mapr.fs.kvstore_delete	The number of delete operations on key-value store files which are used by the CLDB and HPE Data Fabric Database.

Name	Description
mapr.fs.kvstore_insert	The number of insert operations on key-value store files which are used by the CLDB and HPE Data Fabric Database.
mapr.fs.kvstore_lookup	The number of lookup operations on key-value store files which are used by the CLDB and HPE Data Fabric Database.
mapr.fs.kvstore_scan	The number of scan operations on key-value store files which are used by the CLDB and HPE Data Fabric Database.
mapr.fs.local_readbytes	The amount of MB read by applications that are running on the file system node where the data resides.
mapr.fs.local_reads	The number of file read operations by applications that are running on the file system node where the data resides.
mapr.fs.local_writebytes	The amount of MB written by applications that are running on the file system node where the data resides.
mapr.fs.local_writes	The number of file write operations by applications that are running on the file system node where the data resides.
mapr.fs.read_bytes	The amount of data (in MB) read remotely.
mapr.fs.read_cachehits	The number of cache hits for file reads. This value includes pages that file system populates using the readahead mechanism.
mapr.fs.read_cachemisses	The number of cache misses for file read operations.
mapr.fs.reads	The number of remote reads.
mapr.fs.statstype_create	The number of file create operations.
mapr.fs.statstype_lookup	The number of lookup operations.
mapr.fs.statstype_read	The number of file read operations.
mapr.fs.statstype_write	The number of file write operations.
mapr.fs.write_bytes	The amount of data (in MB) written remotely.
mapr.fs.writes	The number of remote writes.

Process Metrics

Every 10 seconds, the collectd service uses a plugin to gather the following process metrics on each node in the cluster.

Name	Description	Additional Tag(s)
mapr.process.context_switch_involuntary	The number of involuntary context switches for Data Fabric processes. An involuntary context switch occurs when a process consumes more CPU time than what it was allocated by the kernel. When an involuntary context switch occurs, the kernel stops a process to provide resources to another process.	<ul style="list-style-type: none"> process_name: Display values for a specified process. Process values: hoststats,mfs,warden,.etc.

Name	Description	Additional Tag(s)
mapr.process.context_switch_voluntary	The number of voluntary context switches for Data Fabric processes. A voluntary context switch occurs when a process does not require the entire CPU time it was allocated by the kernel or when a process is suspended. When a voluntary context switch occurs, the kernel provides CPU resources to another process.	<ul style="list-style-type: none"> process_name: Display values for a specified process. Process values: hoststats,mfs,warden,.etc.
mapr.process.cpu_percent	The percentage of CPU used for Data Fabric processes.	<ul style="list-style-type: none"> process_name: Display values for a specified process. Process values: hoststats,mfs,warden,.etc.
mapr.process.cpu_time.syst	The amount of time, measured in seconds, that the process has been in kernel mode.	
mapr.process.cpu_time.user	The amount of time, measured in seconds, that the process has been in user mode	
mapr.process.data	The amount memory, in MB, used by the data segments of Data Fabric processes.	<ul style="list-style-type: none"> process_name: Display values for a specified process. Process values: hoststats,mfs,warden,.etc.
mapr.process.disk_octets.read	The number of bytes read from disk for Data Fabric processes.	
mapr.process.disk_octets.write	The number of bytes written to disk for Data Fabric processes.	
mapr.process.disk_ops.read	The number of read operations for Data Fabric processes.	
mapr.process.disk_ops.write	The number of write operations for Data Fabric processes.	
mapr.process.mem_percent	The percentage of total system memory (not capped by Data Fabric processes) used for Data Fabric processes.	<ul style="list-style-type: none"> process_name: Display values for a specified process. Process values: hoststats,mfs,warden,.etc.
mapr.process.page_faults.majflt	The number of major Data Fabric process faults that required loading a memory page from disk.	<ul style="list-style-type: none"> process_name: Display values for a specified process. Process values: hoststats,mfs,warden,.etc.
mapr.process.page_faults.minflt	The number of minor Data Fabric process faults that required loading a memory page from disk.	<ul style="list-style-type: none"> process_name: Display values for a specified process. Process values: hoststats,mfs,warden,.etc.
mapr.process.rss	The actual amount of memory, in MB, used by Data Fabric processes.	<ul style="list-style-type: none"> process_name: Display values for a specified process. Process values: hoststats,mfs,warden,.etc.
mapr.process.vm	The amount of virtual memory, in MB, used by Data Fabric processes.	<ul style="list-style-type: none"> process_name: Display values for a specified process. Process values: hoststats,mfs,warden,.etc.

I/O Metrics

Every 10 seconds, the collectd service uses a plugin to gather the following I/O metrics on each node in the cluster.

Name	Description
mapr.io.read_bytes	The number of MB read from disk.
mapr.io.reads	The number of file system disk read operations.
mapr.io.write_bytes	The number of MB written to disk.
mapr.io.writes	The number of file system disk write operations.

RPC Metric

Every 10 seconds, the collectd service uses a plugin to gather the following RPC metrics on each node in the cluster.

Name	Description
mapr.rpc.bytes_rcvd	The number of bytes received by the file system over RPC.
mapr.rpc.bytes_sent	The number of bytes sent by the file system over RPC.
mapr.rpc.calls_rcvd	The number of RPC calls received by the file system.

Spark JMX Metrics

Every 10 seconds, the collectd service gathers the following Spark JMX metrics on each node in the cluster.

For detailed information about Spark metrics, see the Apache Spark [documentation](#).

- mapr.spark.driver_block_manager_disk_space_used_mb
- mapr.spark.driver_block_manager_memory_max_mem_mbb
- mapr.spark.driver_block_manager_memory_max_off_heap_mem_mb
- mapr.spark.driver_block_manager_memory_max_on_heap_mem_mb
- mapr.spark.driver_block_manager_memory_mem_used_mb
- mapr.spark.driver_block_manager_memory_off_heap_mem_used_mb
- mapr.spark.driver_block_manager_memory_on_heap_mem_used_mb
- mapr.spark.driver_block_manager_memory_remaining_mem_mb

Topology Metrics

Every 60 seconds, the `collectd` service uses a plugin to gather the following topology metrics on each node in the cluster. Use these metrics to understand disk utilization across a topology or rack. By default, these

metrics include all racks and topologies associated with the cluster. However, you can use tags to specify which rack(s) or topologies(s) to include. **Note:** Racks and topologies can span multiple nodes and one rack can be associated with multiple topologies.

Name	Description	Tag
mapr.topology.disks_total_capacity	The disk capacity in gigabytes. This metric is available as of EEP 3.0.	<ul style="list-style-type: none"> rack_name: Display values for a specified rack. topology_name: Display values for a specified topology. Provide the full topology path.
mapr.topology.disks_used_capacity	The amount disk space used in gigabytes. This metric is available as of EEP 3.0.	<ul style="list-style-type: none"> rack_name: Display values for a specified rack. topology_name: Display values for a specified topology. Provide the full topology path.
mapr.topology.utilization	The aggregate percentage of CPU utilization. This metric is available as of EEP 3.0.	<ul style="list-style-type: none"> rack_name: Display values for a specified rack. topology_name: Display values for a specified topology. Provide the full topology path.

Volume Metrics

Every 10 seconds, the collectd service uses a plugin to gather the following volume metrics on each CLDB node in the cluster.

For volumes prefixed with `mapr.internal*`, the reported volume metrics are not meaningful.

Name	Description	Tag(s)
mapr.volume.logical_used	The number of MBs used for logical volumes before compression is applied to the files.	<ul style="list-style-type: none"> volume_name: Display values for a specified volume. entity_name: Display values for a specified user or group.
mapr.volume.snapshot_used	The number of MBs used for snapshots.	<ul style="list-style-type: none"> volume_name: Display values for a specified volume. entity_name: Display values for a specified user or group.
mapr.volume.total_used	The number of MB used for volumes and snapshots.	<ul style="list-style-type: none"> fqdn: Display values for a specified node. volume_name: Display values for a specified volume. entity_name: Display values for a specified user or group.

Name	Description	Tag(s)
mapr.volume.used	The number of MB used for volumes after compression is applied to the files.	<ul style="list-style-type: none"> fqdn: Display values for a specified node. volume_name: Display values for a specified volume. entity_name: Display values for a specified user or group.
mapr.volume.quota	The number of megabytes(MB) used for volume quota.	<ul style="list-style-type: none"> fqdn: Display values for a specified node. volume_name: Display values for a specified volume. entity_name: Display values for a specified user or group.

Every 10 seconds, the collectd service uses a plugin to gather the following Data Fabric volume metrics on each CLDB node in the cluster.

Name	Description	Tag(s)
mapr.volmetrics.read_throughput	The per volume read throughput in KB	<ul style="list-style-type: none"> fqdn: Display values for a specified node. volume_name: Display values for a specified volume. clusterid: Display values for a cluster specified by ID. clustername: Display values for a cluster specified by name.
mapr.volmetrics.write_throughput	The per volume write throughput in KB	<ul style="list-style-type: none"> fqdn: Display values for a specified node. volume_name: Display values for a specified volume. clusterid: Display values for a cluster specified by ID. clustername: Display values for a cluster specified by name.
mapr.volmetrics.read_latency	The per volume read latency in milliseconds	<ul style="list-style-type: none"> fqdn: Display values for a specified node. volume_name: Display values for a specified volume. clusterid: Display values for a cluster specified by ID. clustername: Display values for a cluster specified by name.

Name	Description	Tag(s)
mapr.volmetrics.write_latency	The per volume write latency in milliseconds	<ul style="list-style-type: none"> fqdn: Display values for a specified node. volume_name: Display values for a specified volume. clusterid: Display values for a cluster specified by ID. clustername: Display values for a cluster specified by name.
mapr.volmetrics.read_ops	A count of the read operations per volume	<ul style="list-style-type: none"> fqdn: Display values for a specified node. volume_name: Display values for a specified volume. clusterid: Display values for a cluster specified by ID. clustername: Display values for a cluster specified by name.
mapr.volmetrics.write_ops	A count of the write operations per volume	<ul style="list-style-type: none"> fqdn: Display values for a specified node. volume_name: Display values for a specified volume. clusterid: Display values for a cluster specified by ID. clustername: Display values for a cluster specified by name.

Virtual Memory Metrics

Every 10 seconds, the collectd service uses the vmem plugin to gather the following memory metrics on each node in the cluster.

Name	Description
vmem.vmpage_faults.majflt	The number of major page faults. Major page faults require pages to be accessed from disk.
vmem.vmpage_faults.minflt	The number of minor page faults. Minor page faults can be resolved by sharing pages that are already in memory.

Memory Metrics

Every 10 seconds, the collectd service uses the memory and swap plugins to gather the following memory metrics on each node in the cluster.

Name	Description	Additional Tag(s)
memory.memory	The amount of physical memory in bytes.	<ul style="list-style-type: none"> memory_type: Display values for a specified memory type. Memory type values: free, used, buffered, etc.

Name	Description	Additional Tag(s)
swap.swap	The amount of swap space in bytes.	<ul style="list-style-type: none"> swap_type: Display values for a specified swap type. Swap type values: used and free.
swap.swap_io	The amount of swap I/O in bytes.	

Network Metrics

Every 10 seconds, the collectd service uses the interface plugin to gather network metrics on each node in the cluster.

Name	Description	Additional Tag(s)
interface.if_errors.rx	The number of network errors received.	<ul style="list-style-type: none"> interface_name: Display values for a specified interface. Interface values: eth0, eth1, etc.
interface.if_errors.tx	The number of network errors transmitted.	<ul style="list-style-type: none"> interface_name: Display values for a specified interface. Interface values: eth0, eth1, etc.
interface.if_octets.rx	The number of bytes received over the network per second.	<ul style="list-style-type: none"> interface_name: Display values for a specified interface. Interface values: eth0, eth1, etc.
interface.if_octets.tx	The number of bytes transmitted over the network per second.	<ul style="list-style-type: none"> interface_name: Display values for a specified interface. Interface values: eth0, eth1, etc.
interface.if_packets.rx	The number of packets received over the network per second.	<ul style="list-style-type: none"> interface_name: Display values for a specified interface. Interface values: eth0, eth1, etc.
interface.if_packets.tx	The number of packets transmitted over the network per second.	<ul style="list-style-type: none"> interface_name: Display values for a specified interface. Interface values: eth0, eth1, etc.

Node Manager Metrics

Every 10 seconds, the collectd service uses a plugin to gather the following Node Manager metrics on each node in the cluster.

Name	Description
mapr.nm.allocated_GB	The amount of memory allocated to the Node Manager in GB.
mapr.nm.allocated_containers	The number of containers allocated to the Node Manager.
mapr.nm.allocated_vcores	The number of CPUs allocated to the Node Manager.
mapr.nm.available_vcores	The number of CPUs available to the Node Manager.
mapr.nm.available_GB	The amount of memory available to the Node Manager in GB.
mapr.nm.containers_completed	The number of containers that have completed.
mapr.nm.containers_failed	The number of containers that have failed.

Name	Description
mapr.nm.containers_initing	The number of containers that are initializing.
mapr.nm.containers_killed	The number of containers that have been killed by the Node Manager.
mapr.nm.containers_running	The number of containers that are running.
mapr.nm.containers_launched	The number of containers started by the Node Manager.
mapr.nm.jvm.gc_count	The number of garbage collections.
mapr.nm.jvm.gc_count_ps_mark_sweep	The number of parallel scavenge mark sweep collections.
mapr.nm.jvm.gc_count_ps_scavenge	The number of parallel scavenge collections.
mapr.nm.jvm.gc_time_millis	The amount of time spent on garbage collection in milliseconds.
mapr.nm.jvm.gc_time_millis_ps_mark_sweep	The amount of time spent on parallel scavenge mark sweep collection in milliseconds.
mapr.nm.jvm.gc_time_millis_ps_scavenge	The amount of time in milliseconds spent on parallel scavenge collection.
mapr.nm.jvm.log_error	The total number of ERROR logs.
mapr.nm.jvm.log_fatal	The total number of FATAL logs.
mapr.nm.jvm.log_info	The total number of INFO logs
mapr.nm.jvm.log_warn	The total number of WARN logs.
mapr.nm.jvm.mem_heap_committed_m	The amount of heap memory committed to the Node Manager in megabytes.
mapr.nm.jvm.mem_heap_max_m	The maximum amount of heap memory that can be committed to the Node Manager in megabytes.
mapr.nm.jvm.mem_heap_used_m	The amount of heap memory used by the Node Manager in megabytes.
mapr.nm.jvm.mem_max_m	The maximum amount of memory that can be committed to the Node Manager in megabytes.
mapr.nm.jvm.mem_non_heap_committed_m	The amount of non-heap memory committed to the Node Manager in megabytes.
mapr.nm.jvm.mem_non_heap_max_m	The maximum amount of non-heap memory that can be committed to the Node Manager in megabytes.
mapr.nm.jvm.mem_non_heap_used_m	The maximum amount of non-heap memory that can be used by the Node Manager in megabytes.
mapr.nm.jvm.threads_blocked	The number of Node Manager threads in BLOCKED state.
mapr.nm.jvm.threads_new	The number of Node Manager threads in NEW state.
mapr.nm.jvm.threads_runnable	The number of Node Manager threads in RUNNABLE state.
mapr.nm.jvm.threads_terminated	The number of Node Manager threads in TERMINATED state.
mapr.nm.jvm.threads_time_waiting	The number of Node Manager threads in TIMED_WAITING state.
mapr.nm.jvm.threads_waiting	The number of Node Manager threads in WAITING state.
mapr.nm.shuffle.shuffle_connection	The number of Node Manager shuffle connections.

Name	Description
mapr.nm.shuffle.shuffle_output_bytes	The amount of Node Manager shuffle output in bytes.
mapr.nm.shuffle.shuffle_outputs_failed	The number of failed Node Manager shuffle outputs.
mapr.nm.shuffle.shuffle_outputs_ok	The number of completed Node Manager shuffle outputs.
mapr.nm.ugi.get_groups_avg_time	The average amount of time spent by Node Manager on group resolution.
mapr.nm.ugi.get_groups_num_ops	The number of group resolutions completed by the Node Manager.
mapr.nm.ugi.login_failure_avg_time	The average amount of time spent by Node Manager on failed login attempts.
mapr.nm.ugi.login_failure_num_ops	The number of failed login attempts by the Node Manager.
mapr.nm.ugi.login_success_avg_time	The average amount of time spent by Node Manager to successfully login.
mapr.nm.ugi.login_success_num_ops	The number of successful logins by the Node Manager.

Resource Manager Metrics

Every 10 seconds, the `collectd` service uses a HPE Data Fabric plugin to gather Resource Manager metrics on the active Resource Manager. `Collectd` gathers metrics on the Resource Manager JVM process, YARN applications, and nodes that are managed by the Resource Manager. The method used to gather the metrics differs based on the metric type.

YARN Application Metrics

`Collectd` gathers YARN application metrics via JMX and REST API. The application metrics that are collected by JMX have the metric name `mapr.rm.<metric_name>`. Application metrics collected via REST API have the metric name `mapr.rm_queue.<metric_name>`.

Metrics Collected Using JMX

The following metrics are collected using JMX. To filter these metrics by queue using the `rm_queue` tag, see [Configure Queue Filters for mapr.rm.<value> Metrics](#) on page 1964.

mapr.rm.active_applications	<p><i>Additional Tags:</i> <code>rm_queue</code>: Display values for a specified queue.</p> <p><i>Description:</i> The number of active applications.</p>
mapr.rm.active_users	<p><i>Additional Tags:</i> <code>rm_queue</code>: Display values for a specified queue.</p> <p><i>Description:</i> The number of users with active applications.</p>
mapr.rm.aggregate_containers_allocated	<p><i>Additional Tags:</i> <code>rm_queue</code>: Display values for a specified queue.</p> <p><i>Description:</i> The number of allocated containers.</p>
mapr.rm.aggregate_containers_released	<p><i>Additional Tags:</i> <code>rm_queue</code>: Display values for a specified queue.</p> <p><i>Description:</i> The number of released containers.</p>
mapr.rm.allocated_MB	<p><i>Additional Tags:</i> <code>rm_queue</code>: Display values for a specified queue.</p> <p><i>Description:</i> The amount of memory allocated to the Resource Manager in MB.</p>

mapr.rm.allocated_vcores	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The number of CPUs allocated to the Resource Manager.</p>
mapr.rm.apps_completed	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The number of completed applications.</p>
mapr.rm.apps_failed	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The number of failed applications.</p>
mapr.rm.apps_killed	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The number of killed applications.</p>
mapr.rm.apps_pending	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The number of pending applications.</p>
mapr.rm.apps_running	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The number of running applications.</p>
mapr.rm.apps_submitted	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The number of submitted applications.</p>
mapr.rm.available_MB	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The amount of memory available to the Resource Manager in MB.</p>
mapr.rm.available_disks	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The number of disks available to the Resource Manager.</p>
mapr.rm.available_vcores	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The number of CPUs available to the Resource Manager.</p>
mapr.rm.pending_MB	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The amount of memory, in MB, waiting to be allocated by the Resource Manager.</p>
mapr.rm.pending_containers	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The number of containers waiting to be allocated by the Resource Manager.</p>
mapr.rm.pending_disks	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p>

mapr.rm.pending_vcores	<p><i>Description:</i> The number of disks waiting to be allocated by the Resource Manager.</p> <p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The number of CPUs waiting to be allocated by the Resource Manager.</p>
mapr.rm.reserved_MB	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The amount of memory reserved by the Resource Manager in MB.</p>
mapr.rm.reserved_containers	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The number of containers reserved by the Resource Manager.</p>
mapr.rm.reserved_disks	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The number of disks reserved by the Resource Manager.</p>
mapr.rm.reserved_vcores	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The number of CPUs reserved by the Resource Manager.</p>

Metrics Collected Using REST API

The following YARN application metrics are collected using REST API.

mapr.rm_queue.aggregate_containers_allocated	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> The number of containers allocated for applications in the default and custom queues.</p>
mapr.rm_queue.appmaster_used_disks	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> When queue resources are managed by the Capacity Scheduler, this parameter denotes the number of disks used by the Application Master for applications in the default and custom queues.</p>
mapr.rm_queue.appmaster_used_memory	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> When queue resources are managed by the Capacity Scheduler, this parameter denotes the amount of memory, in MB, used by the Application Master for applications in the default and custom queues.</p>
mapr.rm_queue.appmaster_used_vcores	<p><i>Additional Tags:</i> rm_queue: Display values for a specified queue.</p> <p><i>Description:</i> When queue resources are managed by the Capacity Scheduler, this parameter denotes the number of CPUs used by the Application Master for applications in the default and custom queues.</p>

mapr.rm_queue.apps_pending*Additional Tags:* rm_queue: Display values for a specified queue.*Description:* The number of pending applications in the default and custom queues.**mapr.rm_queue.apps_running***Additional Tags:* rm_queue: Display values for a specified queue.*Description:* The number of applications running in the default and custom queues.**mapr.rm_queue.fairshare_disks***Additional Tags:* rm_queue: Display values for a specified queue.*Description:* When queue resources are managed by the Fair Scheduler, this parameter is the number of disks allocated to default and custom queues.**mapr.rm_queue.fairshare_memory***Additional Tags:* rm_queue: Display values for a specified queue.*Description:* When queue resources are managed by the Fair Scheduler, this parameter denotes the amount of memory, in MB, allocated to default and custom queues.**mapr.rm_queue.fairshare_vcores***Additional Tags:* rm_queue: Display values for a specified queue.*Description:* When queue resources are managed by the Fair Scheduler, this parameter denotes the number of CPUs used by applications in the default and custom queues.**mapr.rm_queue.used_disks***Additional Tags:* rm_queue: Display values for a specified queue.*Description:* The number of disks used by applications in the default and custom queues.**mapr.rm_queue.used_memory***Additional Tags:* rm_queue: Display values for a specified queue.*Description:* The amount of memory, in MB, used by applications in the default and custom queues.**mapr.rm_queue.used_vcores***Additional Tags:* rm_queue: Display values for a specified queue.*Description:* The number of CPUs used by applications in the default and custom queues.**mapr.rm_queue.max_disks***Additional Tags:* rm_queue: Display values for a specified queue.*Description:* When queue resources are managed by the Fair Scheduler, this parameter denotes the maximum number of disks available to default and custom queues.**mapr.rm_queue.max_memory***Additional Tags:* rm_queue: Display values for a specified queue.*Description:* When queue resources are managed by the Fair Scheduler, this parameter denotes the maximum amount of memory, in MB, available to default and custom queues.

mapr.rm_queue.max_vcores

Additional Tags: rm_queue: Display values for a specified queue.

Description: When queue resources are managed by the Fair Scheduler, this parameter denotes the maximum number of CPUs available to default and custom queues.

mapr.rm_queue.user_allocated_disks

Additional Tags:

- rm_queue: Display values for a specified queue.
- rm_user: Display values for a specified user.

Description: When queue resources are managed by the Capacity Scheduler, this parameter denotes the number of disks allocated to the queues.

mapr.rm_queue.user_allocated_memory

Additional Tags:

- rm_queue: Display values for a specified queue.
- rm_user: Display values for a specified user.

Description: When queue resources are managed by the Capacity Scheduler, this parameter denotes the amount of memory, in MB, allocated to the queues.

mapr.rm_queue.user_allocated_vcores

Additional Tags:

- rm_queue: Display values for a specified queue.
- rm_user: Display values for a specified user.

Description: When queue resources are managed by the Capacity Scheduler, this parameter denotes the number of CPUs allocated to queues.

mapr.rm_queue.user_appmaster_used_disks

Additional Tags: rm_queue: Display values for a specified queue.

Description: When queue resources are managed by the Capacity Scheduler, this parameter denotes the number of disks used by the queues.

mapr.rm_queue.appmaster_used_memory

Additional Tags: rm_queue: Display values for a specified queue.

Description: When queue resources are managed by the Capacity Scheduler, this parameter denotes the amount of memory used by the queues.

mapr.rm_queue.appmaster_used_vcores

Additional Tags: rm_queue: Display values for a specified queue.

Description: When queue resources are managed by the Capacity Scheduler, this parameter denotes the number of CPUs used by the queues.

mapr.rm_queue.user_apps_pending

Additional Tags:

- rm_queue: Display values for a specified queue.
- rm_user: Display values for a specified user.

Description: When queue resources are managed by the Capacity Scheduler, this parameter denotes the number of applications pending in the queues.

mapr.rm_queue.user_apps_running*Additional Tags:*

- **rm_queue:** Display values for a specified queue.
- **rm_user:** Display values for a specified user.

Description: When queue resources are managed by the Capacity Scheduler, this parameter denotes the number of applications running in the queues.

mapr.rm_queue.user_used_disks*Additional Tags:*

- **rm_queue:** Display values for a specified queue.
- **rm_user:** Display values for a specified user.

Description: When queue resources are managed by the Capacity Scheduler, this parameter denotes the number of number of disks used by the queues.

mapr.rm_queue.user_used_memory*Additional Tags:*

- **rm_queue:** Display values for a specified queue.
- **rm_user:** Display values for a specified user.

Description: When queue resources are managed by the Capacity Scheduler, this parameter denotes the amount of memory, in MB, used by the queues.

mapr.rm_queue.user_used_vcores*Additional Tags:*

- **rm_queue:** Display values for a specified queue.
- **rm_user:** Display values for a specified user.

Description: When queue resources are managed by the Capacity Scheduler, this parameter denotes the number of CPUs used by the queues.

Resource Manager Node Metrics

The following are the Node metrics:

mapr.rm_cluster.active_nodes

The number of nodes in the cluster where containers are running.

mapr.rm_cluster.total_nodes

The number of nodes in the cluster.

mapr.rm_cluster.unhealthy_nodes

The number of nodes in the cluster that are unable to accept applications.

Resource Manager JVM Metrics

The following Resource Manager metrics are collected using JMX:

mapr.rm.jvm.gc_count

The number of garbage collections.

mapr.rm.jvm.gc_count_ps_mark_sweep

The number of parallel scavenge mark sweep collections.

mapr.rm.jvm.gc_count_ps_scavenge

The number of parallel scavenge collections.

<code>mapr.rm.jvm.gc_time_millis</code>	The amount of time, in milliseconds, spent on garbage collection.
<code>mapr.rm.jvm.gc_time_millis_ps_mark_sweep</code>	The amount of time, in milliseconds, spent on parallel scavenge mark sweep collection.
<code>mapr.rm.jvm.gc_time_millis_ps_scavenge</code>	The amount of time, in milliseconds, spent on parallel scavenge collection.
<code>mapr.rm.jvm.log_error</code>	The total number of ERROR logs.
<code>mapr.rm.jvm.log_fatal</code>	The total number of FATAL logs.
<code>mapr.rm.jvm.log_info</code>	The total number of INFO logs.
<code>mapr.rm.jvm.log_warn</code>	The total number of WARN logs.
<code>mapr.rm.jvm.mem_heap_committed_m</code>	The amount of heap memory, in megabytes, committed to the Resource Manager.
<code>mapr.rm.jvm.mem_heap_max_m</code>	The maximum amount of heap memory, in megabytes, that can be committed to the Resource Manager.
<code>mapr.rm.jvm.mem_heap_used_m</code>	The amount of heap memory, in megabytes, used by the Resource Manager.
<code>mapr.rm.jvm.mem_max_m</code>	The maximum amount of memory, in megabytes, that can be committed to the Resource Manager.
<code>mapr.rm.jvm.mem_non_heap_committed_m</code>	The amount of non-heap memory, in megabytes, committed to the Resource Manager.
<code>mapr.rm.jvm.mem_non_heap_max_m</code>	The maximum amount of non-heap memory, in megabytes, that can be committed to the Resource Manager.
<code>mapr.rm.jvm.mem_non_heap_used_m</code>	The maximum amount of non-heap memory, in megabytes, that can be used by the Resource Manager.
<code>mapr.rm.jvm.threads_blocked</code>	The number of Resource Manager threads in BLOCKED state.
<code>mapr.rm.jvm.threads_new</code>	The number of Resource Manager threads in NEW state.
<code>mapr.rm.jvm.threads_runnable</code>	The number of Resource Manager threads in RUNNABLE state.
<code>mapr.rm.jvm.threads_terminated</code>	The number of Resource Manager threads in TERMINATED state.
<code>mapr.rm.jvm.threads_time_waiting</code>	The number of Resource Manager threads in TIMED_WAITING state.
<code>mapr.rm.jvm.threads_waiting</code>	The number of Resource Manager threads in WAITING state.

Configure the OpenTSDB Service Heap Size

By default, the OpenTSDB service is configured to use a default heap size of 6 gigabytes. The default heap size can be adjusted by modifying certain configuration files.

In EEPs 6.0.1 and later, the OpenTSDB service is configured to use a default heap size of 6 GB. In earlier EEPs, the default was configured to be 2 GB. If you configure a custom value for the OpenTSDB service heap size and then upgrade to EEPs 6.0.1 or later, you will see the 6-GB default implemented in the `/opt/mapr/conf/conf.d/warden.opentsdb.conf` file.

To change the heap size to a different setting, edit the configuration files on all OpenTSDB nodes as follows. The following steps change the heap size from 2 GB to 6 GB. The default heap size might need further adjustment if your cluster grows to a large number of nodes. If the 6-GB heap size is insufficient, you can use these same steps to adjust it:

1. Edit the `/opt/mapr/conf/conf.d/warden.opentsdb.conf` file to change:

```
service.heapsize.max=2000
service.heapsize.min=2000
```

to

```
service.heapsize.max=6000
service.heapsize.min=6000
```

2. Edit the `/opt/mapr/opentsdb/opentsdb-*/etc/init.d/opentsdb` file to change:

NOTE: Step 2 is not required for EEPs 6.0.1 and later, which contain logic to edit the `opentsdb` file automatically.

```
$
{JVMXMX:=-Xmx2000m -Xss1m -XX:MaxMetaspaceSize=128m}
```

to

```
$
{JVMXMX:=-Xmx6000m -Xss1m -XX:MaxMetaspaceSize=128m}
```

3. Restart the OpenTSDB service:

```
maprcli node services -name opentsdb -nodes <space-separated list of
OpenTSDB nodes> -action restart
```

Metric Visualization

Use dashboards to visualize metrics across multiple nodes and clusters.

You can use a single dashboard to visualize metrics for multiple nodes in the cluster, for an entire cluster, or for multiple clusters. In a dashboard, you can use metric tags to filter the type of data that you want to see. To learn more about the tags available for each metric, see [Metric Collection](#) on page 1963.

Before you start visualizing metrics, review the following notes:

Sample Dashboards

As of EEP 1.1, the Grafana UI includes sample CLDB, node, and volume dashboards. For more information, see [Sample Dashboards in Grafana](#) on page 2022.

Grafana Documentation

For information about creating and using dashboards, see the [Grafana documentation](#).

The Embedded Grafana Database

Grafana uses an embedded database to store configuration data such as users, data sources, and dashboards. When used with the HPE Data Fabric, Grafana uses SQLite for its embedded database. Other databases, such as MySQL and PostgreSQL, are not supported for use with the Data Fabric implementation of Grafana.

Note also that in a Data Fabric cluster, each instance of Grafana has its own embedded SQLite database. Therefore, if you make a change to the Grafana configuration data (for example, if you add a new user) on one node, you must repeat the change on all other nodes where Grafana is installed.

Access the Grafana UI

You can launch the Grafana UI from the Control System or directly from a web browser.

About this task

Procedure

1. Use one of the following methods to launch the Grafana UI:
 - In the Control System, go to the **Services** page and click **Grafana** to launch the Grafana UI in another tab.
 - From a web browser, launch the following URL: `http://<IPAddressOfGrafanaNode>:3000`
2. Provide user credentials. See [Logging on to Grafana](#) on page 2020.
3. Click **Log in**.

Logging on to Grafana

This page describes the credentials needed to log on to Grafana for secure and nonsecure clusters for Data Fabric 6.0 and later.

EEP 5.0.0 and Installer 1.9.0 implemented some changes in security that affect the user IDs and passwords you need to log on to Grafana. Beginning with EEP 5.0.0, Grafana no longer uses its own database to authenticate on secure Data Fabric clusters. On secure clusters, when you enter your user name and password into the browser, the Grafana server sends the user name and password to the CLDB, and the CLDB authenticates using the Pluggable Authentication Module (PAM) and HTTPS. Grafana still relies on its database for some user information. However, because authentication relies on the CLDB, any new user that you add to Grafana must also exist on the Data Fabric cluster.

EEP 4.x.x (Grafana 4.4.2) and Earlier

To log on, enter the default Grafana admin user and password:

- **User:** admin
- **Password:** admin

EEP 5.x.x (Grafana 4.6.1) and Later

To log on, specify the user and password as follows:

	Secure Cluster	Nonsecure Cluster
User	Type the Data Fabric cluster admin user ID.	Type the Grafana admin user ID.

	Secure Cluster	Nonsecure Cluster
	 NOTE: If the cluster admin user has no password or is not able to log in, see Logging on to Grafana Without Using the Cluster Admin on page 2021.	
Password	Type the Data Fabric cluster admin password that you specified during cluster installation.	Type the password for the Grafana admin user that you specified during cluster installation. (During cluster installation, the Installer web interface asks you to provide this password. You can also provide the password by using <code>configure.sh</code> during a manual installation.)

For More Information

To change the Grafana password, see [Changing the Password for Grafana](#) on page 2021.

For more information about the Grafana versions supported by each EEP, see [Ecosystem Pack Components and OS Support](#) on page 7672.

For information about the EEPs supported by different Data Fabric Core versions, see [Ecosystem Pack Support and Lifecycle Status](#) on page 7664.

Logging on to Grafana Without Using the Cluster Admin

In secure Grafana installations where the cluster admin (typically `mapr`) has no password and is not allowed to log in as a user, special steps are required to enable login with a user other than the cluster admin.

Use this procedure only if the cluster admin has no password. After an upgrade or a new installation of Grafana, perform these steps on the Grafana nodes:

1. Remove the old Grafana database. You will be able to access the Grafana database later using the new Grafana admin user:

```
cd /opt/mapr/grafana/grafana-<version>/var/lib/grafana
mv grafana.db grafana.db.sv
```

2. Use the `export` command to specify the new Grafana admin user:

```
export GRAFANA_ADMIN_ID=<username>
```

3. Run `configure.sh` with the `-R` option:

```
configure.sh -R
```

4. Restart Grafana.

Changing the Password for Grafana

Describes how to change the Grafana password for secure clusters.

Secure Clusters

To change the Grafana password for a secure cluster, you must change the password for the Data Fabric cluster admin user. The security implementation determines how you change the password. For example, if your security implementation is PAM and LDAP, you need to use LDAP to change the cluster admin password.

NOTE: If the cluster is secure, attempting to change the Grafana password using the Grafana interface has no effect.

Adding a New Grafana User to a Secure Data Fabric Cluster

In a secure Data Fabric cluster, adding a new Grafana user requires an extra step to ensure that the user can be authenticated through the CLDB.

Beginning with EEP 5.0.0, Grafana no longer uses its own database to authenticate on secure Data Fabric clusters. On secure clusters, when you enter your user name and password into the browser, the Grafana server sends the user name and password to the CLDB, and the CLDB authenticates using the Pluggable Authentication Module (PAM) and HTTPS.

Because authentication relies on the CLDB, any new user that you add to Grafana must also exist on the Data Fabric cluster. Therefore, to add a new Grafana user in a secure Data Fabric cluster:

1. Add the user to the Linux system first. This user must have the same Linux UID and GID on every node in the Data Fabric cluster.
2. Add the same user to Grafana, making sure that you use the user ID you added to the Linux system. In Grafana: **Settings > ServerAdmin > Users > Add new user**.

Sample Dashboards in Grafana

Use the sample dashboards to get familiar with the types of graphs you can create. As of EEP 1.1, sample dashboards are available by default in Grafana.

Displaying the Sample Dashboards

For Grafana 4.x, 5.x, and 6.x, navigate to the **Welcome to Grafana** page, and click the **Home** drop-down menu to display the sample dashboards. Once you select a dashboard, it displays in the **Recently viewed dashboards** list on the Home page.

In Grafana 7.5.x and later, use these steps to display the dashboards:

1. Navigate to the **Welcome to Grafana** page.
2. On the left-side icon menu, click **Dashboard > Manage**. The list of dashboards is displayed.
3. Click a dashboard in the list to load the dashboard. The **General / Node Dashboard** page is displayed.
4. Loading the dashboard adds the dashboard to the **Recently viewed dashboards** list on the **General / Home** page.

Sample Dashboard Descriptions

CLDB Dashboard

The CLDB dashboard provides a high-level view of the Data Fabric cluster. It displays the following information about the cluster: number of nodes, status of nodes, number of volumes, container information, disk capacity, and the utilization of CPU, memory, and disks across the cluster.

Node Dashboard

The Node dashboard provides node-specific information. It displays the following information for the selected node: CPU, memory, network I/O, file system I/O, HPE Data Fabric Database operations, and Node Manager metrics. All the metrics are tagged with node hostname and the fqdn drop-down menu on the top left can be used to switch between nodes.

Volume Dashboard

The Volume dashboard provides volume-specific information. It displays the following information for the selected volume: raw data size, snapshot size, total size (including the snapshot size), volume utilization

trends, read/write latency, number of reads/writes, and read/write throughput. All the metrics are tagged with volume name. Use the VolumeName drop-down menu on the top left to switch between volumes.

Troubleshooting Sample Dashboards

The sample dashboards should display metrics automatically. However, with certain EEPs, some manual configuration may be required to view sample dashboard metrics.

Configure the ClusterID in the CLDB dashboard

When the ClusterID drop-down menu on the CLDB dashboard is set to None, you must manually enter the ClusterID. You can determine the ClusterID from the Manage Licenses page on the Control System. ClusterID is usually an eighteen digit number.

Configure the Hostname in the Node dashboards

When the fqdn drop-down menu on the Node dashboard is set to None, you must manually enter the hostname for the node that you want to view metrics for.

Configure the Volume in the Volume dashboard

When the VolumeName drop-down menu on the Volume dashboard is set to None, you must manually enter the volume name for the volume that you want to view metrics for. The Volumes page on the Control System lists the volume names in the format required by the field. For example, you can enter mapr.cluster.root in the VolumeName drop-down menu.

NOTE: You must apply the manual configuration each time you view a dashboard.

Update the OpenTSDB Data Source For Grafana

Grafana connects to a single OpenTSDB node to read metrics. If Grafana cannot read the metrics because an OpenTSDB node has failed, you must configure Grafana to connect to a different OpenTSDB node.

About this task

NOTE: The OpenTSDB node that Grafana connects to by default is determined by the first OpenTSDB node that was specified when the cluster was configured to use metrics monitoring.

Procedure

1. Use one of the following methods to launch the Grafana user interface:
 - From the Control System, select the **Grafana** view. After you select the **Grafana** view, you might also need to select the **Pop-out page into a tab** option.
 - From a web browser, launch the following URL: `http://<IPAddressOfGrafanaNode>:3000`
2. Click the Grafana icon in the upper left corner to toggle the side-menu bar.
3. Select **Data Sources** from the menu.
4. Click the **MapRMonitoringOpenTSDB** data source.
5. In the **Http setting** section, update the **Url** field to point to an active OpenTSDB node.
6. Click **Save & Test**.

Log Collection

Fluentd collects log events from each node in the cluster and stores them in a centralized location so that administrators can search the logs when troubleshooting issues in the cluster. The process that fluentd uses to parse and send log events to Elasticsearch differs based on the formatting of log events in each log file.

Fluentd uses one or both of the following mechanisms to parse logs:

multi-line matching

Using the log time stamp as a delimiter, multi-line matching uses the `tail` plugin to read logs and determine the end of a log event. Each log event is sent to Elasticsearch when the next log event is written to the log file. This mechanism is often used when each log event starts with a timestamp and then includes a stack trace.

multi-pattern matching

Multi-pattern matching uses the `grok` plugin to parse logs events using complex expressions. This mechanism is often used to parse logs events that have non-uniform log formatting.

Before Fluentd sends the log entries to Elasticsearch, Fluentd assigns the following columns to each log event:

Tag	Description
level	The message level of the log entry. For example, info, warning, or error.
class	Java or C++ process name associated with the log entry.
message	The log message.
event_time	The time, with millisecond precision, when the log entry was written to the log file.
service_name	The name of the service that generated the log entry.
@timestamp	The time, with second precision, when fluentd read the message.
fqdn	The node on which the log entry was written.
clusterid	The clusterid of the cluster on which the log was written.

NOTE: The log event contents differs based on the service that logs it and the type of log. Therefore, the log events sent to Elasticsearch may include empty columns.

For more information about Elasticsearch, see the [Elasticsearch website](#).

Configure Logs to Index

Edit the *fluentd.conf* file (`/opt/mapr/fluentd/fluentd-<version>/etc/fluentd/fluentd.conf`) to enable or disable the indexing of a specific log.

About this task

The *fluentd.conf* file includes a source parameter for each log file that it indexes.

Procedure

1. To disable the indexing of a log, comment all lines for the associated source parameter.
2. To enable the indexing of a log, for example syslogs, uncomment the lines for the associated source parameter.

- Restart `fluentd` on each node in the cluster which is impacted by changes to the index configuration. For example, if you disable the indexing of Kibana logs, restart `fluentd` on the node that runs Kibana.

```
maprcli node services -name fluentd -nodes <space separated list of
hostname/IPaddresses> \
  -action restart
```

Example

For example, in this excerpt of the `fluentd.conf` file, NodeManager error logs are disabled and ResourceManager logs are enabled:

```
# yarn nodemanager log
# <source>
#   @type tail
#   @id yarn_nodemanager_input
#   format multiline
#   format_firstline /\d{4}-\d{1,2}-\d{1,2}/
#   format1 /^(?<my_event_time>[^\ ]* [^\ ]*) (?<level>[^\ ]*) (?<class>[^\:]*):
#   (?<message>.*)$/
#   time_key my_event_time
#   keep_time_key true
#   path /opt/mapr/hadoop/hadoop-*/logs/yarn-*-nodemanager-*.log
#   tag nodemanager
#   pos_file /opt/mapr/fluentd/fluentd-0.14.00/var/log/fluentd/tmp/
#   nodemanager.pos
# </source>

# yarn resourcemanager log
<source>
  @type tail
  @id yarn_resourcemanager_input
  format multiline
  format_firstline /\d{4}-\d{1,2}-\d{1,2}/
  format1 /^(?<my_event_time>[^\ ]* [^\ ]*) (?<level>[^\ ]*) (?<class>[^\:]*):
  (?<message>.*)$/
  time_key my_event_time
  keep_time_key true
  path /opt/mapr/hadoop/hadoop-*/logs/yarn-*-resourcemanager-*.log
  tag resourcemanager
  pos_file /opt/mapr/fluentd/fluentd-0.14.00/var/log/fluentd/tmp/
  resourcemanager.pos
</source>
```

Forward Logs to Syslog Server

You can configure `fluentd` to send logs to a syslog server in addition to Elasticsearch. This topic provides instructions for configuring `fluentd` to send logs to syslog compatible collectors. However, it only provides guidelines for the syslog configuration, as syslog parameters differ by version. Knowledge of how to configure a syslog compatible collector is required to complete this configuration.

Complete the following steps:

- Configure `fluentd` to send logs to the syslog server.
- Configure syslog server to accept logs from `fluentd`.

Step 1: Configure fluentd to send logs to the syslog server

Complete the following steps on each `fluentd` node.

- Open the `fluentd.conf` file (`/opt/mapr/fluentd/fluentd-<version>/etc/fluentd/fluentd.conf`).

2. Remove the # to uncomment the following store section:

```
# <store>
# @type remote_syslog
# host 10.10.100.92
# port 51400
# severity debug
# tag fluentd
# </store>
```

3. Update the host parameter to the hostname/IP address of the receiving sys log server.
4. Update the port parameter to match the port that the receiving sys log server is expecting remote logging information on.
5. Restart the fluentd service:

```
maprccli node services -name fluentd -nodes <space separated list of
hostname/IPaddresses> -action restart
```

NOTE: You can run this command after completing the steps on a node or run this command with a list of nodes once you have configured each fluentd node.

Step 2: Configure syslog to accept logs from fluentd

In general, you need to perform the following steps on the sys log collection server:

- Configure syslogd to listen for logs outside of the sys log node.
- Set up rules for how syslog handles the logs once it receives it.

1. In */etc/rsyslog.d/listen.conf*, comment out the following parameter:

```
$SystemLogSocketName /run/systemd/journal/syslog
```

2. In */etc/rsyslog.conf*, uncomment the following properties:

```
#$ModLoad imudp
#$UDPServerRun 514
```

3. In */etc/rsyslog.conf*, update the UDPServerRun to a value above 1000 that matches the port you configured in *fluentd.conf*. For example: Set UDPServerRun to 51400
4. In */etc/rsyslog.conf*, configure rules for handling logs. For example, add the following before the RULES section to route messages from the fluentd node to a log file named *qa-node91.log*.

```
if $fromhost-ip == '10.10.100.91' then /var/log/qa-node91.log
& ~
```

NOTE: In this example, the IP address must match the IP address of the fluentd node.

Data Fabric Core Logs

The fluentd component reads and parses the following Data Fabric Core log files on each node in the cluster.

Service Name	Parsing Method	Description
adminuiapp	Multi-line	Control System logs from /opt/mapr/apiserver/logs/apiserver.log.
cldb	Multi-line	CLDB server logs from \$MAPR_HOME/logs/cldb.log.
cldbfssummary	Multi-line	Summary of the CLDB server logs from \$MAPR_HOME/logs/cldbfssummary.log
mfs_maprdb	Multi-line	HPE Data Fabric Database logs from \$MAPR_HOME/logs/mfs.log-5.  NOTE: If nodes in the cluster run two filesystem instances, Fluentd only reads and parses logs from primary fileserver instance. Therefore, logs from the secondary fileserver instance will not be indexed by Elasticsearch.
mfs	Multi-line	Data Fabric filesystem logs from \$MAPR_HOME/logs/mfs.log-3.  NOTE: If nodes in the cluster run two filesystem instances, Fluentd only reads and parses logs from primary fileserver instance. Therefore, logs from the secondary fileserver instance will not be indexed by Elasticsearch.
nfsserver	Multi-line and Multi-pattern	NFS for the HPE Data Fabric server log from \$MAPR_HOME/logs/nfsserver.log
nodemanager	Multi-line	Node Manager logs from \$MAPR_HOME/hadoop/hadoop-*/logs/yarn-*-nodemanager-*.log.
resourcemanager	Multi-line	ResourceManager logs from \$MAPR_HOME/hadoop/hadoop-*/logs/yarn-*-resourcemanager-*.log
warden	Multi-line and Multipattern	Warden logs from \$MAPR_HOME/logs/warden.log.
zookeeper	Multi-line	Zookeeper logs from \$MAPR_HOME/zookeeper/zookeeper-*/logs/zookeeper.log

Data Fabric Ecosystem Logs

The `fluentd` component reads and parses the following Data Fabric ecosystem component logs on each node in the cluster.

Service Name	Parsing Method	Description
drill	Multi-line	Drill logs from \$MAPR_HOME/drill-*/logs/drillbit.log.
drillbitsSqlline	Multi-line	Drill SQL query logs from \$MAPR_HOME/drill/drill-*/logs/sqlline.log.
hbaserest	Multi-line and Multipattern	HBase REST Server logs from \$MAPR_HOME/hbase/hbase-*/logs/hbase-*-rest-*.log.
hbasethriftserver	Multi-line	Hbase Thrift Server logs from \$MAPR_HOME/hbase/hbase-*/logs/hbase-*-thrift-*.log.
hive	Multi-line	HiveServer logs from \$MAPR_HOME/hive/hive-*/logs/root/hive.log.
httpfs	Multi-line	HttpFS logs from \$MAPR_HOME/httpfs/httpfs-*/logs/httpfs.log.
hue	Multi-line	Hue logs from \$MAPR_HOME/hue/hue-*/logs/hue-mapr-runcpserver-*.out.
oozie	Multi-line	Oozie logs from \$MAPR_HOME/oozie/oozie-*/logs/oozie.log.
oozieOps	Multi-line	Oozie operation logs from \$MAPR_HOME/oozie/oozie-*/logs/oozie-ops.log.
oozieCatalina	Multi-line and Multipattern	Oozie Catalina logs from \$MAPR_HOME/oozie/oozie-*/logs/catalina.out.
sparkhistory	Multi-line	Spark HistoryServer logs from \$MAPR_HOME/spark/spark-*/logs/spark-mapr-org.apache.spark.deploy.history.HistoryServer-1-*.out.

System Logs

The `fluentd` component does not collect the following system logs by default because they require the configuration of additional permissions for the `$MAPR_USER`.

Service name	Parsing Method	Description
kernlog	Multi-line	Kernel logs from <code>/var/log/kern.log</code> .
syslog	Multi-line	System logs from <code>/var/log/syslog</code> and <code>/var/log/messages</code> .
mysql_errors	Multi-line	MySQL errors from <code>/var/log/mysql/error.log</code> .

NOTE: To enable `fluentd` to read and parse these logs, see [Configure Logs to Index](#) on page 2024 and also perform the following:

- On Ubuntu and RHEL/CentOS, add `$MAPR_USER` to the `admin` group.
- On RHEL/CentOS, change the ownership of the log file so that it is owned by both the `root` user and the `admin` group.

Data Fabric Monitoring Logs

The `fluentd` component reads and parses the following Data Fabric Monitoring component logs on each node in the cluster.

Service Name	Parsing Method	Description
collectd	Multi-line	The collectd component logs from <code>\$MAPR_HOME/collectd/collectd-*/var/log/collectd/collectd_daemon.log</code>
fluentd	Multi-line	The fluentd component logs from <code>\$MAPR_HOME/fluentd/fluentd-*/var/log/fluentd/fluentd.log</code> ,
grafana	Multi-line	Grafana logs from <code>\$MAPR_HOME/grafana/grafana-*/var/log/grafana/grafana.log</code> .
kibana	Multi-line	Kibana logs from <code>\$MAPR_HOME/kibana/kibana-*/var/log/kibana/kibana.log</code> .

Log Aggregation and Storage

Fluentd uses a round-robin approach when writing logs to Elasticsearch nodes. If an Elasticsearch node is unavailable, Fluentd can fail over log storage to another Elasticsearch node.

Each Fluentd service connects to each Elasticsearch node that you configure to aggregate and store logs. The Elasticsearch nodes are set when you configure Monitoring with the Installer or when you run [configure.sh](#) with the `-ES` parameter.

The Elasticsearch index directory is shared among all the Elasticsearch nodes in the cluster. When you use the Installer to install Elasticsearch, each Elasticsearch node writes index data to `/opt/mapr/es_db`, unless you specified a different location during the installation. When you manually install Elasticsearch, each Elasticsearch node writes index data to `/opt/mapr/elasticsearch/elasticsearch-<version>/var/lib/MaprMonitoring/`, unless you specified a different location using the `configure.sh -ESDB` option. For a cluster with one Elasticsearch node, the index directory is allocated 5 shards. For clusters with 2 or more Elasticsearch nodes, the index directory is allocated a number of shards equal to 3 times the number of Elasticsearch nodes in the cluster.

Fluentd does not require additional configuration to enable automatic failover to an available Elasticsearch node. However, it is important that at least three Elasticsearch nodes are configured to aggregate and store logs so that failure of one node does not prevent logs from being used for monitoring purposes. Based on your environment, more Elasticsearch nodes may be required. [Service Layout Guidelines for Large Clusters](#) on page 86.

For more information about Elasticsearch, see the [Elastic website](#).

Configure Log Retention

By default, Elasticsearch indexes 2 days of logs. Based on your requirements, you can configure a different retention period for Elasticsearch.

The following cron job runs each day to purge logs based on the retention period.

```
$min $hour * * * $ES_HOME/bin/curator --config $ES_HOME/etc/elasticsearch/
curator.yml \
  $ES_HOME/etc/elasticsearch/curator_actions/delete_indices.yml >>
$ES_HOME/var/log/elasticsearch/purgeData.log 2>&1 "
```

Log Retention for Elasticsearch

Complete the following steps to edit the log retention period for Elasticsearch:

1. Open the `/opt/mapr/elasticsearch/elasticsearch-<version>/etc/elasticsearch/curator_actions/delete_indices.yml` file.
2. Update the `unit` and `unit_count` to the new retention period.

unit The unit of measure for the retention period. Valid parameter values: days and weeks.

unit_count The number of days or weeks.

For example, this version of the `delete_indices.yml` file retains logs for 2 days.

```
actions:
  1:
    action: delete_indices
    description: >-
      Delete indices older than 2 days (based on index name), for
      mapr_monitoring-
      prefixed indices. Ignore the error if the filter does not result
      in an
      actionable list of indices (ignore_empty_list) and exit cleanly.
    options:
      ignore_empty_list: True
      timeout_override:
      continue_if_exception: False
      disable_action: False
    filters:
      - filtertype: pattern
        kind: prefix
        value: mapr_monitoring-
        exclude:
      - filtertype: age
        source: name
        direction: older
        timestring: '%Y.%m.%d'
        unit: days
        unit_count: 2
        exclude:
```

Log Retention for Kibana

Each time you start Kibana, it logs data to its log file. You cannot delete the log file while Kibana is running.

To purge the log files:

1. Restart Kibana so that a new log file is created.

```
maprcli node services -name kibana -nodes <kibana hostname/
IPAddress> -action restart
```

2. Delete all the old log files (`kibana.*.<#>`) from the following location: `/opt/mapr/kibana/kibana-<version>/var/log/kibana/`.

Configure Purge Duration

Based on your requirements, you can configure a purge duration for Elasticsearch.

To update the purge duration on node with installed Elasticsearch 6.5.3, run the following command:

```
/opt/mapr/elasticsearch/elasticsearch-<Version>/usr/share/elasticsearch/bin/es_cluster_mgmt.sh --purgeAge <newValue>
```

This command will automatically update the `delete_indices.yml` file. This change updates only the `unit_count` value to `newValue`, without changing the unit value.

Configure Log Rotation Policies for Monitoring Services

New log files are created based on the log rotation policy. By default, each Monitoring service has a log rotation policy. In most cases, you can change the policy based on your requirements.

OpenTSDB Log Rotation Policy

By default, OpenTSDB creates a new log file when each log file reaches the maximum file size of 128MB. After 4 log files are generated, it deletes the oldest log file.

To change the log rotation policy, edit the following file: `/opt/mapr/opentsdb/opentsdb-<version>/etc/opentsdb/logback.xml`. For more information, see the [OpenTSDB Logging documentation](#).

Fluentd and CollectD Log Rotation Policy

By default, Fluentd and Collectd create a new log file each day and they both retain 30 log files. Log rotation for Fluentd and Collectd logs is managed by logrotate.

To change the log rotation policies, edit the following files: `/etc/logrotate.d/fluentd` and `/etc/logrotate.d/collectd`. For details on how to update the log rotation policy, see the [logrotate documentation](#).

Elasticsearch Log Rotation Policy

By default, Elasticsearch creates a new log file each day and it retains 7 days of logs.

To change the log rotation policy, edit the following file `/opt/mapr/elasticsearch/elasticsearch-<version>/etc/elasticsearch/logging.yml`. For details on how to update logging.yml, see the [Elasticsearch documentation](#).

Grafana Log Rotation Policy

By default, Grafana creates a new log file whenever the current log file exceeds the 256MB. It retains log files that were generated in the last 7 days.

To change the log rotation policy, edit the `[log]` section of the following file: `/opt/mapr/grafana/grafana-<version>/etc/grafana/grafana.ini`. For details on how to update the grafana.ini, see the [Grafana documentation](#).

Kibana Log Rotation Policy

Each time you start Kibana, it logs data to its log file and it does not automatically delete old log files. A new log file is created when you restart Kibana. To purge the log files, see [Configure Log Retention](#) on page 2029.

Configure the Elasticsearch Service Heap Size

The Elasticsearch service is memory-intensive. By default, the Elasticsearch service is configured to use a minimum and maximum heap size of 2 GB. You can override these default values by making changes in the Elasticsearch Warden configuration file and the `jvm.options` file. Restart Elasticsearch after you modify the settings.

Configuring Memory in the Warden Configuration File

You can enable memory settings in the Elasticsearch Warden configuration file, located in the `/opt/mapr/conf/conf.d/warden.elasticsearch.conf` directory. Modify the `service.heapsize.min` and `service.heapsize.max` values set in `warden.elasticsearch.conf`, as shown:

```
service.heapsize.min=2000
service.heapsize.max=2000
```

The `service.heapsize.min` and `service.heapsize.max` values are set in megabytes as an integer. For older EEPs, you must make sure that the `-Xms` and `-Xmx` values in the `jvm.options` file match the settings in the Warden configuration file.

About the jvm.options File

The `jvm.options` file centralizes arguments to the Java Virtual Machine to simplify the management of the JVM options. You can no longer set the JVM options through the `ES_MIN_MEM`, `ES_MAX_MEM`, `ES_HEAP_SIZE`, `ES_HEAP_NEWSIZE`, `ES_DIRECT_SIZE`, `ES_USE_IPV4`, `ES_GC_OPTS`, `ES_GC_LOG_FILE`, and `JAVA_OPTS` environment variables.

If you installed the Elasticsearch service from the TAR or ZIP distributions, you can locate the `jvm.options` file in `config/jvm.options`. If you installed Elasticsearch from the Debian or RPM packages, you can locate the `jvm.options` file in the `$ES_HOME/etc/elasticsearch/jvm.options` directory, for example:

```
/opt/mapr/elasticsearch/elasticsearch-<version>/etc/elasticsearch
```

To specify an alternative location, set the `ES_JVM_OPTIONS` environment variable to the file path.

Configuring Memory in the jvm.options File

NOTE: If you configured Elasticsearch memory in the Warden configuration file, configuring memory in the `jvm.options` file is not required for EEPs 6.2.0, 6.1.1, 6.0.2 and later, which contain logic to edit the `jvm.options` file automatically. For other EEPs, you must ensure that memory-configuration changes are made *both* in the Warden configuration file and in the `jvm.options` file.

The `-Xms` and `-Xmx` values in the `jvm.options` file set the Elasticsearch heap size, as shown:

```
-Xms2g
-Xmx2g
```

The `-Xms` parameter sets the minimum heap size in gigabytes. The `-Xmx` parameter sets the maximum heap size in gigabytes. Elasticsearch recommends that both parameters have the same value.

Restarting the Elasticsearch Service

After you modify memory settings, issue the following command to restart the Elasticsearch service:

```
maprcli node services -name elasticsearch -nodes <space separated list of
Elasticsearch nodes> -action restart
```

TIP:

- On a production cluster, you can lock Elasticsearch memory to improve performance. To lock Elasticsearch memory, set the `bootstrap.mlockall: true` option in `$ES_HOME/etc/elasticsearch/elasticsearch.yml`.
- If Elasticsearch uses more than 75% of the configured heap size, you may want to increase the maximum heap size value.

For more information, see the [Elasticsearch documentation](#).

Configure Fluentd Services to Write to Elasticsearch Nodes on the Same Rack

On clusters with high-density racks, ensure you have at least one Elasticsearch server per rack and configure each Fluentd service to write to Elasticsearch nodes that run on the same rack as the Fluentd service. This configuration minimizes the impact of log aggregation on other processes that run on the cluster and in particular, minimizes the amount of backbone bandwidth used by the log aggregation.

About this task

Complete the following steps on each node that runs the Fluentd service.

Procedure

1. Open the `/opt/mapr/fluentd/fluentd-<version>/etc/fluentd/es_config.conf` file.
2. Edit the `hosts` property to only include Elasticsearch nodes that are on the same rack as the Fluentd service.
Example:

```
hosts qa-node90:9200,qa-node91.qa.lab:9200,qa-node92.qa.lab:9200
```

3. Restart Fluentd.

```
maprcli node services -name fluentd -nodes <space separated list of
fluentd nodes> -action restart
```

What to do next

WARNING: Changes to the `es_config.conf` files are overridden by `configure.sh`. Therefore, you will need reconfigure the `hosts` property in the `es_config.conf` file after `configure.sh` is run on Fluentd nodes.

60-mapr_elasticsearch.conf

The `/etc/sysctl.d/60-mapr_elasticsearch.conf` file is created when you install Elasticsearch. This file specifies a Docker host setting for Elasticsearch.

The `vm.max_map_count` setting is a tuning parameter that limits the number of discrete mapped memory areas for the Linux VM:

Example

```
vm.max_map_count=262144
```

For more information about the `max_map_count` parameter, see the [Linux Kernel documentation](#).

60-mapr_fluentd.conf

The `/etc/sysctl.d/60-mapr_fluentd.conf` file is created when you install Fluentd. This file contains Linux kernel tuning parameters.

The `tcp_tw_reuse` parameter allows you to reuse sockets in the `TIME_WAIT` state for new connections.

The `ip_local_port_range` parameter defines the local port range that is used by TCP and UDP to choose the local port.

Example

```
net.ipv4.tcp_tw_reuse = 1
net.ipv4.ip_local_port_range = 10240 65535
```

Log Visualization

Use dashboards to visualize the logs across multiple nodes and clusters.

For information about creating and using dashboards, see the [Kibana documentation](#).

Access the Kibana UI

You can launch the Kibana UI from the Control System or directly from a web browser.

About this task

Procedure

1. Use one of the following method to launch the Kibana UI:
 - In the Control System, go to **Services** and click **Kibana** to launch the Kibana UI in another tab.
 - From a web browser, launch the following URL: `http://<IPAddressOfKibanaNode>:5601`
2. Log on as needed. See [Logging on to Kibana](#) on page 2034.

Logging on to Kibana

This page describes the credentials needed to log on to Kibana for secure and nonsecure clusters for HPE Ezmeral Data Fabric 6.0 and later.

Elasticsearch has its own user database, which also serves Kibana. EEP 5.0.0 and Installer 1.9.0 implemented some changes in security that affect the user IDs and passwords you need to log on to Kibana.

IMPORTANT: The Kibana version included in HPE Ezmeral Ecosystem Packs (EEPs) is a free version that does not support the integration of LDAP/AD users. Integrating LDAP/AD users requires a paid subscription to Elasticsearch. The paid subscription is not supported for use with the HPE Data Fabric. Therefore, you must use the Kibana `admin` user, as described later on this page, to access the Kibana web UI for use with the Data Fabric.

EEP 4.x.x

To log on, specify the user and password as follows:

	Secure Cluster	Nonsecure Cluster
User	Type the Kibana <code>admin</code> user.	No logon required.
Password	Type <code>admin</code> .	No logon required.

EEP 5.0.0 and Later

To log on, specify the user and password as follows:

	Secure Cluster	Nonsecure Cluster
User	Type the Kibana admin user ID.	No logon required.
Password	Type the ElasticSearch/Kibana password that you specified during cluster installation.	No logon required.

For More Information

To change the Elasticsearch/Kibana password, see [Changing the Password for Elasticsearch and Kibana](#) on page 2035.

For more information about the Grafana versions supported by each EEP, see [Ecosystem Pack Components and OS Support](#) on page 7672.

For information about the EEPs supported by different HPE Ezmeral Data Fabric Core versions, see [Ecosystem Pack Support and Lifecycle Status](#) on page 7664.

Changing the Password for Elasticsearch and Kibana

Describes how to change the password for Elasticsearch / Kibana.

Kibana gets its password from Elasticsearch. To change the password for the admin user for Elasticsearch and Kibana:

1. On one of the Elasticsearch nodes, run these commands:

```
ESHOME=/opt/mapr/elasticsearch/elasticsearch-<es_version>
cd $ESHOME/usr/share/elasticsearch/plugins/search-guard-6
bash tools/hash.sh -p "NewPasswordYouWantForAdmin"
$2a$12$6ASxMQEBKYPyGUc10Ryle0hz3c8RrvPGb7oqLC9xGGwPxJFw0LJtq
```

The es_version depends on the EEP that you have installed. To determine the es_version, use the following table, or refer to [Component Versions for Released Ecosystem Packs](#) on page 7704:

Core Version	EEP Version	<es_version>
7.7.0	9.2.2	6.8.8
7.6.1	9.2.1	6.8.8
7.5.0	9.2.x	6.8.8
7.4.0	9.x.x	6.8.8
7.3.0	9.x.x	6.8.8
7.2.0	9.x.x	6.8.8
7.1.0	9.0.0	6.8.8
7.0.0	8.0.0	6.8.8
6.2.0	8.0.0	6.8.8
6.2.0	7.1.1	6.8.8
6.2.0	7.1.0	6.8.8
6.2.0	7.0.1	6.8.8
6.2.0	7.0.0	6.8.8
6.1.1	6.3.5	6.8.8
6.1.1 or 6.1.0	6.3.4	6.8.8

Core Version	EEP Version	<es_version>
6.1.1 or 6.1.0	6.3.3	6.8.8
6.1.0	6.3.2	6.8.8
6.1.0	6.3.1	6.8.8
6.1.0	6.3.0	6.5.3
6.1.0	6.2.0	6.5.3
6.1.0	6.1.1	6.5.3
6.1.0	6.1.0	6.5.3
6.1.0	6.0.2	6.2.3
6.1.0	6.0.1	6.2.3
6.1.0	6.0.0	6.2.3

- Using the hash generated in step 1, edit the `sgconfig/sg_internal_users.yml` file. Change this:

```
admin:
hash: $2a$12$VcCDgh2NDk07JGN0rjGbM.Ad41qVR/YFJcgHp0UGns5JDymv..TOG
#password is: <PasswordSpecifiedAtClusterInstallation>
```

to this:

```
admin:
hash: $2a$12$6ASxMQEBKYPyGUc10Ryle0hz3c8RrvPGb7oqLC9xGGwPxJFw0LJtq
#password is: <NewPasswordYouWantForAdmin>
#hash: $2a$12$VcCDgh2NDk07JGN0rjGbM.Ad41qVR/YFJcgHp0UGns5JDymv..TOG
#password is: <PasswordSpecifiedAtClusterInstallation>
```

- Save the file.
- Load the new users database into Elasticsearch:

```
./tools/sgadmin.sh -h <esHostname> -f sgconfig/sg_internal_users.yml -t
internalusers -cacert ../../../../../../etc/elasticsearch/certs/ca/
chain-ca.pem -cert ../../../../../../etc/elasticsearch/certs/
admin-usr-clientCert.pem -key ../../../../../../etc/elasticsearch/certs/
admin-usr-private-key.pem -cn MaprMonitoring
```

Related concepts

[Checking the EEP Version](#) on page 7530

Some Installer operations require you to know the version of the currently installed Ecosystem Pack (EEP). You can check the EEP version easily from within the Installer user interface or derive the EEP version from your repository information.

Related tasks

[Checking the Installer Version](#) on page 7529

Some Installer features require you to use the latest version of the Installer. You can check the Installer version easily from within the user interface.

Display Logs Chronologically

To display logs chronologically in Kibana, sort the log events by the `event_time` column.

@timestamp indicates the time with second precision and is not as precise as event_time which indicates the time with millisecond precision. Therefore, if you want to display logs chronologically in Kibana, sort the log events by the event_time column, not the @timestamp column.

Update the Elasticsearch URL for Kibana

Kibana connects to a single Elasticsearch node to read logs. In the event that Kibana is unable to read logs due to the failure of an Elasticsearch node, configure Kibana to connect to an available Elasticsearch node.

About this task

NOTE: The Elasticsearch node that Kibana connects to by default is determined by the first Elasticsearch node that was specified when the cluster was configured to use Monitoring

Procedure

1. Open /opt/mapr/kibana/kibana-<version>/config/kibana.yml.
2. Update the elasticsearch.url parameter to point to an available Elasticsearch node.

TIP: If you want to configure Kibana to work even if the Elasticsearch node is unavailable, see the [Kibana documentation](#) for the steps to configure Kibana to load balance across multiple Elasticsearch nodes.

HPE Data Fabric Monitoring Tips and Troubleshooting

Lists the nuances of monitoring clusters.

Monitoring a Secure Cluster

After regenerating the HPE Data Fabric user ticket, service failures occur for collectd and OpenTSDB

If you delete or regenerate the HPE Data Fabric user ticket, the running collectd and OpenTSDB services will fail. After updating the HPE Data Fabric user ticket, restart collectd and OpenTSDB services.

Monitoring Logs

I notice a sudden increase in fluentd logs. What can I do?

A sudden increase in the log file for fluentd could mean that a feedback loop is occurring where fluentd logs an error in the log file for a fluentd issue and that log entry causes yet another error when fluentd tries to parse it. In this case, consider disabling the index of fluentd logs. See [Configure Logs to Index](#) on page 2024.

I see "400 - Rejected by Elasticsearch" messages in the fluentd logs. What can I do?

Messages such as the following can accumulate in the fluentd log when a process does not produce logs with valid UTF-8 output:

```
2019-04-25 17:00:11 -0700 [warn]: #0
dump an error event:
error_class=Fluent::Plugin::Elasticsearch
ErrorHandler::ElasticsearchError
error="400 - Rejected by
Elasticsearch" location=nil
after setting this option in
es_config.conf
```

In a message such as the following, you might see invalid characters represented as

a diamond with a question mark: . The "service_name": "collectd" part of the message indicates that collectd is generating the invalid UTF-8 output:

```
[2019-04-30T19:06:29,495][DEBUG]
[o.e.a.b.TransportShardBulkAction]
[mfs73] [mapr_monitoring-2019.05.01]
[4] failed
to execute bulk item (index) index
{[mapr_monitoring-2019.05.01]
[mapr_monitoringv1]
[taQkcWoBCeW3tMAsn1cW],
source[{"my_event_time":"2019-04-30
18:36:39","level":"info","message":"wr
ite_mapstreams plugin: Produced:

ctd\"}}]}
org.elasticsearch.index.mapper.MapperP
arsingException: failed to parse
field [message] of type [text]
Caused by:
com.fasterxml.jackson.core.JsonParseEx
ception: Invalid UTF-8 middle byte
0x5c
```

One workaround is to comment out the log producing the invalid character. You can do this in the `fluentd.conf` file. For more information, see [Configure Logs to Index](#) on page 2024.

Another workaround is to fix the application that produces the error message. If the log file is produced by an application that you control, change the output of the log producing the invalid character.

Monitoring Metrics

Where should I store the Elasticsearch index?

Elasticsearch requires a lot of disk space. Also, when you upgrade Elasticsearch, the default index directory is removed along with the package update. Therefore, it is recommended to configure a separate filesystem for the index data. It is not recommended to store index data under the `/` or the `/var` filesystem.

NOTE: If you store the Elasticsearch index on a filesystem that is locally hosted, you will be able to access logs in the event that the HPE Data Fabric cluster is not available.

For more information about the Elasticsearch index and the default index directory, see [Log Aggregation and Storage](#) on page 2029.

I see a "Bad Request" error message for my HPE Data Fabric Database metrics? What can I do?

If you have more than 1000 active tables in HPE Data Fabric Database and the HPE Data Fabric monitoring request size to OpenTSDB is more than 4 KB, you may see the following error message:

```
"Sorry but your request was rejected
as being invalid.
The reason provided was: Chunked
request not supported."
```

You can increase the maximum request size of OpenTSDB to up to 64 KB by setting the following parameters in the `opentsdb.conf` file:

```
tsd.http.request.enable_chunked=true
tsd.http.request.max_chunk=65536
```

For more information, see the [OpenTSDB configuration guide](#).

Installation and Configuration Errors

See [Troubleshoot Monitoring Installation Errors](#) on page 281

Reconfiguring Data Fabric Monitoring

Changes to an existing cluster, such as the addition of services, may require additional steps to enable the collection of metrics and logs.

Configure Monitoring for Additional Services

When you add services to a cluster where Data Fabric Monitoring is already configured, you must restart `collectd` and `Fluentd` services to enable the collection of logs and metrics for the newly added services.

About this task**Procedure**

1. Restart the `collectd` service on each node that runs the service that was added to the cluster.

```
maprcli node services -name collectd -nodes <space separated list of
hostname/IPaddresses> -action restart
```

2. Restart the `Fluentd` service on each node that runs the service that was added to the cluster.

```
maprcli node services -name fluentd -nodes <space separated list of
hostname/IPaddresses> -action restart
```

Update the Monitoring Storage Nodes

You must reconfigure HPE Data Fabric Monitoring when you add additional OpenTSDB or Elasticsearch nodes, or when you change the OpenTSDB or Elasticsearch node locations.

About this task

Procedure

1. Run [configure.sh](#) on each node in the HPE Data Fabric cluster with the -R, -ES, and -OT parameters. Optionally, you can include the -ESDB parameter.

```
/opt/mapr/server/configure.sh -R -ES <comma-separated list of
Elasticsearch nodes> \
  -OT <comma-separated list of OpenTSDB nodes> [-ESDB <filepath>]
```

For the entire list of available `configure.sh` parameters, see [configure.sh](#)

If you encounter any errors after running `configure.sh`, see [Troubleshoot Monitoring Installation Errors](#) on page 281

2. If you updated the list of Elasticsearch nodes, restart all the Fluentd, Elasticsearch, and Kibana services.

```
maprcli node services -name fluentd -nodes <space separated list of
Fluentd nodes> -action restart
```

```
maprcli node services -name elasticsearch -nodes <space separated list
of Elasticsearch nodes> -action restart
```

```
maprcli node services -name kibana -nodes <space separated list of
Kibana nodes> -action restart
```

3. If you updated the list of OpenTSDB nodes, restart the collectd, OpenTSDB, and Grafana services.

```
maprcli node services -name opentsdb -nodes <space separated list of
OpenTSDB nodes> -action restart
```

```
maprcli node services -name collectd -nodes <space separated list of
collectd nodes> -action restart
```

```
maprcli node services -name grafana -nodes <space separated list of
Grafana nodes> -action restart
```

Configuring Data Fabric to Track User Behavior

Describes how to configure Data Fabric to track user behavior.

Introduction

When auditing is enabled in Data Fabric, files, streams, S3 objects, and tables can be audited for cluster administration and/or data access operations. See [Enabling and Disabling Auditing of Cluster Administration](#) on page 1318 to enable auditing for cluster administration.

NOTE: Audit logs are generated into audit log files when auditing is enabled.

See [Streaming Audit Logs](#) on page 923 for information on audit log streaming. See [Enabling and Disabling Audit Streaming Using the CLI](#) on page 1325 to enable audit streaming.

Data Fabric generates audit logs for the services that are related to various Data Fabric components. The services include CLDB, S3, MFS, auth. Auth logs are authentication audit logs.

Auditing is useful to record user behavior and assists in tracking anomalies or potential data security threats with respect to Data Fabric. See [Auditing in Data Fabric](#) on page 912 for information on auditing.

See [Log files](#) on information about the various log files generated by Data Fabric.

See [Viewing Audit Logs](#) for information on how to view audit logs in Data Fabric.

Data Fabric audit logs provide insights into the activity that has taken place in relation to a cluster.

The audit logs are stored on nodes on which the respective Data Fabric service runs. This makes it cumbersome to establish a correlation between the various logs.

Data Fabric stores audit logs in files and the audit logs can be directed to streams. However, the audit data in log files nor stream are not queriable to make meaningful insights. The insight service reads the audit data from streams / files, and adds them to the respective Apache Iceberg tables. The audit data is stored in a more structured manner, so that can insights can be gathered from the audit data on user behavior and activities going on in Data Fabric.

HPE recommends you to have [Spark](#) and [Zeppelin](#) installed. With these services made available, Insight service will help generate some standard graphs which represent the activities going on Data Fabric.

NOTE: Data Fabric creates the relevant Iceberg tables for storage of insight data on successful installation of the `mapr-hivemetastore` package.

IMPORTANT: The insight service must be installed on all nodes of your cluster/fabric to effectively gather information about activities and events recorded in the audit log for each node. All the data gathered by the insight service is stored in a single set of Iceberg tables.

You can write applications that consume the audit log data stored on Iceberg to detect anomalies in user behavior.

The insight service can be installed from `mapr-insight` package available on the HPE website that hosts the Data Fabric packages.

The insight-related Iceberg tables are stored on Data Fabric and use Iceberg Catalog as Hive via Hive Metastore service which needs to be [configured with RDBMS](#) for production or use the default database (Derby) for trial purposes.

Insight related Iceberg tables are placed in default namespace of Hive Meta Store.

Types of Audit Logs Copied for Analysis

The following audit logs are expanded using a variant of `expand-audit` utility to include user-friendlier versions of the fields such as UID, VolID (username, volume name), before committing the logs to Iceberg table.

- CLDB logs
- MFS logs
- authentication logs
- S3 logs

There are four distinct Iceberg tables designated for each type of audit log stream. See [Enabling Insight Gathering in Trial Mode](#) on page 2042 and [Enabling Insight Gathering in Production Mode](#) on page 2043 for the Iceberg table names for each of the modes in which the insight gathering can be operated.

Configure Data Fabric to Track User Behavior

The insight service can be enabled to gather insights at the cluster level, type level, and the node level.

If you do not want data from nodes to be copied to Iceberg, you can disable audit log/insights from node. By default, insights are disabled. When insight feature is enabled at the global level, audit logs for all types and all nodes are committed to Iceberg tables periodically. [insight](#) commands are available to enable/disable insights based on the type of logs, or at the node level on a node-by-node basis.

IMPORTANT: Install and set up your cluster before installing the packages for the insight service and enabling the insight service.

You can customize the insights with the [insight](#) on page 2519 CLI command.

For instance, you can turn off insight gathering on some nodes (although this is not recommended), or you can turn off insight gathering of certain audit components such as S3 due to heavy S3 traffic on your cluster/fabric.

On installing [Spark Standalone](#) and [Zeppelin](#), you can generate standard charts using [insight dashboard](#). The charts can help to detect any anomalies in user behavior related to the data access operations and cluster administration.

Enable Insight Gathering

The insight service gathers audit data and commits to respective Iceberg table every five minutes, by default. The audit records are collected put into a data file in a batch of 1024 records before pushing the data files to Apache Iceberg at the five-minute interval, by default.

NOTE: See [insight](#) to change the default interval, data file buffer size settings, and other insight-related parameters. See [insight cluster](#) on page 2521 to enable insight gathering.

TIP: Purging of Apache Iceberg table records happens periodically. The purge operation is performed once every hour and the records older than 5 days are purged, by default. See [config save](#) on page 2394 to change the default purge frequency. The retention period for the Iceberg tables can be configured using the [insight purge](#) on page 2526 command.

The insight gathering stops when Hive Metastore is down and waits for the Hive Metastore service to be up and running, before the insight service can commit records to the respective Apache Iceberg table. When Hive Metastore is running in high availability mode, Data Fabric communicates any switchover of the Hive Metastore master to insight services running on the individual nodes.

Upgrade Considerations for User Behavior Tracking

Describes the backward compatibility considerations for user behavior tracking with insight gathering, when upgrading from Data Fabric release version 7.8 to 7.9.

The following changes must be taken into considered if you have enabled insight gathering to track user behavior in Data Fabric, and are now upgrading from Data Fabric release version (version) 7.8 to 7.9 or later.

- Tables created in Data Fabric 7.8 are not supported in Data Fabric 7.9 or later.
- New Apache Iceberg tables with a different schema are created for Data Fabric 7.9 or later.
- When CLDB is upgraded to 7.9 or later, insights running 7.8 version are shutdown, as the Apache Iceberg table formats differ from Data Fabric version 7.9.
- Insight gathering shutdown and restart is automatically performed by the CLDB service, per the requirement of the mode in which the insight service is running.

Enabling Insight Gathering in Trial Mode

Describes how to enable insight collection in trial mode.

Prerequisites

The following prerequisites must be met before you can start insight gathering in trial mode:

- The cluster/fabric on which you wish to track user behavior must have the insight service installed on at least one of the nodes of the cluster/fabric.
- Hive Metastore must be installed and allowed to run with the default Derby database.

About this task

In the trial mode, the insight service is allowed to run only on a single node of a cluster/fabric. In other words, all the other insight services installed and configured to run are shutdown.

NOTE: The insight service stops gathering audit data when Hive Metastore is not running, and waits for Hive Metastore service to begin running to collect audit records and commit to respective Iceberg Tables. The insight service supports the HA mode of Hive MetaStore and operates accordingly.

Running the insight gathering in trial mode requires the following:

- Auditing enabled in the cluster.
- Streams for audit is enabled.

In trial mode, the insight service collects audit logs from all the nodes through streams and adds the audit log data to respective Iceberg tables.

Follow the steps given below to enable insight gathering in trial mode.

Procedure

1. Enable audit. See [Enabling and Disabling Auditing of Cluster Administration](#) on page 1318 to enable auditing for cluster administration.
2. Enable audit streaming. See [Streaming Audit Logs](#) on page 923 for information on audit log streaming. See [Enabling and Disabling Audit Streaming Using the CLI](#) on page 1325 to enable audit streaming.
3. Enable insight. See [insight cluster](#) on page 2521 to enable insight.

Results

Insight gathering begins in trial mode.

When the insight service is run in trial mode, the `CLUSTER_ALARM_INSIGHTS_TRIAL_MODE` alarm is raised that the insight service is operating in trial mode.

The insight data is gathered on the following Apache Iceberg tables.

- Data from cldb audit stream is pushed to the `cldb_is_demo` table.
- Data from auth audit stream is pushed to the `auth_is_demo` table.
- Data from mfs audit stream is pushed to the `mfs_is_demo` table.
- Data from s3 audit stream is pushed to the `s3_is_demo` table.

Enabling Insight Gathering in Production Mode

Describes the steps to enable insight gathering in production mode.

Prerequisites

The following prerequisites must be met before you can start insight gathering in production mode:

- The cluster/fabric on which you wish to track user behavior has the insight service installed on all the nodes of the cluster or the desired nodes.

- Hive Metastore must be installed with a production grade RDBMS like MySQL, Postgres, MariaDB. HPE recommends that you have the Hive Metastore running in high availability mode.

About this task

Insight gathering can be enabled on few nodes, but the approach does not give a complete picture of the events taking place on the cluster/fabric.

HPE recommends that insight gathering is enabled on all nodes, when you wish to gather insights in production mode. In other words, insight gathering must be enabled at the global level in production mode.

The insight service automatically runs in production mode when Hive Metastore is configured with a production-grade RDBMS. The insight service picks the audit logs directly from the audit log files, and adds them to the respective Iceberg tables. Audit streaming is not required for insight gathering in production mode.

Insight gathering is more efficient and more scalable for file or production mode as files containing audit data are distributed on the global level.

Follow the steps given below to enable insight gathering in production mode.

Procedure

1. Enable audit. See [Enabling and Disabling Auditing of Cluster Administration](#) on page 1318 to enable auditing for cluster administration.
2. [Configure a production-grade database for the Hive Metastore](#). Restart Hive Metastore after the database is changed.
3. Enable insight. See [insight cluster](#) to enable insight.

Results

Insight gathering automatically begins in production mode after Hive Metastore successfully configured with a production-grade RDBMS.

The insight data is gathered on the following Apache Iceberg tables.

- Data from cldb audit file is pushed to the `cldb_is` table.
- Data from auth audit file is pushed to the `auth_is` table.
- Data from mfs audit file is pushed to the `mfs_is` table.
- Data from s3 audit file is pushed to the `s3_is` table.

Configuring Security

Describes how to configure security and manage secure clusters.

Configuring Data Fabric Security

Provides usage information for frequently used security functionality, including Access Control Lists (ACLs), Access Control Expressions (ACEs), file permissions, and subnet allowlisting.

NOTE: Release 6.1 makes it easier to secure new Data Fabric installations. See [Using the Enable Secure Cluster Option](#) on page 7543 in the [Installer](#) on page 7511.

Wired encryption and authentication (including impersonation) for the Data Fabric platform and for all supported ecosystem products are enabled on all new installations through [Installer](#) on page 7511.

Alternatively, enable security manually by running the `configure.sh` on page 3186 command with the `-secure` option.

Enable security features at any time, but additional configuration is required for the individual components to work with security enabled. This section discusses initial configuration of a secure cluster as well as other forms of security.

The following access control elements are available irrespective of whether security features are enabled for your cluster. After security features are enabled, these elements benefit from encrypted traffic within the cluster and strong authentication to the cluster.

- ACLs for the cluster, the volumes in the cluster, and the MapReduce application queue
- [ACEs](#) control user permissions for directories, files, and HPE Data Fabric Database tables that are stored natively
- File permissions for objects in the file system layer
- Subnet allowlisting restricts access to the cluster's FileServer service

On clusters with security features enabled, ecosystem components may require additional configuration. For example, Hive functionality has different security requirements depending on the interaction between the HiveServer2 component, the Hive command-line interface, and the Hive metastore.

See the [Security Support Matrix](#) on page 7735 for more information about supported security options for Ecosystem components. See the specific Ecosystem component in [Ecosystem Components](#) on page 4647 for information on security configuration.

See [Security Vulnerabilities](#) on page 8400 for a list of known vulnerabilities.

Verifying if Files Needed for Security are Present

When you run `configure.sh` with the `-secure` option, the following files are automatically created in the `/opt/mapr/conf` directory. To ensure that security is properly configured, navigate to the `/opt/mapr/conf` directory and verify that the files are present.

Master value controlling the cluster secure or non-secure state	<p><i>File or command:</i> <code>/opt/mapr/conf/mapr-clusters.conf</code></p> <pre>maprcli dashboard info -cluster <clusterName> -json grep secure</pre> <p><i>Default secure setting:</i> <code>secure=true</code></p> <p><i>Alternate possible values/notes:</i> <code>secure=false</code> disables security on restarting the cluster.</p>
Data Fabric service account	<p><i>File or command:</i> <code>sudo passwd -S mapr</code></p> <p><i>Default secure setting:</i> Site Specific Password.</p> <p><i>Alternate possible values/notes:</i> No password. Use <code>su</code> to access.</p>
CLDB key file	<p><i>File or command:</i> <code>/opt/mapr/conf/cldb.key</code></p> <p><i>Default secure setting:</i> Created at install. Do not change.</p> <p><i>Alternate possible values/notes:</i> Must exist on all CLDB nodes and be identical.</p>
Server ticket	<p><i>File or command:</i> <code>/opt/mapr/conf/maprserverticket</code></p>

	<p><i>Default secure setting:</i> Created at install, do not change.</p> <p><i>Alternate possible values/notes:</i> Must exist on all cluster nodes and be identical.</p>
User ticket	<p><i>File or command:</i> /opt/mapr/conf/mapruser.ticket</p> <p><i>Default secure setting:</i> Created at install, do not change.</p> <p><i>Alternate possible values/notes:</i> Must exist on all cluster nodes and be identical. This ticket is owned and used by the service account as needed.</p>
SSL keys	<p><i>File or command:</i> /opt/mapr/conf/ssl.truststore /opt/mapr/conf/ssl.keystore</p> <p><i>Default secure setting:</i> Created at install, and should rarely change. These keys are used by web and REST HTTPS interfaces.</p> <p><i>Alternate possible values/notes:</i> How to import CA (Certificate Authority) signed certificates to Data Fabric 7.</p>
Java (JAAS) authentication service settings	<p><i>File or command:</i> /opt/mapr/conf/mapr.login.conf</p> <p><i>Default secure setting:</i> Created at install. Do not change.</p> <p><i>Alternate possible values/notes:</i> Must exist on all cluster nodes and be identical.</p>
Roles for use with ACEs	<p><i>File or command:</i> /opt/mapr/conf/m7_permissions_roles_refimpl.conf</p> <p><i>Default secure setting:</i> Specific roles defined using automation.</p> <p><i>Alternate possible values/notes:</i> Use should be deprecated. Linux groups are a much better method, centralized and consistent with enterprise standards.</p>
Default security settings for some Data Fabric services	<p><i>File or command:</i> /opt/mapr/conf/env.sh</p> <p><i>Default secure setting:</i> Created at install, do not change.</p> <p><i>Alternate possible values/notes:</i> Must exist on all cluster nodes and be identical. View the list of settings by using this command: <code>grep -i secure env.sh</code></p>
ZooKeeper security setting	<p><i>File or command:</i> /opt/mapr/zookeeper/zookeeper-\$zkver/conf/zoo.cfg</p> <p><i>Default secure setting:</i> authMech=MAPR-SECURITYauthProvider.1=org.apache.zookeeper.server.auth.SASLAuthenticationProvider</p> <p><i>Alternate possible values/notes:</i> authMech=SIMPLE-SECURITY</p>
JMX remote access (debug and metrics monitoring)	<p><i>File or command:</i> /opt/mapr/conf/jmxremote.{access,password}</p>

Default secure setting: read-only and with the password limited to the Data Fabric service account.

Alternate possible values/notes: read-write but is not recommended.

Determining if Wire-Level Security is Enabled Using the CLI

If you run `configure.sh` with the `-secure` option, wire-level security is automatically enabled at the cluster level. You can, optionally, disable wire-level security at the individual volume-level. To determine if wire-level security is enabled for a volume, run the following command:

```
/opt/mapr/bin/maprcli volume list -json |grep wire
```

This command returns the value of `wireSecurity` as 1 if wire-level security is enabled for the volume; 0 otherwise.

Enabling Cluster Wide Data Access Auditing

To enable auditing data access operations at a cluster level, run:

```
/opt/mapr/bin/maprcli audit data -enabled
```

Determining if per Volume Data Access Auditing is Enabled

To determine if auditing data access operations is enabled for a volume, run:

```
/opt/mapr/bin/maprcli volume info -name <volume_name> -json | grep -i 'audited\|coalesce'
```

This command returns the value of `audited` as 1 if data access auditing is enabled for the volume; 0 otherwise.

Getting Started with HPE Data Fabric Security

Describes quick implementation of security.

MapR 6.1 introduced enhanced security settings that simplify the process of creating secure clusters. For a brief introduction, see [Security](#). To learn how to secure a cluster, see [this course](#).

To set up a secure cluster:

1. Enable cluster security, authentication, and wire-level encryption by running [configure.sh](#) if you performed a manual installation.

See [Enabling Security on a Configured Cluster](#) on page 2048 for more information.

NOTE: If you selected the [Using the Enable Secure Cluster Option](#) on page 7543 after installing with the [Installer](#) on page 7511, proceed to the next step.

2. Generate HPE Data Fabric user tickets to authenticate with your username and password.
See [Generating a HPE Data Fabric User Ticket](#) on page 2103 for more information.
3. Configure each Ecosystem component, where necessary, for security.
See [Security and Ecosystem Components](#) on page 1060 for more information.
4. (Optional) Enable encryption of data at rest at the cluster level and selectively for volumes as well.
See [Enabling Encryption of Data at Rest](#) on page 2070 for more information.

5. (Optional) Turn on auditing for the cluster and for directories that contain sensitive data.

See [Enabling and Disabling Auditing of Cluster Administration](#) on page 1318 and [Enabling and Disabling Auditing of Data Access Operations](#) on page 1319 for more information.

6. (Optional) Enable authorization using ACEs for files, tables, streams, or volumes; and ACLs for administrative activities that can be performed on the cluster.

See [Managing Access Control Expressions](#) on page 2126 and [Managing Access Control Lists](#) on page 2123 for more information.

TIP: After you enable security, review the [System Behavior Changes After Enabling Security](#) on page 2067.

Enabling Security on a Configured Cluster

Describes how to enable security for the cluster, platform, ecosystem components, and network-based connections.

About this task

The following steps enable:

- Security for the cluster nodes
- Wire-level encryption for the platform and ecosystem components
- Authentication for all network-based connections

These steps DO NOT enable data-at-rest encryption (DARE). For DARE information, see [Enabling Encryption of Data at Rest](#) on page 2070 and [Converting to Cluster Enabled for Data-at-Rest Encryption](#) on page 2072.

These steps DO NOT enable security for client nodes. For client-installation information, see [Setting Up Clients and Services](#) on page 357.

Use *one* of the following procedures based on the composition of nodes in your cluster:

- [Enabling Security When All Nodes Are Non-FIPS](#) on page 2048
- [Enabling Security When All Nodes Are FIPS](#) on page 2052
- [Enabling Security for a Mix of FIPS and Secure Non-FIPS Nodes](#) on page 2056

Enabling Security When All Nodes Are Non-FIPS

About this task

Use these steps to enable security for a cluster in which all nodes are non-FIPS-enabled nodes:

Procedure

1. If the cluster is running, [shut it down](#).
2. If you are re-running the `configure.sh` script because of an invocation error from a previous run, remove the following files from `${MAPR_HOME}/conf` (if they are present) if you want to re-generate the CLDB key, server ticket, and certificates:
 - All key and trust stores. The files differ depending on whether the node is FIPS enabled. FIPS-enabled nodes use BCFKS key and trust stores, while secure non-FIPS nodes use JKS/JCEKS/P12 key and trust stores:
 - `maprkeycreds.jceks`

- `maprtrustcreds.jceks`
- `ssl_keystore, ssl_keystore.p12`
- `ssl_truststore, ssl_truststore.p12`
- `ssl_userkeystore`
- `ssl_usertruststore`
- All other files in `${MAPR_HOME}/conf` that are generated and configured on the first CLDB node:
 - All PEM files: `ssl_keystore-signed.pem` and `ssl_userkeystore-signed.pem`
 - All files in the `${MAPR_HOME}/conf/tokens` directory
 - `maprserverticket`
 - `mapruserticket`
 - The `store-passwords.txt` file containing the clear-text passwords, if not already removed

For example:

```
cd /opt/mapr/conf
rm -rf ssl_* *.bcfks *.jceks tokens store-passwords.txt maprserverticket
mapruserticket ssl-client.xml ssl-server.xml
```

WARNING: The DARE master key is generated in the `tokens/` directory only if data at rest encryption is enabled on the cluster using the `-dare` option with `configure.sh`. Deleting the `tokens` directory is only intended for existing clusters without DARE already enabled to re-attempt enabling secure mode. If the cluster is already running with DARE enabled, deleting the `tokens` directory results in a complete cluster loss.

3. Run the `configure.sh` script with the `-secure -genkeys` options on the first CLDB node in your cluster:

```
/opt/mapr/server/configure.sh -secure -genkeys -Z
<Zookeeper_node_list> -C <CLDB_node_list> -N <cluster_name>
```

where both `<Zookeeper_node_list>` and `<CLDB_node_list>` have the form `hostname[:port_no][,hostname[:port_no]...]` and `-N <cluster_name>` specifies the cluster name. For the hostname, specify an FQDN as described in [Connectivity](#) on page 222. Do not specify an alias or IP address.

IMPORTANT: You must not run `configure.sh` with the `-genkeys` option on any other node after running it with the `-genkeys` option on the first CLDB node. The files must be generated only once on the first CLDB node by running `configure.sh` with the `-genkeys` option, and then copied to other nodes in the cluster.

TIP: For a comprehensive listing of the Trust and Key Store files, see [Understanding the Key Store and Trust Store Files](#) on page 2063.

4. Copy files to the destination nodes as follows:

- If your cluster consists of all secure non-FIPS-enabled nodes, use the following table as a guide to copy files to the destination nodes which are the nodes where the `-genkeys` option is not used to generate keys.

Destination Node Type	Copy these files under <code>\${MAPR_HOME}</code> to the destination node . . .
CLDB and/or ZooKeeper Nodes	<ul style="list-style-type: none"> • <code>conf/maprhsm.conf</code> • <code>conf/maprkeycreds.conf</code> • <code>conf/maprkeycreds.jceks</code> • <code>conf/maprserverticket</code> • <code>conf/maprtrustcreds.conf</code> • <code>conf/maprtrustcreds.jceks</code> • <code>conf/private.key¹</code> • <code>conf/public.crt¹</code> • <code>conf/ssl_keystore</code> • <code>conf/ssl_keystore.p12</code> • <code>conf/ssl_keystore.pem</code> • <code>conf/ssl_keystore-signed.pem</code> • <code>conf/ssl_truststore</code> • <code>conf/ssl_truststore.p12</code> • <code>conf/ssl_truststore.pem</code> • <code>conf/ssl_userkeystore</code> • <code>conf/ssl_userkeystore.p12</code> • <code>conf/ssl_userkeystore.pem</code> • <code>conf/ssl_userkeystore-signed.pem</code> • <code>conf/ssl_usertruststore</code> • <code>conf/ssl_usertruststore.p12</code> • <code>conf/ssl_usertruststore.pem</code> • <code>conf/tokens</code> (use a command such as <code>scp -r</code> to copy everything in this folder)

Destination Node Type	Copy these files under \${MAPR_HOME} to the destination node . . .
All other cluster nodes, including MFS-only nodes	<ul style="list-style-type: none"> • conf/maprhsm.conf • conf/maprkeycreds.conf • conf/maprkeycreds.jceks • conf/maprserverticket • conf/maprtrustcreds.conf • conf/maprtrustcreds.jceks • conf/private.key¹ • conf/public.crt¹ • conf/ssl_keystore • conf/ssl_keystore.p12 • conf/ssl_keystore.pem • conf/ssl_keystore-signed.pem • conf/ssl_truststore • conf/ssl_truststore.p12 • conf/ssl_truststore.pem • conf/ssl_userkeystore • conf/ssl_userkeystore.p12 • conf/ssl_userkeystore.pem • conf/ssl_userkeystore-signed.pem • conf/ssl_usertruststore • conf/ssl_usertruststore.p12 • conf/ssl_usertruststore.pem

¹If you are running Data Fabric 7.0.0.5 or later, the `private.key` and `public.crt` are not present and do not need to be copied to all other nodes. On Data Fabric 7.0.0.5, the `/opt/mapr/conf/ssl_usertruststore` performs this function and is present on all nodes.

5. Run `configure.sh` on each existing node in the cluster using the same arguments as in Step 3 but without the `-genkeys` option.

```
/opt/mapr/server/configure.sh -secure -Z <Zookeeper_node_list> -C
<CLDB_node_list> -N <cluster_name>
```

The `-secure` option indicates that security must be enabled on the node where the command is run.

**IMPORTANT:**

- You must also do this on any nodes that you add to the cluster in the future.
- If you run `configure.sh -secure` on a node *before* you copy the necessary files to that node, the command fails.

6. Optionally, enable encrypted quorum ZooKeeper communication. See [zoo.cfg](#) on page 3390 for more information.

*Enabling Security When All Nodes Are FIPS***About this task**

Use these steps to enable security for a cluster in which all nodes are FIPS-enabled:

Procedure

1. If the cluster is running, [shut it down](#).
2. If you are re-running the `configure.sh` script because of an invocation error from a previous run, remove the following files from `${MAPR_HOME}/conf` (if they are present) if you want to re-generate the CLDB key, server ticket, and certificates:
 - All key and trust stores. The files differ depending on whether the node is FIPS enabled. FIPS-enabled nodes use BCFKS key and trust stores, while secure non-FIPS nodes use JKS/JCEKS/P12 key and trust stores:
 - `maprkeycreds.bcfks`
 - `maprtrustcreds.bcfks`
 - `ssl_keystore` (symlink), `ssl_keystore.bcfks`
 - `ssl_truststore` (symlink), `ssl_truststore.bcfks`
 - `ssl_userkeystore` (symlink), `ssl_userkeystore.bcfks`
 - `ssl_usertruststore` (symlink), `ssl_usertruststore.bcfks`
 - All other files in `${MAPR_HOME}/conf` that are generated and configured on the first CLDB node:
 - All PEM files: `ssl_keystore-signed.pem` and `ssl_userkeystore-signed.pem`
 - All files in the `${MAPR_HOME}/conf/tokens` directory
 - `maprserverticket`
 - `mapruserticket`
 - The `store-passwords.txt` file containing the clear-text passwords, if not already removed

For example:

```
cd /opt/mapr/conf
rm -rf ssl_* *.bcfks *.jceks tokens store-passwords.txt maprserverticket
mapruserticket ssl-client.xml ssl-server.xml
```

3. Run the `configure.sh` script with the `-secure -genkeys` options on the first CLDB node in your cluster:

```
/opt/mapr/server/configure.sh -secure -genkeys -Z  
<Zookeeper_node_list> -C <CLDB_node_list> -N <cluster_name>
```

where both `<Zookeeper_node_list>` and `<CLDB_node_list>` have the form `hostname[:port_no][,hostname[:port_no]...]` and `-N <cluster_name>` specifies the cluster name. For the hostname, specify an FQDN as described in [Connectivity](#) on page 222. Do not specify an alias or IP address.

IMPORTANT: You must run `configure.sh` with the `-genkeys` option only *once* on one CLDB node, since the resulting files should be generated only once and then copied to other nodes.

TIP: For a comprehensive listing of the Trust and Key Store files, see [Understanding the Key Store and Trust Store Files](#) on page 2063.

4. Copy files to the destination nodes as follows:
 - If your cluster consists of all FIPS-enabled nodes, use the following table as a guide to copy files to the destination nodes (the nodes where the `-genkeys` option is not used to generate keys):

Destination Node Type	Copy these files under \${MAPR_HOME} to the destination node . . .
CLDB and/or ZooKeeper Nodes	<ul style="list-style-type: none"> • conf/maprhsm.conf • conf/maprkeycreds.bcfks • conf/maprkeycreds.conf • conf/maprserverticket • conf/maprtrustcreds.bcfks • conf/maprtrustcreds.conf • conf/private.key² • conf/public.crt² • conf/ssl_keystore.bcfks¹ • conf/ssl_keystore-signed.pem¹ • conf/ssl_keystore.p12¹ • conf/ssl_keystore.pem¹ • conf/ssl_truststore.bcfks¹ • conf/ssl_truststore.p12¹ • conf/ssl_truststore.pem¹ • conf/ssl_userkeystore.bcfks¹ • conf/ssl_userkeystore.pem¹ • conf/ssl_userkeystore-signed.pem¹ • conf/ssl_usertruststore.bcfks¹ • conf/ssl_usertruststore.pem¹ • conf/tokens (use scp -r to copy everything in this folder)

Destination Node Type	Copy these files under \${MAPR_HOME} to the destination node . . .
All other cluster nodes, including MFS-only nodes	<ul style="list-style-type: none"> • conf/maprhsm.conf • conf/maprkeycreds.bcfks • conf/maprkeycreds.conf • conf/maprserverticket • conf/maprtrustcreds.bcfks • conf/maprtrustcreds.conf • conf/private.key² • conf/public.crt² • conf/ssl_keystore.bcfks¹ • conf/ssl_keystore.p12¹ • conf/ssl_keystore.pem¹ • conf/ssl_keystore-signed.pem¹ • conf/ssl_truststore.bcfks¹ • conf/ssl_truststore.p12¹ • conf/ssl_truststore.pem¹ • conf/ssl_userkeystore.bcfks¹ • conf/ssl_userkeystore.p12¹ • conf/ssl_userkeystore.pem¹ • conf/ssl_userkeystore-signed.pem¹ • conf/ssl_usertruststore.bcfks¹ • conf/ssl_usertruststore.p12¹ • conf/ssl_usertruststore.pem¹

¹Do NOT copy the ssl_ symlink files contained in the conf/ directory. The symlinks are:

- ssl_keystore (symlink)
- ssl_truststore (symlink)
- ssl_userkeystore (symlink)
- ssl_usertruststore (symlink)

²If you are running Data Fabric 7.0.0.5 or later, the private.key and public.crt are not present and do not need to be copied to all other nodes. On Data Fabric 7.0.0.5, the /opt/mapr/conf/ssl_usertruststore performs this function and is present on all nodes.

5. Run `configure.sh` on each existing node in the cluster using the same arguments as in Step 3 but without the `-genkeys` option.

```
/opt/mapr/server/configure.sh -secure -Z <Zookeeper_node_list> -C
<CLDB_node_list> -N <cluster_name>
```

The `-secure` option indicates that security must be enabled on the node where the command is run.

IMPORTANT:

- You must also do this on any nodes that you add to the cluster in the future.
 - If you run `configure.sh -secure` on a node *before* you copy the necessary files to that node, the command fails.
6. Optionally, enable encrypted quorum ZooKeeper communication. See [zoo.cfg](#) on page 3390 for more information.

Enabling Security for a Mix of FIPS and Secure Non-FIPS Nodes

About this task

A mixed cluster is a cluster consisting of both FIPS-enabled and secure non-FIPS enabled nodes. Since the key and trust store formats are different between FIPS-enabled and secure non-FIPS enabled nodes, the BCFKS stores from FIPS-enabled nodes cannot be copied directly to secure non-FIPS enabled nodes, or vice versa. The Hadoop Credential stores also cannot be copied between FIPS-enabled and secure non-FIPS enabled nodes.

For a mixed configuration, you must:

- Generate the key and trust store, and user key and trust stores if required, on the secure non-FIPS node using the new `${MAPR_HOME}/server/manageSSLKeys.sh convert` utility:
 - After adding a FIPS-enabled node to a cluster consisting of only non-FIPS enabled nodes, generate the BCFKS key and trust stores on the non-FIPS enabled node. Copy them to the `${MAPR_HOME}/conf` directory of the FIPS-enabled node before running `configure.sh`.
 - After adding a secure non-FIPS enabled node to a cluster consisting of only FIPS-enabled nodes, copy the BCFKS key and trust stores from the FIPS-enabled node to a temporary location in the secure non-FIPS enabled node. Generate the JKS key and trust store on the secure non-FIPS enabled node.
- Run the `configure.sh` with the `-storepasswd` option on the node being configured to generate the credential stores.

Enabling Security for the First CLDB Node

About this task

The following steps describe how to enable security for the first CLDB node in the cluster. Note that the Data Fabric core platform is installed as secure by default on FIPS-enabled hosts. Security is enabled even if the `-secure` flag is not specified to the `configure.sh` script.

Procedure

1. If the cluster is running, [shut it down](#).

2. If you are re-running the `configure.sh` script because of an invocation error from a previous run, remove the following files from `${MAPR_HOME}/conf` (if they are present) if you want to re-generate the CLDB key, server ticket, and certificates:
 - All key and trust stores. The files differ depending on whether the node is FIPS enabled. FIPS-enabled nodes use BCFKS key and trust stores, while secure non-FIPS nodes use JKS/JCEKS/P12 key and trust stores:

FIPS	Secure Non-FIPS
<code>maprkeycreds.bcfks</code>	<code>maprkeycreds.jceks</code>
<code>maprtrustcreds.bcfks</code>	<code>maprtrustcreds.jceks</code>
<code>ssl_keystore (symlink), ssl_keystore.bcfks</code>	<code>ssl_keystore, ssl_keystore.p12</code>
<code>ssl_truststore (symlink), ssl_truststore.bcfks</code>	<code>ssl_truststore, ssl_truststore.p12</code>
<code>ssl_userkeystore (symlink), ssl_userkeystore.bcfks</code>	<code>ssl_userkeystore</code>
<code>ssl_usertruststore (symlink), ssl_usertruststore.bcfks</code>	<code>ssl_usertruststore</code>

- All other files in `${MAPR_HOME}/conf` that are generated and configured on the first CLDB node:
 - All PEM files: `ssl_keystore-signed.pem` and `ssl_userkeystore-signed.pem`
 - All files in the `${MAPR_HOME}/conf/tokens` directory
 - `maprserverticket`
 - `mapruserticket`
 - The `store-passwords.txt` file containing the clear-text passwords, if not already removed

For example:

```
cd /opt/mapr/conf
rm -rf ssl_* *.bcfks *.jceks tokens store-passwords.txt maprserverticket
mapruserticket ssl-client.xml ssl-server.xml
```

3. Run the `configure.sh` script with the `-secure -genkeys` options on the first CLDB node in your cluster:

```
/opt/mapr/server/configure.sh -secure -genkeys -Z
<Zookeeper_node_list> -C <CLDB_node_list> -N <cluster_name>
```

where both `<Zookeeper_node_list>` and `<CLDB_node_list>` have the form `hostname[:port_no][,hostname[:port_no]...]` and `-N <cluster_name>` specifies the cluster name. For the hostname, specify an FQDN as described in [Connectivity](#) on page 222. Do not specify an alias or IP address.

IMPORTANT: You must run `configure.sh` with the `-genkeys` option only *once* on one CLDB node, since the resulting files should be generated only once and then copied to other nodes.

Enabling Security for Additional Cluster Nodes

About this task

To enable security for additional cluster nodes, run `configure.sh` without the `-genkeys` option after copying the required files to the node. For a mixed configuration, first create the key and trust stores on the secure non-FIPS node using the `${MAPR_HOME}/server/manageSSLKeys.sh convert` utility. Then copy these stores to the key and trust stores of the additional cluster node:

- If you are connecting an additional secure non-FIPS cluster node to the first FIPS-enabled cluster node, copy the `ssl_keystore.bcfks` and `ssl_truststore.bcfks` from the `${MAPR_HOME}/conf` directory of the first FIPS-enabled cluster node to the node being configured. Then run the `manageSSLKeys.sh convert` utility from the secure non-FIPS node. Copy the converted JKS key and trust stores to the additional secure non-FIPS cluster node (or simply specify the destination key/trust store as `${MAPR_HOME}/conf/ssl_keystore` and `${MAPR_HOME}/conf/ssl_truststore` respectively in the `${MAPR_HOME}/server/manageSSLKeys.sh convert` utility).
- If you are connecting an additional FIPS-enabled cluster node to the first secure non-FIPS cluster node, copy the JKS `ssl_keystore` and `ssl_truststore` from the `${MAPR_HOME}/conf` directory of the first secure non-FIPS cluster node to a temporary directory of the first node. Then run the `manageSSLKeys.sh convert` utility from the first secure non-FIPS node. Copy the converted BCFKS key and trust stores to the `${MAPR_HOME}/conf` directory of the additional FIPS-enabled cluster node.

Adding a FIPS-Enabled Server to a FIPS Cluster**About this task**

To connect a FIPS-enabled server to a cluster consisting of at least one FIPS-enabled node.

Procedure

1. Copy the following files from the existing FIPS-enabled server to the new FIPS server:

Destination Node Type	Copy these files under <code>\${MAPR_HOME}</code> to the destination node . . .
CLDB and/or ZooKeeper nodes	<ul style="list-style-type: none"> • <code>conf/ssl_keystore.bcfks</code> • <code>conf/ssl_keystore.p12</code> • <code>conf/ssl_keystore.pem</code> • <code>conf/ssl_truststore.bcfks</code> • <code>conf/ssl_truststore.p12</code> • <code>conf/ssl_truststore.pem</code> • <code>conf/maprkeycreds.bcfks</code> • <code>conf/maprkeycreds.conf</code> • <code>conf/maprtrustcreds.bcfks</code> • <code>conf/maprtrustcreds.conf</code> • <code>conf/maprhsm.conf</code> • <code>conf/maprhsm.conf</code> • <code>conf/maprserverticket</code> • <code>conf/tokens</code> (use <code>scp -r</code> to copy everything in this folder)

Destination Node Type	Copy these files under \${MAPR_HOME} to the destination node . . .
All other cluster nodes, including MFS-only nodes	<ul style="list-style-type: none"> • <code>conf/ssl_keystore.bcfks</code> • <code>conf/ssl_keystore.p12</code> • <code>conf/ssl_keystore.pem</code> • <code>conf/ssl_truststore.bcfks</code> • <code>conf/ssl_truststore.p12</code> • <code>conf/ssl_truststore.pem</code> • <code>conf/maprkeycreeds.bcfks</code> • <code>conf/maprkeycreeds.conf</code> • <code>conf/maprtrustcreeds.bcfks</code> • <code>conf/maprtrustcreeds.conf</code> • <code>conf/maprhsm.conf</code> • <code>conf/maprserverticket</code> • <code>conf/ca</code> (use a command such as <code>scp -r</code> to copy everything in this folder)

CAUTION: Do NOT copy `conf/ssl_keystore` and `conf/ssl_truststore`. These are symbolic links to `ssl_keystore.bcfks` and `ssl_truststore.bcfks`, which will be generated by `configure.sh`.

CAUTION: When adding a non-FIPS node to a FIPS cluster, DO NOT copy the Hadoop `ssl*.xml` files to the other cluster nodes. The `manageSSLKeys.sh` script (invoked by `configure.sh`) uses the store type to determine if FIPS is enabled and assumes the system is FIPS-enabled if the store type is BCFKS. Copying the Hadoop `ssl*` files that are set to the BCFKS store type from a FIPS node to a non-FIPS node causes the `configure.sh` script to fail.

2. Run `configure.sh` without the `-genkeys` option. For example, if the cluster name is `fips0.cluster.com` and the CLDB and ZooKeeper nodes are at `m2-mapreng-vm166250`, then the command is:

```
/opt/mapr/server/configure.sh -secure -N fips0.cluster.com \
-C m2-mapreng-vm166250:7222
```

Adding a Secure Non-FIPS Server to a FIPS Cluster

About this task

Non-FIPS enabled nodes do not support the BCFKS trust store format. Copying the BCFKS trust store from a FIPS-enabled server to the non-FIPS enabled server that is being added will not work. Create the JKS trust store on the non-FIPS server by importing the same keys and certificates that are in the BCFKS key and trust stores on the existing FIPS-enabled server host. Different configuration procedures apply depending on whether you are configuring for the first cluster or for subsequent clusters.

Procedure

1. Copy the following files from an existing FIPS-enabled node in the cluster to the new non-FIPS node being added:

Destination Node Type	Copy these files under \${MAPR_HOME} to the destination node . . .
CLDB and/or ZooKeeper nodes	<ul style="list-style-type: none"> • conf/ssl_keystore.p12 • conf/ssl_keystore.pem • conf/ssl_truststore.p12 • conf/ssl_truststore.pem • conf/maprkeycreds.conf • conf/maprtrustcreds.conf • conf/maprhsm.conf • conf/maprserverticket • conf/tokens (use scp -r to copy everything in this folder)
All other cluster nodes, including MFS-only nodes	<ul style="list-style-type: none"> • conf/ssl_keystore.p12 • conf/ssl_keystore.pem • conf/ssl_truststore.p12 • conf/ssl_truststore.pem • conf/maprkeycreds.conf • conf/maprtrustcreds.conf • conf/maprhsm.conf • conf/maprserverticket • conf/ca (use a command such as scp -r to copy everything in this folder)

CAUTION: When adding a non-FIPS node to a FIPS cluster, DO NOT copy the Hadoop `ssl*.xml` files to the other cluster nodes. The `manageSSLKeys.sh` script (invoked by `configure.sh`) uses the store type to determine if FIPS is enabled and assumes the system is FIPS-enabled if the store type is BCFKS. Copying the Hadoop `ssl*` files that are set to the BCFKS store type from a FIPS node to a non-FIPS node causes the `configure.sh` script to fail.

2. Copy the following key store, trust store, userkey store, and usertrust store files from the FIPS-enabled server to a temporary directory of the secure non-FIPS enabled server being added:
 - `${MAPR_HOME}/conf/ssl_keystore.bcfks`
 - `${MAPR_HOME}/conf/ssl_truststore.bcfks`
 - `${MAPR_HOME}/conf/ssl_userkeystore.bcfks`
 - `${MAPR_HOME}/conf/ssl_usertruststore.bcfks`

3. Run the `manageSSLKeys.sh convert` utility to convert the key and trust store (and userkey and usertruststore) from BCFKS format to JKS format. The destination key and trust store will be set to the same password as the source key/trust store. You can obtain the key and trust store passwords from the `store-passwords.txt` file. For example:

```
# /opt/mapr/server/manageSSLKeys.sh convert \
  -srcType bcfks -dstType JKS \
  -p Vcc0L_Qhg3Ix6tLaRJhZr_b53judiaKC \
  /tmp/ssl_keystore.bcfks /opt/mapr/conf/ssl_keystore
# /opt/mapr/server/manageSSLKeys.sh convert \
  -srcType bcfks -dstType JKS \
  -p 1IB_wtxT5Lbj60U8xFpWpQiZ0SjE6BrA \
  /tmp/ssl_truststore.bcfks /opt/mapr/conf/ssl_truststore
# /opt/mapr/server/manageSSLKeys.sh convert \
  -srcType bcfks -dstType JKS \
  -p Vcc0L_Qhg3Ix6tLaRJhZr_b53judiaKC \
  /tmp/ssl_userkeystore.bcfks /opt/mapr/conf/ssl_userkeystore
# /opt/mapr/server/manageSSLKeys.sh convert \
  -srcType bcfks -dstType JKS \
  -p 1IB_wtxT5Lbj60U8xFpWpQiZ0SjE6BrA \
  /tmp/ssl_usertruststore.bcfks /opt/mapr/conf/ssl_usertruststore
```

4. Run the `configure.sh` script without the `-genkeys` option on the secure non-FIPS enabled server being added, using the `-storepasswd` option to specify the key and trust store passwords. Since the converted key and trust stores are set to the same password as the source, the passwords must be the same as the passwords you specified using the `-p` option in [step 3](#). For example:

```
# /opt/mapr/server/configure.sh -secure \
  -N hpe186.cluster.com \
  -C m2-mapreng-vm167186:7222 \
  -Z m2-mapreng-vm167186:5181 \
  -storepasswd \
  Vcc0L_Qhg3Ix6tLaRJhZr_b53judiaKC:1IB_wtxT5Lbj60U8xFpWpQiZ0SjE6BrA
```

Adding a FIPS Server to a Secure Non-FIPS Cluster

About this task

Use the following steps to connect a FIPS-enabled server to a cluster consisting of only secure non-FIPS enabled nodes;

Procedure

1. Copy the following files from an existing secure non-FIPS node in the cluster to the FIPS-enabled server being added:

Destination Node Type	Copy these files under \${MAPR_HOME} to the destination node . . .
CLDB and/or ZooKeeper nodes	<ul style="list-style-type: none"> • conf/ssl_keystore.p12 • conf/ssl_keystore.pem • conf/ssl_truststore.p12 • conf/ssl_truststore.pem • conf/maprkeycreds.conf • conf/maprtrustcreds.conf • conf/maprhsm.conf • conf/maprserverticket • conf/tokens (use scp -r to copy everything in this folder)
All other cluster nodes, including MFS-only nodes	<ul style="list-style-type: none"> • conf/ssl_keystore.p12 • conf/ssl_keystore.pem • conf/ssl_truststore.p12 • conf/ssl_truststore.pem • conf/maprkeycreds.conf • conf/maprtrustcreds.conf • conf/maprhsm.conf • conf/maprserverticket • conf/ca (use a command such as scp -r to copy everything in this folder)

CAUTION: When adding a non-FIPS node to a FIPS cluster, DO NOT copy the Hadoop `ssl*.xml` files to the other cluster nodes. The `manageSSLKeys.sh` script (invoked by `configure.sh`) uses the store type to determine if FIPS is enabled and assumes the system is FIPS-enabled if the store type is BCFKS. Copying the Hadoop `ssl*` files that are set to the BCFKS store type from a FIPS node to a non-FIPS node causes the `configure.sh` script to fail.

- On the secure non-FIPS enabled server in the existing cluster, run the `manageSSLKeys.sh` `convert` utility to convert the key and trust store (and `userkey` and `usertruststore`) from JKS to BCFKS format. You can obtain the key and trust store passwords from the `store-passwords.txt` file. For example:

```
# /opt/mapr/server/manageSSLKeys.sh convert \
  -srcType JKS -dstType bcfks \
  -p Vcc0L_Qhg3Ix6tLaRJhZr_b53judiaKC \
  /opt/mapr/conf/ssl_keystore /tmp/ssl_keystore.bcfks
# /opt/mapr/server/manageSSLKeys.sh convert \
  -srcType JKS -dstType bcfks \
  -p 1IB_wtxT5Lbj60U8xFpWpQiZ0SjE6BrA \
  /opt/mapr/conf/ssl_truststore /tmp/ssl_truststore.bcfks
# /opt/mapr/server/manageSSLKeys.sh convert \
  -srcType JKS -dstType bcfks \
  -p Vcc0L_Qhg3Ix6tLaRJhZr_b53judiaKC \
  /opt/mapr/conf/ssl_userkeystore /tmp/ssl_userkeystore.bcfks
# /opt/mapr/server/manageSSLKeys.sh convert \
  -srcType JKS -dstType bcfks \
  -p 1IB_wtxT5Lbj60U8xFpWpQiZ0SjE6BrA \
  /opt/mapr/conf/ssl_usertruststore /tmp/ssl_usertruststore.bcfks
```

- Copy the converted `.bcfks` files from the secure non-FIPS server to the FIPS server being added as follows:

Copy this converted file ...	To this location on the FIPS server ...
<code>ssl_keystore.bcfks</code>	<code>/opt/mapr/conf/ssl_keystore.bcfks</code>
<code>ssl_userkeystore.bcfks</code>	<code>/opt/mapr/conf/ssl_userkeystore.bcfks</code>
<code>ssl_truststore.bcfks</code>	<code>/opt/mapr/conf/ssl_truststore.bcfks</code>
<code>ssl_usertruststore.bcfks</code>	<code>/opt/mapr/conf/ssl_usertruststore.bcfks</code>

- Run `configure.sh` without the `-genkeys` option on the FIPS enabled server being added, using the `-storepasswd` option to specify the key and trust store passwords. Since the converted BCFKS key and trust store is set to the same password as the source, the passwords must be the same as the passwords specified using the `-p` option in [step 2](#). For example:

```
/opt/mapr/server/configure.sh -secure \
  -N hpe186.cluster.com \
  -C m2-mapreng-vm167186:7222 \
  -Z m2-mapreng-vm167186:5181 \
  -storepasswd \
  Vcc0L_Qhg3Ix6tLaRJhZr_b53judiaKC:1IB_wtxT5Lbj60U8xFpWpQiZ0SjE6BrA
```

Understanding the Key Store and Trust Store Files

Provides a comprehensive listing of the key store and trust store files.

Key Stores and Trust Stores Added for Release 7.0.0

Release 7.0.0 added the following key store and trust store files to support FIPS compliance. For Java applications, the Bouncy Castle BCFKS key and trust stores are used. This is new for release 7.0.0. For non-Java applications, the existing PKCS#12 key and trust stores, as well as PEM files are used.

As part of [Enabling Security on a Configured Cluster](#) on page 2048, you must copy the key and trust stores, as well as the associated key and trust store credentials, from the `/opt/mapr/conf` directory of the first CLDB node to the `/opt/mapr/conf` directory on all other server nodes. For client-only nodes, only copy the trust stores and the associated trust store credentials.

maprkeycreds.bcfks	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> On FIPS-enabled nodes, the encrypted key store that contains passwords used to access the ssl_keystore and ssl_userkeystore.</p>
maprkeycreds.jceks	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> On non-FIPS-enabled nodes, the encrypted key store that contains passwords used to access the ssl_keystore and ssl_userkeystore.</p>
maprtrustcreds.bcfks	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> On FIPS-enabled nodes, the encrypted trust store that contains passwords used to access the ssl_truststore and ssl_usertruststore.</p>
maprtrustcreds.jceks	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> On non-FIPS-enabled nodes, the encrypted trust store that contains passwords used to access the ssl_truststore and ssl_usertruststore.</p>
ssl_keystore.bcfks	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> On FIPS-enabled nodes, the encrypted key store that is generated by configure.sh and used by various Data Fabric server-side components for TLS 1.2 communication.</p>
ssl_truststore.bcfks	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> On FIPS-enabled nodes, the encrypted trust store that is generated by configure.sh and used by various Data Fabric server-side components for TLS 1.2 communication.</p>
ssl_userkeystore.bcfks	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> On FIPS-enabled nodes, the encrypted key store containing the private keys and the certificates for log-monitoring users.</p>
ssl_usertruststore.bcfks	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> On FIPS-enabled nodes, the encrypted trust store containing the public keys, and no private keys, for log-monitoring users.</p>

Key Stores and Trust Stores Added for Release 6.2.0

The following key store and trust store files were added at release 6.2.0 to support SSL security for the log stack (Kibana, Elasticsearch, and Fluentd). As part of [Enabling Security on a Configured Cluster](#) on page 2048, you must copy these files from the /opt/mapr/conf directory of the security master node to the /opt/mapr/conf directory on all other nodes, and assign the [appropriate ownership and permissions](#).

ssl_userkeystore	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> The key store containing the private keys and the certificates for log-stack users.</p>
ssl_userkeystore.csr	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> The certificate-signing request created when the certs are signed using the CA chain.</p>
ssl_userkeystore.p12	<p><i>Location:</i> /opt/mapr/conf</p>

ssl_userkeystore.p12	<p><i>Description:</i> The PKCS#12 version of the ssl_userkeystore. The .p12 version of the file is reserved for future use.</p> <p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> The key store containing all of the certs from the ssl_userkeystore in the .pem format.</p>
ssl_userkeystore-signed.pem	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> The key store containing all of the signed certs from the ssl_userkeystore in the .pem format.</p>
ssl_usertruststore	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> The trust store containing the public keys, and no private keys, for the log-stack users.</p>
ssl_usertruststore.p12	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> The PKCS#12 version of the ssl_usertruststore. The .p12 version of the file is reserved for future use.</p>
ssl_usertruststore.pem	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> The key store containing all of the certs from the ssl_usertruststore in the .pem format.</p>

Certificate Files in 6.2.0

The following files were added at release 6.2.0 to facilitate self-signing of Data Fabric certificates. Previously, Data Fabric certificates were unsigned. As part of [Enabling Security on a Configured Cluster](#) on page 2048, you must copy these files from the /opt/mapr/conf directory of the security master node to the /opt/mapr/conf directory on all other nodes, and assign the appropriate ownership and permissions:

root-ca.pem	<p><i>Location:</i> /opt/mapr/conf/ca</p> <p><i>Description:</i> The root signing certificate authority.</p>
chain-ca.pem	<p><i>Location:</i> /opt/mapr/conf/ca</p> <p><i>Description:</i> The chain certificate authority, which contains both the root CA and signing CA.</p>
signing-ca.pem	<p><i>Location:</i> /opt/mapr/conf/ca</p> <p><i>Description:</i> The signing certificate authority.</p>

KMIP Tokens Added in 6.2.0

External key store (KMIP) tokens were also added as part of release 6.2.0. The KMIP tokens are used for authentication and communication with an external key store. The tokens are contained in /opt/mapr/conf/tokens. Tokens must be copied to all the CLDB nodes in the cluster.

Key Stores and Trust Stores in Release 6.1.0

The following files are generated by running `configure.sh -dare -genkeys` on a CLDB node. Alternatively, you can generate them by running the [manageSSLKeys.sh](#) on page 3268 script. The ssl_keystore, ssl_keystore.p12, ssl_keystore.pem, ssl_truststore, ssl_truststore.p12, and ssl_truststore.pem files are also generated during installation of the Web server, even if you did not enable security. For more information, see [Enabling Security on a Configured Cluster](#) on page 2048.

cldb.key	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> The CLDB key file. This file must exist on all CLDB nodes and be identical. Releases 7.0.0 and later no longer use this key file. For more information, see Protection of CLDB and DARE Master Keys on page 2085.</p>
dare.master.key	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> The key file that enables data-at-rest encryption. The dare.master.key file is generated only if data-at-rest encryption is enabled on the cluster. This file must be copied to all the nodes with the CLDB service installed.</p>
maprserverticket	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> The server ticket. This file must exist on all cluster nodes and be identical.</p>
ssl-client.xml	<p><i>Location (symlink):</i> /opt/mapr/conf</p> <p><i>Location (file):</i> \$ {MAPR_HOME}/hadoop/hadoop-<version>/etc/hadoop/ssl-client.xml</p> <p><i>Description:</i> Contains the SSL configuration for the client in XML format.</p>
ssl_keystore	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> This file is needed on all nodes where the webserver is running.</p>
ssl_keystore.p12	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> When upgrading from Core 5.2.2 or Core 6.0.x to Data Fabric 6.1 or later, create the ssl_keystore.p12 and ssl_truststore.p12 files. Copy them to the /opt/mapr/conf directory on all nodes in the cluster. The .p12 files are required to generate the .pem files needed by Grafana and the Data Access Gateway. This step is necessary only for manual upgrades.</p>
ssl_keystore.pem	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> When upgrading from Core 5.2.2 or Core 6.0.x to Data Fabric 6.1 or later, create the ssl_truststore.pem and ssl_keystore.pem files. Copy them to the /opt/mapr/conf directory on all nodes in the cluster. The Data Access Gateway, Grafana, and Hue components use these files. This step is necessary only for manual upgrades.</p>
ssl-server.xml	<p><i>Location (symlink):</i> /opt/mapr/conf</p> <p><i>Location (file):</i> \$ {MAPR_HOME}/hadoop/hadoop-<version>/etc/hadoop/ssl-server.xml</p> <p><i>Description:</i> Contains the SSL configuration for the server in XML format.</p>
ssl_truststore	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> contains the certificates required by nodes initiating communication over TLS.</p>
ssl_truststore.p12	<p><i>Location:</i> /opt/mapr/conf</p> <p><i>Description:</i> When upgrading from Core 5.2.2 or Core 6.0.x to Data Fabric 6.1 or later, create</p>

ssl_truststore.pem

the `ssl_keystore.p12` and `ssl_truststore.p12` files, and copy them to the `/opt/mapr/conf` directory on all nodes in the cluster. The `.p12` files are required to generate the `.pem` files needed by Grafana and the Data Access Gateway. This step is necessary only for manual upgrades.

Location: `/opt/mapr/conf`

Description: When upgrading from Core 5.2.2 or Core 6.0.x to Data Fabric 6.1 or later, create the `ssl_truststore.pem` and `ssl_keystore.pem` files. Copy them to the `/opt/mapr/conf` directory on all nodes in the cluster. The Data Access Gateway, Grafana, and Hue components use these files. This step is necessary only for manual upgrades.

System Behavior Changes After Enabling Security

After enabling security features for a cluster, the following behaviors change:

- Users must authenticate with the [maprlogin](#) utility.
- Components that have web UIs, such as the Control System, Hive, and Oozie, require authentication.
-  **WARNING:** Note that you must also complete the [PAM configuration](#) to set up user authentication for the Control System logins.
- Several components that communicate over HTTP use HTTPS instead.
- Encryption is used for network traffic.
- Access to a cluster using URIs that use the CLDB node's name or IP address, instead of the cluster name, is no longer supported, as in the following examples. The following URIs no longer work after enabling security:

```
http://cldb1.cluster.com:7222/f1
```

```
http://10.10.20.10:7221/f1
```

The following URIs work after enabling security:

```
http:///f1 <access f1 in default cluster>
```

```
http://my.cluster.com/f1
```

Managing Encryption

Provides information that allows you to use encryption across the HPE Data Fabric platform.

This section describes how to enable security for data at rest and on the wire as well as general security components and system changes.

Enabling Wire-level Security**About this task**

Wire-level security encrypts data transmission between the nodes in your cluster.

Enable encryption for data on the wire at the volume level only if security is enabled at the cluster level. If necessary, refer to [Determining if a Cluster is Secure Using the CLI and REST API](#) on page 2075 to determine if the cluster is secure before enabling wire-level encryption on a volume. If your cluster is

enabled for security, wire-level security is enabled by default on all new volumes and no additional steps are required. This section describes how to enable wire-level security on new and existing volumes (if the volume is already not enabled for wire-level security).

Enabling Wire-level Security for a Volume Using the Control System

About this task

Procedure

1. Log in to the Control System and click **Data > Volumes**.
2. Click **Create Volume** to display the **Create New Volume** page or go to the [Edit Volume](#) page.
3. Set the value for the **Data on Wire Encryption** property to **Yes** (to enable).
See [Creating a Volume](#) on page 1437 or [Modifying a Volume](#) on page 1467 for more information.
4. Complete the steps to create or modify the volume.
See [Creating a Volume](#) on page 1437 or [Modifying a Volume](#) on page 1467 for more information.

Enabling Wire-Level Security for a Volume Using the CLI and REST API

About this task

CLI

Set the value for the `wiresecurityenabled` parameter to true when you:

- Create the volume. For example:

```
maprcli volume create -name
<volName> -path
<volMountPath> -wiresecurityenabled
true
```

- Modify the volume. For example:

```
maprcli volume modify -name
<volName> -wiresecurityenabled true
```

REST

Send a request of type POST and set the value for the `wiresecurityenabled` parameter to true when you:

- Create the volume. For example:

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/
create?
name=<volName>&path=<volMountPath>&
wiresecurityenabled=true' --user
<username>:<password>
```

- Modify the volume. For example:

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/
modify?
name=<volName>&wiresecurityenabled=
true' --user <username>:<password>
```

See [volume create](#) on page 2929 and [volume modify](#) on page 3018 for more information.

Disabling Wire-level Security

About this task

Disable wire encryption for a volume using the Control System, the CLI, and REST API.

Disabling Wire-level Security for a Volume Using the Control System

Procedure

1. Log in to the Control System and click **Data > Volumes**.
2. Click **Create Volume** to display the **Create New Volume** page or go to the [Edit Volume](#) page.
3. Set the value for the **Data on Wire Encryption** property to **No** (to disable).
See [Creating a Volume](#) on page 1437 or [Modifying a Volume](#) on page 1467 for more information.
4. Complete the steps to create or modify the volume.
See [Creating a Volume](#) on page 1437 or [Modifying a Volume](#) on page 1467 for more information.

Disabling Wire-Level Security for a Volume Using the CLI and REST API

About this task

You can disable encryption of data on wire at the volume level.

CLI

Set the value for the wiresecurityenabled parameter to false when you:

- Create the volume. For example:

```
maprcli volume create -name
<volName> -path
<volMountPath> -wiresecurityenabled
false
```

- Modify the volume. For example:

```
maprcli volume modify -name
<volName> -wiresecurityenabled
false
```

REST

Send a request of type POST and set the value for the wiresecurityenabled parameter to false when you:

- Create the volume. For example:

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/
create?
name=<volName>&path=<volMountPath>&
wiresecurityenabled=false' --user
<username>:<password>
```

- Modify the volume. For example:

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/
modify?
name=<volName>&wiresecurityenabled=
false' --user <username>:<password>
```

See [volume create](#) on page 2929 and [volume modify](#) on page 3018 for more information.

Enabling Encryption of Data at Rest

About this task

Enable or disable data-at-rest encryption at the volume level using the Control System, CLI, and REST API if encryption of data at rest is enabled at the cluster level. If you installed using the [Installer](#) on page 7511 and selected the **Enable DARE** option, the cluster is automatically enabled for data-at-rest encryption during installation.

NOTE: Conversion of existing HPE Data Fabric clusters to data-at-rest encryption is not currently supported. If you need to convert an existing non-DARE cluster to DARE, contact HPE support.

If encryption is enabled at the cluster level, data-at-rest encryption is also enabled at the volume level by default through the `mapr.volume.dare.default` configuration parameter. If you do not wish to encrypt data at rest in a volume, you can disable encryption when you create a volume. You cannot modify the data-at-rest encryption setting on a volume after the volume is created. For more information, see the following later on this page:

- [Enabling or Disabling Data-at-Rest Encryption at the Volume Level Using the Control System](#) on page 2071
- [Enabling or Disabling Data-at-Rest Encryption at the Volume Level Using the CLI and REST API](#) on page 2071

Standard volumes inherit the data-at-rest encryption setting from a volume by default if the `inherit` property is specified. If you create a mirror volume for a source volume enabled for data-at-rest encryption, the mirror volume:

- Inherits the data-at-rest encryption setting from the source volume if the mirror volume is in the same cluster as the source volume or if the mirror volume is on a remote cluster enabled for encryption of data at rest.
- Does not inherit the data-at-rest encryption setting from the source volume if the mirror volume is on an unsecure cluster, or if the mirror volume is on secure cluster that is not enabled for encryption of data at rest.

NOTE: If you want to create a mirror volume enabled for data-at-rest encryption for a source volume not enabled for data-at-rest encryption, set the value to `true` for the `dare` property after creating the mirror volume.

This section describes how to enable data-at-rest encryption at the volume level.

Enabling or Disabling Data-at-Rest Encryption at the Volume Level Using the Control System

About this task

You can enable data-at-rest encryption at the volume level only if data-at-rest encryption is enabled at the cluster level. If necessary, refer to [Determining if a Secure Cluster is Enabled for Encryption Using the Control System](#) on page 2074 to determine if the cluster is enabled for encryption of data at rest before enabling data-at-rest encryption on a volume.

NOTE: If you do not want to encrypt data at rest in a volume, disable encryption after you create a volume. You cannot modify data-at-rest encryption setting on a volume after the volume is created.

To enable or disable data-at-rest encryption for a new volume using the Control System:

Procedure

1. Log in to the Control System and click **Data > Volumes**.
2. Click **Create Volume** to display the **Create New Volume** page.
3. Select volume type, specify values for required and optional properties, and set the value for the **Data at Rest Encryption** property to **Yes** (to enable) or **No** (to disable).
See [Creating a Volume](#) on page 1437 for more information.
4. Click **Create Volume** to create a volume enabled for encryption of data at rest.

Enabling or Disabling Data-at-Rest Encryption at the Volume Level Using the CLI and REST API

About this task

You can enable DARE at the volume level only if data-at-rest encryption is enabled at the cluster level. If necessary, refer to [Determining if a Secure Cluster is Enabled for Encryption of Data at Rest Using the CLI and REST API](#) on page 2076 to determine if the cluster is enabled for encryption of data at rest before enabling a volume for data-at-rest encryption.

NOTE: If you do not want to encrypt data at rest in a volume, disable encryption after you create that volume. You cannot modify data-at-rest encryption setting on a volume after the volume is created.

CLI

Set the value for the dare parameter to one of the following when you create the volume:

- true to enable data-at-rest encryption.

NOTE: true is the default value.

For example:

```
maprcli volume create -name
<volName> -path <volMountPath>
[-dare true]
```

- false to disable data-at-rest encryption.

For example:

```
maprcli volume create -name
<volName> -path
<volMountPath> -dare false
```

REST

Send a request of type POST and set the value for the `dare` parameter to one of the following when you create the volume:

- `true` to enable data-at-rest encryption.

NOTE: This is the default value.

For example:

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
name=<volName>&path=<volMountPath>[
&dare=true]' --user mapr:mapr
```

- `false` to disable data-at-rest encryption.

For example:

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/create?
name=<volName>&path=<volMountPath>&
dare=false' --user mapr:mapr
```

See [volume create](#) on page 2929 for more information.

Converting to Cluster Enabled for Data-at-Rest Encryption

Enable data-at-rest encryption for a cluster.

About this task

Conversion of existing HPE Data Fabric clusters to data-at-rest encryption is not currently supported. If you need to convert an existing non-DARE cluster to DARE, contact HPE support.

Managing SSL Certificates

This section describes how to manage certificates and keystores such as when encryption is initially not enabled or when a custom certificate is used.

[Using Custom Signed Certificates](#) on page 2073

[Using Custom Signed Certificates with Object Store](#) on page 659

Re-running `configure.sh` after Configuration

If the `configure.sh` script is initially run without the `-genkeys` option, the script generates a `ssl_keystore` file for use by the web server for the Control System.

Then if the `configure.sh` script is re-run with the `-genkeys` option, the system detects the existing `ssl_*` files and exits with an error to prevent inadvertent deletion or reuse of the `ssl_keystore` file.

NOTE: For general information on certificates, see [SSL Certificates](#) on page 909.

To re-run `configure.sh` on clusters without security features enabled:

1. Manually delete the `ssl_keystore` file on each node.
2. Run the `configure.sh -genkeys -R` command.

NOTE: The contents of the `ssl_keystore` file are unique to each node.

To re-run `configure.sh` on clusters where the contents of the `ssl_keystore` file are customized:

1. Run the `configure.sh -genkeys -nocerts -R` command to preserve your customizations.

SSL Keys Error Message

The error message will look like the following example:

```
/opt/mapr/server/configure.sh
  -secure -genkeys -C $CLDB_GRP -Z $ZK_GRP -RM $RM -HS
  $HISTORYSERVER
  <hostname1>: Configuring Hadoop-2.x at
  /opt/mapr/hadoop/hadoop-2.x
  <hostname1>: Done configuring Hadoop
  <hostname1>: CLDB node list:
  <hostname1>:7222,<hostname2>:7222,<hostname3>:7222

  <hostname1>: Zookeeper node
  list: <hostname1>:5181,<hostname2>:5181,<hostname3>:5181

  <hostname1>: Node setup configuration: cldb fileserver
  historyserver nfs nodemanager resourcemanager webserver
  zookeeper
  <hostname1>: Log can be found at:
  /opt/mapr/logs/configure.log
  <hostname1>: /opt/mapr/conf/ssl_keystore already exists
  <hostname1>: ERROR: could not generate ssl keys. See log file
  for more details
  clush: <hostname1>: exited with exit code 1
```

Using Custom Signed Certificates

Describes how to use custom certificates signed by a Certificate Authority (CA) instead of the default self-signed certificate provided during installation of the Data Fabric cluster.

For instructions on replacing a certificate and configuring the system to recognize and trust the CA-signed certificate, see the following articles on the HPE Support Center:

[How to import CA \(Certificate Authority\) signed certificates to Ezmeral Data Fabric 7](#)

[How to import CA signed Certificates for the EDF Monitoring components](#)

General Security for Ecosystem Components

Ecosystem components in HPE Data Fabric use the Java Authentication and Authorization Service (JAAS) for security configuration.

- `/opt/mapr/conf/mapr.login.conf` file-defines JAAS configurations
- `MAPR_ECOSYSTEM_LOGIN_OPTS` environment variable in the `/opt/mapr/conf/env.sh` file-specifies the JAAS configuration used by installed Ecosystem components

NOTE: See the [Ecosystem Guide](#) for component-specific security configuration information.

When security is [enabled](#), the value of the `MAPR_ECOSYSTEM_LOGIN_OPTS` is modified to include the hybrid JVM option for `hadoop.login`. This is equivalent to setting the `-Dhadoop.login=hybrid` flag at the command line. This setting specifies a mixed security environment using Kerberos and MapR tickets.

The `mapr.login.conf` file has two stanzas for hybrid security:

```
/**
 * authenticate using hybrid of kerberos and MapR
 * maprticket must already exist on filesystem as MapR login module
 * cannot get kerberos identity from subject for implicit login.
 */

hadoop_hybrid {
    org.apache.hadoop.security.login.KerberosBugWorkAroundLoginModule optional
```

```

        useTicketCache=true
        renewTGT=true
        doNotPrompt=true;
com.mapr.security.maprsasl.MaprSecurityLoginModule required
        checkUGI=false;
org.apache.hadoop.security.login.GenericOSLoginModule required;
org.apache.hadoop.security.login.HadoopLoginModule required
        principalPriority=com.mapr.security.MapRPrincipal;
};

hadoop_hybrid_keytab {
    org.apache.hadoop.security.login.KerberosBugWorkAroundLoginModule optional
        refreshKrb5Config=true
        doNotPrompt=true
        useKeyTab=true
        storeKey=true;
com.mapr.security.maprsasl.MaprSecurityLoginModule required
        checkUGI=false
        useServerKey=true;
org.apache.hadoop.security.login.GenericOSLoginModule required;
org.apache.hadoop.security.login.HadoopLoginModule required
        principalPriority=com.mapr.security.MapRPrincipal;
};

```

Determining if a Cluster is Secure and Enabled for Encryption

Explains how to use the Control System, the CLI, and REST API to determine whether a cluster is secure and whether on-wire encryption and data-at-rest encryption are enabled at the cluster and volume levels.

Determining if a Cluster is Secure Using the Control System

Procedure

- Log in to the Control System and click  to display the **Security** page.
The **Security** page contains information for determining whether the cluster is secure and enabled for on-wire encryption and/or data-at-rest encryption.

Determining if a Secure Cluster is Enabled for Encryption Using the Control System

Procedure

- Log in to the Control System on a secure cluster and click  to display the **Security** page.
The page displays the following:
 - Cluster-level Settings**—whether on-wire encryption and authentication, and data-at-rest encryption is enabled at the cluster-level. The pane shows:
 - —if enabled
 - —if disabled
 - Volume Settings**—the number of volumes that are not enabled for:
 - Data On-Wire Encryption
 - Data-at-Rest Encryption

Click the number associated with Data On-Wire Encryption or Data-at-Rest Encryption to display the list of volumes filtered.

Determining if a Cluster is Secure Using the CLI and REST API

About this task

CLI

Run the following command to determine if a cluster is secure or unsecure:

```
/opt/mapr/bin/maprccli dashboard
info -cluster <clusterName> -json |
grep secure
```

The value for secure is true if secure and false if unsecure in the command output.

REST

Send a request of type GET. For example:

```
curl -X GET 'https://10.10.82.24:8443/
rest/dashboard/info' --user
<username>:<password>
{"timestamp":1525198793701,"timeofday"
:"2018-05-01 11:19:53.701 GMT-0700
AM", "status":"OK", "total":1, "data":
[{"version":"6.1.0.20180501072815.GA",
"cluster":
{"name":"ksTest", "secure":true, "dare":

_vcores":0, "used_disks":0}}]]}
```

The value for secure is true if secure and false if unsecure.

If the value for secure is true, your cluster is enabled for on-wire encryption. See [dashboard info](#) on page 2401 for more information.

Determining if a Secure Cluster is Enabled for Encryption of Data at Rest Using the CLI and REST API

About this task

CLI

Run the following command to determine if a cluster is enabled or disabled for data-at-rest encryption:

```
/opt/mapr/bin/maprcli dashboard
info -name <clusterName> -json | grep
dare
```

The value for dare is true if enabled and false if disabled in the command output.

REST

Send a request of type GET. For example:

```
curl -X GET 'https://10.10.82.24:8443/
rest/dashboard/info' --user
<username>:<password>
{"timestamp":1525198793701, "timeofday":
"2018-05-01 11:19:53.701 GMT-0700
AM", "status":"OK", "total":1, "data":
[{"version":"6.1.0.20180501072815.GA",
"cluster":
{"name":"ksTest", "secure":true, "dare":

```

The value for `dare` is true if enabled and false if disabled.

See [dashboard info](#) on page 2401 for more information.

Managing FIPS Security

The topics in this section describe how to learn about and manage your FIPS configuration.

Determining if a Host Is in FIPS Mode

Explains how to use the CLI, REST commands, or the Control System to determine if a host is in FIPS mode.

