
curl -kv \
  -b cookies.txt \
  -X POST \
  -H "Content-Type: application/json" \
  -d @/tmp/hive-storage-plugin.json \
  https://HOSTNAME:8047/storage/hive.json
```

**NOTE:** The session remains active for one hour. You can increase the session time through the `drill.exec.http.session_max_idle_secs` option in `drill-override.conf`:

```
drill.exec: {
  http: {
    session_max_idle_secs: 86400, # 24hr
  }
}
```

## REST API Methods and Web UI Functions

The following table and subsections describe requests and privilege levels for accessing the REST API methods and corresponding Drill Web UI functions. Privileges in the table are listed as ADMIN, USER, and ALL. ALL indicates privileges given to both the user and administrator.

Path	Request Type	Output Type	Functionality	Privileges
/	GET	text/html	Returns Drillbit stats in a table in HTML format.	ALL
/stats.json	GET	application/json	Returns Drillbit stats such as ports and max direct memory in json format.	ALL
/status	GET	text/html	Returns Running!	ALL
/options.json	GET	application/json	Returns a list of options. Each option consists of name-value-type-kind (for example: (boot system datatype).	ALL
/options	GET	text/html	Returns an HTML table where each row is a form containing the option details and ability to modify the option values.	ALL
/option/{optionName}	POST	text/html	Updates the options and calls <code>getSystemOptions</code> to display list of options.	ADMIN
/storage.json	GET	application/json	Returns a list of storage plugin wrappers each containing name-config (instance of <code>StoragePluginConfig</code> ) and enables the storage plugin configuration.	ADMIN
/storage	GET	text/html	Returns an HTML page with sections that contain: <ul style="list-style-type: none"> <li>a table where each row is a form containing the plugin button for update page link and a button to disable the plugin.</li> <li>a table where each row is a form containing the plugin button for update page and a button to enable the plugin.</li> </ul>	ADMIN
/storage/{name}.json	GET	application/json	Returns a plugin config wrapper for the requested web page.	ADMIN

/storage/{name}	GET	text/html	Returns an HTML page that has an editable text box for configuration editing, followed by buttons for creating, updating, and deleting. Each of the buttons make calls that generate the new page again.	ADMIN
/storage/{name}/enable/{val}	GET	application/json	Updates the storage plugin status. Returns success or failure.	ADMIN
/storage/{name}.json	DELETE	application/json	Deletes the storage plugin. Returns success or failure.	ADMIN
/storage/{name}/delete	GET	application/json	Same as deletePluginJSON but a GET instead of a DELETE request.	ADMIN
/storage/{name}.json	POST	application/json	Creates or updates the storage plugin. Returns success or failure. Expects JSON input.	ADMIN
/storage/{name}	POST	application/json	Same as createOrUpdatePluginJSON expects JSON or FORM input.	ADMIN
/profiles.json	GET	application/json	Returns currently running and completed profiles from PStore. For each profile a queryId, startTime, foremanAddress, query, user, and state is returned. Each list (running and completed) is organized in reverse chronological order.	ADMIN, USER
/profiles	GET	text/html	Generates an HTML page from the data returned by getProfilesJSON with a hyperlink to a detailed query page.	ADMIN, USER
/profiles/{queryid}.json	GET	application/json	Returns the entire profile in JSON.	ADMIN, USER
/profiles/{queryid}	GET	text/html	Returns a complex profile page.	ADMIN, USER
/profiles/cancel/{queryid}	GET	text/html	Cancel the given query and sends a message.	ADMIN, USER
/query	GET	text/html	Gets the query input page.	ALL
/query.json	POST	application/json	Submits a query and waits until it is completed and then returns the results as one big JSON object.	ALL
/query	POST	text/html	Returns the results of submitQueryJSON in an HTML table.	ALL
/status/metrics	GET	application/json	Returns a page that fetches metric info from resource, status, and metrics.	ALL
/status/threads	GET	text/html	Returns a page that fetches metric information from resource, status, and threads.	ALL

/login	GET	text/html	Returns an HTML log in page. If the user is already logged in, returns the home page. If the URL contains a redirect, sets the redirect URI for the session and forwards the user to the redirect page after the user is successfully logged in.	ALL
/login	POST	text/html	Returns a validation error for incorrect credentials.	ALL
/logout	GET	text/html	Ends a session.	ALL

**GET /profiles.json**

- ADMIN - gets all profiles on the system.
- USER - only the profiles of the queries the user has launched.

**GET /profiles**

- ADMIN - gets all profiles on the system.
- USER - only the profiles of the queries the user has launched.

**GET /profiles/{queryid}.json**

- ADMIN - return the profile.
- USER - if the query is launched the by the requesting user return it. Otherwise, return an error saying no such profile exists.

**GET /profiles/{queryid}**

- ADMIN - return the profile.
- USER - if the query is launched the by the requesting user return it. Otherwise, return an error saying no such profile exists

**GET /profiles/cancel/{queryid}**

- ADMIN - can cancel the query.
- USER - cancel the query only if the query is launched by the user requesting the cancellation.

**Related concepts**

[Securing Drill](#) on page 4028

An administrator can install Drill with the default security configuration or manually configure custom security for Drill.

**More information**

<https://drill.apache.org/docs/rest-api/>

**SPNEGO for HTTP Authentication**

Drill 1.13 and later supports the Simple and Protected GSS-API Negotiation mechanism (SPNEGO) to extend the Kerberos-based single sign-on authentication mechanism to HTTP. An administrator configures the web server (Drillbit) to use SPNEGO for authentication. Depending on the system, either the administrator or the user configures the client (web browser or web client tool) to use SPNEGO for authentication.

An administrator can configure both FORM (username and password) and SPNEGO authentication together, which provides the ability for clients with different security preferences to connect to the same

Drill cluster. When a client (a web browser or a web client tool, such as curl) requests access to a secured page from the web server (Drillbit), the SPNEGO mechanism uses tokens to perform a handshake that authenticates the client browser and the web server.

The Drill Web UI provides two possible log in options for a user depending on the configuration. If a user selects FORM, s/he must enter their username and password to access restricted pages in the Drill Web UI. The user is authenticated through PAM. If the user selects SPNEGO, the user is automatically logged in if they are an authenticated Kerberos user. If accessing a protected page directly, the user is redirected to the authentication log in page. If the client fails to authenticate using SPNEGO, an error page displays with an option to use FORM authentication, assuming FORM authentication is configured on the server side.

### **Browser Support**

The following browsers were tested with Drill configured to use SPNEGO authentication:

- Firefox
- Chrome
- Safari
- Internet Explorer
- Web client tool, such as curl

### **Prerequisites**

SPNEGO authentication for Drill requires the following:

- Drill 1.13 or later installed on each node.
- A working Kerberos infrastructure, which Drill does not provide.
- A Linux-based or Windows Active Directory (AD) Kerberos environment with secure clusters and a Drill server configured for Kerberos.
- Kerberos principal and keytab on each web server (Drillbit) that will use SPNEGO for authentication.
- Kerberos Ticket Granting Ticket on the client machine for the user accessing the Drillbit (web server).
- Drill web server configured for SPNEGO.

### **Configuring SPNEGO on the Web Server and Web Client**

The following sections provide the steps that an administrator can follow to configure SPNEGO on the web server (Drillbit). An administrator or a user can follow the steps for configuring the web browser or client tool.

#### *Configuring SPNEGO on the Drillbit (Web Server)*

To configure SPNEGO on the web server, complete the following steps:

1. Generate a Kerberos principal on each web server that will receive inbound SPNEGO traffic. Each principal must have a corresponding keytab. The principal must have the following form:

```
"HTTP/<client-known-server-hostname@realm>"
```

Example: "HTTP/example.QA.LAB@QA.LAB"

//In this example, the client known server hostname is example.QA.LAB.

**NOTE:** If HTTPS is enabled on the Drillbit (web server), the SPNEGO principal should also start with "HTTP/", not "HTTPS/" even though the URL includes HTTPS.

2. Update the `/opt/mapr/drill/drill-<version>/conf/drill-override.conf` file on each Drillbit with the following server-side SPNEGO configurations:

- To enable SPNEGO, add the following configuration to `drill-override.conf`:

```
impersonation: {
    enabled: true,
    max_chained_user_hops: 3
},
drill.exec.http: {
    spnego.auth.principal: "HTTP/hostname@realm",
    spnego.auth.keytab: "path/to/keytab",
    auth.mechanisms: [ "SPNEGO" ]
}
//The default authentication mechanism is "FORM".
```

- To enable SPNEGO and FORM authentication, add the following configuration to `drill-override.conf`:

```
impersonation: {
    enabled: true,
    max_chained_user_hops: 3
},
security.user.auth: {
    enabled: true,
    packages +=
"org.apache.drill.exec.rpc.user.security",
    impl: "pam4j",
    pam_profiles: [ "sudo", "login" ]
}
drill.exec.http: {
    spnego.auth.principal: "HTTP/hostname@realm",
    spnego.auth.keytab: "path/to/keytab",
    auth.mechanisms: [ "SPNEGO", "FORM" ]
}
}
```

- (Optional) To configure the mapping from a Kerberos principal to a user account used by Drill, update the `drill.exec.security.auth.auth_to_local` property in the `drill-override.conf` file with custom rules, as described in [Mapping from Kerberos Principal to OS user account](#).

**NOTE:** Drill uses a Hadoop Kerberos name and rules to transform the client Kerberos principal to the principal Drill uses internally as the client's identity. By default, this mapping rule extracts the first portion from the provided principal. For example, if the principal format is `Name1/Name2@realm`, the default rule extracts only `Name1` from the principal and stores `Name1` as the client's identity on server side. Drill uses the short name, for example `Name1`, as the user account known to Drill. This user account name is used to determine if the authenticated user has administrative privileges.

### *Configuring SPNEGO on the Client*

An administrator or user can configure SPNEGO on the client (web browser or client tools, such as curl). To configure SPNEGO on the client, a Kerberos Ticket Granting Ticket must exist for the user accessing the web server. The Kerberos Ticket Granting Ticket generated on the client side is used by the web client to get a service ticket from the KDC. This service ticket is used to generate a SPNEGO token, which is presented to the web server for authentication.

The client should use the same web server hostname (as configured in the server-side principal) to access the Drill Web Console. If the server hostname differs, SPNEGO authentication will fail. For example, if the server principal is `"HTTP/example.QA.LAB@QA.LAB"`, the client should use `http://example.QA.LAB:8047` as the Drill Web Console URL.

The following sections provide instructions for configuring the supported client-side browsers:

#### **Firefox**

To configure Firefox to use a negotiation dialog, such as SPNEGO to authenticate, complete the following steps:

- Go to **About > Config**, and accept the warnings.
- Navigate to the network settings.
- Set `network.negotiate-auth.delegation-uris` to `"http://,https://"`.
- Set `network.negotiate-auth.trusted-uris` to `"http://,https://"`.

#### **Chrome**

For MacOS or Linux, add the `--auth-server-whitelist` parameter to the `google-chrome` command. For example, to run Chrome from a Linux prompt, run the `google-chrome` command, as shown:

```
google-chrome --auth-server-whitelist = "hostname/domain"
Example: google-chrome --auth-server-whitelist = "example.QA.LAB"
```

#### **Safari**

No configuration is required for Safari. Safari automatically authenticates using SPNEGO when requested by the server.

#### **Internet Explorer**

To configure Internet Explorer to use a negotiation dialog, such as SPNEGO to authenticate, complete the following steps:

1. Go to **Tools > Options > Security > Local Intranet > Sites**, and select all options.
  2. Select **Advanced**, and add one or both of the following URLs to server:
    - http://
    - https://
-  **NOTE:** Make sure you use the hostname of the Drillbit in the URL.
3. Close the **Advanced** tab, and click **OK**.
  4. Go to **Tools > Options > Advanced > Security** (in the checkbox list), and enable the **Integrated Windows Authentication** option.
  5. Click **OK**.
  6. Close and reopen IE. You can browse to your Spengo protected resource.

## REST API

You can use CURL commands to authenticate using SPNEGO and access secure web resources over REST.

Issue the following `curl` command to log in using SPNEGO, and save the authenticated session cookie to a file, such as `cookie.txt`, as shown:

```
curl -v --negotiate -c cookie.txt -u : http://<hostname>:8047/spnegoLogin
```

Use the authenticated session cookie stored in the file, for example `cookie.txt`, to access the Drill Web Console pages, as shown in the following example:

```
curl -v --negotiate -b cookie.txt -u : http://<hostname>:8047/query
Example: curl -v --negotiate -b cookie.txt -u : http://
example.QA.LAB:8047/query
```

## Using ACEs on Views to Limit Data Access

Describes how to use access control expressions to limit data access for Views.

[Apache Drill](#) on page 3928 is a distributed SQL query layer that runs on the data platform. You can enable [user impersonation](#) and [create views](#) in Drill to control user access to data stored in the data platform at the row and column levels. Access to data is based on file permissions set on the data (source files) and on the view definition files.

In addition to standard POSIX permissions, [ACEs \(access control expressions\)](#) are supported to secure data in the distributed filesystem. ACEs are a flexible access control mechanism that applies to files, tables, and streams. [Setting an ACE \(access control expression\)](#) on a file modifies the file permission to honor the [ACE](#) setting. Drill honors [ACE](#) set on Drill view files and on the source files that views access.

Each [Drill view](#) created has an associated view definition file, with a `.view.drill` extension, on which you can set ACEs to secure the view.

## Example

Frank creates a [workspace](#) in the [dfs storage plugin configuration](#) in Drill that points to his home directory in the distributed filesystem. He then uses Drill to create a table named “employees” that he and the HR group can access:

```
-rwxr----- frank:hr /user/frank/employees
```

Joe, a member of the HR and MGR groups, creates a view named `emp_mgr_view` in his home directory to share a subset of the employees data with managers that belong to the MGR group:

```
-rwxr----- joe:mgr /user/joe/emp_mgr_view.drill.view
```

Managers in the MGR group have read permission on the `emp_mgr_view.drill.view` file so they can query the `emp_mgr_view` that Joe created and they can create new views from his view.

Setting [ACE](#) on the underlying data source (the “employees” table) or on the view file (`emp_mgr_view.drill.view`) that accesses the underlying data source resets the POSIX mode bits to match the permissions granted through [ACE](#) settings.

For example, if Frank issues the following command to apply an [ACE](#) to the “employees” table, a user must be a member of the EXEC group to read data in the “employees” table:

```
hadoop mfs -setace -R -readfile 'g:exec' employees
```

Anyone in the HR group that previously had access to the table can no longer access the table data unless they also belong to the EXEC group.

Running the `-getace` command on the table lists the [ACE](#) settings on the table:

```
hadoop mfs -getace /user/frank/employees
```

```
Path: /user/frank/employees
readfile: g:exec
writefile:
executefile:
readdir:
addchild:
deletechild:
lookupdir:
inherit: true
mode: -----
```

Similarly, if Joe issues the following command on the `emp_mgr_view.drill.view` file, only members of the HR group can read the file. Users that belong to the MGR group can no longer access the data through the view, unless they also belong to the HR group.

```
hadoop mfs -setace -R -readfile 'g:hr' emp_mgr_view.drill.view
```

Running the `-getace` command on view file shows the [ACE](#) settings on the file:

```
hadoop mfs -getace /user/joe/emp_mgr_view.drill.view
```

```
Path: /user/joe/emp_mgr_view.drill.view
readfile: g:hr
writefile:
executefile:
readdir:
addchild:
deletechild:
lookupdir:
inherit: true
mode: -----
```

You may also want to view another [File ACE Example](#) on page 1856.

## Drill Drivers

HPE Ezmeral Data Fabric provides Drill ODBC and JDBC drivers that you can download and use to connect Drill to BI tools. The drivers are updated periodically to include support for new functionality in Drill.

The following table provides links to driver download sites and documentation:

 **IMPORTANT:** To access the Data Fabric internet repository, you must specify the email and token of an HPE Passport account. For more information, see [Using the HPE Ezmeral Token-Authenticated Internet Repository](#) on page 93.

Driver	Driver Download Site	Driver Documentation
Drill ODBC Driver	All versions of the Drill ODBC driver are located at <a href="https://package.ezmeral.hpe.com/tools/MapR-ODBC/MapR_Drill/">https://package.ezmeral.hpe.com/tools/MapR-ODBC/MapR_Drill/</a> .	<ul style="list-style-type: none"> <li>Information about the driver, including Drill driver version compatibility and important messages, is located at <a href="#">Drill ODBC Driver</a> on page 4099.</li> <li>Driver documentation, including installation and configuration instructions, is located in the <a href="#">Drill ODBC Driver PDF file</a>.</li> <li><a href="#">How to Connect to Drill from Tableau on Windows</a> on page 4101</li> </ul>
Drill JDBC Driver	All versions of the Drill JDBC driver are located at <a href="https://package.ezmeral.hpe.com/tools/MapR-JDBC/MapR_Drill/">https://package.ezmeral.hpe.com/tools/MapR-JDBC/MapR_Drill/</a> .	<ul style="list-style-type: none"> <li>Information about the driver, including Drill driver version compatibility and important messages, is located at <a href="#">Drill JDBC Drivers</a> on page 4087.</li> <li>Driver documentation, including installation and configuration instructions, is located in the <a href="#">Drill JDBC Driver PDF file</a>.</li> </ul>

## Drill JDBC Drivers

Download the Drill JDBC driver and use it on all platforms to connect BI tools, such as SquirrelL and Spotfire, to Drill. Drill also includes an embedded, open-source JDBC driver.

The downloadable Drill JDBC driver provides read-only access to Drill data sources and supports the security features described in [Securing Drill](#).

Alternatively, you can use the [open-source JDBC driver](#) embedded in Drill; however, *the open-source JDBC driver is not tested on the HPE Ezmeral Data Fabric*. The open-source driver supports Kerberos and Plain authentication mechanisms, but does not support the MapR-SASL authentication mechanism. After you install Drill from the `mapr-drill` package, you can find the open-source JDBC driver files in the following directories:

- `$DRILL_HOME/jars/jdbc-driver/drill-jdbc-all-<drill-version>.jar`
- `$DRILL_HOME/jars/drill-jdbc-<drill-version>.jar`

## Drill JDBC Driver Download

Use the version of the driver that correlates with the version of the installed Drill server. Although older versions of the driver may connect to an upgraded version of Drill, the older drivers do not include all the server features available in the newer drivers.

 **NOTE:** It is integral that you install and retain all files associated with the Drill JDBC driver as downloaded. Dependencies exist among driver files, and downloading and retaining all files allow for successful driver functionality and averts failures.

The following table provides links to the download locations for the Drill JDBC drivers that correlate with each of the Drill versions listed:

 **IMPORTANT:** To access the Data Fabric internet repository, you must specify the email and token of an HPE Passport account. For more information, see [Using the HPE Ezmeral Token-Authenticated Internet Repository](#) on page 93.

Drill Version	JDBC Version
1.20.x.x	<a href="#">1.6.14.1000</a>
1.16.1.[200 or later]	<a href="#">1.6.11.1008</a>
1.16.1.[0-199]	<a href="#">1.6.6.1008</a>
1.16.0.x	<a href="#">1.6.8.1011</a>
1.16.0.x	 <b>ATTENTION:</b> This driver supports JRE 8 only and includes updated driver classes. See <a href="#">Driver Class</a> on page 4088.
1.15.0	<a href="#">1.6.0.1001</a>
1.14.0	<a href="#">1.6.0.1001</a>
1.13.0	<a href="#">1.5.9.1018</a>
1.12.0	<a href="#">1.5.8.1017</a>
1.11.0	<a href="#">1.5.6.1012</a>
1.10.0	<a href="#">1.5.3.1006</a>

### Driver Class

 **IMPORTANT:** The [Drill JDBC Driver](#) installation and configuration PDF document does not include the information provided in the following sections:

### Driver Class

The *Registering the Driver Class* section of the [Drill JDBC Driver](#) documentation incorrectly lists the driver classes as `com.simba.drill.jdbc41.Driver` and `com.simba.drill.jdbc41.DataSource`.

- For driver version **1.6.6.1009 and earlier**, the correct driver classes are:
  - `com.mapr.drill.jdbc41.Driver`
  - `com.mapr.drill.jdbc41.DataSource`
- For driver version **1.6.7.1010**, the correct driver classes are:
  - `com.mapr.drill.jdbc.Driver`
  - `com.simba.drill.jdbc.DataSource`

### JDBC Connection String

You can indicate the `schema` parameter in the connection string, as shown in the following example:

```
jdbc:drill:zk=10.10.100.30:5181,10.10.100.31:5181,10.10.100.32:5181/drill/drillbits1;schema=hive
```

You can also include the authentication mechanism in the connection string using the `AuthMech` or `auth` parameter. For MapR-SASL, use `auth=MAPRSASL`.

- If using the MapR-SASL or Plain authentication mechanism, you must add the Drill JDBC JAR files and `/opt/mapr/lib/*` to the classpath of the third-party client tool, as shown in the following example for SquirrelL when the path to the driver is `C:\driver\MapRDrillJDBC41-1.5.6.1012`:

```
-cp
"%SQUIRREL_CP%;C:\driver\MapRDrillJDBC41-1.5.6.1012\*;C:\opt\mapr\lib\*"

```

The driver JAR files should appear before `/opt/mapr/lib/*` in the classpath.

### Using MapR-SASL for Authentication on Windows

Drill is automatically configured with [Data Fabric security](#) when you install Drill on a cluster configured with default security. To successfully connect to Drill from a Windows JDBC client, a user ticket must exist on the Windows client in the `%TEMP%` directory or in the location specified by the `$MAPR_TICKETFILE_LOCATION` environment variable.

The JDBC driver locates user tickets for the current Windows user in the default ticket location, `%TEMP%`, or in the location specified by the environment variable, `$MAPR_TICKETFILE_LOCATION`. See [Tickets](#) and [Generating a Data Fabric User Ticket](#) for more information.

You can either copy a user ticket that was generated on the cluster into the default location (`%TEMP%`), or you can install the data-fabric client on the Windows client and then run the `maprlogin` command to generate the ticket on the Windows client.

**NOTE:** The JDBC user must be the same as the Windows user that created the ticket.

### Example

If you want to connect to Drill as the `mapr` user, you must create a ticket for the `mapr` user, as shown:

```
$ maprlogin password -user mapr
[Password for user 'mapr' at cluster 'Cluster1':]

```

The credentials for the `mapr` user in `Cluster1` are written to `/tmp/maprticket_1000`.

Next, place the ticket in the `%TEMP%` directory on the Windows client. For example, the default location for a Windows 10 user named `Tabetha Stephens` is shown:

```
'C:\Users\TABETH~1\AppData\Local\Temp\maprticket_Tabetha Stephens'
```

To override this location, set the `"MAPR_TICKETFILE_LOCATION"` global variable for the Windows user.

**NOTE:** Using the `MAPR_TICKETFILE_LOCATION` is recommended because the `%TEMP%` directory differs between Windows versions. You may also want to set the `MAPR_TICKETFILE_LOCATION` per user on the operating system to prevent all users from using the same user ticket on the client.

### Avoiding Driver Conflicts

If you download and use the Drill JDBC driver, rename the embedded JDBC driver files to avoid any conflict between the downloaded driver and the open-source driver. The embedded JDBC driver files are in the following directories after you install Drill:

```
$DRILL_HOME/jars/jdbc-driver/drill-jdbc-all-1.10.0.jar
$DRILL_HOME/jars/drill-jdbc-1.10.0.jar

```

Changing the file extension to rename these files, as shown in the following example, prevents Drill or any other application, such as SQLLine, from picking up the embedded driver:

```
$DRILL_HOME/jars/jdbc-driver/drill-jdbc-all-1.10.0.jar.original
$DRILL_HOME/jars/drill-jdbc-1.10.0.jar.original
```

### Connecting to Drill via the Drill Shell (SQLLine)

See [Connecting to Drill via the Drill Shell \(SQLLine\)](#) on page 4090.

### Driver Limitations

When using MapR-SASL with JDBC or ODBC drivers, there is no way to specify the target cluster name as part of the connection parameters. MapR-SASL reads the first entry in the `/opt/mapr/conf/mapr-clusters.conf` file and assumes it is the target cluster name.

For example, if the `mapr-clusters.conf` file has an entry for 'cluster1' followed by an entry for 'cluster2' and you want to connect to a node in 'cluster2', authentication fails. As a workaround, manually switch the order of entries in the `mapr-clusters.conf` file.

#### *Connecting to Drill via the Drill Shell (SQLLine)*

SQLLine is a JDBC application that is packaged with Drill and serves as the Drill shell. When you issue queries from the SQLLine client, SQLLine passes the queries to the connected Drillbit (Drill node).

You can connect to Drill through Sqlline directly or through a connection-property file. To avoid exposing credentials, connect through the connection-property file.

A JDBC connection string supplies the connection information to a Drill node or ZooKeeper cluster. When you connect to a ZooKeeper cluster, ZooKeeper selects the Drillbit for SQLLine to connect to.

### JDBC Connection String Example

Here is an example of a JDBC connection string that connects SQLLine to drillnode1:

```
jdbc:drill:drillbit=drillnode1:31010
```

The default port on a Drill node is 31010.

### Connection Parameters

You can include SQLLine connection parameters in the connection string and run various shell commands, as described in [Configuring the Drill Shell](#).

In the following example, `-u` is the connection parameter for the JDBC connection string, `-n` is the parameter for the username, and `-p` is the parameter for the password:

```
/opt/mapr/drill/drill-<version>/bin/sqlline -u
"jdbc:drill:drillbit=drillnode1:31010" -n mapr -p mapr
```

### Starting SQLLine

Start SQLLine from the Drill installation directory, as shown:

```
/opt/mapr/drill/drill-<version>/bin/sqlline -u
jdbc:drill:drillbit=drillnode1:31010
```

## Configuration Options

You can also include configuration options, such as `schema`:

```
/opt/mapr/drill/drill-<version>/bin/sqlline -u "jdbc:drill:drillbit
drillnode1:31010;schema=dfs" -n <username> -p <password>
```

### Schema

The `schema` is the name of a [storage plugin](#) configuration to use as the default for queries. If you indicate the `schema` in the connection URL, you do not have to run the `USE <schema>;` query to switch to the `schema` you want to use. All queries run against the `schema` indicated in the JDBC connection string.

### Authentication

If authentication (Plain, MAPRSASL, or Kerberos) is enabled, include the `auth` option in the connection string. If Drill is installed on a cluster secured by default security, set `auth=MAPRSASL`.

For additional configuration options, refer to the *Driver Configuration Options* section in the [JDBC Installation and Configuration Guide](#).

## Connecting to a Specific Drill Node

Indicate which Drill node you want SQLLine to connect to in the JDBC connection string by using the following JDBC connection string format:

```
jdbc:drill:drillbit=<host>:<port>
```

Note that properties are case-sensitive. The `host` is the DNS or IP address of the server (Drill node). By default, the driver connects to port 31010.

### Example

The following example shows how to run SQLLine with the JDBC connection string and includes the `username`, `password`, and `auth` parameters to authenticate to the server with Plain authentication:

```
/opt/mapr/drill/drill-<version>/bin/
sqlline -u
"jdbc:drill:drillbit=<ip-address>:<por
t>;auth=PLAIN" -n <username> -p
<password>
```

If you installed Drill on a cluster with default security enabled, set the `auth` type to `maprsasl`:

```
/opt/mapr/drill/drill-<version>/bin/
sqlline -u
"jdbc:drill:drillbit=<ip-address>:<por
t>;auth=MAPRSASL"
```

## Connecting to ZooKeeper

When you include the ZooKeeper nodes in the JDBC connection string, ZooKeeper selects an available Drill node for SQLLine to use.

Indicate the ZooKeeper cluster you want SQLLine to connect to in the JDBC connection string, using the following JDBC connection string format:

```
jdbc:drill:zk=<zk-server-list>/drill/<clustername>
```

The `zk-server-list` is a comma-separated list of the ZooKeeper nodes in the cluster. The `clustername` is the unique name of the Drillbit cluster that you want to connect to.

 **IMPORTANT:** You can locate the name of the Drillbit cluster in `/opt/mapr/drill/drill-<version>/conf/drill-distrib.conf`. The default name of the Drillbit cluster is `drillbits1`. The name is set by the `cluster-id` property. If you have multiple Drill clusters, you might want to override the Drillbit cluster name in `drill-override.conf`. However, first [back-up your storage plugin configurations](#), as they might reset to the defaults when you change the cluster name. Restart Drill after you edit `drill-override.conf`.

Note that properties are case-sensitive. The `host` is the DNS or IP address of the server (ZooKeeper node).

#### Example

The following example shows you how to configure the JDBC connection string to connect SQLLine to the ZooKeeper cluster:

```
/opt/mapr/drill/drill-<version>/bin/
sqlline
jdbc:drill:zk=<node-ip>:<port>,<node-ip>:<port>,<node-ip>:<port>/drill/
drillbits1;auth=PLAIN
```

**NOTE:** The default port for ZooKeeper nodes in a data-fabric cluster is 5181.

If you installed Drill on a secure cluster, set the `auth` type to `maprsasl`:

```
/opt/mapr/drill/drill-<version>/bin/
sqlline
jdbc:drill:zk=<node-ip>:<port>,<node-ip>:<port>,<node-ip>:<port>/drill/
drillbits1;auth=MAPRSASL
```

### Using a Connection-Property File with SQLLine

If you use a connection-property file, make sure you restrict user permission on the file to only those users you want to have access.

Complete the following steps to create a connection-property file and connect to Drill:

1. Create a connection-property file named `login.properties` with the following information:

```
url:<jdbc-connection-url>
user:<username>
password:<password>

//Example
cat login.properties
url:jdbc:drill:schema=dfs;drillbit=drill-lab-node01
user:drilluser
password:letsdrill
```

2. To connect to Drill, run SQLLine, as shown:

```
sqlline <sqlline args> <path/to/login.properties file>
```

The following examples show you how to connect to Drill through the connection-property file and how to verify that log in details are safe:

**Example 1: Connecting to Drill via the connection-property file**

```
sqlline login.properties

Java HotSpot(TM) 64-Bit Server VM
warning: ignoring option
MaxPermSize=512M; support was removed
in 8.0
apache drill 1.16.0
"drill baby drill"
0: jdbc:drill:schema=dfs> !list
1 active connection:
  #0 open
jdbc:drill:schema=dfs;drillbit=drill-1
ab-node01
0: jdbc:drill:schema=dfs>!q
```

**Example 2 : Submitting a query when connecting to Drill via the connection-property file**

```
sqlline -q "SELECT version FROM
sys.version" login.properties
Java HotSpot(TM) 64-Bit Server VM
warning: ignoring option
MaxPermSize=512M; support was removed
in 8.0
apache drill 1.16.0
"the only truly happy people are
children, the creative minority and
drill users"
0: jdbc:drill:schema=dfs> select
version from sys.version
. . . . . > +-----+
| version |
+-----+
| 1.16.0 |
+-----+
1 row selected (0.295 seconds)
0: jdbc:drill:schema=dfs> Closing:
org.apache.drill.jdbc.impl.DrillConnec
tionImpl
$
```

**Example 3: Use the properties command to connect to Drill via the connection-property file**

```
Run sqlline from /opt/mapr/drill/
drill-<version>/bin sqlline

Java HotSpot(TM) 64-Bit Server VM
warning: ignoring option
MaxPermSize=512M; support was removed
in 8.0
apache drill 1.16.0
"a little sql for your nosql"

sqlline> !properties /home/drilluser/
login.properties
0: jdbc:drill:schema=dfs>
0: jdbc:drill:schema=dfs> !list
1 active connection:
  #0 open
jdbc:drill:schema=dfs;drillbit=drill-1
```

```
ab-node01
0: jdbc:drill:schema=dfs>
```

#### Example 4: Verify that Login Details are Safe

You can verify sqlline process information to confirm login details are not exposed to other users.

```
ps -ef | grep sqlline
drilluser      18938 21924 99 14:14
pts/0         00:00:03 /opt/
jdk1.8.0_141/bin/
java -XX:MaxPermSize=512M -Djava.secur
ity.auth.login.config=/opt/mapr/conf/
mapr.login.conf \
-Dzookeeper.sasl.client=false -Dhadoop
.login=simple -Dlog.path=/opt/mapr/
drill/drill-1.10.0/logs/
sqlline.log -Dlog.query.path=/opt/
mapr/drill/drill-1.16.0/logs/
sqlline_queries.json \
-cp /opt/mapr/drill/drill-1.10.0/
conf:/opt/mapr/drill/drill-1.16.0/
jars/*:/opt/mapr/drill/drill-1.16.0/
jars/ext/*:/opt/mapr/drill/
drill-1.16.0/jars/3rdparty/*:/opt/
mapr/drill/drill-1.16.0/jars/classb/*
sqlline.SqlLine -d
org.apache.drill.jdbc.Driver --maxWidt
h=10000 --color=true login.properties
drilluser      20119 1691 0 14:14
pts/1         00:00:00 grep sqlline
```

#### How to Protect the Password

Use the `!connect` command to mask and protect the password, as shown in the following example:

```
sqlline> !connect
jdbc:drill:drillbit=ip-10-0-0-33.eu-west-2.compute.internal:31010

Enter username for
jdbc:drill:drillbit=ip-10-0-0-33.eu-west-2.compute.internal:31010: alice
Enter password for
jdbc:drill:drillbit=ip-10-0-0-33.eu-west-2.compute.internal:31010: *****
```

#### Start|Stop the Drill Service

You can start|stop|restart the Drillbit service on one or more nodes by using the Control System or the following command:

```
maprcli node services -name drill-bits -action start|restart|stop -nodes
<node host names separated by a space>
```

Use the host name if possible. Using host names instead of IP addresses is a best practice.

#### Drill Log Files

You can access the Drill log files in `/opt/mapr/drill/drill-<version>/logs/drillbit.log`.

### *Using the Drill JDBC Driver with Squirrel*

You can use the Drill JDBC driver with Squirrel to connect to Drill and query the data sources configured in Drill.

To use the Drill JDBC Driver with Squirrel, verify that your system meets the prerequisites and then download and configure the driver.

#### **Prerequisites**

Verify that the system meets the following prerequisites:

- Java Runtime Environment (JRE), version 7.0 or later, installed on each machine where you plan to use the JDBC driver.
- Drill installed in distributed mode on one or multiple nodes in a cluster with data sources configured. See [Connecting Drill to Data Sources](#).
- Verify that the system can resolve the hostnames of the ZooKeeper nodes of the Drill cluster. You can do this by configuring DNS for all of the systems. Alternatively, you can edit the hosts file to include the hostnames and IP addresses of all the ZooKeeper nodes used with the Drill cluster.
  - For Windows, create the entry in the %WINDIR%\system32\drivers\etc\hosts.
  - For Linux and Mac, create the entry in /etc/hosts.

Example: 127.0.1.1 maprdemo

#### Downloading and Configuring the Driver

This topic provides instructions for downloading and configuring the Drill JDBC driver for Squirrel.

#### **About this task**

When you configure the driver, you define the driver and create an alias. The alias is a specific instance of the driver configuration. Squirrel uses the driver definition and alias to connect to Drill so you can access data sources that you have registered with Drill. When you create the alias, you provide a connection URL that includes the name of the Drill directory stored in ZooKeeper and the cluster ID. The URL has the following format:

```
jdbc:drill:zk=<zookeeper_quorum>/<drill_directory_in_zookeeper>/<cluster_ID>
```

The following example shows a URL for Drill installed on a single node:

```
jdbc:drill:zk=10.10.100.56:5181/drill/demo_mapr_com-drillbits
jdbc:drill:zk=10.10.100.24:2181/drill/drillbits1
```

The following example shows a URL for Drill installed in distributed mode with a connection to a ZooKeeper quorum:

```
jdbc:drill:zk=10.10.100.30:5181,10.10.100.31:5181,10.10.100.32:5181/drill/
drillbits1
```

**NOTE:**

- The ZooKeeper port is 2181. In a data-fabric cluster, the ZooKeeper port is 5181.
- The Drill directory stored in ZooKeeper is /drill.
- The Drill default cluster ID is drillbits1. To determine the cluster ID, check the following file:

```
<drill-installation>/conf/drill-override.conf
```

For example:

```
... drill.exec: { cluster-id: "docs41cluster-drillbits", zk.connect:
"centos23.lab:5181,centos28.lab:5181,centos29.lab:5181" } ...
```

To use the Drill JDBC driver with SquirrelL, complete the following steps:

**Procedure**

1. [Download the latest Drill JDBC Driver](#) and then unzip the file. The Drill JDBC Driver JAR files must exist in a directory on your machine before you can configure the driver in the SquirrelL client.
2. *If using the data-fabric-SASL or Plain authentication mechanism*, add the Drill JDBC JAR files and /opt/mapr/lib/\* to Squirrel's classpath, as shown in the following example when the path to the driver is C:\driver\MapRDrillJDBC41-1.5.6.1012:

```
-cp
"%SQUIRREL_CP%;C:\driver\MapRDrillJDBC41-1.5.6.1012\*;C:\opt\mapr\lib\*"
```

**NOTE:** The driver JAR files should appear before /opt/mapr/lib/\* in the classpath.

3. Define the driver.
  - a) Open the SquirrelL client.
  - b) In the SquirrelL toolbar, select **Drivers > New Driver**. The Add Driver dialog appears.
  - c) Enter the following information:
    - **Name** - Name for the Drill JDBC Driver
    - **Example URL** - jdbc:drill:zk=<zookeeper\_quorum>  
Example: jdbc:drill:zk=maprdemo:5181
    - **Website URL** - jdbc:drill:zk=<zookeeper\_quorum>  
Example: jdbc:drill:zk=maprdemo:5181  
Example: jdbc:drill:zk=10.10.100.113:5181,10.10.100.115:5181
  - d) Select **Extra Class Path**, and click **Add**.
  - e) Navigate to the directory that contains the JDBC JAR files.
  - f) Select all of the files in the directory, and click **Choose**.

- g) In the Class Name drop-down field, select the driver class. For driver version 1.6.6.1009 and earlier, select **com.mapr.drill.jdbc41.Driver** or type **com.mapr.drill.jdbc41.Driver** in the field if the option does not appear. For driver version 1.6.7.1010, select **com.mapr.drill.jdbc.Driver** or type **com.mapr.drill.jdbc.Driver** in the field if the option does not appear.
  - h) Click **Ok**. The SQuirreL client displays a message stating that the driver registration is successful, and you can see the driver in the Drivers panel.
4. Create a database alias.
- a) Select the **Aliases** tab.
  - b) In the SQuirreL toolbar, select **Aliases > New Alias**. The Add Alias dialog box appears.
  - c) Enter the following information and click **Ok**.
    - **Alias Name** - A unique name for the Drill JDBC Driver alias
    - **Driver** - Select the Drill JDBC Driver
    - **URL** - Enter the connection URL with the name of the Drill directory stored in ZooKeeper and the cluster ID.
    - **User Name** - admin
    - **Password** - admin

The *Connect to:* dialog appears.
  - d) Click **Connect**. SQuirreL displays a message stating that the connection is successful.
  - e) Click **Ok**. SQuirreL is connected to Drill through the Drill JDBC driver. You can run your queries.

#### Running a Drill Query from SQuirreL

Query sample data in Drill to verify that the SQuirreL client is successfully connected to the cluster through the Drill JDBC driver.

#### About this task

Run a test query on sample data to test the Drill connection.

To query sample data with Squirrel, complete the following steps:

#### Procedure

1. Click the **SQL** tab.
2. Enter the following query in the query box: `SELECT * FROM cp.`employee.json`;`
3. Press **Ctrl+Enter** to run the query. The query results display.

#### Results

You have successfully run a Drill query from the SQuirreL client!

#### Java Sample Code

To use the Drill JDBC driver in an application, you must include all of the JAR files from the ZIP archive in the classpath for the Java project.

The following Java code demonstrates how to use the JDBC API to:

- Register the driver for Drill
- Establish a connection to a Drill server

- Query the database
- Parse a result set
- Handle exceptions
- Clean up to avoid memory leakage

```
// java.sql packages are required
import java.sql.*;
class DrillJDBCExample {
    // Define a string as the fully qualified class name
    // (FQCN) of the desired JDBC driver
    private static final String JDBC_DRIVER =
        "com.mapr.drill.jdbc.Driver";
    // Define a string as the connection URL
    private static final String CONNECTION_URL =
        "jdbc:drill:drillbit=192.168.1.1:31010";

    public static void main(String[] args) {
        Connection con = null;
        Statement stmt = null;
        ResultSet rs = null;
// Define a plain query
String query = "SELECT first_name, last_name, emp_id
FROM `hive`.`default`.`emp`";

        try {

            // Register the driver using the class name
            Class.forName(JDBC_DRIVER);
            // Establish a connection using the connection
            // URL
            con = DriverManager.getConnection(CONNECTION_
            URL);
            // Create a Statement object for sending SQL
            // statements to the database
            stmt = con.createStatement();

            // Execute the SQL statement
            rs = stmt.executeQuery(query);
            // Display a header line for output appearing in
            // the Console View
            System.out.printf("%20s%20s%20s\r\n", "FIRST
            NAME", "LAST NAME" , "EMPLOYEE ID");

            // Step through each row in the result set
            // returned from the database
            while(rs.next()) {
                // Retrieve values from the row where the

                // cursor is currently positioned using
                // column names
                String FirstName = rs.getString("first_
                name");
                String LastName = rs.getString("last_name");
                String EmployeeID = rs.getString("emp_id");

                // Display values in columns 20 characters
                // wide in the Console View using the
                // Formatter
                System.out.printf("%20s%20s%20s\r\n",
                FirstName, LastName, EmployeeID);
            }
        }
    }
}
```

```

    }
  } catch (SQLException se) {
    // Handle errors encountered during interaction
    // with the data source
  } catch (Exception e) {
    // Handle other errors
  } finally {
    // Perform clean up
  try {
    if (rs != null) {
      rs.close();
    }
  } catch (SQLException se1) {
    // Log this
  }
  try {
    if (stmt != null) {
      stmt.close();
    }
  } catch (SQLException se2) {
    // Log this
  }
  try {
    if (con != null) {
      con.close();
    }
  } catch (SQLException se3) {
    // Log this
  } // End try
} // End try
} // End main
} // End DrillJDBCExample

```

### Drill ODBC Driver

HPE Ezmeral Data Fabric provides a Drill ODBC driver that you can download and use on all platforms to connect BI tools, such as Tableau, to Drill.

Use the version of the driver that correlates with the version of the installed Drill server. Although older versions of the driver may be able to connect to an upgraded version of Drill, the older drivers do not include all the server features available in the newer drivers.

The following table provides links to the download locations for the Drill ODBC drivers that correlate with each of the Drill versions listed:

**IMPORTANT:** To access the Data Fabric internet repository, you must specify the email and token of an HPE Passport account. For more information, see [Using the HPE Ezmeral Token-Authenticated Internet Repository](#) on page 93.

Drill Version	ODBC Version
1.16.0.100 - 1.20.3.100	<a href="#">1.5.1.1002</a>
1.16.0, 1.16.1.0	<a href="#">1.3.22.1055</a>
1.15.0	<a href="#">1.3.22.1055</a>
1.14.0	<a href="#">1.3.22.1055</a>
1.13.0	<a href="#">1.3.16.1049</a>
1.12.0	<a href="#">1.3.15.1048</a>
1.11.0	<a href="#">1.3.15.1046</a>
1.10.0	<a href="#">1.3.8.1030</a>

**IMPORTANT:**

- Detailed documentation for the Drill ODBC driver is available at [Drill ODBC Driver](#).
- The 32-bit version of the Drill ODBC driver does not support MapR-SASL. MapR-SASL is only supported in the 64-bit Drill ODBC driver.
- The Drill ODBC driver does not support MapR-SASL for ZooKeeper connections. The Drill ODBC driver only supports MapR-SASL when connecting directly to Drillbits (Drill nodes).
- If you plan to use MapR-SASL for authentication on Windows, review [Using MapR-SASL for Authentication on Windows](#) on page 4100 for additional information and instructions.

**Using MapR-SASL for Authentication on Windows**

Drill is automatically configured with default security when you install Drill 1.11 and later on a secure (version 6.x or later) cluster configured with the [default security](#). To successfully connect to Drill from a Windows ODBC client, the data-fabric client must be installed and a `mapr` user ticket must exist on the Windows client in the `%TEMP%` directory or in the location specified by the `$MAPR_TICKETFILE_LOCATION` environment variable.

The ODBC driver locates user tickets for the current Windows user in the default ticket location, `%TEMP%`, or in the location specified by the environment variable, `$MAPR_TICKETFILE_LOCATION`. See [Tickets](#) and [Generating a MapR User Ticket](#) for more information.

You can either copy a user ticket that was generated on the cluster into the default location (`%TEMP%`), or you can run the `maprlogin` command to generate the ticket on the Windows client.

If you copy a user ticket that was generated on the cluster, you must copy the `mapr-clusters.conf` file to the client machine. Copy the file from `/opt/mapr/conf/mapr-clusters.conf` to `C:/opt/mapr/conf/mapr-clusters.conf` on the client machine. Verify that the cluster to which the client is connecting is listed as the first entry in the `mapr-clusters.conf` file. Also, if the cluster is secure, verify that `secure=true` for the cluster entry in the file.

**NOTE:** The ODBC user must be the same as the Windows user that created the ticket.

**Example**

If you want to connect to Drill as the `mapr` user, you must create a ticket for the `mapr` user, as shown:

```
$ maprlogin password -user mapr
[Password for user 'mapr' at cluster 'Cluster1':]
```

The credentials for the `mapr` user in Cluster1 are written to `/tmp/maprticket_1000`.

Next, place the ticket in the `%TEMP%` directory on the Windows client. For example, the default location for a Windows 10 user named Tabetha Stephens is shown:

```
'C:\Users\TABETH~1\AppData\Local\Temp\maprticket_Tabetha Stephens'
```

To override this location, set the "MAPR\_TICKETFILE\_LOCATION" global variable for the Windows user.

**NOTE:** Using the `MAPR_TICKETFILE_LOCATION` is recommended because the `%TEMP%` directory differs between Windows versions. You may also want to set the `MAPR_TICKETFILE_LOCATION` per user on the operating system to prevent all users from using the same user ticket on the client.

## Driver Limitations

When using MapR-SASL with JDBC or ODBC drivers, there is no way to specify the target cluster name as part of the connection parameters. MapR-SASL reads the first entry in the `/opt/mapr/conf/mapr-clusters.conf` file and assumes it is the target cluster name.

For example, if the `mapr-clusters.conf` file has an entry for 'cluster1' followed by an entry for 'cluster2' and you want to connect to a node in 'cluster2', authentication fails. As a workaround, manually switch the order of entries in the `mapr-clusters.conf` file.

## Driver Issues

The following errors can occur in RHEL 8, Rocky Linux 8, CentOS, and CentOS 8 due to an incompatibility between the bundled `libcrypto.so` ODBC driver library and the `libk5crypto.so` system library:

- ```
SQLDriverConnect = [iODBC][Driver Manager]/lib64/libk5crypto.so.3: \
undefined symbol: EVP_KDF_ctrl, version OPENSSL_1_1_1b (0) SQLSTATE=00000
```
- ```
[unixODBC][Driver Manager]Can't open lib '/opt/mapr/drill/lib/64/
libdrillodbc_sb64.so':\
file not found
```

Use either of the following methods to resolve the issue:

- Remove the bundled crypto library from the ODBC driver RPATH:

```
rm /opt/mapr/drill/lib/64/ThirdParty/libcrypto.so.1.1
```

- Make the dynamic linker load the system version of the crypto library with a higher priority than the bundled ODBC library. How this is done depends on the version of the dynamic linker.

## How to Connect to Drill from Tableau on Windows

Provides instructions for using the Drill ODBC driver to connect Tableau on a Windows PC to Drill on an HPE Ezmeral Data Fabric node.

The instructions in this document were created using the following environment:

- PC running Windows 10 (64-bit system)
- Secure HPE Ezmeral Data Fabric 7.0.0 node (non-FIPS compliant)
- Drill 1.16.1.400 (EEP 8.1.0) installed on the HPE Ezmeral Data Fabric node
- Tableau version 2021.4.3 installed on the Windows PC

This document walks you through the steps required to:

- Download, install, and configure JDK 11
- Install the Data Fabric 7.0.0 client on a Windows 64-bit computer (Required to access Drill on the HPE Ezmeral Data Fabric) node
- Download and install the Drill ODBC driver (v1.3.22.1055) and configure the DSN
- Connect to Tableau (version 2021.4.3)
- Run a couple of queries to test the Tableau connection to Drill

## Download and Install JDK 11

Complete the steps in the following sections to download and install JDK 11. Once you have it installed, set `JAVA_HOME`.

### Download JDK 11

Downloading JDK requires an Oracle account. You can create an account before completing the steps listed in this section, or you can follow the steps listed, create your account in step 4 and then repeat steps 1 - 4 again, but instead of creating an account in step 4, entering your credentials.

To download JDK 11:

1. Go to <https://www.oracle.com/java/technologies/downloads/#java11>.
2. Scroll down to the **Java SE Development Kit 11.0.14** section and select the **Windows** tab.
3. Click **jdk-11.0.14\_windows-x64\_bin.exe** to download.
4. Accept the license agreement and click the download button. An Oracle account log in window appears. Enter your Oracle account credentials or click Create Account. If you enter your credentials and click Sign in... the download begins. If you create an account, complete steps 1 - 4 again to get the download after you create your account.

### Install JDK 11

Click the downloaded `jdk-11.0.14_windows-x64_bin.exe` file. An installation wizard walks you through the installation process. Once installation completes, set the `JAVA_HOME` environment variable.

### Set `JAVA_HOME`

To set `JAVA_HOME`:

1. In Windows, go to **View advanced system settings**. The System Properties window appears.
2. Select the **Advanced** tab.
3. Click **Environment Variables**.
4. Click **New**. The New System Variable window opens.
5. Enter `JAVA_HOME` as the variable name.
6. Enter `C:\PROGRA~1\Java\jdk-11.0.14` as the Variable value. If your JDK version is different, replace `jdk-11.0.14` with your version. Currently, Data Fabric 7.0.0 supports JDK 11.
7. In the System Variables section, select **Path** and then click **Edit**.
8. Verify that `%JAVA_HOME%\bin` is listed. If it is not listed, add it.
9. Click **OK** on each system screen until they all close. To verify that JDK was installed, open the Windows command prompt and run:

```
C:\Users\myname> java -version

//The system should return the following:
java version "11.0.14" 2022-01-18 LTS
Java(TM) SE Runtime Environment 18.9 (build 11.0.14+8-LTS-263)
Java HotSpot(TM) 64-Bit Server VM 18.9 (build 11.0.14+8-LTS-263, mixed
mode)
```

## Install the HPE Ezmeral Data Fabric Client on Windows

The HPE Ezmeral Data Fabric client is required to connect to the HPE Ezmeral Data Fabric cluster node running Drill. Note that when you download the client, the client package name is `mapr-client`.

To install the Data Fabric client on your Windows PC, download the client package for Windows and then complete the installation and configuration steps.

1. Create an `\opt\mapr` directory on your `c:` drive. You can do this using Windows Explorer, or you can open the Windows command prompt and type the following in the prompt:

```
mkdir c:\opt\mapr
```

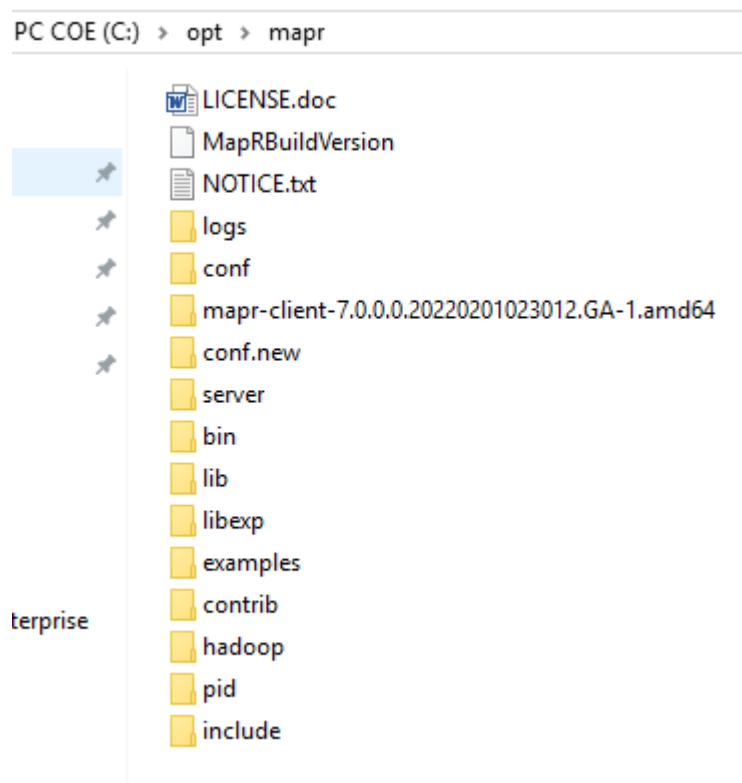

2. Add the `MAPR_HOME` environment variable:
  - a. In Windows, go to **View advanced system settings**. The System Properties window appears.
  - b. Select the **Advanced** tab.
  - c. Click **Environment Variables**.
  - d. Click **New**. The New System Variable window opens.
  - e. Enter `MAPR_HOME` as the variable name.
  - f. Enter `MAPR_HOME=C:\opt\mapr` as the variable value.
  - g. Click **OK**.
  - h. In the System Variables section, double-click the **Path** variable. The Edit Environment Variable window opens.
  - i. Verify that the following variables appear in the list:

```
%JAVA_HOME%\bin
%MAPR_HOME%\bin
```

- j. Click **New** and add `%MAPR_HOME%\hadoop\hadoop-2.7.6\bin`. You should now see the following environment variables in the list:

```
%JAVA_HOME%\bin
%MAPR_HOME%\bin
%MAPR_HOME%\hadoop\hadoop-2.7.6\bin
```

- k. Click **OK** on all screens to exit the environment variables windows.
3. Download the `mapr-client` package:
    - a. Go to [https://package.ezmeral.hpe.com/releases/v7.0.0/windows/<package\\_name>](https://package.ezmeral.hpe.com/releases/v7.0.0/windows/<package_name>).
    - b. Click on the `mapr-client-7.0.0.0` Windows client package to download it.
    - c. Right-click on the downloaded file and select **Extract All...** Extract all to the `C:\opt\mapr\` folder. Once extracted, you should see several files and folders listed in `C:\opt\mapr`, as shown in the following image:

4. If your Windows command prompt is open, close it and reopen it.
5. Go to the `C:/opt/mapr` directory by running the following command:

```
cd /opt/mapr
```

6. Run the configuration script. These instructions assume that the cluster you will be connecting to is secure. To run the configuration script, run the following command in the Windows command prompt:

```
server\configure.bat -N <cluster_name> -c -secure -C  
<node-ip-address>:7222
```

**NOTE:**

- `-N` specifies the cluster name.

**TIP:** If you do not know the cluster name, you can use Putty or a similar tool to access the node in the cluster that you want to connect the client to and get the cluster name from the `mapr-clusters.conf` file. When you access the node, go to `/opt/mapr/conf` and then `cat` the `mapr-clusters.conf` file, for example:

```
cd /opt/mapr/conf
cat mapr-clusters.conf

//You will see something like the following example returned
where myCluster is the cluster name:
myCluster secure=true 10.10.10.279:7222
```

- `-c` (lowercase) specifies a client configuration.
  - `-secure` indicates connecting to a secure cluster.
  - `-C` (uppercase) specifies the CLDB node(s).
  - 7222 is the default port for the CLDB node.
7. Copy the `ssl_truststore` and `ssl-client.xml` files from the `/opt/mapr/conf` directory on the cluster node to the `C:\opt\mapr\conf` directory on the Windows client. Using a tool like WinSCP is useful for this.
  8. On the Windows PC, run the following command to create a ticket:

**NOTE:** When you connect to Drill, you will authenticate to Drill with the username and password that you use in this step.

```
maprlogin password -user <DataFabricUserName>
```

This command creates a ticket for `<DataFabricUserName>`, usually found in:

```
C:\Users\<WindowsUserName>\AppData\Local\Temp\maprticket_<WindowsUserName>
```

9. In Windows, create a new environment variable named `MAPR_TICKETFILE_LOCATION` and set the variable value to `C:\Users\<WindowsUserName>\AppData\Local\Temp\maprticket_<WindowsUserName>`.
10. From the Windows command prompt, run a `hadoop` command to validate that the client is connected to the cluster node:
  - a. Go to the `hadoop-2.7.6` directory:

```
cd /opt/mapr/hadoop/hadoop-2.7.6
```

- b. Run the following `hadoop` command:

```
hadoop fs -ls /
```

//Note that the `/` indicates a directory path.

The command should return results similar to the following:

```
Found 5 items
drwxr-xr-x - uid_5000 gid_5000 4 2022-02-07 06:22 /apps
drwxr-xr-x - uid_5000 gid_5000 0 2022-02-07 06:10 /opt
drwxrwxrwx - uid_5000 gid_5000 0 2022-02-07 06:08 /tmp
drwxr-xr-x - uid_5000 gid_5000 1 2022-02-07 06:11 /user
drwxr-xr-x - uid_5000 gid_5000 2 2022-02-07 06:11 /var
```

### Download the Drill ODBC Driver

To download the Drill ODBC driver:

1. Go to [https://package.ezmeral.hpe.com/tools/MapR-ODBC/MapR\\_Drill/MapRDrill\\_odbc\\_v1.3.22.1055/](https://package.ezmeral.hpe.com/tools/MapR-ODBC/MapR_Drill/MapRDrill_odbc_v1.3.22.1055/).
2. Click `MapRDrill 1.3 64-bit.msi` to download the Windows 64-bit driver.
3. Click the downloaded file and follow the setup wizard to install the driver.
4. If you received a license file through email, copy the license file into the `\lib` sub-folder of the installation folder. You must have administrator privileges to change the contents of this folder.

### Configure the DSN

To create a Data Source Name on Windows:

1. In Windows, go to **ODBC Data Sources**. The ODBC Data Source Administrator (64-bit) window opens.
2. In the ODBC Data Source Administrator, click the **Drivers** tab and then scroll down to verify that the **MapR Drill ODBC Driver** appears in the list of ODBC drivers installed on your system.
3. click the **System DSN** tab.
4. Click **Add**.
5. In the Create New Data Source dialog box, select **MapR Drill ODBC Driver** and then click **Finish**. The Drill ODBC Driver DSN Setup dialog box opens.
6. In the Data Source Name field, type a name for your DSN.
7. To connect to the Drill node, select **Direct to Drillbit** and then type the IP address or host name of the Drill server in the field beside the Direct to Drillbit option and the port on which the Drill server is listening. The port is typically 31010, for example: `10.10.10.279:31010`.
8. In the Authentication Type drop-down, select **MapRSASL**.
9. To test the connection, click **Test**. A successful connection returns a success message. If the connection fails, verify that the settings in the MapR Drill ODBC Driver DSN Setup dialog box are correct.
10. Click **OK** to exit the windows.

## Connect Tableau to the Drill ODBC Driver (DSN)

Note that version 2021.4.3 of Tableau was used to create these instructions.

To connect Tableau to the Drill ODBC driver (DSN):

1. Open Tableau.
2. Select **Connect To Server > More > Other Database (ODBC)**. The Other Database (ODBC) window opens.
3. In the DSN drop-down, select the DSN you created (when you completed the steps in the *Configure the DSN* section).
4. Click **Connect**.
5. Enter your credentials to authenticate and then click **Sign in....** Use the same credentials you used when you created a ticket for the mapr-client.
6. To verify that Tableau is connected to the Drill node, run a couple of test queries:
  - a. Double-click **New Custom SQL**.
  - b. In the Edit Custom SQL box, enter the following query and then click **Preview Results...**:

```
SELECT * FROM sys.drillbits
```

The query should return results similar to the following:

View Data: Custom SQL Query+

1 row

current	hostname	state	version	control_port	data_port	http_port	user_port
True	m2-mapreng-vm...	ONLINE	1.16.1.400-ee...	31,011	31,012	8,047	31,010

- c. Close the View Data: Custom SQL Query + box.
- d. In the Edit Custom SQL box, enter the following query and then click **Preview Results...**:

```
SELECT * FROM cp.`employee.json` LIMIT 3
```

This query runs against a sample file (`employee.json`) included in Drill's classpath. The query should return the following results:

View Data: Custom SQL Query+

3 rows

birth_date	education_level	first_name	full_name	gender	hire_date	last_name	management_role	marital_status	position_title	department_id	employee_id	position_id	salary	store_id	supervisor_id
1961-08-26	Graduate Degree	Sheri	Sheri Nowmer	F	1994-12-01 00:...	Nowmer	Senior Managem...	S	President	1	1	1	80,000.00	0	0
1915-07-03	Graduate Degree	Derrick	Derrick Whelply	M	1994-12-01 00:...	Whelply	Senior Managem...	M	VP Country Man...	1	2	2	40,000.00	0	1
1969-06-20	Graduate Degree	Michael	Michael Spence	M	1998-01-01 00:...	Spence	Senior Managem...	S	VP Country Man...	1	4	2	40,000.00	0	1

## Drill Configuration Files

The Drill installation includes configuration files with start-up options that you can modify prior to starting Drill.

The configuration files reside in a **HOCON** configuration file format, which is a hybrid between a properties file and a JSON file. The files have a nested relationship and a hierarchical structure, where one file overrides another. You can locate the files in the `/opt/mapr/drill/drill-<version>/conf` directory.

The configuration files are listed below in their hierarchical order. The `drill-distrib.conf` file overrides the `drill-module.conf` file, and the `drill-override.conf` file overrides the `drill-distrib.conf` file.

- `drill-override.conf`

- drill-distrib.conf
- drill-module.conf

Environment variables are also overridden in the same way, in the order listed below:

- drill-env.sh (or explicitly defined in environment)
- distrib-env.sh
- drill-config.sh

The following table lists the configuration files with their descriptions:

File Name	Description	Default Configuration with Secure Installation
drill-distrib.conf	Contains distribution-specific configurations for Drill. Automatically updated by configure.sh when you configure the cluster.	<ul style="list-style-type: none"> <li>• Enables authentication, impersonation, and encryption with HPE Ezmeral Data Fabric-SASL as the default mechanism.</li> <li>• Enables TLS for the HTTPS channel.</li> </ul> <p> <b>NOTE:</b> By default, HTTPS uses the SSL certificate provided by the cluster installation; however, an administrator can specify a certificate in a keystore.</p> <ul style="list-style-type: none"> <li>• Enables the inbound impersonation policy for administrators to impersonate any other user.</li> </ul>
distrib-env.sh	Contains distribution-specific defaults for various environment variables.	<ul style="list-style-type: none"> <li>• Enables authentication between the Drillbits and ZooKeeper.</li> <li>• Configures the location of the default security configuration file, mapr.login.conf, used by Drill.</li> </ul>
drill-env.sh	The drill-env.sh file contains the cluster administrator-specific environment variables that can differ from the defaults. You can modify this file to override the default values of system properties defined in the distrib-env.sh file or to define a new system property. For example, you can configure the amount of heap and direct memory allocated to Drill. See <a href="#">Configuring Drill Memory</a> on page 3984.	Empty upon installation.

drill-override.conf	Use the drill-override.conf file to override the default values obtained from drill-module.conf and drill-distrib.conf. A cluster administrator can update this file to configure a Drillbit as required (different from default installation)	When you first install Drill, drill-override.conf contains ZooKeeper and Drillbit configuration information; however, after you run configure.sh -R, the entries are removed and the file does not contain any configurations.
---------------------	--	--

### Mask Sensitive Data in Query Logs and Profiles

Starting in Drill 1.20.2 (EEP 9.0.0 installed on Core 7.1.0), you can define a set of rules in a JSON file to mask sensitive data in Drill query logs and query profiles.

### Masking Data in Query Logs

Drill includes the following Logback encoder and layout classes that enable you to configure Drill logs such that data in the final message is masked:

- `org.apache.drill.logback.MaskingPatternEncoder`
- `org.apache.drill.logback.MaskingPatternLayout`

The Drill encoder and layout provide the same functions as the following encoder and layout:

- `ch.qos.logback.classic.encoder.PatternLayoutEncoder`
- `ch.qos.logback.classic.PatternLayout`

The following examples demonstrate how to configure the Drill masking pattern encoder and layout in the `/opt/mapr/drill/drill-<version>/conf/logback.xml` file:

#### Masking Pattern Encoder Example

```
<configuration>
  <appender name="STDOUT"
class="ch.qos.logback.core.ConsoleAppender">
    <encoder
class="org.apache.drill.logback.MaskingPatternEncoder">
      <rulesConfig>$
{pathToJsonConfig}</rulesConfig>
      <pattern>%d{HH:mm:ss.SSS}
[%thread] %-5level %logger{36} -
%msg%n</pattern>
    </encoder>
  </appender>

  <root>
    <level value="error" />
    <appender-ref ref="STDOUT" />
  </root>
</configuration>
```

#### Masking Pattern Layout Example

```
<configuration>
  <appender name="STDOUT"
class="ch.qos.logback.core.ConsoleAppender">
    <encoder
class="ch.qos.logback.core.encoder.LayoutWrappingEncoder">
      <layout
```

```

class="org.apache.drill.logback.MaskingPatternLayout">
  <rulesConfig>$
  {pathToJsonConfig}</rulesConfig>
  <pattern>%d{HH:mm:ss.SSS}
[%thread] %-5level %logger{36} -
%msg%n</pattern>
  </layout>
  </encoder>
</appender>

<root>
  <level value="error" />
  <appender-ref ref="STDOUT" />
</root>
</configuration>

```

Both examples include the `rulesConfig` parameter. The `rulesConfig` parameter is where you include the path to a JSON file that defines the masking rules. Enter the absolute path to the JSON file; do not use a relative path.

For information about how to define masking rules in a JSON file, see [Configuring Masking Rules in a JSON File](#) on page 4110.

### Masking Data in Query Profiles

You can define rules that mask the following information in query profiles:

- Query plan text
- Queries
- Errors
- Verbose errors

To mask data in query profiles, define the masking rules in a JSON file and then set the `drill.exec.query_profile.masking_rules.config_path` parameter in the `/opt/mapr/drill/drill-<version>/conf/drill-override.conf` or `/opt/mapr/drill/drill-<version>/conf/drill-distrib.conf` file to point to the JSON file.

For information about how to define masking rules in a JSON file, see [Configuring Masking Rules in a JSON File](#) on page 4110. For more information about Drill configuration files, see [Drill Configuration Files](#) on page 4107.

### Configuring Masking Rules in a JSON File

The JSON file that defines the masking rules must include an array of objects with the following fields:

- search
- replace
- description

Use these fields to define the rules, as shown in the following examples:

```

[
  {
    "search": "([\\w\\d]+\\.)(com)",
    "replace": "secret.domain.com",

```

```

    "description": "Mask domain names"
  },
  {
    "search": "MagicCompany",
    "replace": "TopSecretCompany",
    "description": "Mask company name"
  }
]

```

The following table describes each of the fields that define the masking rules:

Field	Required	Description	Default
search	Yes	Defines the string or regex pattern to mask. If entering a regex pattern, use the <a href="#">correct escaping</a> . Drill does not apply the rule when this field is empty, null, or omitted.	-
replace	No	Defines the string that you want to mask the search string or regex pattern with. If you want to remove the search string or regex pattern, use "" to leave the space empty.	""
description	No	An optional field used to describe the search and replace rules. The description is not returned in the logs or query profiles.	Empty

### Monitoring Drill Metrics

You can monitor Drill metrics and logs using the Kibana and Grafana interfaces that are available through [Data Fabric Monitoring](#). The [Kibana](#) interface is a log monitoring tool. The [Grafana](#) interface is a metrics monitoring tool where you can view system-level metrics for Drill.

Drill uses JMX ([Java Management Extensions](#)) to monitor queries at runtime. JMX provides the architecture to dynamically manage and monitor applications. JMX collects Drill system-level metrics that you can access through Grafana or through the Metrics page in the [Drill Web Console](#).

You must install a specific set of services on cluster nodes to use the Kibana and Grafana monitoring tools. You can install the services using the [Data Fabric installer](#), or you can [install these services manually](#). If you install the monitoring services in a cluster running Drill, you must restart Drill in order for Drill to communicate with JMX. However, if you install Drill after the monitoring services are installed, you must run the `configure.sh` command and restart the Drillbit service in order for the monitoring services to recognize that a new application is running in the cluster.

The following table lists the predefined Drill system-level metrics that you can view in Grafana:

Metric	Description
mapr.drill.allocator_root_used	The amount of memory used by the internal memory allocator. Measured in bytes.
mapr.drill.queries_running	The number of queries running for which the Drillbit is the foreman.
mapr.drill.queries_completed	The number of completed, cancelled, or failed queries for which the Drillbit was the foreman.
mapr.drill.fragments_running	The number of query fragments currently running in the Drillbit.
mapr.drill.allocator_root_peak	The peak amount of memory used by the internal memory allocator. Measured in bytes.
mapr.drill.heap_used	The amount of heap memory used by the JVM. Measured in bytes.
mapr.drill.non_heap_used	The amount of non-heap memory used by the JVM. Measured in bytes.

mapr.drill.count	The number of live daemon and non-daemon threads.
mapr.drill.fd_usage	The ratio of used file descriptors to total file descriptors.
mapr.drill.runnable_count	The number of threads executing in the JVM. This metric is useful for debugging Drill issues.
mapr.drill.waiting_count	The number of threads waiting to be executed. This may occur when a thread waits on another thread to perform an action before proceeding. This metric is useful for debugging Drill issues.
mapr.drill.blocked_count	The number of blocked threads waiting for a monitor lock. This metric is useful for debugging Drill issues.

### Optimizing Queries with Indexes

HPE Ezmeral Data Fabric Database provides a highly scalable key-value database platform on which you can run SQL queries using Drill. As a part of the 6.0 release, HPE Ezmeral Data Fabric Database natively supports indexes on secondary fields in JSON tables.

**NOTE:** HPE Ezmeral Data Fabric Database does not support indexes on binary tables.

An index is a special table that stores a subset of document fields from a JSON table. The primary field in a JSON table is the `_id` field (unique key field). By default, HPE Ezmeral Data Fabric Database sorts the JSON table by the `_id` field. All other fields in the JSON table are secondary fields. You can create indexes on the secondary fields in a JSON table to eliminate full tables scans and significantly improve query performance. See [HPE Ezmeral Data Fabric Database as a Document Database](#) and [Secondary Index Concepts](#) for more information.

### Benefits of Indexes

Well-designed indexes can optimize access to data stored in HPE Ezmeral Data Fabric Database JSON tables and improve performance for high read operations, fast integrated analytics, and complex operational analytics. See [Secondary Indexes](#) for more information about the benefits of indexes.

### Types of Queries that Benefit from Indexes

Indexes primarily benefit queries with filters in the WHERE clause and queries with an ORDER BY clause for sorting, as described in the following table:

Query Type	Description
Equality	Equality queries contain equality conditions, such as <code>a=1</code> and can also include IN. See <a href="#">Equality Queries</a> .
Range	Range queries contain range conditions, such as <code>&lt;=</code> , <code>&gt;=</code> , and the LIKE pattern matching condition. See <a href="#">Range Queries</a> .  <b>NOTE:</b> The LIKE operator only works on fields that have varchar data types. To use the LIKE operator in queries, use the <a href="#">CAST</a> function to explicitly cast fields to varchar. To use indexes for such queries, create indexes on the cast expressions, as explained in <a href="#">Using Casts in Secondary Indexes</a> .
ORDER BY	ORDER BY queries specify a sort order. If the ordering and sorting of the index key list match the ordering specified in a query, the optimizer in Drill does not have to sort the data after the index scan. See <a href="#">ORDER BY Queries</a> .

Multi-index	Multi-index queries contain conditions on multiple fields. Drill can scan multiple indexes and use the intersection of the matching documents to optimize these queries. Multi-index queries are an alternative to using <a href="#">composite key indexes</a> . See <a href="#">Multi-Index Queries</a> .
-------------	--

Drill can create index plans for queries with and without filters in the WHERE clause. For example, Drill can create an index plan for an ORDER BY query that does not have filters.

Drill 1.12 and later also supports the following types of queries without filters :

- GROUP BY
- JOIN
- DISTINCT

See [Index Planning in Drill](#) for more information.

### Types of Indexes Supported by HPE Ezmeral Data Fabric Database

HPE Ezmeral Data Fabric Database supports several types of indexes on JSON tables including simple, composite, hashed, covering, and indexes with the CAST function.

**NOTE:** HPE Ezmeral Data Fabric Database enforces certain [restrictions](#) on indexes, such as a limit of 32 KB on the collective size of all indexed keys for each index. See [Restrictions on Secondary Indexes](#) for a full list of restrictions and [Data Types Supported for Secondary Indexes](#).

The following table lists the supported index types with brief descriptions and links to topics that provide more information:

Index Type	Description
Simple	Simple indexes are indexes with a single indexed field (or key). See <a href="#">Simple Indexes</a> .
Composite	Composite indexes are indexes that have more than one indexed field (or key). See <a href="#">Composite Indexes</a> .
Hashed	Hashed indexes are indexes that distribute keys across logical partitions to avoid the creation of hot spots when HPE Ezmeral Data Fabric Database updates the index with new keys from the JSON table. See <a href="#">Hashed Indexes</a> .
Covering	A covering index is an index that allows HPE Ezmeral Data Fabric Database to process a query using only the secondary indexes. HPE Ezmeral Data Fabric Database does not have to read data in the JSON table. See <a href="#">Covering Indexes</a> on page 690.
Indexes with the CAST function	Indexes with the CAST function convert the indexed field to the data type specified by the CAST function and store the results. See <a href="#">Using Casts in Secondary Indexes</a> .

### Steps Required to Use Indexes

To use the index functionality with Drill, complete the following steps:

1. Install the latest version of the required data-fabric software on the cluster. See [Preparing Clusters for Querying using Secondary Indexes on JSON Tables](#) and Installing Drill.
2. Evaluate your queries and design indexes that support the queries. See [Understanding the Secondary Index Workflow](#) and [Designing Secondary Indexes](#).

3. Create indexes on JSON tables in HPE Ezmeral Data Fabric Database. See [Adding Secondary Indexes on JSON Tables](#) and [Managing Secondary Indexes](#).

**NOTE:** The user that creates indexes on a JSON table must have created the table or have the `indexperm` permission in addition to `readAce` on the volume and `lookupdir` on directories in the table path. If you do not have these permissions, consult with your system administrator.

4. Issue queries.
5. Verify that Drill uses the available indexes. See [Determining Index Use](#) and [Troubleshooting Indexes](#).

### Additional Information

- To see how Drill selects a query plan, see [Selection and Execution of Secondary Indexes](#).
- To learn about the index planning and execution configuration options available in Drill, see [Index Planning and Execution Configuration Options](#).
- For information about index architecture, see [Implementation of Secondary Indexes](#).

### Index Planning in Drill

Index planning reduces the I/O operation costs associated with full table scans. If an index is available, Drill can use the index to improve query performance.

Drill can use indexes to create query plans for queries that filter on indexed fields or fields included in an index. Fields in `COUNT`, `COUNT DISTINCT`, `JOIN`, `GROUP BY`, and `ORDER BY` also determine index use. Drill can create index-based query plans for queries with and without filters (`WHERE` clause).

**NOTE:** In Drill 1.11 and earlier, if a query does not have a filter, the query must have an `ORDER BY` clause.

Drill can create index plans for queries with an `ORDER BY` clause whether or not the query contains a filter, as shown in the following example:

```
SELECT L_LINENUMBER FROM lineitem ORDER BY L_LINENUMBER;
```

**NOTE:** In this example, `L_LINENUMBER` is an indexed field in the index selected for the query plan.

In Drill 1.12 and later, Drill can also create index-based query plans for the following types of queries when they do not have filters (`WHERE` clause):

- **GROUP BY** queries, as shown in the following example where `L_COMMITDate` is an indexed field in the index selected for the query plan:

```
SELECT L_COMMITDate FROM lineitem GROUP BY L_COMMITDate;
```

- **JOIN** queries, as shown in the following example where `L_ORDERKEY` and `O_ORDERKEY` are indexed fields and `L_LINESTATUS` is an included field in the index selected for the query plan:

```
SELECT L.L_LINESTATUS FROM lineitem L, orders O WHERE
L.L_ORDERKEY=O.O_ORDERKEY;
```

**NOTE:** If the planner picks two indexes, one for `lineitem` and one for `orders`, a sort merge join is used instead of a hash join.

- Queries with **DISTINCT** projections, as shown in the following examples where L\_LINENUMBER is an indexed field in the index selected for the query plan:

```
SELECT DISTINCT L_LINENUMBER FROM lineitem;
SELECT COUNT(DISTINCT L_LINENUMBER) FROM lineitem;
```

Drill can use indexes for queries that GROUP BY or ORDER BY the leading fields in an index. Drill does not use indexes for queries that GROUP BY or ORDER BY the trailing or included fields in an index.

When a query contains GROUP BY and ORDER BY operations on the leading indexed column, Drill can use the sort order of the index to create index-based query plans that use streaming aggregates and merge joins to improve query performance.

You can run the [EXPLAIN PLAN FOR](#) command with a query to see the query plan that Drill creates. See [Covering and Non-Covering Queries](#) for more information about index planning in Drill.

### Index Planning and Execution Configuration Options

The 1.11 release of Drill introduces options that affect how Drill uses indexes when planning and executing queries. You can set the query planning and execution options, at the system or session level, using the ALTER SYSTEM|SESSION SET commands, as shown:

```
ALTER SYSTEM SET `planner.enable_index_planning` = true
ALTER SESSION SET `planner.enable_index_planning` = false
```

Options set at the session level only apply to queries that you run during the current Drill connection. Options set at the system level affect the entire system and persist between restarts. Session level settings override system level settings. Typically, you set the options at the session level unless you want the setting to persist across all sessions.

The following table lists the index planning and execution options that you can enable, disable, or modify:

**NOTE:** The planning option names are prefaced by planner, for example `planner.enable_index_planning`. The execution options are prefaced by exec, for example `exec.query.rowkeyjoin_batchsize`.

Option	Description	Default Value	Possible Values
<code>planner.enable_index_planning</code>	Enables or disables index planning	true	true false
<code>planner.index.force_sort_noncovering</code>	Forces Drill to sort for non-covering indexes. If the query has an ORDER-BY on index columns and a non-covering index is chosen, by default Drill leverages the sortedness of the index columns and does not sort. Fast changing primary table data may produce a partial sort. This option forces a sort within Drill.  <b>NOTE:</b> (Drill 1.11 only) You must enable this option for Drill to return the results of a non-covering query in sorted order.	false	true false

planner.enable_rowkeyjoin_conversion	<p>Introduced in Drill 1.13. Drill can push down the rowkey filter to HPE Ezmeral Data Fabric Database during runtime. For a query to qualify for runtime filter pushdown, the join condition must filter on a rowkey. A rowkey is the value of the <code>_id</code> field in a JSON document, for example:</p> <pre>SELECT t.mscIdentities FROM dfs.root.`/user/mapr/MixTable` t WHERE t.row_key IN (SELECT max(convert_fromutf8(i.KeyA.ENTRY_KEY)) FROM dfs.root.`/user/mapr/TableIMSI` i WHERE i.row_key='460021050005636')</pre> <p>Drill evaluates the results of the subquery at runtime. The subquery yields a list of rowkeys from the TableIMSI table. Drill pushes down the list of rowkeys to HPE Ezmeral Data Fabric Database. HPE Ezmeral Data Fabric Database uses the rowkeys to locate the corresponding documents in the MixTable table and sends the results to Drill.</p> <p> <b>NOTE:</b> Currently, Drill does not support runtime filters for queries with equality conditions. The query planner in Drill converts an equality condition to a left join. As a workaround, use the IN operator instead of the equality (=) operator for queries in which you want Drill to push down the rowkey filter to HPE Ezmeral Data Fabric Database.</p> <p>Drill does not perform runtime filter pushdown for queries that filter on rowkeys in small fact tables when the rowcount is generated from the right side of the join.</p>	true	true false
planner.rowkeyjoin_conversion_selectivity_threshold	Introduced in Drill 1.13. Sets the selectivity (as a percentage) under which Drill uses a rowkey join for eligible queries.	0.01	Range : 0.0-1.0
planner.rowkeyjoin_conversion_using_hashjoin	Introduced in Drill 1.13. When enabled, Drill uses the hash join operator instead of a rowkey join.	false	true false
planner.index.covering_selectivity_threshold	For covering indexes, this option specifies the filter selectivity that corresponds to the leading prefix of the index below which the index is considered for planning. For example, for the filter 'a > 10 AND b < 20' if an index has indexed fields (a, b, c) and the combined selectivity of the above condition is less than the threshold, the index is considered for the query plan.	0.75	0 - 1.0
planner.index.noncovering_selectivity_threshold	For non-covering indexes, this option specifies the filter selectivity that corresponds to the leading prefix of the index below which the index is considered for planning.	0.025	0 - 1.0
planner.index.max_chosen_indexes_per_table	The maximum number of "chosen" indexes for a table after index costing and ranking.	5	0 - 100
planner.index.rowkeyjoin_cost_factor	The cost factor that provides some control over the I/O cost for non-covering indexes when the rowkey join back to the primary table causes random I/O from the primary table.	0.1	0 - max_double
planner.enable_statistics	Enable or disable statistics for the filter conditions on indexed columns.	true	true false
exec.query.rowkeyjoin_batchsize	For batch GET operations, this option specifies the batch size in terms of the number of rowkeys. Used for non-covering index plans when doing joins back to primary table.	128	0 - Long. MAX_VALUE

exec.query.progress.update	Enable or disable updating transient query state in ZooKeeper. Disable this option for short running operational queries. When disabled, you do not see the query state , such as STARTING and RUNNING in the Drill Web Console.	true	true false
exec.udf.use_dynamic	Enable or disable using dynamic UDFs for the queries. Disable this option for operational queries. When disabled, you cannot use dynamic UDFs for queries.	true	true false
exec.query_profile.save	Enable or disable saving query profiles for the queries. Disable this option for operational queries. When disabled, Drill does not save query profiles and they are not available for analysis or debugging.	true	true false
planner.use_simple_optimizer	Enable or disable using simple optimizer for queries. Simple optimizer applies fewer rules to reduce planning time and is meant to be used only for simple operational queries that use limit, sort, and filter. This optimizer applies rules for leveraging secondary indexes when index planning is enabled. Enable this option for operational queries.	false	true false

### Index Planning and Execution Options for Operational Queries

The following table lists the index planning and execution options for operational queries that you can enable, disable, or modify:

Option	Description	Default Value	Possible Values
exec.query.progress.update	Enable or disable updating transient query state in ZooKeeper. Disable this option for short running operational queries. When disabled, you do not see the query state , such as STARTING and RUNNING in the Drill Web Console.	true	true false
exec.udf.use_dynamic	Enable or disable using dynamic UDFs for the queries. Disable this option for operational queries. When disabled, you cannot use dynamic UDFs for queries.	true	true false
exec.query_profile.save	Enable or disable saving query profiles for the queries. Disable this option for operational queries. When disabled, Drill does not save query profiles and they are not available for analysis or debugging.	true	true false
planner.use_simple_optimizer	Enable or disable using simple optimizer for queries. Simple optimizer applies fewer rules to reduce planning time and is meant to be used only for simple operational queries that use limit, sort, and filter. This optimizer applies rules for leveraging secondary indexes when index planning is enabled. Enable this option for operational queries.	false	true false

## Covering and Non-Covering Queries

Drill uses a cost-based approach to determine an optimal query plan. When queries are eligible for index planning, the queries are either covering or non-covering.

For covering queries, only the index is needed to process the query. Drill creates an index-based query plan that includes an index scan. Covering queries avoid the overhead of fetching data from the primary table.

For non-covering queries, the index only contains a subset of the data required to process the query. Drill creates a query plan that includes an index scan and a join back to the primary table. In some scenarios, a full table scan is more cost efficient than an index scan and Drill will not create an index plan.

**NOTE:** (Drill 1.11 only) You must enable the `planner.index.force_sort_noncovering` option for Drill to return the results of a non-covering query in sorted order. See [Index Planning and Execution Configuration Options](#)

Indexes for covering and non-covering queries can contain indexed fields, or a combination of indexed and included fields. HPE Ezmeral Data Fabric Database stores included fields in the index. Each field added to the index increases the storage requirement for the index. As the storage size increases, the cost of reading the index also increases. Likewise, for the cost of adding and updating documents. Consider the impact on storage and updates when adding included fields to an index.

- For information about how Drill selects a query plan, see [Selection and Execution of Secondary Indexes](#).
- For information about the types of queries that qualify for index-based plans, see [Queries that Benefit from Secondary Indexes](#).
- For index concepts, see [Secondary Index Concepts](#).

## Covering and Non-Covering Query Examples

A query can be covering or non-covering based on the fields referenced in the query and the fields on which an index is created and/or includes.

The following query examples use an index, `l_comp_1`, created on a table, `lineitem`.

The `l_comp_1` index was created using the `maprcli table index add` command, as shown:

```
maprcli table index add -path /drill/testdata/tpch/sf1/
maprdb/json/range/lineitem -index l_comp_1 -indexedfields
L_LINENUMBER,L_ORDERKEY -includedfields L_LINESTATUS,L_QUANTITY
```

### Covering Query Example

The following query references the `L_LINESTATUS`, `L_QUANTITY`, `L_LINENUMBER`, and `L_ORDERKEY` fields in the `lineitem` table:

```
SELECT L_LINESTATUS, L_QUANTITY FROM lineitem WHERE L_LINENUMBER = 1 AND
L_ORDERKEY BETWEEN 40 AND 75;
```

Because the `l_comp_1` index includes all fields referenced in the query, Drill creates a query plan that uses the index only.

Running the [EXPLAIN PLAN FOR](#) command with the query shows that Drill created a query plan that only uses the index to process the query:

```
EXPLAIN PLAN FOR SELECT L_LINESTATUS, L_QUANTITY FROM lineitem WHERE
L_LINENUMBER = 1 AND L_ORDERKEY BETWEEN 40 AND 75;
```

```

00-00      Screen
00-01      Project(L_LINESTATUS=[0], L_QUANTITY=[1])
00-02      Scan(table=[[si, tpch_sf1_maprdb_range,
lineitem]], groupscan=[JsonTableGroupScan [ScanSpec=JsonScanSpec
[tableName=maprfs:///drill/testdata/tpch/sf1/maprdb/json/range/lineitem,
condition=((L_LINENUMBER = {"$numberLong":1}) and (L_ORDERKEY
>= {"$numberLong":40})) and (L_ORDERKEY <= {"$numberLong":75}))],
indexName=l_comp_1, columns=[`L_LINESTATUS`, `L_QUANTITY`]])

```

Reading the query plan, you can see that the plan includes an index scan, as indicated by `groupscan=[JsonTableGroupScan` and `indexName`. Drill and HPE Ezmeral Data Fabric Database can process this query using only the index.

### Non-Covering Query Example

The following query references the `L_RETURNFLAG`, `L_LINESTATUS`, `L_QUANTITY`, `L_LINENUMBER`, and `L_ORDERKEY` fields in the `lineitem` table:

```

SELECT L_RETURNFLAG, L_LINESTATUS, L_QUANTITY FROM lineitem WHERE
L_LINENUMBER = 1 AND L_ORDERKEY BETWEEN 40 AND 75;

```

Because the `l_comp_1` index does not include the `L_RETURNFLAG` field, Drill creates a query plan that uses the index, but also includes a join on the primary table.

Running the `EXPLAIN PLAN FOR` command with the query shows that Drill includes an index scan and a table scan:

```

EXPLAIN PLAN FOR SELECT L_RETURNFLAG, L_LINESTATUS, L_QUANTITY FROM
lineitem WHERE L_LINENUMBER = 1 AND L_ORDERKEY BETWEEN 40 AND 75;

00-00      Screen
00-01      Project(L_RETURNFLAG=[0], L_LINESTATUS=[1], L_QUANTITY=[2])
00-02      Project(L_RETURNFLAG=[2], L_LINESTATUS=[3], L_QUANTITY=[4])
00-03      Project(L_LINENUMBER=[0], L_ORDERKEY=[1],
L_RETURNFLAG=[2], L_LINESTATUS=[3], L_QUANTITY=[4])
00-04      RowKeyJoin(condition=[($5, $6)], joinType=[inner])
00-06      Scan(table=[[si, tpch_sf1_maprdb_range,
lineitem]], groupscan=[RestrictedJsonTableGroupScan [ScanSpec=JsonScanSpec
[tableName=maprfs:///drill/testdata/tpch/sf1/maprdb/json/range/lineitem,
condition=((L_LINENUMBER = {"$numberLong":1}) and (L_ORDERKEY
>= {"$numberLong":40})) and (L_ORDERKEY <= {"$numberLong":75}))],
columns=[`L_LINENUMBER`, `L_ORDERKEY`, `L_RETURNFLAG`, `L_LINESTATUS`,
`L_QUANTITY`, `_id`], rowcount=60012.15000000001]])
00-05      Scan(table=[[si, tpch_sf1_maprdb_range,
lineitem]], groupscan=[JsonTableGroupScan [ScanSpec=JsonScanSpec
[tableName=maprfs:///drill/testdata/tpch/sf1/maprdb/json/range/lineitem,
condition=((L_LINENUMBER = {"$numberLong":1}) and (L_ORDERKEY
>= {"$numberLong":40})) and (L_ORDERKEY <= {"$numberLong":75}))],
indexName=l_comp_1, columns=[`_id`]])

```

Reading the query plan, you can see that the plan includes an index scan, as indicated by the `groupscan=[JsonTableGroupScan` and `indexName`, and also a scan on the primary table, as indicated by the `groupscan=[RestrictedJsonTableGroupScan` and the `RowKeyJoin`. To process this query, Drill and HPE Ezmeral Data Fabric Database can use the index, but HPE Ezmeral Data Fabric Database must also use the rowkey to perform a join on the primary table to fetch data in the `L_RETURNFLAG` field.

If this query ran on a regular basis, you could remove the `l_comp_1` index and create a new index that includes all fields referenced in the query, including the `L_RETURNFLAG` field, to improve query performance. However, running a query only once or a few times may not justify the overhead of removing the old index and creating a new index.

### Non-Hashed and Hashed Indexes

You can create non-hashed and hashed indexes for queries on JSON tables in HPE Ezmeral Data Fabric Database.

Non-hashed indexes support conditional queries with an ORDER BY clause because HPE Ezmeral Data Fabric Database sorts the data in non-hashed indexes. When processing ORDER BY queries, Drill does not have to perform sort operations on the data.

Hashed indexes support the same conditional queries as non-hashed indexes, but they do not have a guaranteed sort order. Hashed indexes enable HPE Ezmeral Data Fabric Database to evenly distribute new writes on an index across logical partitions to avoid hot spotting. Drill must perform a sort for ORDER BY queries that use hashed indexes. Sorting the data can increase the CPU costs and negatively impact performance. See [Hashed Indexes](#) for additional information.

If you notice performance issues with ORDER BY queries that use hashed indexes, review the query plans to see if the plans include sort and merge operations. If this is the case, create non-hashed indexes to support the queries and achieve the best performance.

### Examples of Hashed and Non-Hashed Index Plans for an ORDER BY Query

The examples here show the difference between a hashed and non-hashed index plan for the following query on the `lineitem` table that contains the `ORDER BY` clause:

```
SELECT L_LINESTATUS, L_QUANTITY FROM lineitem WHERE L_LINENUMBER = 1 AND
L_ORDERKEY BETWEEN 40 AND 75 ORDER BY L_LINENUMBER;
```

#### Hashed Index Plan Example

A hashed index, `l_hash_comp_1`, was created using the `maprccli table index add` command on a table, `lineitem`, as shown:

```
maprccli table index add -path /drill/testdata/tpch/sf1/
maprdb/json/hash/lineitem -index l_hash_comp_1 -indexedfields
L_LINENUMBER,L_ORDERKEY -includedfields L_LINESTATUS,L_QUANTITY -hashed true
```

Running the example query with the `EXPLAIN PLAN FOR` command shows that Drill produces an index plan with sort and merge operations to process the query when using the hashed index, as follows:

```
EXPLAIN PLAN FOR SELECT L_LINESTATUS, L_QUANTITY FROM lineitem WHERE
L_LINENUMBER = 1 AND L_ORDERKEY BETWEEN 40 AND 75 ORDER BY L_LINENUMBER;

00-00   Screen
00-01     Project(L_LINESTATUS=[0], L_QUANTITY=[1])
00-02       SingleMergeExchange(sort0=[2])
01-01         SelectionVectorRemover
01-02           Sort(sort0=[2], dir0=[ASC])
01-03             Project(L_LINESTATUS=[2], L_QUANTITY=[3],
L_LINENUMBER=[0])
01-04               Scan(table=[[si, tpch_sf1_maprdb_hash,
lineitem]], groupscan=[JsonTableGroupScan [ScanSpec=JsonScanSpec
[tableName=maprfs:///drill/testdata/tpch/sf1/maprdb/json/hash/lineitem,
condition=((L_LINENUMBER = {"$numberLong":1}) and (L_ORDERKEY
>= {"$numberLong":40})) and (L_ORDERKEY <= {"$numberLong":75})),
indexName=l_hash_comp_1, columns=[`L_LINENUMBER`, `L_ORDERKEY`,
`L_LINESTATUS`, `L_QUANTITY`]]])
```

Reading the query plan, you can see that Drill uses the hashed index in the plan, as indicated by `indexName=l_hash_comp_1`. To process the query, HPE Ezmeral Data Fabric Database can use the index, but Drill must sort and merge the data, as indicated by the `Sort` and `SingleMergeExchange` operations in the query plan.

Using the hashed index plan for this ORDER BY query requires additional processing and negatively impacts performance.

### Non-Hashed Index Plan Example

A non-hashed index, `l_comp_1`, was created using the `maprcli table index add` command on a table, `lineitem`, as shown:

```
maprcli table index add -path /drill/testdata/tpch/sf1/
maprdb/json/range/lineitem -index l_comp_1 -indexedfields
L_LINENUMBER,L_ORDERKEY -includedfields L_LINESTATUS,L_QUANTITY
```

Running the example query with the [EXPLAIN PLAN FOR](#) command shows that Drill produces an index plan without the additional sort and merge operations when using the non-hashed index to process the query, as follows:

```
EXPLAIN PLAN FOR SELECT L_LINESTATUS, L_QUANTITY FROM lineitem WHERE
L_LINENUMBER = 1 AND L_ORDERKEY BETWEEN 40 AND 75 ORDER BY L_LINENUMBER;

00-00    Screen
00-01      Project(L_LINESTATUS=[$0], L_QUANTITY=[$1])
00-02        Project(L_LINESTATUS=[$2], L_QUANTITY=[$3], L_LINENUMBER=[$0])
00-03          Scan(table=[[si, tpch_sf1_maprdb_range,
lineitem]], groupscan=[JsonTableGroupScan [ScanSpec=JsonScanSpec
[tableName=maprfs:///drill/testdata/tpch/sf1/maprdb/json/range/lineitem,
condition=((L_LINENUMBER = {"$numberLong":1}) and (L_ORDERKEY
>= {"$numberLong":40})) and (L_ORDERKEY <= {"$numberLong":75})),
indexName=l_comp_1, columns=[`L_LINENUMBER`, `L_ORDERKEY`, `L_LINESTATUS`,
`L_QUANTITY`]]])
```

Reading the query plan, you can see that Drill uses the non-hashed index plan, as indicated by `indexName=l_comp_1`. To process the query, HPE Ezmeral Data Fabric Database uses the index and Drill does not have to perform sort and merge operations on the data, as indicated by the absence of the Sort and SingleMergeExchange operations in the query plan. HPE Ezmeral Data Fabric Database sorted the data in the index when the index was created.

### Writing Drill Queries that Leverage Indexes on Array Fields

Starting in EEP 6.0, the query planner in Drill can leverage indexes created on Data Fabric Database JSON document fields with array data types, such as `"NUMBERS": [1, 2, 3, 4, 5]` and `"ADDRESSES": [{"CITY": "SAN JOSE"}, {"CITY": "PALO ALTO"}]`.

See [JSON Document Data Types](#) and [Data Types and Secondary Index Fields](#) for definitions and detailed examples.

If you want the query planner in Drill to leverage an index created on a field with an array data type, you must write the Drill query such that it includes specific SQL syntax, as shown in bold in the following example:

```
SELECT NAME, PHONE
FROM CUSTOMERS
WHERE _id IN ( SELECT _id
                FROM ( SELECT _id, FLATTEN(ADDRESSES) as f
                FROM CUSTOMERS) as t
                WHERE t.f.CITY = 'SAN JOSE' and t.f.STATE = 'CA')
;
```

The specific SQL syntax indicates (to the query planner in Drill) that the query is eligible for an index-based query plan.

The [FLATTEN function](#) separates elements in an array into individual records in a table. For example, if an array consists of five elements, FLATTEN separates each element into a single row, creating a table with five rows.