Determining if a Host Is in FIPS Mode Using the CLI and REST API

About this task

FIPS is a host-specific property, not a cluster-wide property. It is possible to have a mix of FIPS-compliant and non-FIPS compliant nodes in the same cluster.

Release 7.0.0 enhanced the output of the [maprcli node list](#) command to include a new `isFips` field name. When the value of `isFips` is 1, the Data Fabric core platform is in FIPS mode on the specified host. If the value is 0, the core platform is in non-FIPS mode.

CLI

Run the `maprcli node list -json` command to determine if a node is in FIPS or non-FIPS mode:

```
$ maprcli node list -json
{
  "timestamp":1629755217258,
  "timeofday":"2021-08-23
02:46:57.258 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "id":"3229336703213394432",
      "ip":"10.163.166.250",
```

```
"hostname":"fips0.storage.hpecorp.net"
,
  "racktopo":"/data/default-rack/
fips0.storage.hpecorp.net",
  "labels":[
    "default"
  ],
  "isFips":1,
  "health":0,
  ...
```

Another option is to run the `sysctl crypto.fips_enabled` command. This is the command that the `configure.sh` script uses to determine if the operating system is FIPS-enabled:

```
sudo sysctl crypto.fips_enabled
crypto.fips_enabled = 1
```

Another option is to run the following command:

```
fips-mode-setup --check
FIPS mode is enabled.
```

REST

Use the REST equivalent of the `maprcli node list` command, which returns the `isFips` value for each node:

```
curl -u <username>:<password> -X
GET -k "https://host:8443/rest/node/
list"
```

Control System

On the **Nodes** page, double-click a **Hostname** to display node-detail information that includes the FIPS status:

You can also customize the **Nodes** pane on the **Nodes** page to include the FIPS status. See [Viewing the list of Nodes](#) on page 1364 and [Customizing the List of Columns/Fields](#) on page 1365.

Using the Java keytool with Bouncy Castle Key and Trust Stores

Use the Java `keytool` command to manipulate key and trust stores, which includes listing the aliases or contents, exporting certificates, and merging trust stores.

keytool Requires Additional Parameters

The Bouncy Castle BCFKS provider is not installed as part of the JDK but is bundled with the HPE Data Fabric core distribution. The Java `keytool` command needs additional options to specify the

BCFKS provider and path. The following example of the keytool command shows how to view the fips9.cluster.com alias. Boldface items are additional, required, and highlighted parameters.

```
{JAVA_HOME}/bin/keytool -list -alias fips9.cluster.com \
  -storepass JNMdxFTlFZ5iMlusFE4l0oaqV06InHYr \
  -keystore /opt/mapr/conf/ssl_keystore.bcfks \
  -storetype bcfks \
  -provider org.bouncycastle.jcajce.provider.BouncyCastleFipsProvider \
  -providerpath /opt/mapr/lib/bc-fips-1.0.2.1.jar \
  -providername BCFIPS \
```

FIPS-Approved Key and Trust Stores

Two key and trust stores are approved for hosts in FIPS mode:

- For Java applications, the Bouncy Castle BCFKS key and trust stores are used. This is new for release 7.0.0.
- For non-Java applications, the existing PKCS#12 key and trust stores, as well as PEM files are used. The keytool command cannot be used for the PKCS#12 key and trust stores in FIPS mode. You must use the openssl PKCS 12 commands.

Key and Trust Stores for Java Applications

The Bouncy Castle FIPS-approved BCFKS store format is the only store type that is used by the HPE Data Fabric core platform if FIPS mode is enabled. In addition to the regular parameters for manipulating BCFKS key and trust stores, you must specify the boldface parameters shown in the following examples.

For example, supposing the key store password is 4HHXZzoU665Lt_Z0yLNMAtnW_t7SQcT. (Obtain key and trust store passwords from the key or trust store property in \${MAPR_HOME}/conf/store-passwords.txt after installation.) Use a new keytool to generate a key pair, and add it to the key store as shown below:

```
# keytool -keystore /opt/mapr/conf/ssl_keystore.bcfks \
  -storetype BCFKS \
  -providername BCFIPS \
  -providerclass org.bouncycastle.jcajce.provider.BouncyCastleFipsProvider \
  -provider org.bouncycastle.jcajce.provider.BouncyCastleFipsProvider \
  -providerpath bc-fips-1.0.2.jar \
  -alias hpe188.cluster.com \
  -genkeypair -sigalg SHA512withRSA -keyalg RSA -storepass \
  4HHXZzoU665Lt_Z0yLNMAtnW_t7SQcT \
  -dname CN=hpe188.cluster.com -keypass 4HHXZzoU665Lt_Z0yLNMAtnW_t7SQcT
```

To import a certificate into the key store manually:

```
# keytool -keystore /opt/mapr/conf/ssl_keystore.bcfks \
  -storetype BCFKS \
  -providername BCFIPS \
  -providerclass org.bouncycastle.jcajce.provider.BouncyCastleFipsProvider \
  -provider org.bouncycastle.jcajce.provider.BouncyCastleFipsProvider \
  -providerpath bc-fips-1.0.2.jar \
  -alias qaclient \
  -storepass 4HHXZzoU665Lt_Z0yLNMAtnW_t7SQcT \
  -keypass 4HHXZzoU665Lt_Z0yLNMAtnW_t7SQcT \
  -import \
  -file <path-to-certificate-file>
```

To view the contents of the keystore, use the `keytool` command. The `storetype`, `providername`, `providerclass`, `provider`, `providerpath`, `alias` and `storepass` options are required. The `storetype`, `providername`, `providerclass`, `provider`, and `providerpath` fields must always be set to the boldface values as shown below:

```
# keytool -keystore /opt/mapr/conf/ssl_keystore.bcfks \
  -storetype BCFKS \
  -providername BCFIPS \
  -providerclass org.bouncycastle.jcajce.provider.BouncyCastleFipsProvider \
  -provider org.bouncycastle.jcajce.provider.BouncyCastleFipsProvider \
  -providerpath bc-fips-1.0.2.jar \
  -alias hpe186.cluster.com\
  -storepass 4HHXZzoU665Lt_Z0yLNMAtnW_t7SQcT \
  -list
hpe186.cluster.com, Mar 1, 2021, trustedCertEntry,
Certificate fingerprint (SHA-256):
69:30:5A:50:6F:4C:17:7F:CD:EA:B3:F9:FE:FE:96:A5:40:05:C2:FF:76:C0:86:35:1E:9
3:E9:A5:2C:12:96:C3
```

Key and Trust Store Password Protection

This section describes how keystore and truststore passwords are protected.

Password Protection in Release 6.2.0 and Earlier Releases

In release 6.2.0 and earlier releases of the HPE Data Fabric, key and trust store passwords are stored in clear text in the Hadoop `ssl-server.xml` and `ssl-client.xml` configuration files. They are the same for both key and trust stores. The following example shows how the passwords (in **boldface**) are configured in `${MAPR_HOME}/hadoop/hadoop-${HADOOP_VERSION}/etc/hadoop/ssl-server.xml`.

```
<configuration>
...
<property>
  <name>ssl.server.truststore.password</name>
  <value>AB8F93FAA45393F84BD358d0</value>
  <description>Optional. Default value is "".
</description>
</property>
...
<property>
  <name>ssl.server.keystore.password</name>
  <value>AB8F93FAA45393F84BD358d0</value>
  <description>Must be specified.
</description>
</property>
<property>
  <name>ssl.server.keystore.keypassword</name>
  <value>AB8F93FAA45393F84BD358d0</value>
  <description>Must be specified.
</description>
</property>
...
</configuration>
```

Key store protection for release 6.2.0 and earlier is by file permissions. There is no protection for trust store passwords since the file permissions are world readable. Using the same password for both key and trust stores is undesirable. Key stores contain sensitive private keys that should be made available only to server applications that need them. Trust stores contain certificates that should be made available to server and client applications.

=

Password Protection in Release 7.0.0 and Later

In release 7.0.0, distinct passwords are generated: One for the key store and one for the trust store. Note that the key store password (used to protect the entire keystore) and key store key password (used to protect the keys in the keystore) are the same. Many applications expect them to be the same, especially for P12 key stores.

The following example shows how passwords (shown in **boldface**) are configured in release 7.0.0 in `${MAPR_HOME}/hadoop/hadoop-${HADOOP_VERSION}/etc/hadoop/ssl-server.xml` in a non-secure installation. (In secure installations, the clear-text passwords are removed from these configuration files and kept in the Hadoop Credentials stores.)

```
<configuration>
...
<property>
  <name>ssl.server.truststore.password</name>
  <value>895FA43FE91344DB98/_K35</value>
  <description>Optional. Default value is ""</description>
</property>
...
<property>
  <name>ssl.server.keystore.password</name>
  <value>AB8F93FAA45393F84BD358d0</value>
  <description>Must be specified.</description>
</property>
<property>
  <name>ssl.server.keystore.keypassword</name>
  <value>AB8F93FAA45393F84BD358d0</value>
  <description>Must be specified.</description>
</property>
...
</configuration>
```

Password Protection with the Hadoop Credential Provider API

This section describes the credential stores on FIPS-enabled and secure non-FIPS-enabled hosts.

The previous section shows how distinct key and trust store passwords are stored on a non-secure host. On a secure host, the passwords are encrypted, and the passwords no longer appear in the Hadoop configuration files (`ssl-client.xml` and `ssl-server.xml`). They are stored in the credential stores and protected using the Hadoop Credential Provider API.

Credential Stores on a FIPS-Enabled Host

On a FIPS-enabled host, the credential stores are in BCFKS format.

Key Store Passwords

The key store passwords are encrypted in the BCFKS key credential store: `${MAPR_HOME}/conf/maprkeycreds.bcfks`. To view the list of aliases in the BCFKS key credential store:

```
hadoop credential list -provider \
    localbcfks://file/opt/mapr/
conf/maprkeycreds.bcfks
ssl.server.keystore.password
ssl.server.keystore.keypassword
```

```
ssl.client.keystore.password
ssl.client.keystore.keypassword
```

Trust Store Passwords

The trust store passwords are encrypted in the BCFKS trust credential store: \${MAPR_HOME}/conf/maprtrustcreds.bcfks. To view the aliases in the BCFKS trust credential store:

```
hadoop credential list -provider \
    localbcfks://file/opt/mapr/
conf/maprtrustcreds.bcfks
ssl.server.truststore.password
ssl.client.truststore.password
```

If you omit the -provider option, the `hadoop credential list` command returns the aliases for the trust store passwords by default, since they are configured in `core-site.xml`. You must specify the -provider argument only if you want to view the aliases in the key store.

Key and Trust Store Providers

The Hadoop \${MAPR_HOME}/hadoop/hadoop-\${HADOOP_VERSION}/etc/hadoop/core-site.xml is configured with the BCFKS key and trust store providers:

```
<configuration>
  <property>

    <name>hadoop.security.credential.provi
der.path</name>

    <value>localbcfks://file/opt/mapr/
conf/maprkeycreds.bcfks, localbcfks://
file/opt/mapr/conf/
maprtrustcreds.bcfks</value>
    <description>Location of key and
trust store credential file</
description>
  </property>
</configuration>
```

Credential Stores on a Non-FIPS-Enabled Host

On a non-FIPS-enabled host, the credential stores are in JCEKS format.

Key Store Passwords

The key store passwords are encrypted in the JCEKS key credential store: \${MAPR_HOME}/conf/maprkeycreds.jceks. To view the list of aliases in the JCEKS key credential store:

```
hadoop credential list -provider \
    localjceks://file/opt/mapr/
conf/maprkeycreds.jceks
ssl.server.keystore.password
ssl.server.keystore.keypassword
ssl.client.keystore.password
ssl.client.keystore.keypassword
```

Trust Store Passwords

The trust store passwords are encrypted in the JCEKS trust credential store: `${MAPR_HOME}/conf/maprtrustcreds.jceks`. To view the aliases in the JCEKS trust credential store:

```
hadoop credential list -provider \
    localjceks://file/opt/mapr/
conf/maprtrustcreds.jceks
ssl.server.truststore.password
ssl.client.truststore.password
```

If you omit the `-provider` option, the `hadoop credential list` command returns aliases for trust store passwords by default since they are configured in `core-site.xml`. Specify the `-provider` argument only to view aliases in the key store.

Key and Trust Store Providers

The Hadoop `${MAPR_HOME}/hadoop/hadoop-${HADOOP_VERSION}/etc/hadoop/core-site.xml` is configured with the JCEKS key and trust store providers:

```
<configuration>
  <property>

    <name>hadoop.security.credential.provider.path</name>

    <value>localjceks://file/opt/mapr/
conf/maprkeycreds.jceks, localjceks://
file/opt/mapr/conf/
maprtrustcreds.jceks</value>
    <description>Location of key and
trust store credential file</
description>
  </property>
</configuration>
```

Password Protection for Non-Java Applications

This section describes an alternative mechanism that non-Java applications can use to access the key and trust store passwords.

As described in the previous section, the Hadoop Credential Provider API protects key and trust store passwords by storing them in an encrypted Java credential store. Non-Java applications cannot access the Hadoop credential store. An alternative mechanism is needed for non-Java applications to retrieve:

- Passwords needed to access the PKCS#12 key and trust stores
- Private keys that are encrypted with a key store password

To protect passwords for non-Java applications, store key store passwords in `maprkeycreds.conf` and trust store passwords in `maprtrustcreds.conf` in `${MAPR_HOME}/conf`. `${MAPR_HOME}/conf` is created by the `${MAPR_HOME}/conf/configure.sh -genkeys` script.

The format of each line of the `maprkeycreds.conf` and `maprtrustcreds.conf` file is shown below.

```
<password property>=ENC:<code>:<checksum>:<Base64 encrypted password>
```

The table below lists keys and provides and key descriptions.

Key	Description
password property	The password property in <code>ssl-client.xml</code> or <code>ssl-server.xml</code> . For example: <code>ssl.server.keystore.password</code>
ENC	Indication that the password is encrypted.
code	Encryption code to denote the type of algorithm used for encryption. For release 7.0.0, the code is always 1 to denote AES-256-CTR using PBKDF2 with 20000 iterations. The password used to derive the encryption key is obtained in an identical way from the Hadoop Credential Provider API (it is obtained from the value of the environment variable <code>HADOOP_CREDSTORE_PASSWORD</code> and defaults to none if <code>HADOOP_CREDSTORE_PASSWORD</code> is not set).
checksum	The SHA-256 checksum used to verify that the password is correctly decrypted. Upon decryption, the application should compute the SHA-256 checksum on the decrypted password and verify that it matches this checksum.
Base-64 encrypted password	The encrypted password in Base-64 encoding.

For example:

```
pwd
/opt/mapr/conf
cat maprkeycreds.conf
ssl.server.keystore.password=ENC:1:b8f9933aa5af6d9d2c0706fec5156fba5233546ac
3bce8213524353b5c70c42f:U2FsdGVkX1+0YGv5p/
2c3nYXw3u2EYax2N9Y7GpfQKeifFkskdDYA17XEqUkinAf7Q==
ssl.server.keystore.keypassword=ENC:1:b8f9933aa5af6d9d2c0706fec5156fba523354
6ac3bce8213524353b5c70c42f:U2FsdGVkX18LDAUdN66mdVxmt8k8xQo2vAnQJ5xw7V/
enAOq3fQ1NVX0Ppi1J027Bg==
ssl.server.truststore.password=ENC:1:e7a15c233a1252a17e6a8a07c2cb397017ecd93
9224593d2327d381cbb56ab54:U2FsdGVkX1+sPmXLhP26sPWC3mi2MD6yRYeVnF0auBEnPVd69+
rGuPE2qoxFcXoJ9A==
```

Applications can use the `openssl` command to decrypt the password. In the following example, replace the default decryption key of `none` with the actual decryption key, which is either the value of the environment variable `HADOOP_CREDSTORE_PASSWORD` or the default value `none`. For example:

```
echo
"U2FsdGVkX18Qbi40XoFrPDjQhVtJAzzP+fsyHmAgXKcz50anmpaQZIOfpNENLZPwIw==" |
openssl enc -aes-256-ctr -iter 20000 -pass pass:none -base64 -md
sha256 -A -d
8M2HdpkZxjb1QLVHG2lx_Dtg_bg870gS
```

To verify that the password is correctly decrypted, use the `openssl dgst` command to obtain the SHA-256 signature of the decrypted password. Then verify that it matches the value configured in the checksum field in `maprkeycreds.conf` or `maprtrustcreds.conf`. For example:

```
echo "8M2HdpkZxjb1QLVHG2lx_Dtg_bg870gS" | \
openssl dgst -sha256 | awk '{print $2}'
b8f9933aa5af6d9d2c0706fec5156fba5233546ac3bce8213524353b5c70c42f
```

To reduce the duplication of code to retrieve these passwords for non-Java applications, `common-ecosystem.sh`, which is already used by most MEP/EEP components, now includes a routine that implements the above steps. Its interface looks like the following:

```
getStorePw() {
# routine expects 2 or 3 inputs
# key to lookup - like ssl.server.keystore.password
# file to look in - like /opt/mapr/conf/maprkeycreds.conf
```

```

# optional password, if not provided, $HAD00P_CREDSTORE_PASSWORD is
used if set,
# otherwise none
#
# returns pw on success otherwise error messages
# rc=0 on success - 1 otherwise
#
# called like:
# pw=$(getStorePw ssl.server.keystore.password /opt/mapr/conf/
maprkeycreds.conf)
# if [ $? -ne 0 ]; then
#     echo "got an error: $pw"
#     ...
# fi

```

Since many ecosystem components need to work in both core 6.2.0- and core 7.0.0 environments, an ecosystem `configure.sh` (or supporting script) must deal with both environments. Example usage would look like the following (assume `maprKeyCredsConf` is set to `$MAPR_HOME/conf/maprkeycreds.conf`):

```

keystorePass="$(grep -F -A 1 ssl.server.keystore.password $sslServerConf |
tail -1 | sed 's/ *<value>//;s/<\value>//')"

if [ "$keystorePass" = "__##CREDENTIALS_STORE##__" ] || [ -z
"$keystorePass" ] && [ -e "$maprKeyCredsConf" ]; then

    keystorePass=$(getStorePw ssl.server.keystore.password
$maprKeyCredsConf
    rc=$?
    if [ $rc -ne 0 ]; then
        echo "Failed to extract keystore password: $keystorePass"
    fi
fi

```

Similar code is expected to be done for the trust store password.

In addition, if a non-Java EEP component requires a private key in PEM format, additional work is required to protect the unencrypted private key or the password for the encrypted private key.

For a component that requires an unencrypted private key pem file, the requirement is that its init/start script must generate the pem key, start the process, and then remove the key after the process is up and running. This assumes that the service does not negatively react to the change in the key file (from containing the key to empty).

Using Grafana, which needs an unencrypted private key, as an example, you can generate an empty key PEM file during `configure.sh` stage. After Warden starts Grafana, the Grafana init/start script extracts the keystore password, and uses that to decrypt the encrypted pem key. Then it puts the unencrypted private key into the `key.pem` file that Grafana requires right before it is started. Additional code is added to the init/start script to detect when the service is fully up and has read the pem key, before zeroing out the file. On an unsuccessful start, the pem key file is also zeroed out.

Similarly, for a service that can use an encrypted private key, but reasonably requires the password for the key in a config file, the password in the config file should only be there during startup. The init/start script must then acquire the required password, edit the config file to fill it in, start the process, and then remove it from the config file. (This only works for processes that do not monitor changes in the config file and restart.)

Protection of CLDB and DARE Master Keys

This section describes how the CLDB key and DARE master keys are encrypted and stored during normal operations.

The following table specifies the location of the `cldb.key` and `dare.master.key` for Data Fabric with and without HSM integration.

Data Fabric version	Location of <code>cldb.key/dare.master.key</code>	<code>cldb.key/dare.master.key</code> generation/security mechanism
Data Fabric version 6.2.0 or earlier without HSM integration	<code>/opt/mapr/conf/</code> folder	The keys are protected by the file level permission with Mode bits. The CLDB key is encrypted using a weak hard-coded key and stored in Base-64 format in <code>\${MAPR_HOME}/conf/cldb.key</code> . The DARE master key is stored in clear text in hexadecimal format in <code>\${MAPR_HOME}/conf/dare.master.key</code> . The files must be encrypted and protected using FIPS-approved algorithms.
Data Fabric 6.2.0 with external HSM integration	stored as part of the <code>/opt/mapr/conf/tokens</code> folder.	The keys are encrypted with HSM encryption keys
Data Fabric version 7.0.0 and later without explicit enterprise HSM integration	<code>/opt/mapr/conf/tokens</code> folder	The keys are generated as part of the <code>configure.sh -genkeys</code> option, and are encrypted using cryptographic keys generated from HSM.  NOTE: By default, Data Fabric simulates file-based HSM locally.
Data Fabric version 7.0.0 and later explicitly integrated with enterprise HSM	<code>/opt/mapr/conf/tokens</code> folder in encrypted form.	The cryptographic keys that are used for encryption of the <code>cldb.key</code> or the <code>dare.master.key</code> lifecycle are managed by the enterprise HSM. The <code>dare.master.key</code> and <code>cldb.key</code> files are protected by using KMIP.

NOTE: It is important to note that `dare.master.key` is generated only when data-at-rest-encryption (DARE) is enabled at cluster level. In MFS Only node, the `dare.master.key` will be created as a zero KB file.

When DARE is enabled at cluster level by passing `-cldb -dare -genkeys` option as part of the `configure.sh` script, it generates `cldb.key/dare.master.key` and encrypts them and store in `/opt/mapr/conf/tokens` folder. It is not required to copy the tokens folder to nodes that are not running the `cldb` service or the `zookeeper` service. On MFS only nodes, a 0 kb `dare.master.key` gets automatically generated as part of the `configure.sh -dare` option while adding node to cluster. It is not required to create a `dare.master.key` explicitly on nodes that are not running the `cldb` service or the `zookeeper` service.

IMPORTANT: While upgrading from 6.x to 7.x, back up the `/opt/mapr/conf/token` folder. If the `/opt/mapr/conf/token` folder is accidentally deleted, the cluster or fabric can be restored from the backed up `/opt/mapr/conf/token` folder.

In case of upgrade of Cluster from 6.2.x to 7.x, the deployments still contain `cldb.key/dare.master.key`. As part of the cluster upgrade, the token folder is generated and it encrypts the `cldb.key` or `dare.master.key`.

For information on `mrhsm` commands, see [mrhsm commands](#).

Note these important considerations:

- Instead of backing up the `cldb.key` and `dare.master.key` as recommended in previous versions, you are encouraged to back up the `${MAPR_HOME}/conf/tokens` directory as well as the `${MAPR_HOME}/conf/maprhsm.conf` file. These are both essential to retrieve the keys.
- During the configuration, you must copy the `${MAPR_HOME}/conf/tokens` directory and the `${MAPR_HOME}/conf/maprhsm.conf` file to all CLDB nodes and Zookeeper nodes, instead of merely copying the `cldb.key` and `dare.master.key` files.
- On MFS only nodes a `dare.master.key` file of size 0 KB gets generate automatically as part of the `configure.sh -dare` option while adding node to cluster. MFS-only nodes still need an empty `${MAPR_HOME}/conf/dare.master.key` file to detect that DARE is enabled. This file does NOT need to contain the actual key. It is NOT required to create `dare.master.key` explicitly on nodes that are not running the CLDB service or Zookeeper service.
- During an upgrade, the `cldb.key` and `dare.master.key` are left intact and untouched even though we expect to have them stored in the PKCS#11 file store. It is a best practice to remove them from the node and store them in a safe location in case they are needed again.

Removing Clear-Text Passwords After Upgrade

Upon upgrade to release 7.0.0 or later, any clear-text passwords that existed in `ssl-client.xml` and `ssl-server.xml` in a pre-7.0.0 release are preserved by default. Remove these passwords by using a `configure.sh` command option.

Preserving the clear-text passwords during an upgrade maintains backward compatibility for any existing custom applications that rely on the passwords. However, Data Fabric core components do not use any of these clear-text passwords.

In release 7.0.0, performing a new installation removes all clear-text passwords from the `ssl-client.xml` and `ssl-server.xml` files. On upgrade, the clear-text passwords are retained by default, but you can override this default to remove the passwords as well.

Passwords are stored in encrypted format in the Hadoop Credential Provider stores which is already configured in `ssl-server.xml`. Client applications should add the `core-site.xml` resource using the `Configuration.addResource()` Hadoop API to access the trust store credential provider.

Users who upgrade from a previous installation might have written custom applications that use `ssl-client.xml` and `ssl-server.xml` that they are unable to change. You can still proceed with the upgrade. Confirm that any custom applications continue to run correctly with encrypted credential files, and remove a clear-text password using the following [configure.sh](#) on page 3186 command:

```
/opt/mapr/server/configure.sh -R -removePasswordsInXML
```

Manipulating Key and Trust Stores

This section describes how the key and trust stores can be used in the Java `keytool` utility and how they can be manipulated using the `manageSSLKeys.sh` command.

Merging Trust Stores

Use the `manageSSLKeys.sh merge` command to merge two trust stores. This operation is required if you configure cross-cluster connectivity for server nodes or for client nodes that connect to multiple clusters.

Parameters for the `manageSSLKeys.sh merge` command are as shown below.

```
/opt/mapr/server/manageSSLKeys.sh merge \  
  <in trust store> <out trust store> [inPassword [outPassword]]
```

The following table describes each `manageSSLKeys.sh merge` parameter:

Parameter	Description
In trust store	The input trust store for the destination cluster. Before running the command, copy the trust store from the destination cluster to a file in the current cluster.
Out trust store	The output trust store for the current cluster. This is typically /opt/mapr/conf/ssl_truststore.bcfks for FIPS-enabled nodes or /opt/mapr/conf/ssl_truststore for secure non-FIPS nodes.
inPassword	The password for in trust store or the path to a file containing the password.
outPassword	The password for out trust store or the path to a file containing the password.

The following example shows how to use the `manageSSLKeys.sh merge` command. Before merging the trust stores, note the two certificates: one for the root CA and the other for the server certificate.

```
# keytool -list -keystore /opt/mapr/conf/ssl_truststore.bcfks \
  -storepass eEJz0u2_Bmp46UrH_gH90rjjqT_LJu0u \
  -storetype bcfks \
  -provider org.bouncycastle.jcajce.provider.BouncyCastleFipsProvider \
  -providerpath /opt/mapr/lib/bc-fips-1.0.2.1.jar \
  -providername BCFIPS
Keystore type: BCFKS
Keystore provider: BCFIPS

Your keystore contains 2 entries

fips0.cluster.com, Sep 17, 2021, trustedCertEntry,
Certificate fingerprint (SHA-256):

4:BC:2C:48:28:60:1C
```

First copy the trust store for the other cluster to a location in the directory path. Use the `keytool` command to verify the contents of the trust store to be merged. You will need the trust store password of the remote cluster.

```
# keytool -list -keystore ssl_truststore.bcfks.fips1 \
  -storepass xjxL_K9qfrbsfH6TSScizoSiFSVMLEcg \
  -storetype bcfks \
  -provider org.bouncycastle.jcajce.provider.BouncyCastleFipsProvider \
  -providerpath /opt/mapr/lib/bc-fips-1.0.2.1.jar \
  -providername BCFIPS

Keystore type: BCFKS
Keystore provider: BCFIPS

Your keystore contains 2 entries

fips1.cluster.com, Sep 17, 2021, trustedCertEntry,
Certificate fingerprint (SHA-256):
BD:BB:7B:C2:2F:2E:C7:26:7E:D2:BF:DF:CA:8B:CA:D5:2A:01:7C:CC:4D:46:45:22:7C:9
8:07:9A:51:80:21:EB
fips1.cluster.com-root-ca-chain, Sep 17, 2021, trustedCertEntry,

0:51:F8:30:74:7D:9A
```

Next merge the trust stores. In this example, `ssl_truststore.bcfks.fips1` is the trust store for the remote cluster to be connected.

```
# /opt/mapr/server/manageSSLKeys.sh merge \
  ssl_truststore.bcfks.fips1 /opt/mapr/conf/ssl_truststore.bcfks \
  xjxL_K9qfrbsfH6TSScizoSiFSVMLEcG \
  eEJz0u2_Bmp46UrH_gH90rjjqT_LJu0u
Merging certificates from ssl_truststore.bcfks.fips1 into existing /opt/
mapr/conf/ssl_truststore.bcfks
```

After the command completes successfully, use the `keytool` command to verify that the trust stores are successfully merged.

```
# keytool -list -keystore ssl_truststore.bcfks \
  -storepass eEJz0u2_Bmp46UrH_gH90rjjqT_LJu0u \
  -storetype bcfks \
  -provider org.bouncycastle.jcajce.provider.BouncyCastleFipsProvider \
  -providerpath /opt/mapr/lib/bc-fips-1.0.2.1.jar \

Using Key and Trust Store Passwords in Keytool

Use the Java `keytool` command to manipulate key and trust stores.

To manipulate key and trust store passwords in `keytool`, use both passwords. Passwords saved in the Hadoop Credential Provider stores cannot be retrieved by using command-line utilities. They can only be retrieved from within Java applications.

Running the `configure.sh` utility with the `-genkeys` option creates the `${MAPR_HOME}/conf/store-passwords.txt` file containing the clear-text key and trust store passwords. You need these passwords if you want to manipulate the key and trust stores using the Java `keytool` utility. It is a best practice to copy the `${MAPR_HOME}/conf/store-passwords.txt` file to a safe place, and then delete it from the `${MAPR_HOME}/conf` directory.

Each line of the `${MAPR_HOME}/conf/store-passwords.txt` file contains the password in the following syntax:

```
password-property=password-value
```

The `password-property` is the value of the `password` property in `ssl-server.xml` and `ssl-client.xml`. The `password-value` is the clear-text password. For example:

```
# cat /opt/mapr/conf/store-passwords.txt
ssl.server.keystore.password=AxWJ0T4K_Arc2apgcypzZps_hr5lyYNQ
ssl.server.keystore.keypassword=AxWJ0T4K_Arc2apgcypzZps_hr5lyYNQ
ssl.server.truststore.password=4i0upzuDDUpvwpbx9_417gmfH0kvLB1w
ssl.client.truststore.password=4i0upzuDDUpvwpbx9_417gmfH0kvLB1w
ssl.client.keystore.password=AxWJ0T4K_Arc2apgcypzZps_hr5lyYNQ
ssl.client.keystore.keypassword=AxWJ0T4K_Arc2apgcypzZps_hr5lyYNQ
```

Converting Between Key and Trust Store Formats

Describes enhancements to the `manageSSLKeys.sh convert` command to enable the conversion of key and trust stores from JKS to BCFKS format or vice versa.

Release 7.0.0 enhanced the `convert` command in the `${MAPR_HOME}/server/manageSSLKeys.sh` utility to support the conversion of key and trust stores from JKS to BCFKS format and vice versa. Key- and trust-store conversion is required if you configure mixed clusters containing both FIPS and non-FIPS enabled nodes. For example:

- Adding a secure non-FIPS node to an existing cluster consisting of only FIPS-enabled nodes.
- Adding a FIPS-enabled node to an existing cluster consisting of only secure non-FIPS enabled nodes.

The node being added can be a server node, such as a CLDB, MFS-only, or another server or client node. Since the JKS store type is not supported on FIPS-enabled node, this command must be run on a secure non-FIPS node.

- If you are adding a secure non-FIPS node to an existing cluster consisting of only FIPS-enabled nodes, copy the BCFKS key or trust store from the `${MAPR_HOME}/conf` directory of the FIPS-enabled node to a temporary location in the secure non-FIPS node. Do so before running the `manageSSLKeys.sh convert` command. Specify the destination location as `${MAPR_HOME}/conf/<store>` in the `manageSSLKeys.sh convert` command so that the newly converted JKS key or trust store is written to the `${MAPR_HOME}/conf` directory.
- If you are adding a FIPS-enabled node to an existing cluster consisting of only secure non-FIPS-enabled nodes, the source JKS-format key or trust store already exists in the `${MAPR_HOME}/conf` directory of the secure non-FIPS node. It can then be used directly as the source file in `manageSSLKeys.sh convert`. There is no need to copy it. After the key/trust store is converted to BCFKS format, copy the newly converted BCFKS key/trust store from the temporary location in the secure non-FIPS enabled node to the `${MAPR_HOME}/conf` directory of the FIPS enabled node.

After the converted JKS (for secure non-FIPS) or BCFKS (for FIPS) is added to the `${MAPR_HOME}/conf` directory, run `configure.sh` with the `-storepasswd` parameter to generate the credential stores and complete the configuration. This process is described in greater detail in [Enabling Security on a Configured Cluster](#) on page 2048.

The basic syntax for the `manageSSLKeys.sh convert` command with new arguments in bold face is shown below.

```
/opt/mapr/server/manageSSLKeys.sh convert \
  [-N <clustername> ] [-k] [-n] [-p <passwd>]
  [-srcType JKS|bcfks|pkcs12] [-dstType JKS|bcfks|pkcs12]
  <in key/trust store> <out key/trust store>
```

Conversion between JKS and BCFKS key and trust stores require the arguments listed in the table below.

Parameter	Description
-p <passwd>	The password for the source key or trust store. The destination key or trust store is set to the same password.
-srcType	The type of the source key or trust store. Supported types for conversion are JKS or bcfs. The value of the -srcType argument must be different from the -dstType argument. That is, if the -srcType is JKS, then the -dstType should be bcfs, and vice versa.
-dstType	The type of the destination key or trust store. Supported types for conversion are JKS or bcfs. The value of the -dstType argument must be different from the -srcType argument. For example, if the -dstType is JKS, then the -srcType should be bcfs, and vice versa.
In key/trust store	Full or relative path name of the source key or trust store to convert from. This store must exist.
Out key/trust store	Full or relative path name of the destination key or trust store which holds the same contents as the source key or trust store but in a different store format. If this file does not exist, it is created. If the file already exists, the contents are overwritten.

Example: Converting JKS to BCFKS Store

The following example converts the JKS trust store in /opt/mapr/conf/ssl_truststore to BCFKS format, and places the BCFKS trust store in ssl_truststore.bcfks in the current directory. This conversion is the case if you are adding a FIPS-enabled node to a cluster containing only secure non-FIPS nodes. Upon successful creation of the BCFKS key or trust store, copy it to the FIPS-enabled node before running configure.sh on that node to complete the configuration.

```
# /opt/mapr/server/manageSSLKeys.sh convert \
-p BrqLhVcjGmYo8y5_qABS6YZetRpKfpqB \
-srcType JKS \
-dstType bcfs \
/opt/mapr/conf/ssl_truststore \
ssl_truststore.bcfks
```

Verify that the BCFKS trust store is correctly converted by verifying that both source JKS and destination BCFKS trust stores have the same contents with the same fingerprints.

```
# keytool -list -keystore /opt/mapr/conf/ssl_truststore -storepass
BrqLhVcjGmYo8y5_qABS6YZetRpKfpqB
Keystore type: JKS
Keystore provider: SUN

```

Example: Converting BCFKS to JKS Store

The following example converts the BCFKS trust store to JKS format when adding a secure non-FIPS node to a cluster containing only FIPS-enabled nodes. Only secure non-FIPS nodes can support both the JKS and BCFKS store formats. First, copy the BCFKS store from the FIPS-enabled node to a temporary directory in the secure non-FIPS node. Upon successful creation of the JKS key or trust store, run `configure.sh` to complete the configuration.

```

# /opt/mapr/server/manageSSLKeys.sh convert \
  -p 4hmQRWSpkMj0owNT_0UEa_kD9djXpgb4 \
  -srcType bcfks \
  -dstType JKS \
  ssl_truststore.bcfks \
  /opt/mapr/conf/ssl_truststore

```

Verify that the JKS trust store is correctly converted by verifying that both source BCFKS and destination JKS trust stores have the same contents with the same fingerprints.

```

# keytool -list -keystore ssl_truststore.bcfks \
  -storepass 4hmQRWSpkMj0owNT_0UEa_kD9djXpgb4 \
  -provider org.bouncycastle.jcajce.provider.BouncyCastleFipsProvider \
  -providerpath /opt/mapr/lib/bc-fips-1.0.2.1.jar \
  -providername BCFIPS -storetype bcfks
Keystore type: BCFKS

Creating Credential Stores

Describes the `manageSSLKeys.sh createcreds` command that can be used to create credential stores that are compatible with the Hadoop Credential Provider API.

A new command `createcreds` is provided in the `${MAPR_HOME}/server/manageSSLKeys.sh` utility to create credential stores compatible with the Hadoop Credential Provider API. This command is normally invoked internally from the `${MAPR_HOME}/server/configure.sh` script when configuring a mixed cluster consisting of FIPS and non-FIPS nodes. The command can also be used independently to recreate credential stores that are somehow missing or corrupted.

Here is the command syntax:

```
${MAPR_HOME}/server/manageSSLKeys.sh createcreds \
  [-k <password>] \
  -t <trustpass> \
  -ug <maprUserGroup>
```

The following table describes the command parameters.

Parameter	Description
-k	Key store password. If not specified, the key credential file is not created.
-t	Trust store password for creating the trust credential file. This parameter is required.

Parameter	Description
-ug	Data Fabric user and group. For example: mapr :mapr. This parameter is required.

Changing Key and Trust Store Passwords

Change key and trust store passwords by using the `${MAPR_HOME}/server/manageSSLKeys` utility.

Release 7.0.0 added a new `changepassword` command to the `${MAPR_HOME}/server/manageSSLKeys` utility. The existing `copywithconfiguredpassword` and `createrandompassword` commands remain for upgrade purposes but are deprecated starting with release 7.0.0.

To change the key store password, you must provide the current key store password with the `-k` option. To change the trust store password, you must provide the current trust store password with the `-t` option. To set the new user-selectable password, use the `-kp` or `-tp` option. Otherwise, a random password is created. Note that you must pair the `-kp` and/or `-tp` options with the `-k` and/or `-t` options, respectively. For example:

```
# /opt/mapr/server/manageSSLKeys.sh changepassword \
    -k 8zVMhs8RtLDXpnTTIBqQkt_q_pFFV3I_ \
    -t 5eqHoTrLRaiev6dwxJhfzm3qpPqw_0J2
```

To change the password:

1. Run the `manageSSLKeys.sh changepassword` command on the first node in the cluster. Running the command creates a directory under `/tmp`, with new password files and a script. A new `store-passwords.txt` is also created in this directory. It is a best practice to keep the passwords in this file and delete `store-passwords.txt` from the `/tmp` directory.
2. Stop ZooKeeper and Warden on all nodes in the cluster.
3. Distribute the above directory to all nodes in the cluster.

NOTE: Instead of distributing the directory to all nodes in the cluster, run the `manageSSLKeys.sh changepassword` command used in [step 1](#) on each node. This option eliminates file type and format issues in a cluster on both FIPS and non-FIPS nodes.

4. On each node in the cluster, make sure they have the correct ownership and permissions, and then run `copyPasswordFiles.sh` from this directory.
5. Run `configure.sh -R` on all nodes to allow all services to update their configuration.
6. Start ZooKeeper and Warden on all nodes in the cluster.

The security-file type and format are different on FIPS- and non-FIPS-enabled nodes. You cannot copy the modified passwords across FIPS to non-FIPS or vice versa. To change a password with both FIPS and non-FIPS nodes in a cluster, run the procedure twice: once on the FIPS node and once on the non-FIPS node. Only copy the generated files to, and run the script on, nodes with the same FIPS or non-FIPS type.

Use the `manageSSLKeys.sh` utility to create and manage SSL certificates.

Application Development with Encrypted Key and Trust Stores

This section describes application development requirements for users writing custom applications for encrypted key and trust stores in both FIPS and non-FIPS modes.

Support for Encrypted Key and Trust Stores

Release 7.0.0 uses Hadoop 2.7.6, so by default HADOOP_HOME is \${MAPR_HOME}/hadoop/hadoop-2.7.6.

Beginning with release 7.0.0, clear-text passwords are removed from the Hadoop `ssl-server.xml` and `ssl-client.xml` configuration files. For Java applications, key and trust store passwords are now protected in credential stores accessible through the Hadoop Credential Provider API.

Credential store provider settings differ depending on whether the node is a non-FIPS secure node or a FIPS-enabled node., due to the difference in store types. In addition, the provider settings differ depending on whether the application requiring access is a client or server application. Client applications only require access to trust stores to retrieve both keys and certificates. Server applications require access to both key and trust stores so that they can retrieve private keys as well as certificates.

Credential Provider Configuration for Client Applications

After running `configure.sh`, the Hadoop global configuration file `${HADOOP_HOME}/etc/hadoop/core-site.xml` is configured with the location of the trust-store provider. Secure non-FIPS nodes use the JCEKS credential store type. FIPS-enabled nodes use the BCFKS credential store type. Therefore, on a secure non-FIPS node, the client-side credential provider setting in `core-site.xml` looks like this:

```
<property>
  <name>hadoop.security.credential.provider.path</name>
  <value>localjceks://file/opt/mapr/conf/maprtrustcreds.jceks</value>
  <description>File-based trust store credential provider.</description>
</property>
```

On a FIPS-enabled node, the client-side credential provider setting in `core-site.xml` looks like this:

```
<property>
  <name>hadoop.security.credential.provider.path</name>
  <value>localjceks://file/opt/mapr/conf/maprtrustcreds.bcfks</value>
  <description>File-based trust store credential provider.</description>
</property>
```

Credential Provider Configuration for Server Applications

For server-side custom applications using `ssl-server.xml`, the credential provider property is configured in `ssl-server.xml` itself. For a secure non-FIPS node, the credential provider setting in `ssl-server.xml` looks like this:

```
<property>
  <name>hadoop.security.credential.provider.path</name>

  <value>localjceks://file/opt/mapr/conf/maprkeycreds.jceks, localjceks://
file/opt/mapr/conf/maprtrustcreds.jceks</value>
  <description>File-based key and trust store credential provider.</
description>
</property>
```

Using the Hadoop Configuration API

Custom client applications that need access to the trust-store password to access `${MAPR_HOME}/conf/ssl_truststore` need to be enhanced to add the `${HADOOP_HOME}/etc/hadoop/core-site.xml` to the Configuration resource. For example:

```
import org.apache.hadoop.conf.Configuration;
...
try {
    final Configuration conf = new Configuration(false);
```

```

    conf.addResource("core-site.xml", false);
    ...
}

```

Server-side custom applications that need the key-store password to access `${MAPR_HOME}/conf/ssl_keystore` need to add `ssl-server.xml` to the Configuration resource. For example:

```

import org.apache.hadoop.conf.Configuration;
...
try {
    final Configuration conf = new Configuration(false);
    conf.addResource("ssl-server.xml", false);
    ...
}

```

Additional Requirements for FIPS 140-2 Application Development

FIPS Security Policy

The HPE Data Fabric FIPS-compliant `java.security` configuration is available in `${MAPR_HOME}/conf/java.security` for use by Java applications. To ensure that only FIPS-compliant cryptography and security providers are used in custom Java applications, use this security file to override the master `java.security` file that is installed by default with JDK 11 using the `java.security.properties==${MAPR_HOME}/conf/java.security.fips` option. Perform this task while running your Java application in FIPS mode.

If you choose to use alternative FIPS-compliant Java security providers, Hewlett Packard Enterprise recommends that you make a copy of the configuration in `java.security.properties==${MAPR_HOME}/conf/java.security.fips` instead of modifying this directly. Hewlett Packard Enterprise recommends this option because the correct functionality of the HPE Data Fabric core components depend on this configuration. It is also the user's responsibility to ensure that any security providers used in a modified `java.security` configuration are FIPS compliant. For example:

```

JAVA_SECURITY_FIPS=
#
# Options required for running your custom Java application
YOUR_CUSTOM_JAVA_OPTS=""
#
# Determine FIPS mode, and add the MAPR_ALTERNATE_JAVA_SECURITY option
get_fips_mode=$(sysctl crypto.fips_enabled 2> /dev/null)
fips_enabled='crypto.fips_enabled = 1'
if [ "$get_fips_mode" == "$fips_enabled" ]; then
    # Override the default java.security when in FIPS mode
    JAVA_SECURITY_FIPS=-Djava.security.properties==${MAPR_HOME}/conf/
    java.security.fips
fi
# Run your custom Java application
"$JAVA_HOME"/bin/java ${JAVA_SECURITY_FIPS} \
    -classpath ${YOUR_CUSTOM_CLASSPATH} com.example.yourapp $args

```

Bouncy Castle FIPS Provider

For Java applications, HPE Data Fabric release 7.0.0 uses the Bouncy Castle FIPS Java API. The Bouncy Castle JAR files are bundled with the release 7.0.0 distribution in `/opt/mapr/lib`:

- `bc-fips-1.0.2.1.jar`
- `bctls-fips-1.0.11.4.jar`

To write FIPS-compliant Java applications using the Bouncy Castle Java FIPS API, see the [Bouncy Castle FIPS Java website](#). For examples, see this [document](#).

TLS Communication

For TLS communication in FIPS mode, the following changes are required.

1. Look for the key store type in the `ssl-server.xml` or `ssl-client.xml`.
2. For the BCFKS store type:
 - a. Set the key manager factory algorithm to PKIX.
 - b. Set the security provider to BCJSSE.
 - c. Set the key store type to BCFKS.

Here is an example using `SslContextFactory`:

```
SslContextFactory.Server sslContextFactory =
    new SslContextFactory.Server();
if (keyStoreType.equalsIgnoreCase(BCFKS_FIPS_KEYSTORE_TYPE)) {
    sslContextFactory.setKeyManagerFactoryAlgorithm("PKIX");
    sslContextFactory.setProvider("BCJSSE");
    sslContextFactory.setKeyStoreType("BCFKS");
}
```

Troubleshooting Tips for FIPS Installations

Answers frequently asked questions and provides troubleshooting tips for FIPS installations.

Release 7.0.0 provides support for FIPS 140-2 Level 1 compliance and many new and upgraded security features, as well as modified functionality. If you are used to configuring and running applications on the core platform before release 7.0.0, you will encounter behavioral differences. These differences can lead to incorrect or unexpected functionality, which might not be a bug. The following is a partial list of answers to frequently asked questions and troubleshooting tips.

1. Can I upgrade an existing installation to FIPS mode?

FIPS is supported only for fresh installations. However, users with pre-7.0.0 installations can take advantage of FIPS functionality while still maintaining access to critical data. You can do this by adding new FIPS nodes to an already-installed secure non-FIPS cluster and then gradually decommissioning the non-FIPS nodes. Be aware, however, that if any existing user data is encrypted using non-secure cryptographic algorithms (such as DES), the data will first have to be re-encrypted using a secure cryptographic algorithm (such as AES-256) in order to decrypt the data from a FIPS-enabled node.

2. When I enable FIPS on a node, does it mean my entire cluster is FIPS-enabled? Can I just enable FIPS for the whole cluster? After I enable FIPS, can I disable it?

The Data Fabric approach to FIPS compliance is a combination of the following strategies:

- Leveraging our partner's FIPS certification for OpenSSL 1.1.1 for C/C++ components.
- Bundling the Bouncy Castle Java FIPS API with the HPE Data Fabric distribution.

The first part means that FIPS has to be enabled at an operating-system level, on a per-node basis. This needs to be done on each cluster node before the HPE Data Fabric is installed. Although you can technically disable FIPS after enabling it at an operating system level, this is not supported by the HPE Data Fabric and will result in incorrect functionality.

The second part regarding the bundling of the Bouncy Castle JARs results in the use of BCFKS key and trust stores if the node is FIPS-enabled, and JKS key and trust stores for secure non FIPS-enabled nodes.

FIPS is not just a flag, and there is no concept of a cluster-wide FIPS setting. Also, the entire cluster is FIPS-enabled if every node in the cluster is FIPS-enabled. You can use the new `isFips` property in the enhanced `maprccli node list` command to determine the FIPS setting of each server node in the cluster. See [Determining if a Host Is in FIPS Mode](#) on page 2077.

3. Can a non-FIPS client communicate with a FIPS server? Can a non-FIPS server communicate with a FIPS server? How do I set this up

Yes, non-FIPS nodes can communicate with FIPS nodes, whether they are servers or clients. The TLS 1.2 communication between the nodes already uses FIPS-compliant cryptography, so no additional setup is required.

4. I want to set up a cross-cluster trust relationship. Can I still use the `configure-crosscluster.sh` script to configure FIPS and non-FIPS clusters?

You can use the `configure-crosscluster.sh` script to configure local and remote clusters if they consist of entirely FIPS nodes or entirely non-FIPS nodes. If you want to configure a cross-cluster relationship where either the local or remote clusters consist of a combination of FIPS and non-FIPS nodes, `configure-crosscluster.sh` provides some limited support, but some additional manual steps are required, as outlined in [Configuring Cross-Cluster Security for a Mixed \(FIPS and Non-FIPS\) Configuration](#) on page 2232.

5. Why doesn't keytool work the same way on a FIPS node and a non-FIPS node?

The `keytool` command that comes as part of the JDK supports JKS key and trust stores by default since the JKS key and trust store type is packaged with the JDK distribution. JKS is also the default store type, so the `-storetype` parameter is optional. The JKS store type is insecure, and does not require a password for store operations such as listing the contents. For example, to list the contents of the trust store in a secure non-FIPS node:

```
keytool -list -keystore /opt/mapr/conf/ssl_truststore
```

For FIPS-enabled nodes, the HPE Data Fabric uses the FIPS-compliant BCFKS store type, which is part of the Bouncy Castle Java FIPS API. Since this is not packaged with the JDK distribution, you need to tell `keytool` where to find the Bouncy Castle provider. In addition, BCFKS stores require that you specify the password for all store operations. So, for the same example of listing the contents of the trust store in a FIPS-enabled node:

```
keytool -list -keystore /opt/mapr/conf/ssl_truststore.bcfks \
        -storepass B28_Xqpcu7_srB8So2T_egUiFn0q9zqZ \
        -provider \
org.bouncycastle.jcajce.provider.BouncyCastleFipsProvider \
        -providerpath /opt/mapr/lib/bc-fips-1.0.2.1.jar \
        -providername BCFIPS -storetype bcfks
```

6. My custom application runs successfully on a FIPS-enabled node. Does that mean my application is FIPS 140-2 Level 1 compliant?

Not necessarily. An application is considered FIPS 140-2 Level 1 compliant if all of the following are true:

- The application runs successfully on a FIPS-enabled node such as RedHat 8.
- All sensitive data is encrypted.
- The application uses only cryptography from FIPS-compliant cryptographic libraries.

If, for example, your application is written in C/C++ and it statically linked a non FIPS-validated cryptographic library, such as CryptoPP, instead of using the FIPS-compliant OpenSSL 1.1.1 from RedHat,

or if sensitive data in the application, such as password data, is not encrypted, the application is not considered FIPS-compliant, even if it runs on a FIPS node.

7. My custom application runs successfully on a release 7.0.0 secure non-FIPS enabled node. Why does it fail on a FIPS-enabled node?

There are multiple reasons for this. FIPS enforces the use of strong cryptographic algorithms from FIPS-approved cryptographic libraries such as RedHat's OpenSSL 1.1.1 and the Bouncy Castle Java FIPS API. It disables weak cryptographic algorithms such as DES. Following is a partial list of reasons that your application will fail on a FIPS-enabled node:

- The application uses weak cryptographic algorithms, such as DES and MD-5.
- The application is written in C/C++ and uses a version of OpenSSL other than 1.1.1.
- The application is written in Java and needs to communicate over TLS, but is unable to access the private keys and/or certificates because it does not support the BCFKS store type.
- The application is trying to access data that was previously encrypted using nonsecure cryptographic algorithms such as DES.
- There is insufficient entropy.

8. I have data stored in the file system or database that was previously encrypted using DES. My application on my FIPS-enabled node fails when I try to access the data. How can I retrieve the data?

FIPS-enabled nodes do not support nonsecure algorithms such as DES. If you stored encrypted data in the file system or database from a non-FIPS node, then you must migrate your data. That is, you must decrypt your DES-encrypted data and re-encrypt your data using a stronger cryptographic algorithm – such as AES – on a non-FIPS node before you can access the data on a FIPS-enabled node. To improve your security infrastructure, Hewlett Packard Enterprise recommends that you upgrade your application to support stronger cryptographic algorithms, such as AES.

9. After installing a new FIPS node, running `configure.sh` results in a hang (specifically, the call to “keytool” hangs for many minutes). What can be done?

The likely reason is low system entropy on the node. Low system entropy is more common on virtual machines; physical machines generate better random numbers from various hardware sources. The `keytool` command reads random bits from `/dev/random`, which blocks while trying to generate new random bits.

Having good entropy available is a pre-requirement for installing the HPE Data Fabric. It is not a feature that the Data Fabric can provide or test for. To see the current entropy level, use this command:

```
sudo cat /proc/sys/kernel/random/entropy_avail
```

Numbers near 3000 or higher are preferable. Some VMs show low entropy (for example, 50). You can search online for possible ways to increase the entropy. These include using the `rng-tools` or `haveged` packages. For example: see these references:

- <https://wiki.archlinux.org/title/Rng-tools>
- <https://wiki.archlinux.org/title/Haveged>
- <https://www.techrepublic.com/article/how-to-add-more-entropy-to-improve-cryptographic-randomness-on-linux/>

Configuring Authentication

Provides information about Data Fabric tickets, Kerberos, Pluggable Authentication Module (PAM) authentication.

Robust authentication prevents third parties from representing themselves as legitimate users. The core component of user authentication in Data Fabric is the *ticket*. A ticket is an object that contains specific information about a user, an expiration time, and a key. Tickets uniquely identify a user and are encrypted to protect their contents. Tickets are used to establish sessions between a user and the cluster.

Data Fabric supports two methods of authenticating a user and generating a ticket:

- Kerberos
- Username/password pairing with PAM

Both of these methods are mediated by the [maprlogin](#) on page 3283 utility. When you authenticate with a username/password pair, the system verifies credentials using Pluggable Authentication Modules (PAM). Configure the cluster to use any registry that has a PAM module.

Managing Tickets

Introduces authentication using tickets for users and HPE Data Fabric servers.

HPE Data Fabric implements authentication with tickets. *Tickets* contain keys and are used to authenticate users and HPE Data Fabric servers. In addition, *certificates* are used to implement server authentication. Every user who wants to access a cluster must have a HPE Data Fabric user ticket (maprticket_<uid>). Every node in the cluster must have an HPE Data Fabric server ticket (maprserverticket).

A ticket is an object that contains specific information about a user and a key. A ticket authenticates a user to the cluster. Tickets are encrypted to protect their contents. The following table describes the tickets used by HPE Data Fabric for internal cluster operations, the user who can generate the ticket, and the command used to generate the ticket. This type of ticket should only be placed on cluster nodes.

Ticket Type	Description	Permissions/Command to Generate Ticket
maprserver	For (internal) cluster operations. This type of ticket can be long lasting.	User root using the configure.sh on page 3186 utility
crosscluster	For (internal) cross-cluster operations, such as mirroring and replication. This type of ticket can be long lasting.	User mapr using the maprlogin on page 3283 utility. The UID of the ticket (mapr) is always used as the identity of the entity using this ticket.

The following table describes the type of tickets supported by HPE Data Fabric for users and services, and whether the ticket can be used to impersonate another user. All of these tickets, except the user ticket, can only be generated by the cluster administrator using the [maprlogin](#) on page 3283 utility. The user ticket can be generated by any valid user using the [maprlogin](#) on page 3283 utility. These type of tickets can be placed on both cluster and client nodes and support (FUSE-based and loopbacknfs) POSIX clients and HDFS APIs.

Ticket Type	Description	Impersonation support	Notes
user	For granting access to individual users. This type of ticket has a short duration.	N/A*	The UID of the ticket (implicit or explicit value of the -user parameter to maprlogin command) is used as the identity of the entity using this ticket, except for the exceptions noted here for user root and user mapr.

Ticket Type	Description	Impersonation support	Notes
service	For accessing services running on client nodes. This type of ticket can have long duration.	N/A*	The UID of the ticket (explicit value of the -user parameter to mapr login command) is used as the identity of the entity using this ticket, except for the exceptions noted here for user root and user mapr.
servicewithimpersonation (not scoped)	For accessing services running on client nodes to run jobs on behalf of any user (except user mapr). This type of ticket can have long duration.	Yes	The ticket cannot be used to impersonate user root or user mapr.
servicewithimpersonation (scoped)	For accessing services running on client nodes to run jobs on behalf of the users (except user root and user mapr) specified in the ticket. This type of ticket can have long duration.	Yes	At ticket generation time, you cannot specify UID/GID of user root or user mapr to impersonate user root or user mapr respectively.  NOTE: In release 6.0.1, scoped impersonation works with FUSE-based POSIX clients. Scoped impersonation cannot be used with NFS and loopbacknfs POSIX clients. To use scoped impersonation in release 6.0.1, obtain the 6.0.1 EBF patch for RPM or DEB-based distributions from HPE Data Fabric Support, and install the patch.
servicewithimpersonationandticket	Allows some ticket holders to generate tickets subject to their impersonation authority. This type of ticket can have long duration.	Yes	Can be scoped or not scoped. See Generating an Impersonation Ticket with Ticket Generation Privileges on page 2105. Supported in release 7.0.0 and later.
tenant	For tenant user(s) to access tenant volume(s) in a multi-tenant environment. This type of ticket can have long duration.	Yes	The ticket can be used to impersonate user root but cannot be used to impersonate user mapr.

* Exceptions:

- User mapr can impersonate other users (including user root)
- User root can impersonate other users (excluding user mapr)

IMPORTANT: The identity of the user that authenticates with the `mapr login` utility is independent from the identity of the user of the client OS.

HPE Data Fabric tickets contain the following information:

- UID (generated from the UNIX user ID)
- GIDs (group IDs for each group to which the user belongs)
- Ticket creation time
- Ticket expiration time (initial duration of the ticket)
- Renewal expiration time (maximum lifetime of the ticket)
- Whether user can (true) or cannot (false) impersonate another user

Since a ticket contains the GIDs for a user at the time the ticket is generated, the user must re-generate their ticket after changing group memberships.

Syntax and Examples of Creating and Managing User Tickets

For complete syntax, see [The maprlogin Utility](#). For examples of creating and managing user tickets, see [maprlogin Command Examples](#) on page 3287

How Tickets Work

Explains the concept of tickets and how they work.

When an authenticated user runs a client, the client uses that user's ticket to communicate securely with the server. After [Enabling Wire-level Security](#) on page 2067, supported communications channels between client and server are encrypted.

Nodes use tickets to identify themselves to one another in order to prevent *spoofing*. Spoofing is a condition where an untrusted machine presents itself as a trusted machine to gain access to the cluster.

User Blocking

System administrators can use the [command line interface](#) to *block* a user. The command to block invalidates all of a user's tickets. After a block command is received by the CLDB, the name of the blocked user is sent to all FileServer nodes. These nodes reject any request sent by that user that has a ticket older than the block time stamp. Due to the nature of this check, there is no explicit removal of a blocked user. Issuing a new ticket with a time stamp more recent than the block time stamp implicitly permits the user. To permanently prevent a user from logging in again, revoke the user's credentials in the PAM registry.

What Blocking Affects

A blocked user cannot access the HPE Data Fabric file system or the CLDB. Blocking only revokes a user's *existing valid tickets*, be aware of the following interactions:

- Blocking does not affect a new authentication with user ID and password or with existing Kerberos credentials.
- Since NFS does not use HPE Data Fabric tickets, blocking does not affect NFS access.
- Blocked users can still be impersonated as impersonation does not check whether a user is blocked or not.
- Blocking has no effect on ZooKeeper. Blocked users can still connect to the ZooKeeper server and execute commands. The workaround to resolve this issue is to delete the ticket file.

Generating a HPE Data Fabric User Ticket

Describes what a user ticket is, and how to generate a user ticket.

A user ticket file is stored in /tmp and can only be read by that user. To generate a HPE Data Fabric user ticket, run the following command:

```
maprlogin password
```

This command prompts for the user's password, then generates a HPE Data Fabric user ticket associated with the UNIX user ID. By default, tickets on Linux systems are generated in the /tmp directory and are named in the form `maprticket_<UID>`. Tickets on Windows systems are generated in the %TEMP% directory and are named in the form `maprticket_<username>`. To change the default location, change the value of the `MAPR_TICKETFILE_LOCATION` environment variable.

NOTE: The mapr user can impersonate any user, including user root.

NOTE: There are no notifications to indicate that a ticket is about to expire. Use the `maprlogin print` command, with the ticket file, to see when the ticket expires. You can renew the ticket until the renewal date mentioned.

To illustrate a typical work flow, suppose a user wants to access two clusters, cluster1 and cluster2. During this session, a user logs in as root to cluster1, gets a HPE Data Fabric user ticket, and displays the ticket contents with the `maprlogin print` command.

```
root@qa-node113:~/SecurityInstall# maprlogin password
[Password for user 'root' at cluster 'cluster1': ]
MapR credentials of user 'root' for cluster 'cluster1' are written to '/tmp/
maprticket_0'
root@qa-node113:~/SecurityInstall#
```

First Ticket for Cluster 1

```
root@qa-node113:~/SecurityInstall# maprlogin print
Opening keyfile /tmp/maprticket_0
qasecurity1: user = root, created = 'Wed Sep 11 14:19:02 PDT 2013', expires
= 'Wed Sep 25 14:19:02 PDT 2013', RenewalTill = 'Fri Oct 11 14:19:02 PDT
2013', uid = 0, gids = 0, 42
root@qa-node113:~/SecurityInstall#
```

Now the root user logs in to cluster2. The `maprlogin` command returns a ticket for cluster2. This ticket is stored in the common ticket file. Commands now have access to both tickets.

```
root@qa-node113:/opt/mapr/conf# maprlogin password -cluster cluster2
[Password for user 'root' at cluster 'cluster2': ]
MapR credentials of user 'root' for cluster 'cluster2' are written to '/tmp/
maprticket_0'
```

Showing Tickets for both Clusters

```
root@qa-node113:/opt/mapr/conf# maprlogin print
Opening keyfile /tmp/maprticket_0
qasecurity1: user = root, created = 'Thu Sep 12 11:07:54 PDT 2013', expires
= 'Thu Sep 26 11:07:54 PDT 2013', RenewalTill = 'Sat Oct 12 11:07:54 PDT
2013', uid = 0, gids = 0, 42
qasecurity2: user = root, created = 'Thu Sep 12 15:20:49 PDT 2013', expires
= 'Thu Sep 26 15:20:49 PDT 2013', RenewalTill = 'Sat Oct 12 15:20:49 PDT
```

```
2013', uid = 0, gids = 0, 500
root@qa-node113:/opt/mapr/conf#
```

Generating a Service Ticket

Applications may have service processes that run outside the Data Fabric cluster but need to access the cluster to run Data Fabric commands. For security reasons, you decide not to run these services as a mapr user. Instead, you can use the mapr login utility to generate a "service ticket" that can be used to access the cluster for the user account that runs the service. The mapr login utility uses the current user's ticket (the user running the mapr login command) to send an authenticated request for a newly generated service ticket.

This type of ticket has a specified duration (expiration), a renewal period (maximum lifetime), and a designated location where the ticket is safely stored. The service process that uses the ticket can access it based on the definition of the MAPR_TICKETFILE_LOCATION environment variable. This variable points to the location of the ticket and should be set for the service process after it starts. Short duration and renewal values may be used for security reasons, but much longer lifetimes are supported for ease of administration.

For example:

```
# maprlogin generateticket -type service -out /tmp/
longlived_ticket -duration 30:0:0 -renewal 90:0:0 -user mapr
MapR credentials of user 'mapr' for cluster 'xxxx' are written to '/tmp/
longlived_ticket'
```

This command generates a service ticket that expires after 30 days and is stored in /tmp/longlived_ticket. The ticket may be renewed at any time before the 30 days pass, extending its lifetime to a maximum of 90 days. The ticket must be renewed explicitly before its expiration date; it does not renew automatically after it expires.

NOTE: This type of ticket can only be generated by a user with full control on a cluster's ACL.

Generating a Service with Impersonation Ticket

Impersonation allows a user to access data and submit jobs on behalf of another user. Consider allowing users, other than the mapr user, to impersonate other users. Use the mapr login utility to generate a "servicewithimpersonation ticket" that is optionally used to access a secure cluster impersonating another user. The servicewithimpersonation ticket provides the user the ability to impersonate other users (except the mapr user) in addition to the ability to access a secure cluster. This type of ticket can only be generated by a user with full control on a cluster's ACL.

If this type of ticket is generated and saved in the location specified with the -out option, after generating the ticket, do the following:

1. Reset the permissions on the ticket to grant the user for whom the ticket was generated read permissions on the ticket.
2. Set the MAPR_TICKETFILE_LOCATION environmental variable to point to the ticket file location if the path specified for the -out option was not /tmp/maprticket_<uid>.

This type of ticket, similar to a service ticket, has a specified duration (expiration), a renewal period (maximum lifetime), and a location where the ticket is safely stored. It grants the specified user the ability to impersonate other users, except the mapr user.

The default duration for this type of ticket is LIFETIME and the duration is not bounded by the CLDB duration properties. Short duration and renewal values may be used for security reasons, but much longer lifetimes are supported for ease of administration.

For example:

```
# maprlogin generateticket -type servicewithimpersonation -user
mapruser1 -out /var/tmp/impersonation_ticket -duration 30:0:0 -renewal
90:0:0
```

The above command generates a service with impersonation ticket that expires after 30 days and is stored in /var/tmp/impersonation_ticket. The ticket may be renewed at any time before the 30 days and can be extended up to a maximum of 90 days. The ticket must be renewed explicitly before its expiration date; it does not renew automatically when it expires. The ticket allows the user to impersonate all users on the cluster.

To allow a user to impersonate only specific users and/or groups, use the impersonateduids and/or impersonatedgids options with the maprlogin command. For example:

```
# maprlogin generateticket -type servicewithimpersonation -user
mapruser1 -out /var/tmp/impersonation_ticket -duration
30:0:0 -impersonateduids 1002,1003 -impersonatedgids 1005,1006 -renewal
90:0:0
```

The above command generates a service with impersonation ticket. The ticket holder can impersonate users whose UIDs are 1002 and 1003 and users in the groups with GIDs 1005 and 1006. The ticket expires after 30 days and is stored in /var/tmp/impersonation_ticket. The ticket may be renewed at any time before the 30 days and can be extended up to a maximum of 90 days. The ticket must be renewed explicitly before its expiration date; it does not renew automatically when it expires.

Generating an Impersonation Ticket with Ticket Generation Privileges

Describes a ticket option that allows some ticket holders to generate tickets subject to their impersonation authority.

Cases exist where an arbitrary process started by another process needs a ticket for a particular user. Before release 7.0.0, such tickets could be created by users with cluster-level “Full Control” capability. For example, in release 6.2.0, we can give the fc privilege to user m7server1:

```
# maprcli acl set -type cluster -user root:login,ss,cv,a,fc,cp \
  mapr:login,ss,cv,a,fc,cp m7server1:login,fc
# maprcli acl show -type cluster
Allowed actions      Principal
[login, ss, cv, a, fc, cp] User root
[login, ss, cv, a, fc, cp] User mapr
[login, ss, cv, fc]    User m7server1
```

With the fc privilege, the m7server1 user can create tickets for any user:

```
[m7server1@m2-mapreng-vm166251 ~]$ maprlogin generateticket -user
m7user1 -type service -out m7user1ticket.out
MapR credentials of user 'm7user1' for cluster 'fips1.cluster.com' are
written to 'm7user1ticket.out'
```

Although this meets the literal requirement, the “Full Control” capability is far too powerful, since the ability to create tickets is unrelated to cluster-level “Full Control” capability.

Release 7.0.0 enhanced the maprlogin generateticket command to allow the generation of a new type of ticket called servicewithimpersonationandticket:

```
# maprlogin generateticket
The -user parameter is required. Specify the user name of the service
identity.
generateticket
-type service|crosscluster|servicewithimpersonation|
```

```

servicewithimpersonationandticket |tenant
-user UNIX user name of service identity.
[ -clusters comma separated list of clusters OR 'all' for all clusters
  present in mapr-clusters.conf]
[ -cluster mapr cluster name ]
-out ticket location
[ -duration [Days:]Hours:Minutes OR -duration Seconds.default: cluster's
  ticket duration setting ]
[ -renewal [Days:]Hours:Minutes OR -duration Seconds.default: cluster's
  ticket duration setting ]
[-ips comma separated list of ips on which ticket should be valid]
[-impersonateduids comma separated list of uids for impersonation]
[-impersonatedgids comma separated list of gids for impersonation]

```

In addition to users with cluster-level “Full Control” capability being able to generate tickets, holders of tickets of the type `servicewithimpersonationandticket` can also generate tickets subject to their impersonation authority. Therefore, for users without cluster-level “Full Control” capability, ticket generation is allowed if the caller holds a ticket with `CanImpersonate = true` and `CanGenerateTicket = true`, and either of the following conditions is true:

- The ticket is not a scoped impersonation ticket. No `impersonatedUids` or `impersonatedGids` ID references are in the ticket. Below is an example of how to generate an unscoped impersonation ticket with ticket-generation permission for user `m7server2`:

```

# maprlogin generateticket -type servicewithimpersonationandticket \
  -user m7server2 -out m7server2ticket.out
MapR credentials of user 'm7server2' for cluster 'fips1.cluster.com' are
written to 'm7server2ticket.out'
# maprlogin print -ticketfile m7server2ticket.out
Opening keyfile m7server2ticket.out
fips1.cluster.com: user = m7server2, created = 'Tue Jan 04 18:00:38 PST
2022', expires = 'Tue Jan 04 18:00:38 PST 12022', RenewalTill = 'Tue Jan
04 18:00:38 PST 12
022', uid = 5004, gids = 5005, CanImpersonate = true, CanGenerateTicket =
true, isExternal = true

```

- If the ticket is a scoped impersonation ticket, the caller is allowed to generate a ticket for the target user if either of the following is true:
 - The target user UID is in the list of impersonated UIDs.
 - At least one group that the target user belongs to is in the list of impersonated GIDs.

Below is an example of how to generate a scoped impersonation ticket with ticket-generation permission for user `m7user2`:

```

# maprlogin generateticket -type servicewithimpersonationandticket -user
m7server2 -out m7server2ticket-imp.out -impersonateduids
5001 -impersonatedgids 5003
[root@m2-mapreng-vm166251 ~]# maprlogin print -ticketfile
m7server2ticket-imp.out
Opening keyfile m7server2ticket-imp.out
fips1.cluster.com: user = m7server2, created = 'Thu Jan 06 00:15:47 PST
2022', expires = 'Thu Jan 06 00:15:47 PST 12022', RenewalTill = 'Thu Jan
06 00:15:47 PST 12022', uid = 5004, gids = 5005, CanImpersonate = true,
CanGenerateTicket = true, isExternal = true, impersonatedUids = 5001,,
impersonatedGids = 5003,

```

User m7server2 is allowed to generate tickets for user m7user1 (UID 5001, GID 5002) because its UID is within the list of impersonatedUids for this ticket:

```
[m7server2@m2-mapreng-vm166251 ~]$ export MAPR_TICKETFILE_LOCATION=/home/
m7server2/m7server2ticket.out
[m7server2@m2-mapreng-vm166251 ~]$ maprlogin generateticket -user
m7user1 -type service -out m7user1ticket.out
MapR credentials of user 'm7user1' for cluster 'fips1.cluster.com' are
written to 'm7user1ticket.out'
```

The user m7server2 also is allowed to generate tickets for user m7user2 (UID 5002, GID 5003) because the GID for m7user2 is within the list of impersonatedGid for this ticket:

```
[m7server2@m2-mapreng-vm166251 ~]$ export MAPR_TICKETFILE_LOCATION=/home/
m7server2/m7server2ticket.out
[m7server2@m2-mapreng-vm166251 ~]$ maprlogin generateticket -user
m7user2 -type service -out m7user2ticket.out
MapR credentials of user 'm7user2' for cluster 'fips1.cluster.com' are
written to 'm7user2ticket.out'
```

User m7server2 is not allowed to generate tickets for user m7user3 (UID 5005, GID 5006) since m7user3 UID (5005) is not in the list of impersonatedUids for this ticket. Neither is its GID (5006) in the list of impersonatedGids:

```
[m7server2@m2-mapreng-vm166251 ~]$ maprlogin generateticket \
-user m7user3 -type service -out m7user3ticket.out
User m7server2 does not have permission to impersonate user m7user3(UID:
5005), and cannot generate ticket
```

Generating a Ticket for a Tenant

Explains what tenant tickets are and how to generate one.

About this task

Tenant tickets allow tenant users to access the tenant volume on the cluster if you have a [multi-tenant environment on file system](#). Generate the tenant ticket on the cluster and copy it to tenant hosts to grant tenant users access to provisioned storage.

Procedure

- To generate a tenant ticket, run one of the following commands on the cluster:

```
maprlogin generateticket -type tenant -cluster <cluster_name> -user
<tenant_admin_user> \
-duration <seconds> -out <ticket_file_path>.txt
```

NOTE: For more information, see the [maprlogin](#) command.

By default, the tenant ticket:

- Is stored in /tmp and can only be read by that user. To change the default location, specify the path to the desired location with the out parameter.
- Has no expiration. To change the expiration time, specify duration for the ticket with the command.

With tenant tickets, the value for `CanImpersonate` and `tenant` is always `true`. For example, if you run the `maprlogin print` command, the output should look similar to the following example.

```
Opening keyfile /user/clstrAdmin/tenant_user_ticket.txt
tenantHost: user = tenant_user, created = 'Mon Jul 11 07:14:53 UTC 2016',
expires = 'Mon Jul 11 07:14:53 UTC 12016', RenewalTill = 'Mon Jul 11
07:14:53 UTC 12016',
uid = 500, gids = 500, 42, CanImpersonate = true, tenant = true
```

To grant access to tenant users, the tenant ticket must be copied over to the tenant hosts.

What to do next

After generating the ticket:

1. Reset the permissions on the ticket to grant the tenant admin read permissions on the ticket.
2. Move the ticket out of the default `/tmp` directory to a secure location on one or more tenant hosts.

Generating a Data Fabric Ticket from a Kerberos Ticket

About this task

On clusters that use Kerberos for authentication, a Data Fabric ticket is implicitly obtained for a user that runs a Data Fabric command without first using the `maprlogin` utility.

If you want to use a Kerberos ticket to generate a `maprticket`, follow these procedure below.

Procedure

1. Obtain a Kerberos identity by running `kinit` or by another mechanism.
2. Run `maprlogin kerberos` to indicate that you have an existing Kerberos ticket. You can also specify these options: [`-cluster`] The name of the cluster. [`-duration`] The ticket duration in seconds.

Configuring PAM Authenticator

The HPE Data Fabric supports [Pluggable Authentication Modules \(PAM\)](#) in the UNIX authentication stack. HPE Data Fabric provides a PAM Authenticator module that generates Data Fabric tickets in conjunction with the `maprlogin` utility. After you install the platform, the PAM Authenticator module is located at `$INSTALL_DIR/lib/libmapr_pam.so`. Configuration files for PAM are located in the `/etc/pam.d` directory. Each UNIX operation, such as `su`, `login`, or `ssh`, has a specific PAM configuration file in that directory.

Configure the PAM Authenticator on Ubuntu or SLES

To configure the PAM Authenticator, append the following line to the end of the `/etc/pam.d/common-auth` file:

```
auth optional /opt/mapr/lib/libmapr_pam.so # MapR PAM module
```

WARNING: An absolute path to the location of the `libmapr_pam.so` file is required. By default, this location is `$MAPR_HOME/lib/libmapr_pam.so`.

Configure the PAM Authenticator on RHEL or CentOS

1. Insert the following line in the `/etc/pam.d/system-auth` file immediately before the first module that uses the `auth sufficient` configuration:

```
auth optional libmapr_pam.so # MapR PAM module
```

2. Append the string `try_first_pass` to the end of the module that uses `auth sufficient`, as in this example:

Before modification:

```
auth required pam_env.so
auth sufficient pam_unix.so nullok
auth requisite pam_succeed_if.so uid >= 500 quiet
auth required pam_deny.so
```

After modification, changes in **bold**:

```
auth required pam_env.so
auth optional libmapr_pam.so # MapR PAM module
auth sufficient pam_unix.so nullok try_first_pass
auth requisite pam_succeed_if.so uid >= 500 quiet
auth required pam_deny.so
```

Enable Debugging for PAM

To enable debugging for the client traffic used by the `mapr login` utility, update the `/opt/mapr/conf/log4j.properties` file with the following line:

```
log4j.logger.com.mapr.login=DEBUG
```

After updating the `log4j.properties` file, trace the `com.mapr.login` package at the `DEBUG` level.

Be sure to update the correct instance of the `log4j.properties` file. Traffic specific to HPE Data Fabric, such as `mapr login` and Control System traffic, uses the instance in the `/opt/mapr/conf` directory. Hadoop applications use the `log4j.properties` file in the `/opt/mapr/hadoop/hadoop-2.x.x/etc/hadoop` directory.

To perform the same tracing activity on the server side, modify the appropriate instance of the `log4j.properties` file on the server. Alternatively, specify the page `com.mapr.login` in the Control System UI's tracing/logger settings. To trace PAM activity from the server, add the following line to the server's `log4j.properties` instance:

```
log4j.logger.net.sf.jpam=DEBUG
```

After modifying this setting, the server log will contain a message similar to the following:

```
2013-07-23 16:05:25,200 DEBUG Pam [1068409264@qtp-874242484-3]: Debug mode active.
```

Detailed information about PAM activity is written to the `/opt/mapr/logs/pam_<username>.log` where `username` is the user name that Linux reports in response to the `getpwuid(geteuid())` call for the process. In this case, Linux returns the *effective user ID*, which can be different from the real user ID or saved user ID. For more information, see [Difference between Real User ID, Effective User ID and Saved User ID](#).

Other Packages

The following packages are not directly related to PAM, but can provide useful insights for subtler errors.

- `org.apache.hadoop.security` - This package contains Apache security code, including HPE Data Fabric enhancements. Tracing this package can provide information about what login configuration is in use.
- `com.mapr.fs.cldb.http.login` - This package contains code that the CLDB uses to validate `mapr login` calls.

Common Issues

The Linux Documentation Project's HOWTO on LDAP Implementation has a [section](#) on PAM and NSS that may prove helpful.

If a user's credentials appear valid, for example where the `su` and `ssh` commands work normally but PAM does not correctly authenticate, the issue may relate specifically to HPE Data Fabric's use of PAM as a normal user. PAM consumers run as the root user, causing permissions issues. The two most common issues relating to this condition are:

- The `/etc/shadow` directory is not readable to the `mapr` user. This directory is made readable to the `mapr` user during install, but some secure environments and configuration management tools undo these changes.
- A Kerberos PAM module is attempting to create and change the ownership of a Kerberos ticket file. This attempt fails, since these changes require root privileges. Different Kerberos PAM modules can report errors differently, leading to difficulty tracking down root causes of errors. To address permissions problems with Kerberos PAM modules, configure the Kerberos PAM module to skip creating a ticket file, using the KDC only to validate the password. PAM configuration information is located in the `/etc/pam.d` directory. HPE Data Fabric can use a custom PAM configuration specified in the `web.conf` file.

Configuring Kerberos

Describes how Kerberos works with HPE Data Fabric tickets.

HPE Data Fabric does not directly support Kerberos. However, Kerberos is indirectly supported through the HPE Data Fabric login utility, which is used to generate HPE Data Fabric tickets. This topic describes how Kerberos works with HPE Data Fabric tickets.

Kerberos Compatibility with RHEL 8

If you install Kerberos out of the box with RHEL 8, it uses a new and default Kerberos Cache Manager (KCM) credentials cache type, which fails to work with the `mapr login kerberos` command. To resolve this issue, disable KCM.

Open the file `/etc/krb5.conf.d/kcm_default_ccache`, and comment out the following lines:

```
[libdefaults]
    default_ccache_name = KCM:
```

Alternatively, remove this file.

Configuring Kerberos for Authentication Using HPE Data Fabric Tickets

To use Kerberos to generate HPE Data Fabric [tickets](#) for users, enable Kerberos on CLDB. Do so by creating a Kerberos identity on the Kerberos server used by the cluster and distributing that identity to the other CLDB nodes in the cluster.

NOTE: You must enable wire-level security on your clusters before using Kerberos. See [Enabling Wire-level Security](#).

HPE Data Fabric clusters do not provide Kerberos infrastructure. This section assumes you have a functioning Kerberos realm and your systems have the Kerberos client installed. The tips in this section

assume a Linux-based Kerberos environment. The specific commands for your environment may vary. Please consult with your Kerberos administrator for assistance.

IMPORTANT: If you are using strong encryption with Kerberos with the Oracle JDK, a new [Java Cryptography Extension \(JCE\)](#) policy file is required.

Creating a Kerberos Identity for the CLDB

The CLDB requires a Kerberos server identity, but no other nodes do. By default, this identity takes the `mapr/<cluster name>` form. Use [configure.sh](#) on page 3186 or edit the `mapr-clusters.conf` file to change this default. Use the following commands in a Linux-based Kerberos environment to set up the identity:

```
kadmin
: addprinc -randkey mapr/my.cluster.com
: ktadd -k /opt/mapr/conf/mapr.keytab mapr/my.cluster.com
```

Copy the resulting `mapr.keytab` file to the same location on every CLDB node. The `mapr.keytab` file must be owned and readable only by the `mapr` user. Optionally specify the location of the `mapr.keytab` file in the `conf/mapr.login.conf` file. The default location for `mapr.keytab` is `/opt/mapr/conf`.

Updating the keytab File

Use the `kadmin` tool to update the server keys that are stored in the keytab file. Because the server tickets used to authenticate to the CLDB use the new keys immediately, you must copy the new keytab file to all the CLDB servers in the cluster immediately after updating the server keys.

To update the keytab file with a new key, run the following command:

```
kadmin
: ktadd -k /opt/mapr/conf/mapr.keytab mapr/my.cluster.com
```

The CLDB automatically detects changes to the keytab file on systems that use Java 7 or later. Systems that use Java 6 require a CLDB restart to detect changes to the keytab file.

NOTE: Starting with the 4.0.1 release of the MapR software, Java 6 is deprecated in favor of Java 7 and Java 8.

Running configure.sh

After a Kerberos principal is created for the CLDB, it is added to the `mapr.keytab` file and the `mapr.keytab` file is copied to all the CLDB servers, Kerberos user authentication is then fully enabled for the HPE Data Fabric cluster.

Two `configure.sh` parameters are important for Kerberos:

- `-K` | `-kerberosEnable`—lets the rest of the cluster know that Kerberos is enabled, so that clients can auto detect Kerberos tickets and use them to get HPE Data Fabric tickets.
- `-P "<cldbPrincipal>"`—specifies the Kerberos instance which is used to form the CLDB Kerberos principal in the form of `mapr/<instance-name>@<realm-name>`. Enclose this value in quotes (").

Run `configure.sh` on each HPE Data Fabric cluster node and on each HPE Data Fabric client node that will communicate with one or more clusters. For more information, see [configure.sh](#) on page 3186.

```
configure.sh -K -P "<cldbPrincipal>"
```

Running `configure.sh` on each node enters the Kerberos information into the local `clusters.conf` file, so that the following command is all that is required for the client to access the cluster:

```
hadoop fs -ls
```

If you do not run `configure.sh` on each node, the following two commands are required from the client:

```
maprlogin kerberos
hadoop fs -ls
```

Kerberos Command Summary

- **kinit:** Creates a Kerberos ticket. Prompts the user for the userid and password. After validating, Kerberos creates a ticket file in `/tmp` which is owned by the user. Use the `-R` option to renew an existing ticket. Kerberos credentials expire in 8-10 hours. Expired credentials must be renewed or replaced. By default, tickets can be renewed for up to 24 hours.
- **klist:** Lists the contents of the user's ticket file.
- **kdestroy:** Destroys the contents of the user's ticket file. The user is no longer authenticated.
- **kadmin:** Used to administer Kerberos. The login for this command is implicitly `<userid>/admin` since administrator IDs typically end in `/admin`.
- **ktutil:** As the Kerberos keytab maintenance utility, combines or alters Kerberos keytabs.

Disabling Replay Detection for Kerberos Authentication

You can set an option, as shown below, in `mapr-clusters.conf` file to disable replay detection for Kerberos runtime authentication.

```
disableReplayDetection=true
```

By default, this parameter is set to `false`, meaning that HPE Data Fabric clients enable Kerberos replay detection. Replay detection is enabled to prevent potential attacks, such as the replay of Kerberos packets or multiple login attempts with the same user ID. Set this parameter to `true` only if you do not want HPE Data Fabric clients to enforce this detection.

This parameter applies if users attempt an implicit or explicit `maprlogin`, using the `maprlogin kerberos` command, or by submitting jobs and other operations with `kerberosEnable=true` set in the `mapr-clusters.conf` file.

This parameter is used if applications connect to the cluster using Kerberos. `mapr-clusters.conf` only needs to be updated if it is used by such applications. If all Kerberos access to the cluster is from clients outside the cluster, only the `mapr-clusters.conf` file on those client machines must be updated. If Kerberos is used from applications running on the cluster, `mapr-clusters.conf` file should be updated there as well.

Configuring YARN with Kerberos

Lists the process to use YARN with Kerberos.

Make sure that the following tasks are already completed, as directed in earlier sections of this guide:

- [Enabling Wire-level Security](#) on page 2067 by running `configure.sh` with the security options.
- [Configuring Kerberos](#) on page 2110 by creating a Kerberos principle and keytab file.

NOTE: To enable YARN REST SPNEGO, see [Configuring SPNEGO on Data Fabric](#) on page 2114.

Now complete the following tasks.

Configure the yarn-site.xml File

Add the following properties to the yarn-site.xml file on every node in the cluster.

```
/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/yarn-site.xml
```

NOTE: You need to use /opt/mapr/conf/mapr.keytab for the keytab property, and mapr instead of yarn for the principal property.

```
<!-- ResourceManager security configs -->
<property>
  <name>yarn.resourcemanager.keytab</name>
  <value>/opt/mapr/conf/mapr.keytab</value>    <!-- path to the YARN
keytab -->

</property>
<property>
  <name>yarn.resourcemanager.principal</name>
  <value>mapr/clustername@YOUR-REALM.COM</value>
</property>

<!-- NodeManager security configs -->
<property>
  <name>yarn.nodemanager.keytab</name>
  <value>/opt/mapr/conf/mapr.keytab</value>    <!-- path to the YARN
keytab -->

</property>
<property>
  <name>yarn.nodemanager.principal</name>
  <value>mapr/clustername@YOUR-REALM.COM</value>
</property>
<property>
  <name>yarn.nodemanager.container-executor.class</name>
  <value>org.apache.hadoop.yarn.server.nodemanager.LinuxContainerExecutor</
value>
</property>
<property>
  <name>yarn.nodemanager.linux-container-executor.group</name>
  <value>mapr</value>
</property>
```

Configure the mapred-site.xml File

Add the following properties to the mapred-site.xml file on every node in the cluster.

```
/opt/mapr/hadoop/hadoop-2.7.0/etc/hadoop/mapred-site.xml
```

Note that you need to use /opt/mapr/conf/mapr.keytab for the keytab property and mapr instead of yarn for the principal property.

```
<!-- MapReduce Job History Server security configs -->
<property>
  <name>mapreduce.jobhistory.address</name>
  <value>host:port</value> <!-- Host and port of the MapReduce Job History
Server; default port is 10020 -->
</property>
<property>
```

```

    <name>mapreduce.jobhistory.keytab</name>
    <value>/opt/mapr/conf/mapr.keytab</value><!-- path to the YARN
keytab -->
</property>
<property>
    <name>mapreduce.jobhistory.principal</name>
    <value>mapr/clustername@YOUR-REALM.COM</value>
</property>

```

Modifying the env_override.sh File

Either the /opt/mapr/conf/env.sh file or the /opt/mapr/conf/env_override.sh file contains a setting for HPE Data Fabric login option that defaults to the value maprsasl. Change this value to hybrid, which includes Kerberos and other security protocols. For more information about the env_override.sh file, see [About env_override.sh](#) on page 3467.

The new line (after the change) should be as follows:

```

MAPR_LOGIN_OPTS="-Dhadoop.login=hybrid ${MAPR_JAAS_CONFIG_OPTS} $
{MAPR_ZOOKEEPER_OPTS}"

```

Restart ResourceManager, NodeManager, and JobHistoryServer

Restart the NodeManager, ResourceManager, and JobHistoryServer services, using either the maprc li node services command (with the name option) or the Control System. After restarting the services, make sure you can run simple Hadoop jobs by running:

```

hadoop jar /opt/mapr/hadoop/hadoop-<version>/share/hadoop/mapreduce/
hadoop-mapreduce-examples-<version>.jar pi

```

Configuring SPNEGO on Data Fabric

About this task

HPE Data Fabric uses the Simple and Protected GSSAPI Negotiation Mechanism (SPNEGO) to secure several web UIs in a secure cluster, as well as the REST calls to the Control System.

Configuring SPNEGO for the Web Server Nodes on Secure Clusters

About this task

The following procedure configures SPNEGO support for the apiserver nodes on your secure cluster.

Procedure

1. Generate a Kerberos principal with the user name HTTP, of the form HTTP/<webserver name>, on each node in the secure cluster that will receive inbound SPNEGO traffic.

Use the FQDN as the name in the principal. Although you could also use a short name or the IP address for the principal name, using the FQDN keeps the name consistent with principal names that `configure.sh` generates and includes in the `mapr.login.conf` file.

Whatever you use as the principal name is what users must match exactly in a browser to access the webpages that are protected.

NOTE: Several services and components in a HPE Data Fabric cluster handle SPNEGO traffic, including the Control System. Name the `mapr.keytab` keytab file if the file does not already exist. If the `mapr.keytab` file already exists, generate the new principal to a different file name and merge it to the `mapr.keytab` file using the `ktutil` tool. For example:

```
kadmin
: addprinc -randkey HTTP/<webserver name>
: ktadd -k /opt/mapr/conf/mapr.keytab HTTP/<webserver name>
```

2. Verify that the `/opt/mapr/conf/mapr.login.conf` file lists the correct principal in the `MAPR_WEBSERVER_KERBEROS` section.

To enable SPNEGO for the Control System UI or for the Control System REST, all nodes with the webserver role, add the following line to the `/opt/mapr/apiserver/conf/properties.cfg` file. For example:

```
mapr.rest.auth.methods=kerberos,basic
```

IMPORTANT: The `mapr.rest.auth.methods=kerberos,basic` option shown above is valid only on a secure cluster. If a cluster is not secure, only basic authentication (WWW-Authenticate: Basic) is available to clients.

3. Restart the Control System for the changes to take effect.

Testing SPNEGO With curl

About this task

This example tests that the Control System is using GSS for REST calls made with `curl`.

Use the following command to verify that your version of `curl` supports SPNEGO. Under the **Features** header, output of the command should show either **GSS-Negotiate** or SPNEGO. For example:

```
# curl --versioncurl 7.22.0 (x86_64-pc-linux-gnu) libcurl/7.22.0
OpenSSL/1.0.1 zlib/1.2.3.4 libidn/1.23 librtmp/2.3Protocols:
dict file ftp ftps gopher http https imap imaps ldap pop3 pop3s rtmp rtsp
smtp smtps telnet tftp
Features: GSS-Negotiate IDN IPv6 Largefile NTLM NTLM_WB SSL libz TLS-SRP
```

Verify that you have a valid Kerberos ticket-granting-ticket (TGT) with the `kinit -p <user>` command. Then, test `curl` with the following command:

```
curl --negotiate -u : -b ~/cookiejar.txt -c ~/cookiejar.txt
https://<web server node>:8443/rest/<API call> -k -v
```

This command returns HTTP/1.1 200 OK if `curl` is working correctly with SPNEGO.

Configuring Browsers for SPNEGO

About this task

Use the following processes to configure browsers for SPNEGO connections.

Firefox

The process below configures your Firefox browser for SPNEGO connections.

NOTE: These instructions are specific for Firefox version 40.0.3xj. The details may differ slightly if you are using a different Firefox version.

1. Open the Firefox configuration page by navigating to the `about:config` address.
2. In the **Search** text field, enter `network.negotiate-auth.trusted-uris` to bring up that property.
3. Right-click on `network.negotiate-auth.trusted-uris`, select **Modify** to edit the property, and then enter the hostnames of the web server nodes in the cluster as a comma-separated list.
4. Click **OK**.

Chromium on Ubuntu

To configure the Chromium browser on Ubuntu for SPNEGO, edit the `/etc/chromium-browser/default` file, and add the following property:

```
CHROMIUM_FLAGS="--user-data-dir --auth-server-whitelist=<web server host names>"
```

The `--user-data-dir` flag enables the root user to launch the browser.

The `--auth-server-whitelist` flag specifies the web servers that support SPNEGO authentication.

Troubleshooting Kerberos

Java errors from Kerberos problems can be obscure and difficult to interpret. To see the Kerberos error messages, enable Kerberos debugging by adding these settings to the JVM:

```
-Dsun.security.krb5.debug=true -Dsun.security.spnego.debug=true -Djavax.net.debug=all
```

Enable Kerberos debugging for the HPE Data Fabric-provided `maprc li` and Hadoop clients by adding the following line to the `/opt/mapr/conf/env_override.sh` shell script:

```
#MAPRLOGIN_OPTS="$  
{MAPRLOGIN_OPTS} -Dsun.security.krb5.debug=true -Dsun.security.spnego.debug=  
true -Djavax.net.debug=all"
```

The `env.sh` script reads this file as part of its execution. For more information, see [About env_override.sh](#) on page 3467.

Capture the Kerberos error to research the issue.

The following sections list common Kerberos error conditions.

Incorrect JVM

Nodes often have multiple JVMs installed. The HPE Data Fabric `env.sh` script automatically configures a JVM to use. To change the automatically-configured JVM, set the value of the `JAVA_HOME` environment variable in the `/opt/mapr/conf/env_override.sh` file. The `env.sh` script reads this file as part of its execution. For more information, see [About env_override.sh](#) on page 3467.

Incorrect Server Name

The following error message is caused by an incorrect CLDB server name in the `mapr.login.conf` file. The error message mentions passwords, but the error condition is unrelated to password authentication.

```
2018-04-25 16:46:02,324 ERROR MapRLoginServlet [185087767@qtp-648535353-2]:
Failed to obtain kerberos identity, continuing anyway...

Invalid or missing keytab file

The keytab file must be consistent with the key versions of the Kerberos principal. The following example shows an inconsistent keytab file:

```

kadmin: getprinc mapr/realml1
Principal: mapr/realml1@mapr
Expiration date: [never]
Last password change: Thu May 23 15:36:01 PDT 2013
Password expiration date: [none]
Maximum ticket life: 0 days 10:00:00
Maximum renewable life: 7 days 00:00:00
Last modified: Thu May 23 15:36:01 PDT 2013 (mapr/admin@mapr)
Last successful authentication: Thu May 23 19:31:59 PDT 2013
Last failed authentication: Thu May 23 15:35:41 PDT 2013
Failed password attempts: 0
Number of keys: 8
Key: vno 15, aes256-cts-hmac-sha1-96, no salt
Key: vno 15, arcfour-hmac, no salt
Key: vno 15, des3-cbc-sha1, no salt
Key: vno 15, des-cbc-crc, no salt
Key: vno 15, des-cbc-md5, Version 4
Key: vno 15, des-cbc-md5, Version 5 - No Realm
Key: vno 15, des-cbc-md5, Version 5 - Realm Only
Key: vno 15, des-cbc-md5, AFS version 3
MKey: vno 1

ktutil: rkt mapr.keytab
ktutil: l
slot KVNO Principal
-----

1 14 mapr/realml1@mapr
2 14 mapr/realml1@mapr
3 14 mapr/realml1@mapr
4 14 mapr/realml1@mapr
ktutil: q

```

Note that the key versions in the Kerberos principal /realml1 are 15, and the versions in the keytab file are 14. This mismatch can result in errors about missing keys or mismatched encryption.

**NOTE:**

This error state can also be caused by the `/opt/mapr/conf/mapr.keytab` file not being owned by the user `mapr` or not being present. The keytab file is owned by `root` at generation. Be sure to use the `chown` command to set the `mapr` user as the owner:

```
$ chown mapr:mapr /opt/mapr/conf/mapr.keytab
```

Incompatible encryption on Java runtime

Incompatible cryptography between the KDC and the JDK results in failed handshakes, leading to errors similar to the following:

```
Caused by: javax.security.auth.login.LoginException: Unable to obtain
Principal Name for authentication
```

With debugging active, the following message is displayed:

```
>>>DEBUG <CCacheInputStream> client principal is username@hostname
>>>DEBUG <CCacheInputStream> server principal is X-CACHECONF:/
krb5_ccache_conf_data/fast_avail/krbtgt/user@hostname
>>>DEBUG <CCacheInputStream> key type: 0
>>>DEBUG <CCacheInputStream> auth time: Wed Dec 31 16:00:00 PST 1969
>>>DEBUG <CCacheInputStream> start time: null
>>>DEBUG <CCacheInputStream> end time: Wed Dec 31 16:00:00 PST 1969
>>>DEBUG <CCacheInputStream> renew_till time: null
>>> CCacheInputStream: readFlags()
>>> unsupported key type found the default TGT: 18
Negotiate support not initiated, will fallback to other scheme if
allowed. Reason:
```

This debug message indicates that the problem is an unsupported key type.

Incompatible encryption errors can occur due to a keytab file that is not present or contains outdated keys.

Be sure to update the Java jurisdiction policy file. Jurisdiction policy files are available from [Oracle](#).

A persistent encryption incompatibility problem may require you to edit the `krb5.conf` file to ensure compatible algorithms between Java and Kerberos.

Bugs in Java

The following error occurs in Java version 1.6.0_25. Upgrade to 1.6.0_45 to resolve the error.

level: Failed to find any Kerberos tgt)]

```

**NOTE:**

Starting with the 4.0.1 release of the HPE Data Fabric software, Java 6 is deprecated in favor of Java 7 and Java 8.

Kerberos and PAM validation

Standard Kerberos implementations are predicated on access to elevated user privileges that are not present on secure HPE Data Fabric clusters. In a HPE Data Fabric cluster, the Control System console and other components call PAM as an ordinary user process. This discrepancy in expected and actual privileges can cause a variety of obscure file permission errors. Since different Kerberos PAM modules are available, error reports can vary.

To diagnose this issue, attempt starting the Control System as the root user, or clear out the `/tmp` folder. If there are no problems when starting the Control System as root, or if clearing out the `/tmp` folder enables a single login before errors appear again, the problem may lie in the Kerberos PAM configuration.

To resolve this condition, prevent Kerberos from creating a ticket file. HPE Data Fabric security does not use Kerberos tickets. The Kerberos KDC is used to validate passwords. Typically the configuration file for PAM is in the `/etc/pam.d` directory. See the documentation for your specific Kerberos PAM module for more information.

Configuring PAM

Describes how PAM works with Data Fabric.

Data Fabric uses [Pluggable Authentication Modules \(PAM\)](#) for password verification in a variety of places. Make sure PAM is installed and configured on the node running the `mapr-apiserver` and other components that will use PAM to verify passwords.

Several PAM modules (profiles), configurable through configuration files in the `/etc/pam.d/` directory, are typically available. Any component verifying user passwords tries the following three profiles in order:

1. `sudo (/etc/pam.d/sudo)`
2. `sshd (/etc/pam.d/sshd)`
3. `mapr-admin` (if you created the `/etc/pam.d/mapr-admin` profile and the component checks beyond the first two profiles).

```
auth    sufficient    pam_unix.so  # For local OS Auth
```

Component-specific PAM Configurations

Some ecosystem components have unique requirements that require setup of a component-specific PAM configuration. See the [Ecosystem Guide](#) for the specific ecosystem component.

Configuring PAM for the Control System and the REST API

Describes how to create a custom PAM profile and use a specific PAM file for authentication.

About this task

Starting in HPE Data Fabric v6.0, no additional configuration is needed to use PAM files for authentication. The `apiserver` supports PAM and automatically loads the following PAM files, if they exist, in the following order for authentication:

```
/etc/pam.d/mapr-admin
/etc/pam.d/sudo
/etc/pam.d/sshd
/etc/pam.d/chkpasswd
/etc/pam.d/passwd
```

You can [create a custom PAM profile](#) and set the admin server property to point to a specific PAM file to use for authentication.

Procedure

1. Open the `/opt/mapr/apiserver/conf/properties.cfg` file and set the PAM file as the value for the `authentication.pam.service` property.

For example, to set `mapr-admin` as the file to use for authentication, your entry in the file should look similar to the following:

```
ojai.cache.size=64
mapr.webui.https.port=8443
doc.url=https://docs.datafabric.hpe.com/home
proxy.zkservices=elasticsearch,opentsdb
authentication.pam.service=mapr-admin
```

2. Save and close the file.

Configuring PAM to use LDAP

About this task

For instructions, refer to your operating system vendor documentation.

Configuring PAM to use Kerberos

About this task

To configure PAM with Kerberos:

Procedure

1. Install the `krb5` packages and configure the Kerberos client as per the configuration for your environment.
2. Install the appropriate PAM packages:
 - On Redhat/Centos, `sudo yum install pam_krb5`
 - On Ubuntu, `sudo apt-get install -krb5`

Creating a Custom PAM Profile

To ensure that Data Fabric uses a unique PAM configuration:

- Leave the `/etc/pam.d/sudo` file as is. Editing the `/etc/pam.d/sudo` file is not recommended.
- Create your own PAM profile in `/etc/pam.d`, naming it `mapr-admin`.
- Manually edit `mapr.login.conf` and other ecosystem component configuration files to use `mapr-admin` only.

Example /etc/pam.d/mapr-admin File

Below are some simple examples of what might work in the PAM profile by editing `mapr-admin` or a different PAM profile.

NOTE: Be sure to consult a Linux administrator before modifying PAM profiles.

```
account      required      pam_unix.so
account      sufficient    pam_succeed_if.so uid < 1000 quiet
account      [default=bad success=ok user_unknown=ignore] pam_ldap.so
account      required      pam_permit.so

auth         sufficient    pam_unix.so nullok_secure
```

auth	requisite	pam_succeed_if.so uid >= 1000 quiet
auth	sufficient	pam_ldap.so use_first_pass
auth	required	pam_deny.so
password	sufficient	pam_unix.so md5 obscure min=4 max=8 nullok
try_first_pass		
password	sufficient	pam_ldap.so
password	required	pam_deny.so
session	required	pam_limits.so
session	required	pam_unix.so
session	optional	pam_ldap.so

NOTE: The file `/etc/pam.d/sudo` should be modified only with care and if absolutely necessary.

Example for Hue

- Set which PAM profiles to use by modifying the `pam_service` option in the `<HUE_HOME>/desktop/conf/hue.ini` file:

```
[desktop]
...
# Configuration options for user authentication into the web application
# -----
[[auth]]
# Authentication backend...
backend=desktop.auth.backend.PamBackend
...
# The service to use when querying PAM.
## pam_service=sudo sshd login
```

NOTE: The `mapr-admin` profile is not used in the default Hue configuration.

NOTE: Hue respects only the `auth` section from the PAM profiles.

Example for Livy

- Authenticate users with PAM only by using Data Fabric MultiMechs authentication, so it uses the configuration from `/opt/mapr/conf/mapr.login.conf`.

Managing Access Controls

Describes how to create, enable, and use ACLs and ACEs.

ACLs specify users or system processes that can perform specific actions on an object. ACEs are Boolean expressions that defines a combination of users, groups, or roles that have access to an object.

Managing Access Control Lists

Defines and describes how to create ACLs.

An access control list (ACL) specifies users or system processes that can perform specific actions on an object.

Creating Cluster-Level ACLs

About this task

A cluster-level ACL determines who has access to a cluster and which actions users are allowed to perform. ACLs on a secure HPE Data Fabric cluster are predicated on a locally-managed OS registry.

 **IMPORTANT:** Before you create an ACL that applies to a particular group, you must create that group and assign users to it.

For example, the Red Hat Linux commands for creating a group called developers and adding a user named jsmith on a locally-managed OS registry are:

```
groupadd developers
useradd -g developers jsmith
```

After users and groups are defined, an administrator can create a cluster-level ACL using the Control System and CLI.

Creating an ACL from the Control System

Procedure

- 1. Click **Admin > User Settings > Permissions**.
- 2. Follow steps for [Adding Cluster Permissions](#) on page 1315.

Each allowed action has a permission code associated with it. The codes are explained below.

Permission Code	Allowed Action
login	Log in to the Control System, use the API, command-line interface, and read access on cluster and volumes.  NOTE: Read access allows you to only view file-system objects that already exist. You cannot create volumes, policies, schedules, snapshots, or other file-system objects.
ss	Start/stop services
cv	Create volumes
cp	Create security policies
a	Provides administrative access to cluster ACLs. Grants no other permissions.
fc	Provides full control over the cluster. Enables all cluster-related administrative options, with the exception of changing the cluster ACLs.

Creating an ACL from the Command Line

About this task

To create an ACL at the command line, use the `acl set` command. Include spaces between multiple entries, such as a list of usernames and their associated permission levels (or *actions*).

The syntax is:

```
maprcli acl set -type volume -name <volume name>
                [-group <groupname>:<action> -user <username>:<action>]
```

 **NOTE:** The `acl set` command *removes* previously set permissions if they are not explicitly called out in the command line.

Other ACL commands include:

- [acl edit](#) - To modify permissions in an ACL. Use this command instead of `acl set` to change some permissions while leaving others intact.
- [acl show](#) - To display permissions in an ACL.

Example

To create an ACL for a cluster named `my.cluster.com` that allows administration of cluster ACLs to user `root` and control over all other aspects of the cluster to all users in the `developers` group, enter this command:

```
maprcli acl set -type cluster -cluster my.cluster.com -user root:a -group
developers:fc
```

To change the `developers` group permissions so they can only log in and start or stop services, use the `acl edit` command:

```
maprcli acl edit -type cluster -cluster my.cluster.com -group
developers:login,ss
```

Note that only the `developers` group's permissions change, while the `root` user retains control over cluster ACL settings.

Creating Job Queue ACLs

About this task

A job queue ACL controls who can submit jobs to a queue, kill jobs, or modify their priority. The default behavior is that any user can submit a job, and jobs can only be seen and killed by the administrator or the user that submitted those jobs.

To create a job queue ACL, specify the following parameters in the `mapred-queue-acls.xml` file.

Parameter	What it does
<code>mapred.queue.names queue1,queue2,...</code>	Names the queues to which jobs can be submitted.
<code>mapred.acls.enabled=true</code>	Indicates that ACLs are checked whenever a user or group submits a job, tries to kill a job, or tries to change its priority. This parameter is set to true by default if security features for the cluster are enabled.
<code>mapred.queue.<queue-name>.acl-submit-job user1,user2,... group1,group2,...</code>	Identifies the users and groups that can submit jobs to the specified <code>queue-name</code> .
<code>mapred.queue.<queue-name>.acl-administer-job user1,user2,... group1,group2,...</code>	Identifies users and groups that can change the priority or kill jobs submitted to the specified <code>queue-name</code> . Note that the job owner can always kill his own job or change its priority.

Results

For information on configuring queue properties, see [Configuring Properties for Queues](#). You can also set job initialization parameters for a queue.

Creating Volume-level ACLs

About this task

Data Fabric provides volumes as a way to organize data and manage cluster performance. For example, to create a volume for each user, department, or project. Create a volume-level ACL that controls which users and groups have access to that volume, and what actions they may perform.

You can create volume-level ACLs from the Control System or from the command line.

Creating Volume-level ACLs from the Control System

Procedure

- For:
 - New volumes, see [Creating a Volume](#) on page 1437 to set volume-level ACLs.
 - Existing volumes, see [Modifying a Volume](#) on page 1467 to modify volume-level ACLs.

Creating Volume-level ACLs from the Command Line

About this task

To create an ACL at the command line, use the `acl set` command to specify a list of authorized users (or groups) and the actions they are allowed to perform.

The syntax is:

```
maprcli acl set -type volume -name <volume name> [-user
<username>:<action> -group <groupname>:<action>]
```

Include spaces between multiple entries, such as a list of usernames and their associated permission levels (or *actions*). Each allowed action has a permission code associated with it. The codes are explained below.

Permission Code	Allowed Action
dump	Dump or back up the volume
restore	Restore or mirror the volume
m	Modify the volume's properties
d	Delete the volume
a	Administrator (can edit and view ACLs but cannot perform volume operations)
fc	Full control over the volume (This enables all volume-related administrative options with the exception of changing the volume ACLs.)

Example

This example shows how to create an ACL for a volume named `test-volume` that allows full control over volume ACLs for user `rjones`. In addition, all users in the `developers` group are given permission to dump, restore, and modify volume properties.

```
maprcli acl set -type volume -name test-volume -user rjones:fc
-group developers:dump,restore,m
```

Managing Access Control Expressions

Defines and describes how to create, enable, and use ACEs.

ACEs are defined by a combination of user, group, or role definitions.

ACE Syntax

Describes how to construct ACEs.

An [ACE](#) is defined by a combination of user, group, or *role* definitions. You can combine these definitions using the following syntax:

Operator	Description
u	Username or user ID, as they appear in /etc/passwd, of a specific user. Usage: u:<username or user ID>
g	Group name or group ID, as they appear in /etc/group, of a specific group. Usage: g:<group name or group ID>
r	Name of a specific role. Usage: r:<role name>.
p	Public. Specifies that this operation is available to the public without restriction. Cannot be combined with any other operator. API request or CLI command to save such settings will return an error.
!	Negation operator. Usage: !<operator>.
&	AND operation.
	OR operation
()	Delimiters for subexpressions.
""	The empty string indicates that no user has the specified permission.

An example definition is `u:1001 | r:engineering`, which restricts access to the user with ID 1001 or to any user with the role `engineering`.

In this next example, members of the group `admin` are given access, and so are members of the group `qa`:

`g:admin | g:qa`

Another example is to have a list of groups to which you want to give read permissions:

- The `admin` group as a whole, but not the admins for a particular cluster (which is named `cl3`).
- Members of the `qa` group who are responsible for testing the two applications (named `app2` and `app3`).
- The business analysts (group `ba`) in department 7A (group `dept_7a`)
- All of the data scientists (group `ds`) in the company.

To grant the read permission, you construct this boolean expression:

```
u:cfkane | (g:admin & !g:cl3) | (g:qa & (g:app2 | g:app3)) | (g:ba &
g:dept_7a) | g:ds
```

This expression is made up of five subexpressions which are separated by OR operators:

- The first subexpression `u:cfkane` grants the read permission to the username `cfkane`.

- The subexpression (g:admin & !g:c13) grants the read permission to the admins for all clusters except cluster c13. The operator g is the group operator, the value admin is the name of the group of all admins. The & operator limits the number of administrators who have read permission because only those administrators who meet the additional condition will have it.

The condition !g:c13 is a limiting condition. The operator ! is the NOT operator. Combined with the group operator, this operator means that this group is excluded and does not receive the read permission.

WARNING: Be careful when using the NOT operator. You might exclude fewer people than you intended. For example, suppose that you do not want anyone in the group group_a to have access. You therefore define this [ACE](#): !g:group_a. You might think that the data is now protected because members of group_a do not have access to it. However, you have not restricted access for anyone else except the members of group_a. The rest of the world can access the data. You should not define [ACEs](#) through exclusion by using the NOT operator. You should define them by inclusion and use the NOT operator to limit further the access of the groups or roles that you have included.

In the subexpression (g:admin & !g:c13), the NOT operator limits the number of members within the admin group who have access. The admin group is included, and all users who are also part of the c13 group are excluded.

- The subexpression (g:qa & (g:app2 | g:app3)) demonstrates use of a subexpression within a subexpression. The larger subexpression means that only members of group qa who are also members of group app2 or app3 have read access to the data. The smaller subexpression limits the number of people who have this permission in the qa group.
- The next two subexpressions -- (g:ba & g:dept_7a) and g:ds -- grant the read permission to the members of group ba who are also in the group dept_7a. It also grants permission to the members of the group ds.

Creating User Roles for ACEs

Describes how to create and use roles for access control.

NOTE: HPE recommends that you use Unix groups over roles whenever possible for centralized maintenance. Use Roles only if you are unable to modify LDAP or AD groups easily.

A role is a label attached to a set of users and defines a common task or set of behaviors for those users. Roles enable you to use functionality similar to Unix groups for your users without requiring you to alter the existing group hierarchy of your system. Role names can be up to 64 characters long and cannot use the :, &, |, or ! characters.

Standard Reference Implementation User Information

The standard reference implementation is a library called libmapr_roles_refimpl.so. This library is located at /opt/mapr/server/permissions. This library opens a configuration file named m7_permissions_roles_refimpl.conf, which should contain a list of all the roles and the users associated with them. This configuration file is located at /opt/mapr/conf and should be identical across all clusters.

The structure of the configuration file is shown below. Roles end with `:` and user names are written on each subsequent line. For example:

```
Role_1:
    user_a
    user_b

Role_2:
    user_b
    user_c
    user_d
    #comment
```

The above example file states that there are two roles from which to choose while assigning permissions: Role_1 and Role_2. The users located under Role_1 are user_a and user_b. Role_2 contains user_b, user_c, and user_d. Blank lines and lines beginning with `#` are ignored.

Assume a table has permissions `r :Role_2`. user_b has access to this table while user_a does not have access.

After adding a new role to the `m7_permissions_roles_refimpl.conf` file, you must issue the following command to enable the file system layer to pick up the new role: `$ /opt/mapr/server/mrconfig dbrolescache invalidate`

Run this command on all the nodes whenever a change is needed in the roles configuration file.

Developer Information

The functions that the `libmapr_roles_refimpl.so` exposes are found in the extensibility implementation. If the library is called initially through `GetSecurityMembership`, it parses the `m7_permissions_roles_refimpl.conf` file and loads it into memory. All user names are read and parsed into user IDs (`uid_t`). If a user ID is not found, the ID is skipped.

The library uses a HashTable. The roles are the keys. The values are a Binary Tree of user IDs.

Each call checks the given user ID and role. The HashTable keys off the role and then searches the Binary Tree for the user ID. If the HashTable finds a user ID, it sets the boolean value of that role to `true`. If the HashTable does not find a user ID or if any errors occur, such as `Role not found`, it sets the boolean value to `false`.

A cleanup method frees the memory allocated to the HashTable along with all of its children. If the `GetSecurityMembership` method is called again, the library reloads the configuration file and loads all the values into memory.

Extensible Implementation

If users decide not to use the reference implementation, they can replace the shared library with their own. In the `mfs.conf` file, add a parameter that specifies the name of the file. If the name of the file is changed, then MFS searches `/opt/mapr/server/permissions` for the new file. If the file is found, it is loaded into memory. If not, then all roles become `false`.

The user's shared library should contain two functions specified under the `mapr : fs` namespace:

```
extern "C"
void GetSecurityMembership(uid_t uid, const char *roles[], int
```

```

numRoles, bool truthValue[]) {
    }

extern "C"
    void cleanup() {
    }

```

GetSecurityMembership takes the given user ID with a list of all the roles, the amount of roles in the array, and an array of all the results, as booleans.

Users must code their own implementation of populating the `truthValue` array with either `true` or `false`. The `truthValue` array has the same length as `numRoles` and is initialized. Do not modify any other variables.

Use the `cleanup` method to reset the shared library to an initialized state. This method resets all values and frees memory since the shared library is not closed until the class that is calling it is destructed.

Invoke Shared Library from MFS

The `TablePermissions` class opens and closes the shared library. During class initialization, the name of the shared library that is read from the `mfs.conf` file is passed to the constructor. The constructor loads the shared library into memory using the `LoadSO` method from `filterutils.cc`. The constructor also loads the `GetSecurityMembership` method with the `cleanup` method and are variables that can be called.

`TablePermissions` contains two methods that can be called to access the shared library:

- The `GetSecurityMembership` method. This method takes three arguments: the user ID, the array of roles, and the amount of roles in the array. This method returns a `RolePermission` structure, which contains all the same data, as well as the boolean of the successful roles for that given user ID. To evaluate the user roles, pass this `RolePermission` structure to the `TablePermission::checkTablePermissions` method.
- The `cleanup` method. This method calls the `cleanup` method in the shared library. This method takes no arguments.

The entity that allocates the `RolePermission` structure into memory also needs to deallocate this structure. Deallocating the `TablePermissions` class calls the `cleanup` method, and closes the shared library.

Shared Library Security

The `/opt/mapr/server/permissions` folder is initialized with 755 permissions. This implies that only the user who installed Data Fabric has access to writing to that folder. These permissions prevent a user from replacing a shared library with a malicious file.

The `m7_permissions_roles_refimpl.conf` file has 755 permission. This permission allows only an administrator to make changes to the file.

The Roles Library Shared Object and ACEs

If you access an object that is secured by an [ACE](#), the file system layer calls the roles library a shared object and checks the permissions of the entity requesting access against the contents of the roles file. The roles library shared object reads the roles file every 600 seconds. You can specify your own roles library shared object and specify the location of that object by using the `mfs.dbroles.sopath` parameter in the `/opt/mapr/conf/mfs.conf` file.

Enabling Volume, Directory, and File Authorizations with ACEs

Describes how to set access control expressions for volumes, directories and files.

[ACEs](#) allow you to define allowlists (to grant access) and denylists (to deny access) for a combination of users, roles, and groups. You can grant different permissions to multiple users, groups, and roles for file system files, directories, and whole volume data using boolean expressions and subexpressions.

ACEs for Files, Directories, and Whole Volume

An [ACE](#) is defined by a combination of user, group, and/or role definitions. Combine these definitions using the supported syntax. For more information, see [Syntax of Access Control Expressions](#).

The examples in the following table demonstrate how [ACEs](#) can be used to create allowlists to grant access, and denylists to deny access.

This Access Control Expression...	Grants access to...	Denies access to...
(u:u1&g:g1)	only user 'u1', if user 'u1' is a member of group 'g1'	users who are not 'u1' and members of group 'g1'
(g:g1&g:g2) r:r1	only users who are in both the groups 'g1' and 'g2', or users who are assigned role 'r1'	users who are not in both the groups 'g1' and 'g2', and users who are not assigned role 'r1'
(g:g1&!g:g2)	only users who are in group 'g1' and not in group 'g2'	users who are in group 'g2', even if they are in group 'g1', and all other users
(g:g1 g:g2)	users who are in groups 'g1' or 'g2' only	users who are not in groups 'g1' or 'g2'
(g:g1 g:g2)&!r:r1	only users in groups 'g1' or 'g2' and who are not assigned role 'r1'	users who are not members of groups 'g1' or 'g2', users who are assigned role 'r1', even if they are in group 'g1' or 'g2', and all other users
(p)	everyone	none
(!g:g1&!g:g2&!g:g3)	users who are not in groups 'g1', 'g2', and 'g3'	only users who are in groups 'g1', 'g2', or 'g3'
((u:u1 u:u2 u:u3)&g:g1&g:g2)&!r:r1	only users 'u1', 'u2', or 'u3', who are also members in groups 'g1' and 'g2', but not assigned role 'r1'	users who are not 'u1', 'u2', or 'u3' and members of groups 'g1' and 'g2', and users who are assigned role 'r1'
(u:u1 u:u2 u:u3)&g:g1 g:g2	only users who are 'u1', 'u2', or 'u3' and who are members in groups 'g1' or 'g2'	users who are not 'u1', 'u2', or 'u3' and members of groups 'g1' or 'g2'

NOTE: The entities — user, group, role, and public — must be the same for file system and HPE Data Fabric Database [ACEs](#).

Managing File and Directory ACEs

Describes the implications of setting access control expressions (ACEs) on files and directories.

A file [ACE](#) allows you to define access (allowlist and denylist) to files and directories for a combination of users, groups, and roles. If ACEs are not set, POSIX mode bits for the file or directory are used to grant or deny access to the file or directory.

When you set ACEs, Data Fabric software sets or resets the corresponding POSIX mode bits to match the permissions granted through ACEs. For more information, see [Setting/Modifying File and Directory ACEs](#).

- If both ACEs and POSIX mode bits are set, access is granted if access is allowed through ACEs or POSIX mode bits.
- If ACEs are not set, POSIX mode bits are used to grant access.
- If neither ACEs nor POSIX mode bits is set, access is denied.

The owner of the file or directory (and `mapr` and `root` users) can set, modify, and remove ACEs for that file or directory using `hadoop mfs` commands.

File ACEs

You can set and modify permissions to read, write, and execute files by using the `hadoop mfs` command or the [FileACE Java APIs](#) on page 2136 and [FileACE C APIs](#) on page 2136. Specifically, the following access types are supported:

Access Type		Description
Command Line	Java API (Enum)	
<code>-readfile</code>	<code>READFILE</code>	Read a file.
<code>-writefile</code>	<code>WRITEFILE</code>	Write to a file.
<code>-executefile</code>	<code>EXECUTEFILE</code>	Execute a file.

For more information, see [hadoop mfs](#), [FileACE Java APIs](#) on page 2136, and [FileACE C APIs](#) on page 2136.

Directory ACEs

You can set the same ACEs on directories that you set on files. In addition, directory ACEs support permissions to list, add child, delete child, and lookup directories using the `hadoop mfs` command. Specifically, the following access types are supported:

Access Type		Description
Command Line	Java API (Enum)	
<code>-readfile</code>	<code>READFILE</code>	Read a file.
<code>-writefile</code>	<code>WRITEFILE</code>	Write to a file.
<code>-executefile</code>	<code>EXECUTEFILE</code>	Execute a file.
<code>-readdir</code>	<code>READDIR</code>	List the contents of a directory. This access is required to write and/or execute files in the directory.
<code>-lookupdir</code>	<code>LOOKUPDIR</code>	Lookup a file in a directory. This access is required to find, read, write, and/or execute files in the directory.
<code>-addchild</code>	<code>ADDCHILD</code>	Add a file or subdirectory.
<code>-deletechild</code>	<code>DELETECHILD</code>	Delete a file or subdirectory.

Although you can set both file and directory ACEs on directories, only the directory ACEs are used for determining access to the directory. The file ACE on the directory is used as the default ACE setting for new files under that directory.

By default, when you set ACEs on a parent directory:

- Permissions for existing files and subdirectories under that parent remain unchanged.
- New files under that parent inherit the file ACEs and corresponding POSIX mode bits of the parent directory, if available. Otherwise, new files get the default ACE, the empty string (""), which indicates that no one has permissions to read, write, or execute the file. POSIX mode bits are set on the file in the traditional way.
- New subdirectories under the parent inherit both the directory and file ACEs and corresponding POSIX mode bits from the parent directory.

NOTE: When accessing files and directories, the ACEs on files have no effect on accessing the parent directory.

Workaround for Execute Operation when ACEs are set on an executable file

When ACEs are set on any file, mode bits are cleared. For a binary to execute, the kernel checks whether the execute bit is set or not, and restricts execution if it is not set. To run an executable file with ACEs set on it, use one of the following workarounds:

1. Set owner mode exec bit on binaries/shell scripts.
2. Set group mode exec bit on binaries/shell scripts.
3. Change owning group for the files to the group used in MapRAces, and set the executable group mode bit.

Setting File and Directory ACEs

Describes how to set ACEs for files and directories.

For files and directories, run the `hadoop mfs` command to set [ACEs](#). After [ACEs](#) are set, by default, the corresponding POSIX mode bits are also set. POSIX mode bits for owner and owning group are deduced by evaluating the corresponding [ACEs](#). POSIX mode bits for others is set only if "p" is given as the value for an [ACE](#).

The following table lists POSIX mode bits and corresponding access types.

	ACE	POSIX Mode Bits
File	readfile	r
	writefile	w
	executefile	x
Directory	readdir	r
	addchild	w
	deletechild	w
	lookupdir	x

The POSIX mode bit that grants write (w) access to a directory is set only if the user, role, or group is granted permission for both access types (addchild and deletechild).

The `hadoop` command, by default, sets the POSIX mode bits that correspond to the given [ACEs](#), and:

- Overwrites existing [ACE](#) values with new values, if specified, for access types that were previously set.
- Sets [ACE](#) values for access types that have not yet been set, if specified.
- Does not modify access types that are not specified with the command, regardless of how they were previously set.

WARNING: Changing the POSIX mode bits using `chmod` does not change the corresponding [ACE](#) setting and may result in different, conflicting permissions to files and directories.

File ACE Example

Illustrates setting access control expressions for files.

Suppose the following sequence of file [ACE](#) settings and corresponding POSIX mode bits are set for user `u1`.

As shown in the preceding illustration, in:

Step 1:

User u1 is granted permissions to read a file, sampleFile.

After the command runs, user u1 has permissions to (only) read the file. The POSIX mode bit for reading the file is set to u1 for owner/users.

There is no change in [ACEs](#) or POSIX mode bits for all other (write and execute) access types.

Step 2:

User u1 is granted permissions to write to the same file.

After the command runs, user u1 has permissions to write to the file. The POSIX mode bit for writing to the file is set to u1 for owner/users.

There is no change in [ACEs](#) or POSIX mode bits for all other (read and execute) access types.

Step 3:

User u1's permissions are modified to remove write permission (using the empty string) and to grant access to execute file.

After the command runs, user u1 has permissions to execute the file, but user u1 can no longer write to the file. The POSIX mode bit for:

- Writing to the file is set to 0 for owner/users, groups, and others.
- Executing the file is set to u1 for owner/users.

NOTE: When the empty string ("") is used to deny a specific type of file access, that type of file access is denied to all users, groups, and roles. To deny access to specific users only, use the negation operator (!).

There is no change in [ACEs](#) or POSIX mode bits for all other (read) access types.

Directory ACEs Example

Explains how to set access control expressions for directories.

For example, suppose the following diagram depicts the (command-line) sequence of directory [ACE](#) settings for user u2:

As shown in the preceding illustration, in:

Step 1:

User u2 is granted access to read directory and sampleDir, while all other directory/file **ACEs** are not specified.

After the command runs, user u2 has permissions to list the contents of the directory. The POSIX mode bits for listing the contents of the directory (r) is set to u2 for owner/users.

There is no change in **ACEs** or POSIX mode bits for all other (file- and directory-level) access types.

Step 2:

User u2 is granted permission only to add and delete child directories, while all other directory/file **ACEs** are not specified.

After the command runs, user u2 has permissions to create and delete child directories. The POSIX mode bit for writing (w) to the directory for owner/user is set to u2 because user u2 is granted access for both (addchild and deletechild) access types.

If user u2 creates child directories, by default, they inherit the **ACE** settings of the parent directory.

There is no change in **ACEs** or POSIX mode bits for all other (file- and directory-level) access types.

Step 3:

User u2's permissions are modified to grant access to read and write to files in the directory. User u2's permissions for adding and deleting child directories are removed (using the negation operator). All other directory/file **ACEs** are not specified.

After the command runs, user u2 can read and write to files in the directory, but user u2 can no longer add and delete child directories. The POSIX mode bits for directory write access (w) is set to 0 for owner/user.

Although at the directory level, user u2 has permissions to read and write to files in the directory for existing files, the file level **ACEs** or the POSIX mode bits for the file are used to determine access. By default, user u2 gets read and write permissions to all new files created under the directory. If user u2 creates new files under the directory, the files inherit the file **ACEs** from the parent directory by default, and

the POSIX mode bits for read (r) and write (w) access are set to u2 for owner/user.

There is no change in [ACEs](#) or POSIX mode bits for all other (lookupdir and execute file) access types.

Deleting File and Directory ACEs

Describes how to delete file and directory ACEs using the CLI.

You can remove all [ACE](#) associated with a file or directory using the `hadoop mfs -delace` command. After you delete all the [ACEs](#), the system sets the [ACE](#) for the file or directory to the default value, which is the empty string (""). The POSIX mode bits are not reset; if necessary, run the `chmod` command to reset POSIX mode bits.

You cannot remove specific access types that have been set. Use the empty string to deny specific types of access. After the empty string (") is used to deny a specific type of access, that type of access is denied to all users, groups, and roles. To deny access to specific users only, use the negation operator (!). If you use the empty string (") or the negation operation (!) to deny a specific type of access, the corresponding POSIX mode bit are also reset to match the [ACE](#) setting.

FileACE Java APIs

Contains the path to the Java FileACE APIs.

The Java FileACE APIs are located at [File ACE APIs](#).

FileACE C APIs

Describes the FileACE C APIs.

The FileACE C APIs are defined in the `hdfs.h` header file and are as described below.

hdfsSetAces

Sets the ACEs for a file or directory.

Syntax

```
int hdfsSetAces(hdfsFS fs, const char *path, hdfsFileAces *faces, int
isSet, int isRecursive);
```

Parameters

- **fs**: The configured filesystem handle.
- **path**: The path to the file or directory for which the ACEs need to be set.
- **faces**: The ACEs to set.
- **isSet**: Set to 0 to merge with any existing ACEs. Set to 1 to replace all existing ACEs.
- **isRecursive**: Set to 1 to apply ACEs recursively if set on a directory.

Return Value

0 on success, else an error code.

hdfsGetAces

Gets the ACEs from a file or directory.

Syntax

```
int hdfsGetAces(hdfsFS fs, const char *path, void *aceBuf, int bufLen,
hdfsFileAces *faces);
```

Parameters

- **fs**: The configured filesystem handle.
- **path**: The path to the file or directory from which the ACEs need to be fetched.
- **aceBuf**: The buffer to hold the ACEs.
- **bufLen**: Length of the ACE buffer (*aceBuf*).
- **faces**: The structure that contains the returned ACEs.

Return Value

The value is 0 upon success. Otherwise, the ERANGE error occurs, which indicates that the buffer is too small to hold the ACE entries.

hdfsDeleteAces

Deletes all ACEs from a file or directory.

Syntax

```
int hdfsDeleteAces(hdfsFS fs, const char *path);
```

Parameters

- **fs**: The configured filesystem handle.
- **path**: The path to the file or directory from which the ACEs need to be deleted.

Return Value

The value is 0 upon success. Otherwise, an error occurs, as appropriate.

Managing Whole Volume ACEs

Describes how to grant permissions to users, groups, and roles for the volume data using whole volume ACEs.

Whole volume [ACEs](#) allow you to define allowlists to grant access and denylists to deny access for files and tables within a volume.

Volume administrators and mapr user can set and modify whole volume [ACEs](#). By default, [ACEs](#) grant everyone access to read and write to files and tables in the volume at the volume-level. Inside the volume, to determine access for:

- Files, the file [ACEs](#) or POSIX mode bits are used.
- Tables, the table [ACEs](#) are used.

Supported Access Types

At the volume level, the following access types are supported:

Access Type	Description
- readAce	Read files, HPE Data Fabric Database binary tables, HPE Data Fabric Database JSON tables, and HPE Data Fabric streams in the volume. By default, this is set to p to grant all users this permission.

Access Type	Description
-writeAce	Write to files, HPE Data Fabric Database binary tables, HPE Data Fabric Database JSON tables, and HPE Data Fabric streams in the volume. By default, this is set to p to grant all users this permission.

ACE Behavior on Snapshots and Mirrors

Volume Snapshots

Volume snapshots reflect the [ACEs](#) of the volume at that point in time. Changes in volume [ACEs](#):

- Are carried over to a new snapshot of the volume.
- Do not propagate to older snapshots of the volume.

Volume Mirrors

[ACEs](#) of a volume are propagated to mirror volumes. After each mirroring operation, mirror volumes reflect the current [ACE](#) setting of their source volume. After a mirror volume is promoted to a read-write volume, you can modify the [ACEs](#) on the mirror volume from the command line. [ACEs](#) on the promoted mirror volume can be different from the source volume.

Setting Whole Volume ACEs

Describes how to set ACE expressions when creating or modifying volumes.

You can set [ACEs](#) at the time of volume creation using the [volume create](#) on page 2929 command and modify them at a later time using the [volume modify](#) on page 3018 command. When you run the command to set or modify [ACEs](#), the command does the following:

- Overwrites existing values with new values, if specified, for access types that were previously set.
- Sets values for access types that have not yet been set, if specified.
- Does not modify access types that were not specified with the command, whether they were previously set or are unset.

When you set whole volume [ACEs](#), permissions on files and tables under that volume remain unchanged. Also, new files and tables in the volume do not inherit the whole volume [ACEs](#) of that volume. Instead, whole volume [ACEs](#), if set, are used to determine volume level access to tables and files within the volume. To gain access to volume data, the user must have access at both the volume and file/table levels.

Whole Volume [ACE](#) Example

For example, suppose the following sequence of whole volume [ACE](#) settings for users u3 and u4 is as follows.

NOTE: In the following illustration, default [ACE](#) values are shown in red.

As shown in the illustration above, in:

Step 1:

User u3 is granted permissions to read.

User u3: User u3 has permissions to read files and tables at the volume level and by default, user u3 has write permission (shown in red) at the volume level. However, for:

- Files in the volume, file [ACE](#) or POSIX mode bits are used to determine read and write access for user u3.
- Tables in the volume, table [ACEs](#) are used to determine read and write access for user u3.

User u4: User u4 cannot read files and tables within the volume because the [ACE](#) for the volume does not explicitly grant access to user u4. Although user u4 has write permission by default, user u4 cannot write to files/tables in the volume because user u4 does not have read permission.

Step 2:

User u3 is granted permissions to write.

User u3: User u3's read access remains unchanged and although user u3 has permissions to write to files and tables, for:

- Files in the volume, file [ACE](#) or POSIX mode bits are used to determine write access for user u3.
- Tables in the volume, table [ACEs](#) are used to determine write access for user u3.

User u4: User u4 cannot write to files/tables in the volume.

Step 3

User u4 is granted read access.

User u3: User u3's read and write access remains unchanged.

User u4: User u4 has permissions to read files and tables at the volume-level; however, for:

- Files in the volume, file [ACE](#) or POSIX mode bits are used to determine read access for user u4.
- Tables in the volume, table [ACEs](#) are used to determine read access for user u4.

Deleting Whole Volume ACEs

You cannot remove ACEs that have been set. If you must remove ACEs, use the empty string ("") to deny specific types of access. If the empty string is used to deny a specific type of access, that type of access is denied to all users. To deny access to specific users only, use the negation operator (!).

Enabling Table and Stream Authorizations with ACEs

About this task

Permissions for Data Fabric tables, column families, and columns are defined by ACEs. Set permissions for tables after you create or edit tables. Set default permissions for column families when you create or edit tables, and you can override these defaults when you create column families.

For the syntax to use when creating Access Control Expressions, see [ACE Syntax](#) on page 2126.

If a user, group, or role requests to read data from, write data to, or append data to a column, HPE Data Fabric Database checks whether that user, group, or role has read or write permission for the column family AND read or write permission for the column. By default, columns allow read and write access to all users; in such cases, only the read or write permission for the column family matters.

However, suppose that a table contains columns col1 and col2 in column family cf1, and these columns grant read and write permission only to the table creator. A different user tries to write data to these columns. HPE Data Fabric Database checks whether this user has write permission on cf1 AND col1 AND col2. If the user does not have all three permissions, HPE Data Fabric Database returns an error that says access for the write is denied.

If this user were to try to read from the same two columns, HPE Data Fabric Database would simply not return the data. If the user tried to read from those two columns and additional columns on which he had read permissions, the results would contain the data for those additional columns but exclude the data for col1 and col2.

NOTE: Table Permissions for Older Releases: Because Data Fabric tables are stored at the file-system level, you can also set permissions for HPE Data Fabric Database tables directly in the file system, if your version of Data Fabric does not support ACEs. Support for ACEs was introduced in version 3.1.

To set permissions directly in the filesystem, see [Performing File System Operations on HPE Data Fabric Database Tables](#) on page 1652.

Setting Table ACEs Using the CLI

About this task

You can set ACEs with the following commands:

- [table create](#) on page 2753 — Creates a new Data Fabric table.
- [table edit](#) on page 2808 — Edits a Data Fabric table.
- [table cf create](#) on page 2778 — Creates a column family for a Data Fabric table.
- [table cf edit](#) on page 2785 — Edits a column-family definition.

- [table cf colperm set](#) on page 2761 — Set Access Control Expressions (ACEs) for a specified column.

Setting Stream ACEs Using the CLI

About this task

You can set ACEs with the following commands:

- [stream create](#) on page 2708 — Creates a new Data Fabric stream.
- [stream edit](#) on page 2715 — Edits a Data Fabric stream.

Permission Types for Fields and Column Families in JSON Tables

By using ACEs, you can grant or deny access to fields and column families that are in JSON tables.

There are three types of permission:

- Traverse (`traverseperm`)
- Read (`readperm`)
- Write (`writeperm`)

Traverse (`traverseperm`)

This permission allows the grantee to descend a hierarchy of fields to access fields on which the grantee has write or read permission.

For example, suppose that a user has read and write access to only field b below.

To access field b, the user would need to be able to traverse (pass through) field a. In this case, because the entire document is in the default column family, the user could be granted traverse permission on the default column family. Field a would inherit the traverse permission.

If a user was denied traverse permission on the default column family, the user would not be able to access field b. Granting traverse permission on field a in this case would have no effect.

In the example below, field a is part of the cf1 column family.

To be able to read and write at field b, the user could be granted the traverse permission on the column family.

Read (readperm)

The read permission allows the grantee to read from a field.

This permission extends to fields that are nested below the field on which the permission was granted. However, grantees can be explicitly denied the permission on any of the nested fields.

Write (writeperm)

This permission allows the grantee to delete a field, insert a value into a field, or overwrite field value.

As illustrated in the two diagrams below, deleting a field also deletes all fields that are nested within that field, even those fields on which the write permission is explicitly denied.

**Obtaining readperm and writeperm on Fields**

In this scenario, you want to perform an operation on a field, and the operation requires that you have readperm and writeperm permissions on that field. How you obtain these permissions depends on whether the field is in the default column family or a non-default column family.

If the field is in the default column family

In the document below, you want to perform an operation on field c, which is in the default column family. The operation requires you to have `readperm` and `writeperm` on field c.

Figure 24: Schematic diagram of an JSON document in which all fields are in the default column family

Case 1: You have `readperm` and `writeperm` on the default column family

In this case, field c inherits these permissions, assuming that the permissions were not denied on field a or b.

If you do not have `readperm` and `writeperm` on field a or b, you need `traverseperm` on the field that denied you those permissions. You also need `readperm` and `writeperm` explicitly granted to you on field c. You could be granted these permissions with the `maprcli table cf colperm set` command, as in these examples:

```
maprcli table cf colperm set -path
<path to JSON table>
-cfname default -name
a.b -traverseperm u:<user ID> |
<existing ACE for this field>
maprcli table cf colperm set -path
<path to JSON table> -cfname default
```

```
-name a.b.c -readperm u:<user ID>
| <existing ACE for this
field> -writeperm
u:<user ID> | <existing ACE for this
field>
```

Case 2: You do not have `readperm` and `writeperm` on the default column family

In this case, you need the `traverseperm` permission on the default column family. Fields a and b inherit this permission. You also need `readperm` and `writeperm` on field c.

You could be granted these permissions with commands similar to these:

```
maprcli table cf edit -path
<path to JSON table> -cfname
default -traverseperm
u:<user ID> | <existing ACE for this
field>
maprcli table cf colperm set -path
<path to JSON table> -cfname
default -name a.b.c
-readperm u:<user ID> | <existing ACE
for this field> -writeperm u:<user
ID> |
<existing ACE for this field>
```

If the field is in a non-default column family

NOTE: Non-default column families are an advanced feature of HPE Data Fabric Database's native JSON support. For information about them, see [Column Families in JSON table](#).

In the following document, you want to perform an operation on field c, which is in the column family cf1 that is defined at field b with the path a . b.

Figure 25: Schematic diagram of an JSON document in which fields b and c are in a column family that has the path a.b

Case 1: You do not have readperm and writeperm on field b

You need traverseperm on field b and both readperm and writeperm on field c. You can be granted these permissions with commands similar to these:

```
/opt/mapr/bin/maprccli table cf
edit -path <path to JSON
table> -cfname cf1
-traverseperm u:<user ID> | <existing
ACE for this field>
maprccli table cf colperm set -path
<path to JSON table> -cfname
cf1 -name a.b.c
-readperm u:<user ID> | <existing ACE
for this field> -writeperm u:<user
ID> |
<existing ACE for this field>
```

Case 2: You do have readperm and writeperm on field b

You do not need any further permissions. Field c inherits your readperm and writeperm permissions from field b.

Obtaining readperm or writeperm on Fields

In this scenario, you want to perform an operation on a field, and the operation requires that you have `readperm` or `writeperm` permissions on that field. How you obtain either permission depends on whether the field is in the default column family or a non-default column family.

If the field is in the default column family

In the following document, you want to perform an operation on field `c`, which is in the default column family. The operation requires you to have `readperm` or `writeperm` on field `c`.

Figure 26: Schematic diagram of an JSON document in which all fields are in the default column family

Case 1: You have the same permission (`readperm` or `writeperm`) on the default column family

In this case, field `c` inherits the permission, assuming that the permission was not denied on field `a` or `b`.

If you do not have `readperm` or `writeperm` on field `a` or `b`, you need `traverseperm` on the field that denied you the permission that you need. You also need `readperm` or `writeperm` explicitly granted to you on field `c`.

Example commands to grant these permissions:

```

/opt/mapr/bin/maprcli table cf
colperm set -path <path to JSON
table> -cfname
default -name a.b -traverseperm
  
```

```
u:<user ID> | <existing ACE for this field>
```

The next example command grants readperm:

```
/opt/mapr/bin/maprcli table cf
colperm set -path <path to JSON
table> -cfname
default -name a.b.c -readperm u:<user
ID> | <existing ACE for this field>
```

Case 2: You do not have the same permission (readperm or writeperm) on the default column family

In this case, you need the traverseperm permission on the default column family. You also need readperm or writeperm explicitly granted to you on field c.

Example commands to grant these permissions:

```
/opt/mapr/bin/maprcli table cf
edit -path <path to JSON
table> -cfname cf1
-traverseperm u:<user ID> | <existing
ACE for this field>
```

This next example command grants readperm:

```
/opt/mapr/bin/maprcli table cf
colperm set -path <path to JSON
table> -cfname cf1
-name a.b.c -readperm u:<user ID> |
<existing ACE for this field>
```

If the field is in a non-default column family

NOTE: Non-default column families are an advanced feature of HPE Data Fabric Database's native JSON support. For information about them, see [Column Families in JSON Tables](#).

In the following document, you want to perform an operation on field c, which is in the column family that is defined at field b with the path a.b. The operation requires you to have readperm or writeperm on field c.

Figure 27: Schematic diagram of an JSON document in which fields b and c are in a column family that has the path a.b

Case 1: You do not have the permission you need (readperm or writeperm) on field b

You need traverseperm on field b, and you need readperm or writeperm granted to you explicitly on field c.

Example commands to grant these permissions:

```
/opt/mapr/bin/maprcli table cf
edit -path <path to JSON
table> -cfname cf1
-traverseperm u:<user ID> | <existing
ACE for this field>
maprcli table cf colperm set -path
<path to JSON table> -cfname cf1
-name a.b.c -readperm u:<user ID> |
<existing ACE for this field>
```

Case 2: You do have the permission you need (readperm or writeperm) on field b

You do not need any further permissions. Field c inherits your readperm and writeperm permissions from field b.

Setting Permissions on Arrays

If you are granting permissions on a field and the field contains array data, you must grant the permission on the array field. This grants access not only to array data in the field, but also nested documents and

scalar data. It is also possible to set permissions on subfields within nested documents that are stored in an array.

NOTE: This topic describes the behavior of permissions in HPE Data Fabric Database version 6.1 and later, regardless of the Data Fabric version you used to grant the permissions.

Granting Permissions on Array Elements

Suppose you have the following documents where person is:

- An array of nested documents in document id001
- A single nested document in document id002
- A scalar value in document id003

```
{
  "_id" : "id001",
  "person" : [
    {"name" : {"last" : "Smith", "first" : "John"}},
    {"name" : {"last" : "Subramaniam", "first" : "Ananya"}}
  ]
}
{
  "_id" : "id002",
  "person" : {"name" : {"last" : "Doe", "first" : "Jane"}}
}
{
  "_id" : "id003",
  "person" : "Unknown"
}
```

If you grant a user read permission on the array `person[]`, that user can read every field in every nested document within the array in document id001. The permission also enables the user to read the `person` field in documents id002 and id003.

If you receive an error when trying to grant permission on `person[]` because you previously granted permission on `person`, then you (or an administrator with the appropriate permissions) must first remove the existing permission on `person`. If you expect the schema of the `person` field to evolve to include non-array and array data, then you should grant the permission on `person[]` rather than `person` to avoid having to remove the conflicting `person` permission.

You cannot grant permissions on individual elements in an array; for example: `person[1]`. Granting permission on an array enables access to the entire array.

Granting Permissions on Nested Document Fields in an Array

If you want to restrict read access to only specific fields in `person`, whether the field is an array of nested documents or a single nested document, perform the following steps:

1. Deny the user read permission on the array `person[]`.
2. Grant the user traverse permission on the array `person[]`.
3. Grant the user read permission on the specific fields.

For example, to grant the user read permission on only the first names in the nested documents for the third step, grant read permission on `person[].name.first`. The permission enables the user to read the field in all nested documents in documents id001 and id002.

If permissions already exist on `person.name.first`, then all attempts to define permissions on `person[].name.first` fails. You (or an administrator with the appropriate permissions) must first remove the existing permission on `person.name.first`. Similar to the scenario described in the previous section, if you expect the schema of the `person` field to evolve to include individual nested documents as well as arrays of nested documents, then you should grant the permission on `person[].name.first` to avoid having to remove the conflicting permission.

If you already have permissions on `person[].name.first`, then attempting to define permissions on `person.name.first` fails. There is no need to add this permission.

Granting Permissions on JSON Tables

Summarizes the default ACEs for the supported ways of setting read, traverse, and write permissions.

The default permissions for column families are determined when tables are created. The default permissions for fields are inherited from the column family where the fields are located.

Action	Method	Permissions	Default Access-Control Expressions
Set default permissions on new column families when creating a JSON table.	Java API	-defaultreadperm -defaulttraverseperm -defaultwriteperm	u:<ID of the process>
	maprcli table create		u:<user ID of table creator>
	mapr dbshell		
	Control System		
Set default permissions on new column families when editing a JSON table.	maprcli table edit		Current ACEs
	Control System		
Set permissions on a column family when creating the column family.	maprcli table cf create	-readperm -traverseperm -writeperm -indexperm	ACEs for -defaultreadperm, -defaulttraverseperm, and -defaultwriteperm
	Control System		
Set permissions on a column family when editing the column family.	maprcli table cf edit		Current ACEs
	Control System		
Set permissions on individual fields.	maprcli table cf colperm set		Inherited from column family or parent field
	Control System		
Set the dynamic mask	maprcli table cf column datamask set	-defaultunmaskedreadperm -unmaskedreadperm	Set to the table creator
	maprcli table cf colperm set		
	maprcli table create		
	maprcli table edit		
	maprcli table cf create		
	maprcli table cf edit		
	maprcli table cf colperm set		
	Control System		

Defining ACEs Using the Access Control Expression Builder

Describes how to build ACEs using the Expression Builder.

About this task

To define access control expressions using the **Access Control Expression** builder in the Control System:

Procedure

1. Choose **All** or **Any** (from the drop-down menu) of the settings to match for access.

Here:

All	AND (&) operation	Indicates that all of the conditions must be met for public or user, group, and role to access the volume.
Any	OR () operation	Indicates that any one of the conditions must be met for public or user, group, and role to access the volume.

2. Click:

+	To add an expression.
()	To add a subexpression.
x	To remove an expression or subexpression.

3. Select **Public or User**, **Group**, or **Role** from the drop-down menu and:
 - a) Choose **Is** to grant or **Is not** to block access to the user, group, or role.
 - b) Enter the name of the user, group, or role.
4. Click **Save Changes** to create an ACE.

Setting Whole Volume ACEs Using the CLI

About this task

See [Setting Whole Volume ACEs](#) on page 1627.

Setting Table ACEs Using the CLI

About this task

See [Enabling Table and Stream Authorizations with ACEs](#) on page 1625.

Setting Stream ACEs Using the CLI

About this task

See [Enabling Table and Stream Authorizations with ACEs](#) on page 1625.

Setting Data ACEs

Describes how to set ACEs using both the GUI and the CLI.

About this task

To set data [ACE](#) using the **Add Access Permission** window in the Control System:

Procedure

1. Specify the entities to set permissions for by doing one of the following:

- Move the slider associated with **Public** to **Yes** to grant access to all users or to **No** to set permissions for individual users, groups, and/or roles.
 - Specify the users, groups, and/or roles to set permissions for in the associated fields.
 - Select the **Custom ACE** checkbox and enter the access control expression in the field.
2. Click **Add** to set permissions for all or for the specified users, groups, and/or roles.
 3. Select the permissions to grant the specified users, groups, and/or roles from the **Permissions** column associated with the entities.
 4. Click **Save Changes** to save the [ACE](#) settings.

Setting Whole Volume ACEs Using the CLI

About this task

See [Setting Whole Volume ACEs](#) on page 1627.

Setting Table ACEs Using the CLI

About this task

See [Enabling Table and Stream Authorizations with ACEs](#) on page 1625.

Setting Stream ACEs Using the CLI

About this task

See [Enabling Table and Stream Authorizations with ACEs](#) on page 1625.

Granting Access Using Security Policy

Describes how to grant access to objects using ACEs in a security policy.

About this task

You can define access controls in a security policy using the Control System, CLI, and REST API.

Defining Access Controls in Security Policy Using the Control System

Procedure

1. Log in to the Control System and go to the **Create Security Policy** page.
See [Creating a Security Policy](#) on page 2165 for more information.
2. Grant or deny access to all users (Public) or to specific users or groups in the **Data Access Control** Section.
The following types of access can be granted to all (Public) or specific users or groups:

Object	Permission
Directories	<ul style="list-style-type: none"> • Read the contents of a directory. If you do not select this permission, mode bits are used to determine read access. To read the contents of a directory that is tagged with this security policy, the user must also have read permissions on the volume, the parent directory (if any), and the file. • Lookup or list the contents in a directory. If you do not select this permission, mode bits are used to determine lookup access. To lookup a file of directory that is tagged with this security policy, the user must also have read permissions on the volume and the lookup permission on the directory. • List the contents of a directory. If you do not select this permission, mode bits are used to determine directorylist access. To list the contents of a directory that is tagged with this security policy, the user must also have read permissions on the volume, and lookup permission on all directories in the path (if any). • Add a file or subdirectory. If you do not select this permission, mode bits are used to determine permissions to create files or subdirectories. To add a child to a directory that is tagged with this security policy, the user must also have write permissions on the volume and the parent directory, add child permission on the parent directory, and read and execute permissions on all directories in the path. • Delete a file or subdirectory. If you do not select this permission, mode bits are used to determine permissions to create files and/or subdirectories. To delete a child of a directory that is tagged with this security policy, the user must also have write permissions on the volume and delete child permission on the parent directory, and lookup permissions on all directories in the path. <p>For more information, see Managing File and Directory ACEs on page 2131.</p>
Files	<ul style="list-style-type: none"> • Read a file. If you do not select this permission, mode bits are used to determine read access to file. To read a file that is tagged with this security policy, the user must also have read permissions on the volume, and lookup permission on all directories in path. • Write to a file. If you do not select this permission, mode bits are used to determine read access to the file. To write to a file that is tagged with this security policy, the user must also have write permissions on the volume, and lookup permission on all directories in the path. • Execute a file. If you do not select this permission, mode bits are used to determine execute access to the file. To execute a file that is tagged with this security policy, the user must also have read permissions on the volume, and lookup permission on all directories in the path. <p>For more information, see Managing File and Directory ACEs on page 2131.</p>

Object	Permission
Tables	<ul style="list-style-type: none"> • Read new column families that are created in the table. • Traverse to descend a hierarchy of column families. • Write to new column families that are created in the table. • Mask information when retrieved from the table. <p>For more information, see Enabling Table and Stream Authorizations with ACEs on page 1625 and Dynamic Data Masking on page 955.</p>

3. Complete the steps to create the security policy.

See [Creating a Security Policy](#) on page 2165 for more information.

Granting Access Using the CLI and REST API

About this task

You can grant access to file system and HPE Data Fabric Database data objects using a security policy at the time of creating or modifying a security policy.

CLI

Use the following command to set access controls when creating a security policy:

```
/opt/mapr/bin/maprcli security policy
create -<ACEparam> <ACESyntax>
```

Use the following command to specify [ACEs](#) when modifying a security policy:

```
/opt/mapr/bin/maprcli security policy
modify -<ACEparam> <ACESyntax>
```

REST

Send a request of type POST. For example:

```
curl -k -X POST 'https://
<hostname>:8443/rest/security/policy/
create?
name=<policyName>&<ACEparam>=<ACESynta
x>' --user <username>:<pwd>
```

```
curl -k -X POST 'https://
<hostname>:8443/rest/security/policy/
modify?
name=<policyName>&<ACEparam>=<ACESynta
x>' --user <username>:<pwd>
```

Refer to the [ACE Syntax](#) on page 2126 for more information. The following sections describe the [ACE](#) parameter to specify for a specific type of access on a data object.

Directories

- **readdirace** to read the contents of a directory. See **Read** for Directories in the *Defining Access Controls in Security Policy Using the Control System* section for more information.

- `lookupdirace` to lookup or list the contents in a directory. See **Lookup** for Directories in the *Defining Access Controls in Security Policy Using the Control System* section for more information.
- `addchildace` to add a file or subdirectory. See **Add** for Directories in the *Defining Access Controls in Security Policy Using the Control System* section for more information.
- `deletechildace` to delete a file or subdirectory. See **Delete** for Directories in the *Defining Access Controls in Security Policy Using the Control System* section for more information.

For more information, see [Managing File and Directory ACES](#) on page 2131.

Files

- `readfileace` to read a file. See **Read** for Files in the *Defining Access Controls in Security Policy Using the Control System* section for more information.
- `writefileace` to write to a file. See **Write** for Files in the *Defining Access Controls in Security Policy Using the Control System* section for more information.
- `executefileace` to execute a file. See **Execute** for Files in the *Defining Access Controls in Security Policy Using the Control System* section for more information.

For more information, see [Managing File and Directory ACES](#) on page 2131.

JSON Tables

- `readdbace` to read new column families that are created in the table.
- `traversedbace` to descend a hierarchy of column families.
- `writedbace` to write to new column families that are created in the table.
- `unmaskedreaddbace` to read data masked.

For more information, see [Enabling Table and Stream Authorizations with ACES](#) on page 1625 and [Dynamic Data Masking](#) on page 955.

Creating Subnet Whitelists

Provides the procedure necessary to restrict access to cluster data.

About this task

To provide additional cluster security, limit cluster data access to a whitelist of trusted subnets. The `mfs.subnets.whitelist` parameter in `mfs.conf` accepts a comma-separated list of subnets in CIDR notation. If this parameter is set, the FileServer service only accepts requests from the specified subnets.

Procedure

1. Edit `/opt/mapr/conf/mfs.conf` and modify the `mfs.subnets.whitelist` parameter.

2. Add a comma-separated list of subnets in CIDR notation.
3. Restart the FileServer.

Configuring Policy-Based Security

Starting in HPE Data Fabric 6.2.0 (EEP 7.0.0), HPE Data Fabric supports Policy-Based Security. Policy-Based Security is a mechanism that enables administrators to create security policies for simplified data management. Administrative users can create and manage security policies through the control system, maprcli, REST API, Hadoop and Linux commands, and Java APIs.

 **IMPORTANT:** Some setup and configuration is required before you can create and manage security policies in a cluster. Read [Policy-Based Security](#) on page 925 for an overview of the process.

The following sections provide information and instruction for several tasks related to security policies:

Setting Global Configuration Options for Policy-Based Security

The CLDB stores global configuration settings for Policy-Based Security. Before creating security policies, an administrator must designate a master security policy cluster through the `cldb.pbs.global.master` option.

You can modify global configuration settings through the `maprcli config save` command and the REST API.

The following table describes the global configuration settings related to Policy-Based Security.

Parameter	Default	Description
<code>cldb.pbs.max.security.policy</code>	10000	Maximum number of configured security policies allowed. Prevents users from arbitrarily creating numerous security policies which could impact performance.
<code>cldb.pbs.global.master</code>	0	<p>(Required) Sets the master security policy cluster for the global namespace. Configure a cluster to perform one of the following roles:</p> <ul style="list-style-type: none"> Master—A master security policy cluster is required to create and manage security policies. Only one master security policy cluster should be chosen among clusters sharing data (using mirroring). Member—On a cluster designated as a member, you can view security policies available for tagging and tag data objects. <p>By default, the host is set to member (0) upon a new installation or upgrade. To set the host to master and enable the creation and modification of security policies, set the value of this property to 1.</p> <p> NOTE: Policy creation or modification on a member cluster is not allowed.</p>
<code>cldb.pbs.audit.only.policy.check</code>	0	Set the value to 1 to enforce permissive mode across all volumes in the cluster. In permissive mode, the system only enforces resource-level ACEs and POSIX mode bits. The system checks the security policies for access and audits denied access events. (It does not actually deny access.) See Volume-Level Security Policy Enforcement Mode on page 932.

<code>cldb.pbs.access.control.enabled</code>	1	Enables and disables policy ACEs set in security policies at the cluster-level. It is set to 0 to disable policy access checks across all volumes in the cluster. The DataAce enforcement mode is automatically enabled. See Disabling Policy Access Controls at the Cluster-Level on page 2159 and Volume-Level Security Policy Enforcement Mode on page 932 for additional information.
--	---	--

Setting the Policy-Based Security Mode Using the CLI and REST API

CLI

Run the following command to set a cluster as the Master for security policies:

```
maprcli config save -values
'{"cldb.pbs.global.master":"1"}'
```

REST

Send a request of type POST. For example, to designate a cluster as the Master for policy-based security creation and management, send a request similar to the following:

```
curl -X POST 'https://<hostname>:8443/
rest/config/save?
values={"cldb.pbs.global.master":"1"}'
--user <username>:<password>
```

Setting the Policy-Based Security Mode Using the Control System

From the Control System, to set the cluster as the Master for security policies:

1. Click the **Security Settings** icon.
2. Click the **PBS Mode** setting.
3. Select **PBS Mode** as **Master** from the drop-down.
4. Click **Submit** to save the setting.

Changing the Policy-Based Security Global Master

To elect a new PBS master:

1. Make sure that the cluster to be set as the master is still a member and not a master already. The value of `cldb.pbs.global.master` on this cluster should be 0.
2. Ensure that no policies are being created or modified on the current master cluster.
3. [Export](#) all policies from the current master cluster, and then [import](#) them to the cluster you want to set as the new master.
4. Demote the current master cluster to a member by setting `cldb.pbs.global.master` to 0.
5. Promote the cluster to be set as the master to be the global master by setting `cldb.pbs.global.master` to 1.

Disabling Policy Access Controls at the Cluster-Level

Disable policy ACEs that are set in security policies at the cluster-level through the `cldb.pbs.access.control.enabled` option in the CLI and REST API and through the Ignore Policy Access Control option in the Control System.

About this task

Typically, you would only disable security policies at the cluster-level if they are causing issues. The `cldb.pbs.access.control.enabled` option is the fastest way for administrators to turn security policies off in a cluster.

CAUTION: Before you disable policy access controls at the cluster-level, verify that POSIX mode bits or ACEs are directly applied to data objects to prevent unauthorized access to data. See [hadoop mfs](#) on page 7489, and refer to the `-getace` parameter.

The following table summarizes how security policy enforcement works when policy access controls are enabled and disabled in a cluster:

Policy Access Controls	Description
Enabled	<ul style="list-style-type: none"> Default. The system enforces all policy access controls (ACEs set in security policies).
Disabled	<ul style="list-style-type: none"> The system does not enforce any policy access controls (ACEs set in security policies). ACEs set in security policies are not applied during any data operations in the cluster. Policy access controls (ACEs set in the security policies) are disabled only for the indicated cluster. It does not matter if the cluster is a master or member security policy cluster; disabling the access controls does not affect the security policy settings and behaviors in any other cluster. The system still enforces: <ul style="list-style-type: none"> Resource controls (POSIX mode bits and ACEs) directly applied to data objects to determine data access. Wire-level encryption and auditing settings in the security policies.

The following sections describe how to enable and disable policy access controls (ACEs set in security policies) at the cluster-level:

Disable Policy Access Controls Using the Control System

Procedure

1. Log in to the Control System and click  to display the **Security** settings page.
2. Move the slider associated with **Ignore Policy Access Control** to **Yes** to disable access control or **No** to enable access control using security policies.
If set to **Yes**, access control enforcement is disabled for all the security policies on the cluster. If set to **No**, you can set the enforcement mode setting at the volume level to **Policy Ace and Data Ace** or **Policy Ace Only** to enable access control enforcement using security policy ACEs.

Disable Policy Access Controls Using the CLI

Procedure

- Run the `config save` on page 2394 command and set the `cldb.pbs.access.control.enabled` property to one of the following values:
 - 0 — disables security policy ACE enforcement for data operations in the cluster
 - 1 — enables security policy ACE enforcement for data operations in the cluster

Example:

```
/opt/mapr/bin/maprccli config save -values
'{"cldb.pbs.access.control.enabled":"0"}'
/opt/mapr/bin/maprccli config save -values
'{"cldb.pbs.access.control.enabled":"1"}'
```

Granting Security Policy Permissions

Permissions define which administrative users can create, view, and modify security policies. Administrators set the permissions on security policies through cluster-level and security policy-level ACLs.

Permission Levels

Policy-Based Security supports cluster-level and policy-level permissions.

The following table describes the two permission levels:

Permission Level	Description
Cluster-level	<ul style="list-style-type: none"> Controls which administrators can create and view security policies in a cluster. Administrators with cluster-level cp permission can create security policies. Administrators with cluster-level fc permission can view all the security policies created.
Policy-level	<ul style="list-style-type: none"> Controls which administrators can view and modify security policies. Policy-level permissions are set on a per-policy basis. Permissions set on one security policy do not apply to other security policies.

Administrators with cluster-level permissions can set cluster-level and security policy-level permissions through any of the following tools:

- Control System
- REST API commands
- `maprccli acl set|edit` commands
- `maprccli security policy create` commands

For additional information, refer to the section [Setting Permissions on Security Policies](#) on page 2165.

IMPORTANT: Note these important considerations for security-policy permissions:

- On a fresh cluster install, the root user and the [Data Fabric user](#) (typically named mapr or hadoop on each node) have cp permission. On an upgraded cluster, only the [Data Fabric user](#) has cp permission.
- As the cluster owner, the [Data Fabric user](#) (typically named mapr or hadoop on each node), has overriding permission on security policies, including the administrative ACLs. The Data Fabric user can create, view, and modify security policies, regardless of the cluster-level and policy-level permission specified.
- By default, [administrators](#) do not have permission to create security policies. Administrators need cluster-level cp (create security policy) permission to create security policies. Administrators with cluster-level a (admin) permission can grant cp permission to themselves or other administrators.

TIP: You must designate a cluster as the global policy master before you create security policies. Setting a global policy master creates a global namespace for security policies. See [Security Policy Domain and Policy Management](#) on page 928.

- Any user with a valid Data Fabric ticket can view security policy IDs and names. This allows non-administrative users to determine which security policies to apply to data objects.

Permission Codes

Cluster-level and security policy-level permission codes that are set through ACLs grant security policy access to administrators. An administrator (with cluster-level a (admin) and cp (create security policy) permissions) that creates a security policy has full control over the security policy unless they specifically grant other administrators access to the security policy through policy-level permissions.

The following sections describe the cluster-level and policy-level permission codes for security policy access:

Cluster-Level Permission Codes

The following table lists some cluster-level permission codes and how they relate to security policies. For a complete list of cluster-level permission codes, see [acl](#).

Cluster-level permission code	Description
a (admin)	<ul style="list-style-type: none"> • Grants administrative access to cluster ACLs. • Can grant create security policy (cp) permission to themselves or other administrators. • Cannot view or edit the details of any security policy created by other admins. Can only view the security policy ID and name. • Needs security policy-level permissions to view or edit security policies created by other admins.

Cluster-level permission code	Description
cp (create security policy)	 ATTENTION: Administrators need this permission to create security policies. <ul style="list-style-type: none"> Administrators with a (admin) cluster-level permission can grant cp permission to themselves or other administrators. Administrators can view and edit all parts of the security policies they create, including the ACEs and permissions on the security policies. Grants the administrator that creates a security policy the following security <i>policy-level</i> permissions on the security policy: <ul style="list-style-type: none"> Full Control (fc) Admin (a) Read (r) Administrators who create security policies can override their access to the security policies by designating policy owners who can then manage the security policies. See policy create on page 2623, policy modify on page 2652, and refer to the -user parameter.
fc (full control)	<ul style="list-style-type: none"> Grants full control over the cluster and enables all cluster-level administrative options. Cannot change the cluster-level ACLs. Can view all security policies. Cannot create security policies. Cannot edit the details of any security policy unless specifically granted access to a security through policy-level permissions.

Policy-Level Permission Codes

Separate read (r) and edit (fc) permissions for policy owners allow some policy owners to view policy information while others can edit policy information. This allows most administrators to administer the system without seeing the data and also prevents some policy owners from adding their credentials to the administrative ACLs to manipulate the data access ACEs.

Policy-level permissions are set on a per-policy basis. Permissions set on one security policy do not apply to other security policies.

The following table lists the policy-level permission codes needed to perform actions on security policies.

Policy-level permission code	Description
a (admin)	<ul style="list-style-type: none"> Can view and modify permissions on the security policy. Cannot view or modify the security policy; can only view the security policy name and ID.
fc (full control)	<ul style="list-style-type: none"> Can view and edit any part of the security policy, including the data access ACEs. Cannot view or modify permissions on the security policy.
r (read)	Can view all parts of a security policy, but cannot modify any part of the security policy.

Permissions Table

The following table lists the cluster-level and policy-level permissions needed to perform specific actions on security policies:

NOTE: Administrators who create a security policy have policy-level r, a, and fc permission on the security policy.

Action	Cluster-Level	Policy-Level
Create a security policy	cp	--
View details of all security policies	fc	--
View details of a security policy	--	r
View and edit permissions on a security policy (ACLs)	--	a
View and edit the details of a security policy (ACEs, auditing, wire-level encryption)	--	fc

Setting Permissions on Security Policies

An administrator with cluster-level permissions can set security policy permissions during policy creation. Administrators with proper edit permissions on a security policy can modify security policy permissions.

Setting Permissions from the Control System

- To set permissions during security policy creation, see [Creating a Security Policy](#) on page 2165.
- To modify permissions on existing security policies, see [Modifying a Security Policy](#) on page 2174.

Setting Permissions from the CLI and REST API

- To grant cluster-level (cp) permission to a cluster administrator, see [acl](#) on page 2273.
- To set permissions during security policy creation, see [policy create](#) on page 2623.
- To modify permissions on existing security policies, see [policy modify](#) on page 2652, [acl set](#) on page 2276, and [acl edit](#) on page 2274.

Viewing Security Policy Permissions

To display cluster-level permissions, run:

```
/opt/mapr/bin/maprcli acl show -type cluster
```

To display policy-level permissions, run:

```
/opt/mapr/bin/maprcli security policy info -name <policy name> \
[-cluster cluster name ] [-output terse|verbose ] \
[ -columns <comma-separated list of column names> ] \
[ -expandaces true|false ] -json
```

Related concepts

[Example Using Security Policies](#) on page 944

This example demonstrates how to secure data, set permissions, and create, view, and modify a security policy.

Creating a Security Policy

Describes how to create a security policy using the Control System, CLI, and REST API.

About this task

Administrators with cluster-level [cp \(create security policy\)](#) permission can create security policies from the Control System, CLI, and REST API. Before creating security policies, first set a cluster as the [global policy master](#). After creating the policy as its owner, edit all parts of the policy, including the policy [ACEs](#). After creating a security policy, the policy is disarmed with the tagging set to `false` (or **No** in the Control System), by default, which makes the policy unavailable for tagging. You can modify the policy state to make it available for tagging. See [Changing the State of a Security Policy](#) on page 2182 for more information.

Creating a Security Policy Using the Control System

Procedure

1. Log in to the Control System, and click  (Security Settings) to display the **Security** page.
2. Click **Create Policy****Create New Policy** to display the **Create Security Policy** page.

NOTE: You must have appropriate permissions to create security policies.

3. Specify the security properties under the **Properties** pane of the page:

- a) Specify a name for the policy in the **Name** field, and enter a brief description of the policy in the **Description** text box.

Security policy names must be unique within the cluster and must contain only alphanumeric characters, hyphens (-), and underscores (_). The maximum length of the security policy name is 32 characters.

- b) Specify **Yes** to enable wire-level encryption by moving the slider. Otherwise, click **No**.
By default, this setting is enabled on secure clusters and disabled on insecure clusters.

- c) Specify **Yes** to enable auditing by moving the slider. Otherwise, click **No**.

If auditing is enabled, choose **Default** to accept the default list of operations to audit, or choose **Custom** to select or deselect the operations to audit. Note that including `setattr` automatically enables the following operations:

- `chown`
- `chgrp`
- `chperm`

If you exclude `setattr`, these operations are automatically disabled. If you do nothing with `setattr` (neither enable nor disable), you can enable or disable `chown`, `chgrp`, and `chperm` in any combination.

- d) Specify whether (**Yes** or **No**) to allow Data Fabric data objects to be tagged with this security policy.

NOTE: Tagging must be set to **Yes** to allow users to associate the security policy with a table, column family, or field. Security policies preside over chosen tables and their related column families and field data by default.

For more information, see [Changing the State of a Security Policy](#) on page 2182.

4. Select one of the following access control states from the Access Control pull-down menu in the **Data Access Control** pane:

- **Armed**
—Enforce the [ACEs](#) in the security policy on the Data Fabric data objects tagged with the policy.
- **Disarmed**—Do not enforce the [ACEs](#), if any, in the policy on the Data Fabric data objects tagged with the policy.
- **Denied**—Deny all access to the Data Fabric data objects tagged with the policy and log any attempt to access.

For more information, see [Changing the State of a Security Policy](#) on page 2182.

5. Click **Add Access Permissions** in the **Data Access Control** pane to set data access controls. The **Add Access Permission** window appears.

6. Do one of the following from the **Add Access Permission** window:

- Set the policy to **Public**. Setting the **Public** slider to Yes makes this policy accessible to everyone.
- Leave this slider at its default setting of No to customize access permissions, and then enter the comma-separated list of users, groups, or roles to be granted to in the **Users**, **Groups**, and **Roles** text boxes respectively.

- Select the **Custom ACE** checkbox to manually enter the ACE in the appropriate text box shown.

For more information on how to build the custom ACE, see [Managing Access Control Expressions](#) on page 2126.

7. Click **Next: Select Permissions** to display the **Add Access Permissions** window.
8. Select and check options, as needed, from the **Add Access Permissions** window. The following table describes the permissions that can be granted to specified users, groups, and roles.

NOTE: If you opt to select **Reads**, **Writes**, and/or **Executes** at the top of the **Add Access Permissions** window, the system automatically checks appropriate options beneath the Directories, Files, and Tables headings of the **Add Access Permissions** window.

- Select **Reads** to grant:
 - read permission on directories and files
 - lookup permission on directories

This is the same as the `readaces` property in the CLI.

- Select **Writes** to grant:
 - write permission on files
 - add and delete child permissions on directories

This is the same as the `writeaces` property in the CLI.

- Select **Executes** to grant execute permission on files. This is the same as the `executefileace` property in the CLI.

Object	Permission
Directories	<ul style="list-style-type: none"> • Read the contents of a directory. If this is not selected, mode bits are used to determine read access. To read the contents of a directory that is tagged with this security policy, the user must also have read permissions on the volume, the parent directory (if any), and the file. This is the same as the <code>readdirace</code> property in the CLI. • Lookup or list the contents in a directory. If this is not selected, mode bits are used to determine lookup access. To read the contents of a directory that is tagged with this security policy, the user must also have read permissions on the volume and the directory. This is the same as the <code>lookupdirace</code> property in the CLI. • Add Child to add a file or subdirectory. If this is not selected, mode bits are used to determine permissions to create files and subdirectories. To add a child to a directory that is tagged with this security policy, the user must also have write permissions on the volume and parent directories, add child permission on the parent directory, and read and execute permissions on all directories in the path. This is the same as the <code>addchildace</code> property in the CLI. • Delete Child to delete a file or subdirectory. If this is not selected, mode bits are used to determine permissions to create files and/or subdirectories. To delete a child of a directory that is tagged with this security policy, the user must also have write permissions on the volume and parent directories, delete child permission on the parent directory, and read and execute permissions on all directories in the path. This is the same as the <code>deletechildace</code> property in the CLI. <p>For more information, see Managing File and Directory ACEs on page 2131.</p>

Object	Permission
Files	<ul style="list-style-type: none"> • Read a file. If this is not selected, mode bits are used to determine read access to file. To read a file that is tagged with this security policy, the user must also have read permissions on the volume. This is the same as the <code>readfileace</code> property in the CLI. • Write to a file. If this option is not selected, mode bits are used to determine read access to the file. To write to a file that is tagged with this security policy, the user must also have write permissions on the volume. This is the same as the <code>writefileace</code> property in the CLI. • Execute a file. If this is not selected, mode bits are used to determine execute access to the file. To execute a file that is tagged with this security policy, the user must also have read permissions on the volume. This is the same as the <code>executefileace</code> property in the CLI. <p>For more information, see Managing File and Directory ACEs on page 2131.</p>
Tables	<ul style="list-style-type: none"> • Read a table. If this is not selected, mode bits are used to determine read access to table. To read a table that is tagged with this security policy, the user must also have read permissions on the volume. This is the same as the <code>readtableace</code> property in the CLI. • Traverse CF a table. Allows the grantee to descend a hierarchy of fields to access fields on which the grantee has write or read permission. This is the same as the <code>traverseperm</code> property in the CLI. • Write to a table. If this is not checked, mode bits are used to determine read access to the table. To write to a table that is tagged with this security policy, the user must also have write permissions on the volume. This is the same as the <code>writetableace</code> property in the CLI. • Unmasked Data a table. If this checkbox is not checked, it disallows the grantee to see all table data.

9. Click **Add** to add the data access permissions to the policy.

10. Opt to do one of the following, or proceed to the next step.

- **Add Another**, and repeat [the initial step](#) for adding access permissions through to the [final step](#) for other users, groups, and roles.
-  to create a copy of the data access controls, which can then be modified by clicking .

11. Grant users and/or groups permissions to perform administrative operations on the policy in the **Policy Administration Control** pane:

- a) Select the entity type, user or group, from the **Type** drop-down list, and enter the entity name in the **Entities** field.
- b) Check the checkbox associated with the following permissions to grant the entity the type of permission:
 - Read access for the policy.
 - Admin access to set and modify ACLs on the policy.
 - Full control over the policy.
- c) Proceed to the next step, or click one of the following to add access controls for other users and groups:
 - **Add Another** and repeat the [the initial step](#) through the [final step](#) of the add access control procedure for other users and groups.
 -  (Duplicate) to create a copy of the access control.
 -  (Delete) to delete a listed permission.

12. Click **Save** to create the security policy.

Creating a Security Policy Using the CLI and REST API

About this task

CLI

The basic command to create a security policy:

```
/opt/mapr/bin/maprcli security policy
create -name <policyName>
```

REST

Send a request of type POST. For example:

```
curl -k -X POST 'https://
<hostname>:8443/rest/security/policy/
create?name=<policyName>' --user
mapr:mapr
```

For more information, see [policy create](#) on page 2623.

Related reference

[table securitypolicy set](#) on page 2862

Replaces a security policy on a HPE Data Fabric Database JSON table with a new security policy.

[table cf securitypolicy set](#) on page 2798

Replaces a security policy associated with a column family for a HPE Data Fabric Database JSON table with a new security policy.

Viewing the List of Security Policies

View the list of security policies using the Control System and extended attributes.

About this task

You can retrieve and view the list of security policies using the Control System, the CLI, and REST API.

Viewing the List of Security Policies Using the Control System

Procedure

- Log in to the Control System, and click the **Security Policies** tab and then **Admin > Cluster Settings**.
The list of security policies display in the **Security Policies** pane. Filter the list of policies by one of the following Access Control statuses: All, Armed, Disarmed, Denied. For each security policy, the page displays the following fields.

Column Name	Description
Policy Name	Shows the name of the policy.
Access Control	Indicates whether access control is enforced by the ACE setting in the policy: <ul style="list-style-type: none"> Armed Disarmed Denied See Changing the State of a Security Policy on page 2182.
Tagging	Indicates whether data objects can be tagged with the policy. See Changing the State of a Security Policy on page 2182.
Description	Displays the description of the policy.
Date Created	Displays the date when the policy was created.
Date Modified	Displays the date when the policy was last modified.

Viewing the List of Security Policies Using the CLI and REST API

About this task

CLI

The basic command to retrieve the list of security policies that you are allowed to view is:

```
/opt/mapr/bin/maprcli security policy
list -json
```

REST

Send a request of type GET. For example:

```
curl -X GET 'https://<host>:8443/
rest/security/policy/list' --user
<username>:<password>
```

For more information, see [policy list](#) on page 2642.

Retrieving Security Policies Using Extended Attributes

About this task

Describes how to retrieve security policies that are tagged using extended attributes.

Linux Commands

Security policies use a special format for the extended attribute name, which is always set to the keyword `security.mapr.policy`.

To retrieve extended attributes, run one of the following commands:

- `getfattr [-hRLP] -n name pathname...`
- `getfattr [-hRLP] -d [-m pattern] pathname...`

The above commands retrieve both policy tags, as well as other extended attributes.

For example, to retrieve all extended attributes for the `/mapr/lab/foo.txt` file, use:

```
getfattr -d /mapr/lab/foo.txt
# file: /mapr/lab/foo.txt

security.mapr.policy="Lab_Security_Policy,Sensitive_data"  policy tag

user.test="test"
                                other
attributes
```

To retrieve the security policy tags without retrieving the rest of the extended attributes, use the `-n` option to match the security policy extended attribute name:

```
getfattr -d -n security.mapr.policy /mapr/lab/foo.txt
# file: /mapr/lab/foo.txt

security.mapr.policy="Lab_Security_Policy,Sensitive_Data"
```

Hadoop Commands

Security policies use a special format for the extended attribute name, which is always set to the keyword `security.mapr.policy`.

To retrieve security policy attributes, use the command:

```
hadoop fs -getfattr [-R] -n
security.mapr.policy | -d <pathname>
```

For example, to retrieve security policy attributes for the `/mapr/lab/foo.txt` file, use:

```
hadoop fs -getfattr -n
security.mapr.policy | -d /mapr/lab/
foo.txt
```

Alternatively, use the Hadoop MFS command to retrieve security policy attributes:

```
hadoop mfs -getsecuritypolicytag [-R]
<path>
```

Java APIs

To retrieve security policy attributes, use the following Java APIs:

- `public byte[] getXAttr(Path path, String name)` throws `IOException` Gets an extended attribute name and value for a file or directory. The name must be prefixed with the namespace, followed by `.` (period). For security policy tags, the extended attribute name is `security.mapr.policy`.
- `public Map<String, byte[]> getXAttrs(Path path)` throws `IOException` Gets all the extended attribute name/value pairs for a file or directory. Only those extended attributes that the logged-in user has permissions to view are returned.
- `public Map<String, byte[]> getXAttrs(Path path, List<String> names)` throws `IOException` Gets the extended attributes specified by the given list of names. Only those extended attributes that the logged-in user has permissions to view are returned.
- `public List<String> listXAttrs(Path path)` throws `IOException` Gets all the extended attribute names for a file or directory. Only those extended attribute names that the logged-in user has permissions to view are returned.

C APIs

Security policies use a special format for the extended attribute name and is always set to the keyword `security.mapr.policy`.

Retrieve extended attribute values

The `getxattr`, `lgetxattr`, and `fgetxattr` system calls are used to retrieve an extended attribute value associated with a file system object, which may be either a file or directory. The synopsis of these commands are shown below. For additional details, refer to the `getxattr(2)` Linux manual page.

NAME

`getxattr`, `lgetxattr`, `fgetxattr` - retrieve an extended attribute value

SYNOPSIS

```
#include <sys/types.h>
#include <attr/xattr.h>
ssize_t getxattr (const char *path,
const char *name, void *value,
size_t size);
ssize_t lgetxattr (const char *path,
const char *name, void *value,
size_t size);
ssize_t fgetxattr (int filedes,
const char *name, void *value,
size_t size);
```

List extended attribute values

Use the `listxattr`, `llistxattr`, and `flistxattr` to list extended attribute names. For more details, refer to the `listxattr(2)` Linux manual page.

NAME

`listxattr`, `llistxattr`, `flistxattr` - list extended attribute names

```
#include <sys/types.h>
#include <attr/xattr.h>
ssize_t listxattr (const char *path,
char *list, size_t size);
ssize_t llistxattr (const char
*path, char *list, size_t size);
ssize_t flistxattr (int
filedes, char *list, size_t
size);
```

Modifying a Security Policy

Describes how to modify a security policy.

About this task

You can modify a security policy using the Control System, the CLI, and REST API. You can change the following settings if you edit a security policy:

- Security policy state
- Wire-level encryption and auditing
- Data access control
- Security policy administration control

If you modify a security policy that is currently tagged (or in use), changes to the policy are enforced within **5 minutes**.

Modifying a Security Policy Using the Control System

Prerequisites

If not already done, you must first set the related cluster as the global policy master node for the Container Location Database (CLDB) associated with the security policy being modified. See [Configuring the Global Policy Master](#) on page 931 for more information.

Procedure

1. Log in to the Control System and go to the **Security Policies** tag in the **Admin > Cluster Settings** page to view the list of security policies that you are allowed to see.
2. Click the name of the security policy to display the **Edit Security Policy** page.
3. Make changes to the security policy status by selecting the state to transition to from the drop-down list of statuses next to the **Edit Security Policy** label.
See [Changing the State of a Security Policy](#) on page 2182 for more information on the various states and the valid state to which you need to transition a security policy.
4. Modify any of the following properties:

Description	The description of the policy. The maximum length of the description is 128 characters.
Enable Wire-level Encryption	The wire-level encryption setting. Enable (Yes) or disable (No) wire-level encryption by moving the slider.
Enable Audit Operations	The audit setting for files, directories, tables, and streams. Enable (Yes) or disable (No) auditing of operations on files, directories, tables, and streams by moving the slider.
Audit Operations	<p>(Visible only if auditing is enabled) The list of file, directory, table, and stream operations to audit. Select the default list of operations to audit by choosing the Default radio button. Select specific file, directory, table, and streams operations to audit by choosing the Custom radio button. Enabling <code>setattr</code> automatically enables the following operations:</p> <ul style="list-style-type: none"> • <code>chown</code> • <code>chgrp</code> • <code>chperm</code> <p>If you disable <code>setattr</code>, these operations are automatically disabled. If you do nothing with <code>setattr</code> (neither enable nor disable), you can enable or disable <code>chown</code>, <code>chgrp</code>, and <code>chperm</code> in any combination and they will not affect <code>setattr</code>.</p>
Allow Tagging (For JSON Tables)	The setting to enable (Yes) or disable (No) tagging of JSON tables for this security policy. If Yes , users can tag data objects of JSON tables with this policy. If No , users cannot tag data objects of JSON tables with this security policy. See Changing the State of a Security Policy on page 2182 for more information.

5. Make changes to data access control as needed in the **Data Access Control** section.

a) Select one of the following state for access control.

- **Disarmed**—Indicates access control is not enforced by the [ACE](#) settings defined in the policy
- **Armed**—Indicates access control is enforced by the [ACE](#) settings defined in the policy
- **Denied**—Indicates access control is always denied.

For more information on access control states, see [Changing the State of a Security Policy](#) on page 2182.

b) Set new or modify existing [ACEs](#) for users, groups, and/or roles.

You can:

- Create a copy of an existing [ACE](#) setting for an entity (user, group, or role) by clicking , which you can then modify.
- Remove [ACEs](#) for an entity (user, group, or role) by clicking .
- Set new [ACEs](#) if you have not set [ACEs](#) before for users, groups, or roles by clicking **Add Access Permission**.
- Add [ACEs](#) for another user, group, or role by clicking **Add Another**.

- Modify an existing [ACE](#) setting for an entity (user, group, or role) by clicking .

After you click **Add Access Permission**, **Add Another**, or , the **Add Access Permission** window displays. You can:

1. Enter new or modify the existing comma-separated list of users, groups, or roles to grant access to in the **Users**, **Groups**, and **Roles** text boxes respectively. Select the **Custom ACE** checkbox to manually enter the [ACE](#) in the text box that appears.

For more information on how to build the custom access control expression, see [Managing Access Control Expressions](#) on page 2126.

2. Click **Next: Select Permissions** to display the **Add Access Permissions** page.

The following table describes the permissions that can be granted to the specified users, groups, or roles in this page:

Object	Permission
Directories	<ul style="list-style-type: none"> • Read the contents of a directory. If you do not select this option, mode bits are used to determine read access. To read the contents of a directory that is tagged with this security policy, the user must also have read permissions on the volume, the parent directory (if any), and the file. This is the same as the <code>readdirace</code> property in the CLI. • Lookup or list the contents in a directory. If you do not select this option, mode bits are used to determine lookup access. To read the contents of a directory that is tagged with this security policy, the user must also have read permissions on the volume and the directory. This is the same as the <code>lookupdirace</code> property in the CLI. • Add a file or subdirectory. If you do not select this option, mode bits are used to determine permissions to create files or subdirectories. To add a child to a directory that is tagged with this security policy, the user must also have write permissions on the volume and the parent directory, add child permission on the parent directory, and read and execute permissions on all directories in the path. This is the same as the <code>addchildace</code> property in the CLI. • Delete a file or subdirectory. If you do not select this option, mode bits are used to determine permissions to create files or subdirectories. To delete a child of a directory that is tagged with this security policy, the user must also have write permissions on the volume and the parent directory, delete child permission on the parent directory, and read and execute permissions on all directories in the path. This is the same as the <code>deletechildace</code> property in the CLI. <p>For more information, see Managing File and Directory ACEs on page 2131.</p>

Object	Permission
Files	<ul style="list-style-type: none"> • Read a file. If you do not select this option, mode bits are used to determine read access to the file. To read a file that is tagged with this security policy, the user must also have read permissions on the volume. This is the same as the <code>readfileace</code> property in the CLI. • Write to a file. If you do not select this option, mode bits are used to determine read access to the file. To write to a file that is tagged with this security policy, the user must also have write permissions on the volume. This is the same as the <code>writefileace</code> property in the CLI. • Execute a file. If you do not select this option, mode bits are used to determine execute access to the file. To execute a file that is tagged with this security policy, the user must also have read permissions on the volume. This is the same as the <code>executefileace</code> property in the CLI. <p>For more information, see Managing File and Directory ACEs on page 2131.</p>
Tables	<ul style="list-style-type: none"> • Read new column families that are created in the table. This the same as the <code>readdbace</code> property in the CLI. See Security on JSON Tables on page 736 for more information. • Traverse CF to descend a hierachy of column families. This is the same as the <code>traversedbace</code> property in the CLI. See Security on JSON Tables on page 736 for more information. • Write to new column families that are created in the table. This is the same as the <code>writedbace</code> property in the CLI. See Security on JSON Tables on page 736 and Enabling Table and Stream Authorizations with ACEs on page 1625 for more information. • Unmasked Data. If you do not select this option, disallows the viewing of select and sensitive table fields of a column family. See Dynamic Data Masking on page 955 for more information on data masking.

3. Select the checkbox associated with the individual permission to grant that type of permission to the user, group, or role, or click the following:

- **Reads** to grant:

- read permission on directories, files, and tables
- lookup permission on directories
- traverse column family permission on tables

This is the same as the `readaces` property in the CLI.

- **Writes** to grant:

- write permission on files and tables
- add and delete child permissions on directories

This is the same as the `writeaces` property in the CLI.

- **Executes** to grant execute permission on files.

This is the same as the `executefileace` property in the CLI.

4. Click **Add** to add the data access permissions to the policy.

6. Make changes as needed to perform administrative operations on the policy in the **Policy Administration Control** section.

You can:

- Create a copy of an existing policy administration control setting for an entity by clicking , which you can then modify.
- Remove a policy administration control setting for an entity by clicking .
- Add a policy administration control setting for another user or group by clicking **Add Another**.
- Modify an existing policy administration control setting for an entity.

To add or modify an existing policy administration control setting for an entity, you can:

- Select new or modify an existing entity type, user or group, from the **Type** drop-down list, or enter a new or modify an existing entity name in the **Entities** field.
- Select or deselect the checkbox associated with the following permissions to grant or deny (respectively) that type of permission for the entity:
 - Read access for the policy
 - Admin access to set and modify ACLs on the policy
 - Full control over the policy

7. Click **Save** for the changes to take effect.

Modifying a Security Policy Using the CLI and REST API

About this task

CLI

The basic command to modify an existing security policy is:

```
/opt/mapr/bin/maprcli security policy
modify -name <policyName> -json
```

REST

Send a request of type POST. For example:

```
curl -X POST 'https://
<host>:port/rest/security/policy/
modify?name=<policyName>' --user
<username>:<password>
```

For more information, see [policy modify](#) on page 2652.

Removing Tagged Security Policies from Data Objects

You can remove security policies associated with data objects using the Control System, CLI, or REST API.

About this task

WARNING: Remove a security policy from data objects before retiring the policy. The system denies all access to data objects tagged with a retired security policy afterwards. See [Changing the State of a Security Policy](#) on page 2182.

The following table lists the methods for removing security policies for each type of data object and provides links to command references, where applicable:

HPE Data Fabric Component	Data Object	How to Remove Security Policies
HPE Data Fabric File System	Volume	<ul style="list-style-type: none"> Control System (See Removing Security Policies from Objects Using the Control System on page 2180 below) <code>maprcli volume modify -securitypolicy ""</code>
	Directory	<ul style="list-style-type: none"> Extended attributes using Linux, Hadoop, Java API, or C API commands (See Removing Security Policies Using Extended Attributes on page 2181 below) <code>hadoop mfs -removeallsecuritypolicytag [-R] <path></code> <code>hadoop mfs -removesecuritypolicytag [-R] <comma-separated list of security policy tags> <path></code>
	File	<ul style="list-style-type: none"> Same as directory
HPE Data Fabric Database	JSON Table	<ul style="list-style-type: none"> Control System (See Removing Security Policies from Objects Using the Control System on page 2180 below) <code>maprcli table securitypolicy remove -path <path> -securitypolicy <comma-delimited list of policies></code>
	Column family	<ul style="list-style-type: none"> Control System (See Removing Security Policies from Objects Using the Control System on page 2180 below) <code>maprcli table cf securitypolicy remove -path <path> -cfname <column family name> -securitypolicy <comma-delimited list of policies></code>

HPE Data Fabric Component	Data Object	How to Remove Security Policies
	Field	<ul style="list-style-type: none"> Control System (See Removing Security Policies from Objects Using the Control System on page 2180 below) <code>maprccli table cf column securitypolicy remove -path <path> -cfname <column family name> -column <JSON table field> -securitypolicy <comma-delimited list of policies></code>

The following sections describe how to remove security policies from data objects through the Control System and extended attributes.

Removing Security Policies from Objects Using the Control System

About this task

You can remove security policies from volumes, JSON tables, JSON column families, and JSON fields using the Control System.

Removing Security Policies from Volumes

1. Log in to the Control System, and click **Data > Volumes**.

NOTE: The **Volumes** page is under the **Volumes** menu in the Kubernetes version of the Control System.

2. On the **Volumes** page, locate and select the volume that is tagged with the security policy to be removed.
3. Click **Edit Volume**.
4. In the **Security** section, click  next to the security policy associated with the volume to remove the security policy.
5. Click **Save Changes**.

Removing Security Policies from Tables, Column Families, and Fields

1. Log in to the Control System, and click **Data > Tables**.
2. In the **Tables** view, locate and select the table with the security policy to be removed. To remove a security policy from a column family or field, select the table that contains the column family or field.
3. On the **Summary** tab, locate the **Security** section.
4. In the **Security** section, click  next to the security policy associated with the table to remove the security policy.
 - To remove a security policy from a column family, click on the table to expand the view. Click  next to security policy associated with the column family to remove the security policy.

- To remove a security policy from a field, click the column family name to expand the view, and remove the security policy.

Removing Security Policies Using Extended Attributes

About this task

The following sections describe how to use extended attributes to remove security policies.

Linux Commands

Security policies use a special format for the extended attribute name, which is always set to the keyword `security.mapr.policy`.

To remove the extended attribute by name, run the `setfattr` command with the `-x` option:

```
setfattr [-h] -x name pathname...
```

Remove all security policy tags

Use the `-x` option to remove all security policy tags from the specified File Store object. For example, to remove all security policies for the file `/mapr/lab/foo.txt`, use the following command:

```
setfattr -x security.mapr.policy /mapr/lab/foo.txt
```

Replace a security policy tag

The `setfattr` command replaces any existing security policy tags with the specified policy tags. For example, to remove a security policy named `Sensitive_Data` tagged to a data object but keep the security policy named `Lab_Security_Policy` tagged to the data object, specify the `Lab_Security_Policy` tag in the `-v` argument without the `Sensitive_Data` policy tag:

```
setfattr -n security.mapr.policy -v "Lab_Security_Policy" /mapr/lab/foo.txt
```

Hadoop Commands

Security policies use a special format for the extended attribute name, which is always set to the keyword `security.mapr.policy`.

To remove security policy tags, run the `hadoop fs -setfattr` command with one of the following parameters:

- `-x` to remove all security policy tags
- `-v` to remove the specified security policy tags

For example, to remove all the security policy tags for the file `/mapr/lab/foo.txt`, use:

```
hadoop fs -setfattr -x security.mapr.policy /mapr/lab/foo.txt
```

To remove some security policy tags, and keep the rest, use the `-v` parameter.

This parameter replaces existing security policy tags with the ones specified.

For example, if two security policies are tagged to the file `/mapr/lab/foo.txt` (namely, `Sensitive_Data` policy and

Lab_Security_Policy) and you want to remove the Sensitive_Data policy tag, specify just the Lab_Security_Policy tag in the -v parameter:

```
hadoop fs -setfattr -n
security.mapr.policy -v
"Lab_Security_Policy,Sensitive_Data" /
mapr/lab/foo.txt
```

Alternatively, use the `hadoop mfs` command to remove security policies.

For example, to remove particular security tags, use the format:

```
hadoop mfs [-removesecuritypolicytag
[-R] <comma-separated list of
security policy tags> <path>]
```

To remove all security tags, use the format:

```
hadoop mfs
[-removeallsecuritypolicytags [-R]
<path>]
```

Java APIs

To remove an extended attribute associated with a file or directory, use the following Java API:

```
public void removeXAttr(Path path,
String name) throws IOException
```

The name must be prefixed with the namespace, followed by . (period). For Data Fabric security policy tags, the attribute name is `security.mapr.policy`.

C APIs

Security policies use a special format for the extended attribute name, which is always set to the keyword `security.mapr.policy`.

To remove an extended attribute value, use the `removexattr` or `fremovexattr` system calls. The brief synopsis is as follows. For more details, refer to the `removexattr(2)` Linux manual page.

NAME

`removexattr`, `fremovexattr` -- remove an extended attribute value

SYNOPSIS

```
#include <sys/xattr.h>
int removexattr(const char *path,
const char *name, int options);
int fremovexattr(int fd, const char
*name, int options);
```

Changing the State of a Security Policy

The security policy state indicates whether users can apply a security policy to data objects and whether the system enforces the ACEs set in the security policy. An administrator can change the state of a security policy through the `allowtagging` and `accesscontrol` parameters when creating or modifying a security policy from the `maprcli` or equivalent REST API commands.

The following table describes the `allowtagging` and `accesscontrol` parameters.

Parameter	Default	Accepted Values and Descriptions
allowtagging	false	<p>false</p> <ul style="list-style-type: none"> Disables tagging; users cannot apply the security policy to data objects. This is the default setting if the administrator creates a security policy, unless the administrator changes the setting when creating the security policy. In cases where a security policy is active (<code>allowtagging=true</code>) but needs to be deprecated, modify the policy and set <code>allowtagging=false</code>. This prevents users from tagging any other data objects with the policy. Note that the system continues to enforce the security controls set in the security policy for data objects that were already tagged with the security policy. <p>true</p> <ul style="list-style-type: none"> Enables tagging; users can apply the security policy to data objects. When creating or modifying a security policy, an administrator can set <code>allowtagging=true</code>. When creating a security policy, the administrator may want to set this parameter to true to test the security settings in the policy or to use tagging tools to discover data content and tag the data. An administrator can set <code>allowtagging=true</code> to enable a deprecated security policy.
accesscontrol	Disarmed	<p>Disarmed</p> <ul style="list-style-type: none"> This is the default setting if the administrator creates a security policy, unless the administrator changes the setting when creating the security policy. The system does not enforce the ACEs set in the security policy during data operations on the data objects tagged with the security policy. <p>Armed</p> <ul style="list-style-type: none"> The system enforces the ACEs set in the security policy during data operations on the data objects tagged with the security policy. When creating or modifying a security policy, the administrator can set <code>accesscontrol=Armed</code>. When creating a security policy, the administrator may want to set this parameter to Armed to verify that ACEs are correctly defined in the policy and the system correctly enforces them. The administrator can set <code>accesscontrol=Armed</code> to enforce ACEs set in a deprecated security policy. The system continues to enforce ACEs set in the security policy for all data operations on the data objects tagged with the policy. <p>Denied</p> <ul style="list-style-type: none"> Denies all access to data objects tagged with the security policy.

Changing the State of a Security Policy

An administrator can change the state of a security policy through the `allowtagging` and `accesscontrol` parameters to move a security policy through a life cycle, as shown in the following image where the security policy moves from new to retired.

The following table describes each of the stages in the security policy life cycle:

Stage	Description
New (default)	<ul style="list-style-type: none"> Default upon security policy creation. Users cannot tag data objects with the security policy. The system does not enforce ACEs set in the security policy.
In-use	<ul style="list-style-type: none"> Users can tag data objects with the security policy. The system enforces all security controls set in the security policy during data operations on data objects tagged with the security policy. Security controls set in the policy can include ACEs, auditing, and wire-level encryption.
Deprecated	<ul style="list-style-type: none"> Users can no longer tag the security policy to data objects. The system still enforces the security controls set in the security policy for all data operations on the data objects tagged with the policy. Users cannot tag any additional data objects with the policy.
Retired	<ul style="list-style-type: none"> Users cannot tag the security policy to data objects. All data operations on the data objects tagged with the security policy are denied by the system. <p> WARNING: Remove a security policy from data objects before retiring it. The system denies all access to data objects tagged with a retired security policy. See Removing Tagged Security Policies from Data Objects on page 2179.</p>

Related concepts

[Tagging Data Objects with Security Policies](#) on page 2185

Once security policies are configured (with tagging enabled), permitted users can associate the security policies with data objects through the Control System, CLI, and REST API. A data object can be associated with one or multiple security policies.

Tagging Data Objects with Security Policies

Once security policies are configured (with tagging enabled), permitted users can associate the security policies with data objects through the Control System, CLI, and REST API. A data object can be associated with one or multiple security policies.

ATTENTION: Verify that the security policy state is set to allow tagging. By default, a security policy has `allowtagging=false` and `accesscontrol=Disarmed` when created. See [Changing the State of a Security Policy](#) on page 2182.

Supported Data Objects

The following table lists the data objects in the Data Fabric platform that users can tag with security policies:

file system	HPE Data Fabric Database
<ul style="list-style-type: none"> Volumes Directories Files 	<ul style="list-style-type: none"> JSON tables JSON table column families JASON table fields <p> NOTE: If you upgrade your Data Fabric cluster to version 6.2.x from a pre-6.2.0 version, you can apply security policies to existing tables if Policy-Based Security is enabled. See Policy-Based Security Quick Reference on page 2206.</p>

Permissions Required to Tag Data Objects

Users must have the required permissions to tag security policies to data objects. Permission requirements vary depending on the Data Fabric platform core component.

The following table lists the users that can tag data objects in the Data Fabric filesystem and database:

file system	HPE Data Fabric Database
<ul style="list-style-type: none"> Owner of the data object Data Fabric administrator (typically mapr) Superuser (root) <p>The superuser cannot tag filesystem objects when the <code>cldb.reject.root</code> flag is set.</p>	<ul style="list-style-type: none"> Data Fabric administrator (typically mapr) User with ACE administrative access (adminaccessperm permission)

The following sections describe how to tag data objects in the file system and HPE Data Fabric Database with security policies

Tagging Volumes, Directories, and Files with Security Policies

Associate security policies with data objects in the file system, including volumes, directories, and files.

Associate up to sixteen security policies with a data object in the file system.

Tagging Volumes

About this task

NOTE: NFSv4 refers to NFS version 4.1.

Associate security policies after you create or modify a volume from the Control System, CLI, or REST API. Note that security policies are not supported with tenant volumes and tenant volume resources, and tagging via nfsv3/nfsv4 is not supported since these protocols do not support extended attributes.

Associate security policies with a volume, the volume mount path, or both the volume and the volume mount path. You can only tag a volume mount path through the `maprcli create volume` command with the `rootdirsecuritypolicy` option. You cannot tag a volume mount path through the Control System.

IMPORTANT: A snapshot contains the security policy that was tagged on the volume after the snapshot was taken. If you modify the security policy on the volume after creating the snapshot, the snapshot continues to use the older security policy.

CLI

The basic command to tag a volume with a security policy is:

```
/opt/mapr/bin/maprcli volume
create -name <volName> -path
<mountPath> -securitypolicy
<policy1,policy2,...>
```

REST API

Send a request of type POST. For example:

```
curl -k -X POST 'https://
<hostname>:8443/rest/volume/create?
name=<volName>&path=<volPath>&security
Policy=<policy>' --user mapr:mapr
```

TIP: For more information, including a complete list of required and optional properties, see [volume create](#) on page 2929.

Control System

1. Log in to the Control System and go to the [Create New Volume](#) page or the [Edit Volume](#) page.

2. Enter or select the name of the security policies to associate with the volume in the **SECURITY POLICIES** field under the **Security** section.
3. Complete the steps to create or modify the volume.

TIP: See [Creating a Volume](#) on page 1437 or [Modifying a Volume](#) on page 1467 for more information.

Tagging Directories and Files

About this task

Associate security policies with directories and files using `hadoop mfs`, extended attributes, and Java APIs.

`hadoop mfs`

Use the following command syntax to tag a directory or file with one or more security policies:

```
hadoop mfs -setsecuritypolicytag
<policyName> <filePath>
```

TIP: For more information, see [hadoop mfs](#) on page 7489.

Extended attributes

- For **Linux**, use the `setfattr` command to tag and restore security attributes. Security policies use a special format for the extended attribute name, which is always set to the keyword `security.mapr.policy`.
- For **Hadoop**, security policies use a special format for the extended attribute name, which is always set to the keyword `security.mapr.policy`.
- For **Java and C APIs**, security policies use a special format for the extended attribute name, which is always set to the keyword `security.mapr.policy`.

Comm and Type		
Linux	Tag an extended attribute name	<p>Use the following command to set an extended attribute name on a file/directory and/or a FUSE-mounted file path:</p> <pre>setfattr {-n attribute-name} [-v value] [-h] pathToDataObject</pre>
	Associate one or more security policies	<p>To associate one or more security policies with the file /mapr/lab/foo.txt, specify a comma-separated list of security policy names. For example, to associate two security policies named Lab_Security_Policy and Sensitive_Data to /mapr/lab/foo.txt, use:</p> <pre>setfattr -n security.mapr.policy -v "Lab_Security_Policy,Sensitive_Data" /mapr/lab/foo.txt</pre>
	Replace security policies	<p>The setfattr command replaces any existing security policies with the specified policies. To remove the Sensitive_Data policy and keep the Lab_Security_Policy, specify the Lab_Security_Policy in the -v argument without the Sensitive_Data policy:</p> <pre>setfattr -n security.mapr.policy -v "Lab_Security_Policy" /mapr/lab/foo.txt</pre>
	Associate a security policy with a directory	<p>Use a similar command to associate a security policy to a directory:</p> <pre>setfattr -n security.mapr.policy -v "Lab_Security_Policy,Sensitive_Data" /mapr/lab</pre>

Comm and Type		
Hadoop	Set security policy attributes	<div><pre>hadoop fs -setfattr -n security.mapr.poli cy -v comma-separated list of policy names path</pre></div> <p>The -v parameter is mandatory, and is a comma-separated list of security policy tags.</p> <p>For example, to associate a security policy Lab_Security_Policy with the file /mapr/lab/foo.txt, use the command:</p> <pre>hadoop fs -setfattr -n security.mapr.policy -v "Lab_Security_Policy " /mapr/lab/foo.txt</pre> <p>If security policy tags already exist for the specified object, this command replaces any existing security policies with the specified policies. Assume that there are two security policies - Sensitive_Data_Policy and Lab_Security_Policy tagged to the file /mapr/lab/foo.txt.</p> <p>To remove Sensitive_Data_Policy, and keep Lab_Security_Policy, specify only Lab_Security_Policy in the -v parameter:</p> <pre>hadoop fs -setfattr -n security.policy -v "Lab_Security_Policy " /mapr/lab/foo.txt</pre> <p>You can use the hadoop mfs command as well.</p> <p>To add policies to an already existing set of policies, use the format:</p> <div><pre>hadoop mfs [-addsecuritypolic ytag [-R] <comma-separated list of security policy tags> <path>]</pre></div>

Comm and Type		
Java API	Tag security policy attributes	<div>public void setXAttr(Path path, String name, byte[] value) throws IOException</div> <div>The following example demonstrates how to use the Java API to tag the security policy as an extended attribute security.mapr.policy with the value Lab_Security_Policy for the file /mapr/lab/foo.txt:</div> <div>import java.net.*; import org.apache.hadoop. fs.*; import org.apache.hadoop. conf.*; ... Java APIs

Associate security policies with data objects using the file system Java APIs. See [Security Policy Java APIs](#) on page 2197 for more information.

More information

[Security Policy Inheritance and Replication](#) on page 941

Security policies are inherited during data-object creation and copied over during mirroring and replication.

Tagging JSON Tables, Column Families, and Fields with Security Policies

Associate security policies with HPE Data Fabric Database JSON tables, column families, and fields.

About this task

NOTE: NFSv4 refers to NFS version 4.1.

You can apply security policies to HPE Data Fabric Database objects from the Control System, CLI, and the REST API. Tagging through nfsv3/nfsv4 is not supported since these protocols do not support extended attributes. No limit exists on the number of policies tagged to a database object, but be cautious of issues than can occur due to conflicting settings in the policies.

NOTE: You cannot tag binary tables or stream topics. If you apply a policy to a volume, the rules set in the policy apply to all the content in the volume.

Tagging JSON Tables

About this task

Associate security policies with JSON tables.

CLI

To associate a comma-separated list of security policies with a table at the time of table creation:

```
maprccli table create -path
<tablePath> -securitypolicy
<policyName, ...>
```

To associate a comma-separated list of security policies with a table without replacing existing security policies, run the following command:

```
maprccli table securitypolicy
add -path <tablePath> -securitypolicy
<policyName, ...>
```

To replace security policies on a table with a comma-separated list of new security policies, run the following command:

```
maprccli table securitypolicy
set -path <tablePath> -securitypolicy
<policyName, ...>
```

To remove one or more security policies from a table, run the following command:

```
maprccli table
securitypolicy remove -path
<tablePath> -securitypolicy
<policyName, ...>
```

REST API

Send a request of type POST. For example, to associate a comma-separated list of security policies with a table at the time of table creation, send a request similar to the following:

```
https://<hostname>:8443/rest/table/
create?
path=<tablePath>&securitypolicy=<polic
yName, ...>
```

To associate a comma-separated list of security policies with a table without replacing existing security policies, send a request similar to the following:

```
https://<hostname>:8443/rest/table/
securitypolicy/add?
path=<tablePath>&securitypolicy=<polic
yName, ...>
```

To replace security policies on a table with a comma-separated list of new security policies, send a request similar to the following:

```
https://<hostname>:8443/rest/table/
securitypolicy/set?
path=<tablePath>&securitypolicy=<policyName,...>
```

To remove one or more security policies from a table, run the following command:

```
https://<hostname>:8443/rest/table/
securitypolicy/remove?
path=<tablePath>&securitypolicy=<policyName,...>
```

Control System

1. Log in to the Control System and go to the **Create New Table** page or the **Edit Table** page.
2. Select the security policies to associate with the table in the **Security** section.
3. Specify all other required settings and click **Save Changes**.

TIP: For more information, see:

- [table create](#) on page 2753
- [table securitypolicy add](#) on page 2860
- [table securitypolicy set](#) on page 2862
- [table securitypolicy remove](#) on page 2861

Tagging Column Families

About this task

Associate security policies with JSON table column families.

CLI

To associate a comma-separated list of security policies with a column family when the column family is created:

```
maprcli table cf
create -path <tablePath> -cfname
<column-family-name> -jsonpath
<family path> -securitypolicy
<policyName,...> -force true
```

To associate a comma-separated list of security policies with a column family without replacing existing security policies, run the following command:

```
maprcli table cf securitypolicy
add -path <tablePath> -cfname
<column-family-name> -securitypolicy
<policyName,...>
```

To replace security policies on a column family with a comma-separated list of new security policies, run the following command:

```
maprcli table cf securitypolicy
set -path <tablePath> -cfname
<column-family-name> -securitypolicy
<policyName,...>
```

To remove one or more security policies from a column family, run the following command:

```
maprcli table cf securitypolicy
remove -path <tablePath> -cfname
<column-family-name> -securitypolicy
<policyName,...>
```

REST API

Send a request of type POST. For example, to associate a comma-separated list of security policies with a column family at the time of table creation, send a request similar to the following:

```
https://<hostname>:8443/rest/table/cf/
create?
path=<tablePath>&cfname=<column-famil
y-name>&securitypolicy=<policyName,...
>
```

To associate a comma-separated list of security policies with a column family without replacing existing security policies, send a request similar to the following:

```
https://<hostname>:8443/rest/table/cf/
securitypolicy/add?
path=<path>&cfname=<column-family-name
>&securitypolicy=<policyName,...>
```

To replace security policies on a column family with a comma-separated list of new security policies, send a request similar to the following:

```
https://<hostname>:8443/rest/table/cf/
securitypolicy/set?
path=<path>&cfname=<column-family-name
>&securitypolicy=<policyName,...>
```

To remove one or more security policies from a column family, run the following command:

```
https://<hostname>:8443/rest/table/cf/
securitypolicy/remove?
path=<path>&cfname=<column-family-name
>&column=<JSON-table-field>&securitypo
licy=<policyName,...>
```

Control System

1. Log in to the Control System, and click **Data > Tables**.

2. Locate and select the table that contains the column family you want to secure.
3. On the **Summary** tab, locate the **Security** section.
4. In the **Security** section, click on the table name to expand the list of column families associated with the table.
5. Click the **+** icon in the **Security Policy** column next to the column family you want to secure with a security policy.
6. In the **Tag Security Policy to Column Family:** window, select the security policy you want to apply to the column family.
7. Click **Add**.

TIP: For more information, see:

- [table cf create](#) on page 2778
- [table cf securitypolicy add](#) on page 2795
- [table cf securitypolicy set](#) on page 2798
- [table cf securitypolicy remove](#) on page 2796

Tagging Fields

About this task

Associate security policies with JSON fields.

CLI

To associate a comma-separated list of security policies with a JSON table field, without replacing existing security policies, run the following command:

```
maprcli table cf
column securitypolicy
add -path <tablePath> -cfname
<column-family-name> -column
<column-name> -securitypolicy
<policyName, ...>
```

To replace security policies on a JSON table field with a comma-separated list of new security policies, run the following command:

```
maprcli table cf
column securitypolicy
set -path <tablePath> -cfname
<column-family-name> -column
<column-name> -securitypolicy
<policyName, ...>
```

To remove one or more security policies from a JSON table field, run the following command:

```
maprcli table cf
column securitypolicy
```

REST API

```
remove -path <tablePath> -cfname
<column-family-name> -column
<column-name> -securitypolicy
<policyName, ...>
```

Send a request of type POST. For example, to associate a comma-separated list of security policies with a column family at the time of table creation, send a request similar to the following:

```
https://<hostname>:8443/rest/table/
create?
path=<tablePath>&securitypolicy=<poli
cyName, ...>
```

To associate a comma-separated list of security policies with a JSON table field without replacing existing security policies, send a request similar to the following:

```
https://<hostname>:8443/rest/table/cf/
column/securitypolicy/add?
path=<path>&cfname=<col-family-name>&s
ecuritypolicy=<policyName, ...>
```

To replace security policies on a JSON table field, with a comma-separated list of new security policies, send a request similar to the following:

```
https://<hostname>:8443/rest/table/cf/
column/securitypolicy/set?
path=<path>&cfname=<column-family-name
>&securitypolicy=<policyName, ...>
```

To remove one or more security policies from a JSON table field, run the following command:

```
https://<hostname>:8443/rest/table/cf/
column/securitypolicy/remove?
path=<path>&cfname=<column-family-name
>&column=<JSON-table-field>&securitypo
licy=<policyName, ...>
```

Control System

1. Log in to the Control System, and click **Data > Tables**.
2. Locate and select the table that contains the field you want to secure.
3. On the **Summary** tab, locate the **Security** section.
4. In the **Security** section, click on the table name to expand the list of column families, and then click on the column family that contains the field you want to secure.
5. Click the **+** icon in the **Security Policy** column next to the field you want to secure with a security policy.

6. In the **Tag Security Policy to Column Family:** window, select the security policy you want to apply to the column family.
7. Click **Add**.

TIP: For more information, see:

- [table cf column securitypolicy add](#) on page 2765
- [table cf column securitypolicy set](#) on page 2777
- [table cf column securitypolicy remove](#) on page 2776

Related tasks

[Removing Tagged Security Policies from Data Objects](#) on page 2179

You can remove security policies associated with data objects using the Control System, CLI, or REST API.

Security Policy Java APIs

You can create, retrieve, and remove security policies, and associate security policies with a data object using file system APIs.

The standard Linux extended attributes to tag file system objects are POSIX-compliant. You can use these attributes on any Linux or POSIX-compliant client without installing additional Data Fabric software.

With the extended attribute syntax, applications need to ensure that to combine tags, they first retrieve the old tags and then combine them with the new tags. Otherwise, the new tags replace the old tags. Alternatively, applications can use an API with the following features:

1. Setting tags should be additive: new tags should be added to the existing tags, and not replace the existing tags.
2. Set multiple tags for the same resource in a single API.
3. Set tags for multiple file system resources in a single operation.

The extended MapRFileSystem Java class provides such an API for setting policy tags.

The list of MapRFileSystem API methods for data tagging is as follows:

```
public class MapRFileSystem extends FileSystem;
```

Method and Description	Modifier and Type
Add a Security Policy Tag	
addSecurityPolicyTag (Path path, String securityPolicyTag) throws IOException; Use this method to add a single security policy tag to the list of existing security policy tags (if any) for the file or directory specified in <i>path</i> . The <i>securityPolicyTag</i> parameter contains a security policy tag.	public int
addSecurityPolicyTag (Pathpath, List<String>securityPolicyTags) throws IOException; Use this method to add one or more security policies to the list of existing security policies (if any) for the file or directory specified in <i>path</i> . The <i>securityPolicyTags</i> parameter contains a list of one or more security policy tags.	public int
Replace a Security Policy Tag	

Method and Description	Modifier and Type
setSecurityPolicyTag (Path <i>path</i> , String <i>securityPolicyTag</i>) throws <i>IOException</i> ; Use this method to set the security policy tag to the file or directory specified in <i>path</i> , replacing all existing tags. The <i>securityPolicyTag</i> parameter contains a security policy tag.	public int
setSecurityPolicyTag (Path <i>path</i> , List<String> <i>securityPolicyTags</i>) throws <i>IOException</i> ; Use this method to set one or more security policy tags for the file or directory specified in <i>path</i> , replacing any existing security policy tags. The <i>securityPolicyTags</i> parameter contains a list of one or more security policy tags.	public int
Remove a Security Policy Tag	
removeSecurityPolicyTag (Path <i>path</i> , String <i>securityPolicyTag</i>) throws <i>IOException</i> ; Use this method to remove the security policy tag contained in the <i>securityPolicyTag</i> parameter from the list of existing security policy tags (if any) for the file or directory specified in <i>path</i> .	public int
removeSecurityPolicyTag (Path <i>path</i> , List<String> <i>securityPolicyTags</i>) throws <i>IOException</i> ; Use this method to remove one or more security policy tags from the list of existing security policy tags (if any) for the file or directory specified in <i>path</i> . The <i>securityPolicyTags</i> parameter contains a list of one or more security policy tags.	public int
removeAllSecurityPolicyTags (Path <i>path</i>) throws <i>IOException</i> ; Use this method to remove all security policies tagged to the file or directory specified by <i>path</i> .	public int
Retrieve Security Policy Tags	
getSecurityPolicyTag (Path <i>path</i> , List<String> <i>securityPolicyTags</i>) throws <i>IOException</i> ; Use this method to retrieve the security policy tags associated with the file or directory specified in <i>path</i> . The <i>securityPolicyTags</i> parameter contains a list of one or more security policy tags.	public int

The following example illustrates the usage of file system APIs, and the interchangeability of using the file system API with the extended attribute APIs:

1. Set three security policy tags: `general`, `hipaa`, and `pci`, on the file `/mapr/lab/foo.txt`.
2. Retrieve these security policy tags using the extended attribute commands and the `getSecurityPolicyTag` API.
3. Remove the tag `pci`. Two tags remain: `hipaa` and `general`.
4. Add a new tag `topsecret`.

The two existing tags, `general` and `hipaa`, are preserved. Finally, there are three tags: `general`, `hipaa`, and `topsecret`.

Step 1: Set Security Policy Tags

Use the Java `addSecurityPolicyTag` API to set three security policies, `pci`, `general`, and `hipaa`, for the file `/mapr/lab/foo.txt` as follows.

```
import java.net.*;
import org.apache.hadoop.fs.*;
```

```
import org.apache.hadoop.conf.*;
import com.mapr.fs.MapRFileSystem;
import java.util.List;
import java.util.ArrayList;
...
Configuration conf = new Configuration();
FileSystem fs = FileSystem.get(conf);
Path path = Paths.get("/mapr/lab/foo.txt");
List<String> securityPolicies = new ArrayList<String>();
securityPolicies.add ("pci");
securityPolicies.add ("general");
securityPolicies.add ("hipaa");
((MapRFileSystem fs).addSecurityPolicyTag (path, securityPolicies);
```

Step 2: Retrieve Security Policy Tags

The `getSecurityPolicyTag` API returns the same set of security policies `general`, `hipaa`, and `pci` in a List of String object, instead of a comma-separated list:

```
List<String> securityPolicies = new ArrayList<String>();
int status = getSecurityPolicyTag (path, securityPolicies);
```

Alternatively, use the `getfattr` extended attribute API, to retrieve the three security policy tags:

```
getfattr -d /mapr/lab/foo.txt
# file: /mapr/lab/foo.txt
security.mapr.policy="general,hipaa,pci"
```

The tags are always returned in alphabetical order regardless of the tags that you set first. All security policies are considered equal in terms of determining access rights.

Use the extended attribute Java API `getXAttr` to obtain the same result: retrieve the three security policy tags. The following segment prints the comma-separated list: `general`, `hipaa`, `pci`.

```
import java.net.*;
import org.apache.hadoop.fs.*;
import org.apache.hadoop.conf.*;
...
Configuration conf = new Configuration();
FileSystem fs = FileSystem.get(conf);
Path path = Paths.get("/mapr/lab/foo.txt");
byte[] securityPolicyBytes = fs.getXAttr(path, "security.mapr.policy");
System.out.println ("Security Policies: " + securityPolicyBytes.toString());
```

Step 3: Remove a Security Policy Tag

At this point, the example has three tags for `/mapr/lab/foo.txt`: `general`, `hipaa`, and `pci`. Now, remove the tag `pci` using the `removeSecurityPolicyTag` API:

```
Configuration conf = new Configuration();
FileSystem fs = FileSystem.get(conf);
Path path = Paths.get("/mapr/lab/foo.txt");
...
((MapRFileSystem fs).removeSecurityPolicyTag (path, "pci");
```

Use any of the methods listed in step 2, to see that the `pci` tag is removed.

Step 4: Add a Security Policy Tag

Add a tag `topsecret` using the `addSecurityPolicyTag` API:

```
FileSystem fs = FileSystem.get(conf);
Path path = Paths.get("/mapr/lab/foo.txt");
...
((MapRFileSystem fs).addSecurityPolicyTag (path, "topsecret");
```

Since this API sets the tags in an additive fashion, it preserves the two existing tags `general` and `hipaa`. The final output is three tags: `general`, `hipaa` and `topsecret`.

Complete Example of Setting and Retrieving Security Policies

The following sample program uses the tagging APIs on the file `/user/root/disks.txt`.

This program does the following tasks:

1. Tags the file with two tags, namely `general`, and `pci`.
2. Retrieve the tags. The output should display `general`, and `pci`.
3. Remove the tag `pci`.
4. Retrieve the tags. The output should display `general`.
5. Add the tag `hipaa`.
6. Retrieve the tags. The output should display `general`, and `hipaa`.

```
package com.mapr.fs;
import java.net.*;
import org.apache.hadoop.fs.*;
import org.apache.hadoop.conf.*;
import java.io.*;
import com.mapr.fs.MapRFileSystem;
import java.util.List;
import java.util.ArrayList;

class SecurityPolicyTest
{
    public static void main (String [] args) throws IOException
    {
        Configuration conf = new Configuration();
        if (args.length != 1) {
            System.out.println ("Usage: com.mapr.fs.SecurityPolicyTest <path>");
            System.exit(-1);
        }
        String pathName = args[0];
        System.out.println ("Path name: " + pathName);
        FileSystem fs = FileSystem.get(conf);
        Path path = new Path (pathName);
        List<String> securityPolicies = new ArrayList<String>();
        System.out.println ("Adding general,pci");
        securityPolicies.clear();
        securityPolicies.add ("general");
        securityPolicies.add ("pci");
        ((MapRFileSystem)fs).setSecurityPolicyTag(path, securityPolicies);
        List<String> tags = new ArrayList<String>();
        int status = ((MapRFileSystem)fs).getSecurityPolicyTag(path, tags);
        if (status == 0) {
            System.out.println ("Tags:");
```

```

        for (int i=0; i<tags.size(); i++) {
            System.out.println (tags.get(i));
        }
    }
    System.out.println ("Removing pci");
    ((MapRFileSystem)fs).removeSecurityPolicyTag (path,"pci");
    tags.clear();
    status = ((MapRFileSystem)fs).getSecurityPolicyTag(path, tags);
    if (status == 0) {
        System.out.println ("Tags:");
        for (int i=0; i<tags.size(); i++) {
            System.out.println (tags.get(i));
        }
    }
    System.out.println ("Add hipaa");
    ((MapRFileSystem)fs).addSecurityPolicyTag(path, "hipaa");
    tags.clear();
    status = ((MapRFileSystem)fs).getSecurityPolicyTag(path,
tags);
    if (status == 0) {
        System.out.println ("Tags:");
        for (int i=0; i<tags.size(); i++) {
            System.out.println (tags.get(i));
        }
    }
}
}

```

Output

```

# sh RUN
# export CLASSPATH=`mapr classpath`
# java -cp $CLASSPATH com.mapr.fs.SecurityPolicyTest /user/root/disks.txt
Path name: /user/root/disks.txt
Adding general,pci
Tags:
    general,pci
Removing pci
Tags:
    general
Add hipaa
Tags:
    general,hipaa

```

Enforcing Security Policies at the Volume-Level

Describes how to set enforcement modes for security policies at the volume-level.

About this task

The system enforces data access controls during data operations. Data access controls are the ACEs defined in security policies and ACEs and POSIX mode bits directly defined on data objects. The enforcement mode tells the system which of these data access controls to evaluate and enforce during data operations.

You can set the enforcement mode to one of the following values from the Control System, CLI, or REST API:

Enforcement Mode	Enforce Security Policies	Enforce Data ACEs and POSIX Mode Bits
PolicyAceAndDataAce (Default)	Yes	Yes
PolicyAceOnly	Yes	No

Enforcement Mode	Enforce Security Policies	Enforce Data ACEs and POSIX Mode Bits
DataAceOnly	No	Yes
PolicyAceAuditAndDataAce (Permissive mode)	Performs checks but does not fail; audits instead	Yes

For detailed information about the enforcement mode options, see [Volume-Level Security Policy Enforcement Mode](#) on page 932.

Set the Enforcement Mode from the Control System

Procedure

1. Log in to the Control System, and go to the [volume information page](#).
2. In the **Security** pane, click  associated with **Enforcement Mode** to display the **Change Enforcement Mode** window.
3. Select the enforcement mode to apply to the volume.
4. Click **Save Changes** for the changes to take effect.

Set the Enforcement Mode from the CLI or REST API

About this task

CLI

Set the enforcement mode when you create a volume:

```
/opt/mapr/bin/maprcli volume
create -name <volName> -path
<mountPath> -securitypolicy
<policyName> -enforcementmode
PolicyAceAndDataAce|PolicyAceOnly|
DataAceOnly
```

Set the enforcement mode when you modify a volume:

```
/opt/mapr/bin/maprcli
volume modify -name
<volName> -enforcementmode
PolicyAceAndDataAce|PolicyAceOnly|
DataAceOnly
```

REST

Send a POST request to set the enforcement mode when you create a volume:

```
curl -X POST 'https://<hostname>:8443/
rest/volume/create?
name=<volName>&path=<mountPath>&securi
typolicy=<policyName>&enforcementmode=
PolicyAceAndDataAce|PolicyAceOnly|
DataAceOnly' --user <username>:<pwd>
```

Send a request of type POST to set enforcement mode when you edit a volume:

```
curl -X POST 'https://<hostname>:8443/
rest/volume/modify?
```

```
name=<volName>&enforcementmode=PolicyA
ceAndDataAce|PolicyAceOnly|
DataAceOnly' --user <username>:<pwd>
```

For more information, see [volume create](#) on page 2929 and [volume modify](#) on page 3018.

Troubleshooting Security Policies

This topic describes problems that you may encounter when creating and using security policies. It includes recommendations on how to troubleshoot and resolve problems.

Cannot Create a Security Policy

You encounter the following error when attempting to create a security policy:

```
ERROR (1) - Security policy create of XXX failed: Security policy creation
failed: No privileges to create a security policy
```

You must have cluster-level create/delete security policy (cp) permission to create a security policy.

To check your cluster-level permissions, assuming you have cluster-level login permission, run the following command:

```
maprcli acl show -type cluster
```

The following shows sample output for a user with the necessary cp permission:

Allowed actions	Principal
[login, cp]	User PolicyAdmin

Cannot view a Security Policy

If you receive an error when running the `maprcli security policy info` command, the root cause depends on the error you encounter:

No Data Fabric Ticket

```
ERROR (22) - You do not
have a ticket to communicate
with 10.10.20.40:7222. Retry after
obtaining a new ticket using maprlogin
```

This indicates that you do not have a Data Fabric ticket to access the secure Data Fabric cluster.

Create a Data Fabric ticket by running [maprlogin password](#).

No Policy-Level Permission

```
ERROR (2) - Security policy lookup
of XXX failed, Operation not permitted
```

The possible reasons for this error are as follows:

Possible Cause	Troubleshooting Steps
Either you or the group that you belong to does not have the policy-level read permission.	<ol style="list-style-type: none"> 1. Ask the user who granted you access to confirm your policy-level permission by running: <pre>maprcli security policy info \ -name XXX \ -columns acl -json</pre> 2. Request access if you do not have the read permission.
You are not a member of a group that has policy-level permission.	<ol style="list-style-type: none"> 1. Run the <code>id</code> command to verify your group membership. 2. If you are not a member of the group, request an administrator to add you. 3. If you are using Data Fabric tickets, recreate your ticket after updating your group membership.
Your Data Fabric ticket does not reflect your updated group membership because you created the ticket before changing your group membership.	<ol style="list-style-type: none"> 1. Verify your Data Fabric ticket by examining the output from <code>maprlogin print</code>. 2. If the ticket does not include the group that has policy-level permission, then recreate your Data Fabric ticket.

Cannot Modify a Security Policy

Depending on the property you are trying to modify, you must have certain policy-level permissions:

Update Non-Permission Properties of a Policy

If you encounter the following error:

```
ERROR (1) - Security policy
update of XXX failed: Insufficient
```

```
privileges to update general section
for security policy XXX
```

You must have one of the following cluster-level or policy-level permissions:

- Cluster-level cp, a, or fc permission
- Policy-level a or fc permission

Update Permission Properties of a Policy

If you encounter the following error:

```
ERROR (1) - Security policy
update of XXX failed: Insufficient
privileges to update ACL for security
policy XXX
```

You must have one of the following cluster-level or policy-level permissions:

- Cluster-level cp or admin permission
- Policy-level admin permission

Cannot tag a security policy to a data object

If you cannot tag a policy to a data object or the volume page search in the Control System is not displaying a security policy, verify that allowtagging is set to true, as described in [Changing the State of a Security Policy](#) on page 2182.

Policies not visible after the CLDB starts

After the CLDB master starts, it can take a couple of minutes for the policyserver to come up. Currently, only the policy server on the cluster designated as the global policy master serves operations. Member clusters standby and do not serve operations. Wait for the policyserver to come up.

Mirroring/Restore fails due to no policies

If mirroring or restore fails due to no policies, import the policies from the global policy master or a member cluster that has the policies, as described in [Security Policy Domain and Policy Management](#) on page 928.

Access check on mirror source and destination clusters differ

The policies may have been modified on the global policy master and not propagated to either of them. Get the latest policies, as described in [Security Policy Domain and Policy Management](#) on page 928.

Access checks fail

View the file system audit logs on the master node.

Where are the logs?

The following table lists the log locations for components related to security policies:

Component	Location
PolicyServer	cldb.log
Access Check	MFS
Audit Logs	NC master node FS Audit Logs
Client (For tagging)	Regular Client logs (ffs.log or enable Hadoop debug then stdout)

Related concepts

[Granting Security Policy Permissions](#) on page 2161

Permissions define which administrative users can create, view, and modify security policies.

Administrators set the permissions on security policies through cluster-level and security policy-level ACLs.

Policy-Based Security Quick Reference

This quick reference provides tips and `maprc li` commands for the most common tasks related to Policy-Based Security.

Task	Commands
Enable PBS (Required for upgrades from pre-6.2.0 versions of Data Fabric)	<p>If upgrading from a Data Fabric version that does not support extended attributes, enter the following command:</p> <pre>/opt/mapr/bin/maprccli cluster feature enable -name mfs.feature</pre> <p>Enable PBS:</p> <pre>/opt/mapr/bin/maprccli cluster feature enable -name mfs.feature</pre> <p>Related documentation:</p> <ul style="list-style-type: none"> Upgrade Workflows (Releases 6.x or 7.x to 8.1) on page 452 Installer on page 7511
Designate a master security policy cluster (Required to create and modify security policies)	<p>You must designate a master security policy cluster to set the security policy global master for member clusters. Master and member security policies form a security policy domain.</p> <pre>maprccli config save -values '{"clbdb.pbs.global.master":"1"}'</pre> <p>#1 = master security policy cluster #0 = member of the security policy cluster</p> <p>To identify which cluster is master, run:</p> <pre>maprccli dashboard info -json grep -i global "globalPolicyMaster"</pre> <p>Related Documentation:</p> <ul style="list-style-type: none"> Configuring the Global Policy Master on page 931 Security Policy Domain and Policy Management on page 928 Setting Global Configuration Options for Policy-Based Security on page 2158
Grant an admin cp permission (Required to create security policies)	<p>Admins with cluster-level <code>a</code> (admin) permission can assign <code>cp</code> (create security policy) permission to users.</p> <pre>/opt/mapr/bin/maprccli acl edit -type cluster -name <cluster-name> -user <user>:<action>[,<action>...][<user>:<action>[,<action>...]]</pre> <p>#Example: Grant jsmith cp cluster-level permission</p> <pre>#!/opt/mapr/bin/maprccli acl edit -type cluster -name myCluster -user jsmith:cp</pre> <p>Related documentation:</p> <ul style="list-style-type: none"> acl edit on page 2274 Example Using Security Policies on page 944

Task	Commands
Grant admins access to a security policy	<p>Admins with cluster-level cp permission can set permissions on a security policy during policy-level permissions through policy-level ACLs. Regardless of how or when the a user or group has on a security policy. Note that the commands shown do not include</p> <div><p>#Grant user permission to a security policy during policy create /opt/mapr/bin/maprccli security policy create -name <security-policy-name></p><p>#Modify a security policy and grant user permission to the policy /opt/mapr/bin/maprccli security policy modify -name <security-policy-name></p><p>#Overwrite the existing permissions on a security policy /opt/mapr/bin/maprccli acl set -cluster <cluster name> -name <security-policy-name></p><p>#Adds or modifies the existing permissions on a security policy /opt/mapr/bin/maprccli acl edit -cluster <cluster name> -name <security-policy-name></p></div> <p>Related documentation:</p> <ul style="list-style-type: none">• Granting Security Policy Permissions on page 2161• policy create on page 2623• policy modify on page 2652• acl set on page 2276• acl edit on page 2274

Task	Commands
Create View Modify Remove security policies	<p>Basic commands are listed. For a list of parameters related to each command, refer to the command reference.</p> <p> NOTE: Users cannot apply a security policy to data objects unless the allowtag parameter is set to Armed. You can set these parameters using the <code>accesscontrol</code> parameter.</p> <p>Create security policy</p> <pre>/opt/mapr/bin/maprcli security policy create [create-policy-p]</pre> <p>View list of security policies</p> <pre>/opt/mapr/bin/maprcli security policy list -json</pre> <p>Modify security policies</p> <pre>/opt/mapr/bin/maprcli security policy modify [modify-policy-p]</pre> <p>Remove security policies</p> <ul style="list-style-type: none"> Data Fabric File System <ul style="list-style-type: none"> #Remove all security policies from a volume <pre>/opt/mapr/bin/maprcli volume modify -securitypolicy "" -name <volume></pre> #Apply the security policies listed to the volume; remove all existing security policies <pre>/opt/mapr/bin/maprcli volume modify -securitypolicy <policy></pre> #Remove all security policies from a file or directory <pre>hadoop mfs -removeallsecuritypolicytag [-R] <path/to/file/directory></pre> #Remove specific security policies from a file or directory <pre>hadoop mfs -removesecuritypolicytag [-R] <comma-separated list of policies></pre> Data Fabric Database <ul style="list-style-type: none"> #Remove security policies from a JSON table <pre>maprcli table securitypolicy remove -path <path/to/table></pre> #Remove security policies from a JSON table column family <pre>maprcli table cf securitypolicy remove -path <path/to/table> -securitypolicy <comma-delimited list of policies></pre> #Remove security policies from a JSON table field <pre>maprcli table cf column securitypolicy remove -path <path/to/table> -column <JSON table field> -securitypolicy <comma-delimited list of policies></pre> <p>Related documentation:</p> <ul style="list-style-type: none"> policy create on page 2623 policy list on page 2642 policy modify on page 2652 Removing Tagged Security Policies from Data Objects on page 2179 volume modify on page 3018 hadoop mfs on page 7489 table securitypolicy remove on page 2861 table cf securitypolicy remove on page 2796 table cf column securitypolicy remove on page 2776

Customizing Security in HPE Data Fabric

Describes the .customSecure file and how HPE Data Fabric 6.x handles custom security settings.

This topic contains the following subsections:

- [What is Custom Security?](#) on page 2212
- [Identifying the Current Security State of the Cluster](#) on page 2212
- [About the .customSecure File](#) on page 2213
- [Custom Security and the HPE Data Fabric Installer](#) on page 2213
- [Adding a Node to a Cluster with Custom Security](#) on page 2213
- [Adding a Service to a Cluster with Custom Security](#) on page 2213

NOTE: Implementing custom security is not recommended unless your installation demands it. Using the custom security option means that HPE Data Fabric software does not ensure that your system is secure by default, and that you need to manually perform all security configuration.

In HPE Data Fabric 6.x, the [configure.sh](#) script detects that a cluster is in one of three security states:

Secure	The cluster is configured with the default HPE Data Fabric security settings.
Custom secure	The cluster has a mixture of HPE Data Fabric security settings and custom settings.

Understanding how `configure.sh` handles custom security settings is important when you upgrade a cluster, add services, add nodes, or change security settings.

What is Custom Security?

Any change to the default HPE Data Fabric configuration for authentication, authorization, or encryption represents a "custom security" change. Users who make such changes are encouraged to create a `.customSecure` file to ensure that `configure.sh` does not remove these changes. Custom security changes include any change to the keystore or truststore passwords or the number of keys in those files or the names of the keys.

Other examples of custom security changes include:

- Implementing Kerberos security
- Changing the Hive authorization model
- Changing the Oozie authorization model

Identifying the Current Security State of the Cluster

If the current security state of the cluster (secure or custom secure) is unknown, you can use one of these checks to identify which state the cluster is in:

- Check the security value in the `/opt/mapr/conf/mapr-clusters.conf` file. For example:

```
<clustername1> secure=true <CLDB> <CLDB> ... <CLDB>
```

For more information, see [mapr-clusters.conf](#) on page 3370.

- Check for the presence of the `.customSecure` file:

```
/opt/mapr/conf/.customSecure
```

If the file is present, `configure.sh` treats the cluster as custom secure.

About the .customSecure File

If you customized the security settings for cluster and you want to ensure that `configure.sh` does not change any of the settings, create a `.customSecure` file. Create the file in the following location on every node:

```
/opt/mapr/conf/.customSecure
```

The `.customSecure` file does not contain any information. The presence of the file tells `configure.sh` that the cluster has security settings that must not be changed by `configure.sh`.

Typically, you create the `.customSecure` file manually. However, in some cases, `configure.sh` creates or removes the `.customSecure` file for you. For example, if `configure.sh` detects that it is being run after an upgrade from a MapR 5.x secure cluster, it creates the `.customSecure` file automatically. If you use the `-forceSecurityDefaults` option and `-secure` with `configure.sh`, the script removes the `.customSecure` file because you are forcing the removal of custom security settings.

Forcing a Change to the Security Configuration

If your HPE Data Fabric 6.x cluster has custom security settings (the `.customSecure` file is present), and you want to change to the default HPE Data Fabric secure or non-secure settings, use the `-forceSecurityDefaults` option of `configure.sh` to make the change. Note these considerations:

- Using the `-forceSecurityDefaults` option removes the `.customSecure` file. You must specify the `-secure` option with `-forceSecurityDefaults`. Otherwise, the command will have no effect.
- The `-forceSecurityDefaults` option might not remove all custom settings. Some manual editing might be necessary to return the cluster to a usable state.
- If you are forcing a custom-secured cluster to be HPE Data Fabric secure, you still must include other `configure.sh` options that are required for security. You must perform any steps required to add security. For example, see [Enabling Wire-level Security](#) on page 2067.

Custom Security and the HPE Data Fabric Installer

Using the HPE Data Fabric Installer or HPE Data Fabric Installer Stanzas is not supported on clusters with custom security or customized configurations.

Adding a Node to a Cluster with Custom Security

Adding a node to a cluster with custom security is similar to adding a node to a cluster with HPE Data Fabric security, but there are some additional steps:

1. Add the node with default HPE Data Fabric security as described in [Adding Nodes to a Cluster](#) on page 1374.
2. To support your custom security mode, copy any custom resources or settings as needed from existing nodes to the added node.
3. Create the `/opt/mapr/conf/.customSecure` file on the added node:

```
/usr/bin/touch /opt/mapr/conf/.customSecure
```

Adding a Service to a Cluster with Custom Security

If you add a new service (ecosystem component) to a secure or custom-secure cluster, `configure.sh` configures the service for HPE Data Fabric security automatically. If the cluster is custom secure, you need

to change the security settings for the service to be compatible with the current cluster settings and restart the service. Any subsequent use of `configure.sh -R` will leave the customization in place.

Managing Impersonation

Provides instructions for enabling and using Data Fabric impersonation features.

Impersonation, also known as identity assertion, is one user accessing data and submitting jobs on behalf of another user. Impersonation in Data Fabric allows centralized control of access to resources in the file system and HPE Data Fabric Database.

Example: Access Control and Impersonation

As an example of impersonation, consider user Bob and a generic Service X:

1. Bob launches a client for the service and may or may not provide credentials.
2. Service X authenticates Bob and establishes a connection for him to use.
3. Bob issues a command to the service that will produce a query.
4. The service uses any user's servicewithimpersonation ticket to authenticate with the datastore - file system/HPE Data Fabric Database.
5. The datastore authenticates the user with the impersonation ticket. The service can now proceed.
6. The service sends the datastore a query, as user Bob.
7. The datastore checks permissions for Bob on the assets that the query will access.
8. If Bob has permissions, the datastore returns the query results to the service, which relays the results to the client, and the query succeeds.
9. If Bob does not have permissions, the datastore sends an access error to the service, which relays the error to the client, and the query fails.

When you use impersonation in Data Fabric:

- The datastore permissions are authoritative.
- The process has end-to-end security.
- Users can do nothing more and nothing less than what they are authorized to do.
- This control is independent of remote authentication and security mechanisms that control user access to application features.
- Any permissions set up within applications, or within the UNIX filesystem permissions on servers where Data Fabric components reside, have no effect on user access to Data Fabric resources.
- The `mapr` superuser is allowed to impersonate any Data Fabric user in any group, connecting from any host. Other users with impersonation capability can impersonate any Data Fabric user in any group, except the `mapr` superuser and the `root` user.

Using Impersonation without Security

Although it is possible to enable impersonation in a non-secure Data Fabric installation, HPE strongly recommends against doing this. The implementation rules are different. Setting up the Data Fabric environment with impersonation operating under those rules makes it very difficult to enable security later. Disabling security in a secure Data Fabric installation is easy, if the need arises.

If you choose to implement impersonation in a non-secure Data Fabric cluster, see [Configuring Impersonation when Cluster Security is not Enabled](#).

Using Impersonation with Security

In general, this documentation assumes that security is enabled in your Data Fabric installation. See [Enabling Wire-level Security](#) on page 2067 and [Enabling Encryption of Data at Rest](#) on page 2070.

You can use the `mapr login` utility to generate a **servicewithimpersonation** ticket that can be used to access a secure cluster impersonating another user. That is, the **servicewithimpersonation** ticket provides the user the ability to impersonate other users (except the `mapr` user) in addition to the ability to access a secure cluster. The **servicewithimpersonation** ticket generated with the list of `impersonatedgids` and `impersonateduids` cannot be used to impersonate user `root` or user `mapr`. If the user is other than `root` or `mapr`, CLDB resolves the username to UID locally. It then checks if the resolved UID can be impersonated (that is, if it is a part of the ticket's `impersonateduids`) or at least one of the GIDs of the resolved UID can be impersonated (i.e., if at least one of the GIDs should be part of the ticket's `impersonatedgids`). The **servicewithimpersonation** ticket can only be generated by a user with full control on a cluster's ACL.

If you are setting up user impersonation in a secure cluster, you need to generate an impersonation ticket. See the *Generating and Printing Service with Impersonation Ticket* section in the [maprlogin Command Examples](#) on page 3287 topic and [Generating a Service with Impersonation Ticket](#) on page 2104 for information.

After generating the ticket:

1. Ensure that `user1` has read permissions on the ticket.
2. If you moved the `ticketfile` to a different location, set the `$MAPR_TICKETFILE_LOCATION` environment variable.

How Impersonation Works

Introduces impersonation functionality, limitations, and core requirements.

If a user attempts to impersonate another user to the file system or HPE Data Fabric Database systems and the configuration parameters for resolving the UID and GIDs on the server (see [Resolving Username with UID and GIDs During Impersonation](#)) are disabled:

1. The Data Fabric client looks for that user name in the local operating system registry.
2. If the user name is:
 - Found, Data Fabric sends the user's UID and GID to the server for impersonation.
 - Not found in the local operating system registry, the user action is not processed.

If a user attempts to impersonate another user to the file system or HPE Data Fabric Database systems and if the configuration parameters for resolving the UID and GIDs on the server (see [Resolving Username with UID and GIDs During Impersonation](#)) are enabled:

1. The Data Fabric client asks CLDB to look for that user name and resolve the UID and GIDs for that user on the server.
2. If the user name is:
 - Found on the server, the server allows the user to proceed with the impersonation.
 - Not found, the user action is not processed.

NOTE: If the configuration property for resolving the username is set on the client, and the configuration property for resolving the username is not set on CLDB, the operation fails with an error.

Limitations on Impersonation

Service with impersonation tickets cannot be used to impersonate the `mapr` or `root` users. A scoped service with impersonation ticket cannot contain the UID of the `root` or `mapr` user (in the impersonated UIDs) and the GID of the `root` or `mapr` user (in the impersonated GIDs). The `mapr` user can impersonate any user, including `root`.

Core Requirements for Impersonation

The `mapr` superuser is allowed to access to the file system and HPE Data Fabric Database systems. The following conditions must be met for the `mapr` superuser to be able to impersonate another Data Fabric user:

1. The `hadoop.proxyuser.mapr.groups` and `hadoop.proxyuser.mapr.hosts` parameters must be set correctly in the `core-site.xml` file.

See [Enabling Impersonation for the mapr Superuser](#).

These settings are not always required. The `hadoop` proxy user functionality is only applicable to ecosystem components included in the Data Fabric distribution for Apache Hadoop. If the Data Fabric client accesses an ecosystem component, such as `HiveServer2`, these settings may be required. These settings are never needed if the Data Fabric client accesses the file system or HPE Data Fabric Database directly. Enabling impersonation here ensures that the correct settings are in place if they are needed.

2. The name of the Data Fabric user that you want the `mapr` superuser to be able to impersonate must appear in the local operating system registry where the Data Fabric client is running if server-side [resolution of UID and GIDs](#) is not enabled.
3. The UID and GUID of the user name under which the Data Fabric client is running must match exactly the UID and GUID for that user name on the server.

NOTE: The `mapr` user can impersonate any user, including user `root`.

For all other users with access to the file system and HPE Data Fabric Database systems, the following conditions must be met for the user to impersonate another user.

1. A valid `servicewithimpersonation` ticket must be present for the user who intends to impersonate on the system.
2. The name of the user to impersonate must appear in the local operating system registry where the Data Fabric client is running if the server-side [resolution of UID and GIDs](#) is not enabled.
3. The UID and GUID of the user name under which the Data Fabric client is running must match exactly the UID and GUID for that user name on the server.

NOTE: If a user is not authorized to impersonate, then the operations proceeds as the user, not the target user. Some operations succeed and some do not, even if the user has all the permissions for these operations. Also, if a user with full access and impersonating capability tries to impersonate another user, the operations succeeds only if the target user has permissions on the directory.

Component Requirements for Impersonation

Some Data Fabric ecosystem components have additional requirements to enable impersonation.

The following components must have settings that support impersonation in the configuration files indicated, on each node where the component resides:

- **Drill:** Edit the `drill-env.sh` file. See [Configuring User Impersonation](#) in the Apache Drill documentation.
- **HBase:** Edit the `hbase-site.xml` file. See [Impersonation through the HBase REST Gateway](#).
- **HiveServer2:** Edit the `hive-site.xml` file. See [Hive User Impersonation](#).
- **Hue:** Edit the `hue.ini` file.
- **Spark:** No special settings are required for Spark in MapReduce 2 (YARN) mode since Spark automatically inherits the correct behavior from YARN. If running standalone, Spark cannot perform impersonation and should not be used if security is important.

Application Development Requirements

You can set up impersonation in an application programmatically.

- **C/C++:** Use `hb_connection_create_as_user()`. See [Creating C Apps - Binary Tables](#) on page 3648 and [Impersonation Example](#) on page 3652 for more information.
- **Java:** Use `UserGroupInformation.doAs()`. See [Class UserGroupInformation](#) in the Hadoop documentation for more information.

Enabling Impersonation for the HPE Data Fabric Superuser

Provides a procedure necessary to implement superuser impersonation.

About this task

To enable impersonation in your HPE Data Fabric installation:

Procedure

1. Open the following file in a text editor:

```
/opt/mapr/hadoop/hadoop-<version>/etc/hadoop/core-site.xml
```

2. Add the following `hadoop.proxyuser` properties:

```
<property>
  <name>hadoop.proxyuser.mapr.hosts</name>
  <value>*</value>
</property><property>
  <name>hadoop.proxyuser.mapr.groups</name>
  <value>*</value>
</property>
```

The `hosts` setting (*) allows the mapr superuser to connect from any host to impersonate a user.

The `groups` setting (*) allows the mapr superuser to impersonate any user in any group.

NOTE: Do not use anything other than a single asterisk here. Other parts of HPE Data Fabric ignore the values here and treat them as if each is set to a single asterisk.

3. Close the file, saving any changes that you made.

Enabling Impersonation for any User

Provides the procedure necessary to implement impersonation for any Data Fabric user.

About this task

To enable impersonation for any Data Fabric user:

Procedure

1. Log in to the system as root, the mapr user, or any user with full control.
2. Generate a `servicewithimpersonation` ticket for the Data Fabric user.

For example:

```
$ maprlogin generateticket -type servicewithimpersonation -user
mapruser1 -out /var/tmp/sample_ticket
```

WARNING: The mapr user ticket can be used to impersonate any user, including user root.

You can generate a scoped `servicewithimpersonation` ticket for the user. Scoped impersonation tickets allow the user using the ticket to impersonate only the UIDs or GIDs specified in the ticket. For example:

```
$ maprlogin generateticket -type servicewithimpersonation -user
mapruser1 -impersonateduids 550 -impersonatedgids 500 -out /var/tmp/
sample_ticket
```

NOTE: If you generate a scoped impersonation ticket, the impersonated UIDs cannot contain the UID of user root or user mapr. Also, the impersonated GIDs cannot contain the GID of user root or user mapr.

For more information, see [maprlogin](#) on page 3283.

3. Move the ticket to a secure location, and share the ticket with the user for whom this ticket is generated.
4. (Optional) Copy the file to a permanent directory.

Configuring Impersonation without Cluster Security

Describes how to use impersonation on a non-secure cluster.

About this task

To configure impersonation without enabling cluster security, perform the following steps on the client.

Procedure

1. Enable impersonation for each ecosystem component you will use that supports impersonation. See *Component Requirements for Impersonation* in [How Impersonation Works](#).
2. Enable impersonation for the Data Fabric core components. See [Enabling Impersonation for the mapr Superuser](#).
3. On each client system from which you want to use impersonation:
 - a) Set a `MAPR_IMPERSONATION_ENABLED` environment variable with the value `true`. This value must be set in the environment of any process you start that does impersonation.

- b) Create a file in `/opt/mapr/conf/proxy/` that has the name of the Data Fabric superuser or any other user. For the Data Fabric superuser, the default file name would be `mapr`. For all other users, use their username for the proxy file.

If the Data Fabric superuser has a different name in your cluster, use that name for the proxy file.

To verify the Data Fabric superuser name, check the `mapr.daemon.user=` line in the `/opt/mapr/conf/daemon.conf` file on a Data Fabric cluster server.

Resolving Username with UID and GIDs During Impersonation

Lists parameters for configuring impersonation.

To resolve username with UID and GIDs on the server (and not the local operating system registry) during impersonation, set the following configuration parameters on the client and CLDB:

Parameter	Description
<code>fs.mapr.server.resolve.user</code>	<p>Must be set in <code>core-site.xml</code> file on the client machine. Value can be one of the following:</p> <ul style="list-style-type: none"> <code>true</code> - enable <code>false</code> - disable <p>By default, this parameter is disabled. If enabled, the client requests the CLDB to resolve the user with UID/GIDs. For example, to enable this property, your entry in the <code>core-site.xml</code> file should be as shown below:</p> <pre><configuration> <property> <name>fs.mapr.server.resolve.user</name> <value>true</value> </property> </configuration></pre>
<code>cldb.security.resolve.user</code>	<p>Must be set using the <code>config</code> command. Value can be one of the following:</p> <ul style="list-style-type: none"> <code>0</code> - disable <code>1</code> - enable <p>By default, this is disabled. If enabled, CLDB resolve the user with UID/GIDs for all incoming client requests. For example, to enable this property, run the following command:</p> <pre>maprcli config save -values {cldb.security.resolve.user:1}</pre>

NOTE: Both configuration parameters must be set to enable support for UID/GID resolution on the server. If the configuration parameter is set on the client to resolve on the server and if the configuration parameter is not set on CLDB, the operation fails with an error.

Managing IAM Policies

Identity Access Management (IAM) policy can be managed by using the CLI or the Data Fabric UI.

IAM policy implementation is crucial for Data Fabric resources to prevent unauthorized access to the data that resides on the fabrics that comprise your global namespace.

An IAM policy could apply to:

- one or more resources from multiple clusters that contain your data
- multi-modal resources (volumes/objects/tables) that contain your data

An IAM policy is a JSON file with a set of statements that specify permissions on Data Fabric resources such as volumes, buckets, and database tables.

While creating an IAM policy, the fabric resources must be represented with consistent naming scheme that is known as Unique Resource Name (URN) . The URN identifies a specific fabric resource. See [Fabric Resource URN Format](#) on page 2221 to understand how a URN is constructed. For fabric resource URN generation and other fabric resource operations by using the command line, see [security iam resource](#) on page 2661.

See [IAM Policy JSON Format](#) on page 2220 for details on IAM policy format, and to understand how to write an IAM policy.

An IAM policy can be tagged to identities (users, groups, and/or roles) to enforce the set of permissions configured in the IAM policy on the respective identities. For example, if you wish to grant access to certain operations related to a few volumes in your global namespace to user A, you must generate the URN for the volumes, create an IAM policy specifying the permissions for the volumes and then tag the IAM policy to user A.

Use command line to manage IAM policies

To configure and manage an IAM policy by using the command line interface (CLI), see [security iam policy](#) on page 2683.

Monitor IAM policy enforcement

IAM policy enforcement is broken down into a series of tasks. The number of tasks correspond to the number of resources that are stated in one or more IAM policies that are to be enforced.

The IAM policies take a while to be enforced. The time taken to enforce an IAM policy depends on the following factors:

- The number of statements in the policy and the number of actions and resources specified in the IAM policy
- The number of policies are being enforced at a given point in time

You can check what policies have been enforced and on what resources based on the task ID. See [security iam task](#) on page 2668 for information on how to list tasks to check the policy enforcement status, filter out tasks, abort unsuccessful tasks.

For information about IAM policy states, see [Identity Access Management Policy Life Cycle](#) on page 1162.

Use Data Fabric UI to manage IAM policies

To configure and manage an IAM policy by using the Data Fabric UI, see [Administering IAM Policies](#) on page 1161.

IAM Policy JSON Format

Describes the JSON format for an IAM policy.

An Identity Access Management (IAM) policy is a JSON file that comprises one or more statements. Each statement contains one or more actions related to one or more resources. The effect in a policy states if the policy allows or denies the operations on the resources specified in the policy.

The following is a sample IAM policy in JSON format:

```
{
  "Description": "Sample IAM Policy",                                <--
  Description of Policy
  "Active": true,                                                    <--
  Indicates whether Policy is to be Enforced (active) or Disarmed (inactive)
  "Statement": [
    {
      "Sid": "Statement-1",                                          <--
      Statement description
      "Effect": "Deny",                                             <--
      Specifies whether to allow or deny resource access
      "Action": ["PutObject", "GetObject", "DeleteObject"],         <-- Access
      is restricted to actions for the specified resource type
      "Resource": ["urn:group1:cluster1:s3bucket:bucket2"]         <-- List
      of actual resources identified with the resource URN, to control access
    },
    {
      "Sid": "Statement-2",
      "Effect": "Allow",
      "Action": ["ReadVolume", "WriteVolume"],
      "Resource": ["urn:group1:cluster2:volume:vol-1",
                  "urn:group1:cluster3:volume:vol-2"]
    }
  ]
}
```

Fabric Resource URN Format

Any resource in a global namespace is represented by its unique resource name (URN).

The URN format is as follows:

URN: <CLUSTER-GROUP>:<CLUSTER-NAME>:<RESOURCE-TYPE>:<RESOURCE-NAME/PATH>

Examples:

- A cluster group cgA that consists of cluster cluster1 exhibits volume with path /opt/mapr/vol-1 has the following URN:

```
urn:cgA:cluster1:volume:/opt/mapr/vol-1
```

- A cluster group groupB that consists of cluster cluster2 exhibits s3bucket with name bucket-5 has the following URN:

```
urn:groupB:cluster2:s3bucket:bucket-5
```

- A cluster group groupA which comprises the cluster cluster123 has the following URN:

```
urn:groupA:cluster123
```

A resource URN is used in IAM policy statements when configuring or creating an Identity Access Management (IAM) policy.

The security iam resource urn command helps to generate the URN for a cluster resource URN.

Managing Secure Clusters

Provides procedures that will enable you to use Data Fabric clusters securely.

Administrative topics such as configuring cross-cluster security, managing mirror volumes in secure clusters, running commands on remote secure clusters are discussed. In addition, access scenarios for secure and non-secure Data Fabric clusters and HDFS clusters are described.

Setting Up Cross-Cluster Security

Provides an overview of the `configure-crosscluster.sh` utility that is used to set up security between two clusters.

About this task

When all local and remote CLDB nodes are reachable from the local node, you can run the [configure-crosscluster.sh](#) on page 3201 utility on any CLDB node to automatically set up a trust relationship between clusters.

For two or more HPE Data Fabric clusters to communicate with one another, a secure trust relationship must exist between the clusters. A secure trust relationship between clusters is required for running commands remotely, creating remote replicas and mirror copies of volumes, and accessing data using NFS on the other cluster. The following sections describe the [quick](#) way to configure both the clusters for mirroring, replication, and remote access, and the [advanced manual](#) way to configure the clusters for mirroring, replication, remote access, and/or NFS server access.

Quick Configuration

About this task

You can run the [configure-crosscluster.sh](#) on page 3201 utility on any CLDB node in a cluster to automatically set up a trust relationship between the cluster and another cluster. To automatically configure two clusters for remote access, mirroring, and replication in both directions:

Procedure

1. Log in to the CLDB node on a cluster.
2. Run the [configure-crosscluster.sh](#) on page 3201 utility with the `all` parameter.

For example:

```
# /opt/mapr/server/configure-crosscluster.sh create all -remoteip
<remote_node_IP>
```

When the utility runs, it performs the following actions on all the clusters:

- a. Updates the `/opt/mapr/conf/mapr-clusters.conf` file to include the first entry from the `/opt/mapr/conf/mapr-clusters.conf` file on the other cluster.
- b. Imports the certificate of the other cluster in the `/opt/mapr/conf/ssl_truststore` file, and copies the updated `/opt/mapr/conf/ssl_truststore` file to all the other nodes on the cluster.
- c. Generates a cross-cluster ticket for the other cluster, copies the ticket to the CLDB node on the other cluster, merges the ticket with the `/opt/mapr/conf/maprserverticket` file on the node in the other cluster, and copies the updated `/opt/mapr/conf/maprserverticket` file to all other CLDB nodes on the other cluster.

For more information on the arguments, syntax, and options, see the [configure-crosscluster.sh](#) on page 3201 utility.

3. Verify access to the remote cluster by:

- Running remote commands on a node in either cluster.
- Creating mirror volumes on any node in the destination cluster.
- Setting up table and stream replication on tables and streams in the source cluster.

To configure access over NFS, see [Configuring Secure Clusters for Cross-Cluster NFS Access](#) on page 2231.

Advanced Configuration

About this task

Using the [configure-crosscluster.sh](#) on page 3201 utility with the default configuration works only when all local and remote CLDB nodes are reachable from the local node. It does not work, for example, if you set up multi-homed clusters as documented in the MAPR_SUBNETS section in [Designating NICs for HPE Data Fabric](#) on page 1416, because the [configure-crosscluster.sh](#) on page 3201 utility cannot traverse between local and remote IPs (for example, from the external IP 23.21.203.95 to internal IP 10.10.100.100). In such environments, run the [configure-crosscluster.sh](#) on page 3201 utility with the `-remotehosts` parameter.

You can configure the clusters manually for unidirectional or bidirectional remote access, mirroring, or replication only. The following sections describe the manual steps for:

Configuring Secure Clusters for Running Commands Remotely

Describes how to configure secure clusters to access them all from a single cluster and run commands remotely on them.

About this task

You can configure a number of secure clusters to access them all from one cluster. You need not log into each secure cluster separately and run `maprc li` commands locally on them.

For example, suppose you need to manage two secure clusters, clusterA and clusterB. One method is to log into each cluster separately and run commands locally on each. However, it is possible to log into clusterA only and manage both clusters from clusterA, running commands locally for clusterA and remotely for clusterB. When you type the `maprc li` commands, you must use the `-cluster` parameter in those commands to specify the cluster on which you want the commands to run.

You can configure the secure clusters for remote access manually (as described in the following section) or automatically by running the `configure-crosscluster.sh` utility. If you run the `configure-crosscluster.sh` utility, the utility configures the clusters for running commands remotely in both directions. See [configure-crosscluster.sh](#) on page 3201 for more information.

Prerequisite

About this task

Ensure that you have the [relevant ports open](#) for secure cluster communication.

Setting Up Secure Clusters Manually for Cross-Cluster Access

About this task

To manually configure two secure clusters for remote access:

Procedure

1. Log in to the secure cluster from which you want to run commands.
In the rest of this procedure, this cluster is referred to as clusterA and the remote cluster is referred to as clusterB.
2. Configure clusterA for communicating with the other clusters by editing `mapr-clusters.conf` file on each node clusterA to specify the hostname or IP address of the CLDB nodes on the other clusters.

For example, suppose:

- clusterA's `/opt/mapr/conf/mapr-clusters.conf` file contains the following:

```
clusterA.cluster.com secure=true perfnode50.lab:7222
```

- clusterB's `/opt/mapr/conf/mapr-clusters.conf` file contains the following:

```
clusterB.cluster.com secure=true perfnode100.lab:7222
```

Perform the following steps to configure the nodes on the clusters:

- a) On any node in clusterA, append the first entry from clusterB's `mapr-clusters.conf` file, entry which is prefixed with the cluster name, to the end of clusterA's `mapr-clusters.conf` file.

Note that clusterA's entry must be the first line of the `mapr-clusters.conf` file:

```
clusterA.cluster.com secure=true perfnode50.lab:7222
clusterB.cluster.com secure=true perfnode100.lab:7222
```

The clusterA's `mapr-clusters.conf` file now contains two entries.

- b) Copy the updated `/opt/mapr/conf/mapr-clusters.conf` file to all the other nodes in clusterA.
- c) On any node in clusterB, append the first entry from clusterA's `mapr-clusters.conf` file, entry which is prefixed with the cluster name, to the end of the remote cluster's `mapr-clusters.conf` file.

Note that clusterB's entry must be the first line of `mapr-clusters.conf` file:

```
clusterB.cluster.com secure=true perfnode100.lab:7222
clusterA.cluster.com secure=true perfnode50.lab:7222
```

The clusterB's `mapr-clusters.conf` file now contains two entries.

- d) Copy the updated `/opt/mapr/conf/mapr-clusters.conf` file to all the nodes in clusterB.

See [mapr-clusters.conf](#) on page 3370.

3. Perform the following steps on clusterA to ensure that the `ssl_truststore` file has signers for all the clusters:

- a) Copy the `ssl_truststore` from the `/opt/mapr/conf` directory of clusterB into a temporary directory on clusterA.

For example:

```
# scp mapr@<remote-ip>:/opt/mapr/conf/ssl_truststore /tmp/
clusterB_ssl_truststore
```

- b) Merge the `ssl_truststore` of clusterB with the `ssl_truststore` of clusterA using the `/opt/mapr/server/manageSSLKeys.sh` utility.

For example, if you copied the `ssl_truststore` file of clusterB as `/tmp/clusterB_ssl_truststore`, run the following command to merge the files:

```
/opt/mapr/server/manageSSLKeys.sh merge /tmp/clusterB_ssl_truststore /opt/mapr/conf/ssl_truststore
```

- c) Copy the merged `ssl_truststore` file to every node on clusterA.

4. Perform the following steps on clusterB *only* if you want to set up access to clusterA from clusterB:

- a) Copy the `ssl_truststore` from the `/opt/mapr/conf` directory of clusterA into a temporary directory on clusterB.

For example:

```
# scp mapr@<remote-ip>:/opt/mapr/conf/ssl_truststore /tmp/clusterA_ssl_truststore
```

- b) Merge the `ssl_truststore` of clusterB with the `ssl_truststore` of clusterA using the `/opt/mapr/server/manageSSLKeys.sh` utility.

For example, if you copied the `ssl_truststore` file of clusterA as `/tmp/clusterA_ssl_truststore`, run the following command to merge the files:

```
/opt/mapr/server/manageSSLKeys.sh merge /tmp/clusterA_ssl_truststore /opt/mapr/conf/ssl_truststore
```

- c) Copy the merged `ssl_truststore` file to every node on clusterB.

5. For crossclusters to work using the Control System, place the `mapruserticket` of the remote cluster into the local cluster.

- a) Generate a `mapruserticket` for the remote cluster as `mapr` user:

```
maprlogin password -cluster demo
[Password for user 'mapr' at cluster 'demo': ]
MapR credentials of user 'mapr' for cluster 'demo' are written to
'/tmp/maprticket_5000'
```

- b) Merge the generated `maprticket`:

```
cat /tmp/maprticket_5000 >>/opt/mapr/conf/mapruserticket
```

6. Verify access by running remote commands on clusterA.

See [Verifying Access to run Remote Commands](#) on page 2226.

Verifying Access to run Remote Commands

Procedure

1. Log in to any node on clusterA and run the [maprlogin](#) on page 3283 utility from clusterA to obtain user ticket for accessing the remote cluster.

For example, to obtain tickets for managing the remote cluster from clusterA, run the following command::

```
# /opt/mapr/bin/maprlogin password -cluster clusterB.cluster.com
```

2. Verify access by running remote commands on clusterA.

For example, the following command, executed from a node in clusterA, lists the volumes on clusterB:

```
# /opt/mapr/bin/maprcli volume list -cluster clusterB.cluster.com
```

Configuring Secure Clusters for Cross-Cluster Mirroring and Replication

Describes configuring clusters for cross-cluster operations such as mirroring and replication.

About this task

Cross-cluster tickets are required on secure clusters that need to pull data from another secure cluster and on secure clusters that need to push data to another secure cluster. For example:

- Volume mirroring is a pull operation. The destination cluster pulls the volume data from the source cluster. Since the destination cluster performs the operation, the destination cluster receives a ticket that is generated on the source cluster.
- Table and streams replication is a push operation. The source cluster pushes table or stream data to the destination cluster. Since the source cluster performs the operation, the source cluster receives a ticket that is generated on the destination cluster.

You can configure secure clusters for cross-cluster mirroring and replication manually (as described in [Manually Setting up Secure Clusters for Cross-Cluster Mirroring](#) on page 2226 and [Manually Setting up Secure Clusters for Cross-Cluster Replication](#) on page 2230). You can configure secure clusters automatically, by running the `configure-crosscluster.sh` utility. This utility configures the clusters for both mirroring and replication in both directions. For more information, see [configure-crosscluster.sh](#) on page 3201.

Manually Setting up Secure Clusters for Cross-Cluster Mirroring

About this task

IMPORTANT: Cross-cluster ticket is essential for cross-cluster mirroring. Configuring a cross-cluster ticket does not enable cross-cluster NFS access. See [Configuring Secure Clusters for Cross-Cluster NFS Access](#) on page 2231 for details on enabling cross-cluster NFS access.

To set up secure clusters for cross-cluster mirroring:

Procedure

1. Verify that the user for whom you are configuring access, exists in the registry on both the clusters and has the following permissions:
 - Permissions to create volumes on the source cluster.
 - Permissions to mirror volumes on the destination cluster.

You can set up access for the *mapr* user, who already has permissions to create volumes and mirror volumes.

2. Configure source cluster (clusterA) to communicate with the other clusters by editing the `mapr-clusters.conf` file on each node of clusterA to specify the hostname or IP address of the CLDB nodes on the other clusters.

For example, suppose:

- The `/opt/mapr/conf/mapr-clusters.conf` file on the source cluster (clusterA) contains the following:

```
clusterA.cluster.com secure=true perfnode50.lab:7222
```

- The `/opt/mapr/conf/mapr-clusters.conf` file on the destination cluster (clusterB) contains the following:

```
clusterB.cluster.com secure=true perfnode100.lab:7222
```

Perform the following steps to configure the nodes on the clusters:

- a) On any node in clusterA, append the first entry from clusterB's `mapr-clusters.conf` file, the entry which is prefixed with the cluster name, to the end of clusterA's `mapr-clusters.conf` file. Note that clusterA's entry must be the first line of the `mapr-clusters.conf` file:

```
clusterA.cluster.com secure=true perfnode50.lab:7222
clusterB.cluster.com secure=true perfnode100.lab:7222
```

The `mapr-clusters.conf` file for clusterA now contains two entries.

- b) Copy the updated `/opt/mapr/conf/mapr-clusters.conf` file to all the other nodes in clusterA.
- c) On any node in the destination cluster (clusterB), append the first entry from clusterA's `mapr-clusters.conf` file, entry which is prefixed with the cluster name, to the end of the remote cluster's `mapr-clusters.conf` file.

Note that clusterB's entry must be the first line of the `mapr-clusters.conf` file:

```
clusterB.cluster.com secure=true perfnode100.lab:7222
clusterA.cluster.com secure=true perfnode50.lab:7222
```

The `mapr-clusters.conf` file for clusterB now contains two entries.

- d) Copy the updated `/opt/mapr/conf/mapr-clusters.conf` file to all the nodes in clusterB.

See [mapr-clusters.conf](#) on page 3370.

3. Log in to any node on the source cluster (ClusterA) and perform the following steps:

- a) Generate a cross-cluster ticket for the destination cluster (clusterB) for the *mapr* user.

For example, to generate a cross-cluster for the destination cluster (clusterB), run the following command on the source cluster (clusterA):

```
/opt/mapr/bin/maprlogin generateticket -type crosscluster -out /tmp/crossclusterticket -user destinationclusteruser
```

- b) Copy the cross-cluster ticket file to all nodes on the destination cluster (clusterB).

For example:

```
scp /tmp/crossclusterticket mapr@<dest-ip>:/tmp/
sourceClusterTicketFile
```

4. Log in to the node on the destination cluster (clusterB) where the cross-cluster ticket was copied, and perform the following steps:

- a) Merge the cross-cluster ticket file with the `/opt/mapr/conf/maprserverticket` file on the node.

For example, to merge, run the following command:

```
cat /tmp/sourceClusterTicketFile >> /opt/mapr/conf/maprserverticket
```

- b) Copy the `/opt/mapr/conf/maprserverticket` file to all CLDB nodes of the destination cluster.

5. Merge the `ssl_truststore` files by using the `/opt/mapr/server/manageSSLKeys.sh` tool.

In this step, you use the `copytruststore` option of `manageSSLKeys.sh` on page 3268 to create a copy of the truststore. Then you copy it to the destination node using SCP, and finally run merge without any additional options. For example:

- a. On clusterA, create a new `ssl_truststore` by using the `copytruststore` option:

```
/opt/mapr/server/manageSSLKeys.sh copytruststore /tmp/
clusterA_ssl_truststore <ssl.server.truststore.password>
<ssl.server.truststore.password>
```

You can obtain the `ssl.server.truststore.password` password from the `/opt/mapr/conf/store-passwords.txt` file for the key `ssl.server.truststore.password` on the CLDB master node for clusterA.

- b. Copy the `ssl_truststore` from clusterA to clusterB:

```
scp mapr@<remote-ip>:/opt/mapr/conf/clusterA_ssl_truststore /tmp/
clusterA_ssl_truststore
```

- c. Merge the `ssl_truststore` on clusterB:

```
/opt/mapr/server/manageSSLKeys.sh merge /tmp/
clusterA_ssl_truststore /opt/mapr/conf/ssl_truststore
<ssl.server.truststore.password on ClusterA>
<ssl.server.truststore.password on clusterB>
```

You can obtain the password for `ssl.server.truststore.password` from the `/opt/mapr/conf/store-passwords.txt` file for the key `ssl.server.truststore.password` on the CLDB master node for clusterA.

You can obtain the password for `ssl.server.truststore.password` from the `/opt/mapr/conf/store-passwords.txt` file for the key `ssl.server.truststore.password` on the CLDB master node for clusterB.

6. Copy the merged `ssl_truststore` file to every node on clusterB.

7. Generate ticket for root user to clusterA from clusterB by using the following command:

```
maprlogin password -cluster clusterA
```

8. **Optional:** If your clusters are secure, configure your source cluster so that you can use the Control System to set up and administer table replication from the source to the destination cluster.

These steps make it convenient to use the Control System for setting up and managing replication involving two secure clusters. However, before following them, perform these prerequisite tasks.

NOTE:

- Ensure that both clusters are managed by the same team or group. The UIDs and GIDs of the users that are able to log in to the Control System on the source cluster must exactly match their UIDs and GIDs on the destination cluster. This restriction applies only to access to both clusters through the Control System, and does not apply to access to both clusters through the maprccli. If the clusters are managed by different teams or groups, use the maprccli instead of the Control System to set up and manage table replication involving two secure clusters.
 - Ensure that the proper file-system and table permissions are in place on both clusters. Otherwise, any user who can log into the Control System and has the same UID or GID on the destination cluster will be able to set up replication either from the source cluster to the destination cluster or vice versa. A user could create one or more tables on the destination cluster, enable replication to them from the source cluster, load the new tables with data from the source cluster, and start replication. A user could also create tables on the source cluster, enable replication to them from tables in the destination cluster, load the new tables with data from the destination cluster, and start replication.
- a. On the source cluster (clusterA), generate a service ticket by using the maprlogin command:
- ```
maprlogin generateticket -type service -cluster <destination cluster>
-user mapr -duration <duration> -out <output folder>
```
- Where -duration is the length of time before the ticket expires. You can specify the value in either of these formats:
- [Days:]Hours:Minutes
  - Seconds
- b. To every node of the destination cluster (clusterB), add the service ticket to the file /opt/mapr/conf/mapruserticket file:
- ```
cat <path and filename of the service ticket> >> /opt/mapr/conf/
mapruserticket
```
- c. Restart the web server by running the maprccli node services command. For the syntax of this command, see [node services](#) on page 2598.

9. Perform the steps to [verify configuration for mirroring](#).

Results

You can now create mirror volumes on the destination cluster and set up a schedule to pull data from the volumes on the source cluster. However, you cannot create volumes on the source cluster that pull data from volumes in the destination cluster, because the setup described above is unidirectional. To configure

the clusters for bidirectional mirroring, repeat the steps above, by switching the source and destination clusters.

For example, suppose there are two clusters, clusterA and clusterB, and you performed the steps above for clusterA as the source cluster and clusterB as the destination cluster. After you complete the steps above, your destination cluster, clusterB can pull data from volumes on clusterA. For clusterA to mirror data on clusterB, perform the steps above with clusterB as the source cluster and clusterA as the destination cluster.

Manually Setting up Secure Clusters for Cross-Cluster Replication

About this task

 **IMPORTANT:** Cross-cluster ticket is essential for cross-cluster replication. Configuring a cross-cluster ticket does not enable cross-cluster NFS access. See [Configuring Secure Clusters for Cross-Cluster NFS Access](#) on page 2231 for details on enabling cross-cluster NFS access.

To set up secure clusters for cross-cluster replication:

Procedure

1. Verify that the user, for whom you are configuring access, exists in the registry on the destination cluster.
2. Log in to any node on the destination cluster and perform the following steps:
 - a) Generate a cross-cluster ticket for the source cluster.
For example, to generate a cross-cluster for the source cluster, run the following command on the destination cluster:

```
/opt/mapr/bin/maprlogin generateticket -type crosscluster -out /tmp/crossclusterticket -user destinationclusteruser
```
 - b) Copy the cross-cluster ticket file to any node on the source cluster.
For example:

```
scp /tmp/crossclusterticket mapr@<source-ip>:/tmp/sourceClusterTicketFile
```
3. Log in to the node in the source cluster where the cross-cluster ticket was copied, and perform the following steps:
 - a) Merge the cross-cluster ticket file with the /opt/mapr/conf/maprserverticket file on the node.
For example, to merge, run the following command:

```
cat /tmp/destinationClusterTicketFile >> /opt/mapr/conf/maprserverticket
```
 - b) Copy the /opt/mapr/conf/maprserverticket file to all CLDB nodes on the source cluster.
4. Configure the Gateway for table and streams replication.
See [Configuring Gateways for Table and Stream Replication](#) on page 1789 for more information.
5. Perform the steps to [verify configuration for replication](#).

Results

You can now set up volumes on the source cluster to push data to replicas on the destination cluster. However, you cannot create replicas on the source cluster that get data from volumes in the destination cluster because the setup described above is unidirectional. To configure the clusters for bidirectional replication, repeat the steps above by switching the source and destination clusters.

For example, suppose there are two clusters, clusterA and clusterB, and you performed the steps above for clusterA as the source cluster and clusterB as the destination cluster. After you complete the steps above, your source cluster, clusterA can push data to replicas on clusterB. For clusterB to replicate data on clusterA, perform the steps above with clusterB as the source cluster, and clusterA as the destination cluster.

Verifying Cross-Cluster Configuration for Mirroring and Replication

About this task

You can verify the cross-cluster configuration for:

Procedure

1. Mirroring by logging in to a node on the destination cluster as the user for whom access was configured, and creating a mirror volume on the destination cluster for a volume on the source cluster. You can create mirror volumes using [the Control System](#) and/or the [CLI](#).
2. Replication by logging in to a node on the source cluster as the user for whom access was configured and creating a replica in the destination cluster for a volume, table, and stream on the source cluster. You can create replicas using the Control System and the CLI. To set up replication on secure clusters for:
 - Tables, refer to the documentation for [the Control System](#) and/or the [CLI](#).
 - Streams, refer to the documentation for [the Control System](#) and/or the [CLI](#).

Configuring Secure Clusters for Cross-Cluster NFS Access

Describes how to manually set up cross-cluster NFS access.

About this task

HPE Data Fabric-NFS offers many usability and interoperability advantages to the customer, and makes big data radically easier and less expensive to use. In a secure environment, however, you must configure NFS carefully because the NFS protocol is inherently insecure. Running the NFS server on any cluster node might expose the file system to be world readable and writeable to any machine that knows the IP address of the cluster node running the NFS server and has access to the network, regardless of the permissions, passwords and other security mechanisms. At the minimum, you should configure iptables firewall rules for all the cluster nodes where the NFS server is running, to restrict incoming NFS traffic to authorized client IP addresses.

Configuring cross-cluster NFS access might expose the entire file system of the other cluster to be world readable and writeable as well. Therefore, automated configuration for cross-cluster NFS access is not available with the [configure-crosscluster.sh](#) on page 3201 utility. You should manually configure cross-cluster NFS access only if you are fully aware of the security risks, and taken appropriate steps to mitigate the risks by securing both your NFS gateway, and incoming client traffic.

This section describes the manual configuration process on a secure cluster for accessing another secure cluster using NFS. There are two methods by which an NFS client can access file systems from multiple clusters:

1. Run the NFS server on one cluster.

For this method, configure cross-cluster NFS security for the NFS gateway on one cluster, so that the NFS client can mount the file system once from the NFS gateway, and then access the file systems for both clusters.

2. Run the NFS server on both clusters.

For this method, cross-cluster NFS configuration is not needed. The NFS client can mount the HPE Data Fabric file system individually for each cluster. This method requires that the NFS gateway to be run on each cluster, and the client performs one NFS mount for each NFS file system to be accessed.

The following procedure describes how to setup NFS for the first method:

Procedure

1. Log in to any node on the secure cluster where the NFS server is running.

In the rest of this procedure, this cluster is referred to as clusterA.cluster.com and the remote cluster is referred to as clusterB.cluster.com.

2. Set up the /opt/mapr/conf/maprserverticket file on clusterA.cluster.com to include the server ticket from clusterB.cluster.com. To set up:

- a) Copy the /opt/mapr/conf/maprserverticket file from any node on clusterB.cluster.com to any directory on the node you are logged into on clusterA.cluster.com.
- b) Append maprserverticket entry in the maprserverticket file from clusterB.cluster.com to the /opt/mapr/conf/maprserverticket file on the node you are logged into on clusterA.cluster.com.

NOTE: If you configured cross-cluster security either automatically using the [configure-crosscluster.sh](#) on page 3201 utility or manually before, there can be multiple entries in the maprserverticket file; copy the first entry with the alias matching the remote cluster name.

For example, to add maprserverticket of clusterB.cluster.com into the /opt/mapr/conf/maprserverticket file of clusterA.cluster.com, run the following command:

```
cat /tmp/remoteclusterticketfile | grep B.cluster.com |
head --lines=+1 >> /opt/mapr/conf/maprserverticket
```

- c) Copy the /opt/mapr/conf/maprserverticket file (on the node you are logged into in clusterA.cluster.com) to all the other nodes running NFS server on clusterA.cluster.com.

3. Verify data access on both clusters using NFS.

Users with access to the NFS servers must be able to access data in both clusters by providing the correct path. For example, users with NFS server access can verify access by running commands similar to the following:

```
# ls /mapr
clusterA.cluster.com clusterB.cluster.com
# ls /mapr/clusterB.cluster.com/
apps file CLUSTERB hbase opt tmp user var
```

Configuring Cross-Cluster Security for a Mixed (FIPS and Non-FIPS) Configuration

Describes how to configure cross-cluster security when the clusters include FIPS and non-FIPS-enabled nodes.

The `configure-crosscluster.sh` script does not support mixed configurations consisting of FIPS and non-FIPS-enabled nodes. However, you can use manual steps to enable cross-cluster security in this scenario.

The following is an example for configuring mixed clusters consisting of a combination of FIPS-enabled and secure non-FIPS-enabled nodes. Suppose you have a five-node local cluster, and three of the nodes are FIPS-enabled nodes:

- AF1.example.com (CLDB)
- AF2.example.com (CLDB)
- AF3.example.com (CLDB)

Suppose the other two nodes are secure non-FIPS nodes:

- AS4.example.com
- AS5.example.com

In addition, suppose the remote cluster is a five-node cluster, and three of the nodes are FIPS-enabled nodes:

- BF1.example.com (CLDB)
- BF2.example.com (CLDB)
- BF3.example.com (CLDB)

Suppose the other two nodes in the remote cluster are secure non-FIPS nodes:

- BS4.example.com
- BS5.example.com

You can use the following steps to configure cross-cluster security:

1. Run the `configure-crosscluster.sh` script on the FIPS-enabled CLDB nodes:

```
$ cat localhostfile
AF1.example.com
AF2.example.com
AF3.example.com
$ cat remotehostsfile
BF1.example.com
BF2.example.com
BF3.example.com
$ /opt/mapr/server/configure-crosscluster.sh create all \
  -localtruststorepassword localtrustpass \
  -remotetruststorepassword remotetrustpass \
  -localhosts localhostfile \
  -remotehosts remotehostsfile
```

2. Copy the `/opt/mapr/conf/ssl_truststore.bcfks` to a temporary location of the first non-FIPS node in the local cluster (AF4.example.com in the example). Then use the `manageSSLKeys.sh` `convert` utility to convert the updated local trust store from BCFKS to JKS format. After confirming that the conversion is successful, copy the trust store to `/opt/mapr/conf`. For example:

```
$ /opt/mapr/server/manageSSLKeys.sh convert \
  -p localtrustpass -srcType bcfks -dstType JKS \
  /opt/mapr/conf/ssl_truststore.bcfks /tmp/ssl_truststore
$ cp /tmp/ssl_truststore /opt/mapr/conf/.
```

3. Copy the `mapr-clusters.conf` and `maprserverticket` (for all or server mode) from the local FIPS node (AF1.example.com) to the secure non-FIPS node of the local cluster (AF4.example.com). For example, on AF1.example.com:

```
$ cd /opt/mapr/conf
$ scp mapr-clusters.conf \
  mapr@AS4.example.com:/opt/mapr/conf/mapr-clusters.conf
$ scp maprserverticket \
  mapr@AS4.example.com:/opt/mapr/conf/maprserverticket
```

4. Use `pscp` to copy the `ssl_truststore`, `mapr-clusters.conf`, and `maprserverticket` to all the other secure non-FIPS nodes in the cluster.
5. Repeat steps 2 and 3 for the non-FIPS hosts in the remote cluster, starting with the first non-FIPS remote node (BF4.example.com):
 - a. On BF4.example.com, use the `manageSSLKeys.sh` `convert` utility to convert the updated remote trust store from BCFKS to JKs format, and copy it to `/opt/mapr/conf`.
 - b. Copy the `mapr-cluster.conf` and `maprticket` files from the remote FIPS node (BF1.example.com) to all the non-FIPS nodes in the remote cluster (BF4.example.com and BF5.example.com).

[configure-crosscluster.sh](#) on page 3201

Use the `configure-crosscluster.sh` utility to set up cross-cluster security between two clusters.

Accessing External HDFS Clusters

Outlines how to use protocols to connect to other clusters.

HPE Data Fabric clusters can access an external HDFS cluster with the `webhdfs://` protocols.

Prerequisites

Before you begin, verify the following:

- The HPE Data Fabric node accessing the HDFS cluster must have the `mapr-core` or `mapr-client` package installed.
- The HDFS cluster is installed and configured according to the vendor's specifications.
- To use the `hdfs://` protocol, edit the `fs.hdfs.impl` property in the `$HADOOP_HOME/conf/core-site.xml` file to include the value `org.apache.hadoop.hdfs.DistributedFileSystem`.

The following cases provide information about HPE Data Fabric and accessing HDFS clusters.

Configuring Access Between Non-Secure Data Fabric and HDFS Clusters

If the Data Fabric and HDFS clusters are both non-secure, verify that the `fs.hdfs.impl` property in the `$HADOOP_HOME/conf/core-site.xml` file has the following value:

```
org.apache.hadoop.hdfs.DistributedFileSystem
```

No additional configuration is required.

Verifying access to HDFS cluster

Use the following commands to verify access to the remote HDFS cluster from the Data Fabric cluster.

CDH3 Only

```
hadoop fs -ls hdfs://<namenode_host:port>/
```

Other HDFS Versions

```
hadoop fs -ls webhdfs://<namenode_host_running_webhdfs_service>/
```

Using Java Applications with Secure Clusters

Describes ramifications associated with using Java applications in a Data Fabric secure environment.

A secure computing environment places additional requirements on the Java Virtual Machine (JVM) properties of Java clients. The JVMs launched by Data Fabric with scripts, such as those used by the `maprccli`, `hadoop`, or `hbase` commands, have those properties automatically set by Data Fabric. Data Fabric attempts to set useful values for these properties.

When a JVM is used or launched directly, such as when you write a stand-alone Java program, any Java code that sets values for the following properties may cause issues on your cluster.

Property	Default Value	Description
<code>java.security.auth.login.config</code>	<code>/opt/mapr/conf/mapr.login.conf</code>	Path to the file that specifies JAAS configurations used by Data Fabric.
<code>javax.net.ssl.trustStore</code>	<code>/opt/mapr/conf/ssl_truststore</code>	Controls the truststore used by Data Fabric clients for HTTPS connections.
<code>http.auth.preference</code>	<code>basic</code>	The default setting disables JVM's default handling of SPNEGO, enabling Data Fabric's Hadoop code to handle SPNEGO authentication.
<code>zookeeper.saslprovider</code>	<code>com.mapr.security.maprsasl.MaprSaslProvider</code>	Enables ZooKeeper security.
<code>hadoop.login</code>	<code>hadoop_default</code>	Controls the JAAS configuration used by Data Fabric security.

Administering the Data Access Gateway

The HPE Data Fabric Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the HPE Data Fabric cluster. This section describes considerations when upgrading the service, how to modify configuration settings, and how to administer and manage the service.

Installing the Data Access Gateway Service

The HPE Data Fabric Data Access Gateway is installed when you install the HPE Data Fabric Database using the HPE Data Fabric Installer. To manually install the service, see [Installing Data Access Gateway](#) on page 316. For conceptual information, see [Understanding the HPE Data Fabric Data Access Gateway](#) on page 1098.

Shutting Down and Upgrading the Data Access Gateway Service

When the Data Access Gateway receives a shutdown request, it stops accepting new requests and returns an error to the client. Any in-progress requests are allowed to complete before shutting down the service. This allows you to perform rolling upgrades.

Modifying Configuration Settings for the Data Access Gateway Service

Logging Properties

The HPE Data Fabric Data Access Gateway uses standard Log4J configuration to control its logging. The log4j properties are in the `/opt/mapr/data-access-gateway/conf/log4j2.xml` file on nodes where you have installed the service. After modifying any properties on a node, restart the service. For details, see [Administering the Data Access Gateway Service](#) on page 2238.

Log data is stored in the `/opt/mapr/data-access-gateway/logs/data-access-gateway.log` file.

Application Properties

To configure HPE Data Fabric Data Access Gateway properties, modify `/opt/mapr/data-access-gateway/conf/properties.cfg` on nodes where you have installed the service.

The following table lists the properties you can configure:

auth.token.expiration	<p><i>Default:</i> 1800 seconds</p> <p><i>Description:</i> Expiration time (in seconds) for the authentication token.</p>
grpc.service.max-message-size	<p><i>Default:</i> 32MB</p> <p><i>Description:</i> The maximum message size that the gRPC service accepts. The default is set to 32MB, as this is the default maximum document size for HPE Data Fabric Database JSON tables. This property is available in Data Access Gateway 2.0.202104302209 and later or 3.0.0.0.202104302219 and later.</p>
grpc.service.ojai.query.result-limit	<p><i>Default:</i> 5000</p> <p><i>Description:</i> Limit on the number of documents returned in retrieval requests using the Node.js and Python OJAI clients.</p>
grpc.service.port	<p><i>Default:</i> 5678</p> <p><i>Description:</i> Port number gRPC clients use to connect to the Data Access Gateway. The Node.js and Python OJAI clients are gRPC clients.</p>
grpc.service.ssl.enabled	<p><i>Default:</i> cluster</p> <p><i>Description:</i> Controls whether TLS is enabled for the gRPC Service.</p> <p>Values: cluster true false</p> <p>If set to cluster:</p>

- TLS is enabled if your HPE Data Fabric cluster is secure.
- TLS is disabled if your HPE Data Fabric cluster is not secure.

rest.https.port*Default:*8243*Description:* Port number used to connect to the Data Access Gateway using HTTPS.**rest.result.limit***Default:*5000*Description:* Limit the number of documents returned in retrieval requests using the HPE Data Fabric Database JSON REST API.

There is also a configuration file `/opt/mapr/data-access-gateway/conf/ojai-config.json` for parameters used by Data Access Gateway clients:

- HPE Data Fabric Database JSON REST API
- Node.js OJAI
- Python OJAI
- C# OJAI
- Go OJAI
- Java OJAI Thin Client

A parameter you can modify is the client sort limit:

```
{
  "ojai": {
    "mapr": {
      "query": {
        "max-client-sort-limit": 6000
      }
    }
  }
}
```

To understand why you might want to modify this parameter, see [Comparisons and Sorts in OJAI Queries](#) on page 3775.

After modifying any parameters on a node, restart the service as described in [Administering the Data Access Gateway Service](#) on page 2238.

Warden Configuration

The Warden configuration for the HPE Data Fabric Data Access Gateway is in the `/opt/mapr/data-access-gateway/conf/warden.data-access-gateway.conf` file on nodes where you have installed the Data Access Gateway. To control the amount of memory allocated to the service, modify the following settings:

service.heapsize.max*Default:*3000*Description:* Defines the maximum heap size (in MB) for the service.**service.heapsize.min***Default:*3000

Description: Defines the minimum heap size (in MB) for the service.

After modifying the warden configuration file on a node, run `configure.sh -R`, and restart the service:

```
/opt/mapr/server/configure.sh -R
maprcli node services -nodes <node name> -name data-access-gateway -action
restart
```

NOTE: Starting from version 5.0, DAG includes Apache Kafka Wire Protocol Service. See [Configuring Apache Kafka Wire Protocol Service](#) on page 3916 for configuration details.

Administering the Data Access Gateway Service

The HPE Data Fabric Data Access Gateway is a service that you administer in the same manner as other HPE Data Fabric services. The name of the service is `data-access-gateway`.

To restart the service through the CLI, run the following command:

```
maprcli node services -nodes <node name> -name data-access-gateway -action
restart
```

For details about other operations you can perform on the service, see [Managing Services](#) on page 1397.

Related concepts

[Understanding the HPE Data Fabric Data Access Gateway](#) on page 1098

The HPE Data Fabric Data Access Gateway is a service that acts as a proxy and gateway for translating requests between lightweight client applications and the HPE Data Fabric cluster.

[Using the HPE Data Fabric Database JSON REST API](#) on page 3887

Starting in the EEP 5.0 release, you can use a REST API to access HPE Data Fabric Database JSON tables. The REST API allows you to use HTTP calls to perform basic operations on HPE Data Fabric Database JSON tables.

[Using the Node.js OJAI Client](#) on page 3862

Starting with EEP 6.0, you can use the Node.js OJAI client to write HPE Data Fabric Database JSON applications. The client provides you with a lightweight library that supports the OJAI API. You can connect to HPE Data Fabric Database JSON from middleware components, and add, update, and query documents in a HPE Data Fabric Database JSON table.

[Using the Python OJAI Client](#) on page 3867

Starting with EEP 6.0, you can use the Python OJAI client to write HPE Data Fabric Database JSON applications. The client provides you with a lightweight library that supports the OJAI API. You can connect to HPE Data Fabric Database JSON, and add, update, and query documents in a HPE Data Fabric Database JSON table.

[Using the C# OJAI Client](#) on page 3877

Starting with EEP 6.1.0, you can use the C# OJAI client to write HPE Data Fabric Database JSON applications. The client provides you with a lightweight library that supports the OJAI API. You can connect to HPE Data Fabric Database JSON, and add, update, and query documents in a HPE Data Fabric Database JSON table.

[Using the Go OJAI Client](#) on page 3881

Starting with EEP 6.0.0, you can use the Go OJAI client to write HPE Data Fabric Database JSON applications. The client provides you with a lightweight library that supports the OJAI API. You can connect to HPE Data Fabric Database JSON, and add, update, and query documents in a HPE Data Fabric Database JSON table.

[Using the Java OJAI Thin Client](#) on page 3859

Starting with EEP 6.3.0, you can use the Java OJAI Thin Client to write HPE Data Fabric Database JSON applications. The Java OJAI Thin Client provides a lightweight library that supports the OJAI API. You

can connect to HPE Data Fabric Database JSON, and add, update, and query documents in a HPE Data Fabric Database JSON table.

L3/L4 Load Balancing with the Data Fabric Data Access Gateway

You can use haproxy for L3/L4 load balancing of clients that use the Data Fabric Data Access Gateway. This topic describes how to install, configure, and run haproxy, and how to set your client connection string to connect to the load balancing service.

Prerequisites

Determine the server where you want to run the load balancing service. The server must be reachable by the clients using the Data Access Gateway. It also must be able to connect to the Data Access Gateway.

Procedure

1. Install the haproxy service on the server you have identified:

CentOS

```
sudo yum install haproxy
```

Ubuntu

```
sudo add-apt-repository ppa:vbernat/haproxy-1.7
sudo apt update
sudo apt install haproxy
```

SLES

```
sudo zypper install haproxy
```

2. Configure the haproxy service by setting the following parameters in the configuration file at `/etc/haproxy/haproxy.cfg`:

- a) Create a frontend section with the following parameters:

```
frontend <section_name>
  mode tcp
  bind *:<port_to_use_in_the_client_connection_string>
  default_backend <backend_section_name>
```

- b) Create a backend section with one server entry for each Data Access Gateway server:

```
backend <backend_section_name>
  mode tcp
  server <DAG_server_name1> <DAG_server_host1>:<DAG_server_port1>
  server <DAG_server_name2> <DAG_server_host2>:<DAG_server_port2>
  ...
  server <DAG_server_nameN> <DAG_server_hostN>:<DAG_server_portN>
```

The `<backend_section_name>` is the parameter you specified in Step 2a.

3. Restart the haproxy service:

```
sudo service haproxy restart
```

What to do next

Setting Your Client Connection String

Assume you have the following haproxy configuration settings and you have installed haproxy on node1.cluster.com:

```
frontend connection_input
  mode tcp
  bind *:8553
  default_backend maprdb_servers

backend maprdb_servers
  mode tcp
  server srv01 node1.cluster.com:5678
  server srv02 node2.cluster.com:5678
```

You can use the following client connection string with this sample configuration:

DAG with HTTPS | TLS

```
node1.cluster.com:8553?
auth=basic;user=mapr;password=mapr;ssl
=true;sslCA=/opt/mapr/conf/
ssl_truststore.pem;sslTargetNameOverri
de=node1.cluster.com
```

DAG with HTTP

```
node1.cluster.com:8553?
auth=basic;user=mapr;password=mapr;ssl
=false
```

L7 Load Balancing with the Data Access Gateway

You can use nginx for L7 load balancing of clients that use the Data Access Gateway. This topic describes how to install, configure, and run nginx, and how to set your client connection string to connect to the load balancing service.

Prerequisites

Determine the server where you want to run the load balancing service. The server must be reachable by the clients using the Data Access Gateway. It also must be able to connect to the Data Access Gateway.

Procedure

1. Install the nginx service on the server you have identified:

CentOS

```
sudo yum install nginx
```

Ubuntu

```
sudo apt install nginx
```

SLES

```
sudo zypper install nginx
```

2. Configure the nginx service by setting the following parameters in the configuration file at /etc/nginx/nginx.conf:

- a) In the `http` section, create an `upstream` block with one `server` entry for each Data Access Gateway server:

```
upstream <upstream_name> {
    server <DAG_server_host1>:<DAG_server_port1>;
    server <DAG_server_host2>:<DAG_server_port2>;
    ...
    server <DAG_server_hostN>:<DAG_server_portN>
}
```

- b) Create (or modify) the `server` block:

Secure Cluster

For a secure cluster, you must specify the following SSL parameters:

- Listen port and protocol
- Path to the SSL certificate
- Path to the SSL key
- Path to the file containing the SSL password

```
server {
    listen 80 ssl http2;
    listen [::]:80;

    ssl_certificate
    <path_to_certificate>;
    ssl_certificate_key
    <path_to_key>;
    ssl_password_file
    <path_to_password_file>;

    access_log logs/access.log
    main;

    location / {
        grpc_pass grpc://
        <upstream_name>;
    }
}
```

The `<upstream_name>` is the parameter you specified in Step 2a.

3. Restart the `nginx` service:

```
sudo service nginx restart
```

What to do next

Setting Your Client Connection String

Assume you have the following `nginx` configuration settings and you have installed `nginx` on `node1.cluster.com`:

Secure Cluster

```
user mapr;
worker_processes 1;
error_log /var/log/nginx/error.log
```

```

warn;
pid /var/run/nginx.pid;
events {
    worker_connections 1024;
}
http {
    log_format main '$remote_addr -
$remote_user [$time_local] "$request"
                    '$status
$body_bytes_sent "$http_referer"
                    '$http_user_agent';
    upstream servers {
        server node1.cluster.com:5678;
        server node2.cluster.com:5678;
    }
    server {
        listen 80 ssl http2;
        listen [::]:80;

        ssl_certificate /opt/mapr/
conf/ssl_keystore.pem;
        ssl_certificate_key /opt/mapr/
conf/ssl_keystore.pem;
        ssl_password_file /root/
passwd;

        access_log logs/access.log
main;

        location / {
            grpc_pass grpc://servers;
        }
    }
}

```

You can use the following client connection string with this sample configuration:

```

node1.cluster.com:80?
auth=basic;user=mapr;password=mapr;ssl
=true;sslCA=/opt/mapr/conf/
ssl_truststore.pem;sslTargetNameOverri
de=node1.cluster.com

```

Planning for High Availability

Configuring a cluster for HA (High Availability) involves running redundant instances of specific services, and configuring NFS properly. When properly licensed and configured for HA, the Data Fabric cluster provides *automatic failover* for continuity throughout the stack.

The following table provides the minimum number of instances of each core service required for HA:

Service	Minimum Number of Instances	Comments
CLDB	2	
ZooKeeper	3	At least 3 are needed to maintain a quorum in case one instance fails.

Service	Minimum Number of Instances	Comments
NFS	2	NFS can be configured for HA using virtual IP addresses (VIPs).
ResourceManager	2	

In HA clusters, it is appropriate to run more than one instance of the WebServer with a load balancer to provide failover. NFS can be configured for HA using VIPs.

The following sections provide information about HA planning:

CLDB Failover

Explains the concept of CLDB failover, and its advantages.

The CLDB service automatically replicates its data to other nodes in the cluster, preserving at least two (and generally three) copies of the CLDB data. If the CLDB process dies, it is automatically restarted on the node. All jobs and processes wait for the CLDB to return, and resume from where they left off, with no data or job loss.

If the node itself fails, the CLDB data is still safe, and the cluster can continue normally as soon as the CLDB is started on another node. In an Enterprise Edition-licensed cluster, a failed CLDB node automatically fails over to another CLDB node without user intervention, and without data loss. It is possible to recover from a failed CLDB node on a Community Edition cluster, but the procedure is different.

Complete the following steps to recover from a failed CLDB node on a community edition cluster:

1. Restore ZooKeeper

If the CLDB node that failed was also running ZooKeeper, install ZooKeeper on another node to maintain the minimum required number of ZooKeeper nodes. Before installing ZooKeeper on another node, ensure that the ZooKeeper role is deleted on the failed node. See [Removing ZooKeeper Role](#) for more information.

2. Locate the CLDB Data

About this task

After restoring the ZooKeeper service on the HPE Data Fabric cluster, use the `maprc li dump zkinfo` command to identify the latest epoch of the CLDB, identify the nodes where replicates of the CLDB are stored, and select one of those nodes to serve the new CLDB node.

Secure cluster must first be converted to non-secure cluster before running the `maprc li dump zkinfo` command. Perform the following steps as root or use `sudo`:

NOTE: For non-secure clusters, skip to step 4.

Procedure

1. On the ZooKeeper nodes, stop Warden and ZooKeeper by running the following commands:

```
service mapr-warden stop
service mapr-zookeeper stop
```

- Convert the secure cluster to non-secure cluster by running the following command on the ZooKeeper nodes:

NOTE: The script `configure.sh` takes comma-separated lists of cluster names and ZooKeeper host names (and optionally ports) or IP addresses.

```
/opt/mapr/server/configure.sh -C <host>[:<port>][,<host>[:<port>]...] |
<IP>[:<port>][,<IP>[:<port>]...] -Z <host>[:<port>][,<host>[:<port>]...] |
<IP>[:<port>][,<IP>[:<port>]...] -unsecure -R
```

- Restart ZooKeeper:

```
service mapr-zookeeper restart
```

- Issue the `maprcli dump zkinfo` command using the `-json` flag.

```
maprcli dump zkinfo -zkconnect localhost:5181 -json | grep -i "Container ID"
```

The output displays the ZooKeeper znodes. For example:

```
maprcli dump zkinfo -zkconnect localhost:5181 -json |grep -i "Container ID" | more
"/datacenter/controlnodes/cldb/epoch/1/KvStoreContainerInfo":
Container ID:1
VolumeId:1 Master:10.10.104.34:5660-10.10.105.34:5660--9-VALID
Servers:
10.10.104.34:5660-10.10.105.34:5660--9-VALID
10.10.104.33:5660-10.10.105.33:5660--9-VALID
10.10.104.32:5660-10.10.105.32:5660--9-VALID
Inactive Servers: Unused Servers: Latest epoch:9"
```

In the above example output, the latest epoch is 9.

- In the `/datacenter/controlnodes/cldb/epoch/1` directory, locate the CLDB with the latest epoch.

The Latest Epoch field identifies the current epoch of the CLDB data.

- Select a CLDB from among the copies at the latest epoch. For example, `10.10.105.32:5660--9-VALID` indicates that the node has a copy at epoch 9 (the latest epoch).

Results

You can now install a new CLDB on the selected node.

What to do next

To convert the non-secure cluster to a secure cluster, run the the following command:

NOTE: The script `configure.sh` takes comma-separated lists of cluster names and ZooKeeper host names (and optionally ports) or IP addresses.

```
/opt/mapr/server/configure.sh -C <host>[:<port>][,<host>[:<port>]...] |
[<port>]...] |<IP>[:<port>][,<IP>[:<port>]...] -Z <host>[:<port>][,<host>[:<port>]...] |
<IP>[:<port>][,<IP>[:<port>]...] -secure -R
```

3. Stop the Selected Node

About this task

Perform the following steps on the node you have selected for installation of the CLDB:

Procedure

1. Change to the root user (or use sudo for the following commands).
2. Stop the Warden:

```
service mapr-warden stop
```

4. Remove the CLDB Role on the Failed Node

About this task

To remove the CLDB role on the failed node, perform the following steps:

Procedure

1. Stop Warden on the node.

```
service mapr-warden stop
```

2. Purge the CLDB package mapr-cldb with the apt-get, yum, or zypper commands, depending on your operating system.

5. Install the CLDB on the Selected Node

About this task

Perform the following steps on the node you have selected for installation of the CLDB:

Procedure

1. Login as root or use sudo for the following commands.
2. Install the CLDB service on the node:
 - RHEL/CentOS: `yum install mapr-cldb`
 - Ubuntu: `apt-get install mapr-cldb`

6. Configure the Selected Node

The script [configure.sh](#) configures a node to be part of a HPE Data Fabric cluster, or modifies services running on an existing node in the cluster. The script creates (or updates) configuration files related to the cluster and the services running on the node.

Before you run [configure.sh](#), make sure you have a list of the hostname of the ZooKeeper nodes. You can optionally specify the ports for the CLDB and ZooKeeper nodes as well. The default ports are:

Service	Default Port #
CLDB	7222
ZooKeeper	5181

The script `configure.sh` takes an optional cluster name and log file, the CLDB hostname, and comma-separated list of ZooKeeper host names or IP addresses (and optionally ports), using the following syntax:

```
/opt/mapr/server/configure.sh -C <host>[:<port>] -Z <host>[:<port>]
[,<host>[:<port>]...] \
[-L <logfile>][-N <cluster name>]
```

NOTE: Each time you specify the `-Z <host>[:<port>]` option, you must use the *same order* for the ZooKeeper node list. If you change the order for any node, the ZooKeeper leader election process will fail.

Example

```
/opt/mapr/server/configure.sh -C r1n1.sj.us:7222 \
-Z
r1n1.sj.us:5181,r2n1.sj.us:5181,r3n1.sj.us:5181,r4n1.sj.us:5181,r5n1.sj.us:5
181 -N MyCluster
```

7. Start the Nodes

About this task

Perform the following steps on the node you have selected for installation of the CLDB:

Procedure

Start the Warden:

```
service mapr-warden start
```

Results

After the CLDB restarts, there is a 15-minute delay before replication resumes, in order to allow all nodes to register and heartbeat. This delay can be configured using the `config save` command to set the `cldb.replication.manager.start.mins` parameter.

8. Restart All Nodes

To restart all nodes in the cluster, stop each node, configure the node with the new CLDB and ZooKeeper addresses, and start the node.

Complete the following steps on each node in the cluster:

1. Stop the node.
 - a. Change to the root user (or use `sudo` for the following commands).
 - b. Stop the Warden:

```
service mapr-warden stop
```

2. Configure all the nodes with the new CLDB and ZooKeeper addresses.

The script `configure.sh` configures a node to be part of a HPE Data Fabric cluster, or modifies services running on an existing node in the cluster. You must run this script to configure a node. The script creates (or updates) configuration files related to the cluster and the services running on the node.

Before you run `configure.sh`, make sure you have the hostname of the CLDB node and the hostnames of the ZooKeeper nodes. You can, optionally, specify the ports for the CLDB and ZooKeeper nodes as well. The default ports are:

Service	Default Port #
CLDB	7222
ZooKeeper	5181

The script `configure.sh` takes an optional cluster name and log file, the CLDB hostname, and comma-separated list of ZooKeeper host names or IP addresses (and optionally ports), using the following syntax:

```
/opt/mapr/server/configure.sh -C <host>[:<port>] -Z <host>[:<port>]
[,<host>[:<port>]...] [-L <logfile>] [-N <cluster name>]
```

NOTE: Each time you specify the `-Z <host>[:<port>]` option, you must use the same order for the ZooKeeper node list. If you change the order for any node, the ZooKeeper leader election process will fail.

Example:

```
/opt/mapr/server/configure.sh -C r1n1.sj.us:7222 -Z
r1n1.sj.us:5181,r2n1.sj.us:5181,r3n1.sj.us:5181,r4n1.sj.us:5181,r5n1.sj.us:5181 -N MyCluster
```

3. Start Warden.

```
service mapr-warden start
```

Best Practices for Running a Highly Available Cluster

Lists high availability cluster replication types, and the best practices for running such a cluster.

Data Fabric runs a wide variety of concurrent applications in a highly available fashion. Node failures do not have cluster-wide impact, and activities on other nodes in the cluster can continue normally. In parallel, Data Fabric components detect failures and automatically recover from them. During the recovery process, clients may experience latency, the duration of which depends on the nature of the failure.

Node Shutdown Instances

The cause of a service failure can be one of the following:

Planned shutdown	A planned/controlled failure. In this case, Data Fabric is informed that a file server will be stopped. Data Fabric services use this information to improve recovery behavior.
Unexpected shutdown	Data Fabric services (file system, NFS server etc.) are stopped. However, the host operating system continues to run and failure detection is fast.
Hard unplanned shutdown	A power off, network down, or some other kind of unplanned stop. A node is stopped in a way that it is no longer reachable. Packets sent to this node do not get an error response and failure is detected through network layer's timeout mechanism. This results in longer failure detection times.

In all of these instances, the recovery process typically involves detecting that a node is unreachable, and contacting another available node for the same piece of information (either for reads, writes, or administrative operations).

How file system and Associated Services Work

Let's review how file system and associated services typically work, using the following illustration.

High-throughput or Cascading Replication Type: As shown in the illustration, the client, Client1, writes to a Data Fabric filesystem, MFS1, which in turn talks to MFS2, which in turn talks to MFS3 for cascading (high throughput) replication. The replication is inline and synchronous, which means MFS1 replies to the client only after it receives a response from MFS2. MFS2, in turn, only responds to MFS1 after MFS3 has replied to it. Client1 can read from any MFS, but write only to MFS1.

Low-latency or Star Replication Type: As shown in the illustration, the client, Client2, writes to MFS5. This illustration shows an example of star (low latency) replication where MFS5 replicates to both MFS4 and MFS6 in parallel. Again, the replication is inline and synchronous, which means that MFS5 responds to Client2 only after it has received responses from both MFS4 and MFS6.

Recommended Settings for Running a Cluster with Low Latency and Fast Failover Characteristics

A well designed cluster provides automatic failover for continuity throughout the stack. For an example of a large, high-availability Enterprise Edition cluster, see [Example Cluster Designs](#) on page 89. On a large cluster designed for high availability, services should be assigned according to the service layout guidelines. For more information, see [Service Layout Guidelines for Large Clusters](#) on page 86. In general, services, specifically CLDB and ZooKeeper, should be installed on separate nodes to prevent the failure of multiple services at the same time and to enable the cluster to recover quickly.

Recommended Settings to Recover from Unplanned Shutdown

Latencies as a result of unplanned or unexpected failures/shutdowns can be improved by performing the following:

Enabling Fast Failover of Services

Describes the Fast Failover feature that allows a cluster to rapidly detect and recover from network failures.

For running a cluster with Fast Failover characteristics, enable the Fast Failover feature:

```
/opt/mapr/bin/maprcli config save -values {mfs.feature.fastfailover:1}
```

If you have enabled the fast failover feature, when the file system detects a failed node, it very quickly declares the node as being down. Clients experience a short latency period while the failure is being detected. Once Data Fabric detects the failure, Data Fabric redirects clients of the failed node to an alternate location (a replica container) for the data. If you have not enabled the fast failover feature, the file system repeatedly contacts the failed node.

This feature is enabled on all new installations. For upgrade installations, this feature is not enabled by default. You need to evaluate whether this feature works well with your existing infrastructure, before enabling it. You cannot turn this feature off after turning it on.

Tuning the TCP for Fast Failure Detection

Describes how to tune the TCP stack to detect node or network failures rapidly.

An unplanned failure chiefly takes the form of a node failure or a network failure. In both instances, the network layer retries to connect to the failed node. The number of retry attempts is dictated by the TCP parameter `/proc/sys/net/ipv4/tcp_syn_retries`. The default value of that parameter is 5 (in Linux), resulting in a latency of more than a minute to detect the node failure. The problem is compounded when the same failed node is contacted repeatedly in the context of a long operation, such as when a client accesses multiple data objects present on that node.

The Data Fabric stack solves the problem by remembering (caching) the information about a node's failure, and by not contacting that node for subsequent operations on data objects present on that node. Since all form of data is replicated, Data Fabric services find alternative locations for a data object. This feature is in-built into the current software and does not have to be enabled explicitly. Hence, the communication between a client and a recently failed node incurs a one-time long-duration latency. As mentioned before, that latency is governed by the number of retries at the TCP level. Hence, to further improve the one-time longer latency of an operation between a pair of nodes, it is recommended that the number of TCP retries be decreased from 5 to 4, resulting in a latency of about 30 seconds.

Setting the Timeout for TCP Connections

To set the TCP retry count, set the value of `tcp_syn_retries` to 4 in the `/proc/sys/net/ipv4/` directory (for IPv4 connections). For example:

```
echo 4 > /proc/sys/net/ipv4/tcp_syn_retries
```

Similarly for IPv6 connections, set:

```
echo 4 > /proc/sys/net/ipv6/tcp_syn_retries
```

This TCP setting of 4 ensures that the TCP stack takes about 30 seconds to detect failure of a remote node. To ensure that this setting is persistent across system reboots, set this value in the `/etc/sysctl.conf` file.

WARNING: This setting impacts all TCP connections to and from a node. Hence, caution must be exercised when lowering this further. Also, in some instances, reducing this further may result in a node being incorrectly flagged as unavailable.

Reducing Failure Detection Time for File Clients

Describes how to set the time for Hadoop and POSIX clients to detect node failures.

To reduce the amount of time it takes (Hadoop and FUSE-based POSIX) clients to detect (CLDB and data node) failure, define the property, `fs.mapr.connect.timeout`, in the `core-site.xml` file. The value for this property can be set in 100 milliseconds and will be rounded up to the nearest 100 milliseconds. The minimum value for this property is 100 milliseconds, which can be incremented only by units of 100

milliseconds. Suppose a value of 260 milliseconds is specified, by default, the value will automatically be rounded up to 300 milliseconds. The default value for this property is 0, which means that the Linux TCP timeout setting will be used for connections if this property is not set.

Your entry in `core-site.xml` file should look similar to the following:

```
<property>
  <name>fs.mapr.connect.timeout</name>
  <value>200</value>
  <description>file client wait time of 200 milliseconds</description>
</property>
```

This setting (for hadoop and FUSE-based POSIX clients) ensures that the clients wait only for the specified amount of time to establish a connection. That is, it is used only for the first request sent to CLDB or a data node before or after a failure. For subsequent requests, the default system connection timeout value is used. In the event of a failure after a connection has been established, the client will wait for the connection to timeout (based on the system timeout value) before it contacts the next (CLDB or data) node to process the request.

For example, suppose the value for this parameter is 100 milliseconds and the Linux TCP connection timeout value is 30 seconds. When a hadoop or FUSE-based POSIX client contacts CLDB or a data node for the first time to establish a connection, the client will wait for 100 milliseconds before trying the next CLDB or data node. After a connection is established, for subsequent requests, the client will wait for 30 seconds for a response. If the node goes down after a connection has been established, the client will wait for 30 seconds before trying the next node. If the client contacts a recovered node for the first time, it will wait for 100 milliseconds to establish the connection.

NOTE: HPE Data Fabric filesystem does not use this property internally; it is used by Hadoop and FUSE-based POSIX clients only. This setting is not applicable to NFS gateway and loopbacknfs POSIX clients.

Detecting CLDB failures

When a connection with CLDB is established, CLDB returns the list of reachable and unreachable CLDB nodes on the cluster.

Populating the cache

The client stores information about the unreachable CLDB nodes in `/tmp/cldbinfo/unreachableCldbs` file on the client host. The format of this file is the same as the `mapr-clusters.conf` file (i.e., "clustername ip:port"). For example:

```
cat /tmp/cldbinfo/unreachableCldbs
object_pools 10.10.104.33:7222
10.10.104.34:7222
```

The client reads the `mapr-clusters.conf` file and the `unreachableCldbs` file to determine the CLDB to connect to. It then tries to reach the available CLDB nodes first; it tries the unreachable CLDB nodes only if the available CLDB is unable to service its request.

Invalidating the cache

If the available CLDB is unable to service the client request, the client tries the unreachable CLDB. If an unreachable CLDB becomes reachable again, it is removed from the `/tmp/cldbinfo/unreachableCldbs` file, making it reachable for all subsequent IOs and if a reachable CLDB becomes unreachable, it is added to the `/tmp/cldbinfo/unreachableCldbs` file.

Recommended Settings for Planned Shutdown

Explains the modalities of a planned shutdown.

The HPE Data Fabric stack improves the latencies for planned shutdowns by implementing a fast failover mechanism where different services respond to the intimation of a failure.

Notifying CLDB to Allow Fast Failover

When planning to shutdown a node, notifying CLDB of an impending shutdown allows CLDB to update the replication chain such that primary and intermediate containers, if any, are not on the node and re-assign VIPs on the node when the node actually goes down. This, in turn, allows clients to continue activities on available nodes.

MapR (v5.1) includes an argument, `node failover`, to the `maprcli` command that notifies CLDB of impending node shutdown so that CLDB can ensure that the specified node does not have any primary containers and intermediate containers (in a cascaded chain), and VIPs are re-assigned.

Shutting Down a Node

To notify CLDB of a planned shutdown of a node:

1. Enable the fast failover behavior.
Refer to [Enabling Fast Failover](#) for more information.
2. Reset the value of `tcp_syn_retries` parameter.
Refer to [Tuning TCP](#) for more information.
3. (Optional) Get the hostname of the node to put in maintenance mode by running the following command:

```
/opt/mapr/bin/maprcli node list -columns hostname
```

4. Run the failover command for that node.

For example:

```
/opt/mapr/bin/maprcli node failover -nodes <node-hostname>
```

Wait for few minutes (to allow containers to failover) before proceeding to the next step.

5. Stop warden on that node by running the following command:

```
service mapr-warden stop
```

6. Notify HPE Data Fabric that the node is in maintenance mode and when the maintenance task is complete, remove the node from maintenance mode.

See [Performing Maintenance on a Node](#) for the commands to run to `put` and `take` a node out of maintenance mode.

WARNING: Shut down only one node at a time. Do not take down multiple nodes for maintenance at the same time.

ResourceManager High Availability

Provides an overview of how high availability for Resource Manager works.

The ResourceManager service tracks a cluster's resources and schedules YARN applications.

Configure high availability for the ResourceManager so that the failure of the ResourceManager service is not a single point of failure for the cluster. The high availability of ResourceManager is based on the cluster configuration for restart, recovery, and failover.

Restart

The restart settings are configured on the [warden.conf](#) file.

By default, the Warden attempts to restart a failed service three times. You can configure the frequency that Warden attempts to restart failed services before initializing failover in the [warden.conf](#) file.

Recovery

By default, ResourceManager recovery is enabled and it uses the `FileSystemRMStateStore` implementation to store the ResourceManager state in the file system.

When a ResourceManager restarts or fails over, the active ResourceManager can recover the state of the previously running ResourceManager. You can configure the ResourceManager to have no recovery. You can also configure the state store implementation that you want to use. For more information, see [Recovery for the ResourceManager](#).

Failover

To configure failover, the cluster must have one or more nodes with the ResourceManager role.

You can select one of the following failover implementations when you use the [configure.sh](#) utility to configure each node:

- **Zero Configuration Failover** - In this failover mechanism, Warden manages the ResourceManager failover. When the active ResourceManager fails, one of the standby ResourceManager nodes automatically loads the working state from the state store and continues providing services to the cluster. It can be configured with a fresh [configure.sh](#) without **-RM** property in command.

Zero configuration failover is the default and recommended setting for the following reasons:

- **Only one ResourceManager process consumes cluster resources.** With the manual or automatic failover option, the active and standby ResourceManagers consume cluster resources.
- **Warden initiates failover automatically.** With the manual failover, you need to manually run the [yarn rmadmin](#) command for failover to occur.
- **Simplified clients connectivity.** Clients identify the active ResourceManager with a single request to the Zookeeper. With the manual or automatic failover option, ResourceManager clients connect to each ResourceManager in a round-robin fashion until they locate the active ResourceManager; this results in delays when launching or querying jobs.
- **Consistent Configuration.** All cluster nodes and clients can use the same `yarn-site.xml` configuration file. With manual or automatic failover, you must maintain a customized [yarn-site.xml](#) file for each node that runs the ResourceManager.

For information, see [Zero Configuration Failover for the ResourceManager](#). For information on enabling zero configuration failover, see [Enabling Zero Configuration Failover for the ResourceManager](#) on page 2258

- **Manual or Automatic Failover** - For information on the manual or automatic failover, see [Manual or Automatic Failover for the ResourceManager](#).

For information on changing to manual failover from automatic failover, see [Manual Failover Administration](#) on page 2256.

For information on configuration of automatic failover, see [Configuring Automatic Failover for the ResourceManager](#).

IMPORTANT: The [ResourceManager configuration properties](#) can be set in yarn-site.xml if you wish to override any of the default values. See [ResourceManager Failover Properties](#) and [ResourceManager Recovery Properties](#) for property details.

Manual or Automatic Failover for the ResourceManager

With the manual or automatic failover mechanism, an active ResourceManager and one or more standby ResourceManager processes run in the cluster. The standby ResourceManager nodes run the ResourceManager process without loading the working state. When the active ResourceManager fails, one of the standby ResourceManager nodes can load the working state from the ZooKeeper and continue providing services to the cluster.

ResourceManager clients (HPE Data Fabric client nodes, ApplicationMaster processes, and NodeManager nodes) attempt connections to the ResourceManager nodes in a round-robin fashion until they hit an active ResourceManager node. If the active ResourceManager node is down, ResourceManager clients resume round-robin polling until an active ResourceManager node is detected.

For web requests, including REST API requests, standby ResourceManager nodes automatically redirect web requests to the active ResourceManager node.

Difference between Manual Failover and Automatic Failover

The difference between manual failover and automatic failover is how the transition from standby to active occurs for the ResourceManager process.

- With manual failover, you manually invoke the transition of the ResourceManager from standby to active with the [yarn radmin](#) command.
- With automatic failover, the ResourceManager processes have an embedded ZooKeeper-based ActiveStandbyElector, which chooses the active ResourceManager. This ActiveStandbyElector detects failures in the currently active ResourceManager and automatically transitions one of the standby ResourceManagers to an active state.

If you specify multiple ResourceManagers when you run configure.sh, automatic failover is configured. However, you can edit the [yarn-site.xml](#) file to enable manual failover instead.

Automatic Failover Administration

The Zookeeper-based ActiveStandbyElector on each ResourceManager node detects failures in the currently active ResourceManager and automatically transitions one of the standby ResourceManagers to an active state. Therefore, `radmin -transitionToStandby` and `-transitionToActive` are disabled.

Configuring Automatic Failover for the ResourceManager

To use automatic failover, specify multiple ResourceManagers when you run configure.sh on each node in the cluster.

The following configure.sh script syntax configures three ResourceManager nodes (one active and two standby) and one HistoryServer node:

```
/opt/mapr/server/configure.sh -C <CLDB node list> -Z <ZK node list> -RM
<hostname1,hostname2,hostname3> -HS <hostname1> [additional parameters]
```

NOTE: After you run configure.sh, each ResourceManager node contains a different value for the yarn.resourcemanager.ha.id property in the yarn-site.xml.

Example yarn-site.xml file

The following configure.sh syntax specifies three ResourceManager nodes (nodeA, nodeB, and nodeC) and a HistoryServer node (nodeA):

```
/opt/mapr/server/configure.sh -C node1,node2,node3 -Z node1,node2,node3 -RM
nodeA,nodeB,nodeC -HS nodeA [additional parameters]
```

```

Manual Failover Administration

Configure manual failover for the ResourceManager if you want to manually transition the state of ResourceManagers in the cluster. In the event of a ResourceManager failure, you use `rmdadmin` commands to check the status of each ResourceManager and then transition a standby ResourceManager to the active state.

Configuring Manual Failover for the ResourceManager

About this task

To configure manual failover, specify multiple ResourceManagers when you run `configure.sh` on each node in the cluster and then edit `yarn-site.xml` to disable automatic failover.

Procedure

1. Specify multiple ResourceManagers when you run `configure.sh` on each cluster and client node. The following the `configure.sh` script syntax configures three ResourceManager nodes (one active and two standby):

```

/opt/mapr/server/configure.sh -C <CLDB node list> -Z <ZK node list> -RM
<hostname1,hostname2,hostname3> -HS <hostname1> [additional parameters]

```

NOTE: After you run `configure.sh`, each ResourceManager node contains a different value for the `yarn.resourcemanager.ha.id` property in the `yarn-site.xml`.

2. Disable the following automatic failover properties in the `yarn-site.xml` on each node with the ResourceManager role:
 - `yarn.resourcemanager.ha.automatic-failover.enabled`
 - `yarn.resourcemanager.ha.automatic-failover.embedded`
3. Restart the ResourceManager service. For more information, see [Restarting the Services](#) on page 1402.

Transitioning a Standby ResourceManager to Active

About this task

The `yarn rmdadmin` command includes options to manage high availability for the ResourceManager, including transitioning a ResourceManager node between active and standby modes. These commands take the ResourceManager service ID as an argument and can be run on any node in the cluster. The `serviceID` of a ResourceManager is set in the `yarn.resourcemanager.ha.rm-ids` property of the `yarn-site.xml` file.

Transition a standby ResourceManager to the active state when the active ResourceManager process has failed or the node that runs the process is no longer accessible.

Procedure

1. Determine if an active ResourceManager is running in the cluster. See [Checking the ResourceManager State](#).
2. Run the following command to set the current active ResourceManager to standby:

```
yarn rmdadmin -transitionToStandby <serviceID>
```

3. Run the following command to transition the standby ResourceManager to the active state:

```
yarn rmdadmin -transitionToActive <serviceID>
```

Checking the ResourceManager State

About this task

When you configure manual or automatic failover, the ResourceManager is either in active or standby state. Each ResourceManager has a `serviceID` that identifies the service.

Procedure

- To check the state of a ResourceManager, run the following command with the `serviceID`:

```
yarn rmdadmin -getServiceState <serviceID>
```

The command returns `active` or `standby` based on the state of the ResourceManager associated with the `serviceID` that you provide.

NOTE: Tip To determine the `serviceIDs` associated with the ResourceManagers in the cluster, run `hadoop conf | grep yarn.resourcemanager.ha.rm-ids`

Zero Configuration Failover for the ResourceManager

As of MapR 4.0.2, you can use zero configuration failover. With zero configuration failover, the ResourceManager role is installed on two or more nodes but the ResourceManager process only runs on one node in the cluster.

If the node running the ResourceManager process fails and the Warden on that node is unable to restart it, the Warden on each node and Zookeeper work together to start a ResourceManager process on the cluster. ResourceManager clients connect to the Zookeeper to determine which ResourceManager node is active. Therefore, when failover occurs, the Resource Manager clients are not affected as they automatically connect to the active ResourceManager.

NOTE: When you run `maprccli service list` command, the state of the active ResourceManager process displays as 2 (running) but the other ResourceManagers displays as 5 (stand by).

Enabling Zero Configuration Failover for the ResourceManager

To enable zero configuration failover, do not specify the `-RM` parameter when you run `configure.sh` on each node in the cluster. However, for failover to occur, at least two nodes in the cluster must have the ResourceManager role.

For example, if the cluster includes multiple nodes with the ResourceManager role, you can run the following `configure.sh` command on each cluster node and no further configuration is required:

```
/opt/mapr/server/configure.sh -N mycluster -C centos21 -Z centos21 -HS
centos22 -F /tmp/disks.txt -disk-opts F
```

`configure.sh` automatically populates `yarn-site.xml` with the following configuration:

```
<configuration>
<!-- Resource Manager MapR HA Configs -->
<property>
  <name>yarn.resourcemanager.ha.custom-ha-enabled</name>
  <value>true</value>
  <description>MapR Zookeeper based RM Reconnect Enabled.
  If this is true, set the failover proxy to be the class
  MapRZKBasedRMFailoverProxyProvider</description>
</property>
<property>
  <name>yarn.client.failover-proxy-provider</name>

  <value>org.apache.hadoop.yarn.client.MapRZKBasedRMFailoverProxyProvider</
  value>
  <description>Zookeeper based reconnect proxy provider. Should
  be set if and only if mapr-ha-enabled property is true.</description>
</property>
<property>
  <name>yarn.resourcemanager.recovery.enabled</name>
  <value>true</value>
  <description>RM Recovery Enabled</description>
</property>
<!-- :::CAUTION::: DO NOT EDIT ANYTHING ON OR ABOVE THIS LINE -->
</configuration>
```

For more information about the ResourceManager properties in `yarn-site.xml`, see [ResourceManager Configuration Properties](#).

Updating ResourceManager Ports

About this task

To simplify the failover configurations in the `yarn-site.xml` file, Warden maintains the list of ResourceManager ports in the `warden.resourcemanager.conf` file. For a list of the default port numbers, see [Ports Used by HPE Data Fabric Software](#) on page 3469. If you want to edit the default ResourceManager ports, edit the `warden.resourcemanager.conf` file and the `yarn-site.xml` file on each ResourceManager node.

NOTE: If each node requires different ResourceManager ports, you must maintain a separate `yarn-site.xml` file for each node. Therefore, to you use Central Configuration, you must create a customized configuration file for each ResourceManager node in the cluster.

To update the port numbers, edit the values in the `warden.resourcemanager.conf` file and add the values in the `yarn-site.xml` file.

Procedure

1. Open the `warden.resourcemanager.conf` file (`/opt/mapr/conf/conf.d/warden.resourcemanager.conf`).
2. Edit the port numbers, which are listed using the following format: `service.extinfo.<port>=<port number>`

Port Name	Property Name in <code>warden.resourcemanager.conf</code>
ResourceManager Scheduler RPC (for ApplicationMasters)	<code>service.extinfo.SCHEDULER_PORT</code>
ResourceManager Resource Tracker RPC (for NodeManagers)	<code>service.extinfo.RESOURCETRACKER_PORT</code>
ResourceManager Client RPC	<code>service.port</code>
ResourceManager Admin RPC	<code>service.extinfo.ADMIN_PORT</code>
ResourceManager Web UI (HTTP)	<code>service.extinfo.WEBAPP_PORT</code>
ResourceManager Web UI (HTTPS)	<code>service.extinfo.WEBAPP_HTTPS_PORT</code>

3. Open the `yarn-site.xml` file (`/opt/mapr/hadoop/hadoop-2.x.x/etc/hadoop/yarn-site.xml`).
4. For each port that you edited, add the associated property to the `yarn-site.xml` file:

Port Name	Property Name in <code>yarn-site.xml</code>
ResourceManager Scheduler RPC (for ApplicationMasters)	<code>yarn.resourcemanager.scheduler.address</code>
ResourceManager Resource Tracker RPC (for NodeManagers)	<code>yarn.resourcemanager.resource-tracker.address</code>
ResourceManager Client RPC	<code>yarn.resourcemanager.address</code>
ResourceManager Admin RPC	<code>yarn.resourcemanager.admin.address</code>
ResourceManager Web UI (HTTP)	<code>yarn.resourcemanager.webapp.address</code>
ResourceManager Web UI (HTTPS)	<code>yarn.resourcemanager.webapp.https.address</code>

For example, to update the port number for the `ADMIN_PORT` to 9000 on each node, enter the following in the `yarn-site.xml` file on each node:

```
<property>
  <name>yarn.resourcemanager.adminaddress</name>
  <value>10.10.30.140:9000</value>
</property>
```

5. Restart the Warden and the ResourceManager services.

Switching from Zero Configuration to Manual or Automatic Failover

You can change your ResourceManager failover implementation from zero configuration to manual or automatic failover by re-configuring all the cluster and client nodes.

For more information, see [Configuring Manual Failover for the Resource Manager](#) or [Configuring Automatic Failover for the Resource Manager](#).

Recovery for the ResourceManager

After a restart or failover, the active ResourceManager recovers the ResourceManager state based on the checkpoints provided in the ResourceManager state store. During recovery, the ResourceManager resumes applications and tasks that were running prior to the failover but were not completed.

Two implementations of the ResourceManager state store are available:

- **FileSystemRMStateStore.** Enables implicit write access to a single ResourceManager node. file system provides fencing implicitly and its state store implementation provides better scalability and failover performance than the ZKRMStateStore. The state store is also naturally protected by file system replication. By default, FileSystemRMStateStore is the state store implementation for the ResourceManager and the ResourceManager state store is maintained in the following MapR filesystem volume: `/var/mapr/cluster/yarn/rm/system`.
- **ZKRMStateStore.** Enables implicit write access to a single ResourceManager node. This is usually recommended for HA implementations where YARN is running on HDFS. However, FileSystemRMStateStore is recommended in a MapR cluster.

NOTE: For recovery to occur, all ResourceManager nodes must have access to the ResourceManager state store.

ResourceManager Recovery Administration

To change the default behavior, update the ResourceManager configuration in the `yarn-site.xml` files and restart the ResourceManager(s). The `yarn-site.xml` is located in the following directory: `/opt/mapr/hadoop/hadoop-3.x.x/etc/hadoop/`

Disabling the restart of applications after failover

You can configure the ResourceManager to not recover its state after a restart or failover occurs.

- Set the value of `yarn.resourcemanager.recovery.enabled` to `false` in `yarn-site.xml` on each ResourceManager node.

Configuring Maximum Attempts for Applications

Describes how to set the maximum number of restart attempts for all applications run by the Data Fabric ResourceManager and the ApplicationMaster.

About this task

When an ApplicationMaster fails, the ResourceManager restarts the ApplicationMaster as long as the number of restart attempts does not exceed the max-attempt values set at the ResourceManager and ApplicationMaster level. By default, the maximum attempt value is set to 2.

Procedure

- To configure the maximum number of ApplicationMaster attempt retries for all applications run by the ResourceManager:
Set the value of `yarn.resourcemanager.am.max-attempts` in the `yarn-site.xml` file. The value defaults to 2.
- To configure the number of ApplicationMaster attempts allowed for the MapReduce ApplicationMaster:
Set the value of `mapreduce.am.max-attempts` in the `mapred-site.xml` file. The value defaults to 2.

Configuring the File System State Store

Describes the configuration of the Data Fabric state store.

About this task

By default, the Resource Manager stores its state in the Data Fabric file system. However, you can change the values for the following properties related to the Data Fabric file system state store:

Procedure

- To configure the URI to the state store location:
Set the value of `yarn.resourcemanager.fs.state-store.uri` in the `yarn-site.xml` file. The value defaults to the ResourceManager volume (`/var/mapr/cluster/yarn/rm/system`).
- To configure the retry policy used by the state store client to connect with Data Fabric file system:
Set the value of `yarn.resourcemanager.fs.state-store.retry-policy-spec` in the `yarn-site.xml` file. The value defaults to (2000,500).
- To configure the number of completed applications retained by the state store:
Set the value of `yarn.resourcemanager.state-store.max-completed-applications` in the `yarn-site.xml` file. The value defaults to 10000.

*Enabling ZooKeeper Based State Store***About this task**

By default, the Resource Manager stores its state in the file system. However, you can use the Zookeeper based state store instead. To configure the ResourceManager to use the Zookeeper state store:

Procedure

- Set the value of `yarn.resourcemanager.store.class` to `org.apache.hadoop.yarn.server.resourcemanager.recovery.ZKRMStateStore` in the `yarn-site.xml`.
- Set the value of `yarn.resourcemanager.zk-address` to a comma-separated list of host:port pairs for each ZooKeeper server used by the ResourceManager. This property needs to be set in `yarn-site.xml`.

ResourceManager Configuration Properties

You can configure the failover and recovery properties for the ResourceManager. The default values for the failover and recovery properties are defined in the `yarn-default.xml` or by Data Fabric. You can configure overrides to the default by adding to or editing the properties in `yarn-site.xml`.

ResourceManager Failover Properties

The following table describes the configuration properties for ResourceManager failover:

Property	Description
<code>yarn.resourcemanager.ha.custom-ha-enabled</code>	When <code>yarn.client.failover-proxy-provider</code> is set to <code>org.apache.hadoop.yarn.client.MapRZKBasedRMFailoverProxyProvider</code> , this property must <code>true</code> . The default, set by <code>configure.sh</code> in <code>yarn-site.xml</code> when the cluster uses zero configuration failover for the ResourceManager, is <code>true</code> .
<code>yarn.resourcemanager.ha.enabled</code>	Enables high availability for the ResourceManager. The default, set by Data Fabric in the <code>yarn-site.xml</code> , is <code>true</code> . This property must be set to <code>true</code> for failover to occur.

Property	Description
yarn.resourcemanager.ha.automatic-failover.enabled	When yarn.resourcemanager.ha.enabled is true, this property enables the ResourceManager to automatically failover. The default, set in yarn-default.xml, is true.
yarn.resourcemanager.ha.automatic-failover.embedded	When yarn.resourcemanager.ha.enabled is true, this property enables the ResourceManager to use the embedded automatic failover. The default, set in yarn-default.xml, is true.
yarn.resourcemanager.cluster-id	Specifies the cluster that the ResourceManager belongs to. This value is originally set by configure.sh in the yarn-site.xml and the value is required for failover to occur.
yarn.resourcemanager.ha.rm-ids	The ResourceManager service ID. Configure.sh adds this property to each node with the ResourceManager role.
yarn.resourcemanager.ha.id	Specifies the serviceID of the ResourceManager on the current node.
yarn.resourcemanager.zk-address	Specifies the zookeeper quorum that the ResourceManager belongs to. This value is originally set by configure.sh in the yarn-site.xml when you configure failover.
yarn.client.failover-proxy-provider	Specifies the ResourceManager failover implementation used by clients, ApplicationMasters, and NodeManagers. configure.sh sets this value based on the type of failover that you configure. <ul style="list-style-type: none"> For automatic or manual failover, configure.sh sets this value to org.apache.hadoop.yarn.client.ConfiguredRMFailoverProxyProvider For zero configuration failover, configure.sh sets this value to org.apache.hadoop.yarn.client.MapRZKBasedRMFailoverProxyProvider This value is set by configure.sh in yarn-site.xml when you configure failover. Otherwise, the default, set in yarn-default.xml is org.apache.hadoop.yarn.client.DefaultFailoverProxyProvider.
yarn.resourcemanager.scheduler.address[.<serviceID>]	The address of the scheduler interface This value, including the serviceID, is set by configure.sh in yarn-site.xml when you configure manual or automatic failover. For zero configuration failover, this property is not needed unless you have configured custom port values. When you specify the custom port number, the serviceID is not required.

Property	Description
yarn.resourcemanager.resource-tracker.address[.<serviceID>]	<p>The address of the resource tracker interface. ResourceManager listens for container requests and heartbeats from the NodeManagers on this port.</p> <p>This value, including the serviceID, is set by configure.sh in yarn-site.xml when you configure manual or automatic failover.</p> <p>For zero configuration failover, this property is not needed unless you have configured custom port values. When you specify the custom port number, the serviceID is not required.</p>
yarn.resourcemanager.address[.<serviceID>]	<p>The address of the client interface. The ResourceManager listens for client requests on this port.</p> <p>This value, including the serviceID, is set by configure.sh in yarn-site.xml when you configure manual or automatic failover.</p> <p>For zero configuration failover, this property is not needed unless you have configured custom port values. When you specify the custom port number, the serviceID is not required.</p>
yarn.resourcemanager.admin.address[.<serviceID>]	<p>The address of the administrative interface. ResourceManager listens for administrative requests from the yarn radmin command on this port.</p> <p>This value, including the serviceID, is set by configure.sh in yarn-site.xml when you configure manual or automatic failover.</p> <p>For zero configuration failover, this property is not needed unless you have configured custom port values. When you specify the custom port number, the serviceID is not required.</p>
yarn.resourcemanager.webapp.address[.<serviceID>]	<p>The address of the ResourceManager web UI.</p> <p>This value, including the serviceID, is set by configure.sh in yarn-site.xml when you configure manual or automatic failover.</p> <p>For zero configuration failover, this property is not needed unless you have configured custom port values. When you specify the custom port number, the serviceID is not required.</p>
yarn.resourcemanager.webapp.https.address[.<serviceID>]	<p>The address of the secure ResourceManager web UI.</p> <p>This value, including the serviceID, is set by configure.sh in yarn-site.xml when you configure manual or automatic failover.</p> <p>For zero configuration failover, this property is not needed unless you have configured custom port values. When you specify the custom port number, the serviceID is not required.</p>
yarn.client.failover-max-attempts	<p>The max number of times FailoverProxyProvider should attempt failover.</p> <p>The default is -1.</p>

Property	Description
yarn.client.failover-sleep-base-ms	The sleep base (in milliseconds) to be used for calculating the exponential delay between failovers. The value defaults to the value set by yarn.resourcemanager.connect.retry-interval.ms, which is 30000 ms.
yarn.client.failover-sleep-max-ms	The maximum sleep time (in milliseconds) between failovers. The value defaults to the value set by yarn.resourcemanager.connect.retry-interval.ms, which is 30000 ms.
yarn.client.failover-retries	The number of times a client attempts to reconnect to a ResourceManager. The default, set in yarn-default.xml, is 0 (infinite).
yarn.client.failover-retries-on-socket-timeouts	The number of times a client attempts to reconnect to a ResourceManager on socket timeouts. The default, set in yarn-default.xml, is 0 (infinite).

ResourceManager Recovery Properties

The following table describes the configuration properties for ResourceManager recovery:

Property	Description
yarn.resourcemanager.recovery.enabled	Enables the ResourceManager to recovery based on the information in the ResourceManager state store. The default, set by configure.sh, is true.
yarn.resourcemanager.am.max-attempts	The maximum number of application attempts. This is a global setting for all ApplicationMaster nodes. You can configure an individual maximum number of application attempts for each ApplicationMaster node, but this property sets a global upper bound that overrides the individual node configuration. The default, set in yarn-default.xml, is 2.
mapreduce.am.max-attempts	The maximum number of MapReduce application attempts. If this value is larger than the value set by the ResourceManager, the ResourceManager value will override this value. The default number is set to 2, to allow at least one retry for AM. This property is set in mapred-default.xml.
yarn.resourcemanager.fs.state-store.uri	URI pointing to the location of the FileSystem path where the ResourceManager state is stored. The default value is configured to the path for the ResourceManager volume (/var/mapr/cluster/yarn/rm/system). If the FileSystem name is not provided, the system uses the value specified in the fs.default.name specified in the core-site.xml file.

Property	Description
yarn.resourcemanager.fs.state-store.retry-policy-spec	<p>Specifies the retry policy for the file system client.</p> <p>This policy is specified in pairs of values for the sleep time, in milliseconds, and number of retries.</p> <p>Each pair is enclosed in parentheses, such as (1000, 20), (2000, 30).</p> <p>The previous example sleeps for 1000 milliseconds for twenty retries, then thirty more retries 2000 milliseconds apart.</p> <p>The default, set in yarn-default.xml, is (2000, 500).</p>
yarn.resourcemanager.store.class	<p>The class name of the state-store to be used for saving application/attempt state and the credentials.</p> <p>The available state-store implementations are <code>org.apache.hadoop.yarn.server.resourcemanager.recovery.ZKRMStateStore</code>, a ZooKeeper based state-store implementation, and <code>org.apache.hadoop.yarn.server.resourcemanager.recovery.FileSystemRMStateStore</code>, a state-store implementation based on file system.</p> <p>The default, yarn-default.xml, is <code>org.apache.hadoop.yarn.server.resourcemanager.recovery.FileSystemRMStateStore</code>.</p>
yarn.resourcemanager.state-store.max-completed-applications	<p>The maximum number of completed applications that the state store retains, which is a number less than or equal to \$<code>{yarn.resourcemanager.max-completed-applications}</code>.</p> <p>The default value is 10000. This setting ensures that the applications kept in the state store are consistent with the applications in ResourceManager memory.</p> <p>Any value larger than \$<code>{yarn.resourcemanager.max-completed-applications}</code> is reset to the default.</p> <p>The value of this property affects ResourceManager recovery performance. Typically, a smaller value optimizes performance for recovery.</p>
yarn.resourcemanager.zk-address	<p>A comma-separated list of Host:Port pairs. Each corresponds to a ZooKeeper server, such as <code>127.0.0.1:5181,127.0.0.1:5181,127.0.0.1:5181</code>.</p> <p>These hosts are used by the ResourceManager to store state.</p>
yarn.resourcemanager.zk-state-store.parent-path	<p>The full path of the root znode where ResourceManager state is stored. The default value is <code>/rmstore</code>.</p>
yarn.resourcemanager.zk-num-retries	<p>Number of times the ResourceManager tries to connect to the ZooKeeper server when the connection is lost.</p> <p>The default value is 500.</p>
yarn.resourcemanager.zk-retry-interval-ms	<p>The interval between retries, in milliseconds, when connecting to a ZooKeeper server. The default value is 2000.</p>

Property	Description
yarn.resourcemanager.zk-timeout-ms	The ZooKeeper session timeout in milliseconds. The ZooKeeper server uses this configuration to determine session expiration. Sessions expire when the server does not receive a heartbeat from the client within the session timeout period. The default value is 10000.
yarn.resourcemanager.zk-acl	ACLs that set permissions on ZooKeeper znodes. The default value is world:anyone:rwcd

Administrator's Reference

This section contains in-depth reference information for the administrator.

maprcli and REST API Syntax

This section provides information about the HPE Data Fabric command API. Most commands can be run on the command-line interface (CLI), or by making REST requests programmatically or in a browser.

To run CLI commands, use an ssh connection to any node in the cluster. To use the REST interface, make HTTP requests to a node that is running the WebServer service.

Overview

Each command reference page includes the command syntax, a table that describes the parameters, and examples of command usage.

In each parameter table, required parameters are in **bold** text. For output commands, the reference pages include tables that describe the output fields. Values that do not apply to particular combinations are marked **NA**.

REST API Syntax

Describes the Data Fabric REST API syntax format.

REST calls use the following format to interact with [REST API server](#) over the HTTPS protocol:

```
https://<host>:<port>/rest/<command>[/<subcommand>...]?<parameters>
```

In the aforementioned statement, <command> is a [maprcli command](#), and <subcommand> is the command's subcommand. Refer to the respective command documentation for its subcommands.

Construct the <parameters> list from the required and optional parameters, in the format <parameter>=<value> separated by the ampersand (&) character. Example:

```
https://r1n1.qa.sj.ca.us:8443/rest/volume/mount?name=test-volume&path=/test
```

NOTE: If used on a command line, the & must be surrounded by quotes, to prevent the shell interpreting it as the background character. Values in REST API calls must be URL-encoded. For readability, the values in this document use the actual characters, rather than the URL-encoded versions.

Authentication

There are 2 main methods to authenticate to REST API, in general:

- Basic authentication without cookies- Basic authentication is done without cookies

- Authentication with session cookies - There are three ways of authentication with session cookies.
 - Basic authentication
 - Form-based authentication
 - SPNEGO

NOTE: All methods will use PAM. To configure PAM for REST API, see [PAM Configuration](#).

Basic Authentication without Cookies

To authenticate using basic authentication, send a request with a basic authorization header, which has a user ID and password.

NOTE: This method has a higher overhead than session cookies because each request is re-authenticated, due to absence of session cookies.

For example, with cURL and wget:

cURL Syntax

```
curl -u <username> https://<host>:<port>/rest/<command>...
```

IMPORTANT: To keep your password secure, do not provide it on the command line. Enter your password securely when cURL prompts you for your password.

wget Syntax

```
wget --user <username> --ask-password https://<host>:<port>/rest/  
<command>...
```

IMPORTANT: To keep your password secure, do not provide it on the command line. Use the --ask-password option instead. You can enter your password securely, when wget prompts you for your password.

Authentication with Session Cookies

NOTE: Session cookies have an idle time of 30 minutes, that is, they will expire if not used within 30 minutes, and have a maximum lifetime of 24 hours.

Basic Authentication

To authenticate using basic authentication, send a request with a basic authorization header, which has a user ID and password. For example, run the following command to save cookies into cookiejar.txt, in your home directory:

```
curl -u <username> -c ~/cookiejar.txt  
https://<host>:<port>
```

Form-based Authentication

To use form based auth to generate a session cookie, send a POST request to /login with the username and password parameters in the form data, for example with curl:

```
curl -X POST -c ~/cookiejar.txt  
https://<host>:<port>/login -d  
'username=<name>&password=<passwd>'
```

SPNEGO

To authenticate using SPNEGO, ensure that the apiserver nodes are [configured for SPNEGO](#). After configuring, send a negotiate authorization header. For example, to authenticate with the SPNEGO token and save the cookie in a text file named `cookiejar.txt` in your home directory, run the following command:

```
curl --negotiate -u : -b ~/
cookiejar.txt -c ~/cookiejar.txt
https://<web server node>:8443/rest/
<API call> -v
```

Once the session cookies are generated, the permission of the cookie file must be restricted with the following command:

```
chmod 600 ~/cookiejar.txt
```

The contents of the cookie is something similar to the following:

```
cat /tmp/cookiejar.txt
# Netscape HTTP Cookie File
# https://curl.haxx.se/docs/http-cookies.html
# This file was generated by libcurl! Edit at your own risk.

#HttpOnly_<webserver-hostname> FALSE / TRUE 1509486224
MAPR.APISERVER.JSESSIONID node014ukard563rhu1ns8umn2s6uft3709.node0
#HttpOnly_<webserver-hostname> FALSE / FALSE 0
MAPR.APISERVER.SESSIONID HZA9C20D084E614E36AA567F47FC9105A4
```

The cookiejar file (session cookie) can now be used to authenticate requests, for example, to retrieve the list of nodes on the cluster with cURL:

```
curl -sS -b ~/cookiejar.txt https://<host>:<port>/rest/node/list |
python -mjson.tool
```

NOTE: In the aforementioned command, `-sS` and `python -mjson.tool` are used to obtain well-formatted JSON content.

REST API Calls to Remote Cluster

If you have secure clusters and you wish to make REST API calls to a remote secure cluster, you can specify the `cluster` parameter in the request if you have your environment configured for remote access. To set up your environment for API calls to remote secure cluster, follow the steps for [configuring secure clusters for running commands remotely](#).

Command-Line Interface

Describes how the MapR CLI command syntax is documented.

The MapR CLI commands are documented using the following conventions:

- [Square brackets] indicate an optional parameter
- <Angle brackets> indicate a value to enter

The following syntax example shows that the `volume mount` command requires the `-name` parameter, for which you must enter a list of volumes, and all other parameters are optional:

```
maprcli volume mount
[ -cluster <cluster> ]
```

```
-name <volume list>
[ -path <path list> ]
```

For clarity, the syntax examples show each parameter on a separate line; in practical usage, the command and all parameters and options are typed on a single line. Example:

```
maprcli volume mount -name test-volume -path /test
```

Common Parameters

Describes parameters that are available for many commands.

The following parameters are available for many commands in both the REST and command-line contexts.

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
zkconnect	A ZooKeeper connect string, which specifies a list of the hosts running ZooKeeper, and the port to use on each, in the format: '<host>[:<port>] [, <host>[:<port>] ...]' Default: 'localhost:5181' In most cases the ZooKeeper connect string can be omitted, but it is useful in certain cases when the CLDB is not running.

Common Options

Describes options that are available for many commands.

The following options are available for most commands in the command-line context.

Option	Description
-noheader	When displaying tabular output from a command, omits the header row.
-long	Shows the entire value. This is useful when the command response contains complex information. When -long is omitted, complex information is displayed as an ellipsis (...).
-json	Displays command output in JSON format. When -json is omitted, the command output is displayed in tabular format.
-cli.loglevel	Specifies a log level for API output. Legal values for this option are: <ul style="list-style-type: none"> • DEBUG • INFO • ERROR • WARN • TRACE • FATAL

Filters

Describes the use of filters with MapR CLI commands.

Some MapR CLI commands use *filters*, which let you specify large numbers of nodes or volumes by matching specified values in specified fields rather than by typing each name explicitly.

Filters use the following format:

```
[<field><operator>"<value>"]<and>[<field><operator>"<value>"] ...
```

field	Field on which to filter. The field depends on the command with which the filter is used.
operator	An operator for that field: <ul style="list-style-type: none">• == - Exact match• != - Does not match• > - Greater than• < - Less than• >= - Greater than or equal to• <= - Less than or equal to
value	Value on which to filter. Wildcards (using *) are allowed for operators == and !=. There is a special value all that matches all values.

You can use the wildcard (*) for partial matches. For example, you can display all volumes whose owner is root and whose name begins with test as follows:

```
maprcli volume list -filter [n=="test*"]and[on=="root"]
```

 **NOTE:** maprcli commands and REST APIs do not support OR conditions.

If you are using the <, >, <=, or >= symbols in the filter expression, ensure that you enclose the expression in single or double quotes. For example, -filter '[quota>=1234]' or -filter "[quota>=1234]"

Response

Describes the different return responses.

The commands return responses in JSON or in a tabular format. When you run commands from the command line, the response is returned in tabular format unless you specify JSON using the -json option; when you run commands through the REST interface, the response is returned in JSON.

 **NOTE:** The columns returned by operations such as get, list, info, and so on are not sorted in any particular order.

Success

On a successful call, each command returns the error code zero (OK) and any data requested. When JSON output is specified, the data is returned as an array of records along with the status code and the total number of records. In the tabular format, the data is returned as a sequence of rows, each of which contains the fields in the record separated by tabs.

JSON

```
{
    "status": "OK",
    "total": <number of
records>,
    "data": [
        {
            <record>
        }
        ...
    ]
}
```

Tabular

```
status
0

Or

<heading>  <heading>  <heading> ...
            <field>    <field>
<field> ...
            ...
```

Error

When an error occurs, the command returns the error code and descriptive message.

JSON

```
{
    "status": "ERROR",
    "errors": [
        {
            "id": <error code>,
            "desc": "<command>: <error
message>"
        }
    ]
}
```

Tabular

```
ERROR (<error code>) - <command>:
<error message>
```

acerole validate

Verifies given user roles for ACEs exists in the /opt/mapr/conf/m7_permissions_roles_refimpl.conf file.

This command returns true if role exists in the /opt/mapr/conf/m7_permissions_roles_refimpl.conf file and false if given role is not in the file. If the MAPR_ROLES_LIB_ENABLE_TRACE environment variable is set to TRUE, the command returns also the number of users assigned to the specified role and the number of roles in the file.

Syntax

CLI

```
maprcli acerole validate
    -role role which need to be
    validate
```

REST

Request Type	GET
Request URL	http[s]://<host:port>/rest/acerole/validate?<parameters>

Parameters

Parameter	Description
role	(Required) The role to validate.

Examples

Verifies whether given role exists when the MAPR_ROLES_LIB_ENABLE_TRACE environment variable is not set:

CLI

```
maprcli acerole validate -role Role_1
maprcli acerole validate command
returned : true
```

REST

```
curl -X
GET 'https://server.sj.us:8443/rest/
acerole/validate?role=Role_1' --user
<username>:<password>
```

Verifies whether given role exists when the MAPR_ROLES_LIB_ENABLE_TRACE environment variable is set:

CLI

```
export
MAPR_ROLES_LIB_ENABLE_TRACE=TRUE

echo $MAPR_ROLES_LIB_ENABLE_TRACE
TRUE

maprcli acerole validate -role Role_1
RoleMap: Added user 500 with role
'Role_1'
RoleMap: Added user 1000 with role
'Role_1'
RoleMap: found 2 users and 2 roles.
maprcli acerole validate command
returned : true
```

REST

```
export
MAPR_ROLES_LIB_ENABLE_TRACE=TRUE

echo $MAPR_ROLES_LIB_ENABLE_TRACE
TRUE
curl -X
GET 'https://abc.sj.us:8443/rest/
acerole/validate?role=Role_1' --user
<username>:<password>
```

acl

Describes the `acl` commands used to access control lists (ACLs).

Specifying Permissions

Specify permissions for a user or group with a string that lists the permissions for that user or group. To specify permissions for multiple users or groups, use a string for each, separated by spaces. The format is as follows:

- Users -

```
<user>:<action>[,<action>...][<user>:<action>[,<action>...]]
```

- Groups -

```
<group>:<action>[,<action>...][<group>:<action>[,<action>...]]
```

To use the `acl edit` command, you must have full control (`fc`) permission on the cluster or volume for which you are running the command.

The following tables list the permission codes used by the `acl` commands.

Cluster Permission Codes

Permission Code	Allowed Action
login	Log in to the Control System, use the API and command-line interface, read access on cluster and volumes.
ss	Start/stop services.
cv	Create volumes.
a	Administrative access to cluster ACLs. Grants no other permissions.
fc	Full control over the cluster. This enables all cluster-related administrative options with the exception of changing the cluster ACLs.
cp	Create security policies

Volume Permission Codes

Code	Allowed Action
dump	Dump the volume.
restore	Mirror or restore the volume.
m	Modify volume properties, create and delete snapshots.
d	Delete a volume.
a	Administrative access to volume ACLs.
fc	Full control (admin access and permission to change volume ACL).

Security Policy Permission Codes

Code	Allowed Action
a (admin)	View and modify the permissions on a security policy; cannot view or modify the security policy.
fc (full control)	View and modify the security policy, including data access ACEs; cannot view or modify the permissions on a security policy.
r (read)	View all parts of a security policy; cannot modify the security policy.

External S3 Permission Codes

Code	Allowed Action
cs3(connect s3)	Connect to an external S3 server

IAM Policy Permission Codes

Code	Allowed Action
cip (create iam policy)	Create, edit, delete an IAM Policy
aip (attach iam policy)	Attach/assign IAM policy

User-defined Role Permission Codes

Code	Allowed Action
cir (create role)	Create, edit, delete a user-defined role
air (attach role)	Attach/assign a user-defined role

acl edit

Modifies a specific user's access to a cluster, volume, or security policy.

Permissions Required

The `acl edit` command grants one or more specific volume or cluster permissions to a user. To use the `acl edit` command, you must have administrative (a) permissions on the volume and cluster for which you are running the command. The permissions are specified as a comma-separated list of permission codes. See [acl](#) on page 2273.

Syntax

CLI

```
maprcli acl edit
[ -cluster <cluster name> ]
[ -group <group> ]
[ -name <name> ]
-type cluster|volume|
securitypolicy
[ -user <user> ]
```

REST

Request Type	POST
Request URL	<code>http[s]://<host:port>/rest/acl/edit?<parameters></code>

Parameters

Parameter	Description
cluster	(Optional) The cluster on which to run the command.
group	(Optional) Groups and allowed actions for each group. See acl on page 2273. Format: <code><group>:<action>[,<action>...]</code> [<code><group>:<action>[,<action>...]</code>]. You must specify either a user or a group.
name	(Optional) The object name. For a volume, specify the name of the volume in this parameter. To set security policy level permissions, specify the name of the security policy in this parameter.
type	(Required) The object type. Allowed values are <code>cluster</code> , <code>volume</code> or <code>securitypolicy</code> .
user	(Optional) Users and allowed actions for each user. See acl on page 2273. Format: <code><user>:<action>[,<action>...]</code> [<code><user>:<action>[,<action>...]</code>]. You must specify either a user or a group.

Examples

Give the user `jsmith` dump, restore, and delete permissions for "test-volume":

CLI

```
maprcli acl edit -type
volume -name test-volume -user
jsmith:dump,restore,d
```

REST

```
curl -X POST 'https://
server.sj.us:8443/rest/acl/edit?
type=volume&name=test-volume&user=jsmi
th%3Adump,restore,d' --user
<username>:<password>
```

acl set

Modifies the Access Control List (ACL) for a cluster, volume, or security policy.

The `acl set` command specifies the [ACL](#) for a cluster or volume. Any previous permissions are overwritten by the new values, and any permissions omitted are removed. To use the `acl set` command, you must have administrative (a) permissions on the volume and cluster for which you are running the command. The [ACL permissions](#) are specified as a comma-separated list of permission codes. See [acl](#) on page 2273. You must specify either a user or a group. When the type is volume, you must specify a volume name using the `name` parameter.

The `acl set` command removes any previous [ACL](#) values. To preserve some of the permissions, you should either use the `acl edit` command instead of `acl set`, or use `acl show` to list the values before overwriting them.

Syntax

CLI

```
maprcli acl set
[ -cluster <cluster name> ]
[ -group <group> ]
[ -name <name> ]
-type cluster|volume|
securitypolicy
[ -user <user> ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/acl/set?<parameters>

Parameters

Parameter	Description
cluster	(Optional) The cluster on which to run the command.
group	(Optional) Groups and allowed actions for each group. See acl on page 2273. Format: <group>:<action>[,<action>...] [<group>:<action>[,<action>...]]

Parameter	Description
name	(Optional) The object name. For a volume, specify the name of the volume in this parameter. To set security policy level permissions, specify the name of the security policy, in this parameter.
type	(Required) The object type. Allowed values are cluster, volume or securitypolicy.
user	(Optional) Users and allowed actions for each user. See acl on page 2273. Format: <user>:<action>[,<action>...] [<user>:<action>[,<action>...]]

Examples

Give the user root full control of the my.cluster.com cluster and remove all permissions for all other users:

CLI

```
maprcli acl set -type cluster -user
user10:fc
```

REST

```
# curl -X POST 'https://
abc.sj.us:8443/rest/acl/set?
type=cluster&user=user10%3Afc' --user
<username>:<password>
{"timestamp":1525462091620,"timeofday"
:"2018-05-04 12:28:11.620 GMT-0700
PM","status":"OK","total":0,"data":[]}
```

Usage Example

```
# maprcli acl show -type cluster
Allowed actions      Principal
[login, ss, cv, a, fc, cp] User mapr
[login, ss, cv, a, fc, cp] User root
[login, cp] User fuser1

maprcli acl set -type cluster -cluster my.cluster.com -user root:fc
maprcli acl show -type cluster
Principal Allowed actions
User root [login, ss, cv, a, fc, cp]
```

WARNING: Notice that the specified permissions have overwritten the existing [ACL](#).

Give multiple users specific permissions for the egVol1 volume and remove all permissions for all other users:

CLI

```
maprcli acl set -type volume -name
egVol1 -user m7user5:dump,restore,m
m7user4:fc -json
{
  "timestamp":1525462647371,
  "timeofday":"2018-05-04
12:37:27.371 GMT-0700 PM",
  "status":"OK",
```

```
"total":0,
"data":[
]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/acl/set?
type=volume&name=egVol1&user=m7user5%3
Adump,restore,m%20m7user4%3Afc' --user
mapr:mapr
{"timestamp":1525463080941,"timeofday"
:"2018-05-04 12:44:40.941 GMT-0700
PM","status":"OK","total":0,"data":[]}
```

acl show

Displays the ACL associated with an object (cluster or a volume).

Syntax

An ACL contains the list of users who can perform specific actions.

CLI

```
maprcli acl show
    -type object type [cluster|
volume|securitypolicy]
    [ -name name ]
    [ -cluster cluster name ]
    [ -user userName whose ACL is
queried ]
    [ -group groupName whose ACL is
queried ]
    [ -output output format short|
long|terse (default short). default:
short ]
    [ -perm list of available
permissions Parameter takes no
value ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/acl/show?<parameters>

Parameters

Parameter	Description
cluster	(Optional) The name of the cluster on which to run the command.- The default is the cluster on which the command is run.
group	(Optional) The group for which to display permissions. By default, displays permissions for all groups by default.

Parameter	Description
name	<i>(Conditionally Required)</i> The object name. To view security policy level permissions, specify the name of the security policy in this parameter. This parameter is required for the securitypolicy ACL type.
output	<i>(Optional)</i> The output format: <ul style="list-style-type: none"> • long • short • terse The default format is short.
perm	<i>(Optional)</i> When you specify this option, <code>acl show</code> displays the permissions available for the object type specified in the <code>type</code> parameter.
type	<i>(Required)</i> The object type. Allowed values are <code>cluster</code> , <code>volume</code> or <code>securitypolicy</code> . To get security policy level permissions, specify the type as <code>securitypolicy</code> .
user	<i>(Optional)</i> The user for whom to display permissions. By default, displays permissions for all users.

Output

The actions that each user or group is allowed to perform on the cluster or the specified volume. For information about each allowed action, see [acl](#) on page 2273.

Principal	Allowed actions
User root	[login, ss, cv, a, fc, cp]
Group root	[login, ss, cv, a, fc, cp]
All users	[login]

Examples

Show the ACL for the cluster:

CLI

```
maprcli acl show -type cluster -json
{
  "timestamp":1555494572399,
  "timeofday":"2019-04-17
02:49:32.399 GMT-0700 AM",
  "status":"OK",
  "total":2,
  "data":[
    {
      "Principal":"User mapr",
      "Allowed
actions":["login, ss, cv, a, fc, cp]"
    },
    {
      "Principal":"User root",
      "Allowed
actions":["login, ss, cv, a, fc, cp]"
    }
  ]
}
```

```
    }
  ]
}
```

REST

```
curl -u mapr:mapr -X GET -k "https://
abc.sj.us:8443/rest/acl/show?
type=cluster"
{"timestamp":1555494852652,"timeofday"
:"2019-04-17 02:54:12.652 GMT-0700
AM","status":"OK","total":2,"data":
[{"Principal":"User mapr","Allowed
actions":"[login, ss, cv, a, fc,
cp]"}, {"Principal":"User
root","Allowed actions":"[login, ss,
cv, a, fc, cp]}]}
```

Show the ACL for "test-volume":**CLI**

```
maprcli acl show -type volume -name
sampleVol1
Allowed actions
Principal
[dump, restore, m, a, d, fc] User
mapr
[dump, restore, m, d, fc]      User
foo
[dump, restore, a]            User
bar
[m, d]                        User abc
```

REST

```
curl -u mapr:mapr -X GET -k "https://
abc.sj.us:8443/rest/acl/show?
type=volume&name=sampleVol1"
{"timestamp":1525461068100,"timeofday"
:"2018-05-04 12:11:08.100 GMT-0700
PM","status":"OK","total":4,"data":
[{"Principal":"User mapr","Allowed
actions":"[dump, restore, m, a, d,
fc]"}, {"Principal":"User
foo","Allowed actions":"[dump,
restore, m, d, fc]"},
{"Principal":"User bar","Allowed
actions":"[dump, restore, a]"},
{"Principal":"User abc","Allowed
actions":"[m, d]}]}
```

Show the permissions that can be set on a cluster:**CLI**

```
maprcli acl show -type cluster -perm
Permissions
Description
login          Login
access
ss              Start/stop services in
the cluster
cv              Create
volumes
```

```
a
Administrator
fc          Full
control
cp          Create security policies
```

REST

```
curl -u mapr:mapr -X GET -k "https://
abc.sj.us:8443/rest/acl/show?
type=cluster&perm"
{"timestamp":1555497261931,"timeofday"
:"2019-04-17 03:34:21.931 GMT-0700
AM","status":"OK","total":6,"data":
[{"Permissions":"login","Description":
"Login access"},
{"Permissions":"ss","Description":"Sta
rt/stop services in the cluster"},
{"Permissions":"cv","Description":"Cre
ate volumes"},
{"Permissions":"a","Description":"Admi
nistrator"},
{"Permissions":"fc","Description":"Ful
l control"},
{"Permissions":"cp","Description":"Cre
ate security policies"}]}
```

Display the available security-level permissions:**CLI**

```
maprcli acl show -type
securitypolicy -perm -name hipaa
Permissions
Description
r          Read
a          Admin
fc         Full control
```

REST

```
curl -u mapr:mapr -X GET -k "https://
abc.sj.us:8443/rest/acl/show?
type=securitypolicy&perm&name=hipaa"

{"timestamp":1525459863777,"timeofday"
:"2019-02-04 11:51:03.777 GMT-0700
AM","status":"OK","total":3,"data":
[{"Permissions":"r","Description":"Rea
d"},
{"Permissions":"a","Description":"Read
"},
{"Permissions":"fc","Description":"Ful
l control"}]}
```

Display list of users and security policy permissions:**CLI**

Run the `maprcli acl show -type securitypolicy` command without the `-perm` option, to display the list of users who have security

policy level permissions for the policy, and the respective permissions:

```
maprcli acl show -type
securitypolicy -name hipaa
    Allowed actions Principal
    [r, a, fc]      User tom
    [a]             User
harry
```

REST

```
curl -u mapr:mapr -X GET -k "https://
abc.sj.us:8443/rest/acl/show?
type=securitypolicy&name=hipaa"
{"timestamp":1555498377874,"timeofday"
:"2019-04-17 03:52:57.874 GMT-0700
AM","status":"OK","total":2,"data":
[{"Principal":"User tom","Allowed
actions":["r, a, fc"]},
{"Principal":"User harry","Allowed
actions":["a"]}]}]
```

Displays only name, ID and ACL for a user having ONLY policy level admin permissions.

CLI

```
maprcli security policy create -name
testpolicy1 -user root:r,a,fc
fuser1:a fuser2:fc -readfileace
u:fuser1

maprcli acl
show -type securitypolicy -name
testpolicy1 -user fuser2
    Allowed actions Principal
    [r, fc] User fuser2

maprcli acl
show -type securitypolicy -name
testpolicy1 -user fuser1
    Allowed actions Principal
    [a] User fuser1

maprcli security policy info -name
testpolicy1 -json
{
  "timestamp":1551432309820,
    "timeofday":"2019-03-01
01:25:09.820 GMT-0800 AM",
    "status":"OK",
    "total":1,
    "data":[
      {
        "policyname":"testpolicy1",
        "policyid":19,
        "acl":[
          {
            "Principal":"User root",
            "Allowed actions":["r,
a, fc]"
```

```
    },
    {
      "Principal": "User",
      "Allowed actions": "[a]"
    },
    {
      "Principal": "User",
      "Allowed actions": "[r,
      fc]"
    }
  ]
}
```

alarm
Describes the alarm commands that perform functions related to system alarms.

Alarm Notification Fields

The following fields specify the configuration of alarm notifications.

Field	Description
alarm	The named alarm.
individual	Specifies whether individual alarm notifications are sent to the default email address for the alarm type: <ul style="list-style-type: none">• 0 - do not send notifications to the default email address for the alarm type• 1 - send notifications to the default email address for the alarm type
email	A custom email address for notifications about this alarm type. If specified, alarm notifications are sent to this email address, regardless of whether they are sent to the default email address.

Alarm Types
See [Alarms Reference](#).

Alarm History
To see a history of alarms that have been raised, look at the file `/opt/mapr/logs/cldb.log` on the master CLDB node. Example:

```
grep ALARM /opt/mapr/logs/cldb.log
```

alarm clear
Clears one or more alarms. Permissions required: `fc` or `a`.

Syntax

CLI

```
maprcli alarm clear
  -alarm <alarm>
  [ -cluster <cluster> ]
  [ -entity entity (hostname OR
volume name OR Ae name) ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/clear?<parameters>

Parameters

Parameter	Description
alarm	(Required) The named alarm to clear. See Alarm Types .
cluster	(Optional) The cluster on which to run the command. By default, this is the cluster on which this command is run.
entity	(Optional) The entity on which to clear the alarm. To be able to use this option, you must have your cluster configured to run commands remotely on other clusters. Refer to Configuring Secure Clusters for Running Commands Remotely on page 2223 for information on configuring clusters to run commands remotely on other clusters.

Examples

Clear a specific alarm:

CLI

```
maprcli alarm clear -alarm
NODE_ALARM_DEBUG_LOGGING
```

REST

 **NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X POST -u <username> 'https://
abcorp.nj.us:8443/rest/alarm/clear?
alarm=NODE_ALARM_DEBUG_LOGGING'
{"timestamp":1666166640211,"timeofday"
:"2022-10-19 08:04:00.211 GMT+0000
AM","status":"OK","total":0,"data":[]}
```

alarm clearmulti

Clears all alarm occurrences of specified multiple alarm types. Permissions required: fc or a.

Syntax**CLI**

```
maprcli alarm clearmulti
[ -cluster cluster_name ]
-alarm alarm[:entity][:aetype]
<comma seperated alarms>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/clearmulti?<parameters>

Parameters

Parameter	Description
alarm	(Required) Comma seperated list of alarm types to clear.
cluster	(Optional) The cluster on which to run the command. Default is the current cluster.

Example**Clear a specific alarm:****CLI**

```
maprcli alarm clear -alarm
NODE_ALARM_DEBUG_LOGGING,VOLUME_ALARM_
COMPACTION_FAILURE
```

REST

NOTE: For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/clearmulti?
alarm=CLUSTER_ALARM_LICENSE_NEAR_EXPIR
ATION,CLUSTER_ALARM_TOO_MANY_COMPOSITE
_IDS
{"timestamp":1668768353611,"timeofday"
:"2022-11-18 10:45:53.611 GMT+0000
AM","status":"OK","total":0,"data":[]}
```

alarm clearall

Clears all alarms. Permissions required: fc or a.

Syntax**CLI**

```
maprcli alarm clearall
[ -cluster <cluster> ]
```

REST

Request Type	POST
--------------	------

Request URL	http[s]://<host>:<port>/rest/alarm/clearall?<parameters>
-------------	--

Parameters

Parameter	Description
cluster	(Optional) The cluster on which to run the command. By default, this is the cluster on which the command is run.

Examples

Clear all alarms:

CLI

```
maprcli alarm clearall
```

REST

NOTE: For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X POST -u <username> https://abc.sj.us:8443/rest/alarm/clearall
{"timestamp":1666948082631,"timeofday":"2022-10-28 09:08:02.631 GMT+0000 AM","status":"OK","total":0,"data":[]}
```

alarm config load

Displays the configuration of alarm notifications. Permission required: login

Syntax

CLI

```
maprcli alarm config load
[ -cluster <cluster> ]
[ -output terse|verbose ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/alarm/config/load?<parameters>

Parameters

Parameter	Description
cluster	(Optional) The cluster on which to run the command. The default is the cluster on which the command is run.

Parameter	Description
output	(Optional) Whether the output should be terse or verbose. The default is verbose.

Output

A list of configuration values for alarm notifications.

Output Fields

See [Alarm Notification Fields](#).

Sample output

```
alarm                                individual  email

Examples

NOTE: For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

Display the alarm notification configuration:

CLI

```
maprcli alarm config load
```

REST

```
curl -X GET -u <username> https://
abc.sj.us:8443/rest/alarm/config/load?
output=terse

```

alarm config save

Sets notification preferences for alarms. Permissions required: fc or a.

Alarm notifications can be sent to the default email address and a specific email address for each named alarm. If `individual` is set to 1 for a specific alarm, then notifications for that alarm are sent to the default email address for the alarm type. If a custom email address is provided, notifications are sent there regardless of whether they are also sent to the default email address.

Syntax

CLI

```
maprcli alarm config save
[ -cluster <cluster> ]
-values <values>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/config/save?<parameters>

Parameters

Parameter	Description
cluster	(Optional) The cluster on which to run the command. The default is the cluster on which to run the command.
values	(Required) A comma-separated list of configuration values for one or more alarms, in the following format: <alarm>,<individual>,<email> See Alarm Notification Fields .

Examples

Send alert emails for the AE_ALARM_AEQUOTA_EXCEEDED alarm to the default email address and a custom email address:

CLI

```
maprcli alarm config save -values
"AE_ALARM_AEQUOTA_EXCEEDED,1,test@example.com"
```

REST

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/config/save?
values=AE_ALARM_AEQUOTA_EXCEEDED,1,tes
t@example.com
```

alarm group

Alarm groups are groups of alarms for which email addresses of users/groups can be set (to send alert to when an alarm is raised) and removed.

Permissions required: fc or a

alarm group addAlarms

Add alarms to a group.

Syntax

CLI

```
maprcli alarm group addAlarms
[ -cluster cluster_name ]
```

```
-groupname <group name>
-alarms <alarm name>
```

REST API

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/group/addAlarms??<parameters>

Parameters

Parameter	Description
cluster	(Optional) The cluster on which to run the command. The default is the cluster on which the command is run.
groupname	(Required) The name of the alarm group to create. If necessary, run listGroup to retrieve the list of alarm groups.
alarms	(Required) The comma-separated list of alarms to add to the group.

Example

Add alarms to the alarm group:

CLI

```
maprcli alarm group addAlarms
  -groupname cldb.alarm.group.info
  -alarms
  NODE_ALARM_HB_PROCESSING_SLOW,CLUSTER_
  ALARM_CLUSTER_ALMOST_FULL
```

REST

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/group/
addAlarms?
groupname=cldb.alarm.group.info&alarms
=NODE_ALARM_HB_PROCESSING_SLOW,CLUSTER
_ALARM_CLUSTER_ALMOST_FULL
```

alarm group addEmails

Adds the email addresses of users/groups to send alert to when an alarm is raised.

Syntax**CLI**

```
maprcli alarm group addEmails
[ -cluster <cluster_name> ]
  -groupname <group name>
  -emails <email addresses>
```

REST API

Request Type	POST
--------------	------

Request URL	http[s]://<host>:<port>/rest/alarm/group/addEmails?<parameters>
-------------	---

Parameters

Parameter	Description
cluster	(Optional) The cluster on which to run this command. The default is the cluster on which this command is run.,
groupname	(Required) The name of the alarm group to add the email addresses to. When an alarm in the group is raised, an alert email will be sent to the users/groups. If necessary, run listgroup to retrieve the list of alarm groups.
emails	(Required) The comma-separated list of email addresses of users to send alert emails to when an alarm is raised.

Example

Add email addresses to cldb.alarm.group.error group.

CLI

```
maprcli alarm
group addEmails -groupname
cldb.alarm.group.error -emails
abc@gmail.com,xyz@gmail.com
```

REST

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/group/
addEmails?
groupname=cldb.alarm.group.error&email
s=abc@gmail.com,xyz@gmail.com
```

alarm group deleteAlarms

Delete alarms in an alarm group.

Syntax

CLI

```
maprcli alarm group deleteAlarms
[ -cluster cluster_name ]
-groupname group name
-alarms alarm names
```

REST API

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/group/deleteAlarms?<parameters>

Parameters

Parameter	Description
cluster	(Optional) The cluster on which to run the command. By default, this is the cluster on which the command is run.
groupname	(Required) The name of the alarm group to remove alarms from.
alarms	(Required) The comma-separated list of alarms to remove from the group.

Example

Delete NODE_ALARM_HB_PROCESSING_SLOW and CLUSTER_ALARM_CLUSTER_ALMOST_FULL alarms in the cldb.alarm.group.info group:

CLI

```
maprcli alarm group deleteAlarms
  -groupname cldb.alarm.group.info
  -alarms
  NODE_ALARM_HB_PROCESSING_SLOW, CLUSTER_
  ALARM_CLUSTER_ALMOST_FULL
```

REST

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/group/
deleteAlarms?
groupname=cldb.alarm.group.info&alarms
=NODE_ALARM_HB_PROCESSING_SLOW, CLUSTER
_ALARM_CLUSTER_ALMOST_FULL
```

alarm group deleteEmails

Deletes the email addresses of users/groups.

Syntax**CLI**

```
maprcli alarm group deleteEmails
[ -cluster <cluster_name> ]
  -groupname <group name>
  -emails <email addresses>
```

REST API

Request Type	POST
Request URL	http[s]://<host>:<port>/ rest/alarm/group/ deleteEmails?<parameters>

Parameters

Parameter	Description
cluster	(Optional) The cluster on which to run the command. The default is the cluster on which the command is run.

Parameter	Description
groupname	(Required) The name of the alarm group to remove the email addresses from. If necessary, run <code>listgroup</code> to retrieve the list of alarm groups.
emails	(Required) The comma-separated list of email addresses of users/groups to remove.

Example

Delete the given emails associated with the `cldb.alarm.group.error` group:

CLI

```
maprccli alarm
group deleteEmails -groupname
cldb.alarm.group.error -emails
xyz@gmail.com,abc@gmail.com
```

REST

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/group/
deleteEmails?
groupname=cldb.alarm.group.errorinfo&e
mails=xyz@gmail.com,abc@gmail.com
```

alarm group listGroup

Lists the alarm groups.

NOTE: The three dots in the output indicate multiple alarms in the group. Use `-json` to format the output.

Syntax

CLI

```
maprccli alarm group listGroup
[ -cluster cluster_name ]
[ -start start. default: 0 ]
[ -limit limit. default:
2147483647 ]
[ -output output. default:
verbose ]
```

REST API

Request Type	GET
Request URL	<code>http[s]://<host>:<port>/rest/alarm/group/listGroup?<parameters></code>

Parameters

Parameter	Description
cluster	(Optional) The cluster on which to run the command. The default is the cluster on which the command is run.
start	(Optional) The list offset at which to start. Default: 0

Parameter	Description
limit	(Optional) The number of records to retrieve. Default value is 2147483647.
output	(Optional) The output format: <ul style="list-style-type: none"> • terse • verbose Default value is verbose.

Example

Return the list of alarms and associated email addresses.

CLI

```
# maprcli alarm group listGroup
alarm name emails group name
... abc@mapr.com
cldb.alarm.group.error
... cldb.alarm.group.info
... cldb.alarm.group.warn
```

In JSON Format:

```
maprcli alarm group listGroup -json
{
  "timestamp":1495018857252,
  "timeofday":"2017-05-17
11:00:57.252 GMT+0000",
  "status":"OK",
  "total":3,
  "data":[
    {
      "group
name":"cldb.alarm.group.error",
      "emails":"abc@mapr.com",
      "alarm name":[
        "NODE_ALARM_DISK_FAILURE",
        "CLUSTER_ALARM_LICENSE_EXPIRED",

        "VOLUME_ALARM_DATA_UNAVAILABLE",
        "NODE_ALARM_MAPRUSER_MISMATCH",
        "VOLUME_ALARM_NO_NODES_IN_TOPOLOGY",
        "VOLUME_ALARM_TABLE_REPL_ERROR",
        "NODE_ALARM_NO_HEARTBEAT",
        "VOLUME_ALARM_QUOTA_EXCEEDED",
        "VOLUME_ALARM_TOPOLOGY_FULL",
```

```
"NODE_ALARM_PAM_MISCONFIGURED",
"NODE_ALARM_MEMORY_ALLOCATION_EXCEEDED",
"NODE_ALARM_TOO_MANY_CONTAINERS",
"NODE_ALARM_NUM_INSTANCES_MISMATCH",
"AE_ALARM_AEQUOTA_EXCEEDED"
]
}
```

REST

```
curl -X GET -u
<username> https://abc.sj.us:8443/
rest/alarm/group/listGroup
```

alarm list

Lists alarms in the system. Permissions required: login.

You can list all alarms, alarms by type (Cluster, Node or Volume), or alarms on a particular node or volume. To retrieve a count of all alarm types, pass 1 in the summary parameter. You can specify the alarms to return by filtering on type and entity. Use start and limit to retrieve only a specified window of data.

Syntax

CLI

```
maprcli alarm list
[ -alarm alarm name ]
[ -all list all raised alarms
including the ones which are muted
Parameter takes no value ]
[ -cluster cluster_name ]
[ -entity entity (hostname OR
volume name OR Ae name) ]
[ -entitylimit entitylimit ]
[ -filter none. default: none ]
[ -from alarms raised after
time(in millis) ]
[ -getcount Send count of
currently raised alarms Parameter
takes no value ]
[ -history list cleared up alarms
only Parameter takes no value ]
[ -limit limit. default:
2147483647 ]
[ -muted list alarms configured
to be mute Parameter takes no value ]
[ -output output. default:
verbose ]
[ -sortby <alarmname|
alarmdescription|alarmtype|alarmstate|
alarmraised|alarmcleared|alarmentity|
alarmmutetime|alarmmuteupto|
alarmmuteduration|alarmgroups> ]
[ -sortorder <asc|desc> ]
[ -start start. default: 0 ]
[ -summary summary ]
[ -till alarms raised
before time(in millis) ]
```

```
[ -type type (CLUSTER
OR NODE OR VOLUME OR AE) ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/ rest/alarm/list? <parameters>

Parameters

Parameter	Description
alarm	(Optional) The alarm name for which to return information. The default is to list all alarms.
all	The list of all raised and muted alarms. This is the default.
cluster	(Optional) The cluster on which to list alarms. The default is the cluster on which the command is run.
entity	(Optional) The name of the cluster, node, volume, user, or group to check for alarms. The default is the name of the cluster on which the command is run.
entitylimit	(Optional) The number of alarm occurrences to return per alarm type. For example, if there are 10 alarms of type VOLUME_ALARM_COMPACTION_FAILURE and the entity limit is set to 4, then only the four latest alarm occurrences of type VOLUME_ALARM_COMPACTION_FAILURE are listed.
filter	(Optional) A filter specifying alarms to list. See Filters for more information. Default: none
from	(Optional) The list of alarms raised after a moment in time (specified in ms). Use from in conjunction with till to list alarms that have been raised within the specified period.
getcount	(Optional) The count of all alarms raised at the moment in time when you invoke this command.
history	(Optional) The list of all alarms cleared in the last 30 days. Muted alarms are not displayed in the output.
limit	(Optional) The number of records to retrieve. Default: 2147483647
muted	(Optional) The list of alarms that are muted.
output	(Optional) 0 Indicates whether the output should be terse or verbose. Default: verbose
sortby	(Optional) Specifies one of the following attributes by which to sort the list of alarms: alarmname, alarmdescripton, alarmtype, alarmstate, alarmraised, alarmcleared, alarmentity, alarmmutetime, alarmmuteupto, alarmmuteduration, alarmgroups. By default, the list of alarms is sorted by alarmtype.

Parameter	Description
sortorder	(Optional) Sorts the output in either ascending or descending order.
start	(Optional) The list offset at which to start. Default: 0
summary	(Optional) Specifies the type of data to return: <ul style="list-style-type: none"> 1 = count by alarm type 0 = List of alarms Default: false (0)
till	(Optional) The list of alarms raised before a moment in time (specified in ms). Use <code>till</code> in conjunction with <code>from</code> to list alarms that have been raised within the specified period.
type	The entity type: <ul style="list-style-type: none"> cluster node volume ae All alarm types are listed by default, if you do not specify this parameter.

Output

Information about one or more named alarms on the cluster, or for a specified node, volume, user, or group.

Output Fields

Field	Description
alarm state	State of the alarm: <ul style="list-style-type: none"> 0 = Clear 1 = Raised
description	A description of the condition that raised the alarm.
entity	The name of the volume, node, user, or group.
alarm name	The name of the alarm.
alarm statechange time	The date and time when the alarm was most recently raised.

Sample Output

```
alarm state
description
entity
alarm statechange time
```

alarm name

```

1          Volume desired replication is 1, current

```

alarm mute

Mutes an active alarm for the specified amount of time.

Syntax

CLI

```
maprcli alarm mute
  -alarm alarm[:entity][:aetype]
[:mute_duration] <comma seperated
alarms>
  [ -cluster cluster_name ]
  [ -muteminutes <mute_period> ]
```

REST API

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/mute?<parameters>

Parameters

Parameter	Description
alarm	(<i>Required</i>) The comma-separated list of the active alarms to mute. To mute an active alarm associated with an entity (such as volume, node, etc.) or type of accountable entity, you must also specify the name of the entity or the type of accountable entity separated by a colon (:).
cluster	(<i>Optional</i>) The cluster on which to run the command. The default is the cluster on which the command is run.
muteminutes	<p>(<i>Optional</i>) The amount of time, in minutes, to mute the alarm.</p> <p>This can be specified separately or specified after the colon (:<mute_period>) immediately following the alarm name. For example, if multiple alarms are being muted for different periods of time, use colon (:<mute_period>) to specify the mute period for each alarm.</p> <p>Specifying this separately is optional if colon (:<mute_period>) is used to specify the amount of time to mute an alarm. For example, when specifying a list of alarms to mute, use this parameter to specify the amount of time to mute the alarm for which no time period is specified using colon (:<mute_period>).</p> <p> NOTE: Either the value for this parameter or colon (:<mute_period>) is required to specify the amount of time for which to mute the alarm.</p>

Examples

Mute an active alarm for 10 minutes using one of the following:

CLI

```
maprcli alarm mute -alarm
CLUSTER_ALARM_LICENSE_NEAR_EXPIRATION:
10 (or)

maprcli alarm mute -alarm
CLUSTER_ALARM_LICENSE_NEAR_EXPIRATION
-muteminutes 10
```

REST

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/mute?
alarm=CLUSTER_ALARM_LICENSE_NEAR_EXPIR
ATION:10 (or)

curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/mute?
alarm=CLUSTER_ALARM_LICENSE_NEAR_EXPIR
ATION&muteminutes=10
```

Mute an active volume alarm on volume1 for 10 minutes using one of the following:

CLI

```
maprcli alarm mute -alarm
VOLUME_ALARM_DATA_UNDER_REPLICATED:vol
ume1:10 (or)
```

REST

```
maprcli alarm mute -alarm
VOLUME_ALARM_DATA_UNDER_REPLICATED:vol
ume1 -muteminutes 10
```

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/mute?
alarm=VOLUME_ALARM_DATA_UNDER_REPLICAT
ED:volume1:10 (or)
```

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/mute?
alarm=VOLUME_ALARM_DATA_UNDER_REPLICAT
ED:volume1&muteminutes=10
```

Mute active volume alarm on volume1 for 10 minutes, active cluster alarm for 20 minutes, and active volume alarm on volume2 for 30 minutes using one of the following:

CLI

```
maprcli alarm mute -alarm
VOLUME_ALARM_DATA_UNDER_REPLICATED:vol
ume1:10,
```

```
CLUSTER_ALARM_LICENSE_NEAR_EXPIRATION:
20,
```

```
VOLUME_ALARM_DATA_UNDER_REPLICATED:vol
ume2:30
```

(or)

```
maprcli alarm mute -alarm
```

```
VOLUME_ALARM_DATA_UNDER_REPLICATED:vol
ume1:10,
```

```
CLUSTER_ALARM_LICENSE_NEAR_EXPIRATION:
20,
```

```
VOLUME_ALARM_DATA_UNDER_REPLICATED:vol
ume2
```

```
-muteminutes 30
```

REST

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/mute?
alarm=VOLUME_ALARM_DATA_UNDER_REPLICAT
ED:volume1:10,
CLUSTER_ALARM_LICENSE_NEAR_EXPIRATION:
20,VOLUME_ALARM_DATA_UNDER_REPLICATED:
volume2:30
```

(or)

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/alarm/mute?
alarm=VOLUME_ALARM_DATA_UNDER_REPLICAT
ED:volume1:10,
CLUSTER_ALARM_LICENSE_NEAR_EXPIRATION:
```

```
20, VOLUME_ALARM_DATA_UNDER_REPLICATED:
volume2&muteminutes=30
```

alarm names

Displays a list of alarm names. Permissions required: login

Syntax

CLI

```
maprcli alarm names
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/alarm/names

Output

 **ATTENTION:** The list of alarms depends on the ecosystem components installed. Your output may vary depending on the ecosystem components that you have installed.

Example

Display all alarm names:

CLI

```
maprccli alarm names
```

REST

```
curl -X GET -u <username> https://
r1n1.sj.us:8443/rest/alarm/names
```

alarm raise

Raises a specified alarm or alarms. Permissions required: fc or a.

Syntax

CLI

```
maprccli alarm raise
  -alarm <alarm>
  [ -cluster <cluster> ]
  [ -description <description> ]
  [ -entity <cluster, entity, host,
node, or volume> ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/raise?<parameters>

Parameters

Parameter	Description
alarm	(Required) The alarm type to raise. See Alarm Types .
cluster	(Optional) The cluster on which to run the command. The default is the cluster on which the command is run,
description	(Optional) A brief description.
entity	(Optional) The entity on which to raise alarms. To be able to use this option, you must have your cluster configured to run commands remotely on other clusters. Refer to Configuring Secure Clusters for Running Commands Remotely on page 2223 for information on configuring clusters to run commands remotely on other clusters.. The default is the hostname of the host on which the command is run.

Examples

Raise a specific alarm:

CLI

```
maprcli alarm raise -alarm
NODE_ALARM_DEBUG_LOGGING
```

REST

 **NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X POST -u <username> 'https://
r1n1.sj.us:8443/rest/alarm/raise?
alarm=NODE_ALARM_DEBUG_LOGGING'
{"timestamp":1666002682984,"timeofday"
:"2022-10-17 10:31:22.984 GMT+0000
AM","status":"OK","total":0,"data":[]}
```

alarm unmute
Unmute a muted alarm.

Syntax

CLI

```
maprcli alarm unmute
-alarm [<alarm
name>[:<entity>[:<aetype>]]]+
[ -cluster cluster_name ]
```

REST API

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/alarm/unmute?<parameters>

Parameters

Parameter	Description
alarm	(Required) The comma-separated list of the muted alarms to unmute. To unmute an alarm associated with an entity (such as volume, node, etc.) or type of accountable entity, you can specify also the name of the entity or the type of accountable entity separated by a colon (:).
cluster	(Optional) The name of the cluster on which to run the command. The default is the cluster on which the command is run.

Example

Unmute alarm NODE_ALARM_SERVICE_APISERVER_DOWN

CLI

```
maprcli alarm unmute
NODE_ALARM_SERVICE_APISERVER_DOWN
```

REST

```
curl -X POST -u <username> https://
r1n1.sj.us:8443/rest/alarm/unmute?
slarm=NODE_ALARM_SERVICE_APISERVER_DOW
N
```

audit

Describes commands used to audit operations related to cluster management and data access.

audit cluster

Enables and disables auditing of operations that are related to the administration of a Data Fabric cluster.

Only the mapr user for the cluster can run this command. For more information about the mapr user, see [Managing Users and Groups](#).

For information about auditing cluster-administration operations, see [Auditing of Activity Related to Cluster Administration](#).

Syntax

CLI

```
maprccli audit cluster
-enabled <true | false>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/audit/cluster?enabled=true_or_false

Parameters

Parameter	Description
enabled	(Required) The value true enables auditing, the value false (default) disables it.

CLI

 **NOTE:** Before running the maprccli audit cluster command, you must obtain a ticket using mapr login. To obtain a ticket using mapr login, run the mapr login password command and enter the password for the root user.

```
maprccli audit cluster -enabled
true -json
{
  "timestamp":1669010238977,
  "timeofday":"2022-11-21 05:57:18.977
GMT+0000 AM",
  "status":"OK",
  "total":0,
  "data":[
```

```
    ]  
  }
```

REST

 **NOTE:** For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X GET -u <username> https://  
abc.sj.us:8443/rest/audit/cluster?  
enabled=true  
{  
  "timestamp":1669008214186,"timeofday"  
  :  
  "2022-11-21 05:23:34.186 GMT+0000  
  AM",  
  "status":"OK",  
  "total":0,  
  "data":[]  
}
```

audit data

Enables and disables auditing of file system and table operations.

See [Auditing of File System Operations and Table Operations](#) for a list of these operations.

All administrative users for the cluster can run this command. For more information, see [Managing Users and Groups](#).

Syntax

CLI

```
maprcli audit data  
  [ -cluster cluster_name ]  
  [ -enabled enable audit for data  
  access ]  
  [ -maxsize size of audit volume per  
  node ]  
  [ -retention retention period of  
  audit logs in days ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/audit/data?<parameters>

Parameters

Parameter	Description
cluster	(Optional) The path and name of a remote cluster. The default is the current cluster on which this command is run.
enabled	(Optional) The value true enables auditing, the value false (default) disables it.

Parameter	Description
maxsize	<p>(Optional) The size in GB at which the system sends an alarm to the dashboard in the Control System. The alarm notifies the cluster administrator that the audit log is becoming large enough that the administrator might want to take action. For more information about this parameter, the alarm, and possible actions, see Managing Audit Logs for File System and Table Operations.</p> <p>The audit log grows until the administrator takes action or until the retention period ends.</p> <p>The default value is 32.</p>
retention	<p>(Optional) The period of time in days for which to keep the data in the audit log for data access. After this period elapses, the file's content is deleted, and new entries are added until the next retention period elapses.</p> <p>The default retention period is 30 days.</p>

Examples

CLI

```
# maprcli audit data -maxsize
200 -json
{
  "timestamp":1669022864689,
  "timeofday":"2022-11-21
09:27:44.689 GMT+0000 AM",
  "status":"OK",
  "total":0,
  "data":[
  ]
}
```

REST

NOTE: For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/audit/data?
maxsize=200
{"timestamp":1669023856431,"timeofday"
:"2022-11-21 09:44:16.431 GMT+0000
AM","status":"OK","total":0,"data":
[]}
```

audit info

This shows whether auditing of cluster-management operations and auditing of data-access operations are enabled. Also, displays the maxSize and retention values for these two levels of auditing.

Only the mapr user for the cluster can run this command. For more information about the mapr user, see [Managing Users and Groups](#).

Syntax

CLI

```
maprcli audit info
[ -cluster <cluster_name> ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/audit/info?<parameters>

Parameter

Parameter	Description
cluster	(Optional) The name of the cluster on which to run the command. The default is the cluster on which the command is run.

Example Output

This output shows that auditing of operations on data and auditing of cluster-level operations are both enabled. For descriptions of maxSizeGB and retentionDays, see the commands [maprcli audit cluster](#) and [maprcli audit data](#).

CLI

```
# maprcli audit info -json
{
  "timestamp":1434458923034,
  "timeofday":"2015-06-16 12:48:43.034 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "data":{
        "enabled":"1",
        "maxSizeGB":"32",
        "retentionDays":"30"
      },
      "cluster":{
        "enabled":"1",
        "maxSizeGB":"NA",
        "retentionDays":"NA"
      }
    }
  ]
}
```

REST

NOTE: For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/audit/info
{"timestamp":1669013470770,"timeofday"
:"2022-11-21 06:51:10.770 GMT+0000
AM","status":"OK","total":1,"data":
[{"data":
{"enabled":"0","maxSizeGB":"32","reten
tionDays":"30"},"cluster":
{"enabled":"1"}}]}
```

blockaccess

Describes commands used to include users in the blocklist and to list users who are in the blocklist.

blockaccess user

Blocks a user on a specific cluster.

This action cancels all existing tickets for the specified user. For information about blocking, see [How Tickets Work](#).

Syntax

CLI

```
maprcli blockaccess user
    -name username to be added to
    blocked users
    [ -blockaccesstime millis from
    epoch or date in MM/DD/YYYY format ]
    [ -cluster name of the cluster ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/blockaccess/user?<parameters>

Parameters

Parameter	Description
name	(Required) Username to block.
blockaccesstime	(Optional) Invalidates all user's tickets raised before the specified date (in the format <MM/DD/YYYY>). Alternatively, you can set the time in milliseconds from epoch time (the number of milliseconds that have elapsed since Jan 1, 1970, midnight UTC).
cluster	(Optional) Name of the cluster from which to block the user. The default is the cluster on which the command is run.

Example

Block the *rogueuser* user name from the cluster *my.cluster.com*:

CLI

```
maprcli blockaccess user -name
rogueuser -cluster my.cluster.com
```

REST

```
curl -X POST -u <username> https://
r1n1.sj.us:8443/rest/blockaccess/user?
name=rogueuser&cluster=my.cluster.com
```

Deny the *rogueuser* user's tickets that were raised prior to *1st September 2020* from the cluster *my.cluster.com*:

CLI

```
maprcli blockaccess
user -name rogueuser -cluster
my.cluster.com -blockaccesstime
09/01/2020
```

REST

```
curl -X POST -u <username> https://
r1n1.sj.us:8443/rest/blockaccess/user?
name=rogueuser&cluster=my.cluster.com&
blockaccesstime=09/01/2020
```

Deny the *rogueuser* user's tickets that were raised prior to *1605418200155* milliseconds from epoch, from the cluster *my.cluster.com*:

CLI

```
maprcli blockaccess
user -name rogueuser -cluster
my.cluster.com -blockaccesstime
1605418200155
```

REST

```
curl -X POST -u <username> https://
r1n1.sj.us:8443/rest/blockaccess/user?
name=rogueuser&cluster=my.cluster.com&
blockaccesstime=1605418200155
```

The value 1605418200155 corresponds to the time November 15th 2020, 11:00:00 am IST+05:30. Therefore, all *rogueuser* tickets that were raised prior to November 15th 2020, 11:00:00 am IST+05:30 are blocked.

Related Log File

The log file `/opt/mapr/logs/cldbaudit.log.json` contains the log of the deny operation including the updated deny time. For example:

```
{"timestamp":
{"$date":"2020-11-13T08:37:36.524Z"},"resource":"mapruser4","operation":"bla
cklist",

"username":"root","uid":0,"clientip":"10.10.50.42","properties":

[{"property":"denylisttime","oldvalue":"1605254599376","newvalue":"160587576
```

```
6173"}]],
    "status":0}{ "timestamp":
{"$date":"2020-11-13T08:37:45.020Z"}, "resource":"cluster",
    "operation":"listBlacklist", "username":"root", "uid":0,
    "clientip":"10.10.50.42", "status":0}
```

Here the old deny list time was 1605254599376 milliseconds (November 13, 2020 1:33:19 PM IST) and is now updated to 1605875766173 milliseconds (Friday, November 20, 2020 6:06:06 PM IST).

blockaccess listusers

Lists users who are blocked on a specific cluster.

By default, this command lists users that have been blocked from the cluster where the command is run. There is no REST equivalent command. For information about blocking, see [How Tickets Work](#).

Syntax

CLI

```
maprcli blockaccess listusers
[ -cluster <cluster name> ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/blockaccess/listusers?<parameters>

Parameters

Parameter	Description
cluster	(Optional) Name of the cluster for which the blocked users must be listed. The default is the cluster on which the command is run.

Examples

Show blocked users for the cluster *my.cluster.com*:

CLI

```
maprcli blockaccess
listusers -cluster my.cluster.com
```

REST

```
curl -X GET -u <username> https://
r1n1.sj.us:8443/rest/blockaccess/
listusers?cluster=my.cluster.com
```

cluster

Manages cluster features, gateways, and cluster-wide settings.

cluster feature enable

Allows features to be enabled. Used after upgrading.

NOTE: Run the [cluster feature list](#) on page 2318 command to retrieve the list of features that can be enabled.

Syntax

CLI

```
maprccli cluster feature enable
[ -name <feature name>]
[ -force <true|false>]
[ -all ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/cluster/feature/enable?<parameters>

Parameters

Parameter	Description
name	(Conditionally required) Enable only the specified feature . Mandatorily pass either this parameter or the all parameter to enable either the specified feature or all features.  NOTE: You can enable IPv6 addressing support on a fabric by using <code>cldb.ipv6.support</code> as the value for the name parameter.
force	(Optional) Set it to <code>true</code> to enable all dependent features for every enabled feature.
all	(Conditionally required) Enable all features. Mandatorily pass either this parameter or the name parameter to enable all features or the specified feature.

NOTE: Once you enable a feature, you cannot disable it.

Example

CLI

To enable all features, use the `cluster feature enable -all` command.

```
maprccli cluster feature enable -all
```

REST

NOTE: When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X
POST https://abc.sj.us:8443/rest/
cluster/feature/enable?all
```

CLI

To enable IPv6 on a fabric, use the value `cldb.ipv6.support` for the `name` parameter in the `cluster feature enable` command.

```
maprcli cluster feature enable -name
cldb.ipv6.support
```

REST

 **NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/cluster/feature/
enable?name=cldb.ipv6.support
```

CLI

To enable auditing on a fabric, run the following command.

```
maprcli cluster feature enable -name
mfs.feature.audit.support
```

REST

 **NOTE:** When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/cluster/feature/
enable?name=mfs.feature.audit.support
```

 **NOTE:** The CLDB operates on IPv4 only, even if it is a dual-stack system with both IPv4 and IPv6 addresses associated with it.

cluster feature list

Lists the status of features. Used after upgrading.

Syntax

CLI

```
maprcli cluster feature list
[ -name <feature name >]
[ -enabled ]
[ -disabled ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/cluster/feature/list?<parameters>

Parameters

Parameter	Description
name	(optional) Lists whether the specified feature is enabled or disabled.
enabled	(optional) Lists only the enabled features.
disabled	(optional) Lists only the disabled features.

TIP: The three dots in the output indicate multiple entries. Use `-json` to format the output.

NOTICE: Running this command without any parameters lists the status for **all** features.

Examples

CLI

Lists the disabled features

```
maprcli cluster feature list -disabled
dependency
name
description      enabled

mfs.feature.audit.support
false
```

REST

NOTE: For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X GET -u <username> https://
abc.sj.us:8443/rest/cluster/feature/
list?disabled
{"timestamp":1669281643862,"timeofday"
:"2022-11-24 09:20:43.862 GMT+0000
AM","status":"OK","total":0,"data":[]}
```

CLI

Lists the status of all features

```
maprcli cluster feature list
dependency
name
description
enabled

cldb.feature.policiesmap.incache.enabl
ed
true

clbdb.feature.multi.compression
```

```

e.enabled

true

mfs.feature.disk.flush
Support for Disk
Flush

```

TIP: Use `-j` son to format the output.

REST

Lists the status for the 'mfs.feature.devicefile.support' feature

NOTE: For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```

curl -X GET -u <username> https://
abc.sj.us:8443/rest/cluster/feature/
list?
name=mfs.feature.devicefile.support
{"timestamp":1669279328178,"timeofday"
:"2022-11-24 08:42:08.178 GMT+0000
AM","status":"OK","total":1,"data":
[{"name":"mfs.feature.devicefile.supp
ort","enabled":true}]}

```

cluster gateway delete

Deletes the list of Data Fabric gateways from a source Data Fabric cluster.

Source Data Fabric clusters can use such lists to locate the gateways that enable replication of table data to a particular Data Fabric cluster or indexing table data in a specific Elasticsearch cluster. You create lists of gateways by running the [cluster gateway set](#) command.

There are three methods of specifying the location of gateways to a Data Fabric cluster that is a source for table replication

or indexing in Elasticsearch. If a source Data Fabric cluster relies on DNS records to find out the location of the gateways, or the cluster relies on the `mapr-clusters.conf` file to locate gateways, there is no list for the cluster gateway delete command to delete.

NOTE: When you delete a list of gateways with the `maprcli cluster gateway delete` command, it's crucial to understand that this action does not uninstall the listed gateways from the Data Fabric cluster where they are located. The gateways will remain in the cluster but no longer be part of the list.

Syntax

CLI

```
maprcli cluster gateway delete
[ -cluster <cluster on which the
command needs to be run> ]
-dstcluster <cluster name>
```

REST

Request Type	DELETE
Request URL	<code>http[s]://<host>:<port>/rest/cluster/gateway/delete?<parameters></code>

Parameters

Parameter	Description
<code>cluster</code>	(Optional) The name of the cluster on which this command should be run. By default, this is the cluster on which the command is run.
<code>dstcluster</code>	(Required) The name of the cluster on which the gateways are located. If you are replicating table data to another Data Fabric cluster, specify the name of that destination cluster. This destination cluster could be the source cluster if you are performing intra-cluster replication. If you are indexing table data in an Elasticsearch cluster, specify the name of the source Data Fabric cluster because that is where the gateways are located.

Example

Deletes a list of gateways that is stored on a source Data Fabric cluster. The gateways that are being used for table replication are located in the destination Data Fabric cluster `newyork`.

CLI

```
maprcli cluster gateway
delete -dstcluster newyork
```

REST

```
curl -X DELETE -u <username> https://
abc.sj.us:8443/rest/cluster/gateway/
delete?dstcluster=newyork
```

cluster gateway get

Lists the Data Fabric gateways that a source Data Fabric cluster is using.

The source Data Fabric cluster might use the Data Fabric gateways to replicate table data to a destination Data Fabric cluster or index data in an Elasticsearch cluster.

The [cluster gateway set](#) command creates this list of gateways.

Syntax

CLI

```
maprcli cluster gateway get
[ -cluster <sourceCluster> ]
  -dstcluster
  <destinationCluster>
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/cluster/gateway/get?<parameters>

Parameters

Parameter	Description
cluster	(Optional) The name of the source cluster on which this command should run. By default, this is the cluster on which you run this command.
dstcluster	(Required) The name of the cluster on which the gateways are located. If you are replicating table data to another Data Fabric cluster, specify the name of that destination cluster. This destination cluster could be the source cluster if you are performing intra-cluster replication. If you are indexing table data in an Elasticsearch cluster, specify the name of the source Data Fabric cluster because that is where the gateways are located.

Example

Gets the list of gateways that is stored on a source Data Fabric cluster. The gateways are being used for table replication and are located in the destination Data Fabric cluster sfcluster.

CLI

```
maprcli cluster gateway
get -dstcluster sfcluster
```

REST

```
curl -X GET -u <username> https://
abc.sj.us:8443/rest/cluster/gateway/
get?dstcluster=sfcluster
```

Example Output

```
cluster gatewayConfig
sfcluster gw1 gw2
```

cluster gateway local

Lists the gateways configured on the Data Fabric cluster on which this command is run.

Syntax

CLI

```
maprcli cluster gateway local
[ -cluster cluster on which command
to be run ]
[ -format dns/text. default: text ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/cluster/gateway/local?<parameters>

Parameters

Parameter	Description
format	<p>(Optional) The output format. Either dns or text. Default: text.</p> <p> NOTE:</p> <ul style="list-style-type: none"> With the output formatted as DNS, you can copy and paste it as a DNS record in the zone file for your domain. The source Data Fabric cluster can locate the gateways by doing a DNS lookup. With the output formatted as text, you can copy and paste that text into the <code>-gateways</code> parameter of the <code>maprccli cluster gateway set</code> command. Running this command is an alternative way of specifying the location of these gateways to the source Data Fabric cluster.
cluster	<p>(Optional) If you are not on a Data Fabric cluster where one or more gateways are configured, provide the name of the cluster.</p> <ul style="list-style-type: none"> When replicating HPE Data Fabric Database table data to one or more replicas on this cluster, it is a destination Data Fabric cluster. When indexing HPE Data Fabric Database table data in one or more Elasticsearch clusters, the current cluster is a source Data Fabric cluster where the tables being indexed are located.

Example

Display the list of gateways configured on a Data Fabric cluster in text format:

CLI

```
maprccli cluster gateway local
```

REST

```
curl -X GET -u
<username> https://abc.sj.us:8443/
rest/cluster/gateway/local
```

Example Output

```
gatewayinfo
centos23 centos22
```

Display the list of gateways configured on a Data Fabric cluster in DNS format:

CLI

```
maprccli cluster gateway local -format
dns
```

REST

```
curl -X GET -u
<username> https://abc.sj.us:8443/
rest/cluster/gateway/local?format=dns
```

Example Output

```
gatewaydnsinfo
; TXT Record addresses
gateway.mycluster IN TXT "centos23
centos22"
```

Describes the commands for listing gateways, checking status of gateways, managing gateways if they fail, and troubleshooting gateways.

cluster gateway resolve

Lists the gateways configured on a Data Fabric cluster that are running at the time that the command is issued.

Run this command on a source Data Fabric cluster to find out how many gateways are available for table replication to a destination Data Fabric cluster or for indexing table data in an Elasticsearch cluster.

This command uses the following criteria to get the list:

- Rest assured, if you have specified the locations of the gateways with the [cluster gateway set](#) on page 2335 command, the `maprcli cluster gateway resolve` command will reliably return a list of them.
- If you have specified the locations of the gateways only with a DNS record, this command performs a DNS lookup for gateways on the specified Data Fabric cluster and returns the list it finds.
- Suppose you have not specified the locations of the gateways using the previously listed methods. This command assumes that gateways are located on the CLDB nodes configured in the `mapr-clusters.conf` file on the Data Fabric cluster where you run this command.

NOTE: Unresponsive gateways are not included in the list.

For more information about gateways, see [Administering Data Fabric Gateways](#).

Syntax**CLI**

```
maprcli cluster gateway resolve
[ -cluster <cluster on which the
command is to be run> ]
-dstcluster <destination cluster
name>
```

REST

Request Type	GET
Request URL	<code>http[s]://<host>:<port>/rest/cluster/gateway/resolve?<parameters></code>

Parameters

Parameter	Description
cluster	<i>(Optional)</i> The name of the cluster on which this command should be run. By default, this is the cluster on which you run this command.
dstcluster	<p><i>(Required)</i> The name of the cluster for which to list the available gateways.</p> <p>If you are replicating table data to another Data Fabric cluster, specify the name of that destination cluster. This destination cluster can be the source cluster if you are performing intra-cluster replication.</p> <p>If you are indexing table data in an Elasticsearch cluster, specify the name of the source Data Fabric cluster because that is where the gateways are located.</p>

Example

The following example shows that only one gateway is running on the Data Fabric cluster `cluster1`. The IP address of this gateway was found in a DNS record, as indicated by the `Source` field.

CLI

```
maprccli cluster gateway
resolve -dstcluster cluster1 -json
```

REST

```
curl -X GET -u <username> https://
abc.sj.us:8443/rest/cluster/gateway/
resolve?dstcluster=cluster1
```

Example Output

```
{
  "timestamp":1424266395862,
  "timeofday":"2015-02-18
01:33:15.862 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "GatewayHosts":"10.10.20.12:7660",
      "Source":"DNS"
    }
  ]
}
```

The Data Fabric source cluster is configured by specifying the destination cluster's CLDB node and gateway nodes.

[gateway.conf](#) on page 3367

[Gateways for Replicating HPE Data Fabric Database Tables](#) on page 831

In HPE Data Fabric Database table replication, HPE Data Fabric Database replicates updates to tables (binary and JSON) on source Data Fabric clusters to replicas of those tables on destination Data Fabric clusters. Gateways are services that receive these updates and apply them to the replicas. These gateways also propagate updates from JSON tables to their secondary indexes.

Related tasks

Lists all the gateways that a source Data Fabric cluster is using.

[cluster gateway local](#) on page 2330

Lists the gateways configured on the Data Fabric cluster on which this command is run.

[cluster gateway set](#) on page 2335

Specifies the locations of the Data Fabric gateways that a source Data Fabric cluster can use for table replication to a destination Data Fabric cluster or for indexing table data in an Elasticsearch cluster.

More information

[Managing Gateways](#) on page 1791

Describes the commands for listing gateways, checking status of gateways, managing gateways if they fail, and troubleshooting gateways.

cluster gateway set

Specifies the locations of the Data Fabric gateways that a source Data Fabric cluster can use for table replication to a destination Data Fabric cluster or for indexing table data in an Elasticsearch cluster.

In addition to this method, there are two other methods for specifying the locations of gateways that a source Data Fabric cluster can use when replicating to a particular Data Fabric cluster or when indexing in an Elasticsearch cluster. See [Configuring Gateways for Table and Stream Replication](#) for details about them.

Syntax

CLI

```
maprcli cluster gateway set
[ -cluster <cluster on which
command to be run> ]
-dstcluster <cluster name>
-gateways <space-separated list of
hostnames>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/cluster/gateway/set?<parameters>

Parameters

Parameter	Description
cluster	(Optional)The cluster on which to run this command. By default, this is the cluster on which you run this command.

Parameter	Description
dstcluster	<p><i>(Required)</i> The name of the Data Fabric cluster in which the gateways are located.</p> <p>If you are replicating table data to another Data Fabric cluster, specify the name of the destination cluster. This destination cluster could be the source cluster if you are performing intra-cluster replication.</p> <p>If you are indexing table data in an Elasticsearch cluster, specify the name of the source Data Fabric cluster because that is where the gateways are located.</p>
gateways	<p><i>(Required)</i> A space-delimited list of gateway hostnames or IP addresses. Place double quotation marks around the list of gateways, as in this example: -gateways "gateway1 gateway2"</p>

Example

This example specifies the hostnames of two gateways that are in the Data Fabric cluster newyork. Use this command in the following scenarios:

- The cluster newyork is the destination cluster for table replication from the source Data Fabric cluster.
- The cluster newyork is both a source and destination cluster for intra-cluster table replication.
- The cluster newyork is a source Data Fabric cluster that contains tables being indexed in one or more Elasticsearch clusters.

CLI

```
maprcli cluster
gateway set -dstcluster
newyork -gateways "gw1.bigcompany.com
gw2.bigcompany.com"
```

REST

```
curl -X POST -u <username> https://
abc.sj.us:8443/rest/cluster/gateway/
set?
dstcluster=newyork&gateways=gw1.bigcom
pany.com%20gw2.bigcompany.com
```

Related concepts

[Administering Data Fabric Gateways](#) on page 1787

A HPE Data Fabric gateway mediates one-way communication between a source HPE Data Fabric cluster and a destination cluster. You can replicate HPE Data Fabric Database tables (binary and JSON) and HPE Data Fabric Streams streams. HPE Data Fabric gateways also apply updates from JSON tables to their secondary indexes and propagate Change Data Capture (CDC) logs.

[Configuring Gateways for Table and Stream Replication](#) on page 1789

Configuring gateways involves installing the mapr-gateway package on nodes on a Data Fabric destination cluster and then configuring the Data Fabric source cluster to communicate with the destination cluster. The Data Fabric source cluster is configured by specifying the destination cluster's CLDB node and gateway nodes.

[gateway.conf](#) on page 3367

[Gateways for Replicating HPE Data Fabric Database Tables](#) on page 831

In HPE Data Fabric Database table replication, HPE Data Fabric Database replicates updates to tables (binary and JSON) on source Data Fabric clusters to replicas of those tables on destination Data Fabric

clusters. Gateways are services that receive these updates and apply them to the replicas. These gateways also propagate updates from JSON tables to their secondary indexes.

cluster get billing usage

Displays billing information for specific data in BRIM (Billing and Revenue Innovation Management) format, and generates the file that you must upload to the Data Fabric billing portal for an air-gapped cluster.

In a connected environment, you can view the billing information that is sent automatically to HPE. Use the following `maprc li` command:

Syntax

CLI

```
maprc li cluster getbillingusage
[ -from start_time (UTC timestamp
in millisecond or time in
yyyy-MM-dd,HH:mm format) ]
[ -till end_time (UTC timestamp
in millisecond or time in
yyyy-MM-dd,HH:mm format) ]
[ -duration duration (in minutes.
Minimum value is 60 minutes) ]
[ -cluster cluster name ]
[ -fileName fileName (file path) ]
[ -clearText <true|false> true
generates the file in clear text ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/cluster/

	getbillingusage? <parameters>
--	----------------------------------

Parameters

Parameter	Description
from	Start time in yyyy-mm-dd, hh:mm format.
till	End time in yyyy-mm-dd, hh:mm format.
duration	Duration in minutes (minimum value is 60 minutes) .
cluster	Cluster name
fileName	File name (File path)
clearText	True or False. True generate the file in clear text format.

Example

```
maprcli cluster getbillingusage -fileName billing.txt -clearText true -json
{
    "timestamp":1688108615644,
    "timeofday":"2023-06-30 12:03:35.644 GMT-0700 AM",
    "status":"OK",
    "total":0,
    "data":[
    ],
    "messages":[
        "Usage Metric data written to the file billing.txt"
    ]
}
```

Related reference

[cluster get metering usage](#) on page 2338
Lists the details of cluster usage for the given time period.

cluster get metering usage

Lists the details of cluster usage for the given time period.

In both connected and air-gapped environment, you can view the cluster metering data for the given user, or for a specific duration.

Syntax

CLI

```
maprcli cluster getmeteringusage
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/ rest/cluster/ getmeteringusage? <parameters>

Parameters

Parameter	Description
from	Start time in yyyy-mm-dd, hh:mm format.
till	End time in yyyy-mm-dd, hh:mm format.
duration	Duration in minutes (minimum value is 60 minutes) .
cluster	Cluster name

Example

To list the information for a given time period, use the following command:

```
maprcli cluster getmeteringusage -from <time> -till <time>
```

For example:

```
maprcli cluster getmeteringusage -from 2023-06-20,00:00 -till 2023-06-21,23:00
userdata epoch          timestamp
1 Mb      1687244400000    Tue Jun 20 07:00:00 UTC 2023
1 Mb      1687248000000    Tue Jun 20 08:00:00 UTC 2023
1 Mb      1687251600000    Tue Jun 20 09:00:00 UTC 2023
1 Mb      1687255200000    Tue Jun 20 10:00:00 UTC 2023

1 Mb      1687269600000    Tue Jun 20 14:00:00 UTC 2023
1 Mb      1687273200000    Tue Jun 20 15:00:00 UTC 2023
2 Mb      1687276800000    Tue Jun 20 16:00:00 UTC 2023
2 Mb      1687280400000    Tue Jun 20 17:00:00 UTC 2023
3 Mb      1687284000000    Tue Jun 20 18:00:00 UTC 2023
3 Mb      1687287600000    Tue Jun 20 19:00:00 UTC 2023
3 Mb      1687291200000    Tue Jun 20 20:00:00 UTC 2023
3 Mb      1687294800000    Tue Jun 20 21:00:00 UTC 2023
3 Mb      1687298400000    Tue Jun 20 22:00:00 UTC 2023
4 Mb      1687302000000    Tue Jun 20 23:00:00 UTC 2023
4 Mb      1687305600000    Wed Jun 21 00:00:00 UTC 2023
4 Mb      1687309200000    Wed Jun 21 01:00:00 UTC 2023
4 Mb      1687312800000    Wed Jun 21 02:00:00 UTC 2023
4 Mb      1687316400000    Wed Jun 21 03:00:00 UTC 2023
```

To get the information for a duration, use the following command:

```
maprcli cluster getmeteringusage -duration <in minutes>
```

To get the information for a cluster, use the following command:

```
maprcli cluster getmeteringusage <cluster name>
```

Related reference

[cluster get billing usage](#) on page 2337

Displays billing information for specific data in BRIM (Billing and Revenue Innovation Management) format, and generates the file that you must upload to the Data Fabric billing portal for an air-gapped cluster.

cluster getssoconf

Fetches the cluster-level SSO parameters.

Note these considerations for using `cluster getssoconf`:

- You can run the `cluster getssoconf` command from any node.

- You must be the fabric manager or infrastructure admin user to run this command.

Syntax

CLI

```
cluster getssoconf
Usage : fetches the cluster level SSO
params
```

Parameters

Parameter	Description
-json	Renders the command output in JSON format.

Example

CLI

The following example shows the CLI output without using the -json option:

```
maprccli cluster getssoconf
clientid
clientsecret
providername issuerendpoint
myclient
PrXMbx0zsn3pXTKSZS1zhs8Syi10Wq4u
keycloak https://
<IP_address>:8443/realms/myrealm
```

The following example shows the CLI output with the -json option:

```
maprccli cluster getssoconf -json
{
  "timestamp":1695603854136,
  "timeofday":"2023-09-24
06:04:14.136 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "issuerendpoint":"https://
<IP_address>:8443/realms/myrealm",
      "providername":"keycloak",
      "clientid":"myclient",
      "clientsecret":"PrXMbx0zsn3pXTKSZS1zhs
8Syi10Wq4u"
    }
  ]
}
```

REST

N/A

[cluster setssoconf](#) on page 2348
Specifies how to configure the HPE Data Fabric to work with an SSO server.

cluster info

Returns the minimum and maximum values for key cluster attributes.

Following are the attributes for which the command returns minimum and maximum values:

- `VolumeSize` — The size of the volume.
- `VolumeQuotaSize` — The hard quota (disk space) for the volume.
- `VolumeAdvisoryQuota` — The advisory quota (disk space) for the volume.
- `VolumeLogicalUsedSize` — The logical size used by the volume.
- `VolumeNumContainers` — The number of replicas for the volume.
- `VolumeGuranteedNumContainers` — The number of guaranteed replicas for the volume.
- `VolumeNumNamespaceContainers` — The number of replicas for the name container associated with the volume.
- `VolumeGuranteedNumNamespaceContainers` — The number of guaranteed replicas for the name container associated with the volume.
- `VolumeNumSnapshots` — The number of snapshots of the volume.
- `VolumeCoalesceInterval` — The coalesce interval setting for the volume.
- `VolumeMaxInodesAlarmThreshold` — The threshold for triggering the `VOLUME_ALARM_INODES_EXCEEDED` alarm.
- `VolumeMaxNsSizeMbAlarmThreshold` — The threshold for triggering the `VOLUME_ALARM_INODES_EXCEEDED` alarm.
- `VolumeReReplicationTimeout` — The timeout value for re-replication.
- `StoragePoolCapacitySize` — The total amount of disk space on the storage pool.
- `StoragePoolUsedSize` — The amount of used space on the storage pool.
- `StoragePoolAvailableSize` — The amount of available space on the storage pool.

Syntax

CLI

```
maprcli cluster info -getminmax  
<attributes>
```

REST API

Request Type	GET
Request URL	<code>http[s]://<host>:<port>/rest/cluster/info?<parameters></code>

Parameters

Parameter	Description
getminmax	(Required) The comma-separated list of attributes for which to return the minimum and maximum values. Use the keyword all to retrieve the minimum and maximum values for all attributes.

Examples

Retrieve the minimum and maximum values for all the attributes:

CLI

```
# maprcli cluster info -getminmax all
unit  min      max      name
MB    1668446  2505237
StoragePoolAvailableSize
MB    0        204800
VolumeAdvisoryQuota
Num   1         2
VolumeGuranteedNumContainers
Num   0         0
VolumeMaxInodesAlarmThreshold
MB    1669494  2506849
StoragePoolCapacitySize
MB    1048     1612
StoragePoolUsedSize
MB    0        972
VolumeLogicalUsedSize
Num   1         2
VolumeGuranteedNumNamespaceContainers
Num   1         3
VolumeNumContainers
MB    0         0
VolumeMaxNsSizeMbAlarmThreshold
MB    0        818      VolumeSize
Num   0         0
VolumeNumSnapshots
MB    0         0
VolumeQuotaSize
Sec   0         300
VolumeReReplicationTimeOut
Num   1         3
VolumeNumNamespaceContainers
Min   60        60
VolumeCoalesceInterval
```

cluster mapreduce get
Displays the cluster-wide default for the MapReduce mode.

 **WARNING:** This command is deprecated alongside MapReduce v1.

Syntax

CLI

```
maprccli cluster mapreduce get
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/cluster/mapreduce/get

Output Fields

Field	Description
default_mode	Displays either yarn or classic.
mapreduce_version	Displays the Hadoop version associated with the default_mode.

Sample Output

```
default_mode  mapreduce_version
classic       0.20.2
```

Examples

CLI

```
maprccli cluster mapreduce get
```

REST

NOTE: When using a self-signed certificate pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X GET https://
abc.sj.us:8443/rest/cluster/
mapreduce/get
{"timestamp":1715235235867,"timeofday"
:"2024-05-08 11:13:55.867 GMT-0700
PM","status":"OK","total":1,"data":
[{"default_mode":"yarn","mapreduce_ver
sion":"3.3.5"}]}
```

cluster mapreduce set

Sets the cluster-wide MapReduce mode.

WARNING: This command is deprecated alongside MapReduce v1.

Syntax

CLI

```
maprcli cluster mapreduce set -mode
yarn
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/cluster/mapreduce/set?<parameters>

Parameters

Parameter	Description
mode	The MapReduce mode of the cluster. Enter yarn to use the Resource Manager and Node Manager to run MapReduce jobs or applications.

Examples

Sets the MapReduce mode for the cluster to yarn.

CLI

```
maprcli cluster mapreduce set -mode
yarn
```

REST

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/cluster/mapreduce/
set?mode=yarn
{"timestamp":1715235732875,"timeofday"

PM","status":"OK","total":1,"data":
[{"default_mode":"yarn","mapreduce_ver
sion":"3.3.5"}]}
```

cluster queryservice

Describes the commands to enable/disable and view the settings for the OJAI Distributed Query Service.

Enable the [OJAI Distributed Query Service](#) on page 711 if you want the following functionality when querying HPE Data Fabric Database JSON tables:

- Advanced secondary index selection
- Sorts of large data sets
- Parallel query execution

Permissions Required

If you enable the OJAI Distributed Query Service during installation, then you must be user mapr to run these commands. If you disable the service, and later re-enable it, then the user that re-enabled the service must run the command.

cluster queryservice getconfig

Retrieves the configuration of the OJAI Distributed Query Service.

Permissions Required

Only the user who enabled the OJAI Distributed Query Service can run this command. If the service was enabled during installation, the user mapr must run the command.

Syntax

CLI

```
maprcli cluster queryservice  
getconfig -cluster < cluster-name >
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/ rest/queryservice/ getconfig

Parameters

Parameter	Description
cluster	(Optional) Name of the cluster that is using secondary indexes to query the HPE Data Fabric Database JSON table. By default, this is the cluster on which you run this command.

Examples

CLI

```
maprcli cluster queryservice  
getconfig -cluster my.cluster.com
```

REST

NOTE: When using a self-signed certificate pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X GET https://
abc.sj.us:8443/rest/cluster/
queryservice/getconfig?
cluster=my.cluster.com
{"timestamp":1715236085166,"timeofday"
:"2024-05-08 11:28:05.166 GMT-0700
PM","status":"OK","total":1,"data":
[{"enabled":false,"zookeeper":"m2-hux6
k-32-n1.mip.storage.hpecorp.net:5181,m
2-hux6k-32-n2.mip.storage.hpecorp.net:
5181,m2-hux6k-32-n3.mip.storage.hpecor
p.net:5181"}]}
```

cluster queryservice setconfig
Enables or disables the OJAI Distributed Query Service. When enabling the service, you can specify the configuration of the service.

Permissions Required

Only the user that enabled the OJAI Distributed Query Service can run this command. If the service was enabled during installation, the user mapr must run the command.

Syntax

CLI

```
maprccli cluster queryservice
setconfig
[ -cluster < cluster-name > ]
  -enabled < true | false >
  -clusterid < cluster-id of Data
Fabric Drill cluster >
  -storageplugin < Name of Data
Fabric Drill Storage plug-in >
  -znode < Root Zookeeper node
user by Data Fabric Drill cluster
>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/queryservice/setconfig?<parameters>

Parameters

Parameter	Description
cluster	(Optional) Name of the cluster that is using secondary indexes to query HPE Data Fabric Database JSON tables
enabled	(Required) Whether the OJAI Distributed Query Service is enabled. Values: true or false

Parameter	Description
clusterid	(Required) Cluster ID of your Data Fabric Drill cluster. Refer to the value of the cluster-id parameter in the drill-distrib.conf file. You can find this file in the /opt/mapr/drill/drill-<version number>/conf directory.
storageplugin	(Required) Name of the Data Fabric Drill Storage plug-in instance used to run OJAI queries (usually dfs)
znode	(Required) Name of the root Zookeeper node used by the Data Fabric Drill cluster (usually /drill)

Examples

CLI

```
maprcli cluster queryservice
setconfig \
  -enabled true \
  -clusterid mycluster \
  -storageplugin dfs \
  -znode /drill
```

REST

NOTE: When using a self-signed certificate pass the -k option to curl to avoid the certificate check.

```
curl -u <username> -X POST https://
server.sj.us:8443/rest/cluster/
queryservice/setconfig?
enabled=true&clusterid=mycluster&stora
geplugin=dfs&znode=/drill
```

cluster setssoconf

Specifies how to configure the HPE Data Fabric to work with an SSO server.

Note the following considerations for using `cluster setssoconf`:

- For fabrics installed using the seed node method, run `cluster setssoconf` on the primary CLDB node of the primary fabric of the global namespace. For more information, see [Identifying All CLDB Nodes](#).
- For fabrics installed using methods other than the seed node method, run `cluster setssoconf` on the primary CLDB node of the cluster. For more information, see [Listing CLDB Nodes](#) on page 1807.
- To run the command, you must be the cluster admin (typically the mapr user) or a user with the fabric manager role.

Syntax

CLI

```
cluster setssoconf
  -issuerendpoint issuers
endpoint
  -providername sso provider
name keycloak
  [ -clientid client's id ]
  [ -clientsecret client's
```

```
secret ]
[ -certfile sso certificate ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/cluster/setsssoconf

Parameters

Parameter	Required or Optional	Description
-issuerendpoint	Required	The IP address of the SSO provider server.
-providername	Required	The name of your SSO provider. Currently, only keycloak is supported.
-clientid	Optional	An identifier that enables communication between Data Fabric and the SSO provider. For example: 00a8m2onb7CAohGdw5d8
-clientsecret	Optional	The key that is used to encrypt communication between Data Fabric and the SSO provider. For example: _Bfj lzbnnQNbNdprf0vnQDSyXcuzziMzyrbm0raB
-certfile	Optional	The self-signed certificate (.crt) file from the SSO provider (Keycloak).
-json	Optional	Renders the command output in JSON format.

Example

This example configures the endpoint, client information, and certificate file for a cluster to communicate with a Keycloak SSO server:

CLI

```
# maprcli cluster
setsssoconf -issuerendpoint https://
<IP_address>:8443/realms/TestReallm/
-providername keycloak -clientid
testclient -clientsecret <secret>
-certfile /tmp/
SAN_SignedCert.crt -json
{
  "timestamp":1693834990616,
  "timeofday":"2023-09-04
06:43:10.616 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "status":"SUCCESS:
SSO configuration set on CLDB."
    }
  ]
}
```

REST

NOTE: When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -v -X POST
https://abc.sj.us:8443/rest/cluster/
setsssoconf?issuerendpoint="https://
<IP_address>:8443/realms/
TestReallm/"&providername=keycloak
```

Fetches the cluster-level SSO parameters.

clustergroup

Adds, deletes and updates clusters from cluster groups/global namespace.

A global namespace stitches multiple data sources into a single accessible entity and provides multiple data access points, where each access point shows the same hierarchical namespace. The entire group of data sources could be accessed and operated by using any one of the access points, without any need to know the source's physical data location.

The global namespace is implemented using `clustergroup` command.

The following example shows the `clustergroup` command-line help:

```
/opt/mapr/bin/maprcli clustergroup

clustergroup
    setprimary
        -clustername name of the primary cluster of the group
        -cldbips "hostname1:port1 hostname2:port2..." of the
primary cluster
        -crossclusterticket cross cluster ticket of the primary
cluster

    updateprimary
        -clustername name of the exisiting cluster to be made as the
new primary

    remove
        -clustername name of the cluster/external server to be
removed from the group

    getcgtable
        [ -showprimary display cluster info for cluster group
primary on ly. default: false ]
        [ -clustername name of cluster ]
        [ -getlicenseinfo get license info. default: false ]

    addexternal
        -type Type of the external server being added, nfs/s3
        -externalservername External server name that would appear
in g lobal namespace
        [ -ips In case of NFS and Generic S3, comma seperated list
of ex ternal server ips ]
        [ -accesskey Access key in case of S3 server ]
```

```
[ -secretkey Secret key in case of S3 server ]
[ -s3vendor External S3 server vendor, either AWS OR GCP OR
HPE_Alletra_Storage_MP_X10000 OR Generic ]
[ -awsregion AWS region in case the S3 vendor type is AWS ]

[ -force if provided skip checking external server ips Parameter
takes no value ]

setupgrade
  -status set upgrade status for given cluster
  -clustername name of cluster

showclustercert
  -clustername name of cluster

getnfsexports
  -externalservername name of the external server for exports info

0
  [ -start start. default: 0 ]
  [ -limit limit. default: 2147483647 ]

generateclusterconf
```

clustergroup get cgtable

Retrieves the cluster group table information.

If you have imported an external NFS server or an external S3 server, the details of the external NFS server or the external S3 server are displayed when you run the command, alongside the details of clusters in the clustergroup.

See [clustergroup addexternal](#) on page 2358 for details to add or import an external NFS server or an external S3 server into a cluster group.

Syntax

CLI

```
maprccli clustergroup getcgtable
[ -showprimary display cluster
info for cluster group primary only.
default: false ]
[ -clustername name of cluster ]
[ -getlicenseinfo get license
info. default: false ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/clustergroup/getcgtable?<parameters>

Parameters

Parameter	Description
showprimary	(Optional) Displays cluster information only for the primary cluster group. Default: false.

Parameter	Description
clustername	(Optional) Name of the cluster for which to fetch the cluster information. By default, the information is fetched only for the cluster to which the node on which the command is run belongs. You can specify the name of the external NFS server or the external S3 server that has been imported into the clustergroup, if you wish to view details of the external NFS server or the external S3 server. .
getlicenseinfo	(Optional) Display the license information for the clusters in the cluster group. Default: false.

Example

Returns the cluster group information:

```
# maprcli clustergroup getcgtable -json
{
  "timestamp":1698211002789,
  "timeofday":"2023-10-24 10:16:42.789 GMT-0700 PM",
  "status":"OK",
  "total":3,
  "data":[
    {
      "clustername":"secure-cluster1",
      "cldbips":"<ip address list>",
      "apiips":"<ip address list>",
      "clusterid":"4217876076225350765",
      "crossclusterticket":"<cross cluster ticket value>",
      "clustergroupprimary":true,
      "clusterupgradestate":"UPDATE_STATUS_UNKNOWN",
      "clusterlocation":"OnPrem",
      "clusterowner":"",
      "installtype":"MANUAL_INSTALL",
      "mossips":"<ip address list>",
      "gatewayips":"<ip address list>"
    },
    {
      "clustername":"secure-cluster3",
      "cldbips":"<ip address list>",
      "apiips":"<ip address list>",
      "clusterid":"1603384556630536671",

          "accessorgroups":""
        }
      }
    ]
  }
}

```

Shows the primary:

```

# maprcli clustergroup getcgttable -showprimary true -json
{
  "timestamp":1698213303438,
  "timeofday":"2023-10-24 10:55:03.438 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "clustername":"secure-cluster1",
      "cldbips":"<ip address list>",
      "apiips":"<ip address list>",
      "clusterid":"4217876076225350765",
      "crossclusterticket":"<cross cluster ticket value>",
      "clustergroupprimary":true,
      "clusterupgradestate":"UPDATE_STATUS_UNKNOWN",
      "clusterlocation":"OnPrem",
      "clusterowner":"",
      "installtype":"MANUAL_INSTALL",
      "mossips":"<ip address list>",
      "gatewayips":"<ip address list>"
    }
  ]
}

```

```
    ]
  }
```

Shows the cluster name:

```
# maprcli clustergroup getcgtable -clustername c3 -json
{
  "timestamp":1682487987480,
  "timeofday":"2023-04-25 10:46:27.480 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "clustername":"c3",
      "cldbips":"<cldb IP address list>",
      "apiips":"<api ip address list>",
      "clusterid":"5671109873516702505",
      "crossclusterticket":"<cross cluster ticket value>"
    }
  ]
}
```

```

clustergroup setprimary

Sets the primary cluster for the group.

Each cluster must know the location and the cross cluster ticket of the primary of the group, so that it can update its own cluster group table by periodically fetching the table from the primary.

The setprimary command sets the given cluster as the primary for the current cluster on which the command is run, and adds the current cluster to the cluster group.

Syntax

CLI

```
maprcli clustergroup setprimary
  -clustername name of the primary
  cluster of the group
  -cldbips "hostname1:port1
hostname2:port2...." of the primary
  cluster
  [ -crossclusterticket cross
  cluster ticket of the primary
  cluster ]
  [ -cctktfilepath cross cluster
  ticket file path of the primary
  cluster ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/clustergroup/setprimary?<parameters>

Parameters

Parameter	Description
clustername	(Required) Name of the cluster to set as the primary cluster.
cldbips	(Required) IP addresses/host names of the CLDB nodes separated with spaces.
crossclusterticket	(Conditionally Required) Cross-cluster ticket of the cluster. Must pass either this parameter or the cctktfilepath parameter.
cctktfilepath	(Conditionally Required) The file path of the cross cluster ticket of the primary cluster. Must pass either this parameter or the crossclusterticket parameter.

Example

CLI

Sets the primary cluster for the group to cluster1.

```
maprcli clustergroup
setprimary -clustername
cluster1 -cldbips
"m2-r2600-49-n4.mip.storage.hpecorp.ne
t:7222" -crossclusterticket "XXXX"
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/clustergroup/
setprimary?
clustername=cluster1&cldbips="m2-r260
0-49-n4.mip.storage.hpecorp.net:7222"&
crossclusterticket="XXXX"
```

clustergroup updateprimary

Updates the primary cluster for the group.

Makes an existing cluster the primary for the cluster group. The difference between setprimary and updateprimary is that the setprimary command adds a new entry in the cluster group, while the updateprimary command elevates an existing entry as the primary.

Syntax**CLI**

```
maprcli clustergroup updateprimary
-clustername <name>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/ rest/clustergroup/ updateprimary? <parameters>

Parameters

Parameter	Description
clustername	(Required) Name of the cluster to elevate as the primary cluster.

Example**CLI**

Updates the primary cluster for the cluster group to cluster2.

```
maprcli clustergroup
updateprimary -clustername cluster2
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/clustergroup/
updateprimary?clustername=cluster2
```

clustergroup addexternal

Imports an external NFS server or an external s3 server into a cluster group/global namespace.

The `addexternal` command adds an external NFS server or an external s3 server to the cluster group, thereby making it part of the NFS/S3 global namespace.

You can to import **HPE Alletra Storage MP X10000** object storage as an external s3 server.

NOTE: HPE Alletra Storage MP X10000 is an intelligent, enterprise-grade, scale-out object storage to accelerate data-intensive applications. HPE Storage MP X10000 I combines automated metadata enrichment services, high-performance all-flash object storage, massive capacity, and effortless management. The X10000 accelerates time to value for your data-intensive initiatives, whether you are building active data lakes for analytics, implementing generative AI and large language models(LLMs), or enabling rapid restore from backups. See [HPE Support Center for Alletra MP X10000](#) or [HPE Alletra MP X10000 Quick Specifications](#) for more details.

IMPORTANT: The cluster administrator must have granted you the `cs3` [ACL](#) for you to be able to add an external S3 server to the cluster group. The cluster administrator must have granted you the `cv` [ACL](#) for you to be able to add an external NFS server to the cluster group.

NOTE: An external NFS server is a network file server hosted on a remote network, typically in a different physical location.

NOTE: NFSv4 refers to NFS version 4.1.

Along with Data Fabric cluster entries, NFSv4 clients see a unified directory space across servers hosted from different locations. Data Fabric data can be copied to or transferred to an external NFS server, so that it is shareable across the clusters in the cluster group.

A NFSv4 client is referred directly to the external NFS server. Data Fabric comes into the picture only when the referral point (like a soft link) is accessed, and after that the client directly communicates with the NFS server. The authentication mechanism will be the same that is used for mounting the global namespace (`sec=none` OR `sec=system` OR `sec=krb5`).

IMPORTANT: If your external NFS server uses authentication mechanism (`sec=system`), Data Fabric and the external NFS should ideally be using same AD/LDAP. If the external NFS server is using Kerberos authentication (`sec=kerberos`), Data Fabric and the external NFS must be using the same AD/LDAP + KDC server, otherwise external NFS server access will be denied with `EPERM`.

To view external NFS server details by using the `maprc li`, see [clustergroup get cgtable](#) on page 2351. To remove the external NFS server from the cluster group by using `maprc li`, see [clustergroup remove cluster](#) on page 2364.

Syntax**CLI**

```
maprc li clustergroup addexternal

        -type Type of the external
server being added, nfs/s3
        -externalservername External
server name that would appear in
global namespace
        [ -ips In case of NFS and
Generic S3, comma seperated list of
external server ips ]
        [ -accesskey Access key in
case of S3 server ]
        [ -secretkey Secret key in
```

```

case of S3 server ]
    [ -s3vendor External S3
server vendor, either AWS OR GCP
OR HPE_Alletra_Storage_MP_X10000 OR
Generic ]
    [ -awsregion AWS region in
case the S3 vendor type is AWS ]
    [ -force if provided
skip checking external server ips
Parameter takes no value ]
    [ -s3usetlsencryption Use
TLSEncryption for external s3.
default: true ]
    [ -s3serverport Port on
which s3server is listening, default
9000 ]
    [ -s3servercertfile External
S3 server certificate ]
    [ -s3servercertfilepath
External S3 server certificate file
path ]
    [ -s3servertransferproto S3
server transfer proto, either https
or http, default https.

```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/clustergroup/addexternal?<parameters>

Parameters

Parameter	Description
type	(Required) Use nfs to add an external NFS server. Use s3 to add external S3 server such as AWS, GCP , HPE Alletra Storage MP X10000 object storage.
externalservername	(Required) Name of the external NFS server/S3 server or object storage like AWS , GCP, HPE Alletra Storage MP X10000, generic to display on the global namespace.
ips	(Conditionally Required) Required for NFS/generic S3 servers, HPE Alletra Storage MP X10000. List of one or more IP addresses or hostnames. An NFS server with multiple network interface controllers (NIC) is identifiable by more than one IP address or host name. Use comma as the separator, when you are specifying multiple IP addresses for the parameter.
accesskey	(Conditionally Required) Required for S3 servers. The access key for the external AWS, GCP, HPE Alletra Storage MP X10000, generic S3 server.  NOTE: Enclose the accesskey parameter in quotes.
secretkey	(Conditionally Required) Required for S3 servers. The secret key for the external AWS S3, GCP, HPE Alletra Storage MP X10000, generic S3 server.  NOTE: Enclose the secretkey parameter in quotes.

Parameter	Description
awswebidrolearn	AWS web-identity role ARN for secure token service or STS-based access. This field is applicable only for STS-based access to AWS S3 object storage. For more information about STS, see Integrating the AWS Security Token Service (STS) with Data Fabric .
s3vendor	<i>(Conditionally Required)</i> Required for S3 servers. Type of S3 vendor. Use the value AWS while adding the AWS S3 server. For other S3 vendors, use the value generic. Use the value GCP for GCP object storage. Use the value HPE_Alletra_Storage_MP_X10000 for the HPE Alletra Storage MP X10000.
awsregion	<i>(Conditionally Required)</i> Required for AWS S3 servers. AWS region for the buckets that contain your data.
gcpregion	<i>(Conditionally Required)</i> GCP region for the buckets that contain your data. This field is applicable to GCP S3 server only.
force	<i>(Optional)</i> Pass the force parameter to skip checking the external server IPs. The parameter does not require a value to be specified.
s3usetlsencryption	<i>(Optional)</i> The field is applicable to generic S3 server, HPE Alletra Storage MP X10000 import. This is a flag indicating if TLS encryption is to be used for the external S3 server. The default value for the flag is true. The HTTPS protocol relies on TLS encryption for secure communication.
s3serverport	<i>(Optional)</i> The port number for the generic S3 server, HPE Alletra Storage MP X10000 on which the communication with Data Fabric must happen. The default value is 9000.
s3servercertfile	<i>(Conditionally Required)</i> Required for generic S3 servers, HPE Alletra Storage MP X10000. The S3 server security certificate content. This is applicable if the communication is to happen over the HTTPS protocol.
s3servercertfilepath	<i>(Conditionally Required)</i> Required for generic S3 servers, HPE Alletra Storage MP X10000. The file path of the S3 server security certificate. This is applicable if the communication is to happen over the HTTPS protocol.
s3servertransferproto	<i>(Optional)</i> The protocol to use to transfer external S3 server data over the Internet. https and http are the allowed valid values. The default value is https.

Example

CLI

Add or import an external NFS server with the name extnfs and associated IP address 10.163.161.123.

```
maprcli clustergroup
addexternal -type
nfs -externalservername extnfs -ips
<ip address>
```

REST

```
curl -u <username> -X POST https://
abc.sj.us:8443/rest/clustergroup/
addexternal?
type=nfs&externalservername=extnfs&ips
=<ip address>
```

CLI

Add or import an external AWS S3 server with the name `awsus1` and AWS region `us-west-1`.

```
maprcli clustergroup
addexternal -type
s3 -externalservername
awsus1 -accesskey
"<access-key>" -secretkey
"<secret-key>" -s3vendor
AWS -awsregion us-west-1
```

REST

```
curl -u <username> -X POST https://
abc.sj.us:8443/rest/clustergroup/
addexternal?
type=s3&externalservername=awsus1&acce
sskey="<access-key>"&secretkey="<secre
t-key>"&s3vendor=AWS&awsregion=us-wes
t-1
```

CLI

Add or import external Scalify server having name `extscalityserver`.

```
maprcli clustergroup
addexternal -type
s3 -externalservername
extscalityserver -ips <scality
server ip> -accesskey
<access-key> -secretkey
<secret-key> -s3vendor
Generic -s3serverport
443 -s3servercertfilepath <file path
for server certificate>
```

REST

```
curl -u <username> -X POST https://
abc.sj.us:8443/rest/clustergroup/
addexternal?
type=s3&externalservername=extscalitys
erver&ips=<scality server
ip>&accesskey="<access-key>"&secretkey
="<secret-key>"&s3vendor=Generic&s3ser
verport=443&s3servercertfilepath=<file
path for server certificate>
```

CLI

Add or import an external Vast server with the name `extvastserver`.

```
maprcli clustergroup
addexternal -type
s3 -externalservername
extvastserver -ips <vast
server ip> -accesskey
<access-key> -secretkey
<secret-key> -s3vendor
Generic -s3serverport
<portnumber> -s3servercertfile
<server certificate content>
```

REST

```
curl -u <username> -X POST https://
abc.sj.us:8443/rest/clustergroup/
addexternal?
type=s3&externalservername=extvastserv
er&ips=<vast server
ip>&accesskey="<access-key>"&secretkey
="<secret-key>"&s3vendor=Generic&s3ser
verport=<portnumber>&s3servercertfile=
<server certificate content>
```

CLI

Add or import an external GCP object storage with the name gcp.

```
maprcli clustergroup
addexternal -type
s3 -externalservername
gcp -accesskey <accesskey> -secretkey
<secretkey> -s3vendor GCP -gcpregion
<gcp-region>
```

REST

```
curl -u <username> -X POST https://
abc.sj.us:8443/rest/clustergroup/
addexternal?

ey="<access key>"&secretkey="<secret
key>"&s3vendor="GCP"&gcpregion=<gcp
region>
```

CLI

Add or import an external HPE Alletra Storage MP X10000 object storage with the name alletra and the associated IP address.

```
maprcli clustergroup
addexternal -type
s3 -externalservername
alletra -s3vendor
HPE_Alletra_Storage_MP_X10000 -s3serve
rtransferproto https -ips <ip
address> -accesskey
testuser -secretkey
testuser -s3usetlsencryption
false -s3serverport
8443 -s3servercertfilepath <file path
for server certificate>
```

REST

```
curl -u <username> -X POST https://
abc.sj.us:8443/rest/clustergroup/
addexternal?
type=HPE_Alletra_Storage_MP_X10000&ext
ernalservername=alletra&ips=<ip
address>&s3servercertfilepath=<file
path for server certificate>
```

clustergroup getnfsexports

Displays the list of exports from the `/etc/exports` file of an external NFS server that has been imported into a cluster group or global namespace.

The entries for the external NFS exports accessible to a Data Fabric user are available in the `/etc/exports` file on the external NFS server. The Data Fabric user can read from and write to such NFS exports.

NOTE: NFSv4 refers to NFS version 4.1.

The `getnfsexports` command lists the exports from the `/etc/exports` file of an external NFS server imported into the global namespace/cluster group.

The command lists a summary of each export along with the total size of the export, used space, and free space available on the export.

NOTE: The command supports NFSv4 servers only.

See [clustergroup addexternal](#) on page 2358 to add or import an external NFS server into the global namespace/cluster group via `maprccli`.

See [clustergroup get cgtable](#) on page 2351 to view external NFS server details via `maprccli`.

See [clustergroup remove cluster](#) on page 2364 to remove the external NFS server from the cluster group via `maprccli`.

Syntax**CLI**

```
maprccli clustergroup getnfsexports
        -externalservername name of
the external server for exports info
        [ -start start. default: 0 ]
        [ -limit limit. default:
2147483647 ]
```

REST

Request Type	GET
Request URL	<code>http[s]://<host>:<port>/rest/clustergroup/getnfsexports?<parameters></code>

Parameters

Parameter	Description
<code>externalservername</code>	(<i>Required</i>) Name of the external NFS server
<code>start</code>	(<i>Optional</i>) The entry to start from when listing. Default: 0 (first entry)
<code>limit</code>	(<i>Optional</i>) The number of records to list. Default: 2147483647

Example**CLI**

Lists the export entries in the `/etc/exports` file for an external NFS server with the name `extnfs` along

with the total, used, and free space on each export. Starts at the second entry and lists two entries.

```
maprcli clustergroup
getnfsexports -externalservername
extnfs -start 1 -limit 2 -json
{
    "timestamp":1698640394720,
    "timeofday":"2023-10-29
09:33:14.720 GMT-0700 PM",
    "status":"OK",
    "total":2,
    "data":[
        {
            "exportpath":"/test2",
            "size":"215G",
            "used":"15G",
            "avail":"200G"
        },
        {
            "exportpath":"/test1",
            "size":"215G",
            "used":"15G",
            "avail":"200G"
        }
    ]
}
```

REST

 **NOTE:** When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X GET https://
abc.sj.us:8443/rest/clustergroup/
getnfsexports?
externalservername=extnfs&start=1&limi
t=2
```

clustergroup remove cluster
Removes a cluster from a cluster group.

Syntax

Only the cluster that acts as the primary can remove other clusters.

Use this command to remove any external NFS servers or external S3 servers that are imported into the global namespace. To remove an external NFS server from a clustergroup, you must use the name of the external NFS server.

CLI

```
maprcli clustergroup remove
-clustername <name of the cluster
or external NFS or S3 server to be
removed from the group>
```

REST

Request Type	DELETE
--------------	--------

Request URL	http[s]://<host>:<port>/rest/clustergroup/remove?<parameters>
-------------	---

Parameters

Parameter	Description
clustername	(Required) Name of the cluster to remove from the group. If you wish to remove an external NFS server or an external S3 server, the parameter value must be the name of the external NFS server or the external S3 server.

Example

CLI

The following command removes the cluster/fabric, cluster2, from the cluster group.

```
maprcli clustergroup
remove -clustername "cluster2"
```

REST

 **NOTE:** When using a self-signed certificate pass, the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X
DELETE https://
abc.sj.us:8443/rest/clustergroup/
remove?clustername=cluster2
```

CLI

The following command removes the external NFS server extnfsstorage from the cluster group.

```
maprcli clustergroup
remove -clustername "extnfsstorage"
```

REST

 **NOTE:** When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X
DELETE https://
abc.sj.us:8443/rest/clustergroup/
remove?clustername=extnfsstorage
```

CLI

The following command removes the external S3 server, "ext_s_three", from the cluster group.

```
maprcli clustergroup
remove -clustername "ext_s_three"
```

REST

NOTE: When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X
DELETE https://
abc.sj.us:8443/rest/clustergroup/
remove?clustername=ext_s_three
```

clustergroup s3gns

Sets the S3 server to redirect or forward external S3 access requests, and enables S3 global namespace.

The `clustergroup s3gns` command defines the way how s3 global name space behaves.

The `clustergroup s3gns` command has the following options.

- `httpsmode`: Used to set the https mode for the S3 global namespace
- `enables3gns`: Used to enable or disable S3 global namespace.

See the individual topic for details on the subcommands.

s3gns httpsmode

S3gns subcommand to set the `httpsmode` for the S3 client - S3 server communication via Data Fabric.

Data Fabric acts as the intermediary between a S3 client and an external S3 server that is added to the cluster group/imported into the global namespace from the Data Fabric UI.

S3 Client-External S3 Server Communication

S3 clients requests for access to external S3 servers in a clustergroup are routed via Data Fabric. Data Fabric forwards requests coming from S3 clients to the external S3 server. The responses from the external S3 server are transported back to the requesting S3 clients via Data Fabric. The forwarding mechanism that happens during the S3 client-external S3 server communication via Data Fabric consumes CPU and memory resources on Data Fabric. This can impact the Data Fabric performance, depending on the use case for frequency of communication between the S3 client and external S3 server.

NOTE: Currently, there is no performance benchmark available on Data Fabric performance for S3 client-external S3 server communication.

S3 Client - Native S3 Server Communication

Data Fabric can work in redirection mode for S3 client-native S3 server communication with the `clustergroup s3gns` command. Data Fabric redirects an incoming S3 client request made to a native S3 server on another fabric in the same global namespace. Once the redirection is successful, the communication between the S3 client and the native S3 server on the other fabric takes place directly. In case of redirection, there is no impact on Data Fabric performance.

Some S3 clients such as the AWS client and the latest versions of minio client do not support the HTTPS redirect error. For such clients, you can use the **forward** mode.

*Forward mode is the **default** and all clients should work with this mode.*

Syntax

```
maprcli clustergroup s3gns
  -httpsmode either forward OR redirect. In forward mode server sends the
  cross fabric request, while in redirect mode client.
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/clustergroup/s3gns?<httpsmode=<"value">>

Parameters

Parameter	Description
httpsmode	(Required) The mode of operation - either forward (default) or redirect.

Example

Redirect mode

Sets the mode of operation to redirect.

CLI

```
maprcli clustergroup s3gns -httpsmode
redirect
{
    "timestamp":1705411835609,
    "timeofday":"2024-01-16
05:30:35.609 GMT-0800 AM",
    "status":"OK",
    "total":0,
    "data":[
        ],
    "messages":[
        "Successfully
executed s3gns command"
    ]
}
```

REST

```
curl -u <username> -X
POST https://server.sj.us:8443/rest/
clustergroup/s3gns?httpsmode=redirect
```

s3gns enables3gns
S3gns subcommand to enable S3 global namespace.

A S3 client can authenticate to all the S3 storage across fabrics in the S3 global namespace, by using a single set of access key/secret key. This is achieved by way of enabling S3 global namespace by using the `clustergroup s3gns` command.

The S3 global namespace provides a unified data plane and control plane for all native S3 storage (S3 storage on fabrics).

The unified S3 storage across fabrics in the S3 global namespace comprises a primary fabric and one or more non-primary or secondary fabrics.

 **IMPORTANT:** The S3 global namespace can be enabled on the primary cluster/fabric only. To enable S3 global namespace on a cluster group, you must run the `clustergroup s3gns` command on the primary cluster/fabric. When you enable S3 global namespace on the primary cluster of a cluster group, the previous access key and secret key for all the non-primary clusters are overwritten with the access key and secret key that belong to the primary cluster. The S3 client can authenticate to the primary/non-primary clusters by using the access key and secret key of the primary cluster only.

Once a S3 global namespace is enabled, S3 storage on a fabric in the S3 global namespace can be accessed using the access point or IP address of any fabric in the cluster group.

Syntax

CLI

```
maprcli clustergroup s3gns
  -enables3gns enabling S3GNS will
  overwrite existing keys/IAM policies
  of the non-primary cluster.
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/clustergroup/s3gns?enables3gns<parameters>

Parameters

Parameter	Description
enables3gns	<p>(Optional) Set this option to <code>true</code> to enable S3 global namespace on the cluster group.</p> <p>This setting must be enabled only if you wish to access the objects and or buckets belonging to all clusters/fabrics in the cluster group from any cluster in the cluster group by way of a common pair of keys and by using a common access point.</p> <p>The default value for this option is <code>false</code>.</p> <p> WARNING: Enabling S3 global namespace overwrites all the keys and IAM policies on non-primary clusters/fabrics with the keys and IAM policies of the primary cluster. Ensure that relevant changes in your S3 client scripts are made, before you can enable S3 global namespace on your cluster group.</p>

Example

CLI

```
maprcli clustergroup
s3gns -enables3gns true -json
{
  "timestamp":1720589652245,
  "timeofday":"2024-07-09
10:35:31.245 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
```

```

    ],
    "messages": [
        "Successfully
        executed s3gns command"
    ]
}

```

REST

```

curl -u <username> -X
POST https://server.sj.us:8443/rest/
clustergroup/s3gns?enables3gns=true

```

NOTE: If you run the `mc ls` command after enabling S3 global namespace, you should see all the native S3 servers listed, along with any external S3/NFS servers that are a part of the cluster group.

```

# /opt/mapr/bin/mc ls
mapralias/gns/
[2024-07-09 22:23:55 PDT] 1B
cluster-a
[2024-07-09 22:23:55 PDT] 7B
cluster-b
[2024-07-09 22:23:55 PDT] 4B
cluster-c
[2024-07-09 22:23:55 PDT] 9B
extcluster-1

```

TIP: If S3 global namespace is not enabled, the `mc ls` command would list only the cluster or fabric on which you are running the command, along with any external S3 servers in the cluster group, even if there are other native clusters/fabrics in the cluster group.

clustergroup fetchchainca

Displays location of the CA certificate chain on the specified cluster or all clusters in the cluster group.

When it comes to a cluster group, there are multiple clusters in the cluster group. One or more external S3 servers could be a part of the cluster group if they are imported into Data Fabric.

A CA certificate is the means for a S3 client will to connect to a cluster or to an external S3 server in a cluster group.

Every cluster or fabric has a CA certificate that is signed by HPE.

You could have generated a combined CA certificate or a CA certificate chain for multiple fabrics/ clusters that are part of the global namespace or cluster group. The CA certificate chain is retrieved from cldb of the primary cluster.

If you wish to add an external s3 server to cluster group, you would require the certificate of external s3 server to be stored on the cldb of the primary server.

Use the `clustergroup fetchchainca` CLI command to display the location of the CA certificate chain for the specified cluster in a cluster group or all clusters in the cluster group.

By default, the CA certificate chain is saved in `/tmp/chain-ca.pem`.

Once you have the location of the CA certificate chain, you can copy it to the desired location.

Syntax**CLI**

```
maprcli clustergroup fetchchainca
[ - clustername name of the
cluster]
[ - allclusters all clusters <true|
false> ]
```

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/clustergroup/fetchchainca?<parameter>

Options

Option	Description
clustername	<i>(Required if allclusters option is not specified)</i> The name of the cluster for which the CA certificate chain path is to be displayed.
allcluster	<i>(Required if clustername option is not specified)</i> Permissible values for this option are true and false. Use true to display the CA certificate chain path for all clusters in the cluster group.

Example**Display CA certificate chain path for cluster-one in a clustergroup****CLI**

```
maprcli clustergroup
fetchchainca -clustername cluster-one
```

REST

```
curl -u <username> -X GET https://
server.sj.us:8443/rest/clustergroup/
fetchchainca?clustername=cluster-one
```

Display CA certificate chain path for all clusters in the cluster group**CLI**

```
maprcli clustergroup
fetchchainca -allclusters true
```

REST

```
curl -u <username> -X GET https://
server.sj.us:8443/rest/clustergroup/
fetchchainca?allclusters=true
```

clustergroup updates3user

Updates permissions for external S3 server.

As a cluster administrator, you can perform the following operations on an external S3 server that has been imported into Data Fabric.

- add access to users and/or groups

- revoke access from users and/or groups
- change the owner

NOTE: When you change the owner, the new owner must be granted the cs3 ACL. The cs3 ACL will enable to new owner to connect the the external S3 server.

Use the `clustergroup updates3user` CLI command to perform the aforementioned operations on an external S3 server that has been imported into Data Fabric.

Syntax

CLI

```
maprccli clustergroup updates3user
  - externalservername name of the
    external server
  - action addaccessors/
    removeaccessors/updateowner
    [- accessorusers comma separated
    list of accessor users]
    [- accessorgroups comma separated
    list of accessor groups]
    [- owner owner name]
```

Request Type	POST
Request URL	<code>http[s]://<host>:<port>/rest/clustergroup/updates3user?<parameters></code>

Parameters

Parameter	Description
<code>externalservername</code>	<i>(Required)</i> The name of the imported external S3 server on which you wish to grant or revoke user access or group access or change owner.
<code>action</code>	<i>(Required)</i> Permissible values for this parameter are as follows: <ul style="list-style-type: none"> • <code>addaccessors</code> - Use this value to add one or more users and/or groups as accessors that can access the external S3 server. • <code>removeaccessors</code> - Use this value to remove access that was previously granted to one or more users and/or groups on the external S3 server • <code>updateowner</code> - Use this value to update the owner of the imported external S3 server.
<code>accessorusers</code>	<i>(Optional)</i> Enter a comma-separated list of users that you wish to provide access to or revoke access on the external S3 server. You could specify the <code>accessorgroups</code> when the value of <code>action</code> parameter is <code>addaccessors</code> or <code>removeaccessors</code> .

Parameter	Description
accessorgroups	(Optional) Enter a comma-separated list of groups that you wish to provide access to or revoke access on the external S3 server. You could specify the accessorgroups when the value of action parameter is addaccessors or removeaccessors.
owner	(Optional) Enter the name of the new owner for the imported external S3 server. Specify the owner when the value of action parameter is updateowner.

Example

NOTE: You can use the [clustergroup get cgtable](#) on page 2351 command, to view changes in the ownership and access to the external S3 server details, after the `clustergroup updates3user` command runs successfully.

Change owner for external S3 server

Change the owner on 'ext1' external S3 server to 'johndoe'.

CLI

```
maprcli clustergroup
updates3user -externalservername
ext1 -action updateowner -owner
johndoe -json
```

REST

```
curl -u <username> -X POST https://
server.sj.us:8443/rest/clustergroup/
updates3user?
externalservername=ext1&action=updateo
wner&owner=johndoe
```

Grant access on external S3 server for user and group

Grant access on 'ext1' external S3 server to user, 'janedoe', and groups, 'sales' and 'qa'.

CLI

```
maprcli clustergroup
updates3user -externalservername
ext1 -action
addaccessors -accessorusers janedoe -
accessorgroups sales,qa -json
```

REST

```
curl -u <username> -X POST https://
server.sj.us:8443/rest/clustergroup/
updates3user?
externalservername=ext1&action=addacce
ssors&accessorusers=janedoe&accessorgr
oups=sales,qa
```

Revoke access on external S3 server for group

Revoke access on 'ext2' external S3 server for groups, 'sales' and 'qa'.

CLI

```
maprcli clustergroup
updates3user -externalservername
```

```
ext2 -action removeaccessors -
accessorgroups sales,qa -json
```

REST

```
curl -u <username> -X POST https://
server.sj.us:8443/rest/clustergroup/
updates3user?
externalservername=ext2&action=removea
ccessors&accessorgroups=sales,qa
```

cluster services

Returns the activation status and enables restoration of a disabled fabric.

If you forget to pay your invoice or renew an expired license, HPE can disable a fabric (connected or air-gapped). If your contract terms are not met, HPE activates a "kill switch" that causes the CLDBs to shut down, eventually causing the fabric to enter a non-functional state.

If you suspect that the fabric has been disabled, contact HPE Support. HPE Support can supply a special activation key that you can use to restore the fabric. With the activation key, you can use the following method to restore the fabric:

Syntax

On all CLDB nodes of the fabric, paste the activation key into the following file:

```
/opt/mapr/conf/services-enable.token
```

To check the status, use the following command:

```
maprcli cluster services status
```

Example

CLI

Check the status of the cluster:

```
maprcli cluster services status -json
{
  "timestamp":1691042428101,
  "timeofday":"2023-08-02
11:00:28.101 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "status":"ENABLED"
    }
  ]
}
```

REST

NOTE: When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X
GET https://abc.sj.us:8443/rest/
cluster/services/status
```

cluster usage

Describes the cluster usage commands that check the service activation URLs, register the cluster, and renew the activation for an air-gapped cluster.

cluster usage export

Checks the currently configured values for the service activation URLs.

Syntax

CLI

```
maprcli usage export status
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/usage/export/status

Parameters

Parameter	Description
status	Displays the status information for the given cluster. For details See the following example.
url	<ul style="list-style-type: none">• Register URL : The URL that is used to register the fabric.• Renew URL : The URL that is used to renew your activation monthly after the initial activation.• Upload URL : The URL that is used to upload billing information.• Proxy URL : The URL that enables your fabric to communicate with the billing service when a proxy is used. You do not need to configure the proxy URL if your organization does not use a proxy.

Examples

To check the current connection mode status for a cluster and display the current URL values:

```
# maprcli usage export status -json
{
  "timestamp":1684302853985,
  "timeofday":"2023-05-17 05:54:13.985 GMT+0000 AM",
  "status":"OK",
  "total":1,
```

```

    "data": [
      {
        "clusterId": "6026083753908386969",
        "clusterUsageMode": "airgapped",
        "airgapped": {
          "Registered": "Yes",
          "activeTill": "2023-06-15 17:22:05.000
GMT+0000"
        },
        "email": {
          "customerEmail": "",
          "emailFrequency": "EmailNone"
        }
      },
    ]
  }
}

```

To show parameters corresponding to the air-gapped mode, use the following command:

```

maprcli usage export status -summary airgapped -json
{
  "timestamp": 1686736554240,
  "timeofday": "2023-06-14 02:55:54.240 GMT-0700 AM",
  "status": "OK",
  "total": 1,
  "data": [
    {
      "clusterId": "8241412123680594388",
      "clusterUsageMode": "airgapped",
      "airgapped": {
        "Registered": "Yes",
        "activeTill": "2023-07-20 03:18:38.000
GMT-0700"
      }
    }
  ]
}

```

Once the activation key is applied, the key is valid (and the fabric is operational) until the **Activetill Date**. After the **Activetill Date**, a short grace period is applied to allow you to perform the steps to maintain activation.

To show parameters corresponding to the air-gapped mode, use the following command:

```

maprcli usage export status -summary airgapped -json
{
  "timestamp": 1686736554240,
  "timeofday": "2023-06-14 02:55:54.240 GMT-0700 AM",
  "status": "OK",
  "total": 1,
  "data": [
    {
      "clusterId": "8241412123680594388",
      "clusterUsageMode": "airgapped",
      "airgapped": {
        "Registered": "Yes",
        "activeTill": "2023-07-20 03:18:38.000
GMT-0700"
      }
    }
  ]
}

```

You can edit the default URL by using the following command with one of the following four options:

```
maprccli usage export url
[ -registerUrl <register-url> ]
[ -uploadUrl <upload-url> ]
[ -renewCredsUrl <renew-creds-url> ]
[ -proxyUrl <proxy-url> ]
```

For example:

```
maprccli usage export url -registerUrl <url name1> -uploadUrl <url
name2> -renewCredsUrl <url name3> -proxyUrl <url name4> -json
{
  "timestamp":1692170117568,
  "timeofday":"2023-08-16 12:15:17.568 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":[
    "export urls updated successfully! "
  ]
}
```

cluster usage register

Registers an air-gapped Data Fabric cluster.

For a new air-gapped cluster, you must register it using the activation key provided by HPE Support when you ordered the product. After registration, the cluster is usable for a month with a 15-day grace period. It continues to be usable as long as you continue to pay your monthly bill and reapply new activation keys.

Syntax

Use this command to register a new cluster:

CLI

```
maprccli usage register
[ -keyFile <path-to-keyfile> ]
[ -key <key-as-string> ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/cluster/usage/register?<parameters>

Parameters

Parameter	Description
keyfile	(Conditionally Required) The file containing the registration key. Either this parameter or the key parameter is required.
key	(Conditionally Required) The registration key. Either this parameter or the keyfile parameter is required.

Example

CLI

Register a cluster.

```
maprccli usage register -keyfile
newact.key -json
{
    "TIMESTAMP":1684302620609,
    "TIMEOFDAY":"2023-05-17
05:50:20.609 GMT+0000 AM",
    "STATUS":"OK",
    "TOTAL":1,
    "DATA":[
        {
            "ACTIVETILL":"2023-06-13 15:24:12.000
GMT+0000"
        }
    ]
}
```

REST

 **NOTE:** When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST
https://abc.sj.us:8443/rest/cluster/
usage/register?keyfile=newact.key
```

cluster usage renew

Renews the activation for an air-gapped Data Fabric cluster.

As long as you continue to provide usage records and pay your monthly invoice within the billing grace period, HPE will continue to provide an activation code that allows you to renew your activation.

After obtaining the new activation code from the customer portal, use the following maprccli command to renew your activation:

Syntax

Use this command to register a new fabric:

CLI

```
maprccli usage renew
[ -keyFile <path-to-keyfile> ]
[ -key <key-as-string> ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/cluster/usage/renew?<parameters>

Parameters

Parameter	Description
keyfile	(Conditionally Required) The file containing the registration key. Either this parameter or the key parameter is required.
key	(Conditionally Required) The registration key. Either this parameter or the keyfile parameter is required.

Example

CLI

Renew a cluster.

```
maprcli usage renew -keyFile
act.txt -json
{
    "timestamp":1684302775148,
    "timeofday":"2023-05-17
05:52:55.148 GMT+0000 AM",
    "status":"OK",
    "total":1,
    "data":[
        {
            "activeTill":"2023-06-15 17:22:05.000
GMT+0000"
        }
    ]
}
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X
POST https://abc.sj.us:8443/rest/
cluster/usage/renew?keyfile=act.txt
```

config

Lists configuration values for the Data Fabric cluster.

Configuration Fields

The following fields are configurable.

apiserver.max.concurrent.user.sessions

apiserver.max.concurrent.user.sessions represents the maximum number of permissible concurrent web server sessions for a Data Fabric user. This is a global setting that applies to all Data Fabric users.

Default Value: -1. The value -1 indicates that there are no restrictions on the maximum number of permissible concurrent web server sessions for a Data Fabric user.

The maximum number of concurrent web server sessions for a Data Fabric user is limited to the value that is specified for the apiserver.max.concurrent.user.sessions

field. For example, if you wish to allow two concurrent web server sessions for every Data Fabric user, you should set the value of `apiserver.max.concurrent.user.sessions` to 2. The number of concurrent web server sessions for a Data Fabric user at a given point in time cannot exceed this value.

NOTE: 0 is an invalid value. Do not set `apiserver.max.concurrent.user.sessions` to 0.

IMPORTANT:

- If you wish to restrict the maximum number of concurrent web server sessions permissible for a Data Fabric user, **DO NOT** configure spring security concurrency control in session-management. For example, DO NOT use code similar to the following:

```
<session-management>
  <concurrency-control
    max-sessions="2" />
</session-management>
```

- If you change the value for the `apiserver.max.concurrent.user.sessions` field when the `apiserver` service is running on your cluster nodes, you must restart the `apiserver` service on all relevant cluster nodes after changing the value for the `apiserver.max.concurrent.user.sessions` field.

`cldb.balancer.disk.max.switches.in.nodes.percentage`

Default Value: 10

The maximum number of containers that can be balanced in parallel by the disk balancer. The value is a percentage of the number of nodes in the system.

`cldb.disk.balancer.enable`

Default Value: 1 (Disk Balancer is enabled)

Enables (1) or disables (0) the Disk Balancer.

`cldb.balancer.disk.sleep.interval.sec`

Default Value: 120

The sleep interval (in seconds) between two successive runs of the Disk Balancer.

`cldb.balancer.disk.threshold.percentage`

Default Value: 70

Percentage of used space that causes containers in a storage pool to be distributed across other less used storage pools.

`cldb.balancer.logging`

Default Value: 0

Disables (0) or enables (1) the logging of messages in the Disk Balancer and Role Balancer.

`cldb.balancer.role.max.switches.in.nodes.percentage`

Default Value: 10

The percentage (of the number of nodes in the system) to use to determine the maximum number

	<p>of containers whose roles (Masters and Tails) are balanced in parallel by the Role Balancer.</p> <p>For example, suppose there are 500 nodes and the value of this parameter is 10(%). The number of containers whose roles are balanced in parallel is $(10/100)*500=50$.</p>
<code>cldb.balancer.role.paused</code>	<p><i>Default Value:</i> 1</p> <p>Enables (0) or Disables (1) the Role Balancer.</p>
<code>cldb.balancer.role.sleep.interval.sec</code>	<p><i>Default Value:</i> 900</p> <p>The sleep interval (in seconds) between two successive runs of the Role Balancer.</p>
<code>cldb.balancer.startup.interval.sec</code>	<p><i>Default Value:</i> 1800</p> <p>The initial startup delay (in seconds) of the Role Balancer for existing clusters.</p>
<code>cldb.cluster.almost.full.percentage</code>	<p><i>Default Value:</i> 90</p> <p>The percentage at which the <code>CLUSTER_ALARM_CLUSTER_ALMOST_FULL</code> alarm is triggered.</p>
<code>cldb.container.alloc.selector.algo</code>	<p><i>Default Value:</i> 0</p> <p>The allocation algorithm to use when creating new containers. The value can be one of:</p> <ul style="list-style-type: none"> • 0 - indicates Round Robin algorithm if the number of nodes is less than or equal to 100, Randomized algorithm otherwise. • 1 - indicates Round Robin algorithm. If selected, containers are allocated across nodes in a topology in a round robin fashion. • 2 - indicates Randomized algorithm. If selected, containers are allocated across nodes in a randomized way.
<code>cldb.container.assign.buffer.sizeMb</code>	<p><i>Default Value:</i> 1024</p> <p>The size of the container (in MB) that should be used as a buffer. When allocating a new container, this size is deducted from the maximum container size.</p> <p> NOTE: When you modify the value of <code>cldb.container.sizeMb</code>, check and update the value of <code>cldb.container.assign.buffer.sizeMb</code> to prevent new containers from being created when existing containers are not full.</p>
<code>cldb.container.create.diskfull.threshold</code>	<p><i>Default Value:</i> 85</p> <p>The percentage of space on a file server to use to classify the file server as full.</p>
<code>cldb.container.sizeMb</code>	<p><i>Default Value:</i> 32768</p> <p>The maximum size for containers (in MB). This is a soft limit.</p>

NOTE: When `cldb.container.size` value is modified, check and update the value of `cldb.container.assign.buffer.size` to prevent new containers from being created when existing containers are not full.

`cldb.default.chunk.size`

Default Value: 256

The size of each chunk (in MB) that make up a file in the Data Fabric file system.

`cldb.default.volume.topology`

Default Value: /data

The default topology for new volumes.

`cldb.dialhome.metrics.file.rotation.period`

Default Value: 365

The retention period of the files (in days) that is used to record Dialhome metrics. Files that are past their retention period are automatically deleted.

`cldb.disable.alarm.history`

Default Value: 0 (false)

Set this to 1 (true) to disable CLDB alarm history, as tracking and fetching the alarm history can degrade the performance of CLDB on large clusters.

`cldb.fs.mark.rereplicate.sec`

Default Value: 3600

The number of seconds that a node can fail to heartbeat before it is considered dead. Once a node is considered dead, the CLDB re-replicates any data contained on the node.

`cldb.fs.reregistration.wait.time`

Default Value: 15

The amount of time (in minutes) to wait before checking for inactive nodes.

NOTE: Reduce the value to raise the [No Heartbeat Alarm](#) on page 3407 without delay, after CLDB failover. To avoid spurious alarms, do not reduce this value below 5 (minutes).

`cldb.insight.buffer.size`

Default Value: 1024 (audit records)

An Iceberg data file is created when the number of audit records tallies to this count.

`cldb.insight.commit.interval.mins`

Default Value: 5

The time interval, in minutes, at which the insight service commits the Iceberg data files containing the audit records into the respective Iceberg table.

`cldb.insight.debug.enabled`

Default Value: false

The boolean parameter to toggle the unit of `cldb.insight.commit.interval` and `cldb.insight.purge.frequency`.

If debug mode is enabled, the insight service treats the unit for the commit interval as seconds (instead of minutes), purge frequency as minutes (instead of hours), retention as minutes (instead of days).

`cldb.insight.heartbeat.seconds`

Default Value: 5

The time interval, in seconds, in which insight sends a heartbeat to CLDB. The heartbeat helps the CLDB determine if the insight service running on a node is alive or dead.

cldb.insight.purge.frequency.hours	<p><i>Default Value:</i> 1 hour</p> <p>The frequency at which records are purged from Iceberg tables by insight service based on the retention days set.</p>
cldb.insight.threshold.heartbeats	<p><i>Default Value:</i> 5</p> <p>The number of consecutive heartbeats to determine the insight service health on a node. If the insight service fails to send this count of consecutive heartbeats to the CLDB, the CLDB declares the insight service on the node as dead.</p>
cldb.insight.hms.host.fetch.seconds	<p><i>Default Value:</i> 60 seconds</p> <p>The time interval at which Data Fabric polls Zookeeper for the master host information about the Hive MetaStore service.</p>
cldb.insight.hivemetastore.sasl.enabled	<p><i>Default Value:</i> true</p> <p>The boolean configuration parameter used by the insight service for secure communication with HiveMetaStore service. This parameter needs to be set based on the SASL configuration of HiveMetaStore service.</p>
cldb.insight.hivemetastore.ssl.enabled	<p><i>Default Value:</i> false</p> <p>This parameter needs to be set based on the SSL config of HiveMetaStore service.</p> <p>The boolean configuration parameter is used by Insight service for secure communication with HiveMetaStore service.</p>
cldb.insight.summarization.minutes	<p><i>Default Value:</i> 5 minutes</p> <p>The time interval at which the summarization occurs. Summarization refers to summarizing information from an Iceberg table and adding it to the respective summary table on Iceberg.</p>
cldb.insight.summarytable.purge.hours	<p><i>Default Value:</i> 1</p> <p>The frequency, in hours, at which records are purged by insight service from summary Iceberg tables, based on the value of retention days.</p>
cldb.insight.zeppelin.port	<p><i>Default Value:</i> 9995</p> <p>The port on which the Zeppelin (for the insight service) is listening.</p>
cldb.log.fileserver.timeskew.interval.mins	<p><i>Default Value:</i> 60</p> <p>The frequency (in minutes) at which CLDB should log messages about the time skew on the file server.</p>
cldb.max.parallel.resyncs.star	<p><i>Default Value:</i> 3</p> <p>The number of container replicas that can resync in parallel from the source for low-latency (star-replicated) volumes.</p>
cldb.max.snapshots.per.volume	<p><i>Default Value:</i> 4096</p> <p>The maximum number of snapshots that you can create for a volume. CLDB will fail snapshot creation once the number of snapshots reaches this limit. Increasing this value has performance implications.</p>

<code>cldb.mfs.heartbeat.timeout.multiple</code>	<p>This should only be changed in consultation with the HPE Data Fabric support team.</p> <p><i>Default Value:</i> 10</p> <p>Specifies a multiple heartbeat timeout. For small clusters, the heartbeat interval is 1 second and the multiple is 10 by default, which makes the heartbeat timeout 10 seconds.</p>
<code>cldb.min.fileservers</code>	<p><i>Default Value:</i> 1</p> <p>The number of file servers hosting the CLDB volume that is required for the master CLDB to complete the bootstrap process.</p>
<code>cldb.num.active.cg.containers</code>	<p><i>Default Value:</i> 20</p> <p>Number of containers to be assigned for a CG assign request. The value can be any integer between 0 and 100.</p>
<code>cldb.pbs.access.control.enabled</code>	<p><i>Default Value:</i> 1</p> <p>Enables and disables policy access controls (ACEs set in security policies) at the cluster level. When set to 0, the system does not enforce security policy ACEs for data operations in the cluster. See Disabling Policy Access Controls at the Cluster-Level on page 2159 for additional information.</p>
<code>cldb.pbs.audit.only.policy.check</code>	<p><i>Default Value:</i> 0</p> <p>Set the value to 1 to enable audit-only policy checks (permissive mode). Permissive mode is useful during initial deployment when testing security policies. When permissive mode is enabled, the volume-level enforcementmode option <code>PolicyAceAuditAndDataAce</code> can be set. In this mode:</p> <ul style="list-style-type: none"> • Resource-level ACEs are enforced. • If security policies are tagged to data objects, the security policies are checked for access; any access denied events will be audited, but access will be allowed. <p>See Setting Global Configuration Options for Policy-Based Security on page 2158 for additional information.</p>
<code>cldb.pbs.max.security.policy</code>	<p><i>Default Value:</i> 10000</p> <p>Maximum number of configured security policies allowed. Prevents users from arbitrarily creating numerous security policies, which could impact performance.</p>
<code>cldb.pbs.global.master</code>	<p><i>Default Value:</i> 0</p> <p>Sets the master security policy cluster for the global namespace. You can configure a cluster to perform one of the following roles:</p> <ul style="list-style-type: none"> • Master — A master security policy cluster is required to create and manage security policies. Only one master security policy cluster can exist. • Member — On a cluster designated as Member, you can view the security policies available and apply them to data objects.

By default, the host is set to member (0) upon a new installation or upgrade. To set the host to master, and enable the creation and modification of security policies, set the value of this property to 1.

For more information, see the [config save](#) on page 2394.

cldb.replication.manager.critical.paused	<p><i>Default Value:</i> 0</p> <p>Disables (0) or enables (1) the processing of critically under-replicated containers. If enabled, the critically under-replicated containers are processed on a priority basis to increase the number of copies.</p>
cldb.replication.manager.max.resyncs.in.nodes.percentage	<p><i>Default Value:</i> 1200</p> <p>The number of containers that can be replicated in parallel, expressed as a percentage of the number of active nodes. If the value is 1200, the number of containers that can be replicated is 12 times the number of active nodes.</p>
cldb.replication.manager.over.paused	<p><i>Default Value:</i> 0</p> <p>Disables (0) or enables (1) the processing of over-replicated containers. Over-replicated containers are processed to delete extra copies, which is when the number of copies is more than the desired replication factor.</p>
cldb.replication.manager.start.mins	<p><i>Default Value:</i> 15</p> <p>The delay (in minutes) between CLDB startup and replication manager startup, to allow all nodes to register and heartbeat.</p>
cldb.replication.max.in.transit.containers.per.sp	<p><i>Default Value:</i> 4</p> <p>The maximum number of containers that can be in transit on a storage pool (SP). Containers that serve either as the source or destination of a resync operation are considered as being in 'transit'.</p>
cldb.replication.sleep.interval.sec	<p><i>Default Value:</i> 15</p> <p>The sleep duration (in seconds) between consecutive runs of the Replication Manager.</p>
cldb.replication.tablescan.interval.sec	<p><i>Default Value:</i> 120</p> <p>The sleep duration (in seconds) between consecutive runs of the Replication Scanner. While the Replication Scanner classifies containers into different buckets, the Manager thread either replicates or removes additional copies.</p>
cldb.rm.wait.rack.violated.fork.copy.mins	<p><i>Default Value:</i> 720</p> <p>The buffer time (in minutes) after which all container copies found on the same rack are fixed.</p>
cldb.rm.wait.fork.on.same.rack.mins	<p><i>Default Value:</i> 180</p> <p>The time (in minutes) to defer creating containers on the same rack, for critically under-replicated containers, if there are at least two copies of the containers.</p>
cldb.security.user.ticket.duration.seconds	<p><i>Default Value:</i> 1209600</p> <p>The length of time (in seconds) before the user ticket (generated using the maprlogin password command) expires.</p>

cldb.security.user.ticket.max.duration.seconds	<p><i>Default Value:</i> 2592000</p> <p>The maximum amount of time (in seconds) allowed for the user ticket (generated using the maprlogin password command).</p>
cldb.security.user.ticket.renew.duration.seconds	<p><i>Default Value:</i> 2592000</p> <p>The length of time (in seconds) to renew the user ticket (generated using the maprlogin password command).</p>
cldb.security.user.ticket.renew.max.duration.seconds	<p><i>Default Value:</i> 7776000</p> <p>The maximum duration allowed for a user ticket (generated using maprlogin password command) renewal.</p>
cldb.snapshot.restore.on.volume.unmount.only	<p><i>Default Value:</i> 1 (true)</p> <p>Indicates whether the Snapshot Restore operation is allowed without first checking whether the volume is unmounted or not.</p> <p>By default, the volume restore operation is allowed only if the volume is unmounted, ensuring that no application is accessing any data in the volume.</p> <p>Set this flag to 0 (false) to perform the restore operation in a single step, without verifying whether the volume is unmounted or not.</p> <p>To set this flag to 0, run:</p> <pre style="background-color: #f0f0f0; padding: 10px;">/opt/mapr/bin/maprcli config \ save -values '{"cldb.snapshot.restore.on.volume.unmount.only":"0"}' -json</pre>
cldb.topology.almost.full.percentage	<p><i>Default Value:</i> 90</p> <p>The threshold percentage that is used to raise alarms when the used space on the nodes of a topology exceed a certain percentage of total space.</p>
cldb.volume.epoch	<p><i>Default Value:</i> Not Applicable</p> <p>The starting epoch of a new Container. Epoch is used internally in the selection of the master container.</p>
cldb.volumes.namespace.default.min.replication	<p><i>Default Value:</i> 2</p> <p>The minimum replication factor for the name container. Containers with fewer copies than this value are replicated on a priority basis.</p> <p> NOTE: To modify, run the maprli volume modify -name <volume name> -nsminreplication <replication factor> command.</p>
cldb.volumes.namespace.default.replication	<p><i>Default Value:</i> 3</p> <p>The desired replication factor for the name container.</p> <p> NOTE: To modify, run the maprli volume modify -name <volume name> -nsreplication <replication factor> command.</p>
dfui.insight.enable	<p><i>Default Value:</i> false</p>

	<p>The parameter indicates whether or not the Data Fabric UI is to be enabled to receive insight information.</p> <p><i>Default Value:</i> false</p> <p>The parameter represents the flag used to force logout of a user session for the Control System, the Object Store UI, or the Data Fabric UI. Set the value for <code>dfui.security.securedtabwindow</code> to <code>true</code>, if you wish to force logout of a user session for the Data Fabric UI, the Control System, or the Object Store UI, when the user closes the web browser tab or window without logging out, or refreshes the web browser window.</p>
<code>dfui.security.securedtabwindow</code>	
<code>mapr.fs.nocompression</code>	<p><i>Default Value:</i> "bz2,gz,tgz,tbz2, zip,z,Z,mp3,jpg, jpeg,mpg,mpeg,avi, gif,png,lzo,jar"</p> <p>The file types that should not be compressed. See File Extensions of Compressed Files on page 1589.</p>
<code>mapr.fs.permissions.supergroup</code>	<p><i>Default Value:</i> root</p> <p>The super group of the Data Fabric file system layer.</p>
<code>mapr.fs.permissions.superuser</code>	<p><i>Default Value:</i> mapr</p> <p>The super user of the Data Fabric file system layer.</p>
<code>mapr.targetversion</code>	<p><i>Default Value:</i> Not Applicable</p> <p>The configuration variable to set the current version of the Data Fabric distribution. Failing to set this variable on an upgrade causes alarms to be missed when all the nodes in a cluster are not at the same version of the software.</p>
<code>mfs.db.parallel.copyregions</code>	<p><i>Default Value:</i> Not Applicable</p> <p>The number of parallel copy regions per MFS instance. Setting this field to a larger value increases the parallelism for data transfers during index updates, CDC propagation, and table replication. A larger value increases the transfer rate and reduces the initial synchronization time, but uses more system resources. The latter may impact the response time and performance of applications that read data from the same nodes.</p>
<code>mfs.high.memory.alarm.threshold</code>	<p><i>Default Value:</i> 110 (percentage of allocated memory)</p> <p>On initialization, the Data Fabric file system is allocated a certain amount of memory. There is some additional headroom that can be used if the Data Fabric file system is under memory pressure. However, if the Data Fabric file system exceeds the high memory threshold (default 10% over the allocated memory, that is 110%), the High FileServer Memory Alarm on page 3404 is raised. This threshold can be 8% to 30% over the allocated memory (that is 108% to 130%) .</p>
<code>mfs.feature.db.json.support</code>	<p><i>Default Value:</i></p> <ul style="list-style-type: none"> • 1 for new Data Fabric installations • 0 for upgraded Data Fabric installations <p>Disables (0) or enables (1) Data Fabric streams and support in HPE Data Fabric Database for JSON documents and tables.</p>

mfs.feature.devicefile.support*Default Value:* 1

Disables (0) or enables (1) usage of Named Pipes over NFS.

mfs.resync.disk.throttle.factor*Default Value:* 20

The factor affects the wait time for Data Fabric file system during resync operations, to allow for other disk I/O operations to happen in tandem. The configuration variable can be used to determine and throttle the speed of disk I/O during resync operations. Increasing the value of the `mfs.resync.disk.throttle.factor` decreases the wait time and decreases throttling of disk bandwidth during resync operations, and vice-versa. If you wish to disable disk bandwidth throttling, set the value for `mfs.resync.disk.throttle.factor` to 10000 or higher.

WARNING: When throttling is disabled, unthrottled resync operations can cause clients accessing hosts involved in the resync operations to be starved of disk bandwidth.

mfs.resync.network.throttle.factor*Default Value:* 20

The factor affects the wait time for Data Fabric file system during resync operations, to allow for other network operations to happen in tandem. The configuration variable can be used to determine and throttle the network speed during resync operations. Increasing the value of the `mfs.resync.network.throttle.factor` decreases the wait time and decreases throttling of network bandwidth during resync operations, and vice-versa. If you wish to disable network bandwidth throttling, set the value for `mfs.resync.network.throttle.factor` to 10000 or higher.

WARNING: When throttling is disabled, unthrottled resync operations can cause clients accessing hosts involved in the resync operations to be starved of network bandwidth.

pernode.numcntrs.alarm.thr*Default Value:* 50000

The maximum number of Read/Write (RW) containers on each node beyond which performance may not be optimal. The optimal number for RW and snapshot containers combined is 10 times the value of this parameter.

mastgateway.recallexp.opt.enabled*Default Value:* 1

The configuration variable controls the enabling or disabling of recall expiry optimization for non-large containers. When the value is set to 1, recall expiry optimization is enabled for non-large containers and vice-versa.

If recall expiry optimization is enabled, the MAST gateway performs the recall expiry operation.

Recall expiry optimization can be disabled by setting the value of the **mastgateway.recallexp.opt.enabled** variable to 0.

mastgateway.recallexp.opt.minpurgemb	<p><i>Default Value:</i> 8 MB</p> <p>Recall threshold value in MB. used in conjunction with <code>mastgateway.recallexp.opt.enabled</code>. For non-large containers, recall expiry is run only if recall expiry optimization is enabled, and the size of recalled data on the container as determined by MAST gateway is larger than this configured threshold.</p>
mastgateway.recallexp.opt.largenuminodes.minpurgemb	<p><i>Default Value:</i> 2 GB</p> <p>The configuration variable is used to configure a recall-threshold value. For large containers, recall expiry is run only if recall expiry optimization is enabled, and the size of recalled data on the container as determined by MAST gateway is larger than this configured threshold.</p>
mastgateway.offload.opt.largenuminodes	<p><i>Default Value:</i> 8 million</p> <p>This configuration variable is used to define the criterion for the size of a container to be a large container. When the number of inodes in a container is greater than the value specified in the configuration variable, the container is classified as large container.</p>
mastgateway.recallexp.opt.largenuminodes.enabled	<p><i>Default Value:</i> 1</p> <p>The configuration variable is used to enable/disable recall expiry optimization for large containers. When the value is set to 1, the recall expiry optimization for large containers is enabled. When the value of the variable is set to 0, the recall expiry optimization for large containers is disabled.</p>
mastgateway.ctc.opt.largenuminodes.enabled	<p><i>Default Value:</i> 1</p> <p>This configuration variable is used to enable/disable large container compaction optimization. Compaction optimization for large containers can be disabled by setting this configuration variable to 0.</p>
mastgateway.ctc.opt.largenuminodes.skipqualifiedctrs.enabled	<p><i>Default Value:</i> 1</p> <p>When this configuration variable is set to 1, compaction is skipped for any large container(namespace container/data container) that has garbage of size higher than the value of <code>mastgateway.ctc.opt.largenuminodes.threshmb</code>. When the compaction is skipped in such a manner, the alarm, 'VOLUME_ALARM_COMPACTION_SKIPPED_LARGE_CONTAINER', is raised. The configuration variable enables administrators to decide whether or not to allow running scheduled compaction on large containers, since compaction on large containers can take time. The compaction can be run manually at a suitable time, such as non-peak hours. Refer to Running the Compactor Using the CLI and REST API on page 1524 for details on running the compactor manually via CLI or REST.</p>
mastgateway.ctc.opt.largenuminodes.threshmb	<p><i>Default Value:</i> 2 GB</p> <p>This configuration variable represents the garbage threshold for large containers. For a large container, if the garbage size to reclaim is less than <code>mastgateway.ctc.opt.largenuminodes.threshmb</code>, compaction is skipped for such container.</p>

mastgateway.offload.opt.largenuminodes.mindatamb

Default Value: 2 GB

This configuration variable represents the minimum data to offload threshold for large containers. For a large container, if the size of data to offload is less than `mastgateway.offload.opt.largenuminodes.mindatamb`, offload is not be triggered on the container.

config load
Displays information about the cluster configuration.

Syntax

CLI

```
maprccli config load
[ -cluster <cluster> ]
[ -keys <keys> ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/config/load?<parameters>

Parameters

Parameter	Description
cluster	(Optional) The cluster for which to display values. The default is the cluster on which the command is run.
keys	(Optional) This parameter is used to specify the information to display. Comma-separated fields are used to display values; see the Configuration Fields table. By default, the command displays all information.

Output

Information about the cluster configuration. See the [Configuration Fields](#) table.

Sample Output

```
{
  "status": "OK",
  "total": 1,
  "data": [
    {
      "mapr.webui.http.port": "8080",
      "mapr.fs.permissions.superuser": "root",

      "mapr.fs.permissions.supergroup": "supergroup"
    }
  ]
}
```

Examples

Display several keys:

CLI

```
maprcli config load -keys
mapr.webui.http.port,mapr.webui.https.
port,mapr.webui.https.keystorepath,ma
pr.webui.https.keystorepassword,mapr.
webui.https.keypassword,mapr.webui.timeo
ut
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X GET https://
abc.sj.us:8443/rest/config/load?
keys=mapr.webui.http.port,mapr.webui.h
ttps.port,mapr.webui.https.keystorepat
h,mapr.webui.https.keystorepassword,ma
pr.webui.https.keypassword,mapr.webui.
timeout
```

View the security policy limit:

CLI

```
maprcli config load -keys
cldb.max.security.policies
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X GET
https://abc.sj.us:8443/rest/config/
load?keys=cldb.max.security.policies
```

View the master security policy cluster:

CLI

```
maprcli config load -keys
cldb.pbs.global.master
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X GET
https://abc.sj.us:8443/rest/config/
load?keys=cldb.pbs.global.master
```

View the number of containers to be assigned for a CG assign request:

CLI

```
maprcli config load -keys
cldb.num.active.cg.containers
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X GET https://
server.sj.us:8443/rest/config/load?
keys=cldb.num.active.cg.containers
```

View the insight service buffer size:**CLI**

```
maprcli config load -keys
cldb.insight.buffer.size
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST
https://abc.sj.us:8443/rest/config/
load?keys=cldb.insight.buffer.size
```

View the time interval for committing insight data:**CLI**

```
maprcli config load -keys
cldb.insight.commit.interval.mins
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/load?
keys=cldb.insight.commit.interval.mins
```

Enable debugging for insights:**CLI**

```
maprcli config load -keys
cldb.insight.debug.enabled
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST
https://abc.sj.us:8443/rest/config/
load?keys=cldb.insight.debug.enabled
```

View the heartbeat frequency for insight service:**CLI**

```
maprcli config load -keys
cldb.insight.heartbeat.seconds
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/load?
keys=cldb.insight.heartbeat.seconds
```

View insight service secure communication settings for the Hive Metastore:**CLI**

```
maprcli config load -keys
cldb.insight.hivemetastore.sasl.enable
d
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/load?
keys=cldb.insight.hivemetastore.sasl.e
nabled
```

View the insight service SSL communication settings for the Hive Metastore:**CLI**

```
maprcli config load -keys
cldb.insight.hivemetastore.ssl.enabled
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/load?
keys=cldb.insight.hivemetastore.ssl.en
abled
```

View the insight summarization interval:**CLI**

```
maprcli config load -keys
cldb.insight.summarization.minutes
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/load?
keys=cldb.insight.summarization.minute
s
```

View the purge frequency for the insight records

CLI

```
maprcli config load -keys
cldb.insight.purge.frequency.hours
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/load?
keys=cldb.insight.purge.frequency.hour
s
```

View the summary table purge frequency:**CLI**

```
maprcli config load -keys
cldb.insight.summarytable.purge.hours
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/load?
keys=cldb.insight.summarytable.purge.f
requency
```

View the Zeppelin port for the insight service:**CLI**

```
maprcli config load -keys
cldb.insight.zeppelin.port
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST
https://abc.sj.us:8443/rest/config/
load?keys=cldb.insight.zeppelin.port
```

View if the insight service on the Data Fabric UI is enabled or disabled**CLI**

```
maprcli config load -keys
dfui.insight.enable
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X
POST https://abc.sj.us:8443/rest/
config/load?keys=dfui.insight.enable
```

View if the object lifecycle is enabled or disabled at the cluster level

CLI

```
maprcli config load -json |grep
"cldb.s3.lifecycle.scanner.disable"
```

config save

Saves configuration information, specified as key/value pairs. Permissions required: fc or a.

See the [Configuration Fields](#) table.

WARNING: Changing the cluster configuration may impact the way the cluster functions. Make sure you understand the change well, or else make the change under the guidance of Data Fabric support.

Syntax

CLI

```
maprcli config save
    [ -cluster cluster name ]
    [-test test only. default: 0]
    -values JSON Object to
    comprise all config properties to save
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/config/save?<parameters>

Parameters

Parameter	Description
cluster	(Optional) The cluster on which to run the command.
values	(Required) A JSON object containing configuration fields; see the Configuration Fields table.
test	(Optional) Set this to 1 to test the SMTP configuration without actually saving the values. The system sends a test email to check if the configuration is correct. This parameter is applicable only for SMTP configuration. The default value is 0.

Examples

Configure Data Fabric SMTP settings:

CLI

```
maprcli config save -values
'{"mapr.smtp.provider":"gmail","mapr.s
mtpr.server":"smtp.gmail.com","mapr.smt
p.sslrequired":"true","mapr.smtp.port"
:"465","mapr.smtp.sender.fullname":"Ab
Cd","mapr.smtp.sender.email":"xxx@gmai
l.com","mapr.smtp.sender.username":"xx
x@gmail.com","mapr.smtp.sender.passwor
d":"abc"}'
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"mapr.smtp.provider":"gmail","
mapr.smtp.server":"smtp.gmail.com","ma
pr.smtp.sslrequired":"true","mapr.smtp
.port":"465","mapr.smtp.sender.fullnam
e":"Ab
Cd","mapr.smtp.sender.email":"xxx@gmai
l.com","mapr.smtp.sender.username":"xx
x@gmail.com","mapr.smtp.sender.passwor
d":"abc"}
```

Define the maximum number of configured security policies:

CLI

```
maprcli config save -values
'{"cldb.max.security.policies":"2048"}'
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.max.security.policies":"
2048"}
```

Set the master security policy cluster:

CLI

```
maprcli config save -values
'{"cldb.pbs.global.master":"1"}'
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.pbs.global.master":"1"}
```

Set the number of volumes to balance at a time:**CLI**

```
maprcli config save -values
'{"cldb.tier.gw.balance.num.vols.per.b
atch":"500"}
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.tier.gw.balance.num.vols
.per.batch":"500"}
```

NOTE: The maximum number of volumes that can be balanced at a time is 1000.

Allocate CLDB memory for mirroring:**CLI**

```
maprcli config save -values
'{"cldb.mirror.memory.factor":"60"}
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.mirror.memory.factor":"6
0"}
```

Allocate CLDB memory for mirroring:**CLI**

```
maprcli config save -values
'{"cldb.mirror.memory.factor":"60"}
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.mirror.memory.factor":"6
0"}
```

Set the maximum number of concurrent web server sessions permissible for a Data Fabric user:**IMPORTANT:**

- If you wish to restrict the maximum number of concurrent user sessions permissible for a Data Fabric user, **DO NOT** configure spring security concurrency control in session-management. For example, DO NOT use code similar to the following:

```
<session-management>
  <concurrency-control max-sessions="2" />
</session-management>
```

- If you change the value for the `apiserver.max.concurrent.user.sessions` field when the `apiserver` service is running on your cluster nodes, you must restart the `apiserver` service on all relevant cluster nodes after changing the value for the `apiserver.max.concurrent.user.sessions` field.

CLI

```
maprcli config save -values
'{"apiserver.max.concurrent.user.sessions":"1"}
```

REST

NOTE: When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"apiserver.max.concurrent.user
.sessions":"1"}
```

Set the buffer size for the insight service to 2048 records:**CLI**

```
maprcli config save -values
'{"cldb.insight.buffer.size":"2048"}
```

REST

NOTE: When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.insight.buffer.size":"20
48"}
```

Set the time interval for committing insight data to 2 minutes:**CLI**

```
maprcli config save -values
'{"cldb.insight.commit.interval.mins":
"2"}
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.insight.commit.interval.
mins":"2"}
```

Enable debugging for insights:**CLI**

```
maprcli config save -values
'{"cldb.insight.debug.enabled":"true"}
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.insight.debug.enabled":"
true"}
```

Set the heartbeat for insight service to 10 seconds:**CLI**

```
maprcli config save -values
'{"cldb.insight.heartbeat.seconds":"10
"}'
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.insight.heartbeat.seconds
":"10"}
```

Set secure communication with the Hive Metastore for the insight service:**CLI**

```
maprcli config save -values
'{"cldb.insight.hivemetastore.sasl.enabled":"true"}
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.insight.hivemetastore.sasl.enabled":"true"}
```

Set SSL communication with the Hive Metastore for the insight service:**CLI**

```
maprcli config save -values
'{"cldb.insight.hivemetastore.ssl.enabled":"true"}'
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.insight.hivemetastore.s
ssl.enabled":"true"}
```

Set the insight summarization interval to 1 minute:**CLI**

```
maprcli config save -values
'{"cldb.insight.summarization.minutes"
:"1"}'
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.insight.summarization.mi
nutes":"1"}
```

Set the purge frequency of the insight records to 5 hours:**CLI**

```
maprcli config save -values
'{"cldb.insight.purge.frequency.hours"
:"5"}'
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.insight.purge.frequency.
hours":"5"}
```

Enable automatic logout from user session when a user closes the browser without logging out of the Control System, the Object Store UI, or the Data Fabric UI (or the user refreshes the web browser window) :**CLI**

```
maprcli config save -values
'{"dfui.security.securedtabwindow":"true"
}'
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"dfui.security.securedtabwindow"
:
```

Set the summary table purge frequency to 5 hours:

CLI

```
maprcli config save -values
'{"cldb.insight.summarytable.purge.hou
rs":"5"}'
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.insight.summarytable.pur
ge.frequency":"5"}
```

Set the Zeppelin port for the insight service to 8000:

CLI

```
maprcli config save -values
'{"cldb.insight.zeppelin.port":"8000"}
,'
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.insight.zeppelin.port":"
8000"}
```

Enable the insight service on the Data Fabric UI

CLI

```
maprcli config save -values
'{"dfui.insight.enable":"true"}'
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"dfui.insight.enable":"true"}
```

Disable the object lifecycle on the cluster level**CLI**

```
maprcli config save -values
{"cldb.s3.lifecycle.scanner.disable":1
}
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/config/save?
values={"cldb.s3.lifecycle.scanner.dis
able":"1"}
```

Related concepts

[config](#) on page 2378

Lists configuration values for the Data Fabric cluster.

dashboard info

Displays a summary of information about the cluster.

Syntax**CLI**

```
maprcli dashboard info
[ -cluster cluster name ]
[ -zkconnect
ZooKeeper Connect String:
'host:port,host:port,host:port,...' ]
[ -version true|false.
default: false ]
[ -multi_cluster_info true|
false. default: false ]
-json
```

NOTE: The -json option is required.

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/dashboard/info[?<parameters>]

Parameters

Parameter	Description
cluster	(<i>Optional</i>) The cluster on which to run the command. By default, the cluster is the one on which this command is run.
multi_cluster_info	(<i>Optional</i>) Specifies whether to display cluster information from multiple clusters. Values: true or false. Default: false.
version	(<i>Optional</i>) Specifies whether to display ONLY the version of the HPE Data Fabric. Values: true or false. Default: false.
zkconnect	(<i>Optional</i>) Common Parameters on page 2269
json	(<i>Required</i>) Formats the output.

Output

The following table summarizes information about the services, volumes, MapReduce applications, health, and utilization of the cluster.

Output Fields

Field	Description
timestamp	The time at which the dashboard info data is retrieved, expressed as a Unix epoch time.
timeofday	The local time and date of the query.
status	The success status of the dashboard info command.
total	The number of clusters for which data is queried in the dashboard info command.
version	The Data Fabric software version running on the cluster.

Field	Description
cluster	<p>Determines the following information about the cluster:</p> <ul style="list-style-type: none"> • <code>name</code> — the cluster name • <code>secure</code> — whether or not the cluster is secure. Value: <code>true</code> (if enabled) or <code>false</code> (if disabled) • <code>dare</code> — whether or not the cluster is enabled for data at rest encryption. Value: <code>true</code> (if enabled) or <code>false</code> (if disabled) • <code>globalPolicyMaster</code> — whether or not the cluster is the master cluster for Policy Based Security. Yes if <code>true</code>, and no if <code>false</code>. You can create security policies only from the master cluster. • <code>ip</code> — the IP address of the active CLDB • <code>id</code> — the cluster ID • <code>nodesUsed</code> — number of nodes in the cluster • <code>totalNodesAllowed</code> — number of allowed nodes
volumes	<p>The number and size (in GiB) of volumes that are:</p> <ul style="list-style-type: none"> • Mounted • Unmounted
mirrors	<p>Indicates whether this cluster is a mirror or is mirrored, and the details of the mirrors, if any.</p>

Field	Description
utilization	<p>The following summarizes utilization information:</p> <ul style="list-style-type: none"> • CPU — utilization, total and active. CPU utilization % is calculated as (100% - idle%) on each node and then averaged across all nodes where hoststats is running. • Memory — total and active (in MiB). • Disk space — total and active (in GiB). • Compression — compressed and uncompressed data size • Tiering — following cluster-level tiering information: <ul style="list-style-type: none"> • — amount of user data stored in tiered volumes (in GiB). This amount is independent of storage system operations relative to compression, replication, or offloading to a warm (erasure-coded) or cold tier. See Understanding how physical, logicalUsed, ecOffloaded data usage is calculated for additional details. • replicatedLogicalUsed — amount of user data stored in tiered volumes (in GiB) multiplied by the configured replication factor for hot tier volume(s). This value is calculated as follows: <i>logicalUsed by volume * number of replicas configured for the hot tier</i>. This value does not change as file data is removed from the hot tier and erasure-coded to the warm tier. • replicatedTotalUsed — amount of user data (after compression, if any) and snapshot user data (after compression, if any) stored in tiered volumes (in GiB) multiplied by the configured replication factor(s) for the hot tier volume(s). This value is calculated as follows: <i>(logical user data after compression used by volume + logical user data after compression in snapshots) * number of replicas configured for the hot tier</i>. This value does not include EC-backend volumes and cache volumes since their replicatedTotalUsed is already accounted for by the front-end and parent volumes respectively. • metaDBUsedMB — disk space (in MiB) used by the metadata volume associated with the tier. • replicatedMetaDBUsedMB — disk space (in MiB) used by the metadata volume associated with the tier multiplied by the configured replication factor for the hot tier. • offloaded — total physical data (in GiB) offloaded to the cold tier. This value is calculated as follows: <i>amount of data purged from the hot tier (HPE Data Fabric cluster) + amount of data recalled to the hot tier (Data Fabric cluster)</i>. • recalled — total physical data (in GiB) recalled from the cold tier. This value is calculated as follows: <i>amount of data recalled to the hot tier (Data Fabric cluster) + total amount of disk space used by the cache volume</i>.

Field	Description
clusterReplication	The following cluster replication information: <ul style="list-style-type: none"> bytesReceived bytesSend
streamThroughput	The following stream throughput information: <ul style="list-style-type: none"> bytesProduced bytesConsumed
label_stats	Information about the labels registered and assigned.
services	The number of active, stopped, failed, and total installed services on the cluster, for example: <div>  NOTE: NFSv4 refers to NFS version 4.1. </div> <ul style="list-style-type: none"> API server CLDB Fileserver File Migrate ResourceManager NodeManager NFSv4 hoststats MAST Gateway

Understanding how physical, logicalUsed, ecOffloaded data usage is calculated

Data usage calculations for physical, logicalUsed, and ecOffloaded can be calculated as shown in the following uncompressed and compressed scenarios.

Scenario:

There are two tiered volumes in a system (Vol3x and Vol6x), and:

- Vol3x is 3x replicated in the hot tier that uses 10+2 erasure coding
- Vol6x is 6x replicated in the hot tier that uses 4+2 erasure coding

Data is Uncompressed

If you write a 100GiB file uncompressed to each volume, for the two volumes:	
logicalUsed = 200	100GiB+100GiB=200GiB
replicatedLogicalUsed = 900	3*100GiB + 6*100GiB = 900GiB

replicatedTotalUsed = 900	For 3x replicated volume: $3 \times (100/1) = 300\text{GiB}$ For 6x replicated volume: $6 \times (100/1) = 600\text{GiB}$
ecOffloaded = 0	Nothing is offloaded to the warm tier.
ecTotalUsed = 0	Nothing is offloaded to the warm tier.
If you offload both volumes to the warm tier:	
logicalUsed = 200	200GiB
replicatedLogicalUsed = 900	Note that file data no longer resides on the hot tier, and physical disk space is not consumed. After it is offloaded, this number reflects the metadata of files that previously resided on the hot tier.
replicatedTotalUsed = 900	Note that file data no longer resides on the hot tier, and physical disk space is not consumed. After it is offloaded, this number reflects the metadata of files that previously resided on the hot tier.
ecOffloaded = 200	$100\text{GiB} + 100\text{GiB} = 200\text{GiB}$
ecTotalUsed = 270	$[100\text{GiB} \times (10+2)/10] + [100\text{GiB} \times (4+2)/4] = 120\text{GiB} + 150\text{GiB} = 270\text{GiB}$

Data is Compressed

If the 100GiB of logical data in Vol3x and Vol6x is compressed by a factor of 4:1 and writes a 100GiB file to each volume:	
logicalUsed = 200	$100\text{GiB} + 100\text{GiB} = 200\text{GiB}$
replicatedLogicalUsed = 900	$(3 \times 100\text{GiB}) + (6 \times 100\text{GiB}) = 900\text{GiB}$
replicatedTotalUsed = 225	For 3x replicated volume: $3 \times (100/4) = 75\text{GiB}$ For 6x replicated volume: $6 \times (100/4) = 150\text{GiB}$
ecOffloaded = 0	Nothing is offloaded to the warm tier.
ecTotalUsed = 0	Nothing is offloaded to the warm tier.
If you offload both volumes to the warm tier:	
logicalUsed equals	200GiB

replicatedLogicalUsed = 900	Note that file data no longer resides on the hot tier, and physical disk space is not consumed. After it is offloaded, this number reflects the metadata of files that previously resided on the hot tier.
replicatedTotalUsed = 900	Note that file data no longer resides on the hot tier, and physical disk space is not consumed. After it is offloaded, this number reflects the metadata of files that previously resided on the hot tier.
ecOffloaded = 50	$(100\text{GiB}+100\text{GiB})/4=50\text{GiB}$
ecTotalUsed = 68	$(100\text{GiB}/4) * ((10+2)/10) + (100\text{GiB}/4) * ((4+2)/4) = 30\text{GiB}+37.5\text{GiB} = 67.5\text{GiB}$

Examples

Display dashboard information:

CLI

```
maprcli dashboard info -json

REST

```
curl -u <username> -X GET https://
server.sj.us:8443/rest/dashboard/info
```

View the master security policy cluster:

CLI

```
maprcli dashboard info -json | grep
globalPolicyMaster
{
  "globalPolicyMaster":true
}
```

dialhome

The dialhome commands are used to change the Dial Home status of the cluster.

dialhome ackdial

Acknowledges the most recent Dial Home on the cluster. Permissions required: login

Syntax

CLI

```
maprcli dialhome ackdial
[ -forDay <date> ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/dialhome/ackdial[?<parameters>]

Parameters

Parameter	Description
forDay	Date for which the recorded metrics were successfully dialed home. Accepted values: UTC timestamp or a UTC date in MM/DD/YY format. Default: yesterday

Sample Output

```
# maprcli dialhome ackdial -forDate 5/26/15
dialhome ackdial
    -forDay Date for which the recorded metrics were successfully dialed
home. Accepted values: UTC timestamp in millisecond or a UTC date in
MM/DD/YY format. default: 5/31/15
```

Examples

Acknowledge Dial Home:

CLI

```
maprcli dialhome ackdial
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/dialhome/ackdial
```

dialhome enable

Enables Dial Home on the cluster. Permissions required: fc or a

Syntax

CLI

```
maprcli dialhome enable
    -enable enable/disable dialhome.
default: true
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/dialhome/enable

Parameters

Parameter	Description
enable	Specifies whether to enable or disable Dial Home: <ul style="list-style-type: none"> false - Disable true - Enable

Output

A success or failure message.

Sample output

```
# maprcli dialhome enable -enable true
enabled
1
```

```
# maprcli dialhome status
enabled
1
```

Examples

Enable Dial Home:

CLI

```
maprcli dialhome enable -enable true
```

REST

NOTE: When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X
POST https://abc.sj.us:8443/rest/
dialhome/enable?enable=true
```

dialhome lastdialed

Displays the date of the last successful Dial Home call in Unix Epoch time. Permissions required: `fc` or `a`.

Syntax

CLI

```
maprcli dialhome lastdialed
```

REST

Request Type	GET
Request URL	<code>http[s]://<host>:<port>/rest/dialhome/lastdialed</code>

Output

The date of the last successful Dial Home call in Unix Epoch time.

Sample output

```
$ maprcli dialhome lastdialed
date
1322438400000
```

Examples

Show the date of the most recent Dial Home:

CLI

```
maprcli dialhome lastdialed
```

REST

 **NOTE:** When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X
GET https://abc.sj.us:8443/rest/
dialhome/lastdialed
```

dialhome metrics

Returns a compressed metrics object. Permissions required: login.

Syntax

CLI

```
maprcli dialhome metrics [ -forDay
<date> ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/dialhome/metrics

Parameters

Parameter	Description
forDay	Date for which the recorded metrics were successfully dialed home. Accepted values: UTC timestamp or a UTC date in MM/DD/YY format. Default: yesterday

Output

Sample output

```
$ maprcli dialhome metrics
metrics
[B@48067064
```

Examples

Show the Dial Home metrics:

CLI

```
maprcli dialhome metrics
```

REST

 **NOTE:** When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X GET https://
abc.sj.us:8443/rest/dialhome/metrics
```

dialhome status

Displays the Dial Home status. Permissions required: login.

Syntax

CLI

```
maprcli dialhome status
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/dialhome/status

Output

The current Dial Home status.

Sample output

```
$ maprcli dialhome status
enabled
1
```

Examples

Display the Dial Home status:

CLI

```
maprcli dialhome status
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X GET https://abc.sj.us:8443/rest/dialhome/status
```

disk

Lists disk parameters.

Disk Fields

The following table shows the fields displayed in the output of the disk list and disk list all commands. You can choose which fields (columns) to display and sort them in ascending or descending order by any field.

availablespace

Terse Name: dsa
Description: Disk space available, in MB.

diskname

Terse Name: n
Description: Name of the disk or partition

error

Terse Name: err
Description: Disk error message, in English. Only sent if **status** is 1.

**NOTE:** This message is **not** translated.**failuretime**

Terse Name: ft

Description: Disk failure time, This field is applicable only for disks. Only sent if **status** is 1.**firmwareversion**

Terse Name: fw

Description: Firmware version

fstype

Terse Name: fs

Description: File system type

hostname

Terse Name: hn

Description: Hostname of the node that owns this disk/partition

labelname

Terse Name: ln

Description: The label assigned to the disk. See [Using Storage Labels](#) on page 1575 for more information on labels.**modelnum**

Terse Name: mn

Description: The model number of the disk

mount

Terse Name: mt

Description: Disk mount status

- 0 = unmounted
- 1 = mounted

powerstatus

Terse Name: pst

Description: Disk power status:

- 0 = Active/idle (normal operation)
- 1 = Standby (low power mode)
- 2 = Sleeping (lowest power mode, drive is completely shut down)

status

Terse Name: st

Description: Disk status:

- 0 = Good
- 1 = Bad disk
- 2 = Offline disk

storagepoolid

Terse Name: sp

Description: The ID of the storage pool that comprises the disk

totalspace

Terse Name: dst

Description: Total disk space, in MB

usedspace

Terse Name: dsu

Description: Disk space used, in MB

uuid

Terse Name: uid

Description: A 128-bit number used to uniquely identify and reference disk partitions or volumes across different systems.

vendor

Terse Name: vn

Description: Name of the disk vendor

Creates a volume.

[volume move](#) on page 3039

Moves the specified volume or mirror to a different topology. Permissions required: m or fc on the volume.

[label list](#) on page 2555

Lists registered labels. Permissions required: fc or a.

[node list](#) on page 2570

Lists nodes in the cluster.

[dump volumeinfo](#) on page 2468

Returns information about volumes and the associated containers. For JSON formatted output, use the -json option from the command line.

[configure.sh](#) on page 3186

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Data Fabric client nodes, and configuring services for a node.

disk add

Adds one or more disks to the specified node. Permissions required: fc or a.

Syntax

CLI

```
maprcli disk add
  -disks <disk names>
  -host <host>
  [ -label <class of the disks>]
  [ -stripewidth <stripe-width> ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/disk/add?<parameters>

Parameters

Parameter: **disks** *(Required)*

Default Value: No default value
Possible Values: Any valid disk names
Description: A comma-separated list of disk names.
Examples:

- /dev/sdc
- /dev/sdd,/dev/sde,/dev/sdf

Parameter: **host** *(Required)*

Default Value: No default value
Possible Values: Any valid host or IP
Description: The hostname or IP address of the machine on which to add the disk.

Parameter: **label** *(Optional)*

Default Value: HDD
Possible Values: Any label
Description: The label to use for the storage pool. See [Using Storage Labels](#) on page 1575 for more information on labels.
The label should contain only the following characters:

A-Z a-z 0-9 _ - .

Parameter: **stripeWidth** *(Optional)*

Default Value: No default value
Possible Values: Any integer
Description: The number of disks per storage pool.

Output

Output Fields

Field	Description
ip	The IP address of the machine that owns the disk(s).
disk	The name of a disk or partition. Example sca or sca/sca1
all	The string all , meaning all unmounted disks for this node.

Example

Add a disk:

CLI

```
maprcli disk add -disks /dev/  
sda1 -host 10.250.1.79
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X POST
https://abc.sj.us:8443/rest/disk/add?
disks=["/dev/sda1"]&host="10.250.1.79"
```

disk setlabel

Adds a label to disks or a storage pool. Permissions required: fc or a.

Syntax

CLI

```
maprccli disk setlabel
  -host name/ip
  -disks comma-separated list of
disks
  -label label-name
[ -force Need this parameter to
reassign label to sp, otherwise
reassignment of label
will not happen on sp.
Parameter takes no value]
```

REST

Request Type	POST
--------------	------

Request URL	http[s]://<host>:<port>/rest/disk/setlabel?<parameters>
-------------	---

Parameters

Parameter: **host** *(Required)*

Default Value: No default value
Possible Values: Any valid host or IP
Description: The hostname or IP address of the machine on which to set the label.

Parameter: **disks** *(Required)*

Default Value: No default value
Possible Values: Any valid disk names
Description: A comma-separated list of disk names.
Examples:

- /dev/sdc
- /dev/sdd,/dev/sde,/dev/sdf

Parameter: **label** *(Required)*

Default Value: HDD
Possible Values: Any label
Description: The label to use for the storage pool. See [Using Storage Labels](#) on page 1575 for more information on labels.
The label should contain only the following characters:

A-Z a-z 0-9 _ - .

Parameter: **force** *(Optional)*

Default Value: Not Applicable
Possible Values: Not Applicable
Description: Forces reassignment of the label to a storage pool.

Output

```
# maprcli disk setlabel -host atsqa4-161.qa.lab -disks /dev/sdd -label label1 -json
{
  "timestamp":1590420155635,
  "timeofday":"2020-05-25 08:22:35.635 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ]
}
```

Examples

Set label `label1` on disk `/dev/sdd`:

CLI

```
# maprcli disk setlabel -host
atsqa4-161.qa.lab -disks /dev/sdd -lab
```

```
el label1 -json
{
    "timestamp":1590420155635,
    "timeofday":"2020-05-25
08:22:35.635 GMT-0700 AM",
    "status":"OK",
    "total":0,
    "data":[
]
```

REST

NOTE: When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X POST https://
abc.sj.us:8443/rest/disk/setlabel?
host="atsqa4-161.qa.lab"&disks=["/dev/
sdd"]&label="label1"
```

disk list

Lists the disks on a node.

Syntax

CLI

```
maprcli disk list
-host name/ip
```

```
[ -system 1/0 ]
[ -output <terse|verbose>. default:
verbose ]
[ -startdisk index of the first node
(starting from 0). default: 0 ]
[ -limitdisk number of nodes to
query. default: 2147483647 ]
[ -sortby <hostname|diskname|
mount|vendor|modelnum|serialnum|
firmwareversion|totalspace|usedspace|
        availablespace|
fstype|powerstatus|status|errormsg|
storagepoolid|failuretime> ]
[ -sortorder <asc|desc> ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/ rest/disk/list? <parameters>

Parameters

Parameter	Description
host	<i>(Required)</i> The node on which to list the disks.
output	<i>(Optional)</i> Whether the output should be terse or verbose. Default is verbose.
sortby	<i>(Optional)</i> Specifies one of the following attributes to sort the list of disks by: hostname, diskname, mount, vendor, modelnum, serialnum, firmwareversion, totalspace, usedspace, availablespace, fstype, powerstatus, status, errormsg, storagepoolid, failuretime. Default: <i>Order in which the disks are detected.</i>
sortorder	<i>(Optional)</i> The order to sort the results by. Value can be: <ul style="list-style-type: none"> asc - for ascending order desc - for descending order Default: <i>Order in which the disks are detected</i>
startdisk	<i>(Optional)</i> The disk from which to start listing. Default: 0 (first disk)
limitdisk	<i>(Optional)</i> The number of disks to list starting from the startdisk parameter. Default: all

Parameter	Description
system	<p>(Optional) Show only operating system disks:</p> <ul style="list-style-type: none"> 0 - shows only file system disks 1 - shows only operating system disks Not specified - shows both file system and operating system disks (Default)

Output

Information about the specified disks. See the [Disk Fields](#) table.

Sample Output

```
# maprcli disk list -host 10.10.82.23 -output terse
mn      pst      sp  fw  mt  fs      dsu  n      st  dsa
dst      hn      vn
Virtual_disk running      1.0  1  ext4      77  /dev/sda1  0  423
500      10.10.82.23  VMware
Virtual_disk running      1.0  0      /dev/sda2  0

disk listall

Lists all disks.

Syntax

CLI

```
maprccli disk listall
[ -cluster <cluster> ]
[ -limit <limit> ]
[ -output terse|verbose ]
[ -start <offset> ]
```

REST

Request Type	GET
--------------	-----

Request URL

```
http[s]://<host>:<port>/
rest/disk/listall[?
<parameters>]
```

Parameters

Parameter	Description
cluster	(Optional) The cluster on which to run the command.
limit	(Optional) The number of rows to return. Default: all
output	(Optional) Either terse or verbose. Default: verbose
start	(Optional) The record to start listing. Default: 0 (first record)

Output

Information about all disks. See the [Disk Fields](#) table.

Sample Output

```
# maprcli disk listall -output terse
st mn          ln          dst
hn
ft          mt  dsu  fs          n          vn          sp

```

Examples

List the disks starting from the second record :

CLI

```
maprcli disk listall -start 1
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X
GET https://abc.sj.us:8443/rest/disk/
listall?start=1
```

disk remove

Removes a disk from file system. Permissions required: fc or a.

The disk remove command does not remove a disk containing unreplicated data, unless forced. To force disk removal, specify -force with the value 1 or true.

**NOTE:**

- Use the `-force 1`, or the equivalent `-force true` option only if you are sure that you do not need the data on the disk. This option removes the disk without regard to the replication factor or other data protection mechanisms, and may result in permanent data loss.
- Removing a disk in the storage pool that contains Container ID 1 stops the cluster. Container ID 1 contains CLDB data for the master CLDB. Run `disk remove` without the `-force 1`, or the equivalent `-force true` option first, and examine the warning messages to make sure that you are not removing the disk with Container ID 1. If you try to remove a disk associated with the storage pool that contains Container ID 1, you receive an error message similar to the following:

```
ERROR (151) - Failed operation for disk /dev/sdb, Operation may
bring
down cluster due to loss of cluster meta-data.
```

TIP: If necessary, run the following command for information on the disk associated with the storage pool that contains Container ID 1:

```
/opt/mapr/server/mrconfig info dumpcontainers | grep cid:1
```

The command output may look similar to the following:

```
cid:1 valid:1 sp:SP1:/dev/sdb
spid:82380c287085486f0058112ecf016b76
prev:0 next:0 issnap:0 isclone:0 deleteinprog:0 fixedbyfsck:0
stale:0
querycldb:0 resyncinprog:0 shared:0 owned:206 logical:206
snapusage:0
snapusageupdated:1 ismirror:0 isrwmmirrorcapable:0 role:1
maxUniq:2100150
isResyncSnapshot:0 snapId:0 port:5660
```

To safely remove such a disk, first perform a [CLDB Failover](#) to make one of the other CLDB nodes the primary CLDB, and then remove the disk as normal.

Syntax**CLI**

```
maprcli disk remove
    -host name/ip
    -disks comma-separated list of
    disks
    [ -force <true|false OR 1|0>.
    Required to remove the disk when
    errors have been reported; otherwise,
    the command behaves like a test
    remove when errors are reported.
    If -force is set to false and there
    are no errors, the disk is removed.
    Default: false ]
    [ -cluster cluster_name ]
```

REST

Request Type	POST
--------------	------

Request URL	http[s]://<host>:<port>/rest/disk/remove?<parameters>
-------------	---

Parameters

Parameter	Description
host	(Required) The hostname or IP address of the node from which to remove the disk.
disks	(Required) A list of disks in the form: ["disk"] or ["disk", "disk", "disk"...] or []
force	(Optional) Whether to force disk removal. <ul style="list-style-type: none">• 0 or false (default) - do not remove the disk or disks if there is unreplicated data on the disk• 1 or true - remove the disk or disks regardless of data loss, or other consequences
cluster	(Optional) The cluster on which to run the command. By default, this is the cluster on which this command is run.

Output

Output Fields

Field	Description
disk	The name of a disk or partition. Example: sca or sca/sca1
all	The string all, meaning all unmounted disks attached to the node.
disks	A comma-separated list of disks which have non-replicated volumes. For example, "sca" or "sca/sca1,sca2"

Examples

Remove a disk:

CLI

```
/opt/mapr/bin/maprcli disk  
remove -disks /dev/sda
```

REST

NOTE: When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X
POST https://abc.sj.us:8443/rest/disk/
remove?disks=["/dev/sda"]
```

dump

Returns key information about volumes, containers, storage pools, and Data Fabric cluster services for debugging and troubleshooting.

dump balancerinfo

Returns detailed information about the storage pools on a cluster. If there are any active container moves, the command returns information about the source and destination storage pools.

The `maprccli dump balancerinfo` command lets you see how much space is used in storage pools and to track active container moves. For best results, use the `-json` option when running `dump balancerinfo` from the command line.

The *disk space balancer* is a tool that balances disk space usage on a cluster by moving containers between storage pools. Whenever a storage pool is over 70% full (or a threshold defined by the `cldb.balancer.disk.threshold.percentage` parameter), the disk space balancer distributes containers to other storage pools with lower utilization than the average for that cluster. The disk space balancer aims to ensure that the percentage of space used on all the disks in the node is similar. For more information, see [Disk Space Balancer](#).

Syntax

CLI

```
maprccli dump balancerinfo
[-cluster <cluster name>]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/dump/balancerinfo?<parameters>

Parameters

Parameter	Description
cluster	(Optional) The cluster on which to run the command. If you omit this parameter, the command uses the cluster on which it runs. In multi-cluster contexts, you can use this parameter to specify a different cluster to run the command.

Output

The `maprcli dump balancerinfo` command returns detailed information about the storage pools on a cluster. If any active container moves occur, the command returns information about the source and destination storage pools..

```
# maprcli dump balancerinfo -cluster my.cluster.com -json
{
  "timestamp":1337036566035,
  "status":"OK",
  "total":187,
  "data":[

      "percentage":47,
      "fullnessLevel":"BelowAverage",
      "inTransitMB":79096,
      "outTransitMB":0
    },
    ....
    {
      "containerid":4034,
      "sizeMB":16046,
      "From fsid":5410063549464613987,
      "From IP:Port":"10.50.60.72:5660-",
      "From SP":"4bc329ce06752062004fa1a537abcefg",
      "To fsid":3770844641152008527,
      "To IP:Port":"10.50.60.73:5660-",
      "To SP":"761fec1fabf32104004fad9630ghijkl"
    },
  ]
}
```

Output fields

Field	Description
spid	The unique ID number of the storage pool.
fsid	The unique ID number of the file server. The FSID identifies an file system instance or a node that has file system running in the cluster. Typically, each node has a group of storage pools, so the same FSID will correspond to multiple SPIDs.
ip:port	The host IP address and file system port.

Field	Description
capacityMB	The total capacity of the storage pool (in MB).
usedMB	The amount of space used on the storage pool (in MB).
percentage	The percentage of the storage pool currently utilized. A ratio of the space used (<i>usedMB</i>) to the total capacity (<i>capacityMB</i>) of the storage pool.
fullnessLevel	The fullness of the storage pool relative to the fullness of the rest of the cluster. Possible values are <i>OverUsed</i> , <i>AboveAverage</i> , <i>Average</i> , <i>BelowAverage</i> , and <i>UnderUsed</i> . For more information, see Monitoring storage pool space usage below.
inTransitMB	The amount of data (in MB) that the disk space balancer is currently moving into a storage pool.
outTransitMB	The amount of data (in MB) that the disk space balancer is currently moving out of a storage pool.
topology	The topology of the node hosting the storage pool.
lastHeartBeatSec	The time of the last heartbeat of the node fileserver with CLDB.
inTransitContainers	The number of containers being moved into the storage pool.
outTransitContainers	The number of containers being moved out of the storage pool.
label	The label of the sotrage pool.

The command returns the following fields only if the disk space balancer actively moves one or more containers when the command is run.

Field	Description
containerid	The unique ID number of the container.
sizeMB	The amount of data (in MB) being moved.
From fsid	The FSID (file server ID number) of the source file server.
From IP:Port	The IP address and port number of the source node.
From SP	The SPID (storage pool ID) of the source storage pool.
To fsid	The FSID (file server ID number) of the destination file server.
To IP:Port	The IP address and port number of the destination node.
To SP	The SPID (storage pool ID number) of the destination storage pool.

Examples

Monitoring storage pool space usage

You can use the `maprcli dump balancerinfo` command to monitor space usage on storage pools.

CLI

```
maprcli dump balancerinfo -json

....
{
  "spid": "4bc329ce06752062004fa1a537abcefg",
  "fsid": 5410063549464613987,
  "ip:port": "10.50.60.72:5660-",
  "capacityMB": 1585096,
  "usedMB": 1118099,
  "percentage": 70,
  "fullnessLevel": "AboveAverage",
  "inTransitMB": 0,
  "outTransitMB": 31874
}
```

REST

NOTE: When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X GET https://
abc.sj.us:8443/rest/dump/balancerinfo"
```

Tracking active container moves

Using the `maprcli dump balancerinfo` command, you can monitor the activity of the disk space balancer. The command returns information about the source and destination storage pools whenever active container moves occur.

```
# maprcli dump balancerinfo -json

....
{
  "containerid": 7840,
  "sizeMB": 15634,
  "From fsid": 8081858704500413174,
  "From IP:Port": "10.50.60.64:5660-",
  "From SP": "9e649bf0ac6fb9f7004fa19d20rstuvw",
  "To fsid": 3770844641152008527,
  "To IP:Port": "10.50.60.73:5660-",
  "To SP": "fefcc342475f0286004fad963flmnopq"
}
```

The example shows that a container (**7840**) is being moved from a storage pool on node 10.50.60.64 to a storage pool on node 10.50.60.73.

TIP: You can use the storage pool IDs (SPIDs) to search the CLDB and file system logs for activity (balancer moves, container moves, creates, deletes, etc.) related to specific storage pools.

dump balancermetrics

Returns a cumulative count of container moves and MB of data moved between storage pools.

The `maprcli dump balancermetrics` command returns a cumulative count of container moves and MB of data moved between storage pools. You can run this command periodically to determine how much data has been moved by the disk space balancer between two intervals. Use the `-json` option when running `dump balancermetrics` from the command line for best results.

The *disk space balancer* is a tool that balances disk space usage on a cluster by moving containers between storage pools. Whenever a storage pool is over 70% full (or it reaches a threshold defined by the `cldb.balancer.disk.threshold.percentage` parameter), the disk space balancer distributes containers to other storage pools that have lower utilization than the average for that cluster. The disk space balancer aims to ensure that the percentage of space used on all the disks in the node is similar. For more information, see [Disk Space Balancer](#).

Syntax

CLI

```
maprcli dump balancermetrics
[-cluster <cluster name>]
```

REST

Request Type	GET
Request URL	http[s]:// <host>:<port>/rest/ dump/balancermetrics? <parameters>

Parameters

Parameter	Description
cluster	(Optional) The cluster on which to run the command. If you omit this parameter, the command uses the cluster on which it runs. In multi-cluster contexts, you can use this parameter to specify a different cluster to run the command.

Output

The `maprcli dump balancermetrics` command returns a cumulative count of container moves and MB of data moved between storage pools since the current CLDB became the master CLDB.

```
# maprcli dump balancermetrics -json
{
  "timestamp":1337770325979,
  "status":"OK",
  "total":1,
  "data":[
    {
      "numContainersMoved":10090,
      "numMBMoved":3147147,
      "timeOfLastMove": "Wed May 23 03:51:44 PDT 2012"
    }
  ]
}
```

Output fields

Field	Description
numContainersMoved	The number of containers moved between storage pools by the disk space balancer.
numMBMoved	The total MB of data moved between storage pools on the cluster.
timeOfLastMove	The date and time of most recent container move.

Example**CLI**

```
maprcli dump balancermetrics -cluster
10.10.82.23 -json
```

REST

NOTE: When using a self-signed certificate, pass the -k option to curl to avoid the certificate check.

```
curl -k -u <username> -X
GET https://abc.sj.us:8443/rest/dump/
balancermetrics?cluster=10.10.82.23"
```

dump cldbnodes

Lists the nodes that contain *container location database* (CLDB) data.

The CLDB is a service running on one or more Data Fabric nodes that maintains the location of cluster containers, services, and other information. The CLDB automatically replicates its data to other nodes in the cluster, preserving at least two (and generally three) copies of the CLDB data. If the CLDB process dies, it is automatically restarted on the node.

Syntax**CLI**

```
maprcli dump cldbnodes
[-cluster <cluster name>]
-zkconnect <ZooKeeper Connect
String>
-json | -long
```

NOTE: Use the -json option from the command line for best results.

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/dump/cldbnodes?<parameters>

Parameters

Parameter	Description
cluster	(Optional) The cluster on which to run the command. If you omit this parameter, the command uses the cluster on which it runs. In multi-cluster contexts, you can use this parameter to specify a different cluster to run the command.
zkconnect	(Required) A ZooKeeper connect string, which specifies a list of the hosts running ZooKeeper, and the port to use on each, in the format: '<host>[:<port>] [<host>[:<port>]...]'. To obtain ZooKeeper connection strings, use the <code>maprcli node listzookeepers</code> command.
json long	(Required) This command returns multiple levels of data. You need to specify either JSON format or "long" format to see the full output.

Output

The `maprcli dump cldbnodes` command returns the IP address and port number of the CLDB nodes on the cluster.

```
$ maprcli dump cldbnodes -zkconnect centos23.lab:5181 -json
{
  "timestamp":1433270634424,
  "timeofday":"2015-06-02 06:43:54.424 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "valid":[
        "10.10.82.23:5660-",
        "10.10.82.28:5660-",
        "10.10.82.29:5660-",
        "10.10.82.22:5660-"
      ]
    }
  ]
}
```

Example

CLI

```
maprcli dump cldbnodes -zkconnect
centos23.lab:5181 -json
```

REST

NOTE: When using a self-signed certificate, pass the `-k` option to `curl` to avoid the certificate check.

```
curl -k -u <username> -X
GET https://abc.sj.us:8443/rest/dump/
cldbnodes?zkconnect=centos23.lab:5181"
```

dump containerinfo

Returns detailed information about one or more specified containers.

A *container* is a unit of sharded storage in a Data Fabric cluster. Every container in a Data Fabric volume is either a *name container* or a *data container*.

TIP: For an explanation of sharding, see the [Configuring the Chunk Size](#) topic.

The name container is the first container in a volume and holds that volume's namespace and file chunk locations. Depending on its replication role, a name container may be either a *master container* (part of the original copy of the volume) or a *replica container* (one of the replicas in the replication chain).

Every data container is either a *master container*, an *intermediate container*, or a *tail container*.

Syntax

CLI

```
maprcli dump containerinfo
[-cluster <cluster name>]
-ids <id1,id2,id3 ...>
[-ctime <true|false>]
```

NOTE: For best results, use the `-json` option from the command line.

REST

N/A

Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
ids	Specifies one or more container IDs. Container IDs are comma separated. The <code>maprcli dump containers</code> command provides the container ID required for <code>-ids</code> parameter.
ctime	Set to <code>true</code> to display container state/role change time. Default: <code>false</code>

Output

The `maprcli dump containerinfo` command returns information about one or more containers.

```
# maprcli dump containerinfo -ids 1 -ctime true -json
{
  "timestamp":1507024362685,
  "timeofday":"2017-10-03 02:52:42.685 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "ContainerId":1,
      "Epoch":9,
      "Master":"10.10.105.35:5660--9-VALID",
      "ActiveServers":{
        "IP":[

      "VolumeMounted": false,
      "AccessTime": "September 29, 2017"
    }
  ]
}

```

Output fields

Field	Description
ContainerID	The unique ID number for the container.
Epoch	A sequence number that indicates the most recent copy of the container. The CLDB uses the epoch to ensure that an out-of-date copy cannot become the master for the container.
Master	The physical IP address and port number of the <i>master copy</i> . The master copy is part of the original copy of the volume.
ActiveServers	The physical IP address and port number of each active node on which the container resides.
InactiveServers	The physical IP address and port number of each inactive node on which the container resides.

Field	Description
UnusedServers	The physical IP address and port number of servers from which no "heartbeat" has been received for quite some time.
OwnedSizeMB	The size on disk (in MB) dedicated to the container.
SharedSizeMB	The size on disk (in MB) shared by the container.
LogicalSizeMB	The logical size on disk (in MB) of the container.
TotalSizeMB	The total size on disk (in MB) allocated to the container. Combines the Owned Size and Shared Size.
Mtime	The time of the last modification to the contents of the container.
NameContainer	Indicates if the container is the <i>name container</i> for the volume. If <code>true</code> , the container holds the volume's namespace information and file chunk locations.
VolumeName	The name of the volume.
VolumeId	The unique ID number of the volume.
VolumeReplication	The <i>replication factor</i> , the number of copies of a volume excluding the original.
VolumeMounted	Indicates whether the volume is mounted. If <code>true</code> , the volume is currently mounted. If <code>false</code> , the volume is not mounted.

Example

CLI

```
maprcli dump containerinfo -ids 2049
-ctime true -json
```

dump clbdbmetainfo

Prints metadata from the *container location database* (CLDB) tables.

Syntax

CLI

```
maprcli dump clbdbmetainfo
-json
```

NOTE: For formatted results, use the `-json` option from the command line.

REST

N/A

Parameters

Parameter	Description
<code>json</code>	Returns formatted output

Output

The `maprcli dump cldmetainfo` command lists meta information from the CLDB tables. For an explanation of the output fields, see [fid stat](#) on page 2490.

```
$ maprcli dump cldbmetainfo -json
{
  "timestamp":1433270634424,
  "timeofday":"2020-06-02 06:43:54.424 GMT+0000",
  "status":"OK",
  "total":2,
  "data":[
    {

    }
  ]
}
```

Example

CLI

```
maprcli dump clbdbmetainfo -json
```

dump clbdbstate

Prints the state of the *container location database* (CLDB).

Syntax

CLI

```
maprcli dump clbdbstate
[ -cluster cluster_name ]
[ -hostip host name or ip ]
```

REST

Request Type	POST
Request URL	http[s]://<host:port>/rest/dump/clbdbstate

Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
hostip	The node from which to retrieve the state of CLDB. If this parameter is omitted, the command returns the CLDB state from all nodes in the cluster.

Output

The `maprcli dump clbdbstate` command lists the state of the CLDB database.

```
$ maprcli dump clbdbstate
mode      ip      state      stateDuration  desc
SLAVE_READ_ONLY  x.x.x.x CLDB_IS_SLAVE_READ_ONLY  03:54:25      cldb
running as slave
SLAVE_READ_ONLY  x.x.x.x CLDB_IS_SLAVE_READ_ONLY  03:54:16      cldb
running as slave
MASTER_READ_WRITE x.x.x.x CLDB_IS_MASTER_READ_WRITE 04:07:58      kvstore
tables loading complete,
                                         cldb
running as master
```

Field	Description
mode	<p>The CLDB mode. A CLDB instance can either run as a Primary or a Secondary instance. The only two states that a CLDB instance should settle in are:</p> <ul style="list-style-type: none"> • SLAVE_READ_ONLY • MASTER_READ_WRITE <p>If a CLDB instance spends a significant amount of time in a state other than these two, then it is highly likely that there is an issue that requires administrative intervention.</p>
ip	The IP address of the node from which the CLDB state is retrieved.
state	Indicates whether the CLDB instance is run as a Secondary with READ_ONLY privilege, or as a Primary with READ_WRITE privilege.
stateDuration	The amount of time in HH:MM:SS format that the CLDB instance has spent in this state.
desc	The description of the state (either Primary or Secondary).

Example**dump cldbstate command without any parameter****CLI**

```
# maprcli dump cldbstate
mode          s3Info ip
state          stateDuration desc
  SLAVE_READ_ONLY ...
10.163.160.124
CLDB_IS_SLAVE_READ_ONLY 04:49:16
cldb running as slave
```

  ]
}

```

dump containers

Returns information about containers in a cluster.

This command provides information about containers based on the following -type criteria:

- **offline** - Returns information about containers that have no valid copies online. This command is useful when you need to find out exactly what data is offline (for example, when a "volume data unavailable" alarm is raised).
- **resync** - Returns information about containers that are resynchronizing.
- **bm** - Returns information about containers that are becoming master but are not yet master.
- **unused** - Returns information about containers that are unused.
- **waiting** - Returns information about containers that are waiting for a role.

A *container* is a unit of sharded storage in a HPE Data Fabric cluster. Every container in a HPE Data Fabric volume is either a *name container* or a *data container*. The name container is the first container in a volume and holds that volume's namespace and file chunk locations. Depending on its replication role, a name container may be either a *master container* (part of the original copy of the volume) or a *replica container* (one of the replicas in the replication chain).

Every data container is either a *master container*, an *intermediate container*, or a *tail container*.

Syntax

CLI

```

maprcli dump containers
[ -cluster <cluster_name> ]
  -type offline|resync|bm|waiting|
unused

```

NOTE: For best results, use the -json option from the command line.

REST

N/A

Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
type	<p>Specifies the type of information that is returned about the containers:</p> <ul style="list-style-type: none"> • offline - Returns information about containers that have no valid copies online. • resync - Returns information about containers that are resynchronizing. • bm - Returns information about containers that are becoming master but are not yet master. • unused - Returns information about containers that are unused. • waiting - Returns information about containers that are waiting for a role.

Output fields

Field	Description
ContainerID	The unique ID number for the container.
Epoch	A sequence number that indicates the most recent copy of the container. The CLDB uses the epoch to ensure that an out-of-date copy cannot become the master for the container.
	The physical IP address and port number of the <i>primary copy</i> . The primary copy is part of the original copy of the volume.
ActiveServers	The physical IP address and port number of each active node on which the container resides.
InactiveServers	The physical IP address and port number of each inactive node on which the container resides.
UnusedServers	The physical IP address and port number of servers from which no "heartbeat" has been received for quite some time.
OwnedSizeMB	The size on disk (in MB) dedicated to the container.
SharedSizeMB	The size on disk (in MB) shared by the container.
LogicalSizeMB	The logical size on disk (in MB) of the container.
TotalSizeMB	The total size on disk (in MB) allocated to the container. Combines the Owned Size and Shared Size.

Field	Description
Mtime	The time of the last modification to the contents of the container.
NameContainer	Indicates if the container is the <i>name container</i> for the volume. If <code>true</code> , the container holds the volume's namespace information and file chunk locations.
VolumeName	The name of the volume.
Volumeld	The unique ID number of the volume.
VolumeReplication	The <i>replication factor</i> , the number of copies of a volume excluding the original.
VolumeMounted	Indicates whether the volume is mounted. If <code>true</code> , the volume is currently mounted. If <code>false</code> , the volume is not mounted.

Example

CLI

```
maprccli dump containers -type
offline -cluster my.cluster -json
```

Output Samples

The following `maprccli dump containers -type offline` command returns information about all offline containers.

```
# maprccli dump containers -type offline -json
{
  "timestamp":1348174731389,
  "status":"OK",
  "total":11,
  "data":[
    {
      "ContainerId":2060,
      "Epoch":3,
      "unknown ip (0)-0-VALID",
      "ActiveServers":{
      },
      "InactiveServers":{
      },
      "UnusedServers":{
        "IP:Port":"10.10.20.39:5660--3"
      },
      "OwnedSizeMB":"0 MB",
      "SharedSizeMB":"0 MB",
      "LogicalSizeMB":"0 MB",
      "TotalSizeMB":"0 MB",
      "NameContainer":"true"
    },
    {
      "ContainerId":2185,
      "Epoch":3,
      "unknown ip (0)-0-VALID",
```

```

        "ActiveServers":{
            },
        "InactiveServers":{
            },
        "UnusedServers":{
            "IP:Port":"10.10.20.39:5660--3"
        },
        "OwnedSizeMB":"0 MB",
        "SharedSizeMB":"0 MB",
        "LogicalSizeMB":"0 MB",
        "TotalSizeMB":"0 MB",
        "NameContainer":"false"
    },
    ...

```

The following `maprcli dump containers -type resync` command returns information about containers that are resynchronizing.

```

# maprcli dump containers -type resync -json
{
    "timestamp":1438666159569,
    "timeofday":"2015-08-03 10:29:19.569 GMT-0700",
    "status":"OK",
    "total":1,
    "data":[

            "InstanceCount":1,
            "ContainerId":2242,
            "Epoch":4,
            "10.10.103.30:5660--4-VALID",
            "ActiveServers":{
                "IP:Port":[
                    "10.10.103.30:5660--4-VALID",
                    "10.10.103.28:5660--4-VALID",
                    "10.10.103.29:5660--3-RESYNC"
                ]
            },
            "InactiveServers":{
            },
            "UnusedServers":{
            },
            "OwnedSizeMB":"0 MB",
            "SharedSizeMB":"0 MB",
            "LogicalSizeMB":"0 MB",
            "TotalSizeMB":"0 MB",
            "NameContainer":"true",
            "CreatorContainerId":0,
            "CreatorVolumeUuid":""
        }
    ]
}

```

dump ecginfo

Indicates whether rebuild is in progress for a container from CLDB.

Syntax**CLI**

```
maprcli dump ecginfo -h
dump ecginfo
    [ -cluster cluster_name ]
    -ids ids
```

NOTE: For best results, use the `-json` option from the command line.

REST

N/A

Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
ids	The container gateway ID to use to retrieve rebuild information.

Output fields

Field	Description
ContainerID	The unique ID number for the container.
Epoch	A sequence number that indicates the most recent copy of the container. The CLDB uses the epoch to ensure that an out-of-date copy cannot become the master for the container.
Master	The physical IP address and port number of the <i>master copy</i> . The master copy is part of the original copy of the volume.
ActiveServers	The physical IP address and port number of each active node on which the container resides.
InactiveServers	The physical IP address and port number of each inactive node on which the container resides.
UnusedServers	The physical IP address and port number of servers from which no "heartbeat" has been received for quite some time.
OwnedSizeMB	The size on disk (in MB) dedicated to the container.
SharedSizeMB	The size on disk (in MB) shared by the container.
LogicalSizeMB	The logical size on disk (in MB) of the container.
TotalSizeMB	The total size on disk (in MB) allocated to the container. Combines the Owned Size and Shared Size.

Field	Description
NumInodesInUse	The total number of inodes that this container occupies.
Mtime	The time of the last modification to the contents of the container.
NameContainer	Indicates if the container is the <i>name container</i> for the volume. If <code>true</code> , the container holds the volume's namespace information and file chunk locations.
ecCgId	The gateway ID of this container.
isRebuildInProgress	<code>true</code> indicates that the container is being rebuilt.
CreatorContainerId	ID for the container.
CreatorVolumeUuid	ID that supports the container chain identification for mirroring. The <code>creatorcontainerid</code> and <code>creatorvolumeuuid</code> fields combined form a unique identifier for the container chain.
UseActualCreatorId	Value can be true or false. ID of the user who created the container.

Example

CLI

```
maprcli dump ecginfo -ids <cgid> -json
```

Output Samples

The following command returns information about container gateway ID 2351 .

```
maprcli dump ecginfo -ids 2351 -json

"cid2":{

[mastgateway ecgstats](#) on page 3319
Returns the list of containers under rebuild from CGManager.

dump replicationmanagerinfo

Returns information about which containers are under or over replicated in a specified volume.
For each container, the command displays the current state of that container.

Syntax

CLI

```
maprcli dump replicationmanagerinfo
[-cluster <cluster name>]
-volumename <volume name>
[-ctime <true|false>]
```

 **NOTE:** For best results, use the -json option from the command line.

REST

N/A

Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
volumename	Specifies the name of the volume. To obtain a volume name, use the maprcli volume list command.
ctime	Set to true to display container state/role change time. Default: false

Output

The maprcli dump replicationmanagerinfo returns information about volumes and the containers on those volumes including the nodes on which the containers have been replicated and the space allocated to each container. If replication activity is not underway when the maprcli command is executed, no container information is included. If replication activity is underway, details of containers are listed.

```
# maprcli dump replicationmanagerinfo -volumename mapr.metrics -ctime true
-json

    }
]
}

```

Output fields

Field	Description
VolumeName	Indicates the name of the volume.
VolumeId	Indicates the ID number of the volume.
VolumeTopology	The volume topology corresponds to the node topology of the rack or nodes where the volume resides. By default, new volumes are created with a topology of / (root directory). For more information, see Volume Topology .
VolumeUsedSizeMB	The size on disk (in MB) of the volume.
VolumeReplication	The desired replication factor, the number of copies of a volume excluding the original. The default value is 3.
VolumeMinReplication	The minimum replication factor, the number of copies of a volume (excluding the original) that should be maintained by the Data Fabric cluster for normal operation. When the replication factor falls below this minimum, writes to the volume are disabled. The default value is 2.
MirrorThrottle	Specifies whether mirror throttling is enabled (true) or disabled (false). Throttling is set on the source volume and applies to all its mirrors. This property was introduced in version 4.0.2.

Field	Description
AccessTime	A value that can be used to determine which volumes are accessed regularly. This value is updated every 6 hours with the last time that an operation occurred on the volume. The access time is not updated for changes to volume properties, creation of a snapshot, or synchronization between a volume and a mirror. However, the volume access time is updated the first time you upgrade to a Data Fabric version that includes this property. This property was introduced in version 4.0.2.
limitSpread	An internal flag for Data Fabric volumes to control the growth of volume in terms of number of containers. When this flag is set, cldb tries to limit the number of new containers created depending on the present size of volume. If volume size (data in volume) is small, cldb tries to reuse space in existing containers to avoid the creation of new containers. This helps reduce the wasting of containers IDs in an environment that has small volumes.
ContainerId	The unique ID number for the container.
Epoch	A sequence number that indicates the most recent copy of the container. The CLDB uses the epoch to ensure that an out-of-date copy cannot become the master for the container.
Master	The physical IP address and port number of the <i>master copy</i> . The master copy is part of the original copy of the volume.
ActiveServers	The physical IP address and port number of each active node on which the container resides.
InactiveServers	The physical IP address and port number of each inactive node on which the container resides.
UnusedServers	The physical IP address and port number of each on which the container does not reside.
OwnedSizeMB	The size on disk (in MB) dedicated to the container.
SharedSizeMB	The size on disk (in MB) shared by the container.
LogicalSizeMB	The logical size on disk (in MB) of the container.
Mtime	Indicates the time of the last modification to the container's contents.
NameContainer	Indicates if the container is the <i>name container</i> for the volume. If <code>true</code> , the container is the volume's first container and replication occurs simultaneously from the master to the intermediate and tail containers.

Example

CLI

```
maprcli dump
replicationmanagerinfo -cluster
```

```
docs41cluster -volumename
mapr.metrics -ctime true -json
```

dump replicationmanagerqueueinfo

Returns information that enables you to check the status of containers in various replication manager queues like under-replicated containers, and over-replicated containers, etc.

Syntax**CLI**

```
maprcli dump
replicationmanagerqueueinfo
[-cluster <cluster name>]
-queue <queue>
```

NOTE: For best results, use the -json option from the command line.

REST

N/A

Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
queue	The name of the queue. Valid values are 0, 1, 2, or 5. Queue 0 includes containers that have copies below the minimum replication factor for the volume. Queue 1 includes containers that have copies below the replication for the volume, but above the minimum replication factor. Queue 2 includes containers that are over-replicated. Queue 5 includes containers which are not rack aware.

Output

The `maprcli dump replicationmanagerqueueinfo` command returns information about one of these queues: 0, 1, 2, or 5. Depending on the queue value entered, the command displays information about containers that are under-replicated or over-replicated. You can use this information to decide if you need to change the replication factor for that volume.

```
# maprcli dump replicationmanagerqueueinfo -queue 0

Output fields

Field	Description
ContainerID	The unique ID number of the container.
Epoch	A sequence number that indicates the most recent copy of the container. The CLDB uses the epoch to ensure that an out-of-date copy cannot become the master for the container.
Master	The physical IP address and port number of the <i>master copy</i> . The master copy is part of the original copy of the volume.
ActiveServers	The physical IP address and port number of each active node on which the container resides.
InactiveServers	The physical IP address and port number of each inactive node on which the container resides.
UnusedServers	The physical IP address and port number of servers from which no "heartbeat" has been received for quite some time.
OwnedSizeMB	The size on disk (in MB) dedicated to the container.
SharedSizeMB	The size on disk (in MB) shared by the container.
LogicalSizeMB	The logical size on disk (in MB) of the container.
TotalSizeMB	The total size on disk (in MB) allocated to the container. Combines the Owned Size and Shared Size.
Mtime	The time of the last modification to the contents of the container.
NameContainer	Indicates if the container is the <i>name container</i> for the volume. If true, the container holds the volume's namespace information and file chunk locations.

Example**CLI**

```

maprcli dump
replicationmanagerqueueinfo -queue
0 -json

```

dump rereplicationinfo

Returns information about the ongoing re-replication of replica containers.

This information includes the destination IP address and port number, the ID number of the destination file server, and the ID number of the destination storage pool.

Re-replication occurs whenever the number of available replica containers drops below the number prescribed by that volume's replication factor. Re-replication may occur for a variety of reasons including replica container corruption, node unavailability, hard disk failure, or an increase in replication factor.

Syntax**CLI**

```
maprcli dump rereplicationinfo
[-cluster <cluster name>]
```

NOTE: For best results, use the `-json` option from the command line.

Output fields

Field	Description
sizeMB	The amount of data (in MB) being moved.
To fsid	The ID number (FSID) of the destination file server.
To IP:Port	The IP address and port number of the destination node.
To SP	The ID number (SPID) of the destination storage pool.

Example

CLI

```
maprcli dump rereplicationinfo -json
```

dump rereplicationmetrics

Displays information about containers that were copied by the replication manager.

This command displays the following fields :

- numContainersCopied - The number of containers that were copied by the replication manager to maintain the volume's replication factor or topology since the current CLDB was the master.
- numMBCopied -The cumulative size of the containers that were copied by the replication manager to maintain the volume's replication factor or topology since the current CLDB was the master.

Syntax

CLI

```
maprcli dump rereplicationmetrics
[-cluster <cluster name>]
```

REST

N/A

Parameters

Parameter	Description
cluster	Cluster name.

Example

CLI

```
maprcli dump rereplicationmetrics
```

Example Output

```
# maprcli dump rereplicationmetrics
numContainersCopied  numMBCopied
0                    0
```

dump rolebalancerinfo

Returns information about active replication role switches.

Use the `dump rolebalancerinfo` command to see if the replication role balancer is currently switching the replication roles of any containers in a cluster. For example, if too many data containers with the master or intermediate roles exist within a storage pool, the replication role balancer switches the role of some of these containers to the tail role to evenly spread the load across nodes during the replication process. If the role balancer is not currently switching the roles of any containers, the command returns a message stating that there are no active role switches.

You can include some additional parameters with the `dump rolebalancerinfo` command, such as the `volumeinfo` parameter, which provides information about how the replication role balancer balanced container roles across each storage pool in a particular volume.

See [Replication Role Balancer](#) for more information about how the replication role balancer works.

For the best readability, use the `-json` option at the end of the command.

Syntax

CLI

```
maprcli dump rolebalancerinfo
[ -cluster cluster_name ]
[ -namecntrinfo Get
NameContainers Info Parameter takes
no value ]
[ -stats Gets RoleBalancer
AcitveSwitches Info Parameter takes
no value ]
[ -volumeinfo Gets Balancing
Info for Volumes(s) Parameter takes
no value ]
[ -volumename Specifies the
name of the volumes ]
```

REST

N/A

Parameters

Parameter	Description
cluster	The cluster on which to run the command. When you omit this parameter, the command runs on the same cluster where it is issued. In a multi-cluster environment, use this parameter to specify a particular cluster.
stats	Provides a list of active switches for the role balancer. The command returns the same information with or without this parameter.
volumeinfo	Provides the volume balancing information and details how the container roles are balanced across each storage pool in a volume. Requires the <code>volumeinfo</code> parameter.
volumename	The name of the volume. To obtain volume names, use the <code>maprcli volume list</code> command.
namecntrinfo	Provides information about how the name containers are distributed across the storage pools in the cluster, including how many name containers are master and tail containers. Useful when the replication role balancer is configured to balance container roles by count instead of size.

Output

The following example shows the output of the `dump rolebalancerinfo` command when the replication role balancer switches a container to the tail role:

```
# maprcli dump rolebalancerinfo -json
{
  "timestamp":1452150159265,
  "timeofday":"2016-01-07 07:02:39.265 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "containerid":57482,
      "Tail IP:Port":"10.10.104.37:5660-10.10.105.37:5660-",
      "Updates blocked Since":"Thu Jan 07 07:02:24 UTC 2016"
    }
  ]
}
```

The following example shows the `dump rolebalancerinfo -volumeinfo -volumename` command:

```
# maprcli dump rolebalancerinfo -volumeinfo -volumename vol2 -json
{
  "timestamp":1452218225547,
  "timeofday":"2016-01-08 01:57:05.547 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[

        "Assign Cache Containers Size":0
    }
}
]
}
]
}
}

```

Output

Field	Description
containerID	The unique ID number of the container.
Tail IP:Port	The IP address and port number of the tail container node.
Updates blocked Since	During a replication role switch, updates to that container are blocked during the date and time indicated.
Volume	Name of the volume.
Assign Cache Containers Count	The total number of containers in the assign cache. The assign cache is a list of containers that the CLDB has reserved on a particular file server node. The CLDB allocates containers from the cache when it receives a request from the file server for more containers.

Assign Cache Containers Size	The total size of the containers in the assigned cache. The assign cache is a list of containers that the CLDB has reserved on a particular file server node. The CLDB allocates containers from the cache when it receives a request from the file server for more containers.
Zero Size Containers Count	The number of empty cache containers.
Storage Pools	The list of storage pools in the specified volume.
Spld	The ID of the storage pool located within the specified volume.
HostAddress	The server on which the storage pool resides.
NumContainers	The total number of containers that reside on the storage pool in the specified volume.
	The total number of master containers that reside on the storage pool in the specified volume.
NumTails	The total number of tail containers that reside on the storage pool in the specified volume.
SizeOfContainers	The total size of the containers that reside on the storage pool in the specified volume.
	The total size of the master containers that reside on the storage pool in the specified volume.
	The cumulative size of master replicas on a specific storage pool within a volume. Typically, this is $1/\text{ReplicationFactor}$ of all containers on a storage pool for a particular volume. For example, if the replication factor is set to 3, then $\frac{1}{3}$ of all containers on a storage pool should have the master container role.
SizeOfTails	The total size of the tail containers that reside on the storage pool in the specified volume.
DesiredSizeOfTails	The cumulative size of tail replicas on a specific storage pool within a volume. Typically, this is $1/\text{ReplicationFactor}$ of all containers on a storage pool for a particular volume. For example, if the replication factor is set to 3, then $\frac{1}{3}$ of all containers on a storage pool should have the tail container role.

Example

CLI

```
maprcli dump rolebalancerinfo -json
```

dump rolebalancermetrics

Returns the cumulative number of times that the replication role balancer has switched the replication role of name containers and data containers on the cluster.

The `maprcli dump rolebalancermetrics` command enables you to view the number of times that the replication role balancer has switched the replication role of the name containers and data containers to ensure that containers are balanced across the nodes in the cluster. For best results, use the `-json` option when running `dump rolebalancermetrics` from the command line.

The *replication role balancer* is a tool that switches the replication roles of containers to ensure that every node has an equal share of master and replica containers (for name containers) and an equal share of master, intermediate, and tail containers (for data containers).

The replication role balancer changes the replication role of the containers in a cluster so that network bandwidth is spread evenly across all nodes during the replication process. A container's replication role determines how it is replicated to the other nodes in the cluster. For *name containers* (the volume's first container), replication occurs simultaneously from the master to all replica containers. For *data containers*, replication proceeds from the master to the intermediate container(s) until it reaches the tail containers. For more information, see [Replication Role Balancer](#).

Syntax

CLI

```
maprcli dump rolebalancermetrics
[-cluster <cluster name>]
```

REST

N/A

Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.

Output

The `maprcli dump rolebalancerinfo` command returns the cumulative number of times that the replication role balancer has switched the replication role of name containers and data containers on the cluster.

```
# maprcli dump rolebalancermetrics -json
{
  "timestamp":1433372048169,
  "timeofday":"2015-06-03 10:54:08.169 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "numNameContainersSwitches":60,
      "numDataContainerSwitches":28,
      "timeOfLastMove":"Wed May 23 05:48:00 PDT 2015"
    }
  ]
}
```

Output fields

Field	Description
numNameContainerSwitches	The number of times that the replication role balancer has switched the replication role of name containers.
numDataContainerSwitches	The number of times that the replication role balancer has switched the replication role of data containers.
timeOfLastMove	The date and time of the last replication role change.

Example

CLI

```
maprcli dump rolebalancermetrics -json
```

dump supportdump

Collects logs and other information about the node to help troubleshoot issues.

Syntax

CLI

```
maprcli dump supportdump [ -cluster  
<cluster name> ] [ -nodes <node  
names> ] [ -params <parameter  
string> ] [ -zkconnect <ZK connect  
string> ]
```

REST

N/A

Parameters

Parameter	Description
cluster	Cluster name.
nodes	Node names for which support dump is needed. Space separated. Default: all
params	Parameter string to create a dump.
zkconnect	ZK connection string.

Output

```
# maprcli dump supportdump  
node  
centos29.lab  
centos23.lab  
centos28.lab  
centos22.lab
```

Example

CLI

```
maprcli dump supportdump
```

dump s3bucketinfo

Returns the s3 Bucket information.

Syntax

CLI

```
maprcli dump s3bucketinfo -bucketname  
<bucket name> -json
```

REST

Request Type	POST
--------------	------

Request URL	https://<host><port>/rest/dump/s3bucketinfo?<bucketname> --user <username>:<password>
-------------	---

Parameters

Parameter	Description
bucketname	Name of the S3 bucket.

Output

```
# /opt/mapr/server/mrconfig s3 bucketinfo bk1
bucketdirfid 3580.43.131424
oltFid 3580.44.131426

```

dump volumeinfo

Returns information about volumes and the associated containers. For JSON formatted output, use the `-json` option from the command line.

A *volume* is a logical unit that allows you to apply policies to a set of files, directories, and sub-volumes. Using volumes, you can enforce disk usage limits, set replication levels, establish ownership and accountability, and measure the cost generated by different projects or departments. For more information, see [Administering Volumes](#) on page 1429.

Syntax

CLI

```
maprccli dump volumeinfo
  [-cluster <cluster name>]
  -volumename <volume name>
  [-ctime <true|false>]
```

REST

N/A

Parameters

ctime

Set to `true` to display container state/role change time.

Default: `false`

cluster

The cluster on which to run the command. If this parameter is omitted, the command is run on the cluster on which it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.

volumename	The name of the volume. To obtain volume names, use the volume list on page 2989 <code>maprccli volume list</code> command. This parameter is mandatory.
-------------------	--

Output

The `maprccli volume info` returns information about the volume and the containers associated with that volume. Volume information includes the ID, volume name, and replication factor. For each container on the specified volume, the command returns information about nodes and storage. See the following [Example](#) on page 2471 for sample output.

AccessTime	Indicates the volumes that are accessed regularly. This value is updated every 6 hours with the last time that an operation occurred on the volume. The access time is not updated for changes to volume properties, creation of a snapshot, or synchronization between a volume and a mirror. However, the volume access time is updated the first time you upgrade to a Data Fabric version that includes this property. This property was introduced in Data Fabric version 4.0.2.
ActiveServers	The IP address and port number of each active node on which the container resides.
allowGrant	Indicates whether (true) or not (false) a parent volume grants permission for a child volume to inherit its properties.
Audited	Indicates whether (1) or not (0) auditing is enabled for the volume.
AuditVolume	Indicates whether (1) or not (0) the volume accommodates audit logs.
CoalesceInterval	The interval of time to elapse after the first instance of an operation on a node is recorded in audit logs, if auditing is enabled. Subsequent identical operations performed on the same node from the same client are ignored during the interval.
ContainerId	The unique ID number of the container.
CreatorContainerId	The container ID of the read-write container. The container ID is retained in all mirrors of those containers (in all mirrors of the volume). The container ID enables the identification of the correct containers to source from, when mirror sources are changed in a mirror chain.
CreatorVolumeUuid	A randomly generated unique ID that is shared by all mirrors of a volume, and all containers of them. You can use this ID to avoid undesirable chaining of containers when mirror sources are changed in a mirror chain.
dareEnabled	Indicates whether (1) or not (0) data-at-rest encryption (DARE) is enabled for the volume.
DisabledDataAuditOperations	The list of operations excluded from auditing.
EnabledDataAuditOperations	The list of operations selected for auditing.
enforcementMode	The data access enforcement mode.
Epoch	A sequence number that indicates the most recent copy of the container. The CLDB uses the epoch to ensure that an out-of-date copy cannot become the master for the container.

fixCreatorId	An internal flag for Data Fabric volumes to fix the creator container ID.
ForceAudit	Indicates whether (1) or not (0) to force audit of operations on all files, tables, and streams in the volume.
InactiveServers	The IP address and port number of each inactive node on which the container resides.
label	The label associated with the volume. See Using Storage Labels on page 1575 for more information on labels.
limitSpread	An internal flag for Data Fabric volumes to control the growth of a volume in terms of number of containers. When this flag is set, CLDB tries to limit the number of new containers created, depending on the present size of a volume. If a volume size (data in volume) is small, CLDB tries to reuse space in existing containers to avoid the creation of new containers. This reuse helps reduce wastage of containers IDs in an environment that has small volumes.
LogicalSizeMB	The logical size on disk (in MB) of the container.
Master	The IP address and port number of the <i>master copy</i> . The master copy is part of the original copy of the volume.
MetricsEnabled	Indicates whether (1) or not (0) metrics collection is enabled for the volume.
MirrorThrottle	Specifies whether mirror throttling is enabled (true) or disabled (false). Throttling is set on the source volume and applies to all its mirrors. This property was introduced in MapR version 4.0.2.
Mtime	Indicates the time when the last modification was made to the contents of the container.
NameContainer	Indicates if the container is the <i>name container</i> for the volume. If <code>true</code> , the container is the first container of the volume. Replication then occurs simultaneously from the master to the intermediate and tail containers.
NameSpaceMinReplication	The minimum replication factor or the number of copies of the name container associated with the volume that should be maintained by the Data Fabric cluster for normal operation. When the replication factor falls below this minimum value, writes to the volume are disabled. The default value is 2.
NameSpaceReplication	The desired replication factor or the number of copies of the name container associated with the volume. The default value is 3. The maximum value is 6.
nslabel	The name container label. See Using Storage Labels on page 1575 for more information on labels.
NumInodesInUse	Indicates the number of inodes used by the container.
OwnedSizeMB	The size on disk (in MB) dedicated to the container.
ReReplicationTimeOutSec	The timeout (in seconds) period until CLDB starts re-replicating the containers on the node of the volume, when CLDB stops receiving a heartbeat from the node.
securityPolicyTags	The list of security policy tags to be associated with this volume.

SharedSizeMB	The size on disk (in MB) shared by the container.
TenantUser	Displays the name of the tenant user, if any.
TotalSizeMB	The total size on disk (in MB) allocated to the container. Combines the Owned Size and Shared Size.
UnusedServers	The IP address and port number of servers from which no "heartbeat" has been received for quite some time.
VolumeId	The unique ID number of the volume.
VolumeMinReplication	The minimum replication factor. Indicates the number of copies of a volume (including the original) that should be maintained by the Data Fabric cluster for normal operation. When the replication factor falls below this minimum value, writes to the volume are disabled. The default value is 2. A replication factor of 2 indicates that the number of copies of a volume is 2 (original +1 copy). A replication factor of 3 indicates that the number of copies of a volume is 3 (original + 2 copies).
VolumeName	The name of the volume.
VolumeReplication	The desired replication factor. Indicates the number of copies of a volume. The default value is 3. The maximum value is 6.
VolumeTopology	The volume topology corresponds to the node topology of the rack or nodes where the volume resides. By default, new volumes are created with a topology of / (root directory). For more information, see Setting Up Node Topology on page 1372.
VolumeUsedSizeMB	The size on disk (in MB) of the volume.
WireSecurityEnabled	Indicates whether (1) or not (0) wire-level security is enabled.

Example

Dump volume information

CLI

```
# /opt/mapr/bin/maprccli dump
volumeinfo -cluster
docs41cluster -volumename
sampleVol -ctime true -json

dump volumenodes

Returns information about the nodes on a volume.

Syntax**CLI**

```
maprccli dump volumenodes
[-cluster <cluster name>]
-volumename <volume name>
```

NOTE: For best results, use the `-json` option from the command line.

REST

N/A

Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
volumename	The name of the volume. To obtain volume names, use the <code>maprccli volume list</code> command.

Output

The `maprccli dump volumenodes` command returns the IP address and port number of volume nodes.

```
# maprccli dump volumenodes -volumename mapr.hbase -json
{
  "timestamp":1433372931725,
  "timeofday":"2015-06-03 11:08:51.725 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "Servers":{
        "IP:Port":[
          "10.10.82.23:5660--3-VALID",
          "10.10.82.28:5660--3-VALID",
          "10.10.82.29:5660--3-VALID"
        ]
      }
    }
  ]
}
```

Output fields

Field	Description
IP:Port	The IP address and file system port.

Example

CLI

```
maprccli dump volumenodes -volumename
mapr.hbase -json
```

dump zkinfo

Returns the ZooKeeper znodes.

NOTE: This command is used by the `mapr-support-collect.sh` script to gather cluster diagnostics for troubleshooting.

This command enables you to view a snapshot of the data stored in Zookeeper as a result of cluster operations

ZooKeeper prevents service coordination conflicts by enforcing a rigid set of rules and conditions, provides cluster-wide information about running services and their configuration, and provides a mechanism for

almost instantaneous service failover. Warden will not start any services unless ZooKeeper is reachable and more than half of the configured ZooKeeper nodes are live.

The `mapr-support-collect.sh` script calls the `maprccli dump supportdump` command to gather cluster diagnostics for troubleshooting. For more information, see [mapr-support-collect.sh](#).

Syntax

CLI

```
maprccli dump zkinfo
[-cluster <cluster name>]
[-zkconnect <connect string>]
```

 **NOTE:** For best results, use the `-json` option from the command line.

REST

N/A

Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
zkconnect	A ZooKeeper connect string, which specifies a list of the hosts running ZooKeeper, and the port to use on each, in the format: '<host>[:<port>][,<host>[:<port>]...]'. To obtain zookeeper connection strings, use the <code>maprccli node listzookeepers</code> command.

Output

The `maprccli dump zkinfo` command is run as part of support dump tools to view the current state of the Zookeeper service. The command should always be run using the `-json` option, since output in the default tabular format is not useful. Command output displays the data stored in the ZooKeeper hierarchical tree of znodes.

```
# maprccli dump zkinfo -json
{
  "timestamp":1335825202157,
  "status":"OK",
  "total":1,
  "data":[
    {
      "_Stats":"\ncZxid = 0,ctime = Wed Dec 31 16:00:00 PST
1969,mZxid = 0,mtime = Wed Dec 31 16:00:00 PST 1969,pZxid = 516,cversion

0,numChildren = 13",
      "/" : [
        {
          ....
        }
      ]
    }
  ]
}
```

Output fields

You can use the `maprccli dump zkinfo` command as you would use a database snapshot. The `/services`, `/services_config`, `/servers`, and `/*_locks` znodes are used by Warden to store and exchange information.

Field	Description
services	The <code>/services</code> directory is used by Warden to store and exchange information about services.
datacenter	The <code>/datacenter</code> directory contains CLDB "vital signs" that you can use to identify the CLDB master, the most recent epoch, and other key data. For more information, see Moving CLDB Data .
services_config	The <code>/services_config</code> directory is used by Warden to store and exchange information.
zookeeper	The <code>/zookeeper</code> directory stores information about the ZooKeeper service.
servers	The <code>/servers</code> directory is used by Warden to store and exchange information.
nodes	The <code>/nodes</code> directory (znode) stores key information about the nodes.

Moving CLDB Data

Describes how to move CLDB data to another node.

About this task

In a Community Edition-licensed cluster, CLDB data must be recovered from a failed CLDB node and installed on another node. The cluster can continue normally as soon as the CLDB is started on another node.

For more information, see [CLDB Failover](#) on page 2243.

Use the `maprccli dump zkinfo` command to identify the latest epoch of the CLDB, identify the nodes where replicates of the CLDB are stored, and select one of those nodes to serve the new CLDB node. Perform the following steps on any cluster node:

Procedure

1. Log in as root or use sudo for the following commands.
2. Issue the `maprccli dump zkinfo` command using the `-json` flag.

```
# maprccli dump zkinfo -json
```

The output displays the ZooKeeper znodes.

3. In the `/datacenter/controlnodes/cldb/epoch/1` directory, locate the CLDB with the latest epoch.

```
{ "/datacenter/controlnodes/cldb/epoch/1/KvStoreContainerInfo": "  
Container ID:1 VolumeId:1  
Master:10.250.1.15:5660-172.16.122.1:5660-192.168.115.1:5660--13-VALID  
Servers: 10.250.1.15:5660-172.16.122.1:5660-192.168.115.1:5660--13-VALID  
Inactive Servers: Unused Servers: Latest epoch:13" }
```

The Latest Epoch field identifies the current epoch of the CLDB data. In this example, the latest epoch is 13.

4. Select a CLDB from among the copies at the latest epoch. For example, `10.250.2.41:5660--13-VALID` indicates that the node has a copy at epoch 13 (the latest epoch).

entity

Manages *entities* (users and groups).

entity info

Displays information about an entity.

Syntax

CLI

```
maprcli entity info  
[ -cluster <cluster> ]  
-name <entity name>  
[ -output terse|verbose ]  
-type <type>
```

REST

Request Type	GET
Request URL	<code>http[s]://<host>:<port>/rest/entity/info?<parameters></code>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
name	The <i>entity</i> name. Obtain the entity name by running the <code>maprcli entity list</code> command.
output	Whether to display terse or verbose output.
type	The entity type. Obtain the entity type by running the <code>maprcli entity list</code> command.

Output

Sample Output

```
DiskUsage EntityQuota EntityType EntityName VolumeCount  
EntityAdvisoryquota EntityId
```

```
864415      0      0      root      208
0           0
```

Output Fields

Field	Short Name	Description
DiskUsage	dsu	Disk space used by the user or group
EntityQuota	qta	The user or group quota
EntityType	t	The entity type
EntityName	n	The entity name
VolumeCount	vct	The number of volumes associated with the user or group
EntityAdvisoryquota	aqt	The user or group advisory quota
EntityId	id	The ID of the user or group

Examples

Display information for the user 'root':

CLI

```
maprcli entity info -type 0 -name root
```

REST

```
https://abc.sj.us:8443/rest/entity/
info?type=0&name=root
```

entity list

Lists and displays information about entities.

Syntax

CLI

```
maprcli entity list
[ -alarmedentities true|false ]
[ -cluster <cluster> ]
[ -columns <columns> ]
[ -filter <filter> ]
[ -limit <rows> ]
[ -output terse|verbose ]
[ -sortby ]
[ -start <start> ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/entity/list[?<parameters>]

Parameters

Parameter	Description
alarmedentities	Specifies whether to list only entities that have exceeded a quota or advisory quota.
cluster	The cluster on which to run the command.
columns	A comma-separated list of fields to return in the query. See the Fields table below.
filter	A filter specifying entities to display. See Filters for more information.
limit	The number of rows to return, beginning at start. Default: 0
output	Specifies whether output should be terse or verbose.
sortby	Specifies one of the following attributes to sort the list of entities by: entityname, entitytype, entityid, entityemail, entityquota, entityadvisoryquota, entitydiskusage, entityvolume count. By default, the list of entities sorted by entityname.
start	The offset from the starting row according to sort. Default: 0

Output

Information about the users and groups. Only users and groups with associated volumes are returned in the output.

Table

Field	Short Name	Description
EntityType	t	Entity type <ul style="list-style-type: none"> 0 = User 1 = Group
EntityName	n	User or Group name
EntityId	id	User or Group id
EntityQuota	qta	Quota, in MB. 0 = no quota.
EntityAdvisoryquota	aqt	Advisory quota, in MB. 0 = no advisory quota.
VolumeCount	vct	The number of volumes this entity owns.
DiskUsage	dsu	Disk space used for all entity's volumes, in MB.

Sample Output

```

DiskUsage  EntityQuota  EntityType  EntityName  VolumeCount
EntityAdvisoryquota  EntityId
5859220    0           0           root        209
0           0           0

```

Examples

List all entities:

CLI

```
maprccli entity list
```

REST

```
https://abc.sj.us:8443/rest/entity/
list
```

Filter entities by entity name:

CLI

```
maprccli entity list -filter
"[EntityName==mapr]"
```

REST

```
https://abc.sj.us:8443/rest/entity/
list?filter=[EntityName%3D%3Dmapr]
```

entity modify

Modifies a user or group quota or email address. Permissions required: fc or a.

Syntax

CLI

```
maprccli entity modify
[ -advisoryquota <advisory quota>
[ -cluster <cluster> ]
[ -email <email>]
[ -entities <entities> ]
-name <entityname>
[ -quota <quota> ]
-type <type>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/entity/modify?<parameters>

Parameters

Parameter	Description
advisoryquota	The advisory quota.
cluster	The cluster on which to run the command.
email	Email address.
entities	A comma-separated list of entities, in the format <type>:<name>. Example: 0:<user1>,0:<user2>,1:<group1>,1:<group2>..
name	The <i>entity</i> name.

Parameter	Description
quota	The quota for the entity.
type	The entity type: <ul style="list-style-type: none"> 0=user 1-group

Examples

Modify the email address for the user 'root':

CLI

```
maprcli entity modify -name
root -type 0 -email test@example.com
```

REST

```
https://abc.sj.us:8443/rest/entity/
modify?
name=root&type=0&email=test@example.co
m
```

Related tasks

[Setting Quota Defaults for Users and Groups](#) on page 1344

Explains how to set disk space quotas for users and groups.

Related reference

[rlimit set](#) on page 2613

Sets the resource usage limit for the cluster's disk resource.

entity remove

Removes an entity (specified by name and type).

NOTE: Entity can be removed only when there are no resources associated with the entity.

Syntax

CLI

```
maprcli entity remove
-name <entity name>
-type <type>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/entity/remove?<parameters>

Parameters

Parameter	Description
name	The entity name. Obtain the entity name by running the <code>maprcli entity list</code> command.

Parameter	Description
type	<p>The entity type. Value can be:</p> <ul style="list-style-type: none"> 0 - for user 1 - for group <p>If necessary, obtain the entity type by running the <code>maprcli entity list</code> command.</p>

Example**Remove an entity by name and type:**

```
maprcli entity remove -name mapruser1 -type 1
```

fid

Displays information about HPE Data Fabric Database or file-system components that are identified by a FID.

fid dump

Displays detailed information for HPE Data Fabric Database or file-system components that are identified by an FID.

NOTE: Only the root user and the MAPR_USER user (user under which HPE Data Fabric services runs) have permissions to run this command.

Syntax**CLI**

```
maprcli fid dump
[ -cluster <cluster_name> ]
-fid <file identified for the
element>
[ -startkey startkey ]
[ -endkey endkey ]
[ -maxkeys maxkeys ]
[ -kvtype
cldb kvtype: cinfo|csize|cmap|
fsprop|spprop|vprop|sinfo|si2scid|
sc2sid|policyinfo|compositeid|spmap|
cgent|hashedstring|filefilterinfo ]
[ -dirraw scan directory inode
as kvstore. default: false ]
```

REST

N/A

Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
fid	The file identifier for the element (region, kvstore, etc.) for which you want detailed information. The output of maprcli table region list lists the FIDs for the table's regions.

Parameter	Description
startkey	starting key from where to dump the element
endkey	ending key till where to dump the element
maxkeys	maximum number of keys to dump
kvtype	type of kvstore (key-value store) to dump
dirraw	boolean value indicating whether to scan directory as raw/inode (set value as true) or as kvstore (set value as false). The default value is false.

NOTE: You can run this command on any FID available on the HPE Data Fabric filesystem.

Tablet Map

Displays output for a tablet map includes the key for each tablet and its corresponding FID.

Each tablet contains a range of data starting with the key associated with the tablet and ending before the key associated with the next tablet

FID for a Tablet Map

Describes how to determine the FID for a tablet map.

About this task

To determine the FID for a tablet map:

Procedure

1. Run `hadoop mfs -ls <table path>` to determine the table FID. The table FID is the FID that displays after the "p."

Example:

```
[mapr@hostname ~]$ hadoop mfs -ls /testdst
Found 1 items
tr----- Z U 3 mapr mapr 2 2015-02-18 15:24 0 /
testdst
p 2049.49.131220 hostname:5660
r 2061.32.131258 hostname:5660
```

2. Run `maprcli fid dump` on the table FID to determine the tablet map FID.

Example:

```
2049.49.131220 [mapr@hostname ~]$ maprcli fid dump -fid
value key
{"value":{"fid":"<parentCID>.51.131224"}} schema
{"value":{"fid":"<parentCID>.50.131222"}}
tabletmap
```

3. Construct the tablet map FID for the `maprcli fid dump` command by replacing `<parentCID>` with the set of numbers before the first period four numbers in the table FID.

Example: 2049.50.131222

Output Example for a Tablet Map

Example command and output.

```
maprcli fid dump -fid 2049.50.131222 -json
{
  "timestamp":1425579595296,
  "timeofday":"2015-03-05 06:19:55.296 GMT+0000",
  "status":"OK",
  "total":4,
  "data":[
    {
      "key": "",
      "value": {
        "fid": "2116.59.131462"
      }
    },
    {
      "key": "user3155781742051747178",
      "value": {
        "fid": "2114.49.131348"
      }
    },
    {
      "key": "user5238840414188136300",
      "value": {
        "fid": "2118.49.131394"
      }
    },
    {
      "key": "user7257930685533675764",
      "value": {
        "fid": "2115.59.131316"
      }
    }
  ]
}
```

Tablet

Describes output for a tablet.

The `maprcli fid dump` output for a tablet includes key and value pairs for the following:

- **startkey.** The first key value in the tablet.
- **pmap.** Each partition.
- **endkey.** The last key value in the tablet.

Output Fields for a Tablet

This table describes a majority of the output values for each partition (pmap) in the tablet.

Field	Description
key	The partition key.
segfid	The FID of the segment map associated with this partition.
isFrozen	A Boolean value that indicates if a partition is in a frozen state or not. Internally, a partition is sometimes temporarily marked as frozen in order for certain operations to complete.

Field	Description
inSplit	A Boolean value that indicates if a partition split is in progress for this partition.
useBucketDesc	This property is for internal use only.
lastFlushedBucketFid	The FID of the bucket file (WAL) which was last flushed for this partition.
numLogicalBlocks	The number of logical blocks (8K) for this partition.
numPhysicalBlocks	The number of physical blocks (8K) for this partition.
numRows	The number of rows stored in this partition.
numRowsWithDelete	The number of rows which are marked for delete in this partition.
numRemoteBlocks	The number of disk blocks which are not local to this partition. When a region splits, a partition moves from one node to another and it is possible to temporarily have some remote blocks.
numSpills	The number of spills.
numSegments	The number of segments.

Output Example for a Tablet

```
maprcli fid dump -fid 2116.59.131462 -json
{
  "timestamp":1425579636931,
  "timeofday":"2015-03-05 06:20:36.931 GMT+0000",
  "status":"OK",
  "total":6,
  "data":[
    {
      "key":"endkey.user3155781742051747178",
      "value":{
      }
    },
    {
      "key":"pmap.",
      "value":{
        "segfid":"<parentCID>.1065.133486",
        "isFrozen":false,

        "numLogicalBlocks":37011,
        "numPhysicalBlocks":23260,
        "numRows":9868,
        "numRowsWithDelete":0,
        "numRemoteBlocks":168,
        "numSpills":147,
        "numSegments":78
    },
    {
        "key":"pmap.user2078250355776544396",
        "value":{
            "segfid":"<parentCID>.445.132238",
            "isFrozen":false,
            "inSplit":false,
            "useBucketDesc":true,
            "lastFlushedBucketFid":"2116.447.132242",
            "numLogicalBlocks":71124,
            "numPhysicalBlocks":44797,
            "numRows":18991,
            "numRowsWithDelete":0,
            "numRemoteBlocks":172,
            "numSpills":300,
            "numSegments":152
        }
    },
    {
        "key":"postSplitCopy",
        "value":{
            "raw":"dummy"
        }
    },
    {
        "key":"startkey.",
        "value":{
        }
    }
    ]
}

```

NOTE: The postSpitCopy key and value are for internal use only.

Segment Map

Describes output of a segment map.

The `maprccli fid dump` output of a segment map includes a map of row keys and the corresponding segment FID.

Output Fields for a Segment Map

Field	Description
key	The row key
value	The FID corresponding to the segment associated with this key.

Output Example for a Segment Map

```
maprcli fid dump -fid 2116.1065.133486 -json
{
  "timestamp":1425579702407,
  "timeofday":"2015-03-05 06:21:42.407 GMT+0000",
  "status":"OK",
  "total":74,
  "data":[
    {
      "key":"","
      "value":{"
        "fid":"<parentCID>.943.133242"
      }
    },
    {
      "key":"user1006417450462802131",
      "value":{"
        "fid":"<parentCID>.945.133246"
      }
    },
    ...
  ]
}
```

Segment
Describes output for a segment.

The output of `maprcli fid dump` for a segment includes details about each spill.

Output Fields for a Segment

Field	Description
key	The index of the spill.
numRemoteBlocks	The number of remote blocks.
numspills	The number of spills.

Field	Description
value	<p>The property contains the following values:</p> <ul style="list-style-type: none"> fid: The FID of the spill containing row and value data. smeSize: The spill map entry size. keyIdxOffset: The offsets and length inside the spill for the index keyIdxLength: The length inside the spill for the index ldbIdxLength: The length of the index portion in the spill. bloomBitsPerKey: The number of bits used in the bloom filter per key. numLogicalBlocks: The number of logical blocks in the spill. numPhysicalBlocks: The number of physical blocks in the spill. numRows: The number of rows in the spill. numRowsWithDelete: The number of rows which are marked for delete in the spill. families: Information about the location of different column family data in the spill and the time range of that data.

Output Example for a Segment

```
maprcli fid dump -fid 2116.945.133246 -json
{
  "timestamp":1425579733821,
  "timeofday":"2015-03-05 06:22:13.821 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "key":0,
      "numRemoteBlocks":0,
      "numSpills":0,
      "numSegments":0,
      "value":{
        "fid":"<parentCID>.946.133248",
        "smeSize":55,
        "keyIdxOffset":12,
        "keyIdxLength":3587,
        "ldbIdxLength":20,
        "bloomBitsPerKey":80,
        "numLogicalBlocks":369,
        "numPhysicalBlocks":232,
        "numRows":99,
        "numRowsWithDelete":0,
        "families":{
          "id":1,
          "offset":524288,
          "length":2976835,
          "minTimeStamp":1425578650850,
```

```

    "maxTimeStamp":1425578856492
  }
}
]
}

```

fid stat

Displays statistics for HPE Data Fabric Database or file system components that are identified by a FID.

Only the root user and the MAPR_USER user (user name under which Data Fabric services runs) have permissions to run this command.

NOTE: This command is similar to the UNIX stat command.

Syntax**CLI**

```

/opt/mapr/bin/maprcli fid stat
[ -cluster <cluster name> ]
-fid <file identifier for the
element>

```

REST

N/A

Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
fid	The file identifier for the element (region, kvstore, etc.) for which you want detailed information. The output of the maprcli table region list command lists the FIDs for the regions of the table.

Output Fields

Columns	Description
atime	The last access time for this FID. For more information, see the <code>atimeUpdateTimeInterval</code> entry in volume create on page 2929.
compression	The compression setting, either on or off. If on, this parameter displays the compression type.
deleteFlags	An internal delete flag that is set on the FID for transactions involving multiple nodes. If deleted, this parameter denotes the deletion type, either self or recursive delete.
diskflush	Indicates whether persistent flush is enabled (true) or not (false) for this inode.
gid	The group ID

Columns	Description
lblocks	Number of logical B-Tree blocks
mode	The UNIX style permission mode bits for the FID
mtime	Last modification time
nblocks	Total number of B-Tree blocks used
networkencryption	Indicates whether wire encryption is enabled or disabled
nlevels	Number of B-Tree levels
nlink	Number of links to this inode
parent	The parent FID
size	The size of the FID. Depending on the type of FID, it can be the actual size (in bytes), or the number of entries
subtype	The subtype of the FID
type	The type of the FID. For example, regular file, dir, filelet, kvstore, fidmap etc.
uid	The user ID of the owner
version	The current version of the FID.
xattrInum	The extended attribute of the FID

Example

Displays statistics for a specified FID:

```
[user@hostname ~]$ maprcli fid stat -fid 2062.32.131252 -json
{
  "timestamp":1586935733623,
  "timeofday":"2020-04-15 12:28:53.623 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "type":"FTDirectory",
      "subtype":"FSTInval",
      "parent":"<parentCID>.35.131200",
      "size":1,
      "nblocks":1,
      "lblocks":0,
      "compression":"off",
      "deleteFlags":"DeleteTypeNone",
      "atime":1583751630,
      "mtime":1583751630,
      "mode":"755",
      "uid":1000,
      "gid":1000,
      "nlink":3,
      "xattrInum":0,
      "version":1048589,
      "networkencryption":true,
      "diskflush":false,
      "nlevels":1
    }
  ]
}
```

file

Lets you perform tiering operations at the file level.

file offload

Initiates offload of a file using a MAST Gateway.

Permissions Required

The user running the command must have (mode bit or [ACE](#)) permissions to write to the file.

Syntax

CLI

```
/opt/mapr/bin/maprccli file offload
-name <file_name>
```

REST

Request Type	POST
Request URL	http[s]://<host:port>/rest/file/offload?<parameters>

Parameters

Parameter	Description
name	The name (including the path) of the file to offload.

Error Message

The OP_TIMEOUT message that indicates that the operation timed out, is returned if the connection to the gateway is lost.

Example

Offload file named test1 in volume named vol1:

CLI

```
/opt/mapr/bin/maprccli file
offload -name /vol1/test1
{
  "timestamp":1520277246831,
  "timeofday":"2018-03-05
07:14:06.831 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {

```

Offload a file named mfs in volume named vol1:**CLI**

```
/opt/mapr/bin/maprcli file
offload -name /vol1/mfs -json
{
  "timestamp":1534141379576,
  "timeofday":"2018-08-12
11:22:59.576 GMT-0700 PM",
  "status":"ERROR",
  "errors":[
    {
      "id":6,
      "desc":"Lost connection
to gateway."
    }
  ]
}
```

REST

```
curl -X GET 'https://
server.sj.us:8443/rest/file/
tierjobstatus?name=/vol1/mfs' --user
<username>:<password>

{"timestamp":1534141379576,"timeofday"
:"2018-08-12 11:22:59.576 GMT-0700
PM","status":"ERROR",
"errors":[{"id":6,"desc":"Lost
connection to gateway."}]}
```

file recall

Initiates recall of a file from a storage tier using a MAST Gateway.

Permissions Required

The user running the command must have (mode bit or [ACE](#)) permissions to write to the file.

Syntax

CLI

```
/opt/mapr/bin/maprccli file recall
-name <file_name>
```

REST

Request Type	GET
Request URL	http[s]://<host:port>/rest/file/recall?<parameters>

Parameters

Parameter	Description
name	The name (including the path) of the file to recall.

Example

Recall file named file1 in volume named vol1:

CLI

```
/opt/mapr/bin/maprccli file
recall -name /vol1/test1 -json
{
  "timestamp":1516337242973,
  "timeofday":"2018-01-19
04:47:22.973 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[{"
    "status":12,
    "message":"File transfer
request queued.",
    "gateway":"10.10.88.198:8660",

    "jobid":"0xb76f872c64fe4677.0x3673092f
759a500d.0x1"
  }]
}
```

REST

```
curl -X GET 'https://abc.sj.us:8443/
rest/file/recall?<parameters>' --user
<username>:<password>
{"timestamp":1516337242973,"timeofday"
:"2018-01-19 04:47:22.973
GMT+0000","status":"OK","total":1,"dat
a":[{"status":12,"message":"File
transfer request
queued.", "gateway":"10.10.88.198:8660"
,"jobid":"0xb76f872c64fe4677.0x3673092
f759a500d.0x1"}]}
```

file tierjobterminate

Initiates termination of an ongoing offload or recall operation.

Permissions Required

The user running the command must have (mode bit or [ACE](#)) permissions to write to the file.

Syntax

CLI

```
/opt/mapr/bin/maprccli file
tierjobterminate
  -name <file_name>
  [ -job <jobID> ]
```

REST

Request Type	POST
Request URL	http[s]://<host:port>/rest/file/tierjobterminate?<parameters>

Parameters

Parameter	Description
name	The name (including the path) of the file being offloaded/recalled.
job	<p>The ID of the job, which was specified with the offload or recall command, to terminate. This must be specified to ensure that the correct offload or recall task is terminated. If this is not specified, the command picks a job to terminate in the following order:</p> <ol style="list-style-type: none">1. Job that is in “already terminating progress” status.2. Job that is in “running jobs with latest jobid” status. <p>If there are no jobs in progress, the command returns “no active transfer in progress” error.</p>

Examples

CLI

```
/opt/mapr/bin/maprccli file
tierjobterminate -name /c1/
file5G -json
{
  "timestamp":1557734728770,
  "timeofday":"2019-05-13
01:05:28.770 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "status":10,
      "message":"File
transfer being terminated.",
      "gateway":"10.10.103.79:8660",
      "jobid":"0x140dea11228a3211.0x18565bc5
```

```
d5e4e4fe.0x2"
    }
  ]
}
```

REST

```
curl -X POST 'https://host:port/rest/
file/tierjobterminate?name=/c1/
file5G' --user <username>:<password>
{"timestamp":1557738947905,"timeofday"
:"2019-05-13 02:15:47.905 GMT-0700
AM","status":"OK","total":1,"data":
[{"status":10,"message":"File
transfer being
terminated.", "gateway":"host:port", "jo
bid":"0x140dea11228a3211.0x18565bc5d5e
4e4fe.0x3"}]}
```

file tierjobstatus

Checks the status of a previous offload or recall operation.

Permissions Required

The user running the command must have (mode bit or [ACE](#)) permissions to write to the file.

Syntax

CLI

```
/opt/mapr/bin/maprcli file
tierjobstatus
    -name <file_name>
    [ -job <jobID> ]
```

REST

Request Type	GET
Request URL	http[s]://<host:port>/rest/file/tierjobstatus?<parameters>

Parameters

Parameter	Description
name	The name (including the path) of the file.
job	The ID of the job specified with the offload or recall command.

Output

The command returns **one** of the following messages:

FTOS_SUCCESS

Indicates that the file tiering operation was successful. For example:

CLI

```

/opt/mapr/bin/
maprccli file
tierjobstatus -n
ame /v5/
nfile2 -json
{
  "timestamp":15335
55093521,
  "timeofday":"201
8-08-06
04:31:33.521
GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "status":0,
      "message":"File
offload
completed.",
      "gateway":"10.10.
104.21:8660",
      "op":"Offload",
      "completedFids":2
,
      "failedFids":0,
      "totalFids":2
    }
  ]
}

```

REST

```

curl -X GET
'https://
abc.sj.us/rest/
file/
tierjobstatus?
name=/v5/
nfile2' -- user
<username>:<passw
ord>

{"timestamp":1533
555093521,"timeof
day":"2018-08-06
04:31:33.521
GMT-0700
AM","status":"OK"
,"total":1,
"data":
[{"status":0,"mes

```

```
sage":"File

completed.", "gate
way":"10.10.104.2
1:8660", "op":"Off
load",

"completedFids":2
, "failedFids":0, "
totalFids":2}}}
```

OP_FAIL

Indicates that the operation failed. For example:

CLI

```
/opt/mapr/bin/
maprccli file
tierjobstatus -na
me /
volume_cold_aws/
sampleFile2 -json
{

"timestamp":15339
37284242,

"timeofday":"201
8-08-10
02:41:24.242
GMT-0700 PM",

"status":"ERROR",
  "errors":[
    {

"id":2,

"desc":"File
offload failed."
    }
  ]
}
```

REST

```
curl -X GET
'https://
abc.sj.us:8443/
rest/file/
tierjobstatus?
name=/
volume_cold_aws/
sampleFile2' --us
er
<username>:<passw
ord>

{"timestamp":1533
937284242, "timeof
day":"2018-08-10
02:41:24.242
GMT-0700
PM", "status":"ERR
```

```
OR",
  "errors":
  [{"id":2,"desc":"
File offload
failed."}]}
```

INVALID_FILE

Indicates that the specified file does not exist. For example:

CLI

```
/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /ecvol1/
file3_24 -json
{
  "timestamp":15341
88250720,
  "timeofday":"201
8-08-13
12:24:10.720
GMT-0700 PM",
  "status":"ERROR",
  "errors":[
    {
      "id":3,
      "desc":"Tierfile
transfer failed,
Could not open
file /ecvol1/
file3_24"
    }
  ]
}
```

REST

```
curl -X GET
'https://
abc.sj.us:8443/
rest/file/
tierjobstatus?
name=/ecvol1/
file3_24' --user
<username>:<passw
ord>

{"timestamp":1534
188250720,"timeof
day":"2018-08-13
12:24:10.720
GMT-0700
PM","status":"ERR
OR",
  "errors":
  [{"id":3,"desc":"
Tierfile
```

```
transfer failed,
Could not open
file /ecvol1/
file3_24"}}}
```

FILE_EMPTY

Indicates that the file contains no data and is empty.
For example:

CLI

```
/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /vol1/
test1 -json
{
  "timestamp":15341
41220360,
  "timeofday":"201
8-08-12
11:20:20.360
GMT-0700 PM",
  "status":"ERROR",
  "errors":[
    {
      "id":5,
      "desc":"File
empty."
    }
  ]
}
```

REST

```
curl -X GET
'https://
server.sj.us:8443
/rest/file/
tierjobstatus?
name=/vol1/
test1' --user
<username>:<passw
ord>

{"timestamp":1534
142083085,"timeof
day":"2018-08-12
11:34:43.085
GMT-0700
PM","status":"ERR
OR",
  "errors":
[{"id":5,"desc":"
File empty."}]}
```

NO_GATEWAY

Indicates that there is no MAST Gateway available. For example:

CLI

```
/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /ecvol1/
file2 -json
{
  "timestamp":15341
85984585,
  "timeofday":"201
8-08-13
11:46:24.585
GMT-0700 AM",
  "status":"ERROR",
    "errors":[
      {
        "id":6,
        "desc":"Lost
connection to
gateway."
      }
    ]
}
```

REST

```
curl -k -X GET
'https://
abc.sj.us:8443/
rest/file/
tierjobstatus?
name=/ecvol1/
file2' --user
mapr:mapr

{"timestamp":1534
185984585,"timeof
day":"2018-08-13
11:46:24.585
GMT-0700
AM","status":"ERR
OR",
  "errors":
[{"id":6,"desc":"
Lost connection
to gateway."}]}
```

HAS_LOCAL_DATA

Indicates that the data is still on the cluster. For example:

CLI

```
/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /vol1/
mfs1 -json
File has local
```

```
data.
{
  "timestamp":15341
41820011,
  "timeofday":"201
8-08-12
11:30:20.011
GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "status":8,
      "message":"File
has local data."
    }
  ]
}
```

REST

```
curl -k -X GET
'https://
abc.sj.us:8443/
rest/file/
tierjobstatus?
name=/vol1/
mfs1' --user
mapr:mapr
```

```
{"timestamp":153414
1975490,"timeofday"
:"2018-08-12
11:32:55.490
GMT-0700
PM","status":"OK",
  "total":1,"data":
[{"status":8,"messa
ge":"File has
local data."}]}
```

FTOS_ABORTED

Indicates that the file tiering operation was aborted.
For example:

CLI

```
/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /v3/dataVol/
file5 -json
{
  "timestamp":15338
45080525,
  "timeofday":"201
8-08-09
01:04:40.525
```

```
GMT-0700 PM",
  "status": "OK",
  "total": 1,
  "data": [
    {
      "status": 9,
      "message": "Transfer aborted.",
      "gateway": "10.10.25.22:8660",
      "op": "Offload",
      "completedFids": 9,
      "failedFids": 0,
      "totalFids": 9
    }
  ]
}
```

REST

```
curl -k -X GET 'https://abc.sj.us:8443/rest/file/tierjobstatus?name=/v3/dataVol/file5' --user mapr:mapr

{"timestamp":1533845080525,"timeofday":"2018-08-09 01:04:40.525 GMT-0700 PM","status":"OK",
,
"total":1,"data":
[{"status":9,"message":"Transfer aborted.", "gateway":"10.10.25.22:8660",
"op":"Offload", "completedFids":9, "failedFids":0, "totalFids":9}]}
```

FTOS_ABORT_IN_PROGRESS

Indicates that the file tiering operation is being aborted. For example:

CLI

```

/opt/mapr/bin/
maprccli file
tierjobstatus -na
me /v3/dataVol/
file5 -json
{
  "timestamp":15338
45004549,
  "timeofday":"201
8-08-09
01:03:24.549
GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "status":10,
      "message":"File

ompletedFids": 5, "
failedFids": 0, "to
talFids": 9]]}
```

FTOS_TRANSFER_IN_PROGRESS

Indicates that offload or recall of file data is currently in progress. For example:

CLI

```
/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /v3/dataVol/
file5 -json
{

"timestamp":15338
44965363,

"timeofday":"201
8-08-09
01:02:45.363
GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {

"op":"Offload", "c
ompletedFids":2, "
failedFids":0, "to
talFids":9]]}
```

FTOS_REQ_QUEUED

Indicates that the file is queued for offload. For example:

CLI

```
/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /v5/
egFile2 -json
{

"timestamp":15341
87988469,

"timeofday":"201
8-08-13
12:19:48.469
GMT-0700 PM",

"status":"OK",
  "total":1,
  "data":[
    {

"status":12,

"message":"File
transfer request
queued.",

"gateway":"10.10.
25.29:8660",

"op":"Offload",

"completedFids":0
,
```

```
"failedFids":0,
"totalFids":0
}
]
```

REST

```
curl -k -X GET
'https://
abc.sj.us:8443/
rest/file/
tierjobstatus?
name=/v5/
egFile2' --uesr
mapr:mapr

{"timestamp":1534
187988469,"timeof
day":"2018-08-13

":"10.10.25.29:86
60",

"op":"Offload","c
ompletedFids":0,"
failedFids":0,"to
talFids":0}]}
```

FTOS_JOB_NOT_AVAILABLE

Indicates that the job ID associated with the specified file tiering operation is not available or is invalid. For example:

CLI

```
/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /v5/
nfile2 -json
{

"timestamp":15338
41993320,

"timeofday":"201
8-08-09
12:13:13.320
GMT-0700 PM",

"status":"ERROR",
"errors":[
```

```
{
  "id":13,
  "desc":"File has
no active
transfer in
progress."
}
```

REST

```
curl -k -X GET
'https://
abc.sj.us:8443/
rest/file/
tierjobstatus?
name=/v5/
nfile2' --user
mapr:mapr

{"timestamp":1533
841993320,"timeof
day":"2018-08-09
12:13:13.320
GMT-0700
PM","status":"ERR
OR",
  "errors":
  [{"id":13,"desc":
  "File has no
  active transfer
  in progress."}]}
```

FTOS_EPERM

Indicates that the user cannot perform the tiering operation. For example:

CLI

```
/opt/mapr/bin/
maprcli file
tierjobstatus -na
me /ecvol1/
file3_1 -json
{
  "timestamp":15341
88598543,
  "timeofday":"201
8-08-13
12:29:58.543
GMT-0700 PM",
  "status":"ERROR",
  "errors":[
    {
      "id":14,
      "desc":"File
```

```
transfer request
permission
denied."
    ]
}
```

REST

```
curl -k -X GET
'https://
abc.sj.us:8443/
rest/file/
tierjobstatus?
name=/ecvol1/
file3_1' --user
mapr:mapr

{"timestamp":1534
188598543,"timeof
day":"2018-08-13
12:29:58.543
GMT-0700
PM","status":"ERR
OR",
  "errors":
[{"id":14,"desc":
"File transfer
request
permission
denied."}]}
```

file tierstatus

Checks the status of the file offload operation and returns information on whether or not the file has any local data.

This command does not require a MAST Gateway.

Syntax

CLI

```
maprccli file tierstatus
-name <file_name>
```

REST

Request Type	GET
Request URL	http[s]://<host:port>/rest/file/tierstatus?<parameters>

Parameters

Parameter	Description
name	The name (including the path) of the file.

Output

The output of this command varies based on whether or not data is local, was offloaded, or was recalled. The output returns *one* of the following messages:

- Data was completely offloaded:

```
File does not have local data
```

- Data could not be completely offloaded or data was recalled:

```
File has local data
```

- File is not configured for tiering:

```
File is not on a tiered volume
```

Examples

Retrieve the status of file named **new2test4** in volume name **testvol2**:

CLI

```
maprcli file tierstatus -name /
testvol2/new2test4 -json
File does not have local data.
{
  "timestamp":1514877988773,
  "timeofday":"2018-01-01
11:26:28.773 GMT-0800",
  "status":"OK",
  "total":1,
  "data":[
    {
      "status":1,
      "message":"File
does not have local data."
    }
  ]
}
```

REST

Send a request of type GET. For example:

```
curl -X GET 'https://servr.sj.us:8443/
rest/file/tierstatus?name=/testvol2/
new2test4' --user
<username>:<password>

{"timestamp":1514877988773,"timeofday"
:"2018-01-01 11:26:28.773
GMT-0800","status":"OK","total":1,
  "data":[{"status":1,"message":"File
does not have local data."}]}
```

Retrieve the status of file named **new2test3** in volume named **testvol2**:

CLI

```
maprcli file tierstatus -name /
testvol2/new2test3 -json
File has local data.
```

```
{
  "timestamp":1514878021374,
  "timeofday":"2018-01-01
11:27:01.374 GMT-0800",
  "status":"OK",
  "total":1,
  "data":[
    {
      "status":0,
      "message":"File
has local data."
    }
  ]
}
```

REST

Send a request of type GET. For example:

```
curl -X GET 'https://
server.sj.us:8443/rest/file/
tierstatus?name=/testvol2/
new2test3' --user
<username>:<password>

{"timestamp":1514878021374,"timeofday"
:"2018-01-01 11:27:01.374
GMT-0800","status":"OK","total":1,
"data":[{"status":0,"message":"File
has local data."}]}
```

Retrieve the status of file named file0 in volume named dir1 inside a volume called std_volume:

CLI

```
/opt/mapr/bin/maprccli
file tierstatus -name /std_volume/
dir1/file0 -json
File is not on a tiered volume.
{
  "timestamp":1609831337961,
  "timeofday":"2021-01-04
11:22:17.961 GMT-0800 PM",
  "status":"ERROR",
  "errors":[
    {
      "id":4,
      "desc":"File is not on a
tiered volume."
    }
  ]
}
```

REST

Send a request of type GET. For example:

```
curl -X
GET 'https://server.sj.us:8443/rest/
file/tierstatus?name=/std_volume/dir1/
file0' --user <username>:<password>
```

filefilter

Creates and modifies filters to restrict certain file types from being stored on specified volumes.

filefilter create

Creates a filter to disallow the specified file type.

Syntax

CLI

```
/opt/mapr/bin/maprccli filefilter
create
    -name name
    [ -description description ]
    -fileextensions extension
```

REST

Request Type	POST
Request URL	http[s]://<host:port>/rest/filefilter/create?<parameters>

Parameters

Parameter	Description
name	The name of the filter to create.
description	An optional description.
fileextensions	Comma separated list of extensions to block. For example, <i>exe,bat</i> blocks <i>exe</i> and <i>bat</i> files from being created and stored.  NOTE: The extensions are NOT case sensitive. Setting the extension to <i>exe</i> blocks <i>file1.exe</i> but does not block <i>file1.EXE</i> .

Example

Create a filter named *noexebat* to disallow *exe* and *bat* files:

CLI

```
/opt/mapr/bin/maprccli filefilter
create -name noexebat -description No
EXE and BAT files \
                                -fileextensions
exe,bat -json
{
    "timestamp":1609740883440,
    "timeofday":"2021-01-03
10:14:43.440 GMT-0800 PM",
    "status":"OK",
    "total":0,
    "data":[
        ],
    "messages":[
        "Filter Created
successfully"
    ]
}
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/filefilter/create?
name=noexeabat&description=No%20EXE%20a
nd%20BAT%20files&fileextensions=exe,ba
t' --user <username>:<password>
{"timestamp":1609743797218,"timeofday"
:"2021-01-03 11:03:17.218 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Filter Created
successfully"]}
```

filefilter modify

Modifies a filter that disallows the specified file type.

Syntax**CLI**

```
/opt/mapr/bin/maprccli filefilter
modify
    -name name
    [ -description description ]
    -fileextensions extension
```

REST

Request Type	POST
Request URL	http[s]://<host:port>/rest/filefilter/modify?<parameters>

Parameters

Parameter	Description
name	Identifies the filter to modify. The name cannot be modified.
description	An optional description.
fileextensions	Comma separated list of extensions to block. For example, <i>exe,bat</i> blocks <i>exe</i> and <i>bat</i> files from being created and stored.  NOTE: The extensions are NOT case sensitive. Setting the extension to <i>exe</i> blocks <i>file1.exe</i> but does not block <i>file1.EXE</i>

NOTE: Modifying file filters does not delete files already present in accordance with the current extensions. They only block new files henceforth. For example, if you modify a filter that currently has *jpg,png*, and now add *txt* to it, files with an extension of *txt* that are already present in the volume are not deleted. New files with the *txt* extension are prevented from being created hereafter.

Example

Modify a filter named *noexeabat* to disallow *exe*, *bat*, and *sh* files:

CLI

```
/opt/mapr/bin/maprccli filefilter
modify -name noextbat -description No
EXE BAT and sh files \
      -fileextensions
exe,bat,sh -json
{
    "timestamp":1609747228371,
    "timeofday":"2021-01-04
12:00:28.371 GMT-0800 AM",
    "status":"OK",
    "total":0,
    "data":[
        ],
    "messages":["Filter Updated
successfully"
    ]
}
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/filefilter/modify?
name=noexebat&description=No%20EXE%20B
AT%20and%20sh%20files&fileextensions=e
xe,bat,sh' --user
<username>:<password>
{"timestamp":1609747413152,"timeofday"
:"2021-01-04 12:03:33.152 GMT-0800
AM","status":"OK","total":0,"data":
[],"messages":["Filter Updated
successfully"]}
```

filefilter list

Lists filters specified by filtering criteria.

Syntax

CLI

```
/opt/mapr/bin/maprccli filefilter list
[ -columns all. default: all ]
[ -filter none. default:
none ]
[ -limit limit. default:
2147483647 ]
[ -output verbose. default:
verbose ]
[ -sortby <filtername|
filterid>, column names of supported
fields. ]
[ -sortorder <asc|desc> ]
[ -start start. default: 0 ]
```

REST

Request Type	POST
--------------	------

Request URL	http[s]://<host:port>/rest/filefilter/list?<parameters>
-------------	---

Parameters

Parameter	Description
columns	A comma-separated list of fields to return in the query.
filter	A filter specifying file filters to list. See Filters on page 2270 for more information. Default: none
limit	Number of filters to list.
output	Either terse or verbose.
sortby	Field on which to sort the output.
sortorder	Either ascending or descending.
start	Filter to start with when listing multiple filters.

Examples

List all file filters:

CLI

```
/opt/mapr/bin/maprcli filefilter
list -json

{
  "timestamp":1609826179089,
  "timeofday":"2021-01-04
09:56:19.089 GMT-0800 PM",
  "status":"OK",
  "total":3,
  "data":[
    {
      "filterid":1,
      "filtername":"nojpg",
      "description":"NO",
      "fileExtention":"jpg,txt"
    },
    {
      "filterid":3,
      "filtername":"notextjpg",
      "description":"No text  jpg and mov
files",
      "fileExtention":"jpg,txt,mov"
    },
    {
      "filterid":4,
```

```

"filename":"noexec",
"description":"No",
"fileExtension":"exe,bat,sh"
    }
]
}

```

REST

```

curl -X POST 'https://
server.sj.us:8443/rest/filefilter/
list' --user <username>:<password>
{"timestamp":1609826294528,"timeofday"
:"2021-01-04 09:58:14.528 GMT-0800
PM","status":"OK","total":3,"data":
[{"filterid":1,"filename":"nojpg","d
escription":"NO","fileExtension":"jpg,
txt"},
{"filterid":3,"filename":"notextjpg",
"description":"No text jpg and mov
files","fileExtension":"jpg,txt,mov"},
{"filterid":4,"filename":"noexec","d
escription":"No","fileExtension":"exe,
bat,sh"}]}

```

List the first two file filters

The `start` and `limit` parameters are useful for limiting the results. You can list the first two file filters as follows:

CLI

```

/opt/mapr/bin/maprccli filefilter
list -start 0 -limit 2 -json
{
    "timestamp":1609826503471,
    "timeofday":"2021-01-04
10:01:43.471 GMT-0800 PM",
    "status":"OK",
    "total":2,
    "data":[
        {
            "filterid":1,
            "filename":"nojpg",
            "description":"NO",
            "fileExtension":"jpg,txt"
        },
        {
            "filterid":3,
            "filename":"notextjpg",
            "description":"No text jpg and mov
files",
            "fileExtension":"jpg,txt,mov"
        }
    ]
}

```

```
    ]  
  }  
}
```

REST

```
curl -X GET 'https://  
server.sj.us:8443/rest/filefilter/  
list?start=0&limit=2' --user  
<username>:<password>  
{  
  "timestamp":1609826617711,"timeofday"  
  :"  
2021-01-04 10:03:37.711 GMT-0800  
PM",  
"status":  
"OK",  
"total":2,  
"data":  
[  
  {  
    "filterid":1,  
    "filtername":  
"nojpg",  
    "description":  
"NO",  
    "fileExtention":  
"jpg,  
txt",  
  },  
  {  
    "filterid":3,  
    "filtername":  
"notextjpg",  
    "description":  
"No text jpg and mov  
files",  
    "fileExtention":  
"jpg,txt,mov"}  
]  
}
```

filefilter info

Displays information about a specified filter.

Syntax

CLI

```
/opt/mapr/bin/maprcli filefilter info  
-name filterName
```

REST

Request Type	POST
Request URL	http[s]://<host:port>/ rest/filefilter/info? <parameters>

Parameters

Parameter	Description
name	Filter for which to display information.

Examples

Display information for the filter named notextjpg:

CLI

```
/opt/mapr/bin/maprcli filefilter  
info -name notextjpg -json  
{  
  "timestamp":1609830546149,  
  "timeofday":  
"2021-01-04  
11:09:06.149 GMT-0800 PM",  
  "status":  
"OK",  
  "total":1,  
  "data":  
  [  
    {  
      "filterid":3,  
      "filtername":  
"notextjpg",  
      "description":  
"No text jpg and mov  
files",  
      "fileExtention":  
"jpg,txt,mov"}  
  ]  
}
```

```
"filtername":"notextjpg",

"description":"No text jpg and mov
files",

"fileExtention":"jpg,txt,mov"
    }
    ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/filefilter/info?
name=notextjpg' --user
<username>:<password>
{"timestamp":1609833232278,"timeofday"
:"2021-01-04 11:53:52.278 GMT-0800
PM","status":"OK","total":1,"data":
[{"filterid":3,"filtername":"notextjpg
","description":"No text  jpg and mov
files","fileExtention":"jpg,txt,mov"}]
}
```

filefilter remove
Removes a file filter.

Syntax

CLI

```
/opt/mapr/bin/maprcli filefilter
remove
    -name filterName
```

REST

Request Type	POST
Request URL	http[s]://<host:port>/rest/filefilter/remove?<parameters>

Parameters

Parameter	Description
name	Filter to remove.

 **NOTE:** Filters that are attached to volumes cannot be removed. [Modify the volumes](#) to remove the filters, before deleting the filters.

Example

Remove filter :

CLI

```
/opt/mapr/bin/maprcli filefilter
remove -name notextjpg -json
{
```

```

        "timestamp":1609834952199,
        "timeofday":"2021-01-05
12:22:32.199 GMT-0800 AM",
        "status":"OK",
        "total":0,
        "data":[

        ],
        "messages":[
            "Filter Removed
successfully"
        ]
    }

```

REST

```

curl -k -X POST 'https://
abc.sj.us:8443/rest/filefilter/remove?
name=notextjpg' --user
<username>:<password>
{"timestamp":1609835456331,"timeofday"
:"2021-01-05 12:30:56.331 GMT-0800
AM","status":"OK","total":0,"data":
[],"messages":["Filter Removed
successfully"]}

```

insight

Describes the maprccli command to enable insights and get information related to insights.

Syntax

The **insight** command is used to manage the retrieval and pushing of audit log data by the insight service. The insight service retrieves and pushes audit log data related to MFS, CLDB, auth, and S3 services to Apache Iceberg tables. The data in the Apache Iceberg tables can be used for analysis related to anomalies in user behavior, such as authentication, authorization, file operations. Audit log data related to the individual services, MFS, CLDB, auth and S3, can be selectively pushed to Apache Iceberg tables.

Other operations related to insight data such as listing and specifying the retention period can be performed by using the **insight** command.

insight

cluster

```

[ -enable set true/false ]
[ -nodes node names space separated ]
[ -type audit type [mfs, s3, auth, cldb] ]

```

info

```

[ -nodes node names space separated ]
[ -type audit type [mfs, s3, auth, cldb] ]
[ -purge true/false ]
[ -dashboard to list dashboard query; supports -id option;
no value ]
[ -summary-table list or display status of summary tables;
supports -id and -verbose options; Parameter takes no value ]
[ -id <n>. Use with -summary-table or -dashboard only ]
[ -verbose true/false. Use with -summary-table only ]

```

purge

```

-retentionDays set retention days

```

```

    dashboard
    [ -enable true/false dashboard query(ies) ]
    [ -id dashboard query identifier <n> ]
    [ -configure to configure zeppelin notebook on the given
ip/hostname; supports -zeppelin, -jsessionid options; Parameter takes no
value ]
    [ -run run zeppelin notebook;
supports -zeppelin, -jsessionid, -notebook, -queryid, logparastatus
options; Parameter takes no value ]
    [ -zeppelin <ip/hostname> to configure, can be used
with -run or -configure only ]
    [ -jsessionid dashboard jsession id <n> needs to be used
with -run or -configure only ]
    [ -logparastatus logs the paragraph result. Use with -run
only Parameter takes no value ]
    [ -notebook notebook path. Use with -run only ]
    [ -queryid dashboard query id. Use with -run only ]

```

See the individual subcommand help for details related to each subcommand.

TIP: Following are the parameters related to insights service that can be configured using the [config save](#) on page 2394 maprccli command.

- `cldb.insight.buffer.size`
- `cldb.insight.commit.interval.mins`
- `cldb.insight.debug.enabled`
- `cldb.insight.heartbeat.seconds`
- `cldb.insight.hivemetastore.sasl.enabled`
- `cldb.insight.hivemetastore.ssl.enabled`
- `cldb.insight.hms.host.fetch.seconds`
- `cldb.insight.purge.frequency.hours`
- `cldb.insight.summarization.minutes`
- `cldb.insight.summarytable.purge.hours`
- `cldb.insight.threshold.heartbeats`
- `cldb.insight.zepplin.port`
- `dfui.insight.enable`

You can view the values for the insight-related parameters by using the [config load](#) on page 2389 maprccli command. For example:

```
# maprccli config load -json | grep insight
    "cldb.insight.buffer.size":"1024",
    "cldb.insight.commit.interval.mins":"1",
    "cldb.insight.debug.enabled":"0",
    "cldb.insight.heartbeat.seconds":"5",
    "cldb.insight.hivemetastore.sasl.enabled":"1",
    "cldb.insight.hivemetastore.ssl.enabled":"0",
    "cldb.insight.hms.host.fetch.seconds":"60",
    "cldb.insight.purge.frequency.hours":"1",
    "cldb.insight.summarization.minutes":"5",
    "cldb.insight.summarytable.purge.hours":"1",
    "cldb.insight.threshold.heartbeats":"5",
    "cldb.insight.zepplin.port":"9995",
    "dfui.insight.enable":"0",
```

insight cluster

Enables or disables addition of audit data to Iceberg tables for the specified type.

Syntax

CLI

```
maprccli insight
cluster
    [ -enable set true/false ]
```

```
[ -nodes node names space separated ]  
[ -type audit type [mfs, s3, auth, cldb] ]
```

REST

Request Type	PUT
Request URL	http[s]://<host>:<port>/rest/insight/cluster?<parameters>

Parameters

Parameter	Description
enable	(Mandatory)Set the value of this option to true to enable retrieval and adding of audit data to Iceberg tables. The default value is false, which means that audit data gathering is disabled. When you enable this without specifying a node name, the audit data gathering is enabled at the cluster level - all types of audit logs, that is, cldb, mfs, auth, and s3 audit logs must be retrieved and pushed to the designated Iceberg table.
nodes	(Optional) The node name from which the audit data is to be retrieved and added to Iceberg table/retrieval and addition of audit data to Iceberg table is to be stopped. This option cannot be used in combination with type option. Specify the node name on which the insight service is running. Specifying this option implies that for the specified node audit log gathering for all components is enabled or disabled.
type	(Optional) The type of audit log. The permissible values are mfs for file server logs, s3 for S3 object store logs, cldb for cldb logs and auth for web server authentication logs. Use comma-separated list for more than one audit log type. When type-level insights are enabled/disabled, the configuration is effective for the type across all nodes in the cluster. If s3 disabled, audit logs for S3 object store across all nodes are not added to Iceberg table. This option cannot be used in combination with node option.

Examples

Enable audit logs data for all components, that is, cldb, mfs, auth, and s3 across all nodes.

 **NOTE:** Each type of audit log is stored on a distinct Iceberg table. There are 4 tables that individually store the audit records for the four types, that is, cldb, mfs, auth and s3.

```
maprcli insight cluster -enable true -json  
{  
  "timestamp":1721998027792,  
  "timeofday":"2024-07-26 05:47:07.792 GMT-0700 AM",  
  "status":"OK",  
  "total":0,  
  "data":[
```

```

    ],
    "messages": [
        "Updated insight Config Successfully. "
    ]
}

```

Enable audit logs data for cldb and s3 components across all nodes.

```

maprcli insight cluster -enable true -type cldb, s3 -json
{
    "timestamp":1721998093460,
    "timeofday":"2024-07-26 05:48:13.460 GMT-0700 AM",
    "status":"OK",
    "total":0,
    "data": [
    ],
    "messages": [
        "Updated insight Config Successfully. "
    ]
}

```

Enable audit logs data for all components for the specified node.

```

maprcli insight cluster -enable true -nodes `hostname -f` -json
{
    "timestamp":1721998231593,
    "timeofday":"2024-07-26 05:50:31.593 GMT-0700 AM",
    "status":"OK",
    "total":0,
    "data": [
    ],
    "messages": [
        "Updated insight Config Successfully. "
    ]
}

```

insight info

Prints the status of the component types, retention days for purging, summary tables and dashboard queries with respect to the insight service.

The `insight info` subcommand displays detailed information related to the following:

- whether the component types are enabled/disabled.
- The time the audit data was last added to the respective Iceberg table, along with relevant status code and a message in case of error.
- The clean-up time activity of older audit data based on the specified `retentionDays`.

NOTE: The value of `retentionDays` would be as configured by using the `insight purge` command.

Syntax

CLI

```

maprcli insight
info
    [ -nodes node names space

```

```
separated ]
[ -type audit type [mfs, s3,
auth, cldb] ],
[ -purge true/false ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/insight/info?<parameters>

Parameters

Parameter	Description
nodes	(Optional) The node name for which the information from the insight service is to be displayed. Specifying this option implies that status for all the components is to be displayed for the specified node. This option cannot be used in combination with the type option.
type	(Optional) The audit component type for which the information from the insight service is to be displayed. The permissible values are mfs for file server logs, s3 for S3 object store logs, cldb for cldb logs and auth for web server authentication logs. Use comma-separated list for more than one audit log type. When type-level insights are enabled/disabled, the configuration is effective for the type across all nodes in the cluster. This option cannot be used in combination with node option.
purge	(Optional) Use this option to view the purge activity of insight service. It is used to display the retentionDays, purge activity time related to the purge. The permissible values are true or false. true denotes that only the purge information should be displayed in the command output. Purge is enabled automatically for the components that have been enabled using insight cluster on page 2521 command.

Example

 **NOTE:** In the sample outputs given below, the value Stream for the insight mode field indicates that the trial mode is enabled for the insights feature. The value File for the insight mode field indicates that the production mode is enabled for the insights feature.

Display all insight information as a well-formatted output (node-wise component and purge details)

```
maprcli insight info -json
{
    "timestamp":1742891055422,
    "timeofday":"2025-03-25 01:24:15.422 GMT-0700 AM",
    "status":"OK",
```

```

"total":1,
"data":[
  {
    "insightMode":"Stream",
    "insightMaster":"m8-mpng-vm1675.storage.hpe.net",
    "hmsMaster":"m8-mpng-vm1675.storage.hpe.net",
    "zeppelinMaster":"m8-mpng-vm1675.storage.hpe.net",
    "zeppelinPort":9995,
    "cluster":{
      "mfs":true,
      "cldb":true,
      "s3":true,
      "auth":true
    },
    "nodes":{
      "m8-mpng-vm1675.storage.hpe.net":{
        "enabled":true,
        "mfs":{
          "running":true,
          "status":0,
          "lastCommitTime":""
        },
        "cldb":{
          "running":true,
          "status":0,
          "lastCommitTime":""
        },
        "s3":{
          "running":true,
          "status":0,
          "lastCommitTime":""
        },
        "auth":{
          "running":true,
          "status":0,
          "lastCommitTime":""
        }
      }
    },

insight purge

Sets the retention period, in days, for the insights data on Apache Iceberg table.

Insight data is retained for the specified number of days in Apache Iceberg. Insight data that is older than the specified number of days specified as the retention period is purged from Apache Iceberg.

Use the `insight purge` subcommand to set the retention period for insight data, in days.

Syntax

CLI

```

maprccli insight
purge

```

-retentionDays set retention days

REST

Request Type	PUT
Request URL	http[s]://<host>:<port>/rest/insight/purge?<parameters>

Parameters

Parameter	Description
retentionDays	(Mandatory) The number of days for which the insight data present on Iceberg is to be retained. Default: 5. The number of days must be mentioned when you use the retentionDays option with the insight purge command.

Example

Set the retention period to 10 days.

```
# maprccli insight purge -retentionDays 10 -json
{
  "timestamp":1721997840346,
  "timeofday":"2024-07-26 05:44:00.346 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
    "messages":["Set insight purge configuration Successfully. "]
  ]
}
```

installer

Describes commands for HPE Data Fabric cluster installation and removal for clusters that were installed using the seed installation method.

installer checkforupdate

Check if a software update is available for a cluster.

Syntax

CLI

```
# maprccli installer checkforupdate -h
usage: cluster_check_updates.py [-h]
[-j CLUSTER_JSON] [-f CLUSTER_JSON_FILE]
                                [-y CLUSTER_YAML_FILE]

Check if a s/w update is available
for the cluster
```

```
options:
  -h, --help            show this
                        help message and exit
  -j CLUSTER_JSON, --cluster_json
                        CLUSTER_JSON
                        URL Encoded
                        JSON string describing cluster's name,
                        type,
                        credentials, and specific to target
                        provider
  -f CLUSTER_JSON_FILE, --cluster_json_file
                        CLUSTER_JSON_FILE
                        Path to JSON
                        file describing cluster's name, type,
                        credentials,
                        and specific to target provider
  -y CLUSTER_YAML_FILE, --cluster_yaml_file
                        CLUSTER_YAML_FILE
                        Path to YAML
                        file describing cluster's name, type,
                        credentials,
                        and specific to target provider
```

Parameters

Parameter	Description
-j --cluster_json	Optional URL encoded JSON string defining the cluster to check for available software updates.
-f --cluster_json_file	Optional path to a JSON file defining the cluster to check for available software updates. Specify either a JSON file or a YAML file.
-y --cluster_yaml_file	Optional path to a YAML file defining the cluster to check for available software updates. Specify either a JSON file or a YAML file.

Example

Check the cluster for updates:

CLI

```
/opt/mapr/bin/maprcli
installer checkforupdate -j
'{"cluster_name":""}' -json
```

installer clustercreate

Creates a cluster.

Syntax

CLI

```
/opt/mapr/bin/maprcli installer
clustercreate
usage: create_cluster.py [-h]
                        [-py path]
pythonpath (optional, default is
```

```
python3, use -h for help) ]
                                -d
{AWS,Azure,GCP,OnPrem}
                                [-j
CLUSTER_JSON]
                                [-f
CLUSTER_JSON_FILE] [-y
CLUSTER_YAML_FILE]

[--run_create_cluster]
[--no_run_create_cluster]

[--run_stanza] [--no_run_stanza]

[--add_to_cluster_group
ADD_TO_CLUSTER_GROUP]

[--add_to_sso ADD_TO_SSO]
```

Parameters

Parameter	Description
-pypath	Optional path to the python executable. Default executable is python3.
-d --deploy_target	Deployment target. One of AWS, Azure, GCP, or OnPrem. Mandatory if you do not specify one of -j, -f or -y.
-j --cluster_json	Optional URL encoded JSON string defining the cluster to create.
-f --cluster_json_file	Optional path to a JSON file defining the cluster to create. Specify either a JSON file or a YAML file.
-y --cluster_yaml_file	Optional path to a YAML file defining the cluster to create. Specify either a JSON file or a YAML file.
--run_create_cluster	Optional. Turn on create cluster execution. Specify either --run_create_cluster (default) or --no_run_create_cluster.
--no_run_create_cluster	Optional. Turn off create cluster execution. Specify either --run_create_cluster (default) or --no_run_create_cluster.
--run_stanza	Optional. Turn on stanza execution. Specify either --run_stanza or --no_run_stanza.
--no_run_stanza	Optional. Turn off stanza execution. Specify either --run_stanza or --no_run_stanza.
--add_to_cluster_group	Optional. Add the cluster to the cluster group of the initiating node.
--add_to_sso	Optional. Add the cluster to the SSO realm.

JSON file example

```
{
  "deploy_target": "AWS",
```

```

    "cluster_name": "APR22kalyandfcluster100gb",
    "storage_size": "100GB",

providedSubnetId: "Subnet Name"
```

Cluster creation example

Create a cluster:

CLI

```
/opt/mapr/bin/maprcli
installer clustercreate -j
aws_create_cluster_payload.json
```

installer clusterinfo

Retrieves cluster information.

Syntax

CLI

```
/opt/mapr/bin/maprcli installer
clusterinfo
usage: cluster_info.py
      [ -pyath pythonpath
(optional, default is python3, use -h
for help) ]
      [-h]
      -c CLUSTER_NAME
```

Parameters

Parameter	Description
-pypath	Optional path to the python executable. Default executable is python3.
-c --cluster_name	Mandatory. Name of the cluster for which to retrieve the information.

Cluster information example

Retrieve the information for cluster NA3213:

CLI

```
/opt/mapr/bin/maprccli installer
clusterinfo -c NA3213
```

installer cluster remove

Removes a cluster.

Not implemented. To remove deployed clusters, see [Shutting Down a Cluster](#) on page 1361.

installer clusterscale

Initiates the cluster scaling operation.

Syntax**CLI**

```
maprccli installer clusterscale
usage: cluster_scale.py [-h] [-j
CLUSTER_JSON] [-f CLUSTER_JSON_FILE]
[-y
CLUSTER_YAML_FILE]
options:
  -h, --help
  -j CLUSTER_JSON, --cluster_json
CLUSTER_JSON
  -f
CLUSTER_JSON_FILE, --cluster_json_file
CLUSTER_JSON_FILE
  -y
CLUSTER_YAML_FILE, --cluster_yaml_file
CLUSTER_YAML_FILE
```

Examples:

Example 1: here is a .yaml file for adding two nodes to on-premise fabric:

```
# This is an example YML/JSON payload that will be sent from the
Controller/MCS WebUI to the MCS Api Server
# Convert this to and from YML/JSON here: https://codebeautify.org/
yaml-to-json-xml-csv

#Create a DF Cluster
# POST /api/v1/df

#AWS | Azure | GCP | OnPrem
deploy_target: "OnPrem"
# deployment name
cluster_name: "onpremfab1"
# Anything related to be scaled nodes goes in here
```

```
onpremconfig:
  ip_addresses:
    - "<FQDN_node_1>"
    - "<FQDN_node_2>"
  ssh_username: "<username>"
  ssh_password: "<password>"

# optional
# airgap_repository: "http://package.ezmeral.hpe.com"
```

Example 2: here is a .yaml file for adding two nodes to AWS cloud fabric:

```
# This is an example YML/JSON payload that will be sent from the
Controller/MCS WebUI to the MCS Api Server
# Convert this to and from YML/JSON here: https://codebeautify.org/
yaml-to-json-xml-csv

deploy_target: AWS
cluster_name: <fabric_name>
scale_host_count: 2
awsconfig:
  access_key_id: <aws_access_key>
  secret_access_key: <aws_secret_key>
```

Example 3: here is a .yaml file for adding two nodes to Azure cloud fabric:

```
# This is an example YML/JSON payload that will be sent from the
Controller/MCS WebUI to the MCS Api Server
# Convert this to and from YML/JSON here: https://codebeautify.org/
yaml-to-json-xml-csv

deploy_target: Azure
cluster_name: dfaas-example.mapr.io
scale_host_count: 2
azureconfig:
  subscription_id: 8f2c24e5-d03d-405c-5555-7d64bdc8c6d6
  tenant_id: 8a843277-7f99-43a4-5555-b60b8ca9b3e9
  client_id: 1d9c61e3-9ed0-4b55-5555-2f5153aee726
  client_secret: 9ABAQ~EXAMPLENOTREALUZYtCXnDPvABra~7
```

Example 3: here is a .yaml file for adding two nodes to Azure cloud fabric:

```
# This is an example YML/JSON payload that will be sent from the
Controller/MCS WebUI to the MCS Api Server
# Convert this to and from YML/JSON here: https://codebeautify.org/
yaml-to-json-xml-csv

deploy_target: GCP
cluster_name: demo.fabric.io
scale_host_count: 2
gcpconfig:
  credentials: <credentials json>
```

Cluster scale example

The following example scales a cluster by adding two nodes as specified in the payload file (see the previous example):

CLI

```
maprccli installer
clusterscale -y examples/mcs_payloads/
onprem_scale_cluster_payload.yml -json
```

installer clusterremovenode

Initiates the cluster remove node operation.

Syntax

CLI

```
maprccli installer clusterremovenode
usage: cluster_remove_node.py [-h]
[-j CLUSTER_JSON] [-f
CLUSTER_JSON_FILE] [-y
CLUSTER_YAML_FILE]
options:
  -h, --help
  -j CLUSTER_JSON, --cluster_json
CLUSTER_JSON
  -f
CLUSTER_JSON_FILE, --cluster_json_file
CLUSTER_JSON_FILE
  -y
CLUSTER_YAML_FILE, --cluster_yaml_file
CLUSTER_YAML_FILE
```

Parameters

Parameter	Description
-j --cluster_json	URL encoded JSON string describing the cluster name, type, and credentials, specific to the target provider.
-f --cluster_json_file	Path to JSON file describing the cluster name, type, and credentials, specific to the target provider.
-y --cluster_yaml_file	Path to YAML file describing the cluster name, type, and credentials, specific to the target provider.

For example, here is a .yml input payload for removing a node:

```
onprem_remove_node_payload.yml

deploy_target: OnPrem
cluster_name: mydfcluster
// Hostname of the host to remove
remove_host: ip1.domain.in
onpremconfig:
  // SSH login credentials for the node to remove
  ssh_username: rocky
  ssh_password: password
```

Cluster remove node example

The following example scales down a cluster by removing nodes as specified in the payload file (see the previous example):

CLI

```
maprccli installer
clusterremovenode -y
examples/mcs_payloads/
onprem_remove_node_payload.yml -json
```

installer clusterscalestatus

Displays the status of the cluster scaling operation initiated using the installer clusterscale command.

Syntax

CLI

```
maprccli installer clusterscalestatus
usage: create_scale_status.py [-h] -c
CLUSTER_NAME
options:
  -h, --help
  -c CLUSTER_NAME, --cluster_name
CLUSTER_NAME
```

Parameters

Parameter	Description
-c --cluster_name	Mandatory. Name of the cluster for which to retrieve the scaling status.

Cluster scaling status example

Retrieve the scaling status for cluster onpremfab1:

CLI

```
maprccli installer
clusterscalestatus -c onpremfab1 -json
{
  "timestamp":1712067359570,
  "timeofday":"2024-04-02
07:16:24.373 GMT-0700 AM",
  "status":"OK",
  "total":0
  "data":[

  ],
  "messages":[
    {
      "cluster_name":
'onpremfab1', 'status': {'log':
{'host': '<nodename1>', 'path': '/opt/
mapr/installer/ezdfaas/logs/
onpremfab1-fabric_scale_24_04_02_07_15
_25_1781038.log'}, 'message':
'Starting fabric scaling with hosts :
['<nodename2>', '<nodename2>']',
'percentage': 0, 'scale_complete':
false, 'scale_successful': false,
'stage': {'hosts' : [{'completion':
0, 'host': '<nodename1>', 'state':
'INSTALLING', 'status': 'Installing
HPE Ezmeral Data Fabric'}],
{'completion': 0, 'host':
```

```
'<nodename2>', 'state': 'QUEUED',
'status': 'Queued']}, 'status_code':
0, 'time': '2024-04-02 07:46:21'}}\n"
    ]
}
```

installer clusterstatus
Displays the state of the cluster.

Syntax

CLI

```
/opt/mapr/bin/maprcli installer
clusterstatus
usage: create_cluster_status.py
        [ -pypath pythonpath
(optional, default is python3, use -h
for help) ]
        [-h]
        -c CLUSTER_NAME
        [-m]
        [-p]
```

Parameters

Parameter	Description
-pypath	Optional path to the python executable. Default executable is python3.
-c	Mandatory. Name of the cluster for which to retrieve the state.
-m --mock_output	Optional. Display mock data for state.
-p --pretty	Optional. Tidy the output for readability.

Cluster status example
Retrieve the status for cluster NA3213:

CLI

```
/opt/mapr/bin/maprcli installer
clusterstatus -c NA3213 -p
```

installer clusterupgrade
Upgrade a cluster.

Syntax

CLI

```
/opt/mapr/bin/maprcli installer
clusterupgrade -h
usage: cluster_upgrade.py [-h] [-j
CLUSTER_JSON] [-f CLUSTER_JSON_FILE]
                        [-y
CLUSTER_YAML_FILE]
options:
```

```
-h, --help          show this
help message and exit
-j CLUSTER_JSON, --cluster_json
CLUSTER_JSON          URL Encoded
JSON string describing cluster's name,
type,
credentials, and specific to target
provider
-f
CLUSTER_JSON_FILE, --cluster_json_file
CLUSTER_JSON_FILE      Path to JSON
file describing cluster's name, type,
credentials,
and specific to target provider
-y
CLUSTER_YAML_FILE, --cluster_yaml_file
CLUSTER_YAML_FILE      Path to YAML
file describing cluster's name, type,
credentials,
and specific to target provider
```

Parameters

Parameter	Description
-j --cluster_json	Optional URL encoded JSON string defining the cluster to upgrade.
-f --cluster_json_file	Optional path to a JSON file defining the cluster to upgrade. Specify either a JSON file or a YAML file.
-y --cluster_yaml_file	Optional path to a YAML file defining the cluster to upgrade. Specify either a JSON file or a YAML file.

Example

Upgrade a cluster:

CLI

```
/opt/mapr/bin/maprcli installer
clusterupgrade -j
'{"cluster_name":"","core_version":"","
"ssh_username":"","ssh_password":""}'
-json
```

installer clusterupgradestatus

Check the upgrade status of a cluster.

Syntax

CLI

```
/opt/mapr/bin/maprcli installer
clusterupgradestatus -h
usage: cluster_upgrade_status.py
[-h] -c CLUSTER_NAME

options:
```

```
-h, --help            show this
help message and exit
-c CLUSTER_NAME, --cluster_name CLUSTER_NAME
                        name of the
                        cluster to check upgrade status
```

Parameters

Parameter	Description
-c --cluster_name	Name of the cluster to check the upgrade status.

Example

Check the upgrade status for the cluster NA3213:

CLI

```
/opt/mapr/bin/maprccli installer
clusterupgradestatus -c NA3213 -json
```

installer listdeployments

Lists all cluster deployments.

Syntax

CLI

```
/opt/mapr/bin/maprccli installer
listdeployments
usage: list_clusters.py
        [-pypath pythonpath
(optional, default is python3, use -h
for help)]
        [-h]
        [-p]
        [-ip]
```

Parameters

Parameter	Description
-pypath	Optional path to the python executable. Default executable is python3.
-p --pretty	Optional. Tidy the output for readability.
-ip --inprogress	Optional. Only display clusters that are in the process of being deployed.

List deployments example

List clusters that are being deployed.

CLI

```
/opt/mapr/bin/maprccli installer
listdeployments -ip -p
```

installer logs

Downloads a zip archive of the logs for Data Fabric that are installed using the seed node method. This command is not supported for clusters installed using other methods because those clusters do not have a deployment directory. Only fabrics installed using the seed node method have a deployment directory.

Syntax**CLI**

```
maprccli installer logs
usage: cluster_logs.py [-h] -c
CLUSTER_NAME [-i INSTALLER_LOGS]
options:
  -h, --help            show this
                        help message and exit
  -c CLUSTER_NAME,     --cluster_name
CLUSTER_NAME
  -i
INSTALLER_LOGS,      --installer_logs
INSTALLER_LOGS
                        type of
logs: ezdfaas(False - default)/
installer(True)
```

Parameters

Parameter	Description
-h --help	Shows help for the command.
-c --cluster_name	Mandatory. Name of the fabric for which to obtain log information
-i --installer_logs	Log type to download. Two types are available: <ul style="list-style-type: none"> ezdfaas – False is the default value for this log type. installer – True is the default value for this log type.

Download Logs Example

Downloads a zip archive of the installer logs for fabric name fabric-25 to the /var/mapr/fabriclogs/fabric-25_installer/ directory.

CLI

```
# maprccli installer logs -c
fabric-25 -i true -a true -json
{
  "timestamp":1715853237475,
  "timeofday":"2024-05-16 02:53:57.475
GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    {"cluster_name':
'fabric-25',
'installer_logs': 'true',
```

```
'log_path': '/var/mapr/fabriclogs/
fabric-25_installer/archive.zip'}"
  ]
}
```

job
Manages Hadoop jobs running on the cluster.

job linklogs
Creates symbolic links to all the logs relating to the activity of a specific job.

The `maprcli job linklogs` command works with the [Centralized Logging](#) to provide a job-centric view or an application-centric view of all log files generated during job or application execution.

The output of `job linklogs` is a directory populated with symbolic links to all log files related to the specified job(s) or to the application. The command can be performed during or after a job or application is processed.

Syntax

CLI

```
maprcli job linklogs
  -jobid <jobPattern>
  -todir <desinationDirectory>
  [-jobconf <pathToJobXml>]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/job/linklogs?<parameters>

Parameters

Parameter	Description
jobid	For MapReduce version 2, specify the application ID.
todir	The target directory for the symbolic links to the log files.
jobconf	For MapReduce version 2, this parameter is not applicable.

Output

For MapReduce version 2, the following directory will be created in the location specified by `todir` for the application ID that you specify for the `jobid` parameter:

- `<applicationId>/hosts/<host>/` contains symbolic links to log directories of tasks executed for `<applicationId>` on `<host>`

Examples

Link logs for all jobs named "wordcount1" and dump output to `/myvolume/joblogviewdir`:

CLI

```
maprcli job linklogs -jobid
job_*_wordcount1 -todir /myvolume/
joblogviewdir
```

REST

```
https://abc.sj.us:8443/
rest/job/linklogs?
jobid=job_*_wordcount1&todir=/
myvolume/joblogviewdir
```

license
Manages Data Fabric licenses.
license add
Adds a license. Permissions required: fc or a.

You can specify the license either by passing the license string itself to `license add`, or by specifying a file containing the license string. In a multinode cluster, add the license to one node (any node). Adding the same license to more than one node returns an error.

Syntax

CLI

```
maprcli license add
[ -cluster cluster name ]
[ -is_file true|false. default:
false ]
-license long_license_string
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/ license/add?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
is_file	Specifies whether the license specifies a file. If false, the license parameter contains a long license string.
license	The license to add to the cluster. If -is_file is true, license specifies the file name of a license file. Otherwise, license contains the license string itself.

Examples

 **NOTE:** After obtaining a valid license file from your Data Fabric sales representative, copy the license file to a cluster node, for example in the path `/tmp/license.txt`.

To add a license from a file:

CLI

```
maprccli license add -is_file
true -license /tmp/license.txt
```

REST

```
https://abc.sj.us:8443/rest/license/
add?
is_file=true&license=%2Ftmp%2Flicense.
txt
```

license addcrl

Adds a certificate revocation list (CRL). Permissions required: fc or a.

Syntax

CLI

```
maprccli license addcrl
[ -cluster <cluster> ]
-crl <crlstring>
[ -is_file true|false. default:
false ]
```

REST

Request Type	POST
--------------	------

Request URL	<code>http[s]://<host>:<port>/rest/license/addcrl?<parameters></code>
-------------	---

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
crl	The CRL to add to the cluster. If file is set, crl specifies the filename of a CRL file. Otherwise, crl contains the CRL string itself.
is_file	Specifies whether the license is contained in a file.

Examples

CLI

```
maprcli license addcrl
-crl crl.txt
-is_file true
```

REST

```
https://centos26.lab:8443/
rest/license/addcrl?
crl=crl.txt&is_file=true
```

license list

Lists licenses on the cluster. Permissions required: login. For best results, use the -json option when running the command.

Syntax**CLI**

```
maprccli license list
[ -cluster <cluster> ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/license/list[?<parameters>]

Parameters

Parameter	Description
cluster	The cluster on which to run the command.

NOTE: If you use the `-json` option with this command, and you pipe the output into another program, you may find that the result cannot be parsed by certain JSON libraries, such as the JSON library for Python. To work around this problem, you can replace the single-escape characters (`\`) in the JSON output that the `license list` command returns, with double-escape characters (`\\`).

Output

Sample Output

```
# maprcli license list -json
{

label

Manages registration and modification of labels.

label add

Registers a label. Permissions required: fc or a.

Registers a label. See [Using Storage Labels](#) on page 1575 for more information on labels. Attempting to register a label that is already registered, results in an error.

When registering a label for a Storage Pool, the label and its associated values apply to all the disks in the Storage Pool.

Syntax

CLI

```
maprcli label add
  -label <label to be registered>
  [ -maxactiveioperdisk max active
io per disk ]
  [ -numdiskspersistence num disks
per mfs instance ]
  [ -isssd is solid state drive ]
  [ -istrimenabled is trim enabled ]
```

REST

Request Type	POST
--------------	------

Request URL	http[s]://<host>:<port>/rest/label/add?<parameters>
-------------	---

Parameters

label	<p><i>Default Value:</i> default</p> <p><i>Possible Values:</i> Any label</p> <p><i>Description:</i> The label to use for the storage pool. See Using Storage Labels on page 1575 for more information on labels.</p> <p>The label should contain only the following characters:</p> <div>A-Z a-z 0-9 _ - .</div>
maxactiveioperdisk	<p><i>Default Value:</i> 100</p> <p><i>Possible Values:</i> Any integer value between 100 and 50000.</p> <p>The number of concurrent IO operations per second that can be issued on the disk. Not specifying this value uses the default value specified in the mfs.conf file.</p>
numdisksininstance	<p><i>Default Value:</i> 20</p> <p><i>Possible Values:</i> Any integer value between 1 and 24.</p> <p>Used in partitioning disks of the same type among multiple instances of file servers on the same node.</p>
issd	<p><i>Default Value:</i> true</p> <p><i>Possible Values:</i> true or false</p> <p>Set to true to indicate that the disk is an SSD.</p>
istrimenabled	<p><i>Default Value:</i> false</p> <p><i>Possible Values:</i> true or false</p> <p>Set to true to indicate that the SSD disk is TRIM enabled.</p> <p>TRIM enables the File System to inform a SSD disk which data blocks it can erase because they are no longer in use. The use of TRIM can improve the performance of writing data to SSDs and contribute to longer SSD life. Set this parameter to true only if the SSD vendor recommends it.</p>

Examples

- 1. Register a label, before using it to label a storage pool.

CLI	maprcli label add -label WDCheetah
REST	https://abc.sj.us:8443/rest/labels/add?label=WDCheetah

2. Register a label with additional settings such as the maximum active IO per disk and marking it as a SSD, before using it to label a storage pool.

CLI

```
maprcli label add -label
WDCheetah -maxactiveioperdisk
5000 -issd true -istrimenabled true
```

REST

```
https://abc.sj.us:8443/rest/labels/
add?
label=WDCheetah&maxactiveioperdisk=500
0&-issd=true&istrimenabled=true
```

label modify

Modifies a label. Permissions required: fc or a.

Modifies a label. See [Using Storage Labels](#) on page 1575 for more information on labels.

When modifying a label for a Storage Pool, the label and its associated values apply to all the disks in the Storage Pool.

Syntax**CLI**

```
maprcli label modify
-label <label to be modified>
[ -maxactiveioperdisk max active
io per disk ]
[ -issd is solid state drive ]
[ -istrimenabled is trim enabled ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/label/modify?<parameters>

Parameters

label

Possible Values: Any label
Description: The label to use for the storage pool. See [Using Storage Labels](#) on page 1575 for more information on labels.
The label should contain only the following characters:

A-Z a-z 0-9 _ - .

maxactiveioperdisk

Possible Values: Any integer value between 100 and 50000.
Description: The number of concurrent IO operations per second that can be issued on the disk. Not specifying this value uses the default value specified in the mfs.conf file.

isssd

Possible Values: true or false
Description: Set to true to indicate that the disk is an SSD.

istrimenabled

Possible Values: true or false
Description: Set to true to indicate that the SSD disk is TRIM enabled.
TRIM enables the File System to inform a SSD disk which data blocks it can erase because they are no longer in use. The use of TRIM can improve the performance of writing data to SSDs and contribute to longer SSD life. Set this parameter to true only if the SSD vendor recommends it.

Examples

Modify a label:

CLI

```
maprcli label modify -label
WDcheetah -maxactiveioperdisk
5000 -isssd true -istrimenabled true
```

REST

```
https://abc.sj.us:8443/rest/labels/
modify?
label=WDcheetah&maxactiveioperdisk=5000
&-isssd=true&istrimenabled=true
```

- [disk setlabel](#) on page 2420
Adds a label to disks or a storage pool. Permissions required: fc or a.
- [volume create](#) on page 2929
Creates a volume.
- [volume move](#) on page 3039
Moves the specified volume or mirror to a different topology. Permissions required: m or fc on the volume.
- [label list](#) on page 2555
Lists registered labels. Permissions required: fc or a.
- [node list](#) on page 2570
Lists nodes in the cluster.
- [configure.sh](#) on page 3186
Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Data Fabric client nodes, and configuring services for a node.

label list

Lists registered labels. Permissions required: fc or a.

Lists registered labels. See [Using Storage Labels](#) on page 1575 for more information on labels.

Syntax

CLI

```
maprcli label list
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/label/list

Examples

List registered labels.

CLI

```
$ maprcli label list -json
{
  "timestamp":1585930322953,
  "timeofday":"2020-04-03
04:12:02.953 GMT+0000 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "registered_labels":[
        {
          "label":"ssd",
```

```

    "id":1
      },
    "label":"hdd",
    "id":2
      }
    ]
  }
}

```

`https://abc.sj.us:8443/rest/label/list`

nfsmgmt

Refreshes NFS exports and server cache.

nfsmgmt refreshexports

Refreshes the list of clusters and mount points available to mount with NFS. Permissions required: fc or a.

Syntax

CLI

```

[ -nfshost <ip or hostname> ]
[ -nfsport <port> ]
[ -isusermode <true | false> ]

```

REST

N/A

Parameters

Parameter	Description
nfshost	The hostname of the node that is running the MapR NFS server. Default: 127.0.0.1
nfsport	The port to use. Default: 9998
isusermode	Specifies whether the mode for creating the ticket for NFS is in user mode or not. Options: True or False. The ticket can not be created for nfs in user mode. Default: false

Example

CLI `maprcli nfsmgmt refreshexports -nfshost 10.10.82.29 -nfsport 9998`

nfsmgmt refreshgidcache

Deletes the GID list (uidGidCache_ entries) in NFS server cache. Permissions required: fc or a.

Useful for immediately reflecting the groups update.

Syntax

CLI

```
[ -nfshost <ip or hostname> ]
[ -nfsport <port> ]
[ -isusermode <true | false> ]
```

REST

N/A

Parameters

Parameter	Description
nfshost	The hostname of the node that is running the MapR NFS server. Default: 127.0.0.1
nfsport	The port to use. Default: 9998
isusermode	Specifies whether the mode for nfs is in user mode or not. Options: True or False. The ticket can not be created for nfs in user mode. Default: false

Example

CLI `maprcli nfsmgmt refreshgidcache -nfshost 10.10.82.29 -nfsport 9998`

nfs4mgmt

Manages NFSv4 server.

NOTE: NFSv4 refers to NFS version 4.1.

nfs4mgmt add-export

Adds an export.

Syntax**CLI**

```
/opt/mapr/bin/maprcli nfs4mgmt
add-export
    [ -nfshost ip/hostname.
default: 127.0.0.1 ]
    [ -nfsport port. default:
9995 ]
    -exportid export id. default:
0
    -conffile conf file path
```

REST

N/A

Parameters

Parameter	Description
conffile	The path to the NFSv4 configuration file.
exportid	The export ID as specified in the configuration file. The default value is 0.
nfshost	The NFS server host. Value can be the IP address or the hostname of the NFS server host. The default value is 127.0.0.1.
nfsport	The NFS server port. The default value is 9995.

Examples**nfs4mgmt list-exports**

Returns the list of exports.

Syntax**CLI**

```
/opt/mapr/bin/maprcli nfs4mgmt
list-exports
    [ -nfshost ip/hostname.
default: 127.0.0.1 ]
    [ -nfsport port. default:
9995 ]
```

REST

N/A

Parameters

Parameter	Description
nfshost	The NFS server host. Value can be the IP address or the hostname of the NFS server host. The default value is 127.0.0.1.
nfsport	The NFS server port. The default value is 9995.

TroubleshootingFor troubleshooting information, see [NFS Troubleshooting](#)

nfs4mgmt remove-export
Removes an export.

Syntax

CLI

```
/opt/mapr/bin/maprcli mfs4mgmt
remove-export
[ -nfshost ip/hostname.
default: 127.0.0.1 ]
[ -nfsport port. default:
9995 ]
-exportid export id. default:
0
```

REST N/A

Parameters

Parameter	Description
exportid	The export ID to remove as specified in the configuration file. The default value is 0.
nfshost	The NFS server host. Value can be the IP address or the hostname of the NFS server host. The default value is 127.0.0.1.
nfsport	The NFS server port. The default value is 9995.

Examples

nfs4mgmt update-export
Updates an export based on configuration changes.

Syntax

CLI

```
/opt/mapr/bin/maprcli mfs4mgmt
update-export
[ -nfshost ip/hostname.
default: 127.0.0.1 ]
[ -nfsport port. default:
9995 ]
-exportid export id. default:
0
-conffile conf file path
```

REST N/A

Parameters

 **NOTE:** NFSv4 refers to NFS version 4.1.

Parameter	Description
conffile	The path to the NFSv4 configuration file.
exportid	The export ID to update as specified in the configuration file. The default value is 0.

Parameter	Description
nfs host	The NFS server host. Value can be the IP address or the hostname of the NFS server host. The default value is 127.0.0.1.
nfs port	The NFS server port. The default value is 9995.

Examples

node

Manages nodes in the cluster

Fields

The following table lists the data fields that provide information about each node. Each field has two names:

- Field name - displayed in the output of the `node list` command
- Short name - used to specify the columns displayed using the `columns` parameter

The short name is also used when specifying rows with a filter, for example when specifying nodes on which to perform an action with the `node services` command.

Field Name	Short Name	Description
blockMovesIn	bmi	Block moves in.
blockMovesOut	bmo	Block moves out.
bytesReceived	br	Bytes received by the node since the last CLDB heartbeat.
bytesSent	bs	Bytes sent by the node since the last CLDB heartbeat.
clienthealth	clhealth	The status of the client. Value can be one of the following: <ul style="list-style-type: none"> • Active • Inactive
clienttype	cltype	The type of client. For example, <code>posixclientgold</code> , <code>posixclientbasic</code> , <code>posixclientplatinum</code> , <code>LOOPBACK_NFS</code> , <code>NFS_V3</code> , <code>NFS_V4</code> .
configuredservice	csvc	Services that are configured as roles on the node.
CorePresentAlarm	ncp	Timestamp when the Core Present alarm was raised.
cpus	cpc	The total number of CPUs on the node.
davail	dsa	Disk space available on the node, in GB.
DiskFailureAlarm	fda	Timestamp when Disk Failure on page 3399 alarm was raised.

Field Name	Short Name	Description
disks	dsc	Total number of disks on the node.
dreadK	drk	Disk Kbytes read since the last heartbeat.
dreads	dro	Disk read operations since the last heartbeat.
DRILLDOWNALARM	nadrill	Timestamp when "Drill Service Down" alarm was raised.
dtotal	dst	Total disk space on the node, in GB.
dused	dsu	Disk space used on the node, in GB.
dwriteK	dwk	Disk Kbytes written since the last heartbeat.
dwrites	dwo	Disk write ops since the last heartbeat.
ESServerDown	naes	Timestamp when "Elasticsearch Server Down" alarm was raised.
faileddisks	nfd	Number of failed file system disks on the node. <ul style="list-style-type: none"> 0 = Clear 1 = Raised
fs-heartbeat	fhb	Time since the last heartbeat to the CLDB, in seconds.
GatewayServiceDown	nagwsd	Timestamp when "Gateway Service Down" alarm was raised.
HbaseThriftServiceDown	hbasethrift	Timestamp when "HBase Thrift Service Down" alarm was raised.
HbProcessingSlow	hbpsa	Timestamp when Heartbeat Processing Slow on page 3401 alarm was raised.
health	h	Overall node health, calculated from various alarm states: <ul style="list-style-type: none"> 0 = Healthy 1 = Needs attention 2 = Degraded 3 = Maintenance 4 = Critical
healthDesc	hd	The health description.
HighMfsMemoryAlarm	nhmm	Timestamp when MapR File System High Memory alarm was raised.
HomeMapRFullAlarm	hmf	Timestamp when Installation Directory Full alarm was raised.

Field Name	Short Name	Description
hostname	hn	The host name. In the output for the <code>clientonly</code> option, this is the hostname where the client is running.
id	id	The node ID.
IncorrectTopologyAlarm	ita	Timestamp when Incorrect Topology alarm was raised.
InstanceMismatch	nanim	Timestamp when Instance Mismatch alarm was raised.
Insufficient memory for buckets	tbwarning	Timestamp when Tiny Bucket Flush alarm was raised.
ip	ip	A list of IP addresses associated with the node. In the output for the <code>clientonly</code> option, this is the IP address of the host where the client is running.
isFips	isFips	The FIPS status of a node: <ul style="list-style-type: none"> 1 = Node is FIPS-enabled 0 = Node is not FIPS-enabled
JobHistoryServerDown	nasjhsd	Timestamp when "Job History Server Down" alarm was raised.
jt-heartbeat	jhb	Time since the last heartbeat to the JobTracker, in seconds.
labels	lbl	Labels associated with a node. See Using Storage Labels on page 1575 for more information on labels.
lasthb	lhb	Time since the last heartbeat from the client host.
LogLevelAlarm	lla	Timestamp when Excess Logs alarm was raised.
MapRfs disks	nmd	Number of disks for use by file system
MemoryAllocationAlarm	maa	Timestamp when Memory Allocation alarm was raised.
MemorySwapping	nams	Timestamp when Memory Usage alarm was raised.
mtotal	mt	Total memory, in MB.
mused	mu	Memory used, in MB.
NodeDuplicateHostIdAlarm	ndh	Timestamp when Duplicate Host ID on page 3399 alarm was raised.
NodeManagerDown	nanmd	Timestamp when "Node Manager Down" alarm was raised.
NodeMaprUserMismatchAlarm	nma	Timestamp when MapR User Mismatch on page 3404 alarm was raised.
NodeNoHeartbeatAlarm	nha	Timestamp when No Heartbeat alarm was raised.

Field Name	Short Name	Description
NodeTooManyContainersAlarm	nmc	Timestamp when Node Too Many Containers on page 3408 alarm was raised.
NoDiskAttached	nanda	Timestamp when No Disk Attached alarm was raised.
numInstances	ni	Number of configured file system instances.
numReportedInstances	nri	The number of running instances reported by file system to CLDB.
numResyncSlots	nrs	The number of resync slots.
numGetsInLastTenSeconds	ngl10s	Number of table get operations in last 10 seconds.
numGetsInLastMinute	ngl1m	Number of table get operations in last 1 minute.
numGetsInLastFiveMinutes	ngl5m	Number of table get operations in last 5 minutes.
numGetsInLastFifteenMinutes	ngl15m	Number of table get operations in last 15 minutes.
numPutsInLastTenSeconds	npl10s	Number of table put operations in last 10 seconds.
numPutsInLastMinute	npl1m	Number of table put operations in last 1 minute.
numPutsInLastFiveMinutes	npl5m	Number of table put operations in last 5 minutes
numPutsInLastFifteenMinutes	npl15m	Number of table put operations in last 15 minutes.
numScansInLastTenSeconds	nsl10s	Number of table scan operations in last 10 seconds.
numScansInLastMinute	nsl1m	Number of table scan operations in last 1 minute.
numScansInLastFiveMinutes	nsl5m	Number of table scan operations in last 5 minutes.
numScansInLastFifteenMinutes	nsl15m	Number of table scan operations in last 15 minutes.
PamMisconfiguredAlarm	pma	PAM misconfigured alarm (NODE_ALARM_PAM_MISCONFIGURED): <ul style="list-style-type: none"> 0 = Clear 1 = Raised
ResourceManagerDown	narmd	Timestamp when "Resource Manager Down" alarm is raised.
RootPartitionFullAlarm	rpf	Timestamp when Root Partition Full alarm was raised.
rpcin	rpi	RPC bytes received since the last heartbeat.

Field Name	Short Name	Description
rpcout	rpo	RPC bytes sent since the last heartbeat.
rpcs	rpc	Number of RPCs since the last heartbeat.
service	svc	A comma-separated list of services running on the node: <ul style="list-style-type: none"> cldb - CLDB fileserver - file system nfs - NFS Gateway Example: "cldb,fileserver,nfs"
ServiceBeeswaxDownNotRunningAlarm	sbwa	Timestamp when "Beeswax Service Down" alarm was raised.
ServiceCLDBDownNotRunningAlarm	sca	Timestamp when CLDB alarm was raised.
ServiceFileserverDownNotRunningAlarm	sfsa	Timestamp when Fileserver alarm was raised.
ServiceHiveDownNotRunningAlarm	shsma	Timestamp when HiveMeta Service Down alarm was raised.
ServiceHoststatsDownNotRunningAlarm	sha	Timestamp when Hoststats alarm was raised.
ServiceHs2DownNotRunningAlarm	shsa	Timestamp when HS2 Service Down alarm was raised.
ServiceHttpfsDownNotRunningAlarm	shfsa	Timestamp when "Httpfs Service Down" alarm is raised.
ServiceHueDownNotRunningAlarm	shuea	Timestamp when "Hue Service Down" alarm was raised.
ServiceNFSDDownNotRunningAlarm	sna	Timestamp when NFS alarm was raised.
ServicesWebserverDownNotRunningAlarm	swa	Timestamp when Webserver alarm was raised.
spsPerInstance	nsp	Number of storage pools per file server instance.
TimeSkewAlarm	tsa	Timestamp when Time Skew alarm was raised.
racktopo	rp	The rack path.
uptime	cpt	Date when the node came up.
utilization	cpu	CPU use percentage since the last heartbeat.
VersionMismatchAlarm	vma	Timestamp when Version alarm was raised.
vip	vip	The virtuaip IP address

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Data Fabric client nodes, and configuring services for a node.

node allow-into-cluster

Allows host IDs to join the cluster after duplicates have been resolved.

When the CLDB detects duplicate nodes with the same host ID, all nodes with that host ID are removed from the cluster and prevented from joining it again. After making sure that all nodes have unique host IDs, you can use the `node allow-into-cluster` command to un-ban the host ID that was previously duplicated among several nodes.

Syntax

CLI

```
maprcli node allow-into-cluster  
[ -hostids <host IDs> ]
```

REST

Request Type	POST
Request URL	<code>http[s]://<host>:<port>/rest/node/allow-into-cluster[?<parameters>]</code>

Parameters

Parameter	Description
hostids	A comma-separated list of host IDs.

Examples

Allow former duplicate host IDs node1 and node2 to join the cluster:

CLI

```
maprcli node
allow-into-cluster -hostids
node1,node2
```

REST

```
https://abc.sj.us:8443/rest/node/
allow-into-cluster?hostids=node1,node2
```

node cldbprimary

Returns the address of the primary CLDB node.

The node cldbprimary API returns the server ID and hostname of the node serving as the CLDB primary node.

Syntax

CLI

```
maprcli node cldbprimary
[ -cluster <cluster name> ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/node/cldbprimary[?<parameters>]

Parameters

Parameter	Description
cluster	The name of the cluster for which to return the CLDB primary node information.

Examples

Return the CLDB primary node information for the cluster my.cluster.com:

CLI

```
maprcli node cldbprimary -cluster
my.cluster.com
```

```
{
  "timestamp":1622099062802,
  "timeofday":"2021-05-27
07:04:22.802 GMT+0000 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cldbprimary":"ServerID:"
```

```
3523090783455785824 HostName:
m2-mapreng-vmm167214.xxxx"
    }
  ]
}
```

REST

```
curl -k -X
POST 'https://10.163.167.214:8443/
rest/node/cldbprimary?
cluster=my.cluster.com' --user
mapr:mapr
```

```
{"timestamp":1622099484367,"timeofday"
:"2021-05-27 07:11:24.367 GMT+0000
AM","status":"OK","total":1,"data":
[{"clbdbprimary":"ServerID:
3523090783455785824 HostName:
m2-mapreng-vmm167214.mip.xxx"}]}
```

node failover

Fails over master containers and VIPs to another node.

When this command runs, all master and intermediate containers are moved off the node and VIPs are re-assigned.

Syntax

CLI

```
maprccli node failover
[ -nodes <node hostname> ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/node/failover[?<parameters>]

Parameters

Parameter	Description
nodes	The hostname of the node going down.

Examples

Notify CLDB of the node, exampleHost, going down:

CLI

```
maprccli node failover -nodes
exampleHost
```

REST

```
https://abc.sj.us:8443/rest/node/
failover?nodes=exampleHost
```

node heatmap

Displays a heatmap for the specified nodes.

Syntax

CLI

```
maprcli node heatmap
[ -cluster <cluster> ]
[ -filter <filter> ]
[ -view <view> ]
-json | -long
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/node/heatmap[?<parameters>]

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
filter	A filter specifying snapshots to preserve. See Filters for more information.
view	<p>Name of the heatmap view to show:</p> <ul style="list-style-type: none">status = Node status (the default view):<ul style="list-style-type: none">0 = Healthy1 = Needs attention2 = Degraded3 = Maintenance4 = Criticalcpu = CPU utilization, as a percent from 0-100.memory = Memory utilization, as a percent from 0-100.diskspace = MapR filesystem disk space utilization, as a percent from 0-100.NODE_* = Status of various alarms: 0 if clear, 1 if raised. For example: NODE_ALARM_DISK_FAILURE or NODE_ALARM_SERVICE_CLDB_DOWN. You can return a complete list of supported alarm parameters by running: maprcli node heatmap -view See the lists of parameters below this table.

Parameter	Description
-json -long	This command returns multiple levels of data. You must specify either JSON format or "long" format to see the full output.

Alarm Parameters

You can view the status of a number of different alarms, including the status of alarms for services down and alarms for other conditions on the cluster.

Service Down Alarms

NODE_ALARM_SERVICE_CLDB_DOWN NODE_ALARM_SERVICE_FILESERVER_DOWN
 NODE_ALARM_SERVICE_JT_DOWN NODE_ALARM_SERVICE_TT_DOWN
 NODE_ALARM_SERVICE_HBMASTER_DOWN NODE_ALARM_SERVICE_HBREGION_DOWN
 NODE_ALARM_SERVICE_WEBSERVER_DOWN NODE_ALARM_SERVICE_NFS_DOWN
 NODE_ALARM_SERVICE_HOSTSTATS_DOWN NODE_ALARM_SERVICE_OOZIE_DOWN
 NODE_ALARM_SERVICE_HUE_DOWN NODE_ALARM_SERVICE_HTTPFS_DOWN
 NODE_ALARM_SERVICE_BEESWAX_DOWN NODE_ALARM_SERVICE_HIVEMETA_DOWN
 NODE_ALARM_SERVICE_HS2_DOWN

Other Alarms

NODE_ALARM_DEBUG_LOGGING NODE_ALARM_DISK_FAILURE NODE_ALARM_VERSION_MISMATCH
 NODE_ALARM_TIME_SKEW NODE_ALARM_ROOT_PARTITION_FULL
 NODE_ALARM_OPT_MAPR_FULL NODE_ALARM_CORE_PRESENT NODE_ALARM_HIGH_MFS_MEMORY
 NODE_ALARM_PAM_MISCONFIGURED NODE_ALARM_TT_LOCALDIR_FULL
 NODE_ALARM_NO_HEARTBEAT NODE_ALARM_MAPRUSER_MISMATCH
 NODE_ALARM_DUPLICATE_HOSTID NODE_ALARM_METRICS_WRITE_PROBLEM
 NODE_ALARM_TOO_MANY_CONTAINERS

Output

In general, the heatmap output looks like this (in JSON format).

```
{
  status:"OK",
  data: [{
    "{{rackTopology}}" : {
      "{{nodeName}}" : {{heatmapValue}},
      "{{nodeName}}" : {{heatmapValue}},
      "{{nodeName}}" : {{heatmapValue}},
      ...
    },
    "{{rackTopology}}" : {
      "{{nodeName}}" : {{heatmapValue}},
      "{{nodeName}}" : {{heatmapValue}},
      "{{nodeName}}" : {{heatmapValue}},
      ...
    },
    ...
  ]
}
```

Table

Field	Description
rackTopology	The topology for a particular rack.

Table (Continued)

Field	Description
nodeName	The name of the node in question.
heatmapValue	The value of the metric specified in the view parameter for this node, as an integer.

Examples

Display a heat map with the node status (default view) for the default rack:

```
maprcli node heatmap -json
{
  "timestamp":1422567293873,
  "timeofday":"2015-01-29 01:34:53.873 GMT-0800",
  "status":"OK",
  "total":1,
  "data":[
    {"/data/default-rack":{
      "centos24":2}
    }
  ]
}
```

The equivalent REST API command would be:

```
https://r1n1.sj.us:8443/rest/node/heatmap
```

Display memory usage for the default rack:

```
maprcli node heatmap -view memory -json
{
  "timestamp":1422585976631,
  "timeofday":"2015-01-29 06:46:16.631 GMT-0800",
  "status":"OK",
  "total":1,
  "data":[
    {"/data/default-rack":{
      "centos24":71}
    }
  ]
}
```

The equivalent REST API command would be:

```
https://r1n1.sj.us:8443/rest/node/heatmap?view=memory
```

Display the value of NODE_ALARM_DISK_FAILURE for the default rack:

```
maprcli node heatmap -view NODE_ALARM_DISK_FAILURE -long
/data/default-rack
{"centos24":0}
```

node list

Lists nodes in the cluster.

You can retrieve information for a set of nodes in several ways:

- To list only nodes with raised alarms, set `alarmednodes` to 1.
- To list only NFS nodes, set `nfsnodes` to 1.

- To view only a few nodes from the list, use the `start` and `limit` options to select only a portion of the results.
- To list nodes that match certain criteria, pass a filter to the `filter` parameter. See the [node](#) on page 2560 table for the filter options. See the [Filters](#) on page 2270 page for information on filters.

Using the `node list` command without the `-clientonly true` or the `-nfsnodes true` option, does not list edge nodes. To include edge nodes, use the `-nfsnodes true` or the `-clientonly true` option.

Syntax

CLI

```
/opt/mapr/bin/maprccli node list
[ -alarmednodes 0|1 ]
[ -cluster <cluster> ]
[ -clientonly true|false ]
[ -columns <columns>|all ]
[ -filter <filter> ]
[ -limit <limit> ]
[ -nfsnodes true|false ]
[ -output terse|verbose ]
[ -sortby <attribute> ]
[ -sortorder asc|desc ]
[ -start <offset> ]
[ -zkconnect <ZooKeeper Connect String> ]
```

REST

Request Type	GET
Request URL	<code>http[s]://<host>:<port>/rest/node/list[?<parameters>]</code>

Parameters

Parameter	Description
<code>alarmednodes</code>	When set to 1, displays only nodes with raised alarms. You cannot use this parameter if <code>nfsnodes</code> is set.
<code>cluster</code>	The cluster on which to run the command.
<code>clientonly</code>	 NOTE: NFSv4 refers to NFS version 4.1. Set this parameter to <code>true</code> to return the list of nodes running unique platinum FUSE-based POSIX clients, and NFSv3, and NFSv4 services. The command returns the following fields: <code>clienttype</code> , <code>clienthealth</code> , <code>hostname</code> , <code>ip</code> , <code>lasthb</code> , <code>id</code> . For more information, see the fields table . If you set this parameter to <code>false</code> , which is the default value, this parameter returns node-level information for all the services running on each node.

Parameter	Description
columns	A comma-separated list of fields to return in the query, specified by the short names. When specifying this option, the ip and hostname columns are always returned in the query.
filter	A filter specifying nodes on which to start or stop services. See the Fields table on the node page for the fields available to filter. See the maprcli and REST API Syntax page for information on filters.
limit	The number of rows to return, beginning at start. Default: 0
nfsnodes	Set this to true to display POSIX (edge) nodes: <pre>maprcli node list -nfsnodes true -columns csvc</pre> When set to false, edge nodes are not displayed. Cannot be used if alarmednodes is set. When you set the cldb.ignore.posix.only.hb.alarm parameter to 1, dead edge nodes are displayed for 4 minutes from the time they went down, as CLDB removes all the dead edge nodes after 4 minutes. However, when you set cldb.ignore.posix.only.hb.alarm parameter to 0, dead edge nodes are displayed for 24 hours.
output	Specifies whether the output should be terse or verbose.
sortby	Specifies one of the following attributes by which to sort the list of nodes: nodeid, nodeip, nodehostname, noderackpath, nodeswitchpath, nodestatus, nodeservices, nodefshb, nodejthb, nodedisktotal, nodediskused, nodediskavail, noderpc, noderpcin, noderpcout, nodediskcount, nodediskreadops, nodediskreadkbytes, nodediskwriteops, nodediskwritekbytes, nodecpucount, nodecpuutil, nodememtotal, nodememused, nodefaileddisks, nodevirtualip, nodevirtualipend, nodeipmaskvnodeipmacaddress, nodegateway, nodebytesreceived, nodebytessent, nodecpuuptime, nodemaprdiskcount, nodestatusdesc, nodeblockmovesout, nodeblockmovesin, nodecontainersthreshold, nodenuminstances, nodenumspersinstance, nodeisfsstate, nodeisposixclient, nodeisloopbacknfs, nodeisloopbacknfsrunning
start	The offset from the starting row according to sort. Default: 0
zkconnect	ZooKeeper Connect String

Output

Information about the nodes. See the [fields](#) for more information.

Sample Output

```
# /opt/mapr/bin/maprcli node list -json
{

Fields

For definitions of the output fields, and short names for use with filters, see the [fields table](#).

Examples

List all nodes:

For neatly formatted results, use the `-json` option when listing all nodes or a large subset of node information.

CLI

```

/opt/mapr/bin/maprcli node list -json
{
  "timestamp":1555342212112,
  "timeofday":"2019-04-15
08:30:12.112 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "id":"7146221175287263104",
      "ip":[
        "10.10.82.29",
        "172.17.0.1"
      ],
      "hostname":"doc29.lab",
      "racktopo":"/data/
default-rack/doc29.lab",
      "health":2,
      "healthDesc":"One or more
services is down",
      "service":"resourcemanager, fileserver,
cldb, nfs4, mastgateway, nodemanager, gate
way, hoststats, apiserver, posixclientbas
ic",
      "configuredservice":"resourcemanager, f
ilemigrate, fileserver, clldb, nfs4, mastga
teway, nodemanager, gateway, hoststats, ap
iserver, posixclientbasic",
      "fs-heartbeat":0,
      "jt-heartbeat":2,
      "dtotal":272,

```

REST

```

curl -u mapr:mapr -X GET -k "https://
host:8443/rest/node/list"

```

List the health and configured service of all nodes:

The following examples show the use of short forms for the column parameter.

CLI

```

/opt/mapr/bin/maprcli node
list -columns
service,health,configuredservice -json
/opt/mapr/bin/maprcli node
list -columns svc,h,csvc -json
{
    "timestamp":1555343115082,
    "timeofday":"2019-04-15
08:45:15.082 GMT-0700 AM",
    "status":"OK",
    "total":1,
    "data":[
        {
            "ip":[
                "10.10.82.29",
                "172.17.0.1"
            ],

```

```

        "hostname":"doc29.lab",
        "health":2,

        "service":"resourcemanager,fileserver,
        cldb,nfs4,mastgateway,nodemanager,gate
        way,hoststats,apiserver,posixclientbas
        ic",

        "configuredservice":"resourcemanager,f
        ilemigrate,fileserver,cldb,nfs4,mastga
        teway,nodemanager,gateway,hoststats,ap
        iserver,posixclientbasic"
    }
]
}

```

REST

Creates a volume.
- [volume move](#) on page 3039
Moves the specified volume or mirror to a different topology. Permissions required: m or fc on the volume.
- [label list](#) on page 2555
Lists registered labels. Permissions required: fc or a.
- [dump volumeinfo](#) on page 2468

Returns information about volumes and the associated containers. For JSON formatted output, use the -json option from the command line.

[configure.sh](#) on page 3186

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Data Fabric client nodes, and configuring services for a node.

node listcldbs

Returns the hostnames of the nodes in the cluster that are running the CLDB service.

Syntax

CLI

```
maprcli node listcldbs
[ -cluster <cluster name> ]
[ -cldb <cldb hostname|ip:port> ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/node/listcldbs[?<parameters>]

Parameters

Parameter	Description
cluster	The name of the cluster for which to return the list of CLDB node hostnames.
cldb	The hostname or IP address and port number of a CLDB node.

Examples

Return the list of CLDB nodes for the cluster `my.cluster.com`:

CLI

```
# maprcli node listcldbs -cluster my.cluster.com -json
{
  "timestamp":1529445021408,
  "timeofday":"2018-06-19 02:50:21.408 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "CLDBs":"in111-22.qa.lab,in111-24.qa.l
ab,in111-21.qa.lab"
    }
  ]
}
```

REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/node/listclbdbzks?
cluster=my.cluster.com' --user
mapr:mapr
{"timestamp":1529445190525,"timeofday"
:"2018-06-19 02:53:10.525 GMT-0700
PM","status":"OK","total":1,"data":
[{"CLDBs":"in111-22.qa.lab,in111-24.qa
.lab,in111-21.qa.lab"}]}
```

Related concepts

[Listing CLDB Nodes](#) on page 1807
Describes how to list CLDB nodes in the HPE Data Fabric.

[Viewing CLDB Information](#) on page 1802
Describes how to view CLDB information from the CLDB page, and provides an explanation of each field that the page displays.

node listclbdbzks

Returns the hostnames of the nodes in the cluster that are running the CLDB service and the IP addresses and port numbers for the nodes in the cluster that are running the ZooKeeper service.

Syntax

CLI

```
maprcli node listclbdbzks
[ -cluster <cluster name> ]
[ -clbdb <clbdb hostname|ip:port> ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/node/listclbdbzks[?<parameters>]

Parameters

Parameter	Description
cluster	The name of the cluster for which to return the CLDB and ZooKeeper information.
clbdb	The hostname or IP address and port number of a CLDB node.

Examples

Return CLDB and ZooKeeper node information for the cluster my.cluster.com:

CLI

```
maprcli node listclbdbzks -cluster
my.cluster.com
{
  "timestamp":1529445399193,
  "timeofday":"2018-06-19
```

```
02:56:39.193 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "CLDBs":"in111-22.qa.lab,in111-24.qa.l
ab,in111-21.qa.lab",
      "Zookeepers":"in111-21.qa.lab:5181,in1
11-22.qa.lab:5181,in111-24.qa.lab:5181
"
    }
  ]
}
```

REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/node/listcldbzs?
cluster=my.cluster.com' --user
mapr:mapr
{"timestamp":1529445324540,"timeofday"
:"2018-06-19 02:55:24.540 GMT-0700
PM","status":"OK","total":1,"data":
[{"CLDBs":"in111-22.qa.lab,in111-24.qa
.lab,in111-21.qa.lab","Zookeepers":"in
111-21.qa.lab:5181,in111-22.qa.lab:518
1,in111-24.qa.lab:5181"}]}
```

node listzookeepers

Returns the hostnames of the nodes in the cluster that are running the ZooKeeper service.

Syntax

CLI

```
maprcli node listzookeepers
[ -cluster <cluster name> ]
[ -cldb <cldb hostname|ip:port> ]
```

REST

Request Type	GET
Request URL	http[s]:// <host>:<port>/rest/ node/listzookeepers[? <parameters>]

Parameters

Parameter	Description
cluster	The name of the cluster for which to return the list of zookeeper node hostnames.
cldb	The hostname or IP address and port number of a valid CLDB node. The other CLDB nodes and zookeeper nodes can be discovered from this node.

Examples

Return the list of zookeeper nodes for the cluster my.cluster.com

If you know that the CLDB service is running on a node with hostname host1, you can enter:

CLI

```
maprcli node listzookeepers -cluster
my.cluster.com -cldb host1 -json
{
  "timestamp":1529451245796,
  "timeofday":"2018-06-19
04:34:05.796 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "Zookeepers":"in111-21.qa.lab:5181,in1
11-22.qa.lab:5181,in111-24.qa.lab:5181
"
    }
  ]
}
```

REST

```
https://abc.sj.us:8443/rest/node/
listzookeepers?
cluster=my.cluster.com&cldb=host1
{"timestamp":1529451245796,"timeofday"
:"2018-06-19 04:34:05.796 GMT-0700
PM","status":"OK","total":1,"data":
[{"Zookeepers":"in111-21.qa.lab:5181,i
n111-22.qa.lab:5181,in111-24.qa.lab:51
81"}]}
```

node maintenance

Places a node into a maintenance mode for a specified duration.

IMPORTANT: To put any node other than a master node into maintenance, you can directly run the `node maintenance` command on the node.

The maintenance mode operation is disallowed on a master node with the CLDB service in the running state on the master node. Before you can put a master node into maintenance mode, you must stop the CLDB service. Run the following command to stop the CLDB service:

```
maprcli node services -name cldb -action stop -nodes mapr-<node>
```

For the duration of the maintenance mode, the cluster's CLDB does not consider the data of this node as lost and does not trigger a resync of the data on this node. See [Administering Nodes](#) on page 1363 for more information.

Syntax

CLI

```
/opt/mapr/bin/maprcli node maintenance
[ -cluster
<cluster> ]
[ -serverids
<serverids> ]
-nodes <node
names>
```

```
-timeoutminutes  
<timeout in minutes>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/node/maintenance?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
serverids	List of server IDs
nodes	List of nodes, space separated.
timeoutminutes	Duration of the maintenance mode in minutes

Examples

CLI

```
/opt/mapr/bin/maprccli  
node maintenance -nodes  
centos22.lab -timeoutminutes 20
```

REST

```
curl -u mapr:mapr -X POST -k 'https://  
abc.sj.us:8443/rest/node/maintenance?  
nodes=centos22.lab&timeoutminutes=20'
```

node metrics

Retrieves metrics information for nodes in a cluster.

WARNING: This command is deprecated. See [Using HPE Data Fabric Monitoring \(Spyglass Initiative\)](#) on page 1959 for information about viewing metrics and logs for nodes, services, and applications.

This command retrieves and displays various metrics related to the operation of nodes. The data displayed comes from the files that each node updates periodically that are stored in the node local volume on each node in the cluster.

Syntax

CLI

```
maprccli node metrics  
    -nodes <hostname>  
    -start <start time>  
    -end <end time>  
    [ -interval <interval  
timestamp> ]  
    [ -events true|false ]
```

```
[ -columns <column names> ]
[ -cluster <cluster name> ]
```

Parameters

Parameter	Description
nodes	A space-separated list of host names. The host name must be either the specific hostname (use the <code>maprc li node list -columns hostname</code> command to obtain the hostname value) or the name "hostname" if using the command line on the actual node. The IP address and "localhost" can not be used.
start	The start of the time range. Can be a UTC timestamp (in this case, a Java millisecond timestamp) or a UTC date in MM/DD/YY or MM/DD/YYYY format.
end	The end of the time range. Can be a UTC timestamp (in this case, a Java millisecond timestamp) or a UTC date in MM/DD/YY or MM/DD/YYYY format.
interval	Data measurement interval in seconds. The minimum value is 10 seconds.
events	Specify TRUE to return node events only. The default value of this parameter is FALSE.
columns	Comma-separated list of column names to return.
cluster	Cluster name.

Column Name Parameters

The `node metrics` API always returns the `NODE` (node name) and `TIMESTAMP` (integer timestamp) columns. Use the `-columns` flag to specify a comma-separated list of column names to return.

WARNING: The `CPUNICE`, `CPUUSER`, and `CPUSYSTEM` parameters return information in *jiffies*. This unit measures one tick of the system timer interrupt and is usually equivalent to 10 milliseconds, but may vary depending on your particular node configuration. The reporting interval is the maximum possible value. In addition, the `CPU*` parameters accumulate and do not reset from report to report. Call `sysconf(_SC_CLK_TCK)` to determine the exact value for your node.

CPUNICE	Amount of CPU time used by processes with a positive nice value.	
CPUUSER	Amount of CPU time used by user processes.	
CPUSYSTEM	Amount of CPU time used by system processes.	
LOAD5PERCENT	Percentage of time this node spent at load 5 or below	
LOAD1PERCENT	Percentage of time this node spent at load 1 or below	

MEMORYCACHED	Memory cache size in bytes	
MEMORYSHARED	Shared memory size in bytes	
MEMORYBUFFERS	Memory buffer size in bytes	
MEMORYUSED	Memory used in megabytes	
PROCRUN	Number of processes running	
RPCCOUNT	Number of Data Fabric RPC calls	
RPCINBYTES	Number of bytes passed in by Data Fabric RPC calls	
RPCOUTBYTES	Number of bytes passed out by Data Fabric RPC calls	
SERVAVAILSIZEMB	Server storage available in megabytes	
SERVUSEDSEIZEMB	Server storage used in megabytes	
SWAPFREE	Free swap space in bytes	
TTMAPUSED	Number of TaskTracker slots used for map tasks	
TTREDUCEUSED	Number of TaskTracker slots used for reduce tasks	

Three column name parameters return data that is too granular to display in a standard table. Use the `-j` option to return this information as a JSON object.

Parameter	Description	Metrics Returned
CPUS	Activity on this node's CPUs. Each CPU on the node is numbered from zero, <code>cpu0</code> to <code>cpuN</code> . Metrics returned are for each CPU.	CPUIDLE: Amount of CPU time spent idle. Reported as <i>jiffies</i> . CPUIOWAIT: Amount of CPU time spent waiting for I/O operations. Reported as <i>jiffies</i> . CPUTOTAL: Total amount of CPU time. Reported as <i>jiffies</i> .
DISKS	Activity on this node's disks. Metrics returned are for each partition.	READOPS: Number of read operations. READKB: Number of kilobytes read. WRITEOPS: Number of write operations. WRITEKB: Number of kilobytes written.
NETWORK	Activity on this node's network interfaces. Metrics returned are for each interface.	BYTESIN: Number of bytes received. BYTESOUT: Number of bytes sent. PKTSIN: Number of packets received. PKTSOUT: Number of packets sent.

Examples

Retrieving the percentage of time that a node spent at the 1 and 5 load levels between dates

```
$ maprcli node metrics
  -nodes centos24.lab
  -start 08/02/15
  -end 08/03/15
  -interval 7200
  -columns LOAD5PERCENT,LOAD1PERCENT
```

Sample Output

NODE TIMESTAMP	LOAD5PERCENT	LOAD1PERCENT	TIMESTAMPSTR

  ]
}
```

node move

Moves one or more nodes to a different topology. Permissions required: fc or a.

Syntax

CLI

```
maprcli node move
[ -cluster <cluster> ]
-serverids <server IDs>
-topology <topology>
```

REST

Request Type	POST
--------------	------

Request URL	<code>http[s]://<host>:<port>/rest/node/move?<parameters></code>
-------------	--

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
serverids	The comma-separated list of server IDs of the nodes to move. If you insert spaces between server IDs, the command only operates on the first server ID in the list.
topology	The new topology.

To obtain existing topology, run

```
maprcli node topo
```

To obtain the server ID, run

```
maprcli node list -columns id
```

Sample output from `maprcli node list -columns id` is shown below. The resulting server ID(s) can be copied and pasted into the `maprcli node move` command.

```
id                hostname      ip
547819249997313015 node-34.lab  10.10.40.34,10.10.88.34
2130988050310536949 node-36.lab  10.10.40.36,10.10.88.36
8683110801227243688 node-37.lab  10.10.40.37,10.10.88.37
5056865595028557458 node-38.lab  10.10.40.38,10.10.88.38
3111141192171195352 node-39.lab  10.10.40.39,10.10.88.39
```

Examples

CLI

```
maprcli node move
-topology /newData
-serverids 547819249997313015
```

REST

```
https://abc.sj.us:8443/rest/node/move?
topology=%2FnewData&serverids=54781924
9997313015
```

node remove

Removes one or more nodes from a cluster. Permissions required: `fc` or `a`.

After issuing the `node remove` command, wait several minutes to ensure that the node has been properly and completely removed.

Syntax

CLI

```
maprccli node remove
[ -filter "<filter>" ]
[ -hostids <host IDs> ]
[ -nodes <node names> ]
[ -service <fileserver or
nfsserver> ]
[ -zkconnect <ZooKeeper Connect
String> ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/node/remove[?<parameters>]

Parameters

Parameter	Description
filter	A filter specifying nodes on which to start or stop services. See Filters for more information.
hostids	A list of host IDs, separated by spaces.
nodes	A list of node names, separated by spaces.
service	Service to be removed. Either fileserver or nfsserver.
zkconnect	ZooKeeper Connect String . Example: 'host:port,host:port,host:port,...'. To obtain zookeeper connection strings, use the maprccli node listzookeepers command. Default: localhost:5181

Examples

CLI

```
maprccli node remove -nodes 10.20.30.40
```

REST

```
https://abc.sj.us:8443/rest/node/
remove?nodes=10.20.30.40
```

node services

Starts, stops, or restarts services on one or more server nodes. Permissions required: ss, fc or a.

To start or stop services, you must specify the service name, the action (start, stop, or restart), and the nodes on which to perform the action. You can specify the nodes in one of two ways:

- Use the nodes parameter to specify a space-delimited list of node names.
- Use the filter parameter to specify all nodes that match a certain pattern. See [Filters](#) for more information.

Syntax

CLI

```
/opt/mapr/bin/maprccli node services -h

node services
    [ -cluster cluster name ]
    [ -filter node names filter.
Please put it in quotes"" ]
    [ -zkconnect
ZooKeeper Connect String:
'host:port,host:port,host:port,...' ]
    [ -nodes node names space
separated ]
    [ -cldb managing cldb

    [ -keycloak managing keycloak
service: [start, stop, suspend,
resume, restart, enable, disable]]
```

REST

Request Type	POST
--------------	------

Request URL

```
http[s]://<host>:<port>/
rest/node/services[?
<parameters>]
```

Parameters

To perform an action on a service, on a particular set of nodes, you must specify the following three parameters:

- **action**- the action to perform:
 - Start, stop, restart a service.
 - Disable a service to prevent it from starting when Warden restarts and enable a service to allow the service to start when Warden restarts.

NOTE: Suspend and resume are not supported.

- **node** or **filter** - the nodes on which to perform the action; either a list of nodes, or a filter that matches a set of nodes
- **name** - the service on which to perform the action

The following table lists the parameters available with the `node services` command.

Parameter	Description
action	An action to perform on a service specified in the name parameter: Values: start, stop, suspend, resume, restart, enable, or disable
apiserver	Starts, stops, or restarts the apiserver. Values: start, stop, restart, enable, or disable
cldb	Starts, stops, or restarts the cldb service. Values: start, stop, suspend, resume, restart, enable, or disable
cluster	The cluster on which to run the command.
fileserv	Starts, stops, or restarts the fileserv service. Values: start, stop, suspend, resume, restart, enable, or disable
filter	<p>A filter specifying nodes on which to start or stop services. For fields to use with the filter, see the node on page 2560 table. See Filters on page 2270 for more information about filters.</p> <p> NOTE: You must specify either the filter parameter or the nodes parameter.</p>
name	A service on which to perform an action specified by the action parameter. Any service can be specified with this option, but the following services can be specified only with the name option: collectd, elasticsearch, fluentd, grafana, historyserver, hivemeta, hoststats, hs2, httpfs, hue, kibana, nodemanager, opentsdb, oozie, and resourcemanager.

Parameter	Description
nfs	Starts, stops, or restarts the nfs service. Values: start, stop, suspend, resume, restart, enable, or disable
nfs4	 NOTE: NFSv4 refers to NFS version 4.1. Starts, stops, or restarts the NFSv4 service. Values: start, stop, restart, enable, or disable
nodes	A list of node names, separated by spaces.  NOTE: Either this or filter is required.
zkconnect	The ZooKeeper Connect String .
s3server	The parameter can be used to perform an action on the MOSS or s3server service that runs as part of a cluster or fabric. One of the action words, start, stop, suspend, resume, restart, enable, disable, must be used after the parameter to indicate the action to be taken with respect to the s3server service.
keycloak	The parameter can be used to perform an action on the keycloak service. One of the action words, start, stop, suspend, resume, restart, enable, disable, must be used after the parameter to indicate the action to be taken with respect to the keycloak service.

Examples

Start the NodeManager Service

```
/opt/mapr/bin/maprcli node services -name nodemanager -nodes
abc.sj.us -action start
```

Stop the ResourceManager Service

```
/opt/mapr/bin/maprcli node services -name resourcemanager -nodes
abc.sj.us -action stop
```

Restart the ResourceManager Service

```
/opt/mapr/bin/maprcli node services -name resourcemanager -nodes
abc.sj.us -action restart
```

Restart NFS4 server

```
/opt/mapr/bin/maprcli node services -nodes abc.sj.us -nfs4 restart
```

Restart NFS4 server using a filter

Using a filter is common, especially in HBase environments, where full restarts of region and master servers are needed.

```
/opt/mapr/bin/maprcli node services -filter ["csvc==nfs"] -nfs4 restart
```

Start the Hue Service

```
/opt/mapr/bin/maprcli node services -name hue -action start -nodes <node n>
```

Restart the hoststats service

Restart the hoststats service after making changes to the HPE Data Fabric Metrics database. You do not need to restart warden.

```
/opt/mapr/bin/maprcli node services -name hoststats -action restart -nodes <nodes>

OR

/opt/mapr/bin/maprcli node services -name hoststats -action restart -filter '[csvc==hoststats]'
```

Restart the MOSS service

```
maprcli node services -nodes <host FQDN for node> -s3server restart
```

Stop the MOSS service

```
maprcli node services -nodes <host FQDN for node> -s3server stop
```

Stop the keycloak service

```
maprcli node services -nodes <host FQDN for node> -keycloak stop
```

node topo

Lists cluster topology information.

Lists internal nodes only (switches/racks/etc) and not leaf nodes (server nodes).

Syntax

CLI

```
maprcli node topo
[ -cluster <cluster> ]
[ -path <path> ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/node/topo?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
path	The path on which to list node topology.

Output

Node topology information.

Sample output

```
{
  "timestamp":1433545849048,
  "timeofday":"2015-06-05 11:10:49.048 GMT+0000",
  "status":"OK",
  "total":4,
  "data":[
    {
      "path":"/"
    },
    {
      "path":"/data"
    },
    {
      "path":"/data/default-rack"
    },
    {
      "path":"/default-rack"
    }
  ]
}
```

Output Fields

Field	Description
path	The physical topology path to the node.

Examples

CLI

```
# maprccli node topo
path
/
/data
/data/default-rack
/default-rack
```

REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/node/topo' --user
mapr:mapr
{"timestamp":1529382835319,"timeofday"
:"2018-06-18 09:33:55.319 GMT-0700
PM","status":"OK","total":4,"data":
[{"path":"/"}, {"path":"/data"},
{"path":"/data/default-rack"},
{"path":"/default-rack"}]}
```

node topospace

Lists disk space utilization for each topology.

Syntax

CLI

```
maprccli node topospace
[ -cluster <cluster> ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/node/toposize[?<parameters>]

Parameters

Parameter	Description
cluster	The cluster on which to run the command.

Output

Field	Description
AvailableSpace	The amount of available disk space (in GB).
path	The cluster rack path to the node (or topology of the node).
TotalSpace	The amount of total disk space (in GB).
UsedSpace	The amount of utilized disk space (in GB).

Example

Retrieve topology-based disk utilization information:

CLI

```
# maprcli node toposize
path
TotalSpace(GB)  UsedSpace(GB)
AvailableSpace(GB)
/
1584             18             1563
/abcd
432              6             425
/abcd/test
288             0             288
/abcd/test/test1
144             0             144
/cldb
576             6             569
/cldb/test
432             0             432
/cldb/test/test1
288             0             288
/cldb/test/test1/test2
144             0             144
/ecvol
288             0             288
/ecvol/test
288             0             288
/ecvol/test/test1
144             0             144
/ecvol/test/test1/test2
144             0             144
/ecvol/test/test1/test2/test3
```

```
144          0          144
/ecvol/test/test1/test2/test3/test4
144          0          144
```

REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/node/
toposize' --user mapr:mapr
{"timestamp":1533655046390,"timeofday"

edSpace(GB)":0,"AvailableSpace(GB)":27
2}]}
```

otel

Commands for managing Open Telemetry (OTel) end points.

For more information on Open Telemetry, see [OTel](#) on page 5373.

otelendpoint add

Adds an Open Telemetry end point for data collection.

Syntax

CLI

```
maprcli otelendpoint add
                                -name end point name
                                -url http[s]://
hostname
                                [ -port port ]
                                [ -key Base64 encoded
key ]
                                [ -keyfile key file
path ]
                                [ -cert Base64
encoded certificate ]
                                [ -certfile
certificate file path ]
                                [ -customopts json
formatted custom options ]
                                [ -customoptsfile
path to json formatted custom
options ]
```

```
cluster_name ] [ -cluster
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/otelendpoint/add?<parameters>

Parameters

Parameter	Description
name	Name of the end point.
url	The server from which to collect the data.
port	(optional) The server port if not already specified in the url field.
key	(conditionally required) The client key used by the collector that is acting as the client with the server.  NOTE: Required only for secure communication between the collector and the server.
keyfile	(conditionally required) Pass the client key in a file instead of directly on the command line.  NOTE: Required only for secure communication between the collector and the server.
cert	(conditionally required) The client certificate used by the collector that is acting as the client with the server.  NOTE: Required only for secure communication between the collector and the server.
certfile	(conditionally required) Pass the client certificate in a file instead of directly on the command line.  NOTE: Required only for secure communication between the collector and the server.
customopts	(optional) Custom options for metric collection. At present, the custom options are: <ul style="list-style-type: none"> export logs: Set to true (by default) to export logs for collection. exportmetrics: Set to true (by default) to export metrics for collection.
customoptsfile	(optional) Pass the custom options in a file instead of directly on the command line.
cluster	(optional) The cluster on which to add the end point. By default, this is the cluster on which this command is run.

Example

Add an *attacks* endpoint to collect metrics from the server *http://starrynova.com* on port *16684* with a custom certificate and key:

CLI

```
maprcli otelendpoint add -name
attacks -url http://
starrynova.com:16684 -certfile /root/
cfssl/cert.pem -keyfile /root/cfssl/
cert-key.pem -json

{
  "timestamp":1702557061912,
  "timeofday":"2023-12-14
04:31:01.912 GMT-0800 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
    "messages":[
      "end point added
successfully"
    ]
  }
}
```

REST

```
https://abc.sj.us:8443/
rest/otelendpoint/add?
name=attacks&url=http://
starrynova.com:16684&certfile=/root/
cfssl/cert.pem&keyfile=/root/cfssl/
cert-key.pem
```

otelendpoint info

Displays information about an Open Telemetry end point.

Syntax

CLI

```
maprcli otelendpoint info
                        -name end point name
                        [ -cluster
cluster_name ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/otelendpoint/info?<parameters>

Parameters

Parameter	Description
name	Name of the end point.

Parameter	Description
cluster	(optional) The cluster on which the end point resides. By default, this is the cluster on which this command is run.

Example

Display information about the *attacks* endpoint:

CLI

```
maprccli otelendpoint info -name
attacks -json
{
    "timestamp":1702558600087,
    "timeofday":"2023-12-14
04:56:40.087 GMT-0800 AM",
    "status":"OK",
    "total":1,
    "data":[
        {
            "name":"attacks",
            "url":"http://
starrynova.com",
            "port":16486
        }
    ]
}
```

REST

```
https://abc.sj.us:8443/rest/
otelendpoint/info?name=attacks
```

otelendpoint list

Lists all Open Telemetry end points.

Syntax

CLI

```
maprccli otelendpoint list
[ -cluster
cluster_name ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/otelendpoint/list?<parameters>

Parameters

Parameter	Description
cluster	(optional) The cluster from which to retrieve the end points. By default, this is the cluster on which this command is run.

Example

List all endpoints:

CLI

```
maprcli otelendpoint list -json
{
  "timestamp":1776763137839,
  "timeofday":"2026-04-21
02:18:57.839 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "name":"ep2",
      "url":"https://10.163.164.124",
      "port":4318,
      "customopts":{
        "exportlogs":"true",
        "exportmetrics":"true"
      }
    }
  ]
}
```

REST

```
https://abc.sj.us:8443/rest/
otelendpoint/list
```

otelendpoint remove

Removes an Open Telemetry end point.

Syntax

CLI

```
maprcli otelendpoint remove
                        -name end point name
                        [ -cluster
cluster_name ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/otelendpoint/remove?<parameters>

Parameters

Parameter	Description
cluster	(optional) The cluster on which the end point resides. By default, this is the cluster on which this command is run.

Example

Remove endpoint *attacks*:

CLI

```
maprcli otelendpoint remove -name
attacks -json
{
    "timestamp":1702561268122,
    "timeofday":"2023-12-14
05:41:08.122 GMT-0800 AM",
    "status":"OK",
    "total":0,
    "data":[
        ],
    "messages":[
        "end point removed
successfully"
    ]
}
```

REST

```
https://abc.sj.us:8443/rest/
otelendpoint/remove?name=attacks
```

otelendpoint update

Updates details for an Open Telemetry end point.

Syntax**CLI**

```
maprcli otelendpoint update
                                -name end point name
                                -url http[s]://
hostname
                                [ -port port ]
                                [ -key Base64 encoded
key ]
                                [ -keyfile key file
path ]
                                [ -cert Base64
encoded certificate ]
                                [ -certfile
certificate file path ]
                                [ -customopts json
formatted custom options ]
                                [ -customoptsfile
path to json formatted custom
options ]
                                [ -cluster
cluster_name ]
```

REST

Request Type	POST
Request URL	<code>http[s]://<host>:<port>/rest/otelendpoint/update?<parameters></code>

Parameters

Parameter	Description
name	Name of the end point.
url	The server from which to collect the data.
port	(optional) The server port if not already specified in the url field.
key	(conditionally required) The client key used by the collector that is acting as the client with the server.  NOTE: Required only for secure communication between the collector and the server.
keyfile	(conditionally required) Pass the client key in a file instead of directly on the command line.  NOTE: Required only for secure communication between the collector and the server.
cert	(conditionally required) The client certificate used by the collector that is acting as the client with the server.  NOTE: Required only for secure communication between the collector and the server.
certfile	(conditionally required) Pass the client certificate in a file instead of directly on the command line.  NOTE: Required only for secure communication between the collector and the server.
customopts	(optional) Custom options for metric collection. At present, the custom options are: <ul style="list-style-type: none"> • <code>export logs</code>: Set to <code>true</code> (by default) to export logs for collection. • <code>export metrics</code>: Set to <code>true</code> (by default) to export metrics for collection.
customoptsfile	(optional) Pass the custom options in a file instead of directly on the command line.
cluster	(optional) The cluster on which the end point resides. By default, this is the cluster on which this command is run.

Example

Update the *attacks* endpoint on server *http://starrynova.com* to port 16486:

CLI

```
maprcli otelendpoint
update -name attacks -url http://
starrynova.com:16486 -json
{
    "timestamp":1702560856968,
    "timeofday":"2023-12-14
05:34:16.968 GMT-0800 AM",
    "status":"OK",
    "total":0,
    "data":[
        ],
    "messages":[
        "end point updated
successfully"
    ]
}
```

REST

```
https://abc.sj.us:8443/
rest/otelendpoint/update?
name=attacks&url=http://
starrynova.com:16486
```

rlimit
Manages resource usage limits for the cluster.
rlimit get
Returns the resource usage limit for the cluster's disk resource.

Syntax

CLI

```
maprcli rlimit get
-resource disk
[ -cluster <cluster name> ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/rlimit/get?<parameters>

Parameters

Parameter	Description
resource	The type of resource to get the usage limit for. Currently only the value disk is supported.
cluster	The name of the cluster whose usage limit is being queried.

Examples

Return the disk usage limit for the cluster my.cluster.com:

CLI

```
# maprcli rlimit get -resource
disk -cluster ksTest -json
{
  "timestamp":1529382231966,
  "timeofday":"2018-06-18
09:23:51.966 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "limit":"251947MB",
      "clusterSize":"279942MB",
      "currentUsage":"3MB"
    }
  ]
}
```

REST

```
# curl -X GET 'https://
server.sj.us:8443/rest/rlimit/get?
cluster=ksTest' --user
<username>:<password>
{"timestamp":1529382231966,"timeofday"
:"2018-06-18 09:23:51.966 GMT-0700
PM","status":"OK","total":1,"data":
[{"limit":"251947MB","clusterSize":"27
9942MB","currentUsage":"3MB"}]}
```

rlimit set
Sets the resource usage limit for the cluster's disk resource.

Syntax

CLI

```
maprcli rlimit set
  -resource disk
  [ -cluster <cluster name> ]
  -value <limit>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/rlimit/set?<parameters>

Parameters

Parameter	Description
resource	The type of resource for which to set the usage limit. Currently disk is the only value that is supported.
cluster	The name of the cluster whose usage limit is being set.
value	The value of the limit being set. You can express the value as KB, MB, GB, or TB.

Examples

Set the disk usage limit for the cluster my.cluster.com to 80TB:

CLI

```
maprcli rlimit set -resource
disk -cluster my.cluster.com -value
80TB
```

REST

```
https://abc.sj.us:8443/rest/rlimit/
get?
resource=disk&cluster=my.cluster.com&v
alue=80TB
```

Explains how to set disk space quotas for users and groups.

Related reference

[entity modify](#) on page 2481
Modifies a user or group quota or email address. Permissions required: fc or a.

schedule

Manages schedules.

Schedule Fields

The schedule object contains the following fields:

Field	Value
id	The ID of the schedule.
name	The name of the schedule.
inuse	Indicates whether the schedule is associated with an action.
rules	An array of JSON objects specifying how often the scheduled action occurs. See Rule Fields below.

Rule Fields

The following table shows the fields to use when creating a rules object.

Field	Values
frequency	<p>How often to perform the action:</p> <ul style="list-style-type: none"> • once - Once • yearly - Yearly • monthly - Monthly • weekly - Weekly • daily - Daily • hourly - Hourly • semihourly - Every 30 minutes • quarterhourly - Every 15 minutes • fiveminutes - Every 5 minutes • minute - Every minute
retain	<p>How long to retain the data resulting from the action. For example, if the schedule creates a snapshot, the retain field sets the snapshot's expiration. The retain field consists of an integer and one of the following units of time:</p> <ul style="list-style-type: none"> • mi - minutes • h - hours • d - days • w - weeks • m - months • y - years <p> NOTE: For offload schedule, set the value for this to 0.</p>
time	The time of day to perform the action, in 24-hour format: HH
date	<p>The date on which to perform the action:</p> <ul style="list-style-type: none"> • For single occurrences, specify month, day and year: MM/DD/YYYY • For yearly occurrences, specify the month and day: MM/DD • For monthly occurrences occurrences, specify the day: DD Daily and hourly occurrences do not require the date field.

Example

The following example JSON shows a schedule called "snapshot," with three rules.

```
{
  "id":8,
  "name":"snapshot",
  "inuse":0,
  "rules":[
    {
      "frequency":"monthly",
      "date":"8",
      "time":14,
      "retain":"1m"
    },
    {
      "frequency":"weekly",
      "date":"sat",
      "time":14,
      "retain":"2w"
    },
    {
      "frequency":"hourly",
      "retain":"1d"
    }
  ]
}
```

schedule create

Creates a schedule. Permissions required: fc or a.

A schedule can be associated with a volume to automate mirror syncing, snapshot creation, and data offload. See [volume create](#) and [volume modify](#).

Syntax

CLI

```
maprcli schedule create
[ -cluster <cluster> ]
-schedule <JSON>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/schedule/create?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
schedule	A JSON object describing the schedule. See Schedule Objects for more information.

Examples

Scheduling a Single Occurrence

CLI

```
maprcli schedule create -schedule
'{"name":"Schedule-1","rules":
[{"frequency":"once","retain":"1w","ti
me":13,"date":"12/5/2010"}]}'
```

REST

```
https://abc.sj.us:8443/rest/schedule/
create?
schedule={"name":"Schedule-1","rules":
[{"frequency":"once","retain":"1w","ti
me":13,"date":"12/5/2010"}]}
```

A Schedule with Several Rules

CLI

```
maprcli schedule create -schedule
'{"name":"Schedule-2","rules":
[{"frequency":"weekly","date":"sun","t
ime":7,"retain":"2w"},
{"frequency":"daily","time":14,"retain
":"1w"},
{"frequency":"hourly","retain":"1w"},
{"frequency":"yearly","date":"11/5","t
ime":14,"retain":"1w"}]}'
```

REST

```
https://abc.sj.us:8443/rest/schedule/
create?
schedule={"name":"Schedule-1","rules":
[{"frequency":"weekly","date":"sun","t
ime":7,"retain":"2w"},
{"frequency":"daily","time":14,"retain
":"1w"},
{"frequency":"hourly","retain":"1w"},
{"frequency":"yearly","date":"11/5","t
ime":14,"retain":"1w"}]}
```

schedule list
Lists the schedules on the cluster.

Syntax

CLI

```
maprcli schedule list
[ -cluster <cluster> ]
[ -output terse|verbose ]
[ -sortby ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/schedule/list[?<parameters>]

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
output	Specifies whether the output should be terse or verbose.
sortby	Specifies one of the following attributes to sort the list of schedules by: scheduleid, schedulename, schedulerulefrequency, scheduleruledate, scheduleruletime, scheduleruleminutes, scheduleruleretaintime, scheduleinuse. By default, the list of schedules sorted by schedulename.

Output

A list of all schedules on the cluster. See [Schedule Objects](#) for more information.

Sample Output

```
# maprccli schedule list
id  name          inuse  rules
1   Critical data  0      ...
2   Important data 0      ...
3   Normal data   0      ...
```

Examples**List schedules:****CLI**

```
# maprccli schedule list -json
{

```

schedule modify

Modifies an existing schedule, specified by ID. Permissions required: fc or a.

To find a schedule's ID:

- 1. Use the [schedule list](#) command to list the schedules.
- 2. Select the schedule to modify.
- 3. Pass the selected schedule's ID in the -id parameter to the `schedule modify` command.

Syntax

CLI

```
maprcli schedule modify
[ -cluster <cluster> ]
-id <schedule ID>
[ -name <schedule name> ]
[ -rules <JSON>]
```

REST

Request Type	POST
Request URL	<code>http[s]://<host>:<port>/rest/schedule/modify?<parameters></code>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
id	The ID of the schedule to modify.
name	The new name of the schedule.
rules	A JSON object describing the rules for the schedule. If specified, replaces the entire existing rules object in the schedule. For information about the fields to use in the JSON object, see Rule Fields .

Examples

Modify a schedule

CLI

```
maprcli schedule modify -id 0 -name
Newname -rules
```

```
'[{"frequency":"weekly","date":"sun","time":7,"retain":"2w"}, {"frequency":"daily","time":14,"retain":"1w"}]'
```

REST

```
https://abc.sj.us:8443/rest/schedule/modify?id=0&name=Newname&rules=[{"frequency":"weekly","date":"sun","time":7,"retain":"2w"}, {"frequency":"daily","time":14,"retain":"1w"}]
```

schedule remove

Removes a schedule.

A schedule can only be removed if it is not associated with any volumes. See [volume modify](#).

Syntax

CLI

```
maprcli schedule remove  
[ -cluster <cluster> ]  
-id <schedule ID>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/schedule/remove?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
id	The ID of the schedule to remove.

Examples

Remove schedule with ID 0:

CLI

```
maprcli schedule remove -id 0
```

REST

```
https://abc.sj.us:8443/rest/schedule/remove?id=0
```

security

Configures security options.

genkey

Generates keys and certificates.

This command is for internal use only. You must use `configure.sh` with the `genkeys` option instead.

genticket

Generates tickets.

This command is for internal use only. You must use the [maprlogin](#) utility instead.

policy create

Describes how to create a security policy using the CLI.

Syntax

CLI

```
/opt/mapr/bin/maprcli security policy
create
                                -name
<security-policy-name>
                                [ -description
<description> ]
                                [ -cluster cluster-name]
                                [ -allowtagging true|
false ]
                                [ -accesscontrol Armed|
Disarmed|Denied ]
                                [ -auditenabled true|
false ]
                                [ -dataauditops <+|-
operations>|all ]
                                [ -wiresecurityenabled
true|false ]
                                [ -readfileace <file
read ACE> ]
                                [ -writefileace <file
write ACE> ]
                                [ -executefileace <file

directory, db, streams ACE> ]
                                [ -unmaskedreaddbace
<DB unmasked read ace> ]
                                [ -user
<user:permission,permission,...
user:permission,permission,...> ]
                                [ -group
<group:permission,permission,...
group:permission,permission,...> ]
```

REST

Request Type	POST
Request URL	<code>http[s]://<host>:<port>/rest/security/policy/create?<parameters></code>

Parameters

Parameter	Description
name	The name of this security policy. Security policy names must be unique within the cluster and must contain only alphanumeric characters, hyphen (-) and underscore (_). Other characters like space and commas are not allowed. Maximum length of the security policy name is 128 characters. This parameter is mandatory.
description	The description of the policy. The maximum length of the description is 128 characters.
cluster	The cluster name on which to run the command. This parameter is optional. The local cluster is the default cluster.
allowtagging	Allows or disallows tagging for the security policy. If set to <code>true</code> , this security policy can be used to tag HPE Data Fabric filesystem resources. When the security policy is first created, the <code>allowtagging</code> flag is set to <code>false</code> to give the administrator time to configure the security policy, before allowing users to tag HPE Data Fabric resources with this security policy. Default is <code>false</code> .
accesscontrol	Determines whether the relevant ACEs in this security policy are enforced for HPE Data Fabric resources that are tagged with this security policy. The following settings are supported: <ul style="list-style-type: none"> • Armed: When a HPE Data Fabric resource is tagged with this security policy, the relevant ACEs in this security policy are enforced when the resource is accessed. This is the normal operation mode. • Disarmed (default setting): Even if a HPE Data Fabric resource is tagged with this security policy, the ACEs in this security policy are NOT enforced. This setting can be used as an emergency switch when an incorrectly configured security policy denies authorized users from accessing resources. • Denied: Access is always denied to any HPE Data Fabric resources tagged with this security policy. Use this setting for security policies that are no longer in use, but are still tagged to some HPE Data Fabric resources. Administrators can look at the audit logs to determine the root cause.
auditenabled	Specifies whether or not to enable auditing for this policy. Set to <code>true</code> to enable auditing, and <code>false</code> to disable auditing. Default: <code>false</code> .

Parameter	Description
dataauditops	<p>The comma separated list of filesystem operations to include (specified with a preceding plus sign (+)), or exclude (specified with a preceding minus sign (-)) from auditing.</p> <p>To exclude the first operation in the list of operations from auditing, precede the operation by two minus (--) signs. Precede subsequent operations to exclude by only a single minus (-) sign, irrespective of whether the first operation was included (using a plus (+) sign) or excluded (using two minus (--) signs). If neither sign is specified, the given operation is included for auditing.</p> <p>The operations that can be included (+) or excluded (-) from auditing are listed in Auditing Data-Access Operations. Alternatively, you can group all the operations using the keyword all, which:</p> <ul style="list-style-type: none"> • If included (+), cannot be specified with a list of other included operations. • If excluded (-), cannot be specified with a list of other excluded operations. <p>All specified operations must either be included or excluded from auditing. You cannot specify a mixed list of included and excluded operations. Other than the specified operations, by default, all other operations are:</p> <ul style="list-style-type: none"> • Included for auditing, if the specified list is a list of excluded operations. • Excluded from auditing, if the specified list is a list of included operations. <p>Including <code>setattr</code> automatically enables the following operations:</p> <ul style="list-style-type: none"> • <code>chown</code> • <code>chgrp</code> • <code>chperm</code> <p>If you exclude <code>setattr</code>, these operations are automatically disabled. If you do nothing with <code>setattr</code> (neither enable nor disable), you can enable or disable <code>chown</code>, <code>chgrp</code>, and <code>chperm</code> in any combination.</p>
wiresecurityenabled	<p>Determines whether or not to perform wire-level encryption on the returned data. Set to <code>true</code> to enable wire-level encryption, and <code>false</code> to disable wire-level encryption.</p> <p>Default: <code>true</code></p>

Parameter	Description
readfileace	<p>An ACE that controls who can read from this file. If you do not set an ACE, basic file permissions are used. Files created with basic file permissions have mode 0755. Anyone can read the file contents. To read a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the volume • Read permission to the file
writefileace	<p>An ACE that controls who can write to this file. If you do not set an ACE, basic file permissions are used. Files created with basic file permissions have mode 0755. Only the owner can write to the file. To write to a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Write permission to the volume • Write permission to the file
executefileace	<p>An ACE that controls who can execute this file. If you do not set an ACE expression, basic file permissions are used. Files created with basic file permissions have mode 0755. Anyone can execute this file (assuming that the contents are executable). To execute a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • • Read permission to the volume • Read and execute permissions to the file
readdirace	<p>Controls who can read the contents of files in this directory. If you do not set an ACE, basic file permissions are used. Directories created with basic file permissions have mode 0755. Anyone can read the contents of files in this directory. To read the contents of a file in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the volume • Read permission to the parent directory • Read permission to the file

Parameter	Description
addchildace	<p>Controls who can create objects (files and directories) in this directory. If you do not set an ACE, basic file permissions are used. Directories created with basic file permissions have mode 0755. By default, only the owner can create files and directories in this directory. To create files and directories in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Add child permission for the parent directory • Read and execute permissions to all directories in the path • Write permission to the parent directory, and • Write permission to the volume.
deletechildace	<p>Controls who can delete objects (files and directories) in this directory. If you do not set an ACE, basic file permissions are used. Directories created with basic file permissions have mode 0755. By default, only the owner can delete files and directories in this directory. To delete files and directories in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Delete child permission for the parent directory • Read and execute access to all directories in the path • Write permission to the parent directory • Write permission to the volume
lookupdirace	<p>Controls who can list the contents (files and directories) of this directory. If you do not set an ACE, basic file permissions are used. Directories created with basic file permissions have mode 0755. Anyone can list the files in this directory. To list the contents of a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the directory • Read permission to the volume
readdbace	<p>The ACE for <i>column reads</i>. Fields within the <i>column family</i> inherit this permission.</p> <p>Default: u:creator.</p> <p>To read fields in <i>JSON DB column families</i> tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the DB column family • Read and execute permissions to all directories in the path • Read permission to the volume

Parameter	Description
writedbace	<p>The ACE for <i>column writes</i> (puts and deletes). Fields within the <i>column family</i> inherit this permission.</p> <p>Default: <code>u:creator</code>.</p> <p>To perform column writes, you must have the following permissions:</p> <ul style="list-style-type: none"> • Write permission to the DB column family • Read and execute permission to all directories in the path • Write permission to the parent directory • Write permission to the volume
traversedbace	<p>DB CF traverse permission settings, which determine the permission to pass over fields in JSON documents. Fields within the <i>column family</i> inherit this permission.</p> <p>Default: <code>u:creator</code>.</p> <p>To traverse fields in <i>JSON DB column families</i> tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Traverse permission to the DB column family • Read and execute permissions to all directories in the path • Read permission to the volume
readaces	<p>A convenience option to set read permissions for all objects. This is equivalent to setting the same ACE for the <code>readfileace</code>, <code>readdirace</code>, <code>lookupdirace</code>, <code>readdbace</code>, and <code>traversedbace</code> options.</p>
writeaces	<p>A convenience option to set write permissions for all objects. This is equivalent to setting the same ACE for <code>writefileace</code>, <code>addchildace</code>, <code>deletechildace</code>, and <code>writedbace</code> options.</p>
unmaskedreaddbace	<p>This is the ACE for determining whether the users have the <code>unmaskedreadperm</code> permission to enable them to read the masked column data unmasked. These users must also have <code>readdbace</code> permission. The <code>unmaskedreadperm</code> permission will not be automatically set when using the convenience <code>readaces</code> parameter. The <code>unmaskedreadperm</code> permission must be specifically enabled in the security policy by using the <code>unmaskedreaddbace</code> ACE. See Dynamic Data Masking on page 955 for more information.</p>

Parameter	Description
user	<p>Space separated list of user:permission, permission pairs. Use commas to separate each permission, and spaces to separate each user. For example, to give user tom, admin (a) and full control (fc) permissions, and user jane, admin (a) permission, use -user tom:a,fc jane:a</p> <p>If you do not specify this option, a security policy level administrative ACL is added for the administrator who created this security policy to have full privileges by default, that is [r, a, fc]. However, another user with admin (a) privilege for this security policy can subsequently remove this privilege. Specifying this option overwrites the default setting to give security policy level privileges only to the users specified in the -user list.</p> <p> CAUTION: You must specify admin (a) privilege for at least one administrator (for example, -user admin1:r, a, fc) in addition to privileges for any other users to modify this security policy after creation. If the -user or -group options are specified but without admin (a) or full control (fc) permission, (for example, -user operator:r), only the mapr user can modify the security policy.</p>
group	<p>Space separated list of group:permission, permission pairs. Use commas to separate each permission, and spaces to separate each group. For example, to give group operators read (r) permission, and group secadmin full control (fc) permission, use -group operators:r secadmin:a,fc</p>

Examples

CLI

```
/opt/mapr/bin/maprcli security policy
create -name TOPSECRET -allowtagging
true -accesscontrol
Armed -wiresecurityenabled true -user
"user7:a,fc user10:a"

/opt/mapr/bin/maprcli security policy
info -name TOPSECRET -json

```

policy export
Exports security policies.

Syntax

CLI

Use the `maprcli security policy export` command to export all security policies from the master node. You can then use the [policy import](#) on page 2641 command to import policies.

```
/opt/mapr/bin/maprcli security policy
export
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/security/policy/export

Parameters

None

CLI

The `maprcli security policy export` command dumps the security policies to the standard output. Use redirection to redirect the output to a file. For example, the following command redirects output to the `/tmp/polfile` file.

```
/opt/mapr/bin/maprcli security policy
export > /tmp/polfile
```

REST

```
curl -u mapr:mapr -X GET -k "https://
host:8443/rest/security/policy/export
> /tmp/polfile
```

datamask info
Displays data mask information.

Syntax

CLI

Use the `maprcli security datamask info` command to view the details of a [data mask](#) or the mask information for a table or array.

```
maprcli security datamask info
-name <mask-name>
[ -cluster <cluster-name> ]
[ -output terse | verbose ]
[ -columns <comma-separated list
of column names> ]
```

REST

Request Type	GET
Request URL	<code>http[s]://<host>:<port>/rest/security/datamask/info?<parameters></code>

Parameters

Parameter	Description						
name	Name of the data mask.						
cluster	The cluster on which to run the command. The default cluster is the local cluster.						
output	Specifies whether the output should be terse or verbose. Default: verbose.						
columns	<p>A comma-separated list of columns to return in the query.</p> <p>By default, all columns are displayed.</p> <p>Supported column names are as follows:</p> <table><tr><td>name</td><td>The name of the dynamic data mask. All predefined dynamic data mask names are prefixed with <code>mrddm_</code>.</td></tr><tr><td>description</td><td>The description of the dynamic data mask.</td></tr><tr><td>applicability</td><td>A comma-separated list of data types for which the data mask is applicable. The JSON document data types are listed in JSON Document Types.</td></tr></table>	name	The name of the dynamic data mask. All predefined dynamic data mask names are prefixed with <code>mrddm_</code> .	description	The description of the dynamic data mask.	applicability	A comma-separated list of data types for which the data mask is applicable. The JSON document data types are listed in JSON Document Types .
name	The name of the dynamic data mask. All predefined dynamic data mask names are prefixed with <code>mrddm_</code> .						
description	The description of the dynamic data mask.						
applicability	A comma-separated list of data types for which the data mask is applicable. The JSON document data types are listed in JSON Document Types .						

Example

1. Display the information for a particluar mask:

CLI

```
maprcli security datamask
info -name mrddm_hash -json
{
    "timestamp":1625172427915,
    "timeofday":"2021-07-01
01:47:07.915 GMT-0700 PM",
```

```

    "status": "OK",
    "total": 1,
    "data": [
      {
        "id": 5,
        "name": "mrddm_hash",
        "description": "Show the
hash of the data",
        "applicability": "[String]"
      }
    ]
  }

```

REST

```

curl -k -X POST \
  'https://
r1n1.sj.us:8443/rest/security/
datamask/info?name=mrddm_hash' \
  -u <username>:<password>

```

2. Display mask information for a table:

CLI

```

maprccli table info -path /
table1 -json
{
  "timestamp": 1612218564113,
  "timeofday": "2021-02-01
02:29:24.113 GMT-0800 PM",
  "status": "OK",
  "total": 1,
  "data": [
    {
      "path": "/table1",
      ...
      "defaultreadperm": "u:mapr",
      "defaultunmaskedreadperm":
      "u:mapr",

```

```

    ...
  }
]
}

```

REST

```

curl -k -X POST \
  'https://r1n1.sj.us:8443/
rest/security/datamask/info?path="/
table1"' \
  -u <username>:<password>

```

policy info

Display security policy information using the CLI.

Syntax

CLI

Use the `maprcli security policy info` command to display the details of the specified security policy.

```
/opt/mapr/bin/maprcli security policy
info
  -name policy name
  [ -cluster cluster name ]
  [ -output terse|verbose. Default:
verbose ]
  [ -columns <comma-separated list of
column names>. Default: all ]
  [ -expandaces true|false. Default:
false ]
```

REST

Request Type	GET
Request URL	<code>http[s]://<host>:<port>/rest/security/policy/info?<parameters></code>

Parameters

Parameter	Description
name	The name of the security policy. This parameter is mandatory.
cluster	The cluster name on which to run the command. This parameter is optional. The local cluster is the default cluster.
output	Specifies whether the output should be terse or verbose. Default: verbose
columns	A comma-separated list of fields to return in the query. See policy create on page 2623 for the list of column names. When issuing <code>maprcli security policy info -columns</code> and <code>maprcli security policy list -columns</code> commands, the column for the policy name is name.
expandaces	Expand ACE into their respective fields for display. Default: false

Examples

Display security policy information with the [ACE](#) information expanded.

CLI

```
/opt/mapr/bin/maprcli security policy
info -name TOPSECRET -expandaces
TRUE -json
```

```

```

policy attach

Attach one or more security policies to one or more volumes on a cluster.

Syntax

CLI

Use the `maprccli security policy attach` command to display the details of the specified security policy.

```
/opt/mapr/bin/maprccli security policy
attach
        -securitypolicy
securityPolicyName
        -volumes volumeNames
        [ -cluster cluster ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/security/policy/attach?<parameters>

Parameters

Parameter	Description
securitypolicy	The name of the security policy to attach. This is a mandatory parameter. You can specify more than one security policies as a comma-separated list to attach to more than one volumes.
volumes	The volume or volumes to which the security policy is to be attached. This is a mandatory parameter. You can specify a comma-separated list of volumes if there are more than one volumes to which the specified security policy or security policies must be attached.
cluster	The cluster to which the volumes belong. This parameter is optional. The local cluster is the default cluster.

Examples

Attach a security policy named sp_salesdept to volumes, salesdec and salesnov, on cluster sales20.

CLI

```
/opt/mapr/bin/maprcli security
policy attach -securitypolicy
sp_salesdept -volumes
salesdec,salesnov -cluster
sales20 --json
```

Attach a security policy named sp_salesold, sp_salesnew to volumes, salesdec and salesnov, on cluster sales20.

CLI

```
/opt/mapr/bin/maprcli security
policy attach -securitypolicy
sp_salesold,sp_salesnew -volumes
salesdec,salesnov -cluster
sales20 --json
```

policy import

Imports security policies.

Syntax**CLI**

Use the maprcli security policy import command to import the exported security policies.

```
/opt/mapr/bin/maprcli security policy
import
-filename fileName
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/security/policy/import?<parameters>

Parameters

Parameter	Description
filename	The file that contains the policies to import. Policies are exported to this file when running the policy export on page 2631 command.

CLI

```
/opt/mapr/bin/maprcli security
policy import -filename /tmp/
polfile
```

REST

```
curl -u mapr:mapr -X GET -k "https://
host:8443/rest/security/policy/import?
filename=/tmp/polfile
```

policy list

List security policies using the CLI.

Syntax

CLI

Use the following command to display the list of security policies. This command returns just the list of security policies that the user is allowed to view. Therefore, if there are a total of 10 security policies, but the administrative privileges only allow the user to view 6 of them, then this command returns the details of the 6 security policies.

For the 4 remaining security policies, this command returns just the name and ID fields:

```
/opt/mapr/bin/maprcli security policy
list
[ -cluster cluster-name]
[ -output terse|verbose. Default:
verbose]
[ -start <start record number,
starting from 0>. Default: 0 ]
[ -limit <limit>. Default:
2147483647 ]
[ -filter <filters>. Default: none ]
[ -columns <comma-separated list of
column names>. Default: all ]
[ -sortby <sort field> ]
[ -sortorder asc|desc ]
[ -expandaces true|false. Default:
false ]
```

REST

Request Type	GET
Request URL	<code>http[s]://<host>:<port>/rest/security/policy/list?<parameters></code>

Parameters

Parameter	Description																											
cluster	The cluster name on which to run the command. This parameter is optional. The local cluster is the default cluster.																											
output	Specifies whether the output should be terse or verbose. Default: verbose																											
start	Starting record to return. Default: 0																											
limit	Number of rows to return, beginning at start. Default: 2147483647 (2 ³¹ – 1)																											
filter	<div>A filter specifying the policies to display. The supported filters are as follows:</div> <table><tr><th>Abbreviated Name</th><th>Filter Name</th><th>Description</th></tr><tr><td>n</td><td>polycyname</td><td>Name</td></tr><tr><td>id</td><td>policyid</td><td>Policy ID</td></tr><tr><td>ct</td><td>ctime</td><td>Creation time</td></tr><tr><td>mt</td><td>mtime</td><td>Modification time</td></tr><tr><td>ea</td><td>audited</td><td>Audit enabled</td></tr><tr><td>ws</td><td>wiresecurity</td><td>Wire security enabled</td></tr><tr><td>at</td><td>allowtagging</td><td>Allow tagging</td></tr><tr><td>ac</td><td>accesscontrol</td><td>Access control</td></tr></table>	Abbreviated Name	Filter Name	Description	n	polycyname	Name	id	policyid	Policy ID	ct	ctime	Creation time	mt	mtime	Modification time	ea	audited	Audit enabled	ws	wiresecurity	Wire security enabled	at	allowtagging	Allow tagging	ac	accesscontrol	Access control
Abbreviated Name	Filter Name	Description																										
n	polycyname	Name																										
id	policyid	Policy ID																										
ct	ctime	Creation time																										
mt	mtime	Modification time																										
ea	audited	Audit enabled																										
ws	wiresecurity	Wire security enabled																										
at	allowtagging	Allow tagging																										
ac	accesscontrol	Access control																										
columns	<div>A comma-separated list of fields to return in the query. See the parameters for the list of column names.</div> <div>When issuing maprcli security policy info -columns and maprcli security policy list -columns commands, the column for the policy name is name.</div>																											

Parameter	Description																											
sortby	The field on which the results should be sorted. You can use either of the two long names or the shortname. Valid values are:																											
	<table><tr><th>Long Name</th><th>Short Name</th><th>Description</th></tr><tr><td>polycname/ securitypolycname</td><td>n</td><td>Name</td></tr><tr><td>policyid/ securitypolicyid</td><td>id</td><td>Policy ID</td></tr><tr><td>ctime/ securitypolyc time</td><td>ct</td><td>Creation time</td></tr><tr><td>mtime/ securitypolycm time</td><td>mt</td><td>Modification time</td></tr><tr><td>audited/ securitypolyc auditdataaccess</td><td>ea</td><td>Audit enabled</td></tr><tr><td>wiresecurity/ securitypolicyw iresecurityenab led</td><td>ws</td><td>Wire encryption enabled</td></tr><tr><td>allowtagging/ securitypolyc allowtagging</td><td>at</td><td>Allow tagging</td></tr><tr><td>accesscontrol/ securitypolyc accesscontrol</td><td>ac</td><td>Access control flag</td></tr></table>	Long Name	Short Name	Description	polycname/ securitypolycname	n	Name	policyid/ securitypolicyid	id	Policy ID	ctime/ securitypolyc time	ct	Creation time	mtime/ securitypolycm time	mt	Modification time	audited/ securitypolyc auditdataaccess	ea	Audit enabled	wiresecurity/ securitypolicyw iresecurityenab led	ws	Wire encryption enabled	allowtagging/ securitypolyc allowtagging	at	Allow tagging	accesscontrol/ securitypolyc accesscontrol	ac	Access control flag
	Long Name	Short Name	Description																									
	polycname/ securitypolycname	n	Name																									
	policyid/ securitypolicyid	id	Policy ID																									
	ctime/ securitypolyc time	ct	Creation time																									
	mtime/ securitypolycm time	mt	Modification time																									
	audited/ securitypolyc auditdataaccess	ea	Audit enabled																									
	wiresecurity/ securitypolicyw iresecurityenab led	ws	Wire encryption enabled																									
	allowtagging/ securitypolyc allowtagging	at	Allow tagging																									
accesscontrol/ securitypolyc accesscontrol	ac	Access control flag																										
sortorder	The sort order. Valid values are asc (ascending) or desc (descending).																											
expandaces	Expand ACEs into their respective fields for display. Default: false																											

Examples

Example 1

A user without administrative privileges can only view the security policy name and ID. In the following example, there are 2 security policies pci and hipaa. test1 is a user with a regular user ticket, but without administrative privileges. This user can only view the name and id fields of the security policies:

CLI

```
/opt/mapr/bin/maprcli security policy
list -json
{
  "timestamp":1548363754194,
  "timeofday":"2019-01-24
01:02:34.194 GMT-0800 PM",
```

```

    "status":"OK",
    "total":2,
    "data":[
      {
        "policyname":"pci",
        "policyid":1
      },
      {
        "policyname":"hipaa",
        "policyid":2
      }
    ]
  }
}

```

REST

```

curl -u mapr:mapr -X GET -k "https://
host:8443/rest/security/policy/list"
{"timestamp":1548363754194,"timeofday"
:"2019-01-24 01:02:34.194 GMT-0800
PM","status":"OK","total":2,"data":
[{"policyname":"pci","policyid":1},
{"policyname":"hipaa","policyid":2}]}

```

Example 2

List the policies sorted by their name. You can use either of the two `sortby` long names parameters, or the `shortname` parameter to sort the policies. In this example, the two policies are `MILITARY` and `TOPSECRET`. The policies are displayed in the ascending order of their name.

CLI

```

/opt/mapr/bin/maprcli security policy
list -sortby securitypolicyname -json
{
  "timestamp":1554957377267,
  "timeofday":"2019-04-10
09:36:17.267 GMT-0700 PM",
  "status":"OK",
  "total":2,
  "data":[
    {
      "policyname":"MILITARY",
      "policyid":2,
      "mtime":"Tue Apr 09
06:07:54 PDT 2019",
      "ctime":"Tue Apr 09
04:19:00 PDT 2019",
      "wiresecurity":"1",
      "audited":"0",
      "allowtagging":"1",

      "accesscontrol":"Disarmed",

      "enableddataauditoperations":"getattr,
      setattr, chown, chperm, chgrp, getxattr, li
      stxattr, setxattr, removexattr, read, writ
      e, create, delete, mkdir, readdir, rmdir, cr
      eatesym, lookup, rename, createdev, trunca
      te, tablecfcreate, tablecfdelete, tablecf
      modify, tablecfScan, tableget, tableput, t
      ablescan, tablecreate, tableinfo, tablemo
      dify, getperm, getpathforfid, hardlink, fi

```

```

lescan,fileoffload,filerecall,filetier
jobstatus,filetierjobabort,filetieroff
loadevent,filetierrecallevent",

"disableddataauditoperations":"","
    "acl":{
        "Principal":"User
root",
        "Allowed
actions":["r, a, fc]"
    },
    "aces":{
        "writeaces":"u:user7
| u:user10"
    }
    "unmaskedreaddbace":"u:user7"
    },
    {
        "policyname":"TOPSECRET",
        "policyid":1,
        "mtime":"Mon Apr 08
22:33:52 PDT 2019",
        "ctime":"Mon Apr 08
22:33:52 PDT 2019",
        "wiresecurity":"1",
        "audited":"0",
        "allowtagging":"1",
        "accesscontrol":"Armed",

"enableddataauditoperations":["getattr,
setattr, chown, chperm, chgrp, getxattr, li
stxattr, setxattr, removexattr, read, writ
e, create, delete, mkdir, readdir, rmdir, cr
eatesym, lookup, rename, createdev, trunca
te, tablecfcreate, tablecfdelete, tablecf
modify, tablecfScan, tableget, tableput, t
ablescan, tablecreate, tableinfo, tablemo
dify, getperm, getpathforfid, hardlink, fi
lescan, fileoffload, filerecall, filetier

loadevent, filetierrecallevent",

"disableddataauditoperations":"","
    "acl":[
        {
            "Principal":"User
user7",
            "Allowed
actions":["r, a, fc]"
        },
        {
            "Principal":"User
user10",
            "Allowed
actions":["a]"
        }
    ]
}

```

Now use the other long name parameter to see if you get the same result:

```
/opt/mapr/bin/maprcli security policy
list -sortby policyname -json
{
  "timestamp":1554957411992,
  "timeofday":"2019-04-10
09:36:51.992 GMT-0700 PM",
  "status":"OK",
  "total":2,
  "data":[
    {
      "policyname":"MILITARY",
      "policyid":2,
      "mtime":"Tue Apr 09
06:07:54 PDT 2019",
      "ctime":"Tue Apr 09
04:19:00 PDT 2019",
      "wiresecurity":"1",
      "audited":"0",
      "allowtagging":"1",

      "accesscontrol":"Disarmed",

      "enableddataauditoperations":"getattr,
setattr, chown, chperm, chgrp, getattr, li
stxattr, setxattr, removexattr, read, writ

eatesym, lookup, rename, createdev, trunca
te, tablecfcreate, tablecfdelete, tablecf
modify, tablecfScan, tableget, tableput, t
ablescan, tablecreate, tableinfo, tablemo
dify, getperm, getpathforfid, hardlink, fi
lescan, fileoffload, filerecall, filetier
jobstatus, filetierjobabort, filetieroff
loadevent, filetierrecalevent",

      "disableddataauditoperations":"",
      "acl":{
        "Principal":"User
root",
        "Allowed
actions":["r, a, fc]"
      },
      "aces":{
        "writeaces":"u:user7
| u:user10"

      "unmaskedreaddbace":"u:user7"
    }
  ],
  {
    "policyname":"TOPSECRET",
    "policyid":1,
    "mtime":"Mon Apr 08
22:33:52 PDT 2019",
    "ctime":"Mon Apr 08
22:33:52 PDT 2019",
    "wiresecurity":"1",
    "audited":"0",
    "allowtagging":"1",
```

```

        "accesscontrol": "Armed",

        "enableddataauditoperations": "getattr,
        setattr, chown, chperm, chgrp, getxattr, li
        stxattr, setxattr, removexattr, read, writ
        e, create, delete, mkdir, readdir, rmdir, cr
        eatesym, lookup, rename, createdev, trunca
        te, tablecfcreate, tablecfdelete, tablecf
        modify, tablecfScan, tableget, tableput, t
        ablescan, tablecreate, tableinfo, tablemo
        dify, getperm, getpathforfid, hardlink, fi
        lescan, fileoffload, filerecall, filetier
        jobstatus, filetierjobabort, filetieroff
        loadevent, filetierrecallevent",

        "disableddataauditoperations": "",
        "acl": [
            {
                "Principal": "User
user7",
                "Allowed
actions": "[r, a, fc]"
            },
            {
                "Principal": "User

```

Example 3

Display just the name of the policy and the access control state.

CLI

```
/opt/mapr/bin/maprcli security
policy list -columns
"policyname,accesscontrol"
accesscontrol  policyname
Armed          TOPSECRET
Disarmed       MILITARY
```

REST

```
curl -u mapr:mapr -X GET -k "https://
host:8443/rest/security/policy/list?
&sortby=securitypolicyname&columns=pol
icyname,accesscontrol"
{"timestamp":1554959313985,"timeofday"
:"2019-04-10 10:08:33.985 GMT-0700
PM","status":"OK","total":2,"data":
[{"policyname":"MILITARY","accesscontr
ol":"Disarmed"},
{"policyname":"TOPSECRET","accesscontr
ol":"Armed"}]}
```

Example 4

Use a filter to search for matching policy(ies):

CLI

```
/opt/mapr/bin/maprcli security policy
list -filter \[n=="TOP*" \] -json
{
  "timestamp":1554963795805,
  "timeofday":"2019-04-10
11:23:15.805 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "policyname":"TOPSECRET",
      "policyid":1,
      "mtime":"Mon Apr 08
22:33:52 PDT 2019",
      "ctime":"Mon Apr 08
22:33:52 PDT 2019",
      "wiresecurity":"1",
      "audited":"0",
      "allowtagging":"1",
      "accesscontrol":"Armed",

      "enableddataauditoperations":"getattr,
setattr,chown,chperm,chgrp,getattr,li
stxattr,setxattr,removexattr,read,writ
e,create,delete,mkdir,readdir,rmdir,cr
eatesym,lookup,rename,createdev,trunca
te,tablecfcreate,tablecfdelete,tablecf

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/security/policy/modify?<parameters>

Parameters

You must specify either name or path, but not both.

Parameter	Description
name	The name of this security policy. Security policy names must be unique within the cluster and must contain only alphanumeric characters, hyphen (-) and underscore (_). Other characters like space and commas are not allowed. Maximum length of the security policy name is 32 characters. This parameter is mandatory.
description	An ASCII string that gives a user-readable description of the policy.
cluster	The cluster name on which to run the command. If the cluster name is not supplied, the command is run on the current cluster.
allowtagging	Allows or disallows tagging for the security policy. If set to true, this security policy can be used to tag HPE Data Fabric file system resources. When the security policy is first created, the allowtagging flag is set to false to give the administrator time to configure the security policy, before allowing users to tag HPE Data Fabric resources with this security policy. Default is false.
accesscontrol	<p>Determines whether the relevant ACEs in this security policy are enforced for HPE Data Fabric resources that are tagged with this security policy. The following settings are supported:</p> <ul style="list-style-type: none"> • Armed: When a HPE Data Fabric resource is tagged with this security policy, the relevant ACEs in this security policy are enforced when the resource is accessed. This is the normal operation mode. • Disarmed (default setting): Even if a HPE Data Fabric resource is tagged with this security policy, the ACEs in this security policy are NOT enforced. Use this setting as an emergency switch when an incorrectly configured security policy denies authorized users from accessing resources. • Denied: Access is always denied to any HPE Data Fabric resources tagged with this security policy. Use this setting for security policies that are no longer in use, but are still tagged to some HPE Data Fabric resources. Administrators can look at the audit logs to determine the root cause.
auditenabled	<p>Specifies whether or not to audit operation on the resource on which the policy is tagged. Set to true to enable auditing, and false to disable auditing.</p> <p>Default: false.</p>

Parameter	Description
dataauditops	<p>The comma separated list of file system operations to include (specified with a preceding plus sign (+)), or exclude (specified with a preceding minus sign (-)) from auditing.</p> <p>To exclude the first operation in the list of operations from auditing, you must precede the operation by two minus (--) signs. You must precede subsequent operations to exclude, by only a single minus (-) sign, irrespective of whether the first operation was included (using a plus (+) sign) or excluded (using two minus (--) signs). If neither sign is specified, the given operation is included for auditing.</p> <p>The operations that can be included (+) or excluded (-) from auditing are listed in Auditing Data Access Operations on page 920. You can, alternatively, group all the operations using the keyword all, which:</p> <ul style="list-style-type: none"> • If included (+), cannot be specified with a list of other included operations. • If excluded (-), cannot be specified with a list of other excluded operations. <p>All specified operations must either be included or excluded from auditing. You cannot specify a mixed list of included and excluded operations. Other than the specified operations, by default, all other operations are:</p> <ul style="list-style-type: none"> • Included for auditing, if the specified list is a list of excluded operations. • Excluded from auditing, if the specified list is a list of included operations. <p>Including <code>setattr</code> automatically enables the following operations:</p> <ul style="list-style-type: none"> • <code>chown</code> • <code>chgrp</code> • <code>chperm</code> <p>If you do nothing with <code>setattr</code> (neither enable nor disable), you can enable or disable <code>chown</code>, <code>chgrp</code>, and <code>chperm</code> in any combination.</p>
disableddataauditops	<p>The comma-separated list of disabled file system audit operations to set. This is an alternate way of setting audit operations from the <code>dataauditops</code> option.</p> <p>No plus (+) or minus signs (-) are allowed for this option.</p> <p>Any audit operations specified with this option replace any existing disabled audit operations configured for this security policy, while any audit operations that are not specified, are enabled.</p> <p>Merging of the specified audit operations with existing audit operations is not done, as compared to the <code>dataauditops</code> option.</p> <p>Excluding <code>setattr</code> automatically disables the following operations:</p> <ul style="list-style-type: none"> • <code>chown</code> • <code>chgrp</code> • <code>chperm</code> <p>If you do nothing with <code>setattr</code> (neither enable nor disable), you can enable or disable <code>chown</code>, <code>chgrp</code>, and <code>chperm</code> in any combination.</p>
wiresecurityenabled	<p>Determines whether or not to perform wire-level encryption for data of resource on which security is tagged. Set to <code>true</code> to enable wire-level encryption, and <code>false</code> to disable wire-level encryption.</p> <p>Default: <code>true</code></p>

Parameter	Description
readfileace	<p>An ACE that controls who can read from this file. If you do not set an ACE, basic file permissions are used. Files created with basic file permissions have mode 0755. Anyone can read the file contents. To read a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the volume • Read permission to the file
writefileace	<p>An ACE that controls who can write to this file. If you do not set an ACE, basic file permissions are used. Files created with basic file permissions have mode 0755. Only the owner can write to the file. To write to a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Write permission to the volume • Write permission to the file
executefileace	<p>An ACE that controls who can execute this file. If you do not set an ACE, basic file permissions are used. Files created with basic file permissions have mode 0755. Anyone can execute this file (assuming that the contents are executable). To execute a file that is tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the volume • Read and execute permissions to the file
readdirace	<p>Controls who can read the contents of files in this directory. If you do not set an ACE, basic file permissions are used. Directories created with basic file permissions have mode 0755. Anyone can read the contents of files in this directory. To read the contents of a file in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the volume • Read permission to the parent directory • Read permission to the file
addchildace	<p>Controls who can create objects (files and directories) in this directory. If you do not set an ACE, basic file permissions are used. Directories created with basic file permissions have mode 0755. By default, only the owner can create files and directories in this directory. To create files and directories in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Add child permission for the parent directory • Read and execute permissions to all directories in the path • Write permission to the parent directory, and • Write permission to the volume.

Parameter	Description
deletechildace	<p>Controls who can delete objects (files and directories) in this directory. If you do not set an ACE, basic file permissions are used. Directories created with basic file permissions have mode 0755. By default, only the owner can delete files and directories in this directory. To delete files and directories in a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Delete child permission for the parent directory • Read and execute access to all directories in the path • Write permission to the parent directory • Write permission to the volume
lookupdirace	<p>Controls who can list the contents (files and directories) of this directory. If you do not set an ACE, basic file permissions are used. Directories created with basic file permissions have mode 0755. Anyone can list the files in this directory. To list the contents of a directory tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the directory • Read permission to the volume
readdbace	<p>The ACE for <i>column reads</i>. Fields within the <i>column family</i> inherit this permission.</p> <p>Default: u:creator.</p> <p>To read fields in <i>JSON DB column families</i> tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Read permission to the DB column family • Read and execute permissions to all directories in the path • Read permission to the volume
writedbace	<p>The ACE for <i>column writes</i> (puts and deletes). Fields within the <i>column family</i> inherit this permission.</p> <p>Default: u:creator.</p> <p>To perform column writes, you must have the following permissions:</p> <ul style="list-style-type: none"> • Write permission to the DB column family • Read and execute permission to all directories in the path • Write permission to the parent directory • Write permission to the volume

Parameter	Description
traversedbace	<p>DB CF traverse permission settings, which determine the permission to pass over fields in JSON documents. Fields within the <i>column family</i> inherit this permission.</p> <p>Default: u:creator.</p> <p>To traverse fields in <i>JSON DB column families</i> tagged with this security policy, you must have the following permissions:</p> <ul style="list-style-type: none"> • Traverse permission to the DB column family • Read and execute permissions to all directories in the path • Read permission to the volume
readaces	A convenience option to set read permissions for all objects. This is equivalent to setting the same ACE for the readfileace, readdirace, lookupdirace, , readdbace, and traversedbace options.
writeaces	A convenience option to set write permissions for all objects. This is equivalent to setting the same ACE for writefileace, addchildace, deletchildace, and writedbace, options.
unmaskedreaddbace	This is the ACE for determining whether the users have the unmaskedreadperm permission to enable them to read the masked column data unmasked. These users must also have readdbace permission. The unmaskedreadperm permission will not be automatically set when using the convenience readaces parameter. The unmaskedreadperm permission must be specifically enabled in the security policy by using the unmaskedreaddbace ACE. See Dynamic Data Masking on page 955 for more information.
user	<p>Space separated list of user:permission,permission pairs. Use commas to separate each permission, and spaces to separate each user. For example, to give user tom, admin (a) and full control (fc) permissions, and user jane, admin (a) permission, use -user tom:a,fc jane:a</p> <p>If you do not specify this option, a security policy level administrative ACL is added for the administrator who created this security policy to have full privileges by default, that is [r, a, fc]. However, any other user with admin (a) privilege for this security policy can remove this privilege . Specifying this option overwrites the default setting to give security policy level privileges only to the users specified in the -user list.</p> <p>Use this option with care. You MUST specify admin (a) privilege for at least one administrator (for example, -user admin1:r, a, fc) in addition to privileges for any other users, to modify this security policy after creation. Otherwise, if the -user or -group options are specified but without admin (a) or full control (fc) permission, (for example, -user operator:r), no one other than the mapr administrator can modify the security policy.</p>
group	Space separated list of group:permission,permission pairs. Use commas to separate each permission, and spaces to separate each group. For example, to give group operators read (r) permission, and group secadmin full control (fc) permission, use -group operators:r secadmin:a,fc

ACE Handling Behaviour

Specified [ACE](#) are merged with the existing [ACE](#) for the security policy. For example, assume there is a security policy hipaa that currently only has readfileace and writefileace specified, with all other [ACEs](#) not specified:

ACE Type	ACE Value
readfileace	g:staff
writefileace	g:staff

Use the `maprcli security policy modify` command to set the `writefileace` and `addchildace` [ACE](#):

```
maprcli security policy modify -name hipaa -writefileace g:mapr -addchildace g:admin
```

Here, the value of `readfileace` remains as `g:staff`, `writefileace` is replaced by the new value `g:mapr`, and `addchildace` is added to the list of [ACE](#) for this security policy:

ACE Type	ACE Value
readfileace	g:staff
writefileace	g:mapr (overwrites older value)
addchildace	g:admin (new ACE)

Using the readaces convenience

The following example illustrates how to use the `readaces` convenience feature.

You create a security policy named `hipaa`, and set the `readfileace` and `writefileace` to `u:mapr`:

```
/opt/mapr/bin/maprcli security policy create -name hipaa -readfileace u:mapr -writefileace u:mapr

/opt/mapr/bin/maprcli security policy info -name hipaa -json
{
  "timestamp":1548660146619,
  "timeofday":"2019-01-27 11:22:26.619 GMT-0800 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "name":"hipaa",
      "id":3,
      "mtime":"Sun Jan 27 23:22:08 PST 2019",
      "ctime":"Sun Jan 27 23:22:08 PST 2019",
      "wireEncrypt":true,
      "auditEnabled":false,
      "allowTagging":false,
      "accessControl":"Disarmed",

      "enabled_dataAuditOps":"getattr,setattr,chown,chperm,chgrp,getattr,listxattr,
      setattr,removexattr,read,write,create,delete,mkdir,readdir,rmdir,createsy
      m,lookup,rename,createdev,truncate,tablecfcreate,tablecfdelete,tablecfmodify
      ,tablecfScan,tableget,tableput,tablescan,tablecreate,tableinfo,tablemodify,g
      etperm,getpathforfid,hardlink,filesan,fileoffload,filerecall,filetierjobsta
      tus,filetierjobabort,filetieroffloadevent,filetierrecallevnt",
      "disabled_dataAuditOps":"",
      "acl":{
        "Principal":"User test1",
        "Allowed actions":"[r, a, fc]"
      },
      "securityPolicyAces":{
        "readfileace":"u:mapr",
        "writefileace":"u:mapr"
```

```
}
}
]
}
```

You use the `maprcli security policy modify` command to change all the read [ACE](#), using the `readaces` option. `readaces` replaces all read [ACE](#) (`executefileace`, `readfileace`, `lookupdirace`, `readdirace`, `readdbace`, `traversedbace`) with the specified [ACE](#), leaving the write [ACE](#) intact:

```
/opt/mpr/bin/maprcli security policy modify -name hipaa -readaces g:mapr
/opt/mapr/bin/maprcli security policy info -name hipaa -json
{
  "timestamp":1548660250167,
  "timeofday":"2019-01-27 11:24:10.167 GMT-0800 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "name":"hipaa",
      "id":3,
      "mtime":"Sun Jan 27 23:24:04 PST 2019",
      "ctime":"Sun Jan 27 23:22:08 PST 2019",
      "wireEncrypt":true,
      "auditEnabled":false,
      "allowTagging":false,
      "accessControl":"Disarmed",
      "enabled_dataAuditOps":"getattr,setattr,chown,chperm,chgrp,getattr,listxattr,
      setattr,removexattr,read,write,create,delete,mkdir,readdir,rmdir,createsy
      m,lookup,rename,createdev,truncate,tablecfcreate,tablecfdelete,tablecfmodify
      ,tablecfscan,tableget,tableput,tablescan,tablecreate,tableinfo,tablemodify,g
      etperm,getpathforfid,hardlink,filesan,fileoffload,filerecall,filetierjobsta
      tus,filetierjobabort,filetieroffloadevent,filetierrecallevnt",
      "disabled_dataAuditOps":"",
      "acl":{
        "Principal":"User test1",
        "Allowed actions":"[r, a, fc]"
      },
      "securityPolicyAces":{
        "executefileace":"g:mapr",
        "readfileace":"g:mapr",
        "lookupdirace":"g:mapr",
        "readdirace":"g:mapr",
        "writefileace":"u:mapr",
        "readdbace":"g:mapr",
        "traversedbace":"g:mapr",
      }
    }
  ]
}
```

Examples

CLI

For example, add the writeaces [ACE](#) setting to the existing security policy `MILITARY`:

```
/opt/mapr/bin/maprcli security policy
modify -name MILITARY -writeaces
"u:user7|u:user10" -json
```

```
{
  "timestamp":1554814308487,
  "timeofday":"2019-04-09
05:51:48.487 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully updated
security policy 'MILITARY'"
  ]
}
```

REST

```
curl -u mapr:mapr -X POST -k "https://
host:8443/rest/security/policy/modify?
name=MILITARY&writeaces=u%3auser7|
u%3auser10"
{"timestamp":1554815274740,"timeofday":
"2019-04-09 06:07:54.740 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully updated
security policy 'MILITARY'"]}
```

security iam resource

Facilitates cluster resource-related operations related to IAM policy management.

The `security iam resource` command is used to retrieve information about a resource, to construct resource URN for a cluster resource, and to list actions that are associated with the individual cluster resource types.

Syntax

CLI

```
maprcli security iam resource -help
security iam resource
    actions
    [ -type <Resource
Type> ]
    info
    -urn <Resource URN>
    urn
    -clustergroup
<Cluster Group>
    -cluster <Cluster
Name>
    -type <Resource Type>
    [ -name <Resource
```

```
Name> ]  
  
[ -path <Resource  
Path> ]
```

security iam resource info

Retrieves information about the cluster resource based on the resource URN.

You can use the `security iam resource info` command to retrieve information about the cluster resource based on the resource URN.

When you run the `security iam resource info` command, you get the cluster group, cluster, resource type and resource path for the cluster resource that the resource URN represents.

Syntax

CLI

```
maprcli security iam resource  
info -urn <Resource URN>
```

REST

Request Type	PUT
Request URL	<code>http[s]:// <host>:<port>/ rest/iam/ resource/info? <parameters></code>

Parameters

Parameter	Description
urn	<p>(Required) The Resource URN such as volume, S3 bucket, or cluster.</p> <p>See Fabric Resource URN Format on page 2221 for details.</p> <p>Format <CLUSTER - GROUP> : <CLUSTER - NAME> : <RESOURCE - TYPE> : <RESOURCE - NAME / PATH>.</p>

Examples

Example 1: Retrieve information for a volume with resource URN as *default:cluster1:volume:a5*

CLI

```
sudo maprcli security iam resource info -urn  
urn:default:cluster1:volume:a5 -json  
{  
  "timestamp":1738059058902,  
  "timeofday":"2025-01-28 02:10:58.902 GMT-0800 AM",  
  "status":"OK",  
  "total":1,  
  "data":[  
    {  
      "ClusterGroup":"default",
```

```

        "ClusterName": "cluster1",
        "ResourceType": "volume",
        "ResourceName": "a5"
      }
    ]
  }

```

REST

```
curl -u <username> -X GET https://server.sj.us:8443/rest/security/iam/
resource/info?urn=urn:default:cluster1:volume:a5
```

Example 2: Retrieve information for a s3 bucket with resource URN as *urn:cg1:cluster-1:s3bucket:bucket1*

```

maprcli security iam resource info -urn
urn:cg1:cluster-1:s3bucket:bucket1 -json
{
  "timestamp": 1726568020508,
  "timeofday": "2024-09-17 03:13:40.508 GMT-0700 AM",
  "status": "OK",
  "total": 1,
  "data": [
    {
      "ClusterGroup": "cg1",
      "ClusterName": "cluster-1",
      "ResourceType": "s3bucket",
      "ResourceName": "bucket1"
    }
  ]
}

```

REST

```
curl -u <username> -X GET https://server.sj.us:8443/rest/security/iam/
resource/info?urn=urn:cg1:cluster-1:s3bucket:bucket1
```

Example 3: Retrieve information for a cluster with resource URN as *urn:cg2:cluster-2*

```

maprcli security iam resource info -urn urn:cg2:cluster-2 -json
{
  "timestamp": 1726567932141,
  "timeofday": "2024-09-17 03:12:12.141 GMT-0700 AM",
  "status": "OK",
  "total": 1,
  "data": [
    {
      "ClusterGroup": "cg2",
      "ClusterName": "cluster-2",
      "ResourceType": "cluster",
      "ResourceName": "cluster-2"
    }
  ]
}

```

REST

```
curl -u <username> -X GET https://server.sj.us:8443/rest/security/iam/
resource/info?urn=urn:cg2:cluster-2
```

security iam resource urn

Generates the unique resource name (URN) for a cluster/fabric resource.

You can use the `security iam resource urn` command to generate a resource URN that is an essential element of an IAM policy statement. See [IAM Policy JSON Format](#) on page 2220 for information about the format in which an IAM policy must be written.

The inputs required are clustergroup name, cluster name, resource name and the resource path.

The standard resource URN format is

`<CLUSTER-GROUP>:<CLUSTER-NAME>:<RESOURCE-TYPE>:<RESOURCE-NAME/PATH>`. See [Fabric Resource URN Format](#) on page 2221 for details.

Syntax**CLI**

```
maprcli security iam resource
urn -clustergroup <Cluster
Group> -cluster <Cluster Name> -type
<Resource Type> [ -name <Resource
Name> | -path <Resource Path> ]
```

REST

Request Type	PUT
Request URL	<code>http[s]:// <host>:<port>/ rest/iam/ resource/urn? <parameters></code>

Parameters

Parameter	Description
clustergroup	(Required) Name of the cluster group.
cluster	(Required) Name of the cluster that belongs to the cluster group specified in the command.
type	(Required) Cluster/fabric resource type. For example, volume, s3bucket.
path	(Required) The path to the resource in the cluster specified in the command, for which you want to generate the resource URN.

Examples for different Resource types

Example 1: Generate resource URN for a volume vol1-1 with path /opt/mapr/vol-1 from the cluster clusterB in the clustergroup cgrpA.

```
maprcli security iam resource urn -clustergroup cgrpA -cluster
clusterB -type volume -path /opt/mapr/vol-1 -json
{
  "timestamp":1726152308319,
  "timeofday":"2024-09-12 07:45:08.319 GMT-0700 AM",
  "status":"OK",
  "total":1,
```

```
"data":[
{
"ResourceURN":"urn:cgrpA:clusterB:volume:/opt/mapr/vol-1"
}
]
}
```

Example 2: s3bucket

```
maprcli security iam resource urn -clustergroup cg1 -cluster clusterX -type
s3bucket -name testbucket-1 -json
{
"timestamp":1726152308319,
"timeofday":"2024-09-12 07:45:08.319 GMT-0700 AM",
"status":"OK",
"total":1,
"data":[
{
"ResourceURN":"urn:cg1:clusterX:s3bucket:testbucket-1"
}
]
}
```

Example 3: Cluster

```
maprcli security iam resource urn -clustergroup cgrpX -cluster
primary -type cluster -json
{
"timestamp":1726152308319,
"timeofday":"2024-09-12 07:45:08.319 GMT-0700 AM",
"status":"OK",
"total":1,
"data":[
{
"ResourceURN":"urn:cgrpX:primary"
}
]
}
```

security iam resource actions

Lists supported resources in an IAM policy.

The iam resource actions command lists the actions that can be performed for the specified resource type. If no resource type is specified, the command lists the actions for all resource types.

 **NOTE:** The resource actions along with the resource URNs for various resources are the building blocks of the json file that represents an IAM policy.

Syntax

CLI

```
maprcli security iam resource actions
[ -type <Resource Type> ]
```

REST

Request Type	PUT
--------------	-----

Request URL	http[s]:// <host>:<port>/ rest/iam/ resource/actions? <parameters>
-------------	--

Parameters

Parameter	Description
type	(Optional) The resource type, such as volume, cluster, and S3 bucket.

Examples

List volume actions

CLI

```
maprcli security iam resource actions -type Volume -json
{
  "timestamp":1738058251706,
  "timeofday":"2025-01-28 01:57:31.706 GMT-0800 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "ResourceType":"volume",
      "ResourceActions":[
        "ReadVolume",
        "WriteVolume",
        "DeleteVolume",
        "MountVolume",
        "MirrorVolume",
        "ManageVolumeConfig",
        "ManageVolumeACE",
        "VolumeFullControl"
      ]
    }
  ]
}
```

REST

```
curl -u <username> -X GET https://server.sj.us:8443/rest/security/iam/
resource/actions?type=Volume
```

List cluster actions

CLI

```
maprcli security iam resource actions -type Cluster -json
{
  "timestamp":1738058425818,
  "timeofday":"2025-01-28 02:00:25.818 GMT-0800 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
```

```

        "ResourceType": "cluster",
        "ResourceActions": [
            "ViewClusterConfig",
            "ManageClusterServices",
            "ManageClusterOperations",
            "ManageClusterSettings",
            "ManageIamRoleOperations",
            "ManageClusterACE",
            "ManageStartStopService",
            "ManageClusterVolume"
        ]
    }
]
}

```

REST

```
curl -u <username> -X GET https://server.sj.us:8443/rest/security/iam/
resource/actions?type=Cluster
```

List S3 bucket actions

CLI

```

maprcli security iam resource actions -type s3bucket -json
{
    "timestamp": 1738058692979,
    "timeofday": "2025-01-28 02:04:52.979 GMT-0800 AM",
    "status": "OK",
    "total": 1,
    "data": [
        {
            "ResourceType": "s3bucket",
            "ResourceActions": [
                "AbortMultipartUpload",
                "DeleteBucket",
                "ForceDeleteBucket",
                "DeleteBucketPolicy",
                "DeleteObject",
                "GetBucketLocation",
                "GetBucketNotification",
                "GetBucketPolicy",
                "GetObject",
                "HeadBucket",
                "ListAllMyBuckets",
                "ListBucket",
                "ListBucketVersions",
                "ListBucketMultipartUploads",
                "ListMultipartUploadParts",
                "PutBucketLifecycle",
                "GetBucketLifecycle",
                "PutBucketNotification",
                "PutBucketEncryption",
                "DeleteObjectTagging",
                "PutBucketPolicy",
                "PutObject",
                "PutObjectRetention",
                "GetObjectRetention",
                "GetObjectLegalHold",
                "PutObjectLegalHold",
                "GetBucketObjectLockConfiguration",
                "PutBucketObjectLockConfiguration",
                "GetBucketTagging",
            ]
        }
    ]
}

```

```

        "PutBucketTagging",
        "GetObjectVersion",
        "GetObjectVersionTagging",
        "DeleteObjectVersion",
        "DeleteObjectVersionTagging",
        "PutObjectVersionTagging",
        "GetObjectTagging",
        "PutObjectTagging",
        "GetBucketEncryption",
        "PutBucketVersioning",
        "GetBucketVersioning",
        "GetReplicationConfiguration",
        "PutReplicationConfiguration"
    ]
}

```

REST

```
curl -u <username> -X GET https://server.sj.us:8443/rest/security/iam/
resource/actions?type=s3bucket
```

security iam task

Syntax

When an IAM policy is in the process of enforcement, the enforcement operation initiates separate tasks for each resource specified in the policy. For example, if an IAM policy contains statements related to two resources, two tasks are created.

See [IAM Policy JSON Format](#) on page 2220 for information on IAM policy format.

These tasks can be managed by using options such as info, list, or abort, as listed here:

```

maprcli security iam task -help
security iam task

    info
        -id <Task ID>

    list
        [ -cluster <Cluster Name> ]
        [ -policy <Policy Name> ]
        [ -status <Task Status> ]

    abort
        -id <Task ID>

```

security iam task list

Lists a list of IAM policy tasks with their status.

You can use `iam task list` command to fetch a list of IAM policy- identity (user,group, and/or role) associations on a fabric.

The task ID comprises three digits that are separated by period, for example, 2.0.0. Each digit represents the following:

- The first digit represents the IAM policy ID in the sequence of policies being enforced at a given time,
- The second digit represents the statement number in the IAM policy.

- The third digit represents the resource number in the statement.

NOTE: The numbering for the statement number and resource number starts at 0. If there are multiple IAM policies being enforced on multiple objects at the same time, the numbering is implemented based on the sequence of policy implementation, and in turn sequence of statements in a policy and the sequence of resources mentioned in the policy statements.

You can filter tasks based on cluster name, policy name and/or task status.

IMPORTANT: Supported values for task status are *NotStarted*, *InProgress*, *Success*, *Error*, *Aborted*.

Syntax

CLI

IMPORTANT: The information is displayed only for identity (IAM) policies that have the status *Enforcing*, *Enforced*, *Disarming*, or *Disarmed* only.

```
maprcli security iam task
list [ -cluster <Cluster Name> ]
[ -policy <Policy Name> ] [ -status
<Task Status> ]
```

REST

Request Type	GET
Request URL	http[s]:// <host>:<port>/ rest/iam/task/ list?<parameters>

Parameters

Parameter	Description
type	(Optional) The resource type. You must use one parameter from: cluster, policy or status to list the tasks. Format: [-cluster <Cluster Name> -policy <Policy Name> -status <Task Status>]

Examples

List current tasks

CLI

```
maprcli security iam task list -json
{
  "timestamp":1726151803004,
  "timeofday":"2024-09-12 07:36:43.004 GMT-0700 AM",
  "status":"OK",
  "total":6,
  "data":[
    {
      "Id":"2.0.0",
```

```

    "Resource": "urn:default:secondary:volume:vol-1",
    "Status": "Success"
  },
  {
    "Id": "2.1.0",
    "Resource": "urn:default:primary:volume:vol-2",
    "Status": "NotStarted"
  },
  {
    "Id": "1.0.0",
    "Resource": "urn:default:primary:volume:vol-1",
    "Status": "Success"
  },
  {
    "Id": "1.1.0",
    "Resource": "urn:default:secondary:volume:vol-2",
    "Status": "Success"
  },
  {
    "Id": "2.2.0",
    "Resource": "urn:default:primary:volume:vol-3",
    "Status": "InProgress"
  },
  {
    "Id": "1.2.0",
    "Resource": "urn:default:secondary:volume:vol-3",
    "Status": "Aborted"
  }
]
}

```

REST

```
curl -u <username> -X GET https://server.sj.us:8443/rest/security/iam/task/
list
```

Filtering the Tasks

You can filter from all resource tasks associated with a cluster. For example:

- **Filter by Cluster**

CLI

```
maprcli security iam task list -cluster primary -json
{
  "timestamp":1726152058255,
  "timeofday":"2024-09-12 07:40:58.255 GMT-0700 AM",
  "status":"OK",
  "total":3,
  "data":[
    {
      "Id":"2.1.0",
      "Resource":"urn:default:primary:volume:vol-2",
      "Status":"NotStarted"
    },
    {
      "Id":"1.0.0",
      "Resource":"urn:default:primary:volume:vol-1",
      "Status":"Success"
    },
    {
      "Id":"2.2.0",
      "Resource":"urn:default:primary:volume:vol-3",
      "Status":"InProgress"
    }
  ]
}
```

REST

```
curl -u <username> -X GET https://server.sj.us:8443/rest/security/iam/
task/list?cluster=primary
```

- **Filter and list tasks by the identity policy 'policy1'**

CLI

```
sudo maprcli security iam task list -policy policy1 -json
{
  "timestamp":1738060289052,
  "timeofday":"2025-01-28 02:31:29.052 GMT-0800 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "Id":"1.0.0",
      "Update":"False",
      "Resource":"urn:default:cluster1:volume:a5",
      "Status":"NotStarted"
    }
  ]
}
```

REST

```
curl -u <username> -X GET https://server.sj.us:8443/rest/security/iam/
task/list?policy=policy1
```

- **Filter and list the tasks by Task Status 'success'**

CLI

```
maprccli security iam task list -status Success -json
{
  "timestamp":1726151803004,
  "timeofday":"2024-09-12 07:36:43.004 GMT-0700 AM",
  "status":"OK",
  "total":6,
  "data":[
    {
      "Id":"2.0.0",
      "Resource":"urn:default:secondary:volume:vol-1",
      "Status":"Success"
    },
    {
      "Id":"1.0.0",
      "Resource":"urn:default:primary:volume:vol-1",
      "Status":"Success"
    },
    {
      "Id":"1.1.0",
      "Resource":"urn:default:secondary:volume:vol-2",
      "Status":"Success"
    }
  ]
}
```

REST

```
curl -u <username> -X GET https://server.sj.us:8443/rest/security/iam/
task/list?status=Success
```

security iam task info

Fetches detailed information about policy enforcement task based on the task ID.

You can use `iam task info` command to get the detailed information for a specific enforcement task, whenever an IAM policy is attached/detached with the specified identities.

Syntax

CLI

```
maprccli security iam task info -id
<Task ID>
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/iam/task/info?<taskid>

Parameters

Parameter	Description
-id	(Required) The task ID, represented in <Policy ID> .<Statement ID>.<Sequence ID> format.

Example
Retrieve information related to task ID 1.0.0

CLI

```
maprcli security iam task info -id 1.0.0 -json
{
  "timestamp":1726143125093,
  "timeofday":"2024-09-12 05:12:05.093 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "Id":"1.0.0",
      "Resource":"urn:default:primary:volume:vol-1",
      "Status":"Success",
      "Type":"EnforceAllow",
      "Identities":{
        "Users":
"user1,user2,user3",
        "Groups":
"",
        "Roles":
""
      }
    }
  ]
}
```

REST

```
curl -u <username> -X GET https://server.sj.us:8443/rest/security/iam/task/info?id=1.0.0
```

security iam task abort

Forcefully aborts a resource task with not started status based on the task ID.

You can use this command to forcefully abort a resource task with not started status.

CLI

 **IMPORTANT:** This operation is only supported on primary cluster group. Only existing tasks with status NotStarted can be aborted.

maprcli security iam task abort -id <Task ID>

REST

Request Type	POST
--------------	------

Request URL	http[s]:// <host>:<port>/ rest/iam/task/ abort?<id>
-------------	--

Parameters

Parameter	Description
-id	(Required) The task ID, represented in <Policy ID> .<Statement ID>.<Sequence ID> format.

Example

Abort task with task ID 1.2.0

CLI

```
maprcli security iam task abort -id 1.2.0 -json
{
  "timestamp":1726570360894,
  "timeofday":"2024-09-17 03:52:40.894 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":[
    "IAM Task '1.2.0' aborted successfully"
  ]
}
```

REST

```
curl -u <username> -X POST https://server.sj.us:8443/rest/security/iam/task/abort?id=1.2.0
```

security iam role

Command to manage custom roles.

You can use the security iam role command to do the following:

- manage custom roles
- attach custom roles to identity policies or detach custom roles from identities, that is, users and groups
- retrieve information about mapping between custom role and identities

Syntax

```
maprcli security iam role
```

Example

```
maprcli security iam role -help
security iam role
```

```
create
    -name <Role Name>
    [ -desc <Role Description> ]
    [ -cluster <Cluster Name> ]

modify
    -name <Role Name>
    -desc <Role Description>
    [ -cluster <Cluster Name> ]

remove
    -name <Role Name>
    [ -cluster <Cluster Name> ]

info
    -name <Role Name>
    [ -cluster <Cluster Name> ]

list
    [ -cluster <Cluster Name> ]
    [ -limit <Limit>. default: 2147483647 ]
    [ -start <Start>. default: 0 ]

attach
    -name <Role Name>
    [ -users <List of Users> ]
    [ -groups <List of Groups> ]

detach
    -name <Role Name>
    [ -users <List of Users> ]
    [ -groups <List of Groups> ]
```

See the specific page of the respective command for details, listed as follows:

security iam role create

Creates custom roles with the security iam role create command.

The security iam role create command is used to create custom roles.

Custom role creation is supported only on primary cluster.

Syntax

CLI

```
maprcli security iam role
create -name <Role Name> -desc
<Description Message>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/iam/role/create?<parameters>

Parameters

Parameter	Description
name	(Required) Name of the role.
desc	(Optional) Description about the role.

Example

Create a custom role with the name *Eng* and description *All Engineers*.

CLI

```
maprcli security iam role create -name Eng -desc "All Engineers" -json
{
  "timestamp":1726571524419,
  "timeofday":"2024-09-17 04:12:04.419 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully created the role 'Eng'."
  ]
}
```

REST

```
curl -u <username> -X POST https://server.sj.us:8443/rest/security/iam/role/
create?name=Eng&desc="All Engineers"
```

security iam role attach

The `security iam role attach` command assigns a custom role to users, and/or groups. You can run the `security iam role attach` command on a primary cluster only.

Syntax**CLI**

```
maprcli security iam role
attach -name <Role Name> [ -users
<List of Users> ] [ -groups <List of
Groups> ]
```

REST

Request Type	POST
Request URL	http[s]:// <host>:<port>/ rest/iam/role/ attach? <parameters>

Parameters

Parameter	Description
name	(Required) Name of the role.

Parameter	Description
users	(Optional) Name of the user. To assign a role to multiple users, use a comma-separated list of users.
groups	(Optional) Name of the group. To assign a role to multiple groups, use a comma-separated list of groups.

Example

Attach the *Eng* role to the user *user1*

CLI

```
maprcli security iam role attach -name Eng -users user1 -json
{
  "timestamp":1726571570127,
  "timeofday":"2024-09-17 04:12:50.127 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":[
    "Successfully attached the role 'Eng'."
  ]
}
```

REST

```
curl -u <username> -X POST https://server.sj.us:8443/rest/security/iam/role/attach?name=Eng\&users=user1
```

security iam role detach

The `security iam role detach` command removes or detaches identities such as users and groups from a custom role.

You can run the `security iam role detach` command on a primary cluster only.

Syntax

CLI

```
maprcli security iam role detach -name <Role Name> [ -users <List of Users> ] [ -groups <List of Groups> ]
```

REST

Request Type	POST
Request URL	<code>http[s]://<host>:<port>/rest/iam/role/detach?<parameters></code>

Parameters

Parameter	Description
name	(Required) Name of the role.
users	(Optional) Name of the user.
groups	(Optional) Name of the group.

Example

Detach role *Eng* from the user *user1*

CLI

```
maprcli security iam role detach -name Eng -users user1 -json
{
  "timestamp":1726571645332,
  "timeofday":"2024-09-17 04:14:05.332 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":[
    "Successfully detached the role 'Eng'."
  ]
}
```

REST

```
curl -u <username> -X POST https://server.sj.us:8443/rest/security/iam/role/
detach?name=Eng&users=user1
```

security iam role modify

The security iam role modify updates the description of a custom role.
You can run the security iam role modify command on a primary cluster only.

Syntax

CLI

```
maprcli security iam role
modify -name <Role Name> -desc
<Description Message>
```

REST

Request Type	POST
Request URL	http[s]:// <host>:<port>/ rest/iam/role/ modify? <parameters>

Parameters

Parameter	Description
name	(Required) Name of the role.
desc	(Required) Description for the role.
cluster	(Optional) Name of the cluster.

Example**Modify the *Eng* role to add the description as *Dev Engineers***

```
maprcli security iam role modify -name Eng -desc "Dev Engineers" -json
{
  "timestamp":1726571720425,
  "timeofday":"2024-09-17 04:15:20.425 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":[
    "Successfully modified the role 'Eng'"
  ]
}
```

REST

```
curl -u <username> -X POST 'https://server.sj.us:8443/rest/security/iam/role/modify?name=Eng&desc="Dev Engineers"'
```

security iam role remove

The `security iam role remove` command deletes the specified custom role.

You can run the `security iam role remove` command on a primary cluster only.

NOTE: A role can be removed only if the role is NOT mapped to a user or group.

Syntax**CLI**

```
maprcli security iam role
remove -name <Role Name>
```

REST

Request Type	POST
Request URL	<pre>http[s]:// <host>:<port>/ rest/iam/role/ remove? <parameters></pre>

Parameters

Parameter	Description
name	(Required) Name of the role.

Example

Delete the *Eng* role

```
maprcli security iam role remove -name Eng -json
{
  "timestamp":1726571893152,
  "timeofday":"2024-09-17 04:18:13.152 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":["Successfully removed the role 'Eng'."]
}
```

REST

```
curl -u <username> -X POST https://server.sj.us:8443/rest/security/iam/role/
remove?name=Eng
```

security iam role list

The security iam role list command lists the existing custom roles.

Syntax

CLI

```
maprcli security iam role list -json
```

REST

Request Type	GET
Request URL	http[s]:// <host>:<port>/ rest/iam/role/ list

Parameters

Parameter	Description
cluster	(Optional) Name of the cluster.
limit	(Optional) Specify the limit and default values, for example, [-limit <Limit>. default: 2147483647].
start	(Optional) Specify the start, and default values, for example, [-start <Start>. default: 0].

Example

List existing roles

```
maprcli security iam role list -json
{
  "timestamp":1725885288560,
  "timeofday":"2024-09-09 05:34:48.560 GMT-0700 AM",
  "status":"OK",
  "total":3,
  "data":[
    {
      "name":"QA",
      "id":9,
      "description":"A QA Role",
      "identities":{
        "users":"","
        "groups":""
      }
    },
    {
      "name":"engineering",
      "id":8,
      "description":"An engineering role",
      "identities":{
        "users":"keycloakuser1,user2",
        "groups":"fabric-manager"
      }
    },
    {
      "name":"r1",
      "id":6,
      "description":"","
      "identities":{
        "users":"u1,u2",
        "groups":"fabric-manager"
      }
    }
  ]
}
```

REST

```
curl -u <username> -X GET https://server.sj.us:8443/rest/security/iam/role/
list
```

security iam role info

The security iam role info gets the detailed information about a specific custom role.

Syntax

CLI

```
maprcli security iam role info -name
<Role Name> -json
```

REST

Request Type	GET
--------------	-----

Request URL	http[s]:// <host>:<port>/ rest/iam/role/ info?<parameters>
-------------	---

Parameters

Parameter	Description
name	(Required) Name of the role.

Example:

Retrieve information for the engineering role

```
maprcli security iam role info -name engineering -json
{
  "timestamp":1725885213163,
  "timeofday":"2024-09-09 05:33:33.163 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "name":"engineering",
      "id":8,
      "description":"An engineering role",
      "identities":{"users":"keycloakuser1,user2",
        "groups":"fabric-manager"
      }
    }
  ]
}
```

REST

```
curl -u <username> -X GET https://server.sj.us:8443/rest/security/iam/role/info?name=engineering
```

security iam role mapping

Displays role-IAM policy mapping information.

The security iam role mapping displays information related to the role or roles that are assigned to the specified identities, that is one or more users and/or groups.

Syntax

CLI

```
maprcli security iam policy mapping
[-users <User Names>] [-groups <Group Names>] [-roles <Role Names>]
```

REST

Request Type	GET
--------------	-----

Request URL	http[s]:// <host>:<port>/ rest/iam/role/ mapping? <parameters>
-------------	--

Parameters

Parameter	Description
users	(Optional) Name of the users. You can specify multiple users in the command.
groups	(Optional) Name of the groups. You can specify multiple users in the command.

Example

Display role or roles assigned to the *mapr* user, and the *test1*, *test2* groups

```
maprccli security iam role mapping -users mapr -groups test1,test2 -json
{
  "timestamp":1727765455055,
  "timeofday":"2024-09-30 11:50:55.055 GMT-0700 PM",
  "status":"OK",
  "total":3,
  "data":[
    {
      "IdType":"USER",
      "IdName":"mapr",
      "IamRoles":"role2,my-role"
    },
    {
      "IdType":"GROUP",
      "IdName":"test1",
      "IamRoles":"my-role"
    },
    {
      "IdType":"GROUP",
      "IdName":"test2",
      "IamRoles":""
    }
  ]
}
```

REST

```
curl -u <username> -X GET 'https://server.sj.us:8443/rest/security/iam/role/
mapping?users=mapr&groups=test1,test2'
```

security iam policy

You can use the security iam policy command to do the following:

- manage identity access management (IAM) policies
- attach identity policies to identities or detach IAM policies from identities, that is, users, groups and roles.

- retrieve information about IAM policy - identity(users, groups, roles) mapping

You can run the `security iam policy` command on a primary cluster only.

Syntax

```
maprcli security iam policy
```

Example

```
$ maprcli security iam policy -help
security iam policy

    create
        -name <Policy Name>
        -content (JSON String | JSON File)
        [ -is_file (true|false). default: false ]

    modify
        -name <Policy Name>
        -content (JSON String | JSON File)
        [ -is_file (true|false). default: false ]

    remove
        -name <Policy Name>

    info
        -name <Policy Name>

    list
        [ -start <Start>. default: 0 ]
        [ -limit <Limit>. default: 2147483647 ]

    attach
        -name <Policy Name>
        [ -users <List of Users> ]
        [ -groups <List of Groups> ]
        [ -roles <List of Roles> ]

    detach
        -name <Policy Name>
        [ -users <List of Users> ]
        [ -groups <List of Groups> ]
        [ -roles <List of Roles> ]

    mapping
        [ -users <List of Users> ]
        [ -groups <List of Groups> ]
        [ -roles <List of Roles> ]
```

See the specific page of the respective command for details, listed as follows:

security iam policy create

Creates an IAM policy.

You can create an Identity Access Management (IAM) policy by running the `security iam policy create` command.

You can run the `security iam policy create` command on a primary cluster only.

 **NOTE:** To create a policy using data content (instead of file), ensure a valid JSON string with `-is_file false` option is provided.

Syntax

CLI

```
maprcli security iam policy
create -name <Policy Name> -content
(<File Path> | <String Content>)
[ -is_file ( true | false ) ]
```

REST

Request Type	POST
Request URL	<code>http[s]://<host>:<port>/rest/iam/policy/create?<parameters></code>

Parameters

Parameter	Description
name	(Required) Name of the policy.
content	(Required) Use one of the following options: <ul style="list-style-type: none">File pathTo create a policy without a file name, ensure that you provide a valid JSON string with <code>-is_file false</code> option.
-is_file false	(Optional) You can select either True or False. Default value : False

Example

Create policy *Policy1* using the specified JSON file

CLI

```
maprcli security iam policy create -name Policy1 -content /tmp/
content.json -is_file true -json
{
    "timestamp":1726152752276,
    "timeofday":"2024-09-12 07:52:32.276 GMT-0700 AM",
    "status":"OK",
    "total":0,
    "data":[
    ],
    "messages":[
        "Identity Policy 'Policy1' created successfully"
    ]
}
```

REST

```
curl -u <username> -X POST 'https://server.sj.us:8443/rest/security/iam/
policy/create?name=Policy1&content=/tmp/content.json&is_file=true'
```

security iam policy attach

Attaches an IAM policy to one or more identities.

You can use `iam policy attach` command to assign an IAM Policy to identities, that is, users, groups, and/or roles.

You can run the `iam policy attach` command on a primary cluster only.

Multiple type of identities (users, groups, roles) and number of identities (comma-separated names) can be specified in same command.

You cannot detach an identity policy that has the *enforcing* or the *disarming* status.

Syntax**CLI**

```
maprcli security iam policy attach
                        -name <Policy Name>
                        [ -users <List of
Users> ]
                        [ -groups <List of
Groups> ]
                        [ -roles <List of
Roles> ]
```

REST

Request Type	POST
Request URL	<pre>http[s]:// <host>:<port>/ rest/iam/policy/ attach? <parameters></pre>

Parameters

Parameter	Description
name	<i>(Required)</i> The name of the IAM policy.
users	<i>(Optional)</i> The list of users to which the policy is to be attached. To specify multiple users, use a comma-separated list of users.
groups	<i>(Optional)</i> The list of groups to which the policy is to be attached. To specify multiple groups, use a comma-separated list of groups.
roles	<i>(Optional)</i> The list of roles to which the policy is to be attached.

Example

Attach IAM policy *Policy1* to user *user3*

CLI

```
maprcli security iam policy attach -name Policy1 -users user3 -groups
group2 -roles role1 -json
{
    "timestamp":1726154305075,
    "timeofday":"2024-09-12 08:18:25.075 GMT-0700 AM",
    "status":"OK",
    "total":0,
    "data":[
        ],
    "messages":["
        Identity Policy 'Policy1' attached successfully"
    ]
}
```

REST

```
curl -u <username> -X POST https://server.sj.us:8443/rest/security/iam/
policy/attach?name=Policy1\&users=user3\&groups=group2\&roles=role1
```

security iam policy detach

Detaches an IAM policy from one or more identities.

You can use iam policy detach command to detach an identity access management (IAM) policy from identities (users, groups, or roles).

You can run the iam policy detach command on a primary cluster only.

Multiple type of identities (users, groups, roles) and number of identities (comma-separated names) can be specified in same command.

Syntax

CLI

```
maprcli security iam policy
detach -name [ -users <User
Names> -groups <Group Names> -roles
<Role Names> ]
```

REST

Request Type	POST
Request URL	http[s]:// <host>:<port>/ rest/iam/policy/ detach? <parameters>

Parameters

Parameter	Description
name	(Required) Name of the policy.
users	(Optional) List of users.
groups	(Optional) List of groups

Parameter	Description
roles	(Optional) Name of roles

Example

Detach IAM policy *Policy1* from user *user3*

CLI

```
maprcli security iam policy detach -name Policy1 -users user3 -json
{
  "timestamp":1726154439156,
  "timeofday":"2024-09-12 08:20:39.156 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":[
    "Identity Policy 'Policy1' detached successfully"
  ]
}
```

REST

```
curl -u <username> -X POST 'https://server.sj.us:8443/rest/security/iam/
policy/detach?name=Policy1&users=user3'
```

security iam policy modify

Modifies an IAM policy.

You can use the iam policy modify command to modify an IAM policy.

You can run the iam policy modify command on a primary cluster only.

To create a policy using data content (instead of file), specify the -is_file false option with a valid JSON string when you run the command.

You cannot modify an IAM policy for an identity policy with status as Enforcing or Disarming.

Syntax

CLI

NOTE:

```
maprcli security iam policy
modify -name <Policy Name> -content
(<File Path> | <String Content>)
[ -is_file ( true | false ) ]
```

REST

Request Type	POST
Request URL	http[s]:// <host>:<port>/ rest/iam/policy/ modify? <parameters>

Parameters

Parameter	Description
name	(Required) The name of the IAM policy.
content	(Required) Use one of the following option: <ul style="list-style-type: none">File pathTo create a policy without a file name, ensure that you provide a valid JSON string with <code>-is_file false</code> option.
-is_file false	(Optional) You can select either true or false. Default value : False

Example

Modify the IAM policy *Policy1* based on the content in the specified JSON file

CLI

```
maprcli security iam policy modify -name Policy1 -content /tmp/newcontent.json -is_file true -json
{
    "timestamp":1726216989302,
    "timeofday":"2024-09-13 01:43:09.302 GMT-0700 AM",
    "status":"OK",
    "total":0,
    "data":[
        ],
    "messages":[
        "Identity Policy 'Policy1' modified successfully"
    ]
}
```

REST

```
curl -u <username> -X POST 'https://server.sj.us:8443/rest/security/iam/policy/modify?name=Policy1&content=/tmp/newcontent.json&is_file=true'
```

security iam policy remove

Removes an IAM policy.

You can use `iam policy remove` to remove an existing IAM policy.

You can run the `iam policy remove` command on a primary cluster only.

You can remove a policy with *untagged* status only.

Syntax

CLI	<pre>maprcli security iam policy remove -name <Policy Name></pre>		
REST	<table><tr><td>Request Type</td><td>DELETE</td></tr></table>	Request Type	DELETE
Request Type	DELETE		

Request URL	http[s]:// <host>:<port>/ rest/iam/policy/ remove? <parameters>
-------------	---

Parameters

Parameter	Description
name	(Required) Name of the policy.

Example

Remove or delete IAM policy *Policy1*

CLI

```
maprcli security iam policy remove -name Policy1 -json
{
  "timestamp":1726217862296,
  "timeofday":"2024-09-13 01:57:42.296 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":[
    "Identity Policy 'Policy1' removed successfully"
  ]
}
```

REST

```
curl -u <username> -X DELETE https://server.sj.us:8443/rest/security/iam/
policy/remove?name=Policy1
```

security iam policy list

Lists all existing identity access management (IAM) policies.

You can use `iam policy list` command to list all the existing identity access management (IAM) policies.

You can run the `iam policy list` command on a primary cluster only.

Syntax

CLI

```
maprcli security iam policy list -json
```

REST

Request Type	GET
--------------	-----

Request URL	http[s]:// <host>:<port>/ rest/iam/policy/ list
-------------	--

Parameters

Parameter	Description
cluster	(Optional) Name of the policy.
limit	(Optional) Specify the limit and default values, for example, [-limit <Limit>. default: 2147483647].
start	(Optional) Specify the start, and default values, for example, [-start <Start>. default: 0].

Example

List details of current IAM policies

CLI

```
maprcli security iam policy list -json
{
  "timestamp":1726218513405,
  "timeofday":"2024-09-13 02:08:33.405 GMT-0700 AM",
  "status":"OK",
  "total":2,
  "data":[
    {
      "Name":"DenyVol",
      "Id":2,
      "Description":"Deny Volume",
      "Version":"1.0",
      "Owner":"mapr",
      "Created":"2024-09-12 03:39:13",
      "Updated":"",
      "Active":true,
      "Identities":{
        "Users":"user3",
        "Groups": "",
        "Roles": ""
      },
      "Status":"Enforced"
    },
    {
      "Name":"AllowVol",
      "Id":1,
      "Description":"Allow Volume",
      "Version":"1.0",
      "Owner":"root",
      "Created":"2024-09-12 03:39:05",
      "Updated":"2024-09-13 01:43:08",
      "Active":false,
      "Identities":{
        "Users": "user2,user3",
        "Groups": "fabric-manager",
        "Roles": ""
      }
    }
  ]
}
```

```
        },
        "Status": "Disarmed"
    }
  ]
}
```

REST

```
curl -u <username> -X GET https://server.sj.us:8443/rest/security/iam/
policy/list
```

security iam policy info

Displays information about an IAM policy.

The `security iam policy info` displays the detailed information about an Identity Access Management (IAM) policy.

Syntax

CLI

```
maprcli security iam policy
info -name <Policy Name>
```

REST

Request Type	GET
Request URL	http[s]:// <host>:<port>/ rest/iam/policy/ info?<parameters>

Parameters

Parameter	Description
name	(Required) Name of the policy.

Example

Display policy information for the IAM policy *AllowVol*

```
maprcli security iam policy info -name AllowVol -json
{
  "timestamp":1726218684110,
  "timeofday":"2024-09-13 02:11:24.110 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "Name":"AllowVol",
      "Id":1,
      "Description":"Allow Volume",
      "Version":"1.0",
      "Owner":"mapr",
      "Created":"2024-09-12 03:39:05",
      "Updated":"2024-09-13 01:43:08",
      "Active":false,
      "Statement":[
        {
```

```

        "Sid": "Statement-1",
        "Effect": "Allow",
        "Action": [
            "VolumeFullControl"
        ],
        "Resource": [
            "urn:default:primary:volume:vol-1"
        ],
    },
    {
        "Sid": "Statement-2",
        "Effect": "Allow",
        "Action": [
            "WriteVolume",
            "ReadVolume"
        ],
        "Resource": [
            "urn:default:secondary:volume:vol-2"
        ],
    },
    {
        "Sid": "Statement-3",
        "Effect": "Allow",
        "Action": [
            "ReadVolume",
            "ManageVolumeConfig"
        ],
        "Resource": [
            "urn:default:secondary:volume:vol-3"
        ],
    },
    "Identities": {
        "Users": "user2,user3",
        "Groups": "fabric-manager",
        "Roles": ""
    },
    "Status": "Disarmed"
}
]
}

```

REST

```
curl -u <username> -X GET https://server.sj.us:8443/rest/security/iam/
policy/info?name=AllowVol
```

security iam policy mapping

Displays IAM policy-identity mapping information.

The security iam policy mapping displays mapping information related to the IAM policies that are assigned to the specified identities, that is one or more users, groups, and/or roles.

You can specify multiple type of identities (users, groups, roles) with comma-separated values for each identity type in the command.

Syntax

CLI

```
maprcli security iam policy mapping
[ -users <List of
Users> ]
[ -groups <List of
Groups> ]
[ -roles <List of
Roles> ]
```

REST

Request Type	GET
Request URL	http[s]:// <host>:<port>/ rest/iam/policy/ mapping? <parameters>

Parameters

Parameter	Description
users	(Optional) List of users
groups	(Optional) List of groups
roles	(Optional) Name of roles

Example

Display IAM policies assigned to users *user2* and *user3*

CLI

```
maprcli security iam policy mapping -users user2,user3 -json
{
  "timestamp":1726218942771,
  "timeofday":"2024-09-13 02:15:42.771 GMT-0700 AM",
  "status":"OK",
  "total":2,
  "data":[
    {
      "IdType":"USER",
      "IdName":"user3",
      "IamPolicies":"AllowVol,DenyVol"
    },
    {
      "IdType":"USER",
      "IdName":"user2",
      "IamPolicies":"AllowVol"
    }
  ]
}
```

REST

```
curl -u <username> -X GET https://server.sj.us:8443/rest/security/iam/
policy/mapping?users=user2,user3
```

service list

Lists all services on the specified node, the memory allocated for each service, the state of each service, and log path for each service.

Syntax**CLI**

```
/opt/mapr/bin/maprcli service list
-node <node name>
[ -cluster <cluster name> ]
[ -zkconnect <ZooKeeper connect
string> ]
[ -output terse|verbose ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/service/list?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.
node	The node for which to list services. Default: localhost. If this is not specified, the /etc/hosts file must include the IP address or hostname for the localhost.
output	Whether the output should be terse or verbose. Default: verbose.
zkconnect	A ZooKeeper connect string, which specifies a list of the hosts running ZooKeeper, and the port to use on each, in the format: '<host>[:<port>][,<host>[:<port>]...]'. To obtain zookeeper connection strings, use the <code>maprcli node listzookeepers</code> command.

Output Fields

Field	Description
name	Service name.
state	Current state of the service. See Service States on page 2695.
logpath	Path to the log files for the service.
displayname	Display name of the service in the Control System.

Service States

The following table lists the service states with their descriptions:

State	Description
0	Not configured. The package for the service is not installed and/or the service is not configured (configure.sh has not run). This state is also returned for all the services if you run the command without specifying a node.
1	Configured. The package for the service is installed and configured.
2	Running. The service is installed, started by the warden, and is currently running.
3	Stopped. The service is installed and configure.sh has run, but the service is not running.
4	Failed. The service is installed and configured, but not running.
5	Stand by. The service is installed and is in standby mode, waiting to take over in case of failure of another instance.

Examples

CLI Example

The following output is an example of the service information returned when you run the `service list` command without specifying the node:

```
# /opt/mapr/bin/maprccli service list -json
{
  "timestamp":1555048050131,
  "timeofday":"2019-04-11 10:47:30.131 GMT-0700 PM",
  "status":"OK",
  "total":10,
  "data":[
    {
      "name":"fileserver",
      "state":0,
      "logpath":"/opt/mapr/logs/mfs.log",
      "displayname":"FileServer"
    },
    {
      "name":"resourcemanager",
      "state":0,
      "logpath":"/opt/mapr/hadoop/hadoop-2.7.4/logs",
      "displayname":"ResourceManager"
    },
    {
      "name":"filemigrate",
      "state":0,
      "logpath":"/opt/mapr/filemigrate/filemigrate-1.0.0/logs",
      "displayname":"FileMigrate"
    },
    {
      "name":"cldb",
      "state":0,
      "logpath":"/opt/mapr/logs/cldb.log",
      "displayname":"CLDB"
    },
    {
      "name":"nfs4",
      "state":0,
      "logpath":"/opt/mapr/logs/nfs4/nfs4server.log",

```

```

        "displayname":"NFS4 Gateway"
    },
    {
        "name":"mastgateway",
        "state":0,
        "logpath":"/opt/mapr/logs/mastgateway.log",
        "displayname":"MASTGatewayService"
    },
    {
        "name":"nodemanager",
        "state":0,
        "logpath":"/opt/mapr/hadoop/hadoop-2.7.4/logs",
        "displayname":"NodeManager"
    },
    {
        "name":"gateway",
        "state":0,
        "logpath":"/opt/mapr/logs/gateway.log",
        "displayname":"GatewayService"
    },
    {
        "name":"hoststats",
        "state":0,
        "logpath":"/opt/mapr/logs/hoststats.log",
        "displayname":"HostStats"
    },
    {
        "name":"apiserver",
        "state":0,
        "logpath":"/opt/mapr/apiserver/logs/apiserver.log",
        "displayname":"APIServer"
    }
]

```

REST Example

The following output is an example of the service information returned when you issue the `service list` REST API call, without specifying a node:

```

# curl -k -X GET 'https://abc.sj.us:8443/rest/service/list' --user mapr:mapr
{"timestamp":1529380971417,"timeofday":"2018-06-18
09:02:51.417 GMT-0700 PM","status":"OK","total":9,"data":
[{"name":"fileserver","state":0,"logpath":"/opt/

        "displayname": "APIServer"
    }
]
}

```

REST Example

The following output is an example of the service information returned when you issue the `service list` REST API call, after specifying a node:

```

curl -k -X GET 'https://abc.sj.us:8443/rest/service/list' --user mapr:mapr
{"timestamp":1529380971417,"timeofday":"2018-06-18
09:02:51.417 GMT-0700 PM","status":"OK","total":9,"data":
[{"name":"fileserver","state":0,"logpath":"/opt/
mapr/logs/mfs.log","displayname":"FileServer"},
{"name":"resourcemanager","state":0,"logpath":"/opt/mapr/
hadoop/hadoop-2.7.0/logs","displayname":"ResourceManager"},
{"name":"cldb","state":0,"logpath":"/opt/mapr/logs/
cldb.log","displayname":"CLDB"}, {"name":"nfs4","state":0,"logpath":"/opt/
mapr/logs/nfs4/nfs4server.log","displayname":"NFS4
Gateway"}, {"name":"mastgateway","state":0,"logpath":"/opt/
mapr/logs/mastgateway.log","displayname":"MASTGatewayService"},
{"name":"nodemanager","state":0,"logpath":"/opt/mapr/
hadoop/hadoop-2.7.0/logs","displayname":"NodeManager"},
{"name":"gateway","state":0,"logpath":"/opt/mapr/
logs/gateway.log","displayname":"GatewayService"},
{"name":"hoststats","state":0,"logpath":"/opt/mapr/
logs/hoststats.log","displayname":"HostStats"},
{"name":"apiserver","state":0,"logpath":"/opt/mapr/apiserver/logs/
apiserver.log","displayname":"APIServer"}]]

```

NOTE: When you configure high availability for the ResourceManager, the status of the standby ResourceManager service differs based on the selected failover implementation. When the cluster uses manual or automatic failover for the ResourceManager, standby ResourceManagers have a state equal to 2 (running). When the cluster uses zero configuration failover for the ResourceManager, standby ResourceManagers have a state equal to 5 (stand by).

setloglevel

Sets log level on individual services.

setloglevel cldb

Sets the log level on the CLDB service. Permissions required: `fc` or `a`.

Syntax

CAUTION: This command must be run under the supervision of HPE support.

CLI

```
maprcli setloglevel cldb
  -classname <class>
  -loglevel DEBUG|ERROR|FATAL|INFO|
TRACE|WARN
  -node <node>
  -port <port>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/setloglevel/cldb?<parameters>

Parameters

Parameter	Description
classname	The name of the class for which to set the log level. The class can be at the package level or a specific class. Contact HPE Support for this parameter.
loglevel	The log level to set. Default: INFO <ul style="list-style-type: none">• DEBUG• ERROR• FATAL• INFO• TRACE• WARN
node	The hostname or IP address of the node on which to set the log level. This is the node on which the cldb service is running.
port	The CLDB port. Default: 7222

Examples

CLI

```
maprcli setloglevel cldb -classname
com.mapr.fs.cldb.CLDBServer -loglevel
debug -node abc.sj.us
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/setloglevel/cldb?
classname=com.mapr.fs.cldb.CLDBServer&
loglevel=debug&node=abc.sj.us' --user
mapr:mapr
{"timestamp":1529380341288,"timeofday"
:"2018-06-18 08:52:21.288 GMT-0700
PM","status":"OK","total":0,"data":[]}
```

setloglevel fileserver

Sets the log level on the FileServer service. Permissions required: fc or a.

Syntax

CAUTION: This command must be run under the supervision of HPE support.

CLI

```
maprcli setloglevel fileserver
  -classname <class>
  -loglevel DEBUG|ERROR|FATAL|INFO|
TRACE|WARN
  -node <node>
  -port <port>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/setloglevel/fileserver?<parameters>

Parameters

Parameter	Description
classname	The name of the class for which to set the log level. The classname is listed under the <code>maprcli trace info</code> command. Contact HPE Support for this parameter.
loglevel	The log level to set. Default: INFO <ul style="list-style-type: none"> • DEBUG • ERROR • FATAL • INFO • TRACE • WARN
node	The hostname or IP address of the node on which to set the log level. This is the node on which the fileserver service is running.
port	The file system port. Default: 5660

Examples**CLI**

```
maprcli setloglevel
fileservice -classname
FileServer -loglevel debug -node
centos26.lab
```

REST

```
https://server.sj.us:8443/rest/
setloglevel/fileserver?
classname=FileServer&loglevel=debug&no
de=centos26.lab
```

setloglevel hbmaster

Sets the log level on the HBase Master service. Permissions required: fc or a.

Syntax

CAUTION: This command must be run under the supervision of HPE support.

CLI

```
maprccli setloglevel hbmaster
  -classname <class>
  -loglevel DEBUG|ERROR|FATAL|INFO|
TRACE|WARN
  -node <node>
  -port <port>
```

REST

```
http[s]://<host>:<port>/rest/
setloglevel/hbmaster?<parameters>
```

Parameters

Parameter	Description
classname	The name of the class for which to set the log level. The class can be specified at the package level or for a specific class. Contact HPE Support for this parameter.
loglevel	The log level to set. Default: INFO <ul style="list-style-type: none"> • DEBUG • ERROR • FATAL • INFO • TRACE • WARN
node	The hostname or IP address of the node on which to set the log level. This is the node on which the hbmaster service is running.
port	The HBase Master webserver port. Default: 16000 (16010 for the WebUI)

Examples**CLI**

```
maprccli setloglevel hbmaster
  -classname
```

```
org.apache.hadoop.hbase.master
-loglevel debug
-node centos26.lab
-port 16000
```

REST

```
https://centos26.lab:8443/rest/
setloglevel/hbmaster?
classname=org.apache.hadoop.hbase.mast
er&loglevel=debug&node=centos26.lab&po
rt=16000
```

setloglevel hbregionserver

Sets the log level on the HBase RegionServer service. Permissions required: fc or a.

Syntax

CAUTION: This command must be run under the supervision of HPE support.

CLI

```
maprccli setloglevel hbregionserver
-classname <class>
-loglevel DEBUG|ERROR|FATAL|INFO|
TRACE|WARN
-node <node>
-port <port>
```

REST

```
http[s]://<host>:<port>/rest/
setloglevel/hbregionserver?
<parameters>
```

Parameters

Parameter	Description
classname	The name of the class for which to set the log level. The class can be specified at the package level or for a specific class. Contact HPE Support for this parameter.
loglevel	The log level to set. Default: INFO <ul style="list-style-type: none"> • DEBUG • ERROR • FATAL • INFO • TRACE • WARN
node	The hostname or IP address of the node on which to set the log level. This is the node on which the hbregionserver service is running.

Parameter	Description
port	The HBase Region Server webserver port. Default: 16020 (16030 for the WebUI)

Examples

CLI

```
maprcli setloglevel
hbregionserver -classname
org.apache.hadoop.hbase.regionserver
-loglevel debug -node
centos26.lab -port 16020
```

REST

```
https://centos26.lab:8443/rest/
setloglevel/hbregionserver?
classname=org.apache.hadoop.hbase.regi
onserver&loglevel=debug&node=centos26.
lab&port=16020
```

setloglevel insight

Sets the log level on the insight service. Permissions required: fc or a.

CAUTION: This command must be run under the supervision of HPE support.

Syntax

CLI

```
maprcli setloglevel insight
[ -classname name of the Java class for which log level should be set]
[ -loglevel Log Level: FATAL|ERROR|WARN|INFO|DEBUG|TRACE]
[ -node address of the node]
[ -port Insight port. set to 8010 by default ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/setloglevel/insight?<parameters>

Parameters

Option	Description
c lassname	The name of the class for which to set the log level. The class can be at the package level or a specific class. Contact HPE Support for this parameter.

Option	Description
log level	The log level to set. Default: INFO <ul style="list-style-type: none">• DEBUG• ERROR• FATAL• INFO• TRACE• WARN
node	The hostname or IP address of the node on which to set the log level. This is the node on which the insight service is running.
port	The port on which the insight service runs. Default: 8010

Example

CLI

```
maprcli setloglevel
insight -classname
com.mapr.fs.insight -loglevel
DEBUG -node 10.123.165.12
```

REST

```
https://server.sj.us:8443/rest/
setloglevel/insight?
classname=com.mapr.fs.insight&loglevel
=debug&node=10.123.165.12
```

setloglevel nfs

Sets the log level on the NFS service. Permissions required: fc or a.

Syntax

CLI

```
maprcli setloglevel nfs
-classname <class>
-loglevel DEBUG|ERROR|FATAL|INFO|
TRACE|WARN
-node <node>
-port <port>
-isusermode <TRUE|FALSE>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/setloglevel/nfs?<parameters>

Parameters

Parameter	Description
classname	The name of the class for which to set the log level. The classname is listed under the <code>maprcli trace info</code> command. Contact HPE Support for this parameter.
loglevel	The log level to set. Default: INFO <ul style="list-style-type: none"> • DEBUG • ERROR • FATAL • INFO • TRACE • WARN
node	The node on which to set the log level.
port	The NFS port. Default: 9998
isusermode	Whether or not is the request is for user mode.

Examples**CLI**

```
maprcli setloglevel nfs
  -classname NFSD
  -loglevel debug
  -node centos26.lab
```

REST

```
https://server.sj.us:8443/rest/
setloglevel/nfs?
classname=NFSD&loglevel=debug&node=centos26.lab
```

stream

Manages stream functionality.

stream assign list

For the given stream, lists consumers and the topics and partitions that the consumers are reading messages from.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) on the volume
- [lookupdir](#) on directories in the path
- `adminperm`, `consumeperm`, `produceperm`, or `topicperm` permission on the stream

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprccli stream assign list -path <Stream Path > [-consumergroup <Consumer Group ID>] [-topic <Topic Name>] [-partition <Partition ID>] [-detail <Detail Parameter takes no value>]</pre>
REST	http[s]://<host>:<port>/rest/stream/assign/list?path=<path>

Parameters

Parameter	Description
path	The path and name of the stream.
consumergroup	Specifies the ID of a particular consumer group that you want to list the consumers for.
topic	The name of a topic to list the consumers for. If you also specify the -partition parameter, only the consumers that are reading from the indicated partition are listed.
partition	The ID of a specific partition. If you specify this ID, you must also use the -topic parameter.
detail	Includes the values of additional parameters in the output. These parameters are used internally.

Sample Output

With the -detail parameter:

```
# maprccli stream assign list -path /s1 -json -detail
{
  "timestamp":1441965109585,
  "timeofday":"2015-09-11 02:51:49.585 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    {
      "consumergroup":"xyzt1",
      "topic":"topic1",
      "assignseqnum":1,
      "consumerguid":"F3693413-2600-0876-CC91-052FA4F25500",
      "consumer":"ravindra.perf",
      "consumerip":"10.10.30.200",
      "consumerpid":"30768",
      "assignment":"0,1,2,3"
    }
  ]
}
```

Without the -detail parameter:

```
# maprccli stream assign list -path /s1 -json
{
  "timestamp":1441965116100,
  "timeofday":"2015-09-11 02:51:56.100 GMT-0700",
  "status":"OK",
  "total":1,
```

```

    "data": [
      {
        "consumergroup": "xyzt1",
        "topic": "topic1",
        "consumer": "ravindra.perf",
        "consumerip": "10.10.30.200",
        "consumerpid": "30768",
        "assignment": "0,1,2,3"
      }
    ]
  }

```

Field Descriptions

consumergroup	The name of the consumer group that is reading messages from this topic partition.
topic	The name of the topic.
assignseqnum	The sequence number of the current assignment of this partition. This value is used internally.
consumerguid	The globally unique identifier for the consumer. This value is used internally.
consumer	The ID of the consumer. This value is set with the <code>client.id</code> configuration parameter.
consumerip	The IP address of the consumer.
consumerpid	The process ID of the consumer.
assignment	The index numbers of the partitions that are assigned to this consumer.

stream create

Creates a new stream.

After you create a stream, you can edit the values of its parameters with the command `maprcli stream edit`.

To see the value of a stream's parameters, use the command `maprcli stream info`.

To run this command, your user ID must have write permission on the directory in which you want to create a stream.

Permissions Required

To run this command, your user ID must have the following permissions:

- readAce and writeAce on the volume
- lookupdir on directories in the path

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre> maprccli stream create -path <Stream Path> [-ttl <Time to live in second> default:604800] [-autocreate <Auto create topics> default:true] [-defaultpartitions <Default partitions per topic> default:1] [-compression off lz4 lzf zlib. default: inherit from parent directory] [-produceperm <Producer access control expression> default u:creator] [-consumeperm <Consumer access control expression> default u:creator] [-topicperm <Topic CRUD access control expression> default u:creator] [-copyperm <Stream copy access control expression> default u:creator] [-adminperm <Stream administration access control expression> default u:creator] [-copymetafrom <Stream to copy attributes from> default:none] [-ischangelog <true false> default: false] [-defaulttimestamptype timestamp type: createtime logappendtime. default: createtime] [-pidexpirysecs <Producer ID expiry time in seconds. Default: 6048000>] [-mincompactionlag <Set time in melliseconds for which a message remains uncompactd. Default: 0>] [-deleteretention <Set the time in milliseconds for which delete records are retained. Default: 86400000>] </pre>
REST	http[s]://<host>:<port>/rest/stream/create?path=<path>

Parameters

Parameter	Description
path	<p>The path and name of the stream to create.</p> <p>The path to the stream can include any character allowed by Data Fabric. For example, /my/path/with:/to/mystream is valid, but /my/path/with:/to/mystream:withcolon is invalid.</p> <p>The name of the stream cannot include a colon (:) or a forward slash (/).</p>
ttl	<p>Specifies the number of seconds to elapse between the publication of a message in a topic in this stream and the expiration of that message.</p> <p>Consumers do not see messages that have expired.</p> <p>Messages that have expired are deleted during the next purge process. See Time-to-Live for Messages for details.</p> <p>A value of 0 causes messages to be retained indefinitely.</p>
autocreate	<p>Specifies whether to create a topic automatically when a producer tries to write the first message to it. Values are true and false. The default is true.</p>

Parameter	Description
defaultpartitions	Specifies the default number of partitions to allocate to new topics in the stream.
compression	<p>Specifies the compression setting to use for the stream. Producer client libraries can bundle messages that are to be published on the same partition and compress them. The messages are sent to the server compressed, are stored compressed, are replicated to other containers compressed, and (if stream replication is configured) replicated to replica streams compressed. Consumer client libraries receive compressed data, decompresses it, and passes it to client applications.</p> <p>Valid options are off, lz4, lz4hc, and zlib. The default setting is the type of compression that is set for the directory in which the stream is located.</p> <p>For more information, see Compression.</p>
produceperm	Specifies the access-control expression that controls who can publish messages to topics in the stream. See ACE Syntax .
consumeperm	Specifies the access-control expression that controls who can who can listen to topics in the stream. See ACE Syntax .
topicperm	Specifies the access-control expression that controls who can create, edit, or remove topics in the stream. See ACE Syntax .
copyperm	Specifies the access-control expression that controls who can use mapr_copystream or mapr_diffstreams on the stream. See ACE Syntax .
adminperm	<p>Determines which users can modify ACEs for a stream, set up replication of a stream, and modify other attributes of a stream. By default, the stream owner and the Data Fabric user can modify this setting. See ACE Syntax.</p> <p>This permission includes the topicperm permission.</p>
copymetafrom	If you plan to replicate messages to this stream from another stream, specify the path to that other stream. The metadata from that stream will be copied to the new stream when the new stream is created.

Parameter	Description
ischangelog	<p>Specifies whether the stream is for the Change Data Capture feature's changed data records. Value: true false. Default: false.</p> <ul style="list-style-type: none"> If you want to use a non-default partition value (Default: 1) for the topic, use the <code>maprcli stream create -path </mypath/stream:topic> -ischangelog true -defaultpartitions < value other than 1 ></code> command to create the stream and then create the topic with the <code>maprcli streams topic create</code> command. If you want to use the default partitions value (1) for the Change Data Capture feature, use the <code>maprcli stream create -path </mypath/stream> -ischangelog true</code> command to create the stream and then use the <code>maprcli table changelog add -path <mypath/stream:topic></code> command to set up the Change Data Capture feature and create the topic.
defaulttimestamptype	<p>Specifies the type of timestamp stored in the topic's message. Value: <code>createtime</code> <code>logappendtime</code>. Default: <code>createtime</code>. The topic inherits the default value from the stream unless the topic sets the timestamp type to a different value.</p> <p>A <code>createtime</code> value is the time defined by the user or application (when creating the message). If user or application does not define this value (or passes null), the client uses the current system timestamp.</p> <p>A <code>logappendtime</code> value is the time when the message (log) was appended to the server.</p>
pidexpirysecs	<p>Specifies the expiration time for the Producer ID. This parameter fixes the lifetime for the Producer ID. Default: 604800</p>
mincompactionlag	<p>Sets the minimum delay (in milliseconds) before which messages are not compacted. It is the minimum time that the messages are available for consumption. Beyond this time period, the messages may be compacted. Default: 0</p> <p>The lag is calculated from the time that a message was produced to the stream topic-partition.</p> <p> NOTE: Compaction is set only when you edit the stream. See stream edit on page 2715.</p>
deleteretention	<p>Sets the minimum time (in milliseconds) before which deleted records are removed. It is the minimum time that the deleted records are still available. Beyond this time period, the deleted messages may be removed. Default: 86400000</p> <p>Used with log compaction.</p>

stream cursor delete

Deletes committed cursors that are in the partitions in a stream.

NOTE: Deleting the committed cursors for active consumers has no effect on the consumers. Consumers use read cursors to keep track of where they currently are in partitions.

For example, the consumer `consumer1` continues reading the messages in a partition from the position of the consumer's read cursor even after the consumer's committed cursor is deleted. However, if `consumer1` goes offline and the partition is reassigned to another consumer (`consumer2`) in the same consumer group before `consumer1` creates another committed cursor, `consumer2` starts reading the partition at the most recent message.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` or `consumeperm` permission on the stream

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprccli stream cursor delete -path <Stream Path> [-consumergroup <Consumer Group ID>] [-topic <Topic Name>] [-partition <Partition ID>]</pre>
REST	<code>http[s]://<host>:<port>/rest/stream/cursor/delete?path=<path></code>

Parameters

Parameter	Description
<code>path</code>	The path and name of the stream in which the committed cursors are located.
<code>consumergroup</code>	Specifies the ID of a particular consumer group that you want to delete the committed cursors for.
<code>topic</code>	The name of a topic to delete committed cursors from. If you also specify the <code>-partition</code> parameter, only the committed cursors in the indicated partition are deleted.
<code>partition</code>	The ID of the partition where the committed cursors that you want to delete is located. If you specify this ID, you must also use the <code>-topic</code> parameter.

stream cursor list

Lists the cursors for the consumers of a stream.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume

- `lookupdir` on directories in the path
- `adminperm`, `consumeperm`, `produceperm`, or `topicperm` permission on the stream

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprcli stream cursor list -path <Stream Path> [-consumergroup <Consumer Group ID>] [-topic <Topic Name>] [-partition <Partition ID>]</pre>
REST	<code>http[s]://<host>:<port>/rest/stream/cursor/list?path=<path></code>

Parameters

Parameter	Description
<code>path</code>	The path and name of the stream in which the cursors are located.
<code>consumergroup</code>	Specifies the ID of a particular consumer group that you want to list the cursors for.
<code>topic</code>	The name of a topic to list committed cursors from. If you also specify the <code>-partition</code> parameter, only the committed cursors in the indicated partition are listed.
<code>partition</code>	The ID of the partition where the particular cursor that you want to list is located. If you specify this ID, you must also use the <code>-topic</code> parameter.

Sample Output

```
# maprcli stream cursor list -path /s1 -topic topic0 -json
{
  "timestamp":1441883091373,
  "timeofday":"2015-09-10 04:04:51.373 GMT-0700",
  "status":"OK",
  "total":4,
  "data":[

        "consumerlagmillis":"6313"
    },
]
}

```

Field Descriptions

consumergroup	The ID of the consumer group to which belongs the consumer that owns the committed cursor.
committedoffset	The last offset that was committed by the consumer that is reading from the listed partition and that belongs to the listed consumer group.
consumerlagmillis	The difference in milliseconds between the timestamp of the last published message and the timestamp of the last message consumed by the consumer.
consumertimestamp	The timestamp of the most recent message that the consumer has consumed.
partitionid	The index number of the partition within the topic. The first partition in a topic has an index of 0, the next partition an index of 1, and so on.
produceroffset	The maximum offset produced for this partition.
topic	The name of the topic that the cursor corresponds to.
stream delete	
Deletes the specified stream. Deleted streams cannot be recovered unless they were previously replicated.	
Producers are no longer able to publish messages to topics in the stream, and consumers are no longer able to read messages from topics in the stream.	

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Streams does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<code>maprccli stream delete -path <Stream Path></code>
REST	<code>http[s]://<host>:<port>/rest/stream/delete?path=<path></code>

Parameters

Parameter	Description
path	The path and name of the stream to delete.

stream edit

Edits the values of parameters for the specified stream.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- `adminperm` permission on the stream

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Streams does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre> maprccli stream edit -path Stream Path [-ttl <Time to live in seconds>] [-autocreate true false] [-defaultpartitions <Default partitions per topic>] [-compression off lz4 lzf zlib] [-produceperm <Producer access control expression> default u:creator] [-consumeperm <Consumer access control expression> default u:creator] [-topicperm <Topic CRUD access control expression> default u:creator] [-copyperm <Stream copy access control expression> default u:creator] [-adminperm <Stream administration access control expression> default u:creator] [-defaulttimestamptype timestamp type: createtime logappendtime. default: createtime] [-compact <Sets log compaction for a stream. Value: true false default: false>] [-pidexpirysecs <Producer ID expiry time in seconds. Default: 604800>] [-mincompactionlag <Sets time in milliseconds for which a message remains uncompactd. default: 0>] [-deleteretention <Sets the time in milliseconds for which delete records are retained. Default: 86400000>] [-force <When used with -compact, forces enabling log compaction on a stream. Parameter takes no value.>] </pre>
REST	http[s]://<host>:<port>/rest/stream/edit?path=<path>

Parameters

Parameter	Description
path	The path and name of the stream to create.
ttl	<p>Specifies the number of seconds to elapse between the publication of a message in a topic in this stream and the expiration of that message.</p> <p>Consumers do not see messages that have expired.</p> <p>Messages that have expired are deleted during the next purge process. See Time-to-Live for Messages for details.</p> <p>A value of 0 causes messages to be retained indefinitely.</p>
autocreate	Specifies whether to create a topic automatically when a producer tries to write the first message to it. Values are true and false. The default is true.
defaultpartitions	Specifies the default number of partitions to allocate to new topics in the stream.

Parameter	Description
compression	<p>Specifies the compression setting to use for the stream. Producer client libraries can bundle messages that are to be published on the same partition and compress them. The messages are sent to the server compressed, are stored compressed, are replicated to other containers compressed, and (if stream replication is configured) replicated to replica streams compressed. Consumer client libraries receive compressed data, decompresses it, and passes it to client applications.</p> <p>Valid options are off, lz4, lz4hc, and zlib. The default setting is the type of compression that is set for the directory in which the stream is located.</p> <p>For more information, see Compression.</p>
produceperm	Specifies the access-control expression that controls who can publish messages to topics in the stream. See ACE Syntax .
consumeperm	Specifies the access-control expression that controls who can who can listen to topics in the stream. See ACE Syntax .
topicperm	Specifies the access-control expression that controls who can create, edit, or remove topics in the stream. See ACE Syntax .
copyperm	Specifies the access-control expression that controls who can use mapr copystream or mapr diffstreams on the stream. See ACE Syntax .
adminperm	<p>Determines which users can modify ACEs for a stream, set up replication of a stream, and modify other attributes of a stream. By default, the stream owner and the Data Fabric user can modify this setting. See ACE Syntax.</p> <p>This permission includes the topicperm permission.</p>
defaulttimestamptype	<p>Specifies the type of timestamp stored in the topic's message. Value: createtime logappendtime Default: createtime. The topic inherits the default value from the stream unless the topic sets the timestamp type to a different value.</p> <p>A createtime value is the time defined by the user or application (when creating the message). If user or application does not define this value (or passes null), the client uses the current system timestamp.</p> <p>A logappendtime value is the time when the message (log) was appended to the server.</p>
pidexpirysecs	Specifies the expiration time for the Producer ID. This parameter fixes the lifetime for the Producer ID. Default: 604800
compact	<p>Sets log compaction for stream. When set to true, enables log compaction. When set to false, disables log compaction.</p> <p>Value: true false Default: false</p> <p> NOTE: A license is required to run the -compact option; otherwise, the command hangs. See Adding a License on page 1339.</p>
mincompactionlag	<p>Sets the minimum delay (in milliseconds) before which messages are not compacted. It is the minimum time that the messages are available for consumption. Beyond this time period, the messages may be compacted. Default: 0</p> <p>The lag is calculated from the time that a message was produced to the stream topic-partition.</p>
deleteretention	<p>Sets the minimum time (in milliseconds) before which deleted records are removed. It is the minimum time that the deleted records are still available. Beyond this time period, the deleted messages may be removed. Default: 86400000</p>

Parameter	Description
force	Used with the -compact parameter to force log compaction on a stream parameter. No values are passed. Used for backward compatibility.

stream info

Displays the values of the parameters of the specified stream.

Permissions Required

To run this command, your user ID must have the following permissions:

- **readAce** on the volume
- **lookupdir** on directories in the path
- **adminperm**

When a user with this permission runs the command, the output includes the access-control expressions for the adminperm and topicperm permissions.
- **produceperm, consumeperm, or topicperm**

When a user with one of these permissions runs the command, the output does not include any access-control expressions.

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Streams does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	maprcli stream info -path <Stream Path>
REST	http[s]://<host>:<port>/rest/stream/info?path=<path>

Parameters

Parameter	Description
path	The path and name of the stream that you want to see information about.

Sample Output

```
maprcli stream info -path /streamVol/stream1 -json
{
  "timestamp":1521233326943,
  "timeofday":"2018-03-16 01:48:46.943 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "path":"/streamVol/stream1",
      "physicalsize":57344,
      "logicalsize":32768,
      "numtopics":1,
      "defaultpartitions":1,
      "ttl":604800,
      "compression":"lz4",
      "autocreate":true,
```

```

        "produceperm": "u:root",
        "consumeperm": "u:root",
        "topicperm": "u:root",
        "copyperm": "u:root",
        "adminperm": "u:root",
        "ischange log": false,
        "timestamp type": "create time"
    }
  ]
}

```

stream purge

Runs the purge process, removing messages that are marked for deletion and reclaiming disk space.

For information about the purge process, see [Time-to-Live for Messages](#).

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Streams does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- adminperm permission on the stream

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Streams does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	maprcli stream purge -path <Stream Path>
REST	http[s]://<host>:<port>/rest/stream/purge?path=<path>

Parameters

Parameter	Description
path	The path and name of the stream to reclaim disk space from.

stream replica add

Registers an existing stream as a replica of the specified stream.

NOTE: A license is required to run this command. Running this command without a license can cause the command to hang. See [Adding a License](#) on page 1339.

Permissions Required at the Source Cluster

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume

- [lookupdir](#) on directories in the path
- adminperm and copyperm permissions on the source stream

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Streams does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Permissions Required at the Target Cluster

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path

Syntax

CLI	<pre>maprcli stream replica add -path <stream path> -replica <remote stream path> [-paused <start replication in paused state> default: false] [-throttle <throttle replication operations under load> default: false] [-networkencryption <enable on-wire encryption> default: false] [-synchronous <replicate to remote stream before acknowledging producers> default: false] [-networkcompression <on-wire compression type: off lz4 lzf zlib> default: compression setting on stream]</pre>
REST	<pre>http[s]://<host>:<port>/rest/stream/replica/add? path=<path>&replica=<name></pre>

Parameters

Parameter	Description
path	The path and name of the stream that you want to create a replica for.
replica	The path and name of the stream that you want to create as a replica of the stream that you specified with the -path parameter.

Parameter	Description
paused	<p>A boolean value that specifies whether to pause the replication so that it does not start immediately. The replication can be resumed using the replica resume command at a later time. The values are true or false. The default is false.</p> <p>Set -paused to true if you want to run mapr copystream to load the replica stream before starting replication. If it is not paused, replication starts immediately after you run the commands maprccli stream replica add and maprccli stream upstream add, in which case the replica stream starts empty and accumulates messages over time. If you are interested only in the messages that are published to the source stream after replication starts, then you do not need to pause replication initially. However, if you want the full set of messages from the source stream that have not yet been purged or marked for deletion, then pause replication initially.</p>
throttle	<p>A boolean value that specifies whether to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The values are true or false. The default is false.</p> <p>Throttling has two effects, both of which allow HPE Data Fabric Streams to use more system resources to process new messages:</p> <ul style="list-style-type: none"> • Throttling slows down the rate at which changes to a stream are replicated. • Throttling slows down the rate at which messages to be replicated are read from disk.
networkencryption	<p>A boolean value that specifies whether or not to enable on-wire encryption. The values are true or false. The default is false. If you set the value to true, the local cluster and any other cluster that is part of the replication process must be enabled for security.</p>
synchronous	<p>A boolean value that specifies whether replication is synchronous or asynchronous. The values are true or false. The default is false and specifies asynchronous replication.</p>
networkcompression	<p>Specifies the type of compression to use when replicating messages. For more information, see Managing Compression.</p>

stream replica autoseup

Sets up and starts replication between a source stream and replica stream.

The maprccli stream replica autoseup command performs the following steps to set up replication:

1. Creates a stream in the destination cluster.
2. Declares the new stream to be a replica of the source stream and ensures that replication does not begin immediately after the next step.
3. Declares the source stream as the original of the replica stream.

4. Runs the `mapr copystream` utility to load a copy of the source data into the replica.
5. For multi-master replication, it declares the source stream to be a replica of the new stream and then declares the new stream to be an upstream source for the source stream.
6. Clears the paused replication state to start replication.

For more information about the automatic setup process, see [Replica Autoseup for Streams](#) on page 869.

NOTE: Before you set up replication for a stream, verify that the cluster is setup for replication. For more information, see [Preparing Clusters for Stream Replication](#) on page 1763.

Permissions Required at the Source Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` and `copyperm` permissions on the source stream

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Permissions Required at the Target Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path

Syntax

CLI	<pre>maprcli stream replica autosetup -path <stream path> -replica <remote stream path> [-synchronous <replicate to remote stream before acknowledging producers> default: false] [-multimaster <set up bi-directional replication> default: false] [-throttle <throttle replication operations under load> default: false] [-networkencryption <enable on-wire encryption> default: false] [-networkcompression <on-wire compression type: off lz4 lzf zlib> default: compression setting on stream] [-directcopy enable directcopy. default: true] [-useexistingreplica use existing replica table if present. default: false]</pre>
REST	<pre>http[s]://<host>:<port>/rest/stream/replica/autosetup? path=<path>&replica=<name></pre>

Parameters

Parameter	Description
path	The path and name of the stream that you want to create a replica for.
replica	The path and name of the stream that you want to create as a replica of the stream that you specified with the -path parameter.
synchronous	A boolean value that specifies whether replication is synchronous or asynchronous. The values are true or false. The default is false and specifies asynchronous replication.
multimaster	A boolean value that specifies whether or not to set up a multi-master topology. The values are true or false. The default is false and specifies to use the basic primary-secondary topology, rather than the multi-master topology.
throttle	<p>A boolean value that specifies whether to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The values are true or false. The default is false.</p> <p>Throttling has two effects, both of which allow HPE Data Fabric Streams to use more system resources to process new messages:</p> <ul style="list-style-type: none"> • Throttling slows down the rate at which changes to a stream are replicated. • Throttling slows down the rate at which messages to be replicated are read from disk.
networkencryption	A boolean value that specifies whether or not to enable on-wire encryption. The values are true or false. The default is false. If you set the value to true, the local cluster and any other cluster that is part of the replication process must be enabled for security.
networkcompression	Specifies the type of compression to use when replicating messages. For more information, see Managing Compression .
directcopy	A Boolean value that specifies whether or not autosetup will use the directcopy option . The values are true or false . Autosetup with direct copy (true) is the default. If you set this parameter to false, the cluster will run autosetup without the directcopy option. For more information, see Replica Autosetup for Streams on page 869.
useexistingreplica	When the directcopy parameter is set to true (default), this Boolean value specifies whether or not an existing stream can be used as the replica stream. The values for this parameter are true or false. No reuse of existing tables (false) is the default. If a stream exists with the specified name, and this parameter is set to false, the create stream operation will fail.

stream replica edit

Modifies the way in which messages are replicated from one stream to another.

Permissions Required at the Source Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` permission on the source stream

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Permissions Required at the Target Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path

Syntax

CLI	<pre>maprcli stream replica edit -path <stream path> -replica <remote stream path> [-newreplica <renamed stream path>] [-throttle <throttle replication operations under load>] [-networkencryption <enable on-wire encryption>] [-synchronous <replicate to remote stream before acknowledging producers>] [-networkcompression <on-wire compression type: off lz4 lzf zlib>]</pre>
REST	<pre>http[s]://<host>:<port>/rest/stream/replica/edit? path=<path>&replica=<name></pre>

Parameters

Parameter	Description
path	The path and name of the stream that you want to create a replica for.
replica	The path and name of the stream that you want to create as a replica of the stream that you specified with the <code>-path</code> parameter.
newreplica	Specifies a new name to give to the replica stream.

Parameter	Description
throttle	<p>A boolean value that specifies whether to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The values are true or false. The default is false.</p> <p>Throttling has two effects, both of which allow HPE Data Fabric Streams to use more system resources to process new messages:</p> <ul style="list-style-type: none"> Throttling slows down the rate at which changes to a stream are replicated. Throttling slows down the rate at which messages to be replicated are read from disk.
networkencryption	A boolean value that specifies whether or not to enable on-wire encryption. The values are true or false. The default is false. If you set the value to true, the local cluster and any other cluster that is part of the replication process must be enabled for security.
synchronous	A boolean value that specifies whether replication is synchronous or asynchronous. The values are true or false. The default is false and specifies asynchronous replication.
networkcompression	Specifies the type of compression to use when replicating messages. For more information, see Managing Compression .

stream replica list

Lists the replicas of a given stream.

Permissions Required on the Source Cluster

To run this command, your user ID must have the following permissions:

- [readAce](#) on the volume
- [lookupdir](#) on directories in the path
- adminperm permission on the source stream

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Streams does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprcli stream replica list -path <stream path> [-refreshnow <immediately refresh replication statistics> default: false]</pre>
REST	<pre>http[s]://<host>:<port>/rest/stream/replica/list?path=<path></pre>

Parameters

Parameter	Description
path	The path and name of the stream that you want to list the replicas of.
refreshnow	A boolean value that specifies whether to trigger an immediate update of the replica statistics. The values are true or false. By default, the value is false and the command lists the current version of the replica statistics, which could be a maximum of five minutes old.

Sample with Output

```
# maprcli stream replica list -path /srcVol/srcStream -json
{
  "timestamp":1507758209755,
  "timeofday":"2017-10-11 02:43:29.755 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"my.cluster.com",
      "stream":"/destVol",
      "type":"MapRStream",
      "replicaPath":"/destVol",
      "replicaState":"REPLICA_STATE_CREATE_SCHEDULE",
      "paused":false,
      "throttle":false,
      "idx":1,
      "networkencryption":false,
      "synchronous":false,
      "networkcompression":"lz4",
      "propagateExistingData":false,
      "isUptodate":true,
      "minPendingTS":0,
      "maxPendingTS":0,
      "bytesPending":0,
      "bucketsPending":0,
      "copyTableCompletionPercentage":0,
    }
  ]
}
```

Data Fields

Data Fields	Description
cluster	The cluster on which the replica stream resides.
stream	The path of the replica stream.
type	Identifies the type of table: HPE Data Fabric Database table or HPE Data Fabric Streams stream.
replicaPath	The replica location of the source stream.
replicaState	The replication state indicates when stream replication is in progress and it also displays the status of operations related to replica autosetup with directcopy.
paused	A Boolean values that specifies if replication is paused.
throttle	A Boolean value that specifies if replication is throttled.

Data Fields	Description
idx	The index number of the replica stream.
networkencryption	A Boolean value that specifies if replication is encrypted.
synchronous	A Boolean value that specifies whether replication is synchronous or asynchronous.
networkcompression	The type of on-wire compression.
propagateExistingData	Used to identify whether existing data in a CDC table is propagated to stream topic.
isUptodate	A Boolean value that specifies if the replica is up-to-date.
minPendingTS	The epoch time in milliseconds of the oldest message that has yet to be replicated.
maxPendingTS	The epoch time in milliseconds of the newest message that has yet to be replicated.
bytesPending	The number of bytes that have yet to be replicated.
bucketsPending	The number of buckets that have yet to be replicated.
copyTableCompletionPercentage	<p>The percentage of data replication completed from the source stream to the destination stream.</p> <p> NOTE: When replicating HPE Data Fabric Database data, the copyTablePercentageCompletion data may re-adjust to a lower rate. This depends on table region (also referred to as tablets) splits and merges as well as the rate of incoming data to replicating data.</p>

stream replica pause

Pauses replication from a *source* stream to a *replica* stream during autosetup and replication phases.

Permissions Required on the Source Cluster

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminperm` permission on the source stream

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprccli stream replica pause -path <stream path> -replica <remote stream path></pre>
REST	<pre>http[s]://<host>:<port>/rest/stream/replica/pause? path=<path>&replica=<name></pre>

Parameters

Parameter	Description
path	The path and name of the stream that is the source for the replica that you want to pause replication to.
replica	The path and name of the stream replica that you want to pause replication to.

stream replica remove

Unregisters a stream as the replica of another stream.

Permissions Required on the Source Cluster

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- adminperm permission on the source stream

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Streams does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprcli stream replica remove -path <stream path> -replica <remote stream path></pre>
REST	<pre>http[s]://<host>:<port>/rest/stream/replica/remove? path=<path>&replica=<name></pre>

Parameters

Parameter	Description
path	The path and name of the stream that is the source for the replica that you want to remove.
replica	The path and name of the stream replica that you want to remove.

stream replica resume

Resumes replication from one stream to another stream Replication can be paused during autosetup and replication phases. When replication resumes, it continues from where it left off.

Permissions Required on the Source Cluster

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- adminperm permission on the source stream

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Streams does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprcli stream replica resume -path <stream path> -replica <remote stream path></pre>
REST	<pre>http[s]://<host>:<port>/rest/stream/replica/resume? path=<path>&replica=<name></pre>

Parameters

Parameter	Description
path	The path and name of the stream that is the source for the replica that you want to resume replicating to.
replica	The path and name of the stream replica that you want to resume replicating to.

stream upstream add

Registers a stream as an upstream source for a given stream. For example, if you wanted to replicate messages from Stream_A to Stream_B, Stream_A would be the upstream source for Stream_B.

Permissions Required on the Target Cluster

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- adminperm permission on the source stream

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Streams does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprcli stream upstream add -path <stream path> -upstream <upstream stream path></pre>
REST	<pre>http[s]://<host>:<port>/rest/stream/upstream/add? path=<path>&upstream=<name></pre>

Parameters

Parameter	Description
path	The path and name of the stream that you want to specify a source stream for.

Parameter	Description
upstream	The path and name of the stream that you want to use as a source for the stream that you specified with the -path parameter.

stream upstream list

Lists all of the streams that are replicating to a given stream.

Permissions Required on the Target Cluster

To run this command, your user ID must have the following permissions:

- [readAce](#) on the volume
- [lookupdir](#) on directories in the path
- adminperm permission on the source stream

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Streams does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<code>maprcli stream upstream list -path <Stream Path></code>
REST	<code>http[s]://<host>:<port>/rest/stream/upstream/list?path=<path></code>

Parameters

Parameter	Description
path	The path and name of the stream that you want to list the source streams for.

Sample Output

```
# maprcli stream upstream list -path /dst -json
{
  "timestamp":1437992841303,
  "timeofday":"2015-07-27 03:27:21.303 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"my.cluster.com",
      "stream":"/src",
      "idx":1,
      "uuid":"3e98ee93-d88a-f3d6-bc80-001b02b65500"
    }
  ]
}
```

Field Descriptions

cluster	The name of the Data Fabric cluster in which the upstream stream is located.
stream	The name of the upstream stream.
idx	The index number of the upstream stream.
uuid	The upstream stream's universally unique identifier.

stream upstream remove

Unregisters a stream as an upstream source for a given stream.

Permissions Required on the Target Cluster

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- adminperm permission on the source stream

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Streams does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprcli stream upstream remove -path <stream path> -upstream <upstream stream path></pre>
REST	<pre>http[s]://<host>:<port>/rest/stream/upstream/remove? path=<path>&upstream=<name></pre>

Parameters

Parameter	Description
path	The path and name of the stream that you want to remove a source stream from.
upstream	The path and name of the stream that you want to remove as a source for the stream that you specified with the -path parameter.

stream topic create

Creates a topic in the specified stream.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- topicperm permission on the stream

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Streams does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprccli stream topic create -path <Stream Path> -topic <Topic Name> [-partitions <Number of partitions> default: attribute defaultpartitions on the stream] [-timestamptype Timestamp type: createtime logappendtime default: createtime]</pre>
REST	<pre>http[s]://<host>:<port>/rest/stream/topic/create?path=<path>&topic=<name></pre>

Parameters

Parameter	Description
path	The path and name of the stream in which to create the topic.
topic	<p>The name of the topic to create.</p> <p>A name can include alphanumeric characters and the period, underscore, and dash characters.</p>
partitions	<p>The number of partitions to use for the topic. After you create the topic, you can increase the number of partitions, but you cannot reduce the number. The default number of partitions for new topics is set by the defaultpartitions parameter in the commands maprccli stream create and maprccli stream edit.</p> <p> IMPORTANT: A CDC changelog stream's default partitions can impact how many partitions a stream topic can have. This is because once you create a stream topic for a changelog stream, the number of topic partitions is <i>locked</i>. The number of topic partitions cannot change.</p> <ul style="list-style-type: none"> If the stream topic create command is used to create a stream topic, then the number of topic partitions can be set at creation time and then is <i>locked</i>. If the table changelog add on page 2799 command is used to add a stream topic (as well as establish a relationship between the source table and the changelog stream), then the number of topic partitions is inherited from the changelog stream and is <i>locked</i>.

Parameter	Description
timestamptype	<p>Specifies the type of timestamp stored in the topic's message. Value: createtime logappendtime Default: createtime. The topic inherits the default value from the stream unless the topic sets the timestamp type to a different value.</p> <p>A createtime value is the time defined by the user or application (when creating the message). If user or application does not define this value (or passes null), the client uses the current system timestamp.</p> <p>A logappendtime value is the time when the message (log) was appended to the server.</p>

stream topic delete

Deletes the specified topic from the specified stream.

Consumers do not have to stop consuming from a topic before the topic is deleted.

The deletion of the topic and the messages is immediate. However, the command also starts a background process for the purging the topic and messages to reclaim disk space.

If the parameter -autocreate for the stream is set to true, a topic with the same name is created if a producer writes a message to a topic of the same name. For example, if you delete the topic Topic_A and then a producer writes a message to the topic Topic_A, HPE Data Fabric Streams creates a topic that is named Topic_A. Aside from the name, the new topic Topic_A shares nothing with the deleted topic Topic_A.

Permissions Required

To run this command, your user ID must have the following permissions:

- readAce and writeAce on the volume
- lookupdir on directories in the path
- topicperm permission on the stream

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Streams does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprcli stream topic delete -path <Stream Path> -topic <Topic Name></pre>
REST	<pre>http[s]://<host>:<port>/rest/stream/topic/delete?path=<path>&topic=<name></pre>

Parameters

Parameter	Description
path	The path and name of the stream from which to delete the topic.
topic	The name of the topic to delete.

stream topic edit

Allows you to increase the number of partitions that are in the specified topic.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- topicperm permission on the stream

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Streams does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprcli stream topic edit -path <Stream Path> -topic <Topic Name> [-partitions <Number of partitions>] [-timestamptype Timestamp type: createtime logappendtime default: createtime]</pre>
REST	<pre>http[s]://<host>:<port>/rest/stream/topic/edit? path=<path>&topic=<name>&partitions=<number></pre>

Parameters

Parameter	Description
path	The path and name of the stream in which the topic is located.
topic	The name of the topic to edit.

Parameter	Description
partitions	<p>The number of partitions to use for the topic. You cannot reduce the number of partitions.</p> <p>To find out how many partitions a topic is currently using, run the command <code>maprcli stream topic info</code>.</p> <p> IMPORTANT: A CDC changelog stream's default partitions can impact how many partitions a stream topic can have. This is because once you create a stream topic for a changelog stream, the number of topic partitions is <i>locked</i>. The number of topic partitions cannot change and the <code>stream topic edit</code> command can not modify the topic's partition number.</p> <ul style="list-style-type: none"> • If the <code>stream topic create</code> command is used to create a stream topic, then the number of topic partitions can be set at creation time and then is <i>locked</i>. • If the table changelog add on page 2799 command is used to add a stream topic (as well as establish a relationship between the source table and the changelog stream), then the number of topic partitions is inherited from the changelog stream and is <i>locked</i>.
timestamptype	<p>Specifies the type of timestamp stored in the topic's message. Value: <code>createtime</code> <code>logappendtime</code> Default: <code>createtime</code>. The topic inherits the default value from the stream unless the topic sets the timestamp type to a different value.</p> <p>A <code>createtime</code> value is the time defined by the user or application (when creating the message). If user or application does not define this value (or passes null), the client uses the current system timestamp.</p> <p>A <code>logappendtime</code> value is the time when the message (log) was appended to the server.</p>

stream topic info

Lists information about a stream's topic, grouped by partition ID.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) on the volume
- [lookupdir](#) on directories in the path
- `adminperm`, `consumeperm`, `produceperm`, or `topicperm` permission on the stream

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Streams does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprccli stream topic info -path <Stream Path> -topic <Topic Name></pre>
REST	<pre>http[s]://<host>:<port>/rest/stream/topic/info?path=<path>&topic=<name></pre>

Parameters

Parameter	Description
path	The path and name of the stream for which you want to display information about topics.
topic	The name of the topic for which you want to display information.

Sample Output

```
maprccli stream topic info -path /streamVol/stream1 -topic topic1 -json
{
  "timestamp":1521232252550,
  "timeofday":"2018-03-16 01:30:52.550 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "partitionid":0,
      "physicalsize":0,
      "logicalsize":0,
      "maxoffset":-1,
      "minoffsetacrossconsumers":0,
      "mintimestamp":"1969-12-31T04:00:00.000-0800 PM",
      "maxtimestamp":"1969-12-31T04:00:00.000-0800 PM",
      "mintimestampacrossconsumers":"1969-12-31T04:00:00.000-0800 PM",
      "fid":"2113.32.131400",
      "master":"doc24.lab:5660",
      "servers":"doc24.lab:5660",
      "timestamptype":"createtime",
      "logcompactionlaststarted":"1969-12-31T04:00:00.000-0800 PM",
      "logcompactionlastcompleted":"1969-12-31T04:00:00.000-0800 PM",
      "logcompactionstatus":"not started"
    }
  ]
}
```

Field Descriptions

partitionid	The index number of the partition within the topic. The first partition in a topic has an index of 0, the next partition an index of 1, and so on.
physicalsize	The physical size (in bytes) of the stream topic with data compression.
logicalsize	The logical size (in bytes) of the stream topic without data compression.

maxoffset	The maximum offset for this partition.
minoffsetacrossconsumers	All known consumers for this partition have consumed messages at least up to this offset.
mintimestamp	The timestamp of oldest message in the partition.
maxtimestamp	The timestamp of newest message in the partition.
mintimestampacrossconsumers	All known consumers for this partition have consumed messages older than this timestamp.
fid	The inode hosting the head of the partition.
master	<i>For use by HPE support:</i> The master server that is hosting the head of the partition.
servers	<i>For use by HPE support:</i> Lists all of the servers that are hosting the head of the partition.
timestamptype	The type of timestamp stored in the topic's message. Possible values: createtime (default) and logappendtime.
logcompactionlaststarted	Displays the last time log compaction was started if log compaction was enabled. The value is displayed in epoch time. This field displays when there is a change in the value for this field.
logcompactionlastcompleted	Displays the last time log compaction completed if log compaction was enabled. The value is displayed in epoch time. This field displays when there is a change in the value for this field.
logcompactionstatus	Displays whether log compaction was started or completed.

stream topic list

Lists the topics that are in a stream, as well as the number of partitions in each topic.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) on the volume
- [lookupdir](#) on directories in the path
- adminperm, consumeperm, produceperm, or topicperm permission on the stream

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Streams does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	maprcli stream topic list -path <Stream Path>
REST	http[s]://<host>:<port>/rest/stream/topic/list?path=<path>

Parameters

Parameter	Description
path	The path and name of the stream for which you want to list the topics.

Sample Output

```
# maprccli stream topic list -path /s1 -json
{
  "timestamp":1441882201851,
  "timeofday":"2015-09-10 03:50:01.851 GMT-0700",
  "status":"OK",
  "total":2,
  "data":[
    {
      "topic":"topic0",
      "partitions":4,
      "consumers":8,
      "physicalsize":148373504,
      "logicalsize":1009713152,
      "maxlag":6314
    },
    {
      "topic":"topic1",
      "partitions":4,
      "consumers":8,
      "physicalsize":148373504,
      "logicalsize":1009713152,
      "maxlag":6385
    }
  ]
}
```

kafkatopic

Displays help for the maprccli commands related to Kafka topics that are available in Data Fabric.

kafkatopic create

Creates a Kafka topic.

Syntax

IMPORTANT: Ensure that the mapr-kafka package is installed on the server node, before running the kafkatopic create command. When mapr-kafka package is not installed, the following error is encountered: Command execution failed! 'kafkatopic' commands requires 'mapr-kafka' package.

CLI

The maprccli command creates a Kafka topic.

```
$ maprccli kafkatopic create -topic
<topicname> [-parameter <parameter
value> -parameter <parameter value>..]
```

REST

```
http[s]://<host>:<port>/rest/
kafkatopic/create?
topic=<topicname>&parameter=<value>&pa
rameter=<value>&parameter=<value>
```

Parameters

Parameter	Description
-topic	The topic name. This is a mandatory parameter.
-partitions	The number of partitions. Default value is 1. This is an optional parameter.
-ttl	The time to live in seconds. Default value is 604800. This is an optional parameter.
-ownvolume	specifies if the topic is created in its own Data Fabric volume. Only users with Create Volumes (cv) or Full Control (fc) can specify "true" for this parameter. Default value is false. This is an optional parameter.
-compression	Turn compression on or off with this parameter. lz4, zlib are the supported compression schemes. Default value is off. This is an optional parameter.

Examples

Use the command `maprcli kafkatopic create -topic` to create a topic by the name `day_temperature`.

```
$ maprcli kafkatopic create -topic day_temperature
```

TIP: Verify the topic creation with the `maprcli kafkatopic info` command.

```
$ maprcli kafkatopic info -topic day_temperature -json
{
  "timestamp":1681933868166,
  "timeofday":"2023-04-19 12:51:08.166 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "topic":"day_temperature",
      "owner":"root",
      "partitions":1,
      "ttl":604800,
      "compression":"off",
      "size":0,
      "ownvolume":false
    }
  ]
}
```

Create a topic `night_temp` with time to live as 40000 seconds, 4 partitions and `zlib` compression scheme.

```
$ maprcli kafkatopic create -topic night_temp -ttl 40000 -partitions
4 -compression zlib
```

kafkatopic list

Lists existing Kafka topics.

Syntax

IMPORTANT: Ensure that the `mapr-kafka` package is installed on the server node, before running the `kafkatopic list` command. When `mapr-kafka` package is not installed, the following error is encountered: Command execution failed! 'kafkatopic' commands requires 'mapr-kafka' package.

CLI

The `maprccli` command lists existing Kafka topics in a cluster/fabric.

```
$ maprccli kafkatopic list
[-topicregex <regular expression>]
```

REST

```
http[s]://<host>:<port>/rest/
kafkatopic/list
```

Parameters

Parameter	Description
-topicregex	regular expression to filter topic names for topic listing. This is an optional parameter.

Examples

Verify the existing topics with the `maprccli kafkatopic list` command.

```
$ maprccli kafkatopic list
owner  partitions  volume  size  topic      compression  ttl
root   1              false   100   day_temp   lz4          604800
root   4              false   256   nght_temp  off          604800
```

List topics with name starting with `dayT`.

NOTE: Use single quotes or double quotes to enclose special Linux shell characters such as `.` or `*` on the command line. The `kafkatopic list` command returns inaccurate results if you use special Linux shell characters in the regular expression, without enclosing the regular expression in quotes.

```
$ maprccli kafkatopic list -topicregex "dayT.*"
owner  partitions  ownvolume  size  topic          compression  ttl
root   1           false      20    dayTemp2305    lz4          604800
root   1           false      20    dayTemp2405    lz4          604800
root   1           false      20    dayTemp2505    lz4          604800
root   1           false      20    dayTemp2605    lz4          604800
root   1           false      20    dayTemp2705    lz4          604800
```

kafkatopic edit

Edit a Kafka topic.

Syntax

IMPORTANT: Ensure that the `mapr-kafka` package is installed on the server node, before running the `kafkatopic edit` command. When `mapr-kafka` package is not installed, the following error is encountered: Command execution failed! 'kafkatopic' commands requires 'mapr-kafka' package.

CLI

The command facilitates editing of a Kafka topic.

```
$ maprcli kafkatopic edit -topic
<topicname> [-parameter <parameter
value> -parameter <parameter value>..]
```

REST

```
http[s]://<host>:<port>/rest/
kafkatopic/edit?topic=<topicname>
```

Parameters

Parameter	Description
-topic	The topic name. This is a mandatory parameter.
-partitions	The number of partitions. Default value is 1. This is an optional parameter.
-ttl	The time to live in seconds. Default value is 604800. This is an optional parameter.
-compression	Turn compression on or off with this parameter. lz4, lz4, zlib are the supported compression schemes. Default value is off. This is an optional parameter.

Examples

Edit a topic night_temp with time to live as 40000 seconds, 4 partitions and zlib compression scheme.

```
$ maprcli kafkatopic edit -topic night_temp -ttl 40000 -partitions
4 -compression zlib
```

TIP: Verify the topic edit with the maprcli kafkatopic info command.

kafkatopic info

Provides detailed information about a Kafka topic.

Syntax

IMPORTANT: Ensure that the mapr-kafka package is installed on the server node, before running the kafkatopic info command. When mapr-kafka package is not installed, the following error is encountered: Command execution failed! 'kafkatopic' commands requires 'mapr-kafka' package.

CLI

The command provides details of an existing Kafka topic.

```
$ maprcli kafkatopic info -topic
<topicname> -json
```

REST

```
http[s]://<host>:<port>/rest/
kafkatopic/info?topic=<topicname>
```

Parameter	Description
-topic	The topic name . This is a mandatory parameter.

Examples

View topic information for a topic by the name `day_temperature`.

```
$ maprcli kafkatopic info -topic day_temperature -json
{
  "timestamp":1681933868166,
  "timeofday":"2023-04-19 12:51:08.166 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "topic":"day_temperature",
      "owner":"root",
      "partitions":1,
      "ttl":604800,
      "compression":"off",
      "size":0,
      "ownvolume":false
    }
  ]
}
```

kafkatopic connectionprops

Lists the connection properties of Kafka clients.

Syntax

IMPORTANT: Ensure that the `mapr-kafka` package is installed on the server node, before running the `kafkatopic connectionprops` command. When `mapr-kafka` package is not installed, the following error is encountered: Command execution failed! 'kafkatopic' commands requires 'mapr-kafka' package.

CLI

The command returns relevant connection properties for Kafka clients.

```
$ maprcli kafkatopic
connectionprops -json
```

REST

```
http[s]://<host>:<port>/rest/
kafkatopic/connectionprops
```

Examples

List connection properties of Kafka clients.

```
$ maprcli kafkatopic connectionprops -json
{ "timestamp": 1678731806417,
  "timeofday": "2023-03-13 11:23:26.417 GMT-0700 AM",
  "status": "OK",
  "total":1,
  "data":[
    {
      "bootstrap.servers": "host1:9092,host2:9092",
      "security.protocol": "SASL_PLAINTEXT",
      "sasl.mechanism": "PLAIN"
    }
  ]
}
```

kafkatopic delete

Delete a Kafka topic.

Syntax

IMPORTANT: Ensure that the `mapr-kafka` package is installed on the server node, before running the `kafkatopic delete` command. When `mapr-kafka` package is not installed, the following error is encountered: Command execution failed! 'kafkatopic' commands requires 'mapr-kafka' package.

CLI

The command deletes a Kafka topic.

```
$ maprcli kafkatopic delete -topic
<topicname>
```

REST

```
http[s]://<host>:<port>/rest/
kafkatopic/delete?topic=<topicname>
```

Parameters

Parameter	Description
-topic	The topic name. This is a mandatory parameter.

ExamplesDelete a topic by the name `day_temperature`.

```
$ maprcli kafkatopic delete -topic day_temperature
```

kafkatopic listbrokers

Lists the Apache Kafka Wire Protocol brokers in a multi-node Data Fabric cluster.

Syntax

IMPORTANT: Ensure that the `mapr-kafka` package is installed on the server node, before running the `kafkatopic listbrokers` command. When `mapr-kafka` package is not installed, the following error is encountered: Command execution failed! 'kafkatopic' commands requires 'mapr-kafka' package.

CLIThe `maprcli` command lists the Apache Kafka Wire Protocol brokers on the multi-node Kafka cluster.

```
$ maprcli kafkatopic listbrokers
```

REST

```
http[s]://<host>:<port>/rest/
kafkatopic/listbrokers
```

Example

Use the command `maprcli kafkatopic listbrokers` to list brokers along with the broker details in the Data Fabric cluster.

```
$ maprcli kafkatopic listbrokers -json
{
  "timestamp":1687251172651,
  "timeofday":"2023-06-20 01:52:52.651 GMT-0700 AM",
  "status":"OK",
  "total":3,
  "data":[
    {
      "id":0,
      "security.protocol":"SASL_PLAINTEXT",
      "saslmecanism":"PLAIN",
      "host":"m2-mapreng-dev10.mip.storage.hpecorp.net",
      "port":"9092",
      "starttime":"1687008286813"
    },
    {
      "id":1,
      "security.protocol":"SASL_PLAINTEXT",
      "saslmecanism":"PLAIN",
      "host":"m2-mapreng-dev09.mip.storage.hpecorp.net",
      "port":"9092",
      "starttime":"1687008287001"
    },
    {
      "id":2,
      "security.protocol":"SASL_PLAINTEXT",
      "saslmecanism":"PLAIN",
      "host":"m2-mapreng-dev11.mip.storage.hpecorp.net",
      "port":"9092",
      "starttime":"1687008285254"
    }
  ]
}
```

kafkatopic getcontroller

Fetches details of the controller node from the available Apache Kafka Wire Protocol brokers in the Data Fabric cluster.

Syntax

IMPORTANT: Ensure that the `mapr-kafka` package is installed on the server node, before running the `kafkatopic getcontroller` command. When `mapr-kafka` package is not installed, the following error is encountered: `Command execution failed! 'kafkatopic' commands requires 'mapr-kafka' package.`

CLI

The `maprcli` command displays information about the Apache Kafka Wire Protocol controller on the Data Fabric cluster.

Use the command to understand which of the nodes in the cluster is the controller.

```
$ maprcli kafkatopic
getcontroller -json
```

REST

```
http[s]://<host>:<port>/rest/  
kafkatopic/getcontroller
```

Example

Use the command `maprcli kafkatopic getcontroller` to display details of the Apache Kafka Wire Protocol broker

```
$ maprcli kafkatopic getcontroller -json  
{  
  "timestamp":1687176345951,  
  "timeofday":"2023-06-19 05:05:45.951 GMT-0700 AM",  
  "status":"OK",  
  "total":1,  
  "data":[  
    {  
      "id":0,  
      "host":"m2-sm2027-14-n2.mip.storage.hpecorp.net",  
      "port":"9092",  
      "security.protocol":"SASL_PLAINTEXT",  
      "sasl.mechanism":"PLAIN",  
      "starttime":"1687008489078"  
    }  
  ]  
}
```

s3domain

Commands for managing HPE Data Fabric Object Store domains.

s3domain info

Displays information about a HPE Data Fabric Object Store domain.

Permissions Required

None

Syntax

CLI	<pre>s3domain info [-cluster cluster_name] -name name</pre>
-----	---

Input Parameters

Parameter	Description
cluster	The cluster on which to run the command. By default, the cluster is the one on which the command is being run.
name	The domain name for which to fetch information.

Output Parameters

Parameter	Description
userCount	The number of users in the domain.

Parameter	Description
usedSizeMB	The amount of disk space in MB used by the domain. Buckets and Objects for every account in the domain use disk space.
bucketCount	The number of buckets present in the accounts in the domain.
totalAccounts	The number of accounts that belong to the domain.
unavailableAccounts	The number of disabled accounts in the domain.

Sample Output

Return information for the domain primary:

CLI

```
maprcli s3domain info -name
primary -json

{
    "timestamp":1637912276781,
    "timeofday":"2021-11-25
11:37:56.781 GMT-0800 PM",
    "status":"OK",
    "total":1,
    "data":[
        {
            "totalAccounts":121,
            "unavailableAccounts":0,
            "userCount":128,
            "bucketCount":356,
            "usedSizeMB":261192
        }
    ]
}
```

s3domain list

List all HPE Data Fabric Object Store domains.

Permissions Required

None

Syntax

CLI	<pre>maprcli s3domain list [-cluster cluster_name]</pre>
-----	--

Sample Output

List all domains

CLI

```
maprcli s3domain list -json

{
  "timestamp":1636354490984,
  "timeofday":"2021-11-07
10:54:50.984 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[
    {
      "root":0,
      "totalAccounts":0,
      "unavailableAccounts":0,
      "userCount":0,
      "bucketCount":0,
      "usedSizeMB":0
    },
    {
      "name":"primary",
      "root":1002
    }
  ]
}
```

s3user

Creates user in the specified s3 account and domain for the specified cluster or refreshes LDAP user information.

Permissions Required

None

Syntax

```
maprcli s3user create
[ -cluster cluster_name ]
  -domainname <domain_name>
  -accountname <account_name>
  -username <user_name>
refreshldap
[ -cluster cluster_name ]
[ -username <user_name> ]
[ -all <true|false> ]
```

s3user create

The command creates a user in the given s3 account and domain in a Data Fabric cluster.

Syntax

The `s3user create` command can be used to create a user in the given S3 account, domain.

In a multi-cluster environment, you must specify the `cluster_name` parameter to create the user on the specified cluster.

```
maprcli s3user create
[ -cluster cluster_name ]
  -domainname <domain_name>
```

```
-accountname <account_name>
-username <user_name>
```

Input Parameters

Parameter	Description
cluster	The cluster on which to run the command. By default, the cluster is the one on which the command is being run. This is an optional parameter. If cluster name not specified, the user is created on the local cluster.
domainname	The s3 domain name in which the user is to be created.
accountname	The s3 account name in which the user is to be created.
username	The s3 username to be created.

Output Parameters

Parameter	Description
accesskey	Access key for the user is generated when the user is created successfully.
secretkey	Secret key for the user is generated when the user is created successfully.

Sample Output

CLI

```
maprcli s3user create -domainname
primary -accountname
default -username user1 -json
{
    "timestamp":1693200369351,
    "timeofday":"2023-08-27
10:26:09.351 GMT-0700 PM",
    "status":"OK",
    "total":1,
    "data":[
        {
            "accesskey":"67845HA2VTKNN6RR58U55G13K
G696SJXK2JU5P1MN80MZFQ1P9HYTGXN3GDF2XV
0BEKQQZANUN8J9WCQG9PGYRTIJP0Z",
            "secretkey":"80XATTWV3HEG4VTFGHLE0VR09
DX1A01XS2ZT93E2MR3T9W1A3W0918HMA8UEK7M
IZM0Q13L2P4B1FS78VNDU0BAW05ALUFWBPERNN
K"
        }
    ]
}
```

s3user refreshldap

The command refreshes user information on the Data Fabric to match the user information on LDAP.

Syntax

The `s3user refreshldap` subcommand is used to refresh the Data Fabric cluster user information, so as to be in sync with any change to the user information on the external LDAP server side.

For instance, a user could be moved from a privileged group (group1) to a less privileged group (group2) on the LDAP server. In such a scenario, the Data Fabric cluster would still have stale user information and might still allow privileged access to the user. Hence, a refresh of the LDAP permissions is essential to reflect the change on to Data Fabric.

NOTE: The LDAP refresh is auto-triggered periodically for an LDAP integrated Data Fabric cluster.

```
maprcli s3user refreshldap
[ -cluster cluster_name ]
[ -username <user_name> ]
[ -all <true|false> ]
```

Input Parameters

Parameter	Description
clustername	The cluster on which to run the command. By default, the cluster is the one on which the command is being run. This is an optional parameter. If cluster name not specified, default value is the local cluster.
username	The user name whose user information should be fetched or synced from LDAP server.
all	Use the value true if all LDAP users are to be refreshed. Default value is false.

s3keys

Commands for managing HPE Data Fabric Object Store access and secret keys.

s3keys generate

Generates access and secret keys for IAM users to access the Object Store.

Syntax

CLI	<pre>maprcli s3keys generate [-cluster cluster_name] -domainname <domain_name> -accountname <account_name> [-username <user_name>]</pre>
REST	http[s]://<host>:<port>/rest/s3keys/generate?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to create the access and secret keys. The default is the current cluster.
domainname	The domain to which the user belongs. This parameter is mandatory.
accountname	The account to which the domain belongs. This parameter is mandatory.
username	The user for which to generate the keys. If not specified, the logged-in user is taken as the user to generate the keys.

Example

TIP: To work properly, the `maprcli s3keys generate` command requires a quorum of the CLDB s3server modules. If you run the command before the quorum is formed, the command can generate an error. To check the quorum status, use the `maprcli dump cldbstate --json` command. The dump output should indicate that the primary and secondary s3server modules are running.

Generate the access and secret keys for the `mapr` user in the default account and primary domain.

CLI

```
maprcli s3keys generate -domainname
primary -accountname
default -username mapr -json
{
  "timestamp":1633527639908,
  "timeofday":"2021-10-06
06:40:39.908 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "accesskey":"XJSV9SD99PET929AAJACUSB52
ABUMWG05WwCTYLGABPB48HA9NLL3UN1Y2X870X
P3G03SZU3LVVJ0CAI9ZQ1DMCKVL1FNTABDSPGB
8P",
      "secretkey":"FFIL30S5IL482GHPQE0LJD360
KJV56Y4ML75ZFMW9STYY24V7X36H3VTQX"
    }
  ]
}
```

s3keys delete

Deletes an access key and the associated secret key.

Syntax

CLI	<pre>maprcli s3keys delete [-cluster cluster_name] [-accesskey <access key>]</pre>
REST	<code>http[s]://<host>:<port>/rest/s3keys/delete?<parameters></code>

Parameters

Parameter	Description
cluster	The cluster on which the access and secret keys were created. The default is the current cluster.
accesskey	The key to delete.

Example

Delete the access key

`2ZYLIHQYR0DXPDx8RGN3ET96RJNSIG1T5CFPR0AXUAX0Y2ZCA5SK7RRU3RHJ2ZW52OVVAINOAO
5ONNFQCHVQIR2GS336OLUHKEE7KEY56GD.`

CLI

```
maprcli s3keys delete -accesskey
"2ZYLIHQYR0DXPDX8RGN3ET96RJNSIG1T5CFPR
0AXUAX0Y2ZCA5SK7RRU3RHJ2ZW520VVAIN0A05
0NNFQCHVQIR2GS3360LUHKEE7KEY56GD"
```

Removed

```
2ZYLIHQYR0DXPDX8RGN3ET96RJNSIG1T5CFPR0
AXUAX0Y2ZCA5SK7RRU3RHJ2ZW520VVAIN0A050
NNFQCHVQIR2GS3360LUHKEE7KEY56GD
```

REST

```
https://abc.sj.us:8443/rest/s3keys/
delete?
accesskey='2ZYLIHQYR0DXPDX8RGN3ET96RJN
SIG1T5CFPR0AXUAX0Y2ZCA5SK7RRU3RHJ2ZW52
0VVAIN0A050NNFQCHVQIR2GS3360LUHKEE7KEY
56GD'
```

s3keys list

Lists all access keys in the HPE Data Fabric Object Store.

Syntax

CLI	<pre>maprcli s3keys list [-cluster cluster_name]</pre>
REST	<pre>http[s]://<host>:<port>/rest/s3keys/list?<parameters></pre>

Parameters

Parameter	Description
cluster	The cluster on which the access and secret keys were created. The default is the current cluster.

Example

CLI

```
maprcli s3keys list

key

username

A58D30E9ZMQV0XELZT46346JWNIWJPEJ7X0Z3Q
5AOL1J9KZ5F3LGYLEA9MMEVDKX4S24EM4NBI0EF
LM9UB7GYQY3ISG31UVSD2W6XJ4YI9NCQ8U539W
J7AELK0Y6 mapr
```

REST

```
https://abc.sj.us:8443/rest/s3keys/
list
```

s3keys gentempkey

Generates temporary access and secret keys for IAM user to access the Object Store.

NOTE: This command is available with the Data Fabric release version 7.7.0.6 (patch release) or higher. You must be the cluster administrator to be able to run this command for the generation of temporary secret key and access key for yourself or other users. The `s3keys gentempkey` command can be used to create a temporary access key and secret key to access an S3 object store for a limited period of time. The temporary access key and secret key generated by using the command expire after a default duration of 15 minutes, unless a different time duration is specified, while generating the temporary access key and secret key. To generate a secret key and access key that can be used for a longer duration, the [s3keys generate](#) on page 2749 command must be used.

Syntax

CLI	<pre>maprccli s3keys gentempkey [-cluster cluster_name] [-username <user_name>] [-accountname <account_name>] [-domainname <domain_name>] [-duration <duration>]</pre>
REST	<code>http[s]://<host>:<port>/rest/s3keys/gentempkey?<parameters></code>

Parameters

Parameter	Description
cluster	The cluster on which to create the access and secret keys. The default is the current cluster.
domainname	The domain to which the user belongs. The default value is <code>primary</code> . The domain contains multiple accounts.
accountname	A unique administrative unit in a domain that owns buckets, policies, and users. The default value is <code>default</code> .
username	The user for which to generate the keys. If not specified, the logged-in user is taken as the user to generate the keys.
duration	<p>Time duration, in seconds, for which the key is valid. The default value is 900 seconds (15 minutes). The temporary access key and secret key expire at the end of this time duration.</p> <p> NOTE: If the <code>s3keys gentempkey</code> command is run before the end of the access key and secret key expiration time duration, the command returns the current access key and secret key, instead of generating a new access key and secret key. The access credentials cannot be renewed or refreshed.</p>

Example

Generate temporary access and secret keys for the `tempuser` user in the default account and primary domain on a cluster by the name `dfcluster`.

CLI

```
maprccli s3keys gentempkey -cluster
dfcluster -username
tempuser -accountname
default -domainname primary -duration
900 -json
{
```

```

        "timestamp":1725520096373,
        "timeofday":"2024-09-05
12:08:16.373 GMT-0700 AM",
        "status":"OK",
        "total":1,
        "data":[
            {
                "accesskey":"VJR5BD0SI7SJIOZRHIDBXDAUD
X1SHWQH6G7VWQSPEXL6U0PKEMQDJKY8GUJS20S
PCQPT2346F6N",
                "secretkey":"49UZ9TKCCE7MTJKUBLI8I",
                "expiryTime":1725520996316
            }
        ]
    }

```

REST

```

curl "https://<server_ip>:8443/rest/
s3keys/gentempkey?
cluster=dfcluster&domainname=primary&a
ccountname=default&username=tempuser&d
uration=900"
--header 'Authorization: Bearer
<bearer token>'

```

table

Performs functions related to HPE Data Fabric Database tables.

table create

Creates a HPE Data Fabric Database binary or JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre> /opt/mapr/bin/maprccli table create -path <path> [-copymetafrom <path to source table>] [-copymetatype all cfs aces splits attrs] [-regionsizeemb <region size in MB>] [-autosplit true false] [-bulkload true false] [-audit true false] [-tabletype <Table Type - json or binary> default: binary] [-packperm <Pack Permission settings>] [-bulkloadperm <Bulk load Permission settings>] [-splitmergeperm <Split and Merge Permission settings>] [-createrenamefamilyperm <Add/Rename Family Permission settings>] [-deletefamilyperm <Delete Family Permission settings>] [-adminaccessperm <ACE Admin Permission settings>] [-replperm <Replication Admin Permission settings>] [-indexperm <ACE Admin Permission settings>] [-defaultversionperm <CF Versions Default Permission setting>] [-defaultcompressionperm <CF Compression Default Permission setting>] [-defaultmemoryperm <CF Memory Default Permission setting>] [-defaultreadperm <CF Read Default Permission setting>] [-defaultwriteperm <CF Write Default Permission setting>] [-defaulttraverseperm CF Traverse Default Permission] [-defaultappendperm <CF Append Default Permission setting>] [-defaultunmaskedreadperm CF Unmasked Read Default Permission] [-metricsinterval <metric interval setting>] [-securitypolicy <comma-delimited list of policies>] </pre>
REST	<pre> curl -k -X POST 'http[s]://<host>:<port>/rest/table/ create?path=<path>&<parameters>' -u <username>:<password> </pre>

Parameters

Parameter	Description
path	<p>The path to the new HPE Data Fabric Database table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under a volume with a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customer under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer <p> NOTE: You cannot use the following characters in the table name:</p> <div style="background-color: #f0f0f0; padding: 5px; margin: 5px 0;"> <p>< > ? % \</p> </div> <p>To use the following characters in the table name, enclose them either in single or double quotes:</p> <div style="background-color: #f0f0f0; padding: 5px; margin: 5px 0;"> <p>; () /</p> </div> <p>For example:</p> <div style="background-color: #f0f0f0; padding: 5px; margin: 5px 0;"> <pre>maprcli table create -path "/^=#; {}&()/" (or) maprcli table create -path '/^=#; {}&()/'</pre> </div> <p>To use either the ' or the " character in the table name, enclose:</p> <ul style="list-style-type: none"> the ' character within double quotes (") the " character within single quote (') <p>For example:</p> <div style="background-color: #f0f0f0; padding: 5px; margin: 5px 0;"> <pre>maprcli table create -path "'/^=#; {}&()/" (or) maprcli table create -path '"/^=#; {}&()/'</pre> </div>

Parameter	Description
copymetafrom	<p>The path to a table that contains the metadata that should be used to create the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, if you want to copymetadadata from a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, if you want to copymetadadata from a table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
copymetatype	<p>The type of metadata to copy from the table identified in the copymetafrom parameter. You can specify one or more of the following options in a comma separated list:</p> <ul style="list-style-type: none"> all. Copy all metadata. This is the default. cfs. Copy column family metadata. aces. Copy ACE permissions. splits. Copy split keys. attrs. Copy table attributes.
regionsizeemb	<p>The average size of the regions into which HPE Data Fabric Database tries to split the table as the table grows. The default is 4096 MB. This value is ignored if autosplit is set to false.</p> <p>If autosplit is set to true, HPE Data Fabric Database splits a region when the size of the region exceeds 150% of the average value. For example, if the average value is 4096 MB, HPE Data Fabric Database splits a region that is larger than 6144 MB.</p> <p>Although splits are automatic, merges are not. For example, if the value of regionsizeemb is changed from 8 GB to 4 GB, all regions that are eligible are split automatically, if autosplit is set to true. However, if the value of regionsizeemb is changed from 2 GB to 4 GB, regions smaller than 4 GB are not automatically merged.</p> <p> NOTE: When a table has less than 4 regions, HPE Data Fabric Database ignores the regionsizeemb parameter and splits regions at a lower threshold.</p>
autosplit	<p>A Boolean value that specifies whether to split the table into regions automatically as the table grows. The average size of each region is determined by the regionsizeemb parameter.</p> <p>The default value is true. If you set the value to false, you can manually split tables into regions by using the table region split command.</p>

Parameter	Description
bulkload	A Boolean value that specifies whether to allow a full bulk load of the table. The default is false. For more information, see Loading Data into Binary Tables on page 1650 and Loading Documents into JSON Tables on page 1647.
audit	Specifies whether to turn auditing on for the table. If auditing is also enabled at the cluster level with the <code>mapcli audit data</code> command and enabled for the current volume, setting this value to true causes auditing to start for the table.
tabletype	Specifies whether the table will be a binary table or a JSON table. The values are <code>binary</code> and <code>json</code> . The default is <code>binary</code> .
packperm	The ACE that controls who can pack table regions. By default, permission is given to the user ID that is used to create the table.
bulkloadperm	The ACE that controls who can load this table with bulk loads if the table was created with bulk load support. By default, permission is given to the user ID that is used to create the table.
splitmergeperm	<p>The ACE that controls who can take the following actions:</p> <ul style="list-style-type: none"> Run the <code>table region split</code> and <code>table region merge</code> commands to split the table into regions or to merge regions of the table together. Change the value of <code>regionsizeemb</code>. <p>By default, permission is given to the user ID that is used to create the table.</p>
createrenamefamilyperm	The ACE that controls who can create column families for this table or rename existing column families. By default, permission is given to the user ID that is used to create the table.
deletefamilyperm	The ACE that defines access to delete column families for this table. Delimit the expression with single-quotation marks. By default, permission is given to the user ID that is used to create the table.
adminaccessperm	The ACE that controls who can view and edit the permissions for this table. By default, permission is given to the user ID that is used to create the table.
replperm	The ACE that controls who can set up replication either to or from a table. By default, permission is given to the user ID that is used to create the table.
indexperm	The secondary index Admin permissions setting that controls who can create an index associated with this table. By default, permission is given to the user ID that is used to create the table.

Parameter	Description
defaultversionperm	<p>The default ACE for the version permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter versionperm in the table cf create and table cf edit commands overrides this value.</p> <p> NOTE: This permission is not applicable to JSON tables. Versioning is not supported for JSON documents.</p>
defaultcompressionperm	<p>Applies to binary tables only: The default ACE for the compression permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter compressionperm in the table cf create and table cf edit commands overrides this value.</p>
defaultmemoryperm	<p>The default ACE for the memory permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter memoryperm in the table cf create and table cf edit commands overrides this value.</p>
defaultreadperm	<p>The default ACE for the read permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter readperm in the table cf create and table cf edit commands overrides this value. See table cf create on page 2778 and table cf edit on page 2785</p>
defaultwriteperm	<p>The default ACE for the write permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter writeperm in the table cf create and table cf edit commands overrides this value. See table cf create on page 2778 and table cf edit on page 2785</p>
defaulttraverseperm	<p>Applies to JSON tables only: The default Access Control Expression for the traverse permission on new column families. For more information about this permission, see Permission Types for Fields and Column Families in JSON Tables on page 1662.</p>
defaultappendperm	<p>Applies to binary tables only: The default ACE for the append permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter appendperm in the table cf create and table cf edit commands overrides this value.</p>

Parameter	Description
defaultunmaskedreadperm	The defaultunmaskedreadperm permission on table creation is set to the table creator. This setting takes effect for all new column families (and therefore also all columns/fields within all column families) unless otherwise overridden by the <code>maprcli table cf</code> or the <code>maprcli table cf colperm</code> command. This permission allows the user to read the data unmasked. Users without this permission have the masked data returned.
metricsinterval	<p>The metrics collection interval, in seconds, for the table.</p> <p>Possible values: 10, 60, 600</p> <p>Default: 60 seconds</p> <p>When configured to 10 seconds, under normal workloads, the metrics are available in OpenTSDB in about 30 seconds. At an interval of 60 seconds, the metrics are available in about 90 seconds.</p> <p> NOTE: You cannot disable metrics collection for a table by setting the interval to 0.</p>
securitypolicy	The security policy or policies that apply to the table. If the parameter is not specified during table creation, the default value is uninitialized ("[-]"), and there is no security policy for the table.

Example

Creates a HPE Data Fabric Database table named `newtable` in `volume1`:

CLI	<code>/opt/mapr/bin/maprcli table create -path /volume1/newtable</code>
REST	<code>curl -k -X POST \ 'https://r1n1.sj.us:8443/rest/table/ create?path=%2Fvolume1%2Fnewtable' \ -u mapr:mapr</code>

table cf

Manages column families for HPE Data Fabric Database tables.

table cf colperm get

Lists the Access Control Expressions (ACEs) for a specified column.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) on the volume
- [lookupdir](#) on directories in the path
- `adminaccessperm` on the table

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table cf colperm get
-path <path>
-cfname <column-family name>
[ -name <column name> ]
[ -json | -long ]
```

REST

```
curl -k -X GET
'http[s]://<host>:<port>/rest/
table/cf/colperm/get?
path=<path>&cfname=<name>&name=<name>'

-u <username>:<password>
```

Parameters

Parameter	Description
path	<p>The path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
cfname	The name of the column family in which the column is located.
name	The name of the column that you want to list the ACEs for. If you do not specify the column name, the ACEs for all of the columns in the family are listed.
json	This command returns multiple levels of data. You must specify to display the output either in JSON or the "long" format to see the full set of information.
long	This command returns multiple levels of data. You must specify to display the output either in JSON or the "long" format to see the full set of information.

Example

Lists ACEs for column col1 in table mytable and column family cf1:

CLI

```
maprcli table cf colperm get -path /
mytable -cfname cf1 -name col1 -long
```

REST

```
curl -X GET \
  'https://r1n1.sj.us:8443/
  rest/table/cf/colperm/get?
  path=%2Fmytable&cfname=cf1&name=col1'
  \
  -u <username>:<password>
```

table cf colperm set

Sets access control expressions (ACEs) for a specified column.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- [adminaccessperm](#) on the table

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax**CLI**

```
/opt/mapr/bin/maprccli table cf
colperm set
-path <path>
-cfname <column-family name>
-name <column name>
[ -appendperm <Access Control
Expression for column appends> ]
[ -readperm <Access Control
Expression for column reads> ]
[ -writeperm <Access Control
Expression for column writes> ]
[ -traverseperm <Access Control
Expression for column traversals in
JSON tables> ]
[ -unmaskedreadperm <Unmasked read
column permission settings> ]
```

REST

```
curl -k -X POST
'http[s]://<host>:<port>/rest/
table/cf/colperm/set?
path=<path>&cfname=<name>&name=<name>&
<parameters>'
-u <username>:<password>
```

Parameters

Parameter	Description
path	<p>The path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
cfname	The name of the column family in which the column is located.
name	<p>For binary tables: The name of the column for which you want to set the ACE.</p> <p>For JSON tables: The fieldpath of the field on which you want to set permissions. For example, if you wanted to grant readperm to a user on field b in the following document, the fieldpath would be a.b.</p> <pre>{ "a" : { "b" : "value_b" } }</pre>
appendperm	<p>Applies to binary tables only: The ACE for column appends. Use single quotation marks around the ACE.</p> <p>Column appends require permission both at the column-family level and at the column level.</p>
readperm	<p>The ACE for column reads. Use single quotation marks around the ACE.</p> <p>Reads require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p>
writeperm	<p>The ACE for column writes (puts and deletes). Use single quotation marks around the ACE.</p> <p>Writes require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p>

Parameter	Description
traverseperm	<p>Applies to JSON tables only: The Access Control Expressions that specifies who has permission to pass over fields in JSON documents. For example, suppose that a JSON table contains documents of this general structure:</p> <pre>{ "_id" : "ID", "a" : { "b" : "value", "c" : "value" } }</pre> <p>Suppose further that the user sjohnson has read permission on a.b, but not on a. For sjohnson to read a.b, the user needs the traverse permission on a. The user can then pass over field a to a.b.</p> <p>This permission is inherited by fields within the column family. By default, this permission is given to the value of defaulttraverseperm for the JSON table.</p>
unmaskedreadperm	<p>The unmaskedreadperm permission, when applied to a column of a JSON table with a dynamic data mask set, allows the user to read the data unmasked. Users without this permission have the masked data returned.</p>

Example

Sets readperm ACE for column col1 in table mytable and column family cf1 :

CLI

```
/opt/mapr/bin/maprccli table cf
colperm set -path /mytable -cfname
cf1 -name col1 -readperm 'g:group1'
```

REST

```
curl -X POST \
'https://r1n1.sj.us:8443/rest/
table/cf/colperm/set?
path=%2Fmytable&cfname=cf1&name=col1&r
eadperm="g:group1"' \
-u <username>:<password>
```

table cf colperm delete

Deletes the Access Control Expressions (ACEs) for a specified column. Deletion cannot be undone.

NOTE: When a user, group, or role requests to read data from, write data to, or append data to a column, HPE Data Fabric Database checks whether that user, group, or role has read or write permission for the column family AND read or write permission for the column. For example, suppose user `i_montoya` tries to write data to columns `col1` and `col2` in column family `cf1`. HPE Data Fabric Database checks whether `i_montoya` has write permission on `cf1` AND `col1` AND `col2`. If `i_montoya` does not have all three permissions, HPE Data Fabric Database returns an error that says access for the write is denied.

If this user were to try to read from the same two columns, HPE Data Fabric Database would simply not return the data. If the user tried to read from those two columns and additional columns on which he had read permissions, the results would contain the data for those additional columns but exclude the data for `col1` and `col2`.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminaccessperm` on the table

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table cf colperm delete
-path <path>
-cfname <column-family name>
-name <column name>
```

REST

```
curl -k -X POST
'http[s]://<host>:<port>/
rest/table/cf/colperm/delete?
path=<path>&cfname=<name>&name=<name>'
-u <username>:<password>
```

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

Parameter	Description
path	<p>The path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
cfname	The name of the column family in which the column is located.
name	The name of the column that you want to delete the ACEs for.

Example

Deletes ACEs for column col1 in table mytable and column family cf1:

CLI

```
maprccli table cf
colperm delete -path /mytable -cfname
cf1 -name col1
```

REST

```
curl -X POST \
'https://r1n1.sj.us:8443/
rest/table/cf/colperm/delete?
path=%2Fmytable&cfname=cf1&name=col1'
-u <username>:<password>
```

table cf column securitypolicy add

Adds one or more security policies to the existing list of policies associated with a field in a HPE Data Fabric Database JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- adminaccessperm on the table

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprcli table cf column securitypolicy add -path <path> -cfname <column family name> -column <JSON table field> -securitypolicy <comma-delimited list of policies></pre>
REST	<pre>http[s]://<host>:<port>/rest/table/cf/ column/securitypolicy/add? path=<path>&cfname=<column-family-name>& column=<JSON-table-field>&securitypolicy =<policies></pre>

Parameters

Parameter	Description
path	<p>The path to the HPE Data Fabric Database table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under a volume with a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customer under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
cfname	The name of the column family of the JSON table field to which the security policies will be added.
column	The JSON table field.
securitypolicy	The list of security policy tags to be added to the JSON table field.

Example

Adds the security policy named newpolicy to the sales field in the default column family of a Data Fabric table named table1:

CLI	<pre>maprcli table securitypolicy add -path "/table1" -cfname "default" -column "sales" -securitypolicy "newpolicy"</pre>
REST	<pre>http[s]://<host>:<port>/rest/table/cf/ column/securitypolicy/add?path=/ table1&cfname=default&column=sales&secur itypolicy=newpolicy</pre>

table cf column datamask set

Sets the data mask on one or more JSON table columns.

To set a [dynamic data mask](#) for a column within a column family (CF) of a JSON table, use the `maprcli table cf column datamask set` command. For columns with existing data, the dynamic data masks will apply to all future SCAN and GET queries for that table column without any client-side or application changes.

Syntax**CLI**

```
maprcli table cf column datamask set
-path <table-path>
-cfname <column family name>
-name <column-name>
-datamask <mask-name>
```

REST

```
http[s]://<host>:<port>/rest/table/cf/
column/datamask/set?<parameters>
```

Parameters

Parameter	Description
path	<p>The path to the HPE Data Fabric Database table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under a volume with a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customer under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
cfname	The name of the column family of the JSON table field to which the data mask will be added.
name	The JSON table field.
datamask	<p>The name of the data mask. This must be one of the predefined data masks. At most one dynamic data mask can be set for a specific column at a time. Obtain supported mask names using the <code>maprcli security datamask list</code> command.</p> <p> NOTE: Using an empty string for a datamask removes all datamasks from the column family. For example:</p> <pre>maprcli table cf column datamask set -path / mytable -cfname default -name a -datamask ""</pre>

Example**CLI**

```
maprcli table cf column datamask
set -path /table1 -cfname default \
    -name Creditcard -datamask
mrddm_last4
```

REST

```
curl -X POST \
    'https://r1n1.sj.us:8443/rest/
table/cf/column/datamask/set?path=/
table1 \

&cfname=default&name=Creditcard&datama
sk=mrddm_last4' -u
<username>:<password>
```

table cf column datamask get

Retrieves the data mask used by one or more JSON table columns.

Syntax

CLI

```
maprcli table cf column datamask get
-path <table-path>
-cfname <column family name>
[ -name <column-name>]
```

REST

```
http[s]://<host>:<port>/rest/table/cf/
column/datamask/get?<parameters>
```

Parameters

Parameter	Description
path	The path to the HPE Data Fabric Database table. <ul style="list-style-type: none">For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under a volume with a mount point at /volume1, specify the following path: /volume1/testFor a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customer under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
cfname	The name of the column family of the JSON table field from which the data mask will be retrieved.
name	The JSON table field. This parameter is optional. If omitted, the query returns all columns for the specified column family that have associated dynamic data masks.

Example

CLI

```
maprcli table cf column
datamask get -path /table1 -cfname
default -json

{
  "timestamp":1612303576139,
  "timeofday":"2021-02-02
02:06:16.139 GMT-0800 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "name":"Creditcard",
      "datamask":"mrddm_last4"
```

```
    }
  ]
}
```

REST

```
curl -k -X POST 'https://
r1n1.sj.us:8443/rest/table/cf/column/
datamask/get?path=/table1
&cfname=default'-u mapr:mapr
```

table cf column datamask remove

Removes the data mask used by one or more JSON table columns.

If the column does not currently have a [dynamic data mask](#) set, this command returns successfully with no changes.

Syntax

CLI

```
maprcli table cf column datamask
remove
  -path <table-path>
  -cfname <column family name>
  -name <column-name>
```

REST

```
http[s]://<host>:<port>/rest/table/cf/
column/datamask/remove?<parameters>
```

Parameters

Parameter	Description
path	The path to the HPE Data Fabric Database table. <ul style="list-style-type: none">For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under a volume with a mount point at /volume1, specify the following path: /volume1/testFor a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customer under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
cfname	The name of the column family of the JSON table field.
name	The JSON table field to check for a dynamic data mask

Example

CLI

```
maprcli table cf column
datamask remove -path /table1 -cfname
default -name CC
```

REST

```
curl -X GET \
  'https://r1n1.sj.us:8443/rest/
table/cf/column/datamask/remove?path=/
table1 \
  &cfname=default&name=CC' -u
<username>:<password>
```

table cf column list

Lists column-level attributes including any dynamic data masking properties set for JSON table columns.

Syntax

CLI

```
maprccli table cf column list -path
<table-path>
  -cfname <column family name>
  [ -name <column-name>
```

REST

```
http[s]://<host>:<port>/rest/table/cf/
column/list?<parameters>
```

Parameters

Parameter	Description
path	<p>The path to the HPE Data Fabric Database table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under a volume with a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customer under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
cfname	The name of the column family of the JSON table field.

Parameter	Description
name	The JSON column family field to list attributes. If omitted, all columns for the specified column family that have associated column-level attributes are returned.

Example

In the following example, only user mapr can read column Creditcard from the default CF of table / table1 unmasked. User user1 can read the Creditcard column, but it will be masked:

CLI

```
maprcli table cf colperm set -path /
table1 -cfname default \
-name Creditcard -readperm "u:user1|
u:mapr" -unmaskedreadperm "u:mapr" \
-writeperm "u:mapr"

maprcli table cf
column securitypolicy set -path /
table1 -cfname default \
-name Creditcard -securitypolicy pci

maprcli table cf column datamask set
-path /table1 -cfname default \
-name Creditcard -datamask
mrddm_last4

maprcli table cf column list -path /
table1 -cfname default -json

{
  "timestamp":1612303576139,
  "timeofday":"2021-02-02
02:06:16.139 GMT-0800 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "name":"Creditcard",
      "aces": {
        "readperm":"u:user1|u:mapr",
        "unmaskedreadperm":"u:mapr",
        "writeperm":"u:mapr"
      },
      "securitypolicy":"pci",
      "datamask":"mrddm_last4"
```

}

table cf column securitypolicy list

Displays the list of security policies associated with a field in a HPE Data Fabric Database JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- adminaccessperm on the table

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table cf column
securitypolicy list
  -path <path>
  -cfname <column family name>
  -column <JSON table field>
```

REST

```
http[s]://<host>:<port>/rest/table/cf/
column/securitypolicy/list?
path=<path>&cfname=<name>&column=<JSO
N-table-field>
```

Parameters

Parameter	Description
path	The path to the table. <ul style="list-style-type: none">For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under volume1 which has a mount point at / volume1, specify the following path: /volume1/testFor a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named test under volume1 in the sanfrancisco cluster, specify the following path:/mapr/sanfrancisco/ volume1/customer
cfname	The name of the column family.
column	The JSON table field.

Example

This example lists the security policies associated with the sales field in the default column family of the JSON table jtable.

CLI

```
maprcli table cf
column securitypolicy list -path /
my.cluster.com/volume1/jtable -cfname
default -column sales
```

REST

```
https://r1n1.sj.us:8443/rest/table/cf/
securitypolicy/list?
path=%2Fmy.cluster.com%2Fvolume1%2Fjta
ble' &cfname=default &column=sales
```

Example Output

```
{
  "timestamp":1539674179277,
  "timeofday":"2018-10-16 12:16:19.277 GMT-0700 AM",
  "status":"OK",
  "total":1,
```

```

    "data": [
      {
        "securitypolicy": ["Sales"]
      }
    ]
  }

```

table cf column securitypolicy remove

Removes one or more security policies from the list of security policies associated with a field in a HPE Data Fabric Database JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre> maprcli table cf column securitypolicy remove -path <path> -cfname <column family name> -column <JSON table field> -securitypolicy <comma-delimited list of policies> </pre>
REST	<pre> http[s]://<host>:<port>/rest/table/cf/ column/securitypolicy/remove? path=<path>&cfname=<column-family-name>& column=<JSON-table-field>&securitypolicy =<policies> </pre>

Parameters

Parameter	Description
path	<p>The path to the HPE Data Fabric Database table.</p> <ul style="list-style-type: none"> • For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> • For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code>
cfname	The name or names of the column families containing the security policies you want to remove.
column	The JSON table field.

Parameter	Description
securitypolicy	The security policy tags to be removed from the list of security policies for the specified JSON table field.

Example

Removes the security policy named newpolicy from the sales field in the default column family of a JSON table named table1:

CLI	<pre>maprcli table cf column securitypolicy remove -path "/table1" -cfname "default" -column "sales" -securitypolicy "newpolicy"</pre>
REST	<pre>http[s]://<host>:<port>/rest/table/cf/ securitypolicy/remove?path=/ table1&cfname=default&column=sales&secur itypolicy=newpolicy</pre>

table cf column securitypolicy set

Replaces the existing list of security policies associated with a field in a HPE Data Fabric Database JSON table with one or more new security policies.

Permissions Required

To run this command, your user ID must have the following permissions:

- adminaccessperm on the table

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprcli table cf column securitypolicy set -path <path> -cfname <column family name> -column <JSON table field> -securitypolicy <comma-delimited list of policies></pre>
REST	<pre>http[s]://<host>:<port>/rest/table/cf/ column/securitypolicy/set? path=<path>&cfname=<column-family-name>& column=<JSON-table-field>&securitypolicy =<policies></pre>

Parameters

Parameter	Description
path	<p>The path to the HPE Data Fabric Database table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under a volume with a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customer under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
cfname	The name of the column family of the JSON table field for which the security policies will be replaced.
column	The JSON table field
securitypolicy	The list of security policy tags to be replaced in the JSON table field.

Example

Replaces the security policy for the sales field in the default column family of a Data Fabric table named table1 with a new security policy named newpolicy:

CLI	<pre>maprcli table securitypolicy set -path "/table1" -cfname "default" -column "sales" -securitypolicy "newpolicy"</pre>
REST	<pre>http[s]://<host>:<port>/rest/table/ securitypolicy/set?path=/ table1&cfname=default&column=sales&secu ritypolicy=newpolicy</pre>

table cf create

Creates a column family for a HPE Data Fabric binary or JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- [createrenamefamilyperm](#) on the table

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```

/opt/mapr/bin/maprccli table cf create
-path <Table path >
-cfname <Column family name >
[ -minversions <Min versions to
keep> Default: 0 ]
[ -maxversions <Max versions to
keep> Default: 1 ]
[ -ttl <Time to live> Enter 0 for
forever, otherwise, enter time in
seconds. Default: 0 ]
[ -inmemory <In-memory> Default:
false ]
[ -compression <off|lzf|lz4|zlib>
Default: table's compression setting
is applied. ]
[ -versionperm <Version
Permissions> ]
[ -compressionperm <Compression
Permissions> ]
[ -memoryperm <Memory Permissions> ]
[ -readperm <Read Permissions> ]
[ -writeperm <Write Permissions> ]
[ -appendperm <Append
Permissions> ]
[ -unmaskedreadperm <CF Unmasked
Read Permission> ]
[ -jsonpath Json <Family Path -
needed for JSON column family, like
a.b.c> ]
[ -securitypolicy <comma-delimited
list of policies> ]
[ -force <Force create non-default
column family for json tabletype>
Default: false ]
[ -traverseperm <Traverse
Permissions> ]

```

REST

```

curl -k -X POST
'http[s]://<host>:<port>/rest/
table/cf/create?
path=<path>&cfname=<name>&<parameters>
'
-u <username>:<password>

```

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

Parameter	Description
path	<p>The path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
cfname	The name of the column family to create.
minversions	Applies to binary tables only: Minimum number of versions of column values to keep. The default is zero.
maxversions	Applies to binary tables only: Maximum number of versions of column values to keep. The default is one.
ttl	<p>Time to live in seconds. When the age of the data in this column family exceeds the value of the ttl parameter, the data is purged. Setting the value of ttl to 0 is equivalent to allowing data to remain indefinitely. Default: 0</p> <p> NOTE: If the value of -ttl for an existing column family in a JSON table is not 0, you cannot add another column family. You also cannot set the TTL for a JSON table if it has secondary indexes. See Setting TTL for Data.</p>

Parameter	Description
inmemory	<p>Boolean. Determines whether preference is given to values of this column family for storage with row keys. Because row keys are cached in memory in preference to row data, column-family data that is stored inline with the row keys is also cached in memory.</p> <p>For all column families in a table together, up to 200 bytes of row data will be stored inline with each row key. Storing data inline with a row key might speed retrieval of the data from a column family because disk access can often be avoided. For each column family, up to 32 bytes can be stored inline with each row key even if its <code>inmemory</code> parameter is set to <code>false</code>, but preference will be given to column families where this parameter is set to <code>true</code>. A column family can have more than 32 bytes stored inline if its <code>inmemory</code> parameter is set to <code>true</code>.</p> <p>If the total number of bytes for all column families together exceeds 200 for a row, then preference for inclusion within the inline storage for that row is given to column families that have the <code>inmemory</code> parameter set to <code>true</code>.</p> <p> NOTE: All of the data for a column family are either stored in-line with the row key, or not stored at all. If the contents in a column family for a particular row are larger than the maximum number of bytes that are allowed to be stored for that column family, then data is not stored in-line for that column family.</p> <p>The default value for the <code>inmemory</code> parameter is <code>false</code>.</p>
compression	<p>The compression setting to use for the column family. Valid options are <code>off</code>, <code>lz4</code>, <code>lz4hc</code>, and <code>zlib</code>. The default setting is equal to the compression setting for the directory in which the table is located. To find out whether a directory is compressed and the type of compression, see Turning Compression On or Off on Directories Using the CLI on page 1590.</p>
versionperm	<p>Applies to binary tables only: ACE for changing the value of the <code>maxversions</code> and <code>minversions</code> parameters. By default, permission is given to the value of <code>defaultversionperm</code> for the table.</p>
compressionperm	<p>Applies to binary tables only: ACE for changing the value of the <code>compression</code> parameter. By default, permission is given to the value of <code>defaultcompressionperm</code> for the table.</p>
memoryperm	<p>The ACE for changing the value of the <code>inmemory</code> parameter. Use single quotation marks around the ACE. By default, permission is given to the value of <code>defaultmemoryperm</code> for the table.</p>

Parameter	Description
readperm	<p>The ACE for column reads. Use single quotation marks around the ACE.</p> <p>Reads require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> <p>By default, permission is given to the value of defaultreadperm for the table.</p>
writeperm	<p>The ACE for column writes (puts and deletes). Use single quotation marks around the ACE.</p> <p>Writes require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> <p>By default, permission is given to the value of defaultwriteperm for the table.</p>
appendperm	<p>Applies to binary tables only: The ACE for column appends. Use single quotation marks around the ACE.</p> <p>Column appends require permission both at the column-family level and at the column level. By default, permission is given to the value of defaultappendperm for the table.</p>
jsonpath	<p>Applies to JSON tables only: Specifies the path to the column family. The path is in dotted notation. For example, suppose the table contained JSON documents that were of this general structure:</p> <pre> { "_id" : "ID", "a" : { "b" : { "c" : "value", "e" : "value" } } } </pre> <p>You want to create a column family at the field d in the new path a.b.d because you plan to store image files in fields in that column family.</p> <p> IMPORTANT: Ensure that the field at which you want to create the column family does not yet exist. Also ensure that there are no secondary indexes defined on the field. If the field does exist or is a field in an index, the data in the field could become inaccessible after you create the column family.</p> <p> RESTRICTION: As of release 6.0, a column family cannot be deleted from a JSON table.</p>

Parameter	Description
securitypolicy	The security policy or policies that apply to the column family. One or more tags can be assigned to a column family at the same time. If a security policy is not specified during column-family creation, the column family inherits the table securitypolicy value as its own security policy at runtime. If a security policy is specified during column-family creation, the table security policy is enforced followed by the column-family security policy.
force	Applies to JSON tables only: By default, every time you try to create a non-default column family in a JSON table, this command fails and returns a warning message that you should ensure there is no existing data at the specified path. Set this parameter to <code>true</code> if you want to override this warning mechanism and create a column family.
traverseperm	<p>Applies to JSON tables only: The Access Control Expressions that specifies who has permission to pass over fields in JSON documents. For example, suppose that a JSON table contains documents of this general structure:</p> <pre> { "_id" : "ID", "a" : { "b" : "value", "c" : "value" } } </pre> <p>Suppose further that the user <code>sjohnson</code> has read permission on <code>a.b</code>, but not on <code>a</code>. For <code>sjohnson</code> to read <code>a.b</code>, the user needs the traverse permission on <code>a</code>. The user can then pass over field <code>a</code> to <code>a.b</code>.</p> <p>This permission is inherited by fields within the column family. By default, this permission is given to the value of <code>defaulttraverseperm</code> for the JSON table.</p>
unmaskedreadperm	<p>The <code>unmaskedreadperm</code> permission, when applied to a column of a JSON table with a dynamic data mask set, allows the user to read the data unmasked. Users without this permission have the masked data returned.</p> <p>Default <code>unmaskedreadperm</code> permission on column family creation is set to the table-level <code>defaultunmaskedreadperm</code> permission set using the <code>maprcli table create</code> or the <code>maprcli table edit</code> command unless the <code>unmaskedreadperm</code> permission is specified when creating the column family. This setting will take effect for all new columns/fields within this CF) unless otherwise overridden by the <code>maprcli table cf colperm</code> command.</p>

NOTE: If a field is specified as a column family JSON path name, that field cannot be defined as either an indexed or included field when creating an index. For example, suppose you have the following JSON table:

```
{
  "_id" : "ID",
  "a" : {
    "b" : {
      "c" : "value",
      "d" : "value"
    },
    "e" : "value"
  }
}
```

If you created a column family at field c in the JSON path a.b.c, when creating an index, field a.b.c cannot be defined as an indexed or included field. However, you can define, as either an indexed or included field, fields a, a.b, a.b.d.

Example

Creates a new column family mynewcf for table mytable, keeping four versions in memory:

CLI

```
/opt/mapr/bin/maprcli table cf
create -path /volume1/mytable -cfname
mynewcf \
  -maxversions 4 -inmemory true
```

REST

```
curl -X POST \
  'https://r1n1.sj.us:8443/rest/
table/cf/create?
path=%2Fvolume1%2Fmytable&cfname=mynew
cf&maxversions=4&inmemory=true' \
  -u <username>:<password>
```

table cf delete

Deletes a column family from a HPE Data Fabric Database binary table or JSON table. Deletion cannot be undone.

IMPORTANT: As of release 6.0, a column family cannot be deleted from a JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- [deletefamilyperm](#) on the table

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table cf delete
-path <path>
-cfname <name>
```

REST

```
curl -k -X POST
'http[s]://
<host>:<port>/rest/table/cf/delete?
path=<path>&cfname=<name>'
-u <username>:<password>
```

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

Parameter	Description
path	<p>The path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
cfname	<p>The name of the column family to delete.</p> <p> NOTE: In JSON tables, it is not possible to delete column families in addition to the default column family.</p>

Example

Deletes a column family mycf from table thetable:

CLI

```
maprcli table cf delete -path /
volume1/thetable -cfname mycf
```

REST

```
curl -X POST \
'https://r1n1.sj.us:8443/rest/
table/cf/delete?
path=%2Fvolume1%2Fthetable&cfname=mycf' \
-u <username>:<password>
```

table cf edit

Edits a column family in a binary table or JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `createrenamefamilyperm` on the table

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
/opt/mapr/bin/maprccli table cf edit
-path <Table path >
-cfname <Column family name>
[ -newcfname <New column family
name> ]
[ -minversions <Min versions to
keep> ]
[ -maxversions <Max versions to
keep> ]
[ -ttl <Time to live> Enter 0 for
forever, otherwise, enter time in
seconds. Default: 0 ]
[ -inmemory <In-memory> ]
[ -compression <off|lzf|lz4|zlib> ]
[ -versionperm <Version
Permissions> ]
[ -compressionperm <Compression
Permissions> ]
[ -memoryperm <Memory Permissions> ]
[ -readperm <Read Permissions> ]
[ -writeperm <Write Permissions> ]
[ -appendperm <Append Permissions> ]
[ -traverseperm <Traverse
Permissions> ]
[ -unmaskedreadperm <CF Unmasked
Read Permission> ]
```

REST

```
curl -k -X POST
'http[s]://<host>:<port>/rest/
table/cf/edit?
path=<path>&cfname=<name>&<parameters>
-u <username>:<password>
```

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

Parameter	Description
path	<p>The path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
cfname	The name of the column family to edit.
newcfname	The new name to give to the column family.
minversions	Applies to binary tables only: Minimum number of versions of column values to keep. The default is zero.
maxversions	Applies to binary tables only: Maximum number of versions of column values to keep. The default is one.
ttr	<p>Time to live in seconds. When the age of the data in this column family exceeds the value of the ttr parameter, the data is purged. Setting the value of ttr to 0 is equivalent to allowing data to remain indefinitely. Default: 0</p> <p> NOTE: If the value of -ttr for an existing column family in a JSON table is not 0, you cannot add another column family. You also cannot set the TTL for a JSON table if it has secondary indexes. See Setting TTL for Data.</p>

Parameter	Description
inmemory	<p>Boolean. Determines whether preference is given to values of this column family for storage with row keys. Because row keys are cached in memory in preference to row data, column-family data that is stored inline with the row keys is also cached in memory.</p> <p>For all column families in a table together, up to 200 bytes of row data will be stored inline with each row key. Storing data inline with a row key might speed retrieval of the data from a column family because disk access can often be avoided. For each column family, up to 32 bytes can be stored inline with each row key even if its <code>inmemory</code> parameter is set to <code>false</code>, but preference will be given to column families where this parameter is set to <code>true</code>. A column family can have more than 32 bytes stored inline if its <code>inmemory</code> parameter is set to <code>true</code>.</p> <p>If the total number of bytes for all column families together exceeds 200 for a row, then preference for inclusion within the inline storage for that row is given to column families that have the <code>inmemory</code> parameter set to <code>true</code>.</p> <p> NOTE: All of the data for a column family will be stored in-line with the row key, or none will be. If the contents in a column family for a particular row are larger than the maximum number of bytes that are allowed to be stored for that column family, no data at all will be stored in-line for that column family.</p> <p>The default value for the <code>inmemory</code> parameter is <code>false</code>.</p>
compression	<p>The compression setting to use for the column family. Valid options are <code>off</code>, <code>lzf</code>, <code>lz4</code>, and <code>zlib</code>. The default setting is equal to the compression setting for the directory in which the table is located. To find out whether a directory is compressed and the type of compression, see Turning Compression On or Off on Directories Using the CLI on page 1590.</p>
versionperm	<p>Applies to binary tables only: ACE for changing the value of the <code>maxversions</code> and <code>minversions</code> parameters. By default, permission is given to the value of <code>defaultversionperm</code> for the table.</p>
compressionperm	<p>Applies to binary tables only: ACE for changing the value of the <code>compression</code> parameter. By default, permission is given to the value of <code>defaultcompressionperm</code> for the table.</p>
memoryperm	<p>ACE for changing the value of the <code>inmemory</code> parameter. Use single quotation marks around the ACE. By default, permission is given to the value of <code>defaultmemoryperm</code> for the table.</p>

Parameter	Description
readperm	<p>The ACE for column reads. Use single quotation marks around the ACE.</p> <p>Reads require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> <p>By default, permission is given to the value of defaultreadperm for the table.</p>
writeperm	<p>The ACE for column writes (puts and deletes). Use single quotation marks around the ACE.</p> <p>Writes require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> <p>By default, permission is given to the value of defaultwriteperm for the table.</p>
appendperm	<p>Applies to binary tables only: ACE for column appends. Use single quotation marks around the ACE.</p> <p>Column appends require permission both at the column-family level and at the column level. By default, permission is given to the value of defaultappendperm for the table.</p>
traverseperm	<p>Applies to JSON tables only: The Access Control Expressions that specifies who has permission to pass over fields in JSON documents. For example, suppose that a JSON table contains documents of this general structure:</p> <pre> { "_id" : "ID", "a" : { "b" : "value", "c" : "value" } } </pre> <p>Suppose further that the user sjohnson has read permission on a.b, but not on a. For sjohnson to read a.b, the user needs the traverse permission on a. The user can then pass over field a to a.b.</p> <p>This permission is inherited by fields within the column family. By default, this permission is given to the value of defaulttraverseperm for the JSON table.</p>

Parameter	Description
unmaskedreadperm	<p>The unmaskedreadperm permission, when applied to a column of a JSON table with a dynamic data mask set, allows the user to read the data unmasked. Users without this permission have the masked data returned.</p> <p>Default unmaskedreadperm permission on column family creation is set to the table-level defaultunmaskedreadperm permission set using the <code>maprcli table create</code> or the <code>maprcli table edit</code> command unless the unmaskedreadperm permission is specified when creating the column family. This setting will take effect for all new columns/fields within this CF) unless otherwise overridden by the <code>maprcli table cf colperm</code> command.</p>

NOTE: If a field is specified as a column family JSON path name, that field cannot be defined as either an indexed or included field when creating an index. For example, suppose you have the following JSON table:

```
{
  "_id" : "ID",
  "a" : {
    "b" : {
      "c" : "value",
      "d" : "value"
    },
    "e" : "value"
  }
}
```

If you created a column family at field c in the JSON path a.b.c, when creating an index, field a.b.c cannot be defined as an indexed or included field. However, you can define, as either an indexed or included field, fields a, a.b, a.b.d.

Example

Changes the name of a column family in table mytable from mycf to mynewcfname. Also changes the time to live setting.

CLI

```
/opt/mapr/bin/maprcli table
cf edit -path /my.cluster.com/volume1/
mytable -cfname mycf \
-newcfname mynewcfname -ttl 86400
```

REST

```
curl -k -X POST \
  'https://r1n1.sj.us:8443/rest/
table/cf/edit?
path=%2Fmy.cluster.com%2Fvolume1%2Fmyt
able&cfname=mycf&newcfname=mynewcfname
&ttl=86400' \
-u mapr:mapr
```

table cf list

Lists the column families for a HPE Data Fabric table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the path
- `adminaccessperm` on the table

 **NOTE:** The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table cf list
-path <path>
[ -cfname <name>]
[ -showcol [true|false]]
```

REST

```
curl -k -X GET \
'http[s]://<host>:<port>/rest/
table/cf/list? \

path=<path>&cfname=<name>&showcol=[tru
e|false]' \
-u <username>:<password>
```

Parameters

Parameter	Description
path	The path to the table. <ul style="list-style-type: none">• For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code>• For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>test</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code>
cfname	The name of the column family.
showcol	Set to <code>false</code> by default. If set to <code>true</code> , then all column-level attributes for this column family are displayed.

Output Fields

Verbose Field Name	Terse Field Name	Field Value
inmemory	inmem	Whether or not this column value resides in memory
cfname	n	The column family name
maxversions	vmax	Maximum number of versions for this column family
minversions	vmin	Minimum number of versions for this column family
compression	comp	Compression scheme used for this column family
ttd	ttd	Time to live for this column family
compressionperm	pcomp	Applies to binary tables only: ACE for changing the value of the compression parameter. By default, permission is given to the value of defaultcompressionperm for the table.
memoryperm	pmem	ACE for changing the value of the inmemory parameter. Use single quotation marks around the ACE . By default, permission is given to the value of defaultmemoryperm for the table.
readperm	pread	<p>The ACE for column reads. Use single quotation marks around the ACE.</p> <p>Reads require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> <p>By default, permission is given to the value of defaultreadperm for the table.</p>

Verbose Field Name	Terse Field Name	Field Value
traverseperm	ptraverse	<p>Applies to JSON tables only: The Access Control Expressions that specifies who has permission to pass over fields in JSON documents. For example, suppose that a JSON table contains documents of this general structure:</p> <pre> { "_id" : "ID", "a" : { "b" : "value", "c" : "value" } } </pre> <p>Suppose further that the user sjohnson has read permission on a.b, but not on a. For sjohnson to read a.b, the user needs the traverse permission on a. The user can then pass over field a to a.b.</p> <p>This permission is inherited by fields within the column family. By default, this permission is given to the value of defaulttraverseperm for the JSON table.</p>
writeperm	pwrite	<p>The ACE for column writes (puts and deletes). Use single quotation marks around the ACE.</p> <p>Writes require permission both at the column-family level and at the column level (for binary tables) or field level (for JSON tables). In JSON tables, this permission is inherited by fields within the column family.</p> <p>By default, permission is given to the value of defaultwriteperm for the table.</p>

Verbose Field Name	Terse Field Name	Field Value
unmaskedreadperm	punmasked	<p>The unmaskedreadperm permission, when applied to a column of a JSON table with a dynamic data mask set, allows the user to read the data unmasked. Users without this permission have the masked data returned.</p> <p>Default unmaskedreadperm permission on column family creation is set to the table-level defaultunmaskedreadperm permission set using the maprccli table create or the maprccli table edit command unless the unmaskedreadperm permission is specified when creating the column family. This setting will take effect for all new columns/fields within this CF) unless otherwise overridden by the maprccli table cf colperm command.</p>

Example

This example lists all column families for the table newtable.

CLI

```
maprccli table cf list -path /
my.cluster.com/volume1/newtable
```

REST

```
curl -X GET \
'https://r1n1.sj.us:8443/rest/
table/cf/list?
path=%2Fmy.cluster.com%2Fvolume1%2Fnew
table' \
-u <username>:<password>
```

Example Output

```
[user@node]# maprccli table cf list -path /mapr/default/user/user/newtable
comp  inmem  vmax   n      ttl      vmin
lz4   false  3      dine   2147483647  0
lz4   false  3      nahashchid 2147483647  0
lz4   false  3      wollachee 2147483647  0
```

This example shows the security policies for the default column family of the JSON table, jtable.

CLI

```
maprccli table cf list -path /
my.cluster.com/volume1/jtable -cfname
default -json
```

REST

```
curl -X GET \
'https://r1n1.sj.us:8443/rest/
table/cf/list?
path=%2Fmy.cluster.com%2Fvolume1%2Fjta
```

```
ble' &cfname=default \
-u <username>:<password>
```

Example Output

```
{
  "timestamp":1539674179277,
  "timeofday":"2018-10-16 12:16:19.277 GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cfname":"default",
      "maxversions":1,
      "minversions":0,
      "ttl":2147483647,
      "inmemory":false,
      "compression":"lz4",
      "securitypolicy":"[Lab_Security_Policy,Sensitive_Data]",
      "compressionperm":"u:root",
      "memoryperm":"u:root",
      "readperm":"u:root",
      "traverseperm":"u:root",
      "writeperm":"u:root",
      "unmaskedreadperm":"u:mapr",
    }
  ]
}
```

In the following example, only user `mapr` can read column `Creditcard` from the default CF of table / `table1` **unmasked**. User `user1` can read the `Creditcard` column, but it will be masked: .

CLI

```
maprccli table cf list -path /
table1 -cfname default -json -showcol
true
```

REST

```
curl -X GET \
      'https://
r1n1.sj.us:8443/rest/table/cf/list?
path=%2Ftable1&cfname=default \
      &showcol=true' -u
<username>:<password>
```

table cf securitypolicy add

Specifies new security policies to be associated with an existing column family for a HPE Data Fabric Database JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `adminaccessperm` on the table

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprcli table cf securitypolicy add -path <path> -cfname <column family name> -securitypolicy <comma-delimited list of policies></pre>
REST	<pre>http[s]://<host>:<port>/rest/table/cf/ securitypolicy/add? path=<path>&cfname=<col-family-name>&sec uritypolicy=<policies></pre>

Parameters

Parameter	Description
path	<p>The path to the HPE Data Fabric Database table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under a volume with a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customer under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
cfname	The name of the column family to which security policies will be added.
securitypolicy	The security policy tags to be added to the list of security policies for the specified column family.

Example

Adds the security policy named newpolicy to the column family mycf for a Data Fabric table named table1:

CLI	<pre>maprcli table cf securitypolicy add -path "/table1" -cfname "mycf" -securitypolicy "newpolicy"</pre>
REST	<pre>http[s]://<host>:<port>/rest/table/cf/ securitypolicy/add?path=/ table1&cfname=mycf&securitypolicy=newpol icy</pre>

table cf securitypolicy remove

Removes specified security policies associated with a column family within a HPE Data Fabric Database JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- adminaccessperm on the table

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprcli table cf securitypolicy remove -path <path> -cfname <column family name> -securitypolicy <comma-delimited list of policies></pre>
REST	<pre>http[s]://<host>:<port>/rest/table/cf/ securitypolicy/remove? path=<path>&securitypolicy=<policies></pre>

Parameters

Parameter	Description
path	<p>The path to the HPE Data Fabric Database table.</p> <ul style="list-style-type: none"> • For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under a volume with a mount point at /volume1, specify the following path: /volume1/test • For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customer under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
cfname	The name or names of the column families containing the security policies you want to remove.
securitypolicy	The security policy tags to be removed from the list of security policies for the specified column family.

Example

Removes the security policy named newpolicy from the default column family of a Data Fabric table named table1:

CLI	<pre>maprcli table cf securitypolicy remove -path "/table1" -cfname "default" -securitypolicy "newpolicy"</pre>
-----	---

REST	<code>http[s]://<host>:<port>/rest/table/cf/ securitypolicy/remove?path= table1&cfname=default&securitypolicy=new policy</code>
------	---

table cf securitypolicy set

Replaces a security policy associated with a column family for a HPE Data Fabric Database JSON table with a new security policy.

Permissions Required

To run this command, your user ID must have the following permissions:

- adminaccessperm on the table.

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<code>maprcli table cf securitypolicy set -path <path> -cfname <column family name> -securitypolicy <comma-delimited list of policies></code>
REST	<code>http[s]://<host>:<port>/rest/table/cf/ securitypolicy/set? path=<path>&cfname=<column-family-name>& securitypolicy=<policies></code>

Parameters

Parameter	Description
path	The path to the HPE Data Fabric Database table. <ul style="list-style-type: none"> • For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under a volume with a mount point at /volume1, specify the following path: /volume1/test • For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customer under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
cfname	The name of the column family for which security policies will be replaced.
securitypolicy	The security policy tags to be replaced in the list of security policies for the specified column family.

Example

Replaces the security policy for the column family mycf for a Data Fabric table named table1 with a new security policy named newpolicy:

CLI	<pre>maprcli table cf securitypolicy set -path "/table1" -cfname "mycf" -securitypolicy "newpolicy"</pre>
REST	<pre>http[s]://<host>:<port>/rest/table/cf/ securitypolicy/set?path=/ table1&cfname=mycf&securitypolicy=newpol icy</pre>

table changelog

These maprcli commands are used to create and manage Change Data Capture (CDC) changelogs. A changelog is used to establish a relationship between a HPE Data Fabric Database source table (JSON or binary) and a HPE Data Fabric Streams stream topic and to manage the propagation process.

table changelog add

Description

Creates a changelog and creates a stream topic if one does not already exist. A changelog establishes a relationship between a HPE Data Fabric Database source table (JSON or binary) and a HPE Data Fabric Streams stream topic.

Syntax**Table**

CLI	<pre>maprcli table changelog add -path <source table path> -changelog <destination stream path>:<topic name></pre>
REST	<pre>http://<ipaddress>:8443/rest/table/changelog/add? path=<source-table-path>&changelog=<destination stream path>:<topic name></pre>

Parameters**Table**

Parameter	Description
path	(Required) Path of the source table.

Table (Continued)

Parameter	Description
changelog	<p>(Required) Target of the change log, specified as <stream_path>:<topic_name>, to which all change data records will be published. The stream must exist, otherwise, the command fails. If the topic does not already exist, <code>maprcli table changelog add</code> creates it. To propagate to an existing topic, specify <code>-useexistingtopic</code>.</p> <p> NOTE: The <code>maprcli stream create</code> command is used to create the changelog stream.</p> <p> IMPORTANT: A CDC changelog stream's default partitions can impact how many partitions a stream topic can have. This is because once you create a stream topic for a changelog stream, the number of topic partitions is <i>locked</i>. The number of topic partitions cannot change.</p> <p>When using the <code>table changelog add</code> command to add a stream topic (as well as establish a relationship between the source table and the changelog stream), then the number of topic partitions is inherited from the changelog stream and is <i>locked</i>.</p>
useexistingtopic	If true, allows propagation to an existing topic. Default: false.
propagateexistingdata	If true, initiates propagation of the existing data to the stream topic, otherwise, only new changes are propagated. Default: true
columns	For HPE Data Fabric Database JSON, a comma separated list of field paths to be propagated. For HPE Data Fabric Database Binary, a comma separated list of column family names, for example, <family>[:<column>] to be propagated. Default: All fields are propagated.
throttle	If true, data transfers to the specified sink are throttled. Default: false
pause	If true, pauses propagation after the changelog is created. Default: false
synchronous	If true, acknowledges the client writes to the table before the internal CDC gateway receives the data. Default: false
networkencryption	Specifies whether the data transfer between Data Fabric file system and the internal gateway is encrypted. If true, data propagation is encrypted on-wire. Default: false
networkcompression	Specifies the compression scheme (off lz4 lz4 zlib) of the data transfer on-wire. Default: lz4

Example

```
maprcli table changelog add -path /tableVolume/cdcTable -changelog /
streamVolume/changelogStream:cdcTopic1
```

```
https://ip.address:8443/rest/table/changelog/add?path=/tableVolume/
cdcTable&changelog=/streamVolume/changelogStream:cdcTopic1
```

table changelog edit

Description

Changes changelog specifications.

Syntax**Table**

CLI	<code>maprcli table changelog edit -path <source table path> -changelog <destination stream path>:<topic name></code>
REST	<code>http://<ipaddress>:8443/rest/table/changelog/edit?path=<source-table-path>&changelog=<destination-stream-path>:<topic-name></code>

Parameters**Table**

Parameters	Description
path	(Required) Path of the HPE Data Fabric Database source table
changelog	(Required) Target of this changelog.
throttle	If true, data propagation is throttled. Default: false
synchronous	If true, acknowledges the client writes to the table before the internal CDC gateway receives the data. Default: false
networkencryption	If true, data propagation is encrypted on-wire. Default: false
networkcompression	Specifies the compression scheme (off lz4 zlib) of the data propagation on-wire. Default: lz4

Example

```
maprcli table changelog edit -path /tableVolume/cdcTable -changelog /
streamVolume/changelogStream:cdcTopic1
```

```
https://10.10.100.17:8443/rest/table/changelog/edit?path=/tableVolume/
cdcTable&changelog=/streamVolume/changelogStream:cdcTopic1
```

table changelog info

Description

Displays changelog source table information.

Syntax**Table**

CLI	<code>maprcli table changelog info -path <destination stream path>:<topic name></code>
REST	<code>http://<ipaddress>:8443/rest/table/changelog/info?path=<destination stream path>:<topic name></code>

Parameters

Table

Parameters	Description
path	(Required) Path to the stream with topic. Specified in the format: pathToStream:streamTopic

Example

```
maprcli table changelog info -changelog /streamVolume/
changelogStream:cdcTopic1 -json
https://10.10.100.17:8443/rest/table/changelog/info?changelog=/streamVolume/
changelogStream:cdcTopic1
```

Output

```
{
  "timestamp":1498526974087,
  "timeofday":"2017-06-26 06:29:34.087 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"clst185",
      "changelog":"/streamVolume/changelogStream/cdcTopic1",
      "idx":0,
      "uuid":"59bf0064-97a1-c417-b6d7-0a6681515900"
    }
  ]
}
```

table changelog list

Description

Lists changelog information.

Syntax

Table

CLI	maprcli table changelog list -path <source table path>
REST	http://<ipaddress>:8443/rest/table/changelog/list? path=<source-table-path>

Parameters

Table

Parameters	Description
path	(Required) Path of the source table in the HPE Data Fabric Database cluster.

Table (Continued)

Parameters	Description
refreshnow	Specifies if the user wants to trigger an immediate update of the sink statistics.

Example

```
// CLI example
maprcli table changelog list -path /tableVolume/cdcTable -json

// REST example
https://10.10.100.17:8443/rest/table/changelog/list?path=/tableVolume/
cdcTable
```

Output

```
{
  "timestamp":1505779365019,
  "timeofday":"2017-09-18 05:02:45.019 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"my.cluster.com",
      "changelog":"/streamVolume/changelogStream:cdcTopic1",
      "changelogStream":"/streamVolume/changelogStream",
      "replicaState":"REPLICA_STATE_REPLICATING",
      "paused":false,
      "throttle":false,
      "idx":1,
      "networkencryption":false,
      "synchronous":false,
      "networkcompression":"lz4",
      "propagateExistingData":true,
      "isUptodate":true,
      "minPendingTS":0,
      "maxPendingTS":0,
      "bytesPending":0,
      "putsPending":0,
      "bucketsPending":0,
      "uuid":"76a3efd3-6357-8cd6-092f-0fca5dc05900",
      "copyTableCompletionPercentage":100
    }
  ]
}
```

Output Data Fields

The following fields display for each replica.

Field	Description
cluster	The cluster on which the replica resides.
changelog	Identifies the destination stream topic for the changelog.
changelogstream	Identifies the destination stream for the changelog.

Field	Description
replicaState	The replication state. For information about the replication states, see Table Replication States on page 835.
paused	A Boolean values that specifies if replication is paused.
throttle	A Boolean value that specifies if replication is throttled.
idx	The internal index value.
networkencryption	A Boolean value that specifies if replication is encrypted.
synchronous	A Boolean value that specifies whether replication is synchronous or asynchronous.
networkcompression	The type of on-wire compression.
propagateExistingData	Identifies whether existing data in the source table is propagated to the destination stream topic.
isUptodate	A Boolean value that specifies if the replica is up-to-date.
minPendingTS	The epoch time in milliseconds of the oldest operation that has yet to be replicated to the replica.
maxPendingTS	The epoch time in milliseconds of the newest operation that has yet to be replicated to the replica.
bytesPending	The number of bytes that have yet to be replicated to the replica.
putsPending	The number of puts that have yet to be replicated to the replica.
bucketsPending	The number of buckets that have yet to be replicated to the replica.
uuid	The table UUID.
copyTableCompletionPercentage	<p>When propagation of existing data is in progress, this value is the percentage of data from the source table that has been propagated to the destination stream topic.</p> <p> NOTE: When replicating HPE Data Fabric Database data, the copyTablePercentageCompletion data may re-adjust to a lower rate. This depends on table region (also referred to as tablets) splits and merges as well as the rate of incoming data to replicating data.</p>
errors	If applicable, an error is displayed.

table changelog pause

Description

Pauses the propagation of changed data records.

Syntax**Table**

CLI	<code>maprcli table changelog pause -path <source table path> -changelog <destination stream path>:<topic name></code>
REST	<code>http://<ipaddress>:8443/rest/table/changelog/pause?path=<source-table-path>&changelog=<destination stream path>:<topic_name></code>

Parameters**Table**

Parameters	Description
path	(Required) Path of the HPE Data Fabric Database source table
changelog	(Required) Target of this change log.

Example

```
maprcli table changelog pause -path /tableVolume/cdcTable -changelog /
streamVolume/changeLogStream:cdcTopic1
```

```
https://10.10.100.17:8443/rest/table/changelog/pause?path=/tableVolume/
cdcTable&changelog=/streamVolume/changeLogStream:cdcTopic1
```

table changelog remove

Description

Removes the changelog connection.

Syntax**Table**

CLI	<code>maprcli table changelog remove -path <source table path> -changelog <destination stream path>:<topic name></code>
REST	<code>http://<ipaddress>:8443/rest/table/changelog/remove?path=<source-table-path>&changelog=<destination stream path>:<topic_name></code>

Parameters**Table**

Parameters	Description
path	(Required) Path of the source table in the HPE Data Fabric Database cluster.

Table (Continued)

Parameters	Description
changelog	(Required) Target of the change log.

Example

```
maprcli table changelog remove -path /tableVolume/cdcTable -changelog /
streamVolume/changeLogStream:cdcTopic1
```

```
https://10.10.100.17:8443/rest/table/changeLog/remove?path=/tableVolume/
cdcTable&changelog=/streamVolume/changeLogStream:cdcTopic1
```

table changelog resume

Description

Resumes the propagation of changed data records after a pause.

Syntax**Table**

CLI	<pre>maprcli table changelog resume -path <source table path> -changelog <destination stream path>:<topic name></pre>
REST	<pre>http://<ipaddress>:8443/rest/table/changeLog/resume? path=<source-table-path>&changelog=<destination stream path>:<topic_name></pre>

Parameters**Table**

Parameters	Description
path	(Required) Path of the HPE Data Fabric Database source table
changelog	(Required) Target of this change log.

Example

```
maprcli table changelog resume -path /tableVolume/cdcTable -changelog /
streamVolume/changeLogStream:cdcTopic1
```

```
https://10.10.100.17:8443/rest/table/changeLog/resume?path=/tableVolume/
cdcTable&changelog=/streamVolume/changeLogStream:cdcTopic1
```

table delete

Deletes a HPE Data Fabric Database binary or JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `adminaccessperm` on the table

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table delete -path <path>
```

REST

```
curl -X POST
'http[s]://<host>:<port>/rest/table/
delete?path=<path>'
-u <username>:<password>
```

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

Parameter	Description
path	<p>Path to the Data Fabric table to delete.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, if you want to delete a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, if you want to delete a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code>

Example

Deletes the table `table`:

CLI

```
maprcli table delete -path /mapr/
mycluster/volume1/table
```

REST

```
curl -X POST \
'https://r1n1.sj.us:8443/rest/table/
delete?
path=%2Fmapr%2Fmycluster%2Fvolume1%2Ft
able' \
-u <username>:<password>
```

table edit

Edits the attributes of a HPE Data Fabric Database binary or JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- [adminaccessperm](#) on the table

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax**CLI**

```
maprccli table edit
  -path <path >
  [ -audit true|false ]
  [ -autosplit <Auto Split table> ]
  [ -regionsizeMB <Region Size in
MB> ]
  [ -bulkload <Bulk load> ]
  [ -deletettl <delete TTL in secs> ]
  [ -packperm <Pack Permission
settings> ]
  [ -bulkloadperm <Bulk load
Permission settings> ]
  [ -splitmergeperm <Split and Merge
Permission settings>]
  [ -createrenamefamilyperm <Add/
Rename Family Permission settings> ]
  [ -deletefamilyperm <Delete Family
Permission settings> ]
  [ -adminaccessperm <Secondary Index
Admin Permission settings> ]
  [ -replperm <Replication Admin
Permission settings> ]
  [ -indexperm <Ace Admin Permission
settings> ]
  [ -defaultversionperm <CF Versions
Default Permission> ]
  [ -defaultcompressionperm <CF
Compression Default Permission> ]
  [ -defaultmemoryperm <CF Memory
Default Permission> ]
  [ -defaultreadperm <CF Read Default
Permission> ]
  [ -defaultwriteperm <CF Write
Default Permission> ]
  [ -defaulttraverseperm <CF Traverse
Default Permission> ]
  [ -defaultappendperm <CF Append
Default Permission> ]
  [ -defaultunmaskedreadperm <CF
Unmasked Read Default Permission> ]
```

```
[ -metricsinterval <Metrics  
collection interval, in seconds> ]
```

REST

```
curl -k -X POST \  
  'http[s]://<host>:<port>/rest/table/  
edit?path=<path>&<parameters>'  
-u <username>:<password>
```

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameter	Description
path	<p>The path to the table.</p> <ul style="list-style-type: none">• For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test• For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
audit	<p>Specifies whether to turn auditing on for the table. If auditing is also enabled at the cluster level with the <code>maprc li audit data</code> command and enabled for the current volume, setting this value to true causes auditing to start for the table.</p> <p>The possible values are true and false. By default, the value is false.</p>
autosplit	<p>A Boolean value that specifies whether to split the table into regions automatically as the table grows. The average size of each region is determined by the <code>regionsize mb</code> parameter.</p> <p>The default value is true. If you set the value to false, you can manually split tables into regions by using the <code>table region split</code> command.</p>

Parameter	Description
regionsizemb	<p>The average size of the regions into which HPE Data Fabric Database tries to split the table as the table grows. The default is 4096 MB. This value is ignored if autosplit is set to false.</p> <p>If autosplit is set to true, HPE Data Fabric Database splits a region when the size of the region exceeds 150% of the average value. For example, if the average value is 4096 MB, HPE Data Fabric Database splits a region that is larger than 6144 MB.</p> <p>Although splits are automatic, merges are not. For example, if the value of regionsizemb is changed from 8 GB to 4 GB, all regions that are eligible are split automatically, if autosplit is set to true. However, if the value of regionsizemb is changed from 2 GB to 4 GB, regions smaller than 4 GB are not automatically merged.</p> <p> NOTE: When a table has less than 4 regions, HPE Data Fabric Database ignores the regionsizemb parameter and splits regions at a lower threshold.</p>
bulkload	A Boolean value that specifies whether to allow a full bulk load of the table. The default is false. For more information, see Loading Data into Binary Tables on page 1650 and Loading Documents into JSON Tables on page 1647.
deletettl	The number of seconds to wait before purging the delete operations. The time-to-live for deletes should be greater than the amount of time that it takes replicated operations to reach replicas. By default, the value is 24 hours for tables configured for replication. If the table is not configured for replication, the default is 0 hours.
packperm	The Access Control Expression that controls who can pack table regions. By default, permission is given to the user ID that was used to create the table.
bulkloadperm	The Access Control Expression that controls who can load this table with bulk loads if the table was created with bulk load support. By default, permission is given to the user ID that was used to create the table.
splitmergeperm	<p>The Access Control Expression that controls who can take the following actions:</p> <ul style="list-style-type: none"> Run the table region split and table region merge commands to split the table into regions or to merge regions of the table together. Change the value of regionsizemb. <p>By default, permission is given to the user ID that was used to create the table.</p>
createrenamefamilyperm	The Access Control Expression that controls who can create column families for this table or rename existing column families. By default, permission is given to the user ID that was used to create the table.

Parameter	Description
deletefamilyperm	The Access Control Expression that defines access to delete column families for this table. Delimit the expression with single-quotation marks. By default, permission is given to the user ID that was used to create the table.
adminaccessperm	The Access Control Expression that controls who can view and edit the permissions for this table. By default, permission is given to the user ID that was used to create the table.
replperm	The Access Control Expression that controls who can set up replication either to or from a table. By default, permission is given to the user ID that is used to create the table.
indexperm	The secondary index admin permission setting that controls who can create an index associated with this table. By default, permission is given to the user ID that is used to create the table.
defaultversionperm	<p>The default Access Control Expression for the version permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter versionperm in the table cf create and table cf edit commands overrides this value.</p> <p> NOTE: This permission is not applicable to JSON tables. Versioning is not supported for JSON documents.</p>
defaultcompressionperm	Applies to binary tables only: The default Access Control Expression for the compression permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter compressionperm in the table cf create and table cf edit commands overrides this value.
defaultmemoryperm	The default Access Control Expression for the memory permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter memoryperm in the table cf create and table cf edit commands overrides this value.
defaultreadperm	The default Access Control Expression for the read permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter readperm in the table cf create and table cf edit commands overrides this value. See table cf create on page 2778 and table cf edit on page 2785

Parameter	Description
defaultwriteperm	The default Access Control Expression for the write permission on new column families that are created in this table. If no value is specified, the default is <code>u:<username of the table creator></code> . This value of the parameter <code>writeperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. See table cf create on page 2778 and table cf edit on page 2785
defaulttraverseperm	Applies to JSON tables only: The default Access Control Expression for the traverse permission on new column families. For more information about this permission, see Permission Types for Fields and Column Families in JSON Tables on page 1662.
defaultappendperm	Applies to binary tables only: The default Access Control Expression for the append permission on new column families that are created in this table. If no value is specified, the default is <code>u:<username of the table creator></code> . This value of the parameter <code>appendperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value.
defaultunmaskedreadperm	The <code>defaultunmaskedreadperm</code> permission on table creation is set to the table creator. This setting takes effect for all new column families (and therefore also all columns/fields within all column families) unless otherwise overridden by the <code>maprcli table cf</code> or the <code>maprcli table cf colperm</code> command. This permission allows the user to read the data unmasked. Users without this permission have the masked data returned.
metricsinterval	<p>The metrics collection interval, in seconds, for the table.</p> <p>Possible values: 10, 60, 600</p> <p>Default: 60 seconds</p> <p>When configured to 10 seconds, under normal workloads, the metrics are available in OpenTSDB in about 30 seconds. At an interval of 60 seconds, the metrics are available in about 90 seconds.</p> <p> NOTE: You cannot disable metrics collection for a table by setting the interval to 0.</p>

Example

Changes the value of `regionsizeMB` for the table `mytable`:

CLI

```
maprcli table edit -path /volume1/
mytable -regionsizeMB 8192
```

REST

NOTE: For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X POST \
  'https://server.sj.us:8443/rest/
  table/edit?
  path=%2Fvolume1%2Fmytable&regionsizemb
  =8192' \
  -u <username>:<password>
```

table index

Manages indexes for HPE Data Fabric Database JSON tables.

Permissions Required

To run this command, your user ID must have the following permissions:

- readAce on the volume
- lookupdir on directories in the table path

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

table index add

This topic describes how to add secondary indexes on HPE Data Fabric Database JSON tables.

Permissions Required

To run this command, your user ID must have the following permissions:

- readAce on the volume
- lookupdir on directories in the table path
- indexperm permission on the table

If you created the table in version 6.0 or later, you automatically have `indexperm` permission. For tables created before 6.0, even if you are the owner of the table, you must explicitly add `indexperm` permission.

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table index add
  -path <path>
  -index <index name>
  -indexedfields < indexed field
  names >
  [ -includedfields < included field
  names > ]
  [ -hashed [ enable hashed index:
  true | false> ]
```

```
[ -numhashpartitions < number of  
hash index partitions when hashed  
index is enabled > ]
```

REST

```
curl -X POST \  
  'http[s]://<host>:<port>/rest/table/  
index/add?path=<path>&index=<index  
name>&indexedfields=<indexed field  
names>&<parameters>' \  
  -u <username>:<password>
```

Parameters

Parameter	Description
path	(Required) Path to where the parent JSON table resides.
index	(Required) Name of the index.

Parameter	Description
indexedfields	<p>(Required) Names of the indexed fields. This is a comma separated list of the fields from the JSON table that are indexed and used for ordering the index. The sort ordering of each field can be specified separately. The syntax is as follows:</p> <pre>-indexedfields <fieldname>:<sort_order>,<fieldname>:<sort_order>,...</pre> <p> IMPORTANT: Do not place a space between the commas and the field names.</p> <p>A sort_order of asc, ASC, or 1 denotes an ascending sort order. This is the default.</p> <p>A sort_order of desc, DESC, or -1 denotes a descending sort order.</p> <p>The following example specifies two indexed fields. fieldName1 has an ascending sort, while fieldName2 is descending.</p> <pre>-indexedfields fieldName1:asc,fieldName2:desc</pre> <p>If an indexed field contains a colon (:) in the name, you need to escape the last colon in the name. In the example below, the indexed field names are the following:</p> <ol style="list-style-type: none"> 1. field1 2. field2 3. colonField:X:Y <p>The following shows how to escape the last colon in the third indexed field.</p> <pre>-indexedfields field1,field2,colonField:X\\:Y</pre> <p> NOTE: The CAST function can be applied on indexed fields. You must enclose each CAST function call in single quotes. See the next section for details.</p>
includedfields	<p>(Optional) Names of the included fields. This is a comma separated list of the fields from the JSON table that are part of the index, but not used for ordering. The syntax is as follows:</p> <pre>-includedfields <fieldname>,<fieldname>,...</pre> <p> IMPORTANT: Do not place a space between the commas and the included field names.</p>
hashed	(Optional) True False. Default: false

Parameter	Description
numhashpartitions	(Optional) Number of hash index partitions when the hashed index option is enabled. This parameter determines the number of logical partitions HPE Data Fabric Database distributes keys across. Incoming keys are hashed to 2 byte partition IDs. Default: 10

Applying CAST on Indexed Fields

Indexes can be defined with the CAST function applied to an indexed field.

The following statement queries a table named `lineitem` and casts the `L_LINENUMBER` and `L_ORDERKEY` fields to the `int` data type.

```
SELECT L_LINESTATUS, L_QUANTITY FROM lineitem WHERE CAST(L_LINENUMBER as int) = 1 AND CAST(L_ORDERKEY as int) = 550;
```

To optimize the previous statement, you can create an index on the `L_LINENUMBER` and `L_ORDERKEY` fields, and use the CAST function to map each field to a specific data type, as shown below:

```
maprcli table index add \
  -path /drill/testdata/qa/sf1/maprdb/json/lineitem \
  -index l_cast_comp_1 -indexedfields
  '$CAST(L_LINENUMBER@INT)', '$CAST(L_ORDERKEY@INT)' \
  -includedfields L_LINESTATUS,L_QUANTITY
```

The index stores the values of the `L_LINENUMBER` and `L_ORDERKEY` fields as the `int` data type. HPE Data Fabric Database can use the index for any subsequent queries that cast these fields to `int` instead of accessing data in the primary table and converting the values to `int`.

See [Using Casts in Secondary Indexes](#) on page 767 for more information.

Restrictions

The following restrictions apply to creating indexes.

Name Restrictions

You cannot use the following characters in the index name and in the indexed fields:

```
< > ? % \
```

To use the following characters in the index name and in the indexed fields, enclose them either in single or double quotes:

```
; | ( ) /
```

For example:

```
maprcli table index
add -path /volume1/MYTABLE -index
  "MYTABLE1_ANALYSIS_1 ^=#;{}&()/" \
  -indexedfields "_timestamp":desc, "
  ", "LOTNo" -includedfields \
  " ", " ^=#;{}&()/" (or)

maprcli table index
add -path /volume1/MYTABLE -index
  'MYTABLE1_ANALYSIS_1 ^=#;{}&()/' \
  -indexedfields "_timestamp":desc, "
```

```
"", "LOTNo" -includedfields \
  "'', '^=#;{}&()/'
```

To use either the ' or the " character in the index name and in the indexed fields, enclose:

- the ' character within double quotes (")
- the " character within single quote (')

For example:

```
maprccli table index
add -path /volume1/MYTABLE -index
  "'MYTABLE1_ANALYSIS_1 ^=#;{}&()/' \
  -indexedfields "_timestamp":desc, "'
  ", "LOTNo" -includedfields \
    "'', '^=#;{}&()/' (or)

maprccli table index
add -path /volume1/MYTABLE -index
  "'MYTABLE1_ANALYSIS_1 ^=#;{}&()/' \
  -indexedfields "'_timestamp":desc, "
  ", "LOTNo" -includedfields \
    "'', '^=#;{}&()/'
```

Type Restrictions

- If a composite index includes the same subfield in multiple indexed fields, the implied types of the subfields must be consistent.

For example, you cannot create an index with the following indexed fields:

```
a.b[] .c, a.b.d
```

Although subfield b appears in both indexed fields, in the first, it is an array and in the second, it is a nested document.

See [Composite Indexes and Container Field Paths](#) on page 764 for more details.

Size Restrictions

- The maximum size of all indexed fields in an index is 32 KB.

If the collective size exceeds 32 KB, then an insert of the corresponding document results in an encoding error (INDEX_ROW_KEY_ENCODER_ERROR_ENCODING_IS_TOO_LONG).

- The maximum number of indexes that you can create on a JSON table is 32.

Field Definition Restrictions

- You cannot specify individual array elements as indexed fields.
- You cannot specify a table's `_id` field as an indexed field.

- If a field contains an array of nested documents and you want to index on subfields in the nested documents, then you must define the indexed field using a container field path.
- You can include a specific field only once as either an indexed or included field, with the following two exceptions:

- The indexed field is a container field path:

```
maprcli table index add -path /
people \
  -index phoneNumberIdx \
  -indexedfields
Phones[].Number \
  -includedfields
Phones[].Number
```

- The field specifies a cast to another type.

You can create an index in which the score field is an indexed field cast as a double type, and score is also an included field. The included field retains the original data type of the score field:

```
maprcli table index add -path /
castTable \
  -index castIdx1 \
  -indexedfields
'$CAST(score@DOUBLE)' \
  -includedFields score
```

You can create an index in which the score field is an indexed field, cast as a double type, and the score field is also another indexed field, cast as a long type:

```
maprcli table index add -path /
castTable \
  -index castIdx2 \
  -indexedfields
'$CAST(score@DOUBLE)', '$CAST(score@LONG)'
```

- You cannot use casts with included fields.

- You cannot specify a field as either an indexed or included field if the field is also specified as a column family JSON path name.

For example, suppose you have the following JSON table:

```
{
  "_id" : "ID",
  "a" : {
    "b" : {
      "c" :
"value",
      "d" :
"value"
    },
    "e" : "value"
  }
}
```

If you create a column family at field c in the JSON path a.b.c, you cannot define field a.b.c as either an indexed or included field. You can define the fields a, a.b, and a.b.d as either indexed or included fields.

- You cannot specify an included field in which the data in the field spans more than one column family.

In the following example, the included field `sl1.sl2` spans column families, `cf2` and `cf3`:

```
maprcli table cf list -path /cftab
compressionperm readperm
traverseperm jsonfamilypath
writeperm minversions
maxversions compression
ttl          inmemory cfname
memoryperm
u:root          u:root
u:root
u:root          0
1                lz4
2147483647 false      default
u:root
u:root          u:root
u:root          sl1
u:root          0
1                lz4
2147483647 false      cf1
u:root
u:root          u:root
u:root          sl1.sl2.sl3
u:root          0
1                lz4
2147483647 false      cf2
u:root
u:root          u:root
u:root          sl1.sl2.sl3.sl4
u:root          0
1                lz4
2147483647 false      cf3
u:root

maprcli table index add -path /
cftab -index i1 -indexedfields
sl1.sl2.sl3.sl4.l4a,
sl1.l1a -includedfields
sl1.sl2,sl1.sl2.sl3.sl4.sl5.l5b -js
on
{
    "timestamp":1507419777919,
    "timeofday":"2017-10-07
04:42:57.919 GMT-0700 PM",
    "status":"ERROR",
    "errors":[
        {
            "id":22,

"desc":"Data for included field
sl1.sl2 may not span more than one
column family."
        }
    ]
}
```

- You cannot specify a composite index with more than one container field path as your indexed fields, unless the prefixes of the container field paths are the same.

See [Composite Indexes and Container Field Paths](#) on page 764 for more details.

- You cannot specify a composite index with an indexed field that is a subfield of another indexed field.

For example, you cannot create an index with the following indexed fields:

```
a, a.b
```

The indexed field `a.b` is a subfield of the indexed field `a`.

Option Restrictions

- As indexes are automatically split, you cannot disable splits when you create your index.

Index Use Restrictions

- Indexes do not optimize non-existence filter conditions.

Example

CLI

```
maprcli table index
add -path /demo/business -index
newIndex -indexedfields fieldName
```

REST

```
curl -k -X POST \
'https://r1n1.sj.us:8443/rest/table/
index/add?
path=%2Fdemo%2Fbusiness&index=newIndex
&indexedfields=fieldName' \
-u mapr:mapr
```

table index list

This topic describes how to list information about the secondary indexes created on HPE Data Fabric Database JSON tables.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` on the volume
- `lookupdir` on directories in the table path

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax**CLI**

```
maprcli table index list
-path <path>
[ -indexname <index name> ]
[ -refreshnow < true | false > ]
```

REST

```
curl -k -X GET
'http[s]://<host>:<port>/rest/table/
index/list?path=<path>&<parameters>'
-u <username>:<password>
```

Parameters

Parameter	Description
path	(Required) Path to where the parent JSON table resides
indexname	(Optional) Name of the index for which to display information. If omitted, the output includes all indexes created on the table.
refreshnow	(Optional) Whether to fetch the current status of the index Default: False

Example**CLI**

```
maprcli table index list -path /
my.cluster.com/volume1/table1
```

```
maprcli table index list -path /demo/
business -json
```

REST

```
curl -X GET \
'https://r1n1.sj.us:8443/rest/table/
index/list?
path=%my.cluster.com%2Fvolume1%2Ftable
1' \
-u <username>:<password>
```

```
curl -X GET \
'https://r1n1.sj.us:8443/rest/table/
index/list?path=%2Fdemo%2Fbusiness' \
-u <username>:<password>
```

Output Fields

Output Field	Description
cluster	The cluster on which the index resides
type	For indexes, this is always maprdb.si

Output Field	Description
indexFid	A unique id used to identify the index in file system
indexName	Name of the index
hashed	A boolean value that specifies whether the index is hashed
indexState	The replication state of the index. For information about the replication states, see Table Replication States on page 835.
idx	The index id. Unique per table.
indexedFields	The list of indexed fields with the sort order of each key
includedFields	The list of included fields in the index. Missing from output if there are no included fields.
isUptodate	A boolean value that specifies if the index is up-to-date
minPendingTS	The epoch time in milliseconds of the oldest operation that has yet to be replicated to the index
maxPendingTS	The epoch time in milliseconds of the newest operation that has yet to be replicated to the index
bytesPending	The number of bytes that have yet to be replicated to the index
putsPending	The number of puts that have yet to be replicated to the index
bucketsPending	The number of buckets that have yet to be replicated to the index
copyTableCompletionPercentage	<p>The percentage of data from the source that has been copied to the index during the setup phase of replication. After replication setup completes, the value remains at 100.</p> <p> NOTE: When replicating data to the index, the copyTableCompletionPercentage value may decrease. This happens when splits or merges occur in the JSON table's regions, or the table receives new data.</p>
numTablets	The number of tablets the index occupies
numRows	The number of rows in the index
totalSize	The total size of the index

Example Output

```
maprcli table index list -path /demo/business -json -indexname i1
{
  "timestamp":1506617667735,
  "timeofday":"2017-09-28 04:54:27.735 GMT+0000 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"my.cluster.com",
      "type":"maprdb.si",
      "indexFid":"2049.93.10257820",
      "indexName":"i1",
```

```

        "hashed":false,
        "indexState":"REPLICA_STATE_REPLICATING",
        "idx":1,
        "indexedFields":"a.b:ASC",
        "isUptodate":true,
        "minPendingTS":0,
        "maxPendingTS":0,
        "bytesPending":0,
        "putsPending":0,
        "bucketsPending":0,
        "copyTableCompletionPercentage":100,
        "numTablets":1,
        "numRows":4,
        "totalSize":24576
      }
    ]
  }

```

Troubleshooting Use Cases

Situations where you can use this command include the following:

- Examine the properties of an index.
- Determine if there is a lag in updates in an index.

See [Troubleshooting Secondary Indexes](#) on page 1722 for more information on these use cases.

table index remove

This topic describe how to remove secondary indexes that are no longer needed.

Permissions Required

To run this command, your user ID must have the following permissions:

- readAce on the volume
- lookupdir on directories in the table path
- indexperm permission on the table, if you did not create the table

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table index remove
-path <path>
-index <index name>
```

REST

```
curl -k -X POST \
'http[s]://<host>:<port>/rest/table/
index/remove?path=<path>&index=<index
name>'
-u <username>:<password>
```

Parameters

Parameter	Description
path	(Required) Path to where the parent JSON table resides
index	(Required) Name of the index

Example**CLI**

```
maprcli table
index remove -path /my.cluster.com/
volume1/newtable -index testIndex
```

REST

```
curl -X POST \
'https://r1n1.sj.us:8443/rest/table/
index/remove?
path=%2Fmy.cluster.com%2Fvolume1%2Fnew
table&index=testIndex' \
-u <username>:<password>
```

table info

Displays information about a HPE Data Fabric Database binary or JSON table, or an index on a JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) on the volume
- [lookupdir](#) on directories in the path

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax**CLI**

```
maprcli table info
-path <path>
[ -index <index name> ]
```

REST

```
curl -k -X GET \
'http[s]://<host>:<port>/rest/table/
info?path=<path>&index=<index name>'
-u <username>:<password>
```

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

Parameter	Description
path	<p>The path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customer under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
index	The name of the index for which to display information.

Example

Lists the information for a table named mytable in the JSON format, as described in [Common Options](#) on page 2269:

CLI

```
maprcli table info -path /mapr/
my.cluster.com/volume1/mytable -json
```

REST

```
curl -k -X GET \
'https://r1n1.sj.us:8443/rest/table/
info?
path=%2Fmapr%2Fmy.cluster.com%2Fvolume
1%2Fmytable' \
-u mapr:mapr
```

Sample Output**Output Fields**

```
maprcli table info -path /mapr/my.cluster.com/volume1/mytable -json
{
  "timestamp":1540362830403,
  "timeofday":"2018-10-23 11:33:50.403 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "path":"/mapr/my.cluster.com/volume1/mytable",
      "numregions":1,
      "totallogicalsize":0,
      "totalphysicalsize":0,
      "totalcopypendingsize":0,
      "totalrows":0,
      "totalnumberofspills":0,
      "totalnumberofsegments":0,
      "autosplit":true,
      "bulkload":false,
      "wireencryptionfrompolicies":false,
      "tabletype":"json",
```

```

    "securitypolicy":["Credit_Card_Data,Confidential]",
    "regionsize":4096,
    "audit":false,
    "metricsinterval":10,
    "maxvalueszinmemindex":100,
    "adminaccessperm":"u:root",
    "createrenamefamilyperm":"u:root",
    "bulkloadperm":"u:root",
    "indexperm":"u:root",
    "packperm":"u:root",
    "deletefamilyperm":"u:root",
    "replperm":"u:root",
    "splitmergeperm":"u:root",
    "defaultcompressionperm":"u:root",
    "defaultmemoryperm":"u:root",
    "defaultreadperm":"u:root",
    "defaulttraverseperm":"u:root",
    "defaultwriteperm":"u:root",
    "defaultunmaskedreadperm": "u:mapr",
    "uuid":"8fea24dc-6e56-6d56-6336-0e0408e15e00"
  }
}

```

Output Field	Description
path	<p>The path to the HPE Data Fabric Database table</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under a volume with a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customer under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
numregions	Number of regions in the table.
totallogicalsize	Estimated size (in bytes) of uncompressed data stored in table (excluding replication).
totalphysicalsize	<p>Estimated size (in bytes) of actual data stored in table (excluding replication).</p> <p>Includes internal metadata and reflects compressed data size when compression is enabled.</p>
totalcopypendingsize	Total size (in bytes) of pending data for replication.
totalrows	Estimated number of rows in a table. Values may not match the actual number of rows. This variance occurs because the counter, for performance reasons, is not updated on each row. Note that internal data management events trigger (in bulk) counter updates.

Output Field	Description
autosplit	<p>A Boolean value that specifies whether to split the table into regions automatically as the table grows. The average size of each region is determined by the <code>regionsizeMB</code> parameter.</p> <p>The default value is <code>true</code>. If value is set to <code>false</code>, you can manually split tables into regions by using the <code>table region split</code> command.</p>
bulkload	<p>A Boolean value that specifies whether to allow a full bulk load of the table. The default is <code>false</code>. For more information, see Loading Data into Binary Tables on page 1650 and Loading Documents into JSON Tables on page 1647.</p>
tabletype	<p>Specifies whether the table will be a binary table or a JSON table. The values are <code>binary</code> and <code>json</code>. The default is <code>binary</code>.</p>
regionsizeMB	<p>The average size of the regions into which HPE Data Fabric Database tries to split the table as the table grows. The default is 4096 MB. This value is ignored if <code>autosplit</code> is set to <code>false</code>.</p> <p>If <code>autosplit</code> is set to <code>true</code>, HPE Data Fabric Database splits a region when the size of the region exceeds 150% of the average value. For example, if the average value is 4096 MB, HPE Data Fabric Database splits a region that is larger than 6144 MB.</p> <p>Although splits are automatic, merges are not. For example, if the value of <code>regionsizeMB</code> is changed from 8 GB to 4 GB, all regions that are eligible are split automatically, if <code>autosplit</code> is set to <code>true</code>. However, if the value of <code>regionsizeMB</code> is changed from 2 GB to 4 GB, regions smaller than 4 GB are not automatically merged.</p> <p> NOTE: When a table has less than 4 regions, HPE Data Fabric Database ignores the <code>regionsizeMB</code> parameter and splits regions at a lower threshold.</p>
audit	<p>Specifies whether to turn auditing on for the table. If auditing is also enabled at the cluster level with the <code>mapcli audit data</code> command and enabled for the current volume, setting this value to <code>true</code> causes auditing to start for the table.</p>
metricsinterval	<p>The table metrics collection interval, in seconds.</p>
maxvaluesizeinmemindex	<p>The maximum value size to save in an in-memory index.</p>
adminaccessperm	<p>The Access Control Expression that controls who can view and edit the permissions for this table. By default, permission is given to the user ID that is used to create the table.</p>
createrenamefamilyperm	<p>The Access Control Expression that controls who can create column families for this table or rename existing column families. By default, permission is given to the user ID that is used to create the table.</p>

Output Field	Description
bulkloadperm	The Access Control Expression that controls who can load this table with bulk loads if the table was created with bulk load support. By default, permission is given to the user ID that is used to create the table.
indexperm	The secondary index Admin permissions setting that controls who can create an index associated with this table. By default, permission is given to the user ID that is used to create the table.
packperm	The Access Control Expression that controls who can pack table regions. By default, permission is given to the user ID that is used to create the table.
deletefamilyperm	The Access Control Expression that defines access to delete column families for this table. Delimit the expression with single-quotation marks. By default, permission is given to the user ID that is used to create the table.
replperm	The Access Control Expression that controls who can set up replication either to or from a table. By default, permission is given to the user ID that is used to create the table.
splitmergeperm	<p>The Access Control Expression that controls who can take the following actions:</p> <ul style="list-style-type: none"> Run the table region split and table region merge commands to split the table into regions or to merge regions of the table together. Change the value of regionsizeemb. <p>By default, permission is given to the user ID that is used to create the table.</p>
defaultappendperm	Applies to binary tables only: The default Access Control Expression for the append permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter appendperm in the table cf create and table cf edit commands overrides this value.
defaultcompressionperm	Applies to binary tables only: The default Access Control Expression for the compression permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter compressionperm in the table cf create and table cf edit commands overrides this value.
defaultmemoryperm	The default Access Control Expression for the memory permission on new column families that are created in this table. If no value is specified, the default is u:<username of the table creator>. This value of the parameter memoryperm in the table cf create and table cf edit commands overrides this value.

Output Field	Description
defaultreadperm	The default Access Control Expression for the read permission on new column families that are created in this table. If no value is specified, the default is <code>u:<username of the table creator></code> . This value of the parameter <code>readperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. See table cf create on page 2778 and table cf edit on page 2785.
defaulttraverseperm	Applies to JSON tables only: The default Access Control Expression for the traverse permission on new column families. For more information about this permission, see Permission Types for Fields and Column Families in JSON Tables on page 1662.
defaultwriteperm	The default Access Control Expression for the write permission on new column families that are created in this table. If no value is specified, the default is <code>u:<username of the table creator></code> . This value of the parameter <code>writeperm</code> in the <code>table cf create</code> and <code>table cf edit</code> commands overrides this value. See table cf create on page 2778 and table cf edit on page 2785.
defaultunmaskedreadperm	The <code>defaultunmaskedreadperm</code> permission on table creation is set to the table creator. This setting takes effect for all new column families (and therefore also all columns/fields within all column families) unless otherwise overridden by the <code>maprcli table cf</code> or the <code>maprcli table cf colperm</code> command. This permission allows the user to read the data unmasked. Users without this permission have the masked data returned.
securitypolicy	The security policy or policies tagged to the table. If the parameter is not specified during table creation, the default value is uninitialized (<code>"[-]"</code>), and there is no security policy for the table.
uuid	The table UUID.
wireencryptionfrompolicies	The system automatically sets this field to true if at least one security policy has wire-level encryption enabled, false otherwise.

table metadata update

Updates table metadata and adds user table entries to the metadata list.

REMEMBER: This command is meant to be used by support engineers to debug issues.

Syntax**CLI**

```
maprcli table metadata update
-path <path>
```

REST

```
curl -k -X GET \
'http[s]://<host>:<port>/rest/table/
metadata/update?path=<path>'
-u <username>:<password>
```

Parameters

Parameter	Description
path	<p>The path to use to fetch the metadata recursively. Metadata entries under this path are updated.</p> <p> NOTE: This parameter is optional. If not specified, the root path / is used.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>ezmeral</code> under <code>volume1</code> that has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/ezmeral</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code>

Example

Updates the metadata for tables in a volume named `nysales` under the `/` path, in the JSON format:

CLI

```
maprcli table metadata update -path /
nysales -json
```

REST

```
curl -k -X POST \
  'https://r1n1.sj.us:8443/rest/table/
  metadata/update?path=/nysales' \
  -u mapr:mapr
```

Sample Output

```
maprcli table metadata update -path /nysales -json
```

```
{
  "timestamp":1699290019872,
  "timeofday":"2023-11-06 09:00:19.872 GMT-0800 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "1 entries were added or updated in table metadata."
  ]
}
```

table metadata list

Lists table metadata

REMEMBER: This command is meant to be used by support engineers to debug issues.

Syntax

CLI

```
maprcli table metadata list
[-terse]
```

REST

```
curl -X GET \
'http[s]://<host>:<port>/rest/table/
metadata/list?terse' \
-u <username>:<password>
```

Parameters

Parameter	Description
terse	Displays only table paths.

Example

List table metadata.

CLI

```
maprcli table metadata
list -terse -json
```

REST

```
curl -X POST \
'https://r1n1.sj.us:8443/rest/table/
metadata/list?terse' \
-u <username>:<password>
```

Sample Output

```
maprcli table metadata list -json
{
  "timestamp":1700050001936,
  "timeofday":"2023-11-15 04:06:41.936 GMT-0800 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "path":"/nysales",
      "numregions":1,
      "totallogicalsize":0,
      "totalphysicalsize":0,
      "owner":"root"
    }
  ]
}
```

```
maprcli table metadata list -terse -json
{
  "timestamp":1700050025638,
  "timeofday":"2023-11-15 04:07:05.638 GMT-0800 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
```

```

    "path": "/nysales"
  }
]
}

```

table region

Manages table regions for HPE Data Fabric Database binary and JSON tables.

table region list

Lists the regions that make up a specified table or index.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) on the volume
- [lookupdir](#) on directories in the path

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```

maprccli table region list
  -path <path>
  [ -start <offset from starting
region> ]
  [ -limit <number of regions to
return> ]
  [ -index <index name> ]
  [ -output terse | verbose ]

```

REST

NOTE: For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```

curl -X GET \
  'http[s]://<host>:<port>/rest/table/
region/list?path=<path>&<parameters>'
  -u <username>:<password>

```

Parameters

Parameter	Description
path	<p>Path to the table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, if you want to list regions for a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, if you want to list regions for a table named <code>test</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code>
start	The offset from the starting region. The default value is 0.
limit	The number of regions to return, counting from the starting region. The default value is 2147483647.
index	The name of the index for which to list region information.
output	<p>Specifies whether the output should be terse or verbose.</p> <p>Default: verbose</p>

Output Fields

Verbose Field Name	Terse Field Name	Field Value
primarymfs	pn	Host name and port of the primary node for this region.
secondarymfs	sn	Host names and ports of the secondary nodes where this region is replicated.
startkey	sk	<p>Value of the start key for this region.</p> <p>For the first region in a table, this value is exclusive. For all other regions, it is inclusive. See the example output.</p>
endkey	ek	<p>Value of the end key for this region.</p> <p>This value is always exclusive. See the example output.</p>
lastheartbeat	lhb	Time since last heartbeat from the region's primary node
fid	fid	The region's FID.
logicalsize	ls	The logical size (in bytes) of the region without data compression (excluding replication).
physicalsize	ps	The physical size (in bytes) of the region with data compression (excluding replication).

Verbose Field Name	Terse Field Name	Field Value
copypendingsize	cps	The size (in bytes) of the data residing on the original remote region after region split that remains to be copied onto the new region.
numberofrows	nr	<p>Estimated number of rows in the region. The estimated value may not match the actual number of rows. The variance occurs because the counter is not updated on each row, for performance reasons. The internal data management events trigger counter updates in bulk.</p> <p>Row count is the same as the actual row count on the table or higher. Upon updates to the table rows, the counter is incremented and finalized to the actual number when compactions (minor [automated] or major[automated or forced via region pack]) run on the table segments/spills.</p> <p> NOTE: You should not depend on the number of rows for logical decision-making as these are only estimates. Full table scan is the only way to fetch the actual row count in the table.</p>
numberofrowswithdelete	nrd	Number of rows in the region, counting deleted rows.
numberofspills	nsp	Number of spills for the region.
numberofsegments	nsg	Number of segments in the region.
ttlcompact		<p>Enables TTL compactions. TTL compaction triggers expired data disk space reclaim based on column family TTL triggered by scans of respective region partitions.</p> <p>The default value for the <code>ttlcompact</code> parameter is <code>false</code>.</p>
ttlcompacthrs		<p>Minimum time (in hours) to next TTL compactions for a single region partition.</p> <p>The default value for the <code>ttlcompact</code> parameter is 24.</p>

Examples

Lists the Region Information for a Table

This example lists the region information for the table `newtable`.

CLI

```
maprcli table region list -path /
my.cluster.com/volume1/newtable
```

REST

NOTE: For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X GET \
  'https://r1n1.sj.us:8443/rest/table/
  region/list?
  path=%2Fmy.cluster.com%2Fvolume1%2Fnew
  table' \
  -u <username>:<password>
```

Example Output Using the -json Option

This example shows two table regions. The value of endkey for the first region is the value of startkey for the second region. The value of endkey is always exclusive. So, for the first region, endkey shows that the first region was split with the addition of the record with the key 5190414F2E44DB732547630A9A81452539749000; for the second region, startkey shows that the region begins with that record.

```
{
  "timestamp":1452554659812,
  "timeofday":"2016-01-11 03:24:19.812 GMT-0800",
  "status":"OK",
  "total":2,
  "data":[
    {
      "primarymfs":"test150.qa.lab:5660",
      "secondarymfs":"test156.qa.lab:5661, test151.qa.lab:5660",
      "startkey":"-INFINITY",

      "logicalsize":794624,
      "physicalsize":794624,
      "copypendingsize":0,
      "numberofrows":0,
      "numberofrowswithdelete":0,
      "numberofspills":0,
      "numberofsegments":0
    },
    {
      "primarymfs":"test161.qa.lab:5660",
      "secondarymfs":"test157.qa.lab:5661, test162.qa.lab:5660",
      "startkey":"5190414F2E44DB732547630A9A81452539749000",
      "endkey":"INFINITY",
      "lastheartbeat":0,
      "fid":"2069.181.131578",
      "logicalsize":745472,
      "physicalsize":745472,
      "copypendingsize":0,
      "numberofrows":0,
      "numberofrowswithdelete":0,
      "numberofspills":0,
      "numberofsegments":0
    }
  ]
}
```

table region merge

Merges regions of a table together to reduce the number of regions that a table occupies.

This command merges the region that you specify with the region that contains the row keys that immediately follow the row keys of the specified region.

NOTE: Consider the table configuration when you decide to merge regions because it is possible that HPE Data Fabric Database might immediately split the regions after they are merged. If `autosplit` is set to true, HPE Data Fabric Database splits a region when the size of the region exceeds 150% of the average value (`regionsizemb`). For example, if the average value is 4096 MB, HPE Data Fabric Database splits a region that is larger than 6144 MB.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `splitmergeperm` permission on the table

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax**CLI**

```
maprcli table region merge
  -fid <regionFID>
  -path <table path>
```

REST

```
curl -k -X POST
  'http[s]://<host>:<port>/rest/
  table/region/merge?fid=<region
  FID>&path=<path>'
  -u <username>:<password>
```

Parameters

Parameter	Description
fid	The FID for the table region that you want to merge. The output of <code>maprcli table region list</code> lists the FIDs for the table.

Parameter	Description
path	<p>The path to the table whose regions are being merged.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, if you want to merge regions for table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test For a path on a remote, you must also specify the cluster name in the path. For example, if you want to merge regions for table named test under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer

Example

Merges the specified region:

CLI

```
maprcli table region merge -path /
user/test5 -fid 2086.32.131296
```

REST

```
curl -X POST \
'https://myhost:8443/rest/table/
region/merge?
path=%2Fuser%2Ftest5&fid=2086.32.13129
6' \
-u <username>:<password>
```

table region pack

Manually triggers the packing of regions.

HPE Data Fabric Database automatically compacts or packs regions and reclaims space when 25% of the data contained in the partitions (max of 3 per tablet) has expired; however, for a time series table, you **must** run this command to reclaim space used by expired rows and to avoid read amplification, if the old rows are never accessed.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on the volume
- [lookupdir](#) on directories in the path
- packperm permission on the table

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table region pack
-path <table path>
```

```
-fid <fid>|all
[ -nthreads <number of threads> ]
```

REST

```
curl -X POST
'http[s]://
<host>:<port>/rest/table/region/pack?
path=<path>&fid=<fid>&<parameters>'
-u <username>:<password>
```

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

Parameter	Description
path	Specifies the path to the table. <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, if you want to pack a table named test under volume1 which has a mount point at /volume1, specify the following path: /volume1/test For a path on another cluster, you must also specify the cluster name in the path. For example, if you want to pack a table named customer under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
fid	Specifies that you want to pack all table regions or a single table region that you identify with a FID. The output of maprcli table region list lists the FIDs for the table.
nthreads	Specifies the number of threads allocated to process the packing of table regions. Default:16

Example

Packs the specified region:

CLI

```
maprcli table region pack -path /user/
test5 -fid 2086.32.131296
```

REST

```
curl -X POST \
'https://myhost:8443/rest/table/
region/pack?
path=%2Fuser%2Ftest5&fid=2086.32.13129
6' \
-u <username>:<password>
```

table region split

Splits a region in a table.

Permissions Required

To run this command, your user ID must have the following permissions:

- `readAce` and `writeAce` on the volume
- `lookupdir` on directories in the path
- `splitmergeperm` permission on the table

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table region split
-path <path>
-fid <fid>
```

REST

NOTE: For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X POST
'http[s]://<host>:<port>/rest/table/
region/split?path=<path>&fid=<fid>'
-u <username>:<password>
```

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

Parameter	Description
path	<p>Path to the table.</p> <ul style="list-style-type: none"> • For a path on the local cluster, start the path at the volume mount point. For example, if you want to split regions in a table named <code>test</code> under <code>volume1</code> which has a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/test</code> • For a path on another cluster, you must also specify the cluster name in the path. For example, if you want to split regions in a table named <code>customer</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customer</code>
fid	<p>The FID of the region to split. The output of <code>maprcli table region list</code> lists the FIDs for the table's regions.</p>

Example

This example splits a region in the table newtable.

CLI

```
maprccli table region split -path /
my.cluster.com/volume1/newtable -fid
2086.32.131296
```

REST

NOTE: For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

```
curl -X POST \
'https://r1n1.sj.us:8443/rest/table/
region/split?
path=%2Fmy.cluster.com%2Fvolume1%2Fnew
table&fid=2086.32.131296' \
-u <username>:<password>
```

table replica

Performs functions related to replication of HPE Data Fabric Database binary and JSON tables. Replication occurs for binary-to-binary tables and JSON-to-JSON tables.

table replica add

Registers a table as a replica of another HPE Data Fabric Database binary or JSON table.

NOTE: You do not need to use this command if you use the `table replica autosetup` command.

Permissions Required

To run this command, your user ID must have the following permissions:

- readAce and writeAce on both the source volume and the target volume
- lookupdir on directories in the paths of both tables
- readperm and replperm permissions on the source table

NOTE: The **mapr user** is not treated as a superuser. HPE Data Fabric Database does not allow the **mapr user** to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
/opt/mapr/bin/maprccli table replica
add
  -path <table path>
  -replica <replica table path>
  [ -columns <comma separated list of
  <family>[:<column>]> ]
  [ -paused <is replication paused>
  default: false ]
  [ -throttle <throttle replication
  ops> default: false ]
  [ -networkencryption <enable
  on-wire encryption> default: false ]
```

```
[ -synchronous <is synchronous
replication> default: false ]
[ -networkcompression <on-wire
compression type: off|on|lz4|lz4|
zlib> default: on ]
```

REST

```
curl -k -X POST
'http[s]://<host>:<port>/rest/table/
replica/add?
path=<path>&replica=<name>&<parameters
>
-u <username>:<password>
```

NOTE: The **mapr user** is not treated as a superuser. HPE Data Fabric Database does not allow the **mapr user** to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

Parameter	Description
path	<p>The path to the source table that you want to replicate.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named testsrc under a volume with a mount point at /volume1, specify the following path: /volume1/testsrc For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named customersrc under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customersrc
replica	<p>The path to the replica.</p> <ul style="list-style-type: none"> For a table on the local cluster, start the path at the volume mount point. For example, for a table named testdst under a volume with a mount point at /volume1, specify the following path: /volume1/testdst For a table on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customerdst under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customerdst <p> NOTE: For replication to a table, the command will fail if the table in the replica path does not exist.</p>

Parameter	Description
columns	<p>By default, all columns in the source table are replicated.</p> <p>If you do not want to replicate all columns in the table, you can specify specific columns to replicate:</p> <div><div>For binary tables</div><div><p>Provide a comma-separated list of column families or columns from a certain column family (column family:qualifier). For example, use the following syntax to replicate the column family purchases and the column stars in the reviews column family: -columns purchases, reviews:stars</p><div> NOTE: While the column families that you specify must already exist in the source table, the columns that you specify do not have to exist in the destination table for replication to succeed. If the column is added at a later date, replication for that column will start at that time.</div></div></div> <div><div>For JSON tables</div><div><p>Provide a comma-delimited list of fields to replicate. Include the full field path for each field.</p><p>Example</p><p>Suppose your table contains documents that contain this general structure:</p><pre>{ "_id" : "ID", "a" : { "b" : { "c" : "value", }, "e" : "value" } }</pre><p>To replicate fields a, c, and e, you would specify these field paths:</p></div></div>

Parameter	Description
paused	A Boolean value that specifies whether to pause the replication so that it does not start immediately. The replication can be resumed using the replica resume command at a later time. The values are true or false. Default: Not paused (false)
throttle	A Boolean value that specifies whether to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The values are true or false. Default: No throttle (false)
networkencryption	A Boolean value that specifies whether or not to enable on-wire encryption. The values are true or false. If you set this to true, the local cluster and any other cluster that is part of the replication process must be enabled for security. Default: No encryption (false)
synchronous	A Boolean value that specifies whether replication is synchronous or asynchronous. The values are true or false. Default: Asynchronous (false)
networkcompression	<p>The type of on-wire compression. Default: on</p> <p>The types are:</p> <ul style="list-style-type: none"> • off • on (default) • lz4 • lz4 • zlib <p>The default compression is lz4, which can be set by specifying on or lz4 as value.</p>

Example

Registers a table on the local cluster as a replica of another table on the local cluster:

CLI

```
/opt/mapr/bin/maprcli table
replica add -path /volume1/
custA -replica /volume2/custA
```

REST

```
curl -k -X POST \
  'https://r1n1.sj.us:8443/rest/table/
replica/add?
path=%2Fvolume1%2FcustA&replica=%2Fvol
ume2%2FcustA' \
  -u mapr:mapr
```

table replica autoseup

Sets up and starts replication between a *source* HPE Data Fabric Database binary or JSON table to a *replica* HPE Data Fabric Database binary or JSON table.

The `maprcli table replica autoseup` command performs the following steps to set up replication:

1. Creates a new table with metadata from the source table in the destination cluster.
2. Declares the new table to be a replica of the source table and ensures that replication does not begin immediately after the next step.
3. Declares the source table as an upstream source for the replica.
4. For multi-master replication, replica autosetup declares the source table to be a replica of the new table and then declares the new table to be an upstream source for the source table.
5. Loads a copy of the source data into the replica(s).
6. Clears the paused replication state to start the replication stream.

For more information about the automatic setup process, see [Replica Autosetup for HPE Data Fabric Database Tables](#) on page 834.

Before you set up replication for a table, verify that the cluster is setup for replication. For more information, see [Preparing Clusters for Table Replication](#) on page 1693.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on both the source volume and the target volume
- [lookupdir](#) on directories in the paths of both tables
- `readperm` and `rep1perm` permissions on the source table

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with [ACE](#).

Syntax

CLI

```
/opt/mapr/bin/maprccli table replica
autosetup
  -path <table path>
  -replica <replica table path>
  [ -columns <comma separated list of
  <family>[:<column>]> ]
  [ -synchronous <is synchronous
  replication> default: false ]
  [ -multimaster <is multi master
  replication> default: false ]
  [ -throttle <throttle replication
  ops> default: false ]
  [ -networkencryption <enable
  on-wire encryption> default: false ]
  [ -networkcompression <on-wire
  compression type: off|on|lz4|
  zlib> default: on ]
  [ -directcopy <enable directcopy>
  default: true ]
  [ -useexistingreplica <use existing
  replica table if present> default:
  false ]
```

REST

```
curl -k -X POST
'http[s]://<host>:<port>/rest/table/
replica/autosetup?
path=<path>&replica=<path>&<parameters
>'
-u <username>:<password>
```

Parameters

path	<p>The path to the source table that you want to replicate.</p> <ul style="list-style-type: none">• For a path on the local cluster, start the path at the volume mount point. For example, for a table named testsrc under a volume with a mount point at /volume1, specify the following path: /volume1/testsrc• For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named customersrc under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customersrc
replica	<p>The path to the replica.</p> <ul style="list-style-type: none">• For a table on the local cluster, start the path at the volume mount point. For example, for a table named testdst under a volume with a mount point at /volume1, specify the following path: /volume1/testdst• For a table on another cluster, you must also specify the cluster name in the path. For example, for a table named customerdst under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customerdst <div> NOTE: For replication to a table, the command will fail if the replica path you specify points to table that already exists.</div>

<p>columns</p>	<p>By default, all columns in the source table are replicated.</p> <p>If you do not want to replicate all columns in the table, you can specify specific columns to replicate:</p> <div><div><p>For binary tables</p><p>Provide a comma-separated list of column families or columns from a certain column family (column family:qualifier). For example, use the following syntax to replicate the column family purchases and the column stars in the reviews column family: - columns purchases, reviews:stars</p><div><p>NOTE: While the column families that you specify must already exist in the source table, the columns that you specify do not have to exist in the destination table for replication to succeed. If the column is added at a later date, replication for that column will start at that time.</p></div></div><div><p>For JSON tables</p><p>Provide a comma-delimited list of fields to replicate. Include the full field path for each field.</p><p>Example</p><p>Suppose your table contains documents that contain this general structure:</p><div><pre>{ "_id" : "ID", "a" : { "b" : { "c" : "value", }, "e" : "value" } }</pre></div><p>To replicate fields a, c, and e, you would specify these field paths:</p><div>a, a.b.c, a.e</div></div></div>
----------------	--

synchronous	A Boolean value that specifies whether replication is synchronous or asynchronous. The value is either <code>true</code> or <code>false</code> . Asynchronous (<code>false</code>) is the default.
multimaster	A Boolean value that specifies whether or not to set up a multi-master topology. The value is either <code>true</code> or <code>false</code> . Basic primary-secondary topology (<code>false</code>) is the default.
throttle	A Boolean value that specifies whether or not to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The value is either <code>true</code> or <code>false</code> . No throttle (<code>false</code>) is the default.
networkencryption	A Boolean value that specifies whether or not to enable on-wire encryption. The value is either <code>true</code> or <code>false</code> . No encryption (<code>false</code>) is the default. If you set this to <code>true</code> , the local cluster and any other cluster that is part of the replication process must be enabled for security.
networkcompression	<p>The type of on-wire compression.</p> <p>The types are:</p> <ul style="list-style-type: none"> • <code>off</code> • <code>on</code> (default) • <code>lz4</code> • <code>lz4</code> • <code>zlib</code> <p><code>lz4</code> is the default compression which is set by parameter values <code>on</code> or <code>lz4</code>.</p>
directcopy	<p>A Boolean value that specifies whether or not autosetup will use the directcopy option. The value is either <code>true</code> or <code>false</code>. Autosetup with direct copy (<code>true</code>) is the default. If you set this parameter to <code>false</code>, the cluster will run autosetup without the directcopy option. For more information, see Replica Autosetup for HPE Data Fabric Database Tables on page 834.</p> <p> NOTE: If a table was originally created in MapR 5.x and the <code>maprcli table replica autosetup</code> command is specified with <code>directcopy=false</code>, then an error, "Copy Table failed for tables", occurs. This is due to the introduction of new table meta information in 6.0. It is recommended that replication be setup using <code>directcopy=true</code> (which is the default). If the default method is not desired, then replication should be setup manually.</p>
useexistingreplica	When the <code>directcopy</code> parameter is set to <code>true</code> (default), this Boolean value specifies whether or not an existing table can be used as the replica table. The value is either <code>true</code> or <code>false</code> . No reuse of existing tables (<code>false</code>) is the default. If a table exists with the specified name, and this parameter is set to <code>false</code> , the create table operation will fail.

Example

CLI

```
/opt/mapr/bin/maprcli table
replica autoseup -path /volume1/
custBsrc -replica /volume2/custBdst
```

REST

```
curl -k -X POST \
'https://r1n1.sj.us:8443/rest/table/
replica/autoseup?
path=%2Fvolume2%2FcustBsrc&replica=%2F
volume2%2FcustBdst' \
-u mapr:mapr
```

table replica edit

Edits the properties of a replica of a HPE Data Fabric Database binary or JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- readAce and writeAce on both the source volume and the target volume
- lookupdir on directories in the paths of both tables
- readperm and replperm permissions on the source table

NOTE: The **mapr user** is not treated as a superuser. HPE Data Fabric Database does not allow the **mapr user** to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprcli table replica edit
-path <table path>
-replica <replica table path>
[ -newreplica <renamed table path> ]
[ -columns <comma separated list of
<family>[:<column>]> ]
[ -throttle <throttle replication
ops> ]
[ -networkencryption <enable
on-wire encryption> ]
[ -synchronous <is synchronous
replication> ]
[ -networkcompression <on-wire
compression type: off|on|lz4|lz4|
zlib> ]
```

REST

```
curl -k -X POST
'http[s]://<host>:<port>/rest/table/
replica/edit?
path=<path>&replica=<path>&<parameters>
'
-u <username>:<password>
```

NOTE: The **mapr user** is not treated as a superuser. HPE Data Fabric Database does not allow the **mapr user** to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

Parameter	Description
path	<p>The path to the source table that you want to replicate.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code> For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code>
replica	<p>The path to the replica.</p> <ul style="list-style-type: none"> For a table on the local cluster, start the path at the volume mount point. For example, for a table named <code>testdst</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testdst</code> For a table on a remote cluster, you must also specify the cluster name in the path. For example, for a table named <code>customerdst</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customerdst</code>
newreplica	<p>The updated replica path due to a renamed replica table, renamed cluster, or changed table path. The table specified in the <code>replica</code> parameter and the table specified in the <code>newreplica</code> parameter must have the same UUID.</p>

Parameter	Description
columns	<p>By default, all columns in the source table are replicated.</p> <p>If you do not want to replicate all columns in the table, you can specify specific columns to replicate:</p> <div><div>For binary tables</div><div>Provide a comma-separated list of column families or columns from a certain column family (column family:qualifier). For example, use the following syntax to replicate the column family purchases and the column stars in the reviews column family: -columns purchases, reviews:stars</div><div> NOTE: While the column families that you specify must already exist in the source table, the columns that you specify do not have to exist in the destination table for replication to succeed. If the column is added at a later date, replication for that column will start at that time.</div></div> <div><div>For JSON tables</div><div>Provide a comma-delimited list of fields to replicate. Include the full field path for each field.</div><div>Example</div><div>Suppose your table contains documents that contain this general structure:</div><div><pre>{ "_id" : "ID", "a" : { "b" : { "c" : "value", }, "e" : "value" } }</pre></div><div>To replicate fields a, c, and e, you would specify these field paths:</div></div>

Parameter	Description
throttle	A Boolean value that specifies whether or not to throttle replication operations. Throttle the replication stream to minimize the impact of the replication process on incoming operations during periods of heavy load. The values are true or false. No throttle (false) is the default.
networkencryption	A Boolean value that specifies whether or not to enable on-wire encryption. The values are true or false. No encryption (false) is the default. If you set this to true, the local cluster and any other cluster that is part of the replication process must be enabled for security.
synchronous	A Boolean value that specifies whether replication is synchronous or asynchronous. The values are true or false. Asynchronous (false) is the default.
networkcompression	<p>The type of on-wire compression.</p> <p>The types are:</p> <ul style="list-style-type: none"> • off • on (default) • lz4 • lz4. This is the default • zlib <p>lz4 is the default compression which is set by parameter values on or lz4.</p>

Examples

Changes the replica path to reflect that replica t2dst is renamed to t2dst_new:

CLI

```
maprcli table replica edit -path /
volume1/t1src -replica /volume1/t2dst \
-newreplica /volume1/t2dst_new
```

REST

```
curl -k -X POST \
'https://r1n1.sj.us:8443/rest/table/
replica/edit?
path=%2Fvolume1%2Ft1&replica=%2Fvolume
1%2Ft2&newreplica=%2Fvolume1%2Ft2_new' \
-u mapr:mapr
```

Changes the column families to replicate:

CLI

```
maprcli table
replica edit -path /volume1/
custAsrc -replica /volume2/custAdst \
-columns purchases, reviews, returns
```

REST

```
curl -k -X POST \
  'https://r1n1.sj.us:8443/rest/table/
  replica/edit?
  path=%2Fvolume1%2FcustAsrc&replica=%2F
  volume2%2FcustAdst&columns=purchases,r
  eviews,returns' \
  -u mapr:mapr
```

table replica list

Lists replicas and the associated replica statistics for a specified HPE Data Fabric Database binary or JSON table. By default, replica statistics are updated every five minutes.

Permissions Required

To run this command, your user ID must have the following permissions:

- readAce on the volume
- lookupdir on directories in the path

 **NOTE:** The **mapr user** is not treated as a superuser. HPE Data Fabric Database does not allow the **mapr user** to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
/opt/mapr/bin/maprccli table replica
list
-path <table path>
[ -refreshnow true|false ]
```

REST

```
curl -X GET
'http[s]://
<host>:<port>/rest/table/replica/list?
path=<path>&refreshnow=false'
-u <username>:<password>
```

Parameters

Parameter	Description
path	<p>The path to the table that you want to list replicas for.</p> <ul style="list-style-type: none">• For a table on the local cluster, start the path at the volume mount point. For example, for a table named test under a volume with a mount point at /volume1, specify the following path: /volume1/test• For a table on another cluster, you must also specify the cluster name in the path. For example, for a table named customer under volume1 in the sanfranciscocluster, specify the following path: /mapr/sanfrancisco/volume1/customer

Parameter	Description
refreshnow	A Boolean value that specifies if you want to trigger an immediate update of the replica statistics. The values are <code>true</code> or <code>false</code> . By default, the value is <code>false</code> ; the command lists the current version of the replica statistics, which could be a maximum of five minutes old.

Output

Lists information about each replica for the specified table.

Output Data Fields

The following fields display for each replica.

Field	Description
cluster	The cluster on which the replica resides.
table	The table name for the replica.
type	The table type.
paused	A Boolean values that specifies if replication is paused.
replicaPath	The table replica path.
replicaState	The replication state. For information about the replication states, see Table Replication States on page 835.
throttle	A Boolean value that specifies if replication is throttled.
idx	The internal index value.
networkencryption	A Boolean value that specifies if replication is encrypted.
synchronous	A Boolean value that specifies whether replication is synchronous or asynchronous.
networkcompression	The type of on-wire compression.
isUptodate	A Boolean value that specifies if the replica is up-to-date.
minPendingTS	The epoch time in milliseconds of the oldest operation that has yet to be replicated to the replica.
maxPendingTS	The epoch time in milliseconds of the newest operation that has yet to be replicated to the replica.
bytesPending	The number of bytes that have yet to be replicated to the replica.
putsPending	The number of puts that have yet to be replicated to the replica.
bucketsPending	The number of buckets that have yet to be replicated to the replica.
uuid	The table UUID.

Field	Description
copyTableCompletionPercentage	<p>When replica autoseup with directcopy is in progress, this value is the percentage of data from the source that has been copied to the replica. After replication is setup, the value remains at 100.</p> <p> NOTE: When replicating HPE Data Fabric Database data, the copyTablePercentageCompletion data may re-adjust to a lower rate. This depends on table region (also referred to as tablets) splits and merges as well as the rate of incoming data to replicating data.</p>
errors	If applicable, an error is displayed.

Sample Output

```
{
  "timestamp":1485555420019,
  "timeofday":"2017-01-27 10:17:00.019 GMT+0000",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"cluster",
      "table":"/dst",
      "type":"MapRDB",
      "replicaPath":"/dst",
      "replicaState":"REPLICA_STATE_REPLICATING",
      "paused":false,
      "throttle":false,
      "idx":1,
      "networkencryption":false,
      "synchronous":false,
      "networkcompression":"lz4",
      "isUptodate":true,
      "minPendingTS":0,
      "maxPendingTS":0,
      "bytesPending":0,
      "putsPending":0,
      "bucketsPending":0,
      "uuid":"4164f38a-b4ed-0302-f929-0d8bc68b5800",
      "copyTableCompletionPercentage":100
    }
  ]
}
```

Example

Lists replicas for the custA table:

CLI

```
/opt/mapr/bin/maprccli table replica
list -path /volume1/custA
```

REST

```
curl -k -X GET \
  'https://r1n1.sj.us:8443/rest/table/
  replica/list?path=%2Fvolume1%2FcustA'
```

```
\
-u mapr:mapr
```

table replica pause

Pauses the replication of data from a *source* HPE Data Fabric Database binary or JSON table to a *replica* HPE Data Fabric Database binary or JSON table during autosetup and replication phases.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on both the source volume and the target volume
- [lookupdir](#) on directories in the paths of both tables
- `replperm` permissions on the source table

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI

```
maprccli table replica pause
-path <table path>
-replica <replica table path>
```

REST

```
curl -X POST
'http[s]://
<host>:<port>/rest/table/replica/
pause?path=<path>&replica=<path>'
-u <username>:<password>
```

Parameters

Parameter	Description
path	<p>The path to the source table.</p> <ul style="list-style-type: none">• For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code>• For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code>

Parameter	Description
replica	<p>The path to the replica that will receive updates from the source.</p> <ul style="list-style-type: none"> For a table on the local cluster, start the path at the volume mount point. For example, for a table named testdst under a volume with a mount point at /volume1, specify the following path: /volume1/testdst For a table on another cluster, you must also specify the cluster name in the path. For example, for a table named customerdst under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customerdst

Example

Sets the replication state to paused:

CLI

```
maprccli table
replica pause -path /volume1/
custAsrc -replica /volume2/custAdst
```

REST

```
curl -X POST \
'https://r1n1.sj.us:8443/rest/table/
replica/pause?
path=%2Fvolume1%2FcustAsrc&replica=%2F
volume2%2FcustAdst' \
-u <username>:<password>
```

table replica remove

De-registers the specified HPE Data Fabric Database binary or JSON table as a replica.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on both the source volume and the target volume
- [lookupdir](#) on directories in the paths of both tables
- [replperm](#) permissions on the source table

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

After running this command, the specified table or index is no longer a replica of the source table and will no longer receive updates from the source table.

In addition, run the `table upstream remove` command to remove the association between the source table and the replica table.

Syntax**CLI**

```
/opt/mapr/bin/maprcli table replica
remove
-path <table path>
-replica <replica table path>
```

REST

```
curl -X POST
'http[s]://
<host>:<port>/rest/table/replica/
remove?path=<path>&replica=<path>'
-u <username>:<password>
```

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

Parameter	Description
path	<p>The path to the source table that is being replicated.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named testsrc under a volume with a mount point at /volume1, specify the following path: /volume1/testsrc For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customersrc under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customersrc
replica	<p>The path to the replica.</p> <ul style="list-style-type: none"> For a table on the local cluster, start the path at the volume mount point. For example, for a table named testdst under a volume with a mount point at /volume1, specify the following path: /volume1/testdst For a table on another cluster, you must also specify the cluster name in the path. For example, for a table named customerdst under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customerdst

Example

De-registers table custAdst as a replica of table custAsrc:

CLI

```
/opt/mapr/bin/maprcli table
replica remove -path /volume1/
custAsrc -replica /volume2/custAdst
```

REST

```
curl -X POST \
  'https://r1n1.sj.us:8443/rest/table/
  replica/remove?
  path=%2Fvolume1%2FcustAsrc&replica=%2F
  volume2%2FcustAdst' \
  -u <username>:<password>
```

table replica resume

Resumes replication between a *source* HPE Data Fabric Database binary or JSON table and a *replica* of that table. Replication can be paused during autoseup and replication phases. When replication resumes, it continues from where it left off.

Permissions Required

To run this command, your user ID must have the following permissions:

- [readAce](#) and [writeAce](#) on both the source volume and the target volume
- [lookupdir](#) on directories in the paths of both tables
- `replperm` permissions on the source table

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax**CLI**

```
maprcli table replica resume
-path <table path>
-replica <replica table path>
```

REST

```
curl -X POST
'http[s]://
<host>:<port>/rest/table/replica/
resume?path=<path>&replica=<path>'
-u <username>:<password>
```

Parameters

Parameter	Description
path	<p>The path to the table that will be replicated.</p> <ul style="list-style-type: none"> • For a path on the local cluster, start the path at the volume mount point. For example, for a table named <code>testsrc</code> under a volume with a mount point at <code>/volume1</code>, specify the following path: <code>/volume1/testsrc</code> • For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named <code>customersrc</code> under <code>volume1</code> in the <code>sanfrancisco</code> cluster, specify the following path: <code>/mapr/sanfrancisco/volume1/customersrc</code>

Parameter	Description
replica	<p>The path to the replica.</p> <ul style="list-style-type: none">For a table on the local cluster, start the path at the volume mount point. For example, for a table named testdst under a volume with a mount point at /volume1, specify the following path: /volume1/testdstFor a table on another cluster, you must also specify the cluster name in the path. For example, for a table named customerdst under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customerdst

Example

CLI

```
maprccli table
replica resume -path /volume1/
custAsrc -replica /volume2/custAdst
```

REST

```
curl -X POST \
'https://r1n1.sj.us:8443/rest/table/
replica/resume?
path=%2Fvolume1%2FcustAsrc&replica=%2F
volume2%2FcustAdst' \
-u <username>:<password>
```

table securitypolicy

Manages security policies for HPE Data Fabric Database JSON tables.

table securitypolicy add

Adds a new security policy to a HPE Data Fabric Database JSON table without replacing existing security policies.

Permissions Required

To run this command, your user ID must have the following permissions:

- adminaccessperm on the table.

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprccli table securitypolicy add -path <path> -securitypolicy <comma-delimited list of policies></pre>
-----	--

REST	<code>http[s]://<host>:<port>/rest/table/ securitypolicy/add? path=<path>&securitypolicy=<policies></code>
------	--

Parameters

Parameter	Description
path	<p>The path to the HPE Data Fabric Database table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under a volume with a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customer under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
securitypolicy	The list of security policy tags to be added to this table.

Example

Adds the security policy named newpolicy to a Data Fabric table named table1:

CLI	<code>maprccli table securitypolicy add -path "/table1" -securitypolicy "newpolicy"</code>
REST	<code>http[s]://<host>:<port>/rest/table/ securitypolicy/add?path= table1&securitypolicy=newpolicy</code>

table securitypolicy remove

Removes a security policy from a HPE Data Fabric Database JSON table.

Permissions Required

To run this command, your user ID must have the following permissions:

- adminaccessperm on the table.

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprcli table securitypolicy remove -path <path> -securitypolicy <comma-delimited list of policies></pre>
REST	<pre>http[s]://<host>:<port>/rest/table/ securitypolicy/remove? path=<path>&securitypolicy=<policies></pre>

Parameters

Parameter	Description
path	<p>The path to the HPE Data Fabric Database table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under a volume with a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customer under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
securitypolicy	The list of security policy tags to be removed from this table.

Example

Removes the security policy named newpolicy from a Data Fabric table named table1:

CLI	<pre>maprcli table securitypolicy remove -path "/table1" -securitypolicy "newpolicy"</pre>
REST	<pre>http[s]://<host>:<port>/rest/table/ securitypolicy/remove?path=/ table1&securitypolicy=newpolicy</pre>

table securitypolicy set

Replaces a security policy on a HPE Data Fabric Database JSON table with a new security policy.

Permissions Required

To run this command, your user ID must have the following permissions:

- adminaccessperm on the table.

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Syntax

CLI	<pre>maprcli table securitypolicy set -path <path> -securitypolicy <comma-delimited list of policies></pre>
REST	<pre>http[s]://<host>:<port>/rest/table/ securitypolicy/set? path=<path>&securitypolicy=<policies></pre>

Parameters

Parameter	Description
path	<p>The path to the HPE Data Fabric Database table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named test under a volume with a mount point at /volume1, specify the following path: /volume1/test For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customer under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customer
securitypolicy	The list of security policy tags to be associated with this table.

Example

Replaces the security policy on a Data Fabric table named table1 with a new security policy named newpolicy:

CLI	<pre>maprcli table securitypolicy set -path "/table1" -securitypolicy "newpolicy"</pre>
REST	<pre>http[s]://<host>:<port>/rest/table/ securitypolicy/set?path=/ table1&securitypolicy=newpolicy</pre>

table upstream

Performs functions related to upstream sources for table replication.

table upstream add

Adds a binary table as upstream source for a replica.

NOTE: You do not need to use this command if you use the `table replica autosetup` command.

Syntax**CLI**

```
maprcli table upstream add
  -path <table path>
  -upstream <upstream table
  path>
```

REST

```
curl -X POST
  'http[s]://
  <host>:<port>/rest/table/upstream/add?
  path=<path>&upstream=<name>'
  -u <username>:<password>
```

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

Parameter	Description
path	<p>The path to the replica.</p> <ul style="list-style-type: none"> For a path to a table on the local cluster, start the path at the volume mount point. For example, for a table named testdst under volume1 which has a mount point at /volume1, specify the following path: /volume1/testdst For a path to a table on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customerdst under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customerdst
upstream	<p>The path to the source table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named testsrc under volume1 which has a mount point at /volume1, specify the following path: /volume1/testsrc For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named customersrc under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customersrc

Example

Adds company1src as the upstream source for replica company1dst:

CLI

```
maprcli table
upstream add -path /volume2/
```

```
company1dst -upstream /volume1/
company1src
```

REST

```
curl -k -X POST \
  'https://r1n1.sj.us:8443/rest/table/
  upstream/add?
  path=%2Fvolume2%2Fcompany1dst&upstream
  =%2Fvolume1%2Fcompany1src' \
  -u mapr:mapr
```

table upstream list

Lists the binary tables that replicate data to the specified replica binary table.

Syntax**CLI**

```
maprcli table upstream list
-path <table path>
```

REST

```
curl -X GET
'http[s]://<server>:<port>/rest/
table/upstream/list?path=<path>'
-u <username>:<password>
```

NOTE: The mapr user is not treated as a superuser. HPE Data Fabric Database does not allow the mapr user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

Parameter	Description
path	<p>The path to the replica.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named testdst under volume1 which has a mount point at /volume1, specify the following path: /volume1/testdst For a path on a remote cluster, you must also specify the cluster name in the path. For example, for a table named customerdst under volume1 in the sanfrancisco cluster, specify the following path: mapr/sanfrancisco/volume1/customerdst

Sample Output

```
maprcli table upstream list -path /volume2/company1 -json
{
  "timestamp":1423162601288,
  "timeofday":"2015-02-05 10:56:41.288 GMT-0800",
  "status":"OK",
  "total":1,
  "data":[
    {
      "cluster":"mycluster",
```

```

        "table":"/volume1/company1",
        "idx":1,
        "uuid":"P?\\x18\\xCC\\x17\\xB1&\\xA7i,\\x04\\xBB\\
\\xB8\\xD3T\\x00"
    }
}

```

Example

Lists sources that replicate data to the replica /volume2/company1:

CLI

```
maprcli table upstream list -path /
volume2/company1 -json
```

REST

```
curl -X GET \
'https://
r1n1.sj.us:8443/rest/table/upstream/
list?path=%2Fvolume2%2Fcompany1' \
-u <username>:<password>
```

table upstream remove

Un-registers a binary table as an upstream source for a replica.

NOTE: This step is separate from the `table replica remove` command, which stops replication updates to a replica.

Syntax

CLI

```
maprcli table upstream remove
-path <table path>
-upstream <upstream table path>
```

REST

```
curl -X POST
'http[s]://
<host>:<port>/rest/table/upstream/
remove?path=<path>&upstream=<path>'
-u <username>:<password>
```

NOTE: The `mapr` user is not treated as a superuser. HPE Data Fabric Database does not allow the `mapr` user to run this command unless that user is given the relevant permission or permissions with access-control expressions.

Parameters

Parameter	Description
path	<p>The path to the replica.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named testdst under volume1 which has a mount point at /volume1, specify the following path: /volume1/testdst For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named customerdst under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customerdst
upstream	<p>The path to the source table.</p> <ul style="list-style-type: none"> For a path on the local cluster, start the path at the volume mount point. For example, for a table named testsrc under volume1 which has a mount point at /volume1, specify the following path: /volume1/testsrc For a path on another cluster, you must also specify the cluster name in the path. For example, for a table named customersrc under volume1 in the sanfrancisco cluster, specify the following path: /mapr/sanfrancisco/volume1/customersrc

Example

Removes company1src as the upstream source for replica company1dst:

CLI

```
maprcli table upstream remove -path /
volume2/company1dst -upstream /
volume1/company1src
```

REST

```
curl -X POST \
'https://r1n1.sj.us:8443/rest/table/
upstream/remove?
path=%2Fvolume2%2Fcompany1dst&upstream
=%2Fvolume1%2Fcompany1src' \
-u <username>:<password>
```

tier

Lets you create, modify, remove, and retrieve list of tiers and tiering rules.

tier create

Creates a new tier.

Syntax**CLI**

```
maprcli tier create
-name <tier_name>
-type cold|ectier
```

```
[ -url <tier_url> ]
[ -credential
<credentials_file_path> ]
[ -tag <object_store_type> ]
[ -credential_str
<tier_credentials> ]
[ -dbtopology
<metadata_volume_path> ]
[ -cluster <cluster_name> ]
```

REST

Request Type	POST
Request URL	http[s]://<host:port>/rest/tier/create?<parameters>

Usage

To create a warm tier:

```
maprcli tier create
[ -cluster <cluster_name> ]
-name <tier_name>
-type ectier
[ -dbtopology <path> ]
```

To create a cold tier:

```
maprcli tier create
[ -cluster <cluster_name> ]
-name <tier_name>
-type cold -url <tier_URL>
-credential|credential_str <credential>
[ -dbtopology <path> ]
[ -tag S3-AWS|S3-GCS|S3-HDS|S3-IBM|Azure-Blobs|S3-Others ]
```

 **NOTE:** The -tag parameter is required for Azure.

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
credential	(For tier of type cold only) The path to the credentials file to use for accessing the tier. The credentials file must already exist on the node from where the tier is being created. For more information, see Setting up a Credentials File for Connecting to a Cold Tier Using the CLI or REST API on page 1551.  NOTE: Either this or -credential_str is required for creating a cold tier.
credential_str	(For tier of type cold only) The credentials, access key and secret key, bucket name, and region in JSON format. Either this or -credential is required for creating a cold tier.

Parameter	Description
dbtopology	The rack path to the volume where metadata is stored in DB tables. The default value is /data.
name	The name of the tier.
tag	<p>(For tier of type cold only) The object store to connect to. Value can be one of the following:</p> <ul style="list-style-type: none"> • S3-GCS (for Google Cloud Platform) • S3-HDS (for Hitachi HCP) • S3-IBM (for IBM Cloud Object Storage) • S3-AWS (for Amazon AWS) • Azure-Blobs (for Microsoft Azure) • S3-Others (for other all vendors) <p>The MAST Gateway uses this to determine the connector library (such as libcurl, etc.) to use. See Specifying the Vendor/Object Store for a Cold Tier on page 1554 for more information on the object store.</p> <p> NOTE: This parameter is required for Azure.</p>
type	<p>The type of tier to create. Value can be:</p> <ul style="list-style-type: none"> • cold — to offload to low-cost storage alternative on the cloud • ectier — to offload to low-cost storage alternative on the Data Fabric cluster
url	<p>(For tier of type cold only) The URL (or endpoint) of the tier in the following format: <protocol>://<IP hostname>.<domain>. For more information, see Specifying the Vendor/Object Store for a Cold Tier on page 1554. When specifying the URL (for S3), use double quotes.</p> <p>If the protocol is https, the MAST Gateway uses HTTPS to upload data to the cold-tier. If the cold-tier storage does not support HTTPS, all tier related operations will fail. If the cold tier does not support HTTPS, set the protocol to http, which is the default.</p>

Examples

Create a cold tier for offloading to S3:

CLI

```
# /opt/mapr/bin/maprcli
tier create -name
ksTestCold -type cold -url
"s3.amazonaws.com" -credential
credentials.txt -json
{
  "timestamp":1519669953410,
  "timeofday":"2018-02-26
10:32:33.410 GMT-0800 AM",
  "status":"OK",
```

```

    "total":0,
    "data":[
    ],
    "messages":[
        "Successfully created tier:
'ksTestCold'"
    ]
}

```

REST

```

# curl -X POST 'https://
abc.sj.us:8443/rest/tier/create?
name=ksTestCold&type=cold&url=s3.amazo
naws.com&credential=/root/
credentials.txt' --user
<username>:<password>
{"timestamp":1519679457859,"timeofday"
:"2018-02-26 01:10:57.859 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
tier: 'ksTestCold'"]}

```

Create a EC tier for offloading to a erasure coded volume on the Data Fabric cluster:**CLI**

```

# /opt/mapr/bin/maprcli tier
create -name ksTestEC -type
ectier -json
{
    "timestamp":1519664750448,
    "timeofday":"2018-02-26
09:05:50.448 GMT-0800 AM",
    "status":"OK",
    "total":0,
    "data":[
    ],
    "messages":[
        "Successfully created tier:
'ksTestEC'"
    ]
}

```

REST

```

# curl -X POST 'https://
testserver.sj.us:8443/rest/tier/
create?
name=ksTestEC&type=ectier' --user
<username>:<password>
{"timestamp":1519679884411,"timeofday"
:"2018-02-26 01:18:04.411 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
tier: 'ksTestEC'"]}

```

Create a cold tier by sending the credentials as a string:**CLI**

```

# maprcli tier create -name
testCold -type cold -url

```

```
"s3.amazon.com" -credential_str
'{"bucketName":"testbucket","credential
ls":
{"accessKey":"ABCDEFGHJKLMN","secretKe
y":"OPQRSTUVWXYZ"}}' -json
{
  "timestamp":1526406945863,
  "timeofday":"2018-05-15
10:55:45.863 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully created tier:
'testCold'"
  ]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/create?
name=testCold&type=cold&url=s3.amazon.
com&credential_str=%7B%22bucketName%22
%3A%22testbucket%22%2C%22credentials%2
2%3A%7B%22accessKey%22%3A%22ABCDEFGHJKLM
%22%2C%22secretKey%22%3A%22OPQRSTUVWXYZ%
22%7D%7D' --user mapr:mapr
{"timestamp":1526483636503,"timeofday":
"2018-05-16 08:13:56.503 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully created
tier: 'testCold'"]}
```

tier info
Retrieves information about a tier.

Syntax

CLI

```
$ maprccli tier info
-name <tier_name>
[ -cluster <cluster_name> ]
```

REST

Request Type	GET
Request URL	http[s]://<host:port>/rest/tier/info?<parameters>

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the tier.

Output

The command returns the following:

volume	The name of the volume associated with the tier.
tiertype	The type of tier. Value can be one of the following: <ul style="list-style-type: none"> • cold • ectier
tierid	The ID of the tier.
dbtopology	The topology of the volume associated with the tier.
dbvolumeid	The ID of the volume associated with the tier.
tiername	The name of the tier.
bucketname	The name of the bucket. The value is displayed for cold tiers only.
region	The region. The value is displayed for cold tiers only.
objectstoretype	The type of object store (for cold tiers only). Value can be one of the following: <ul style="list-style-type: none"> • S3-GCS • S3-HDS • S3-IBM • S3-Others • Azure-Blobs
url	The tier URL. The value is displayed for cold tiers only.

Examples

Retrieve information about a warm tier:

CLI

```
# maprcli tier info -name testWarm
volume
tiertype dbtopology dbvolumeid
tierid tiername
mapr.internal.tier.testWarm
ectier /data 201186661
74117928 testWarm
```

REST

```
# curl -X GET 'https://
server.sj.us:8443/rest/tier/info?
name=testWarm' --user
<username>:<password>
{"timestamp":1530987914127,"timeofday"
:"2018-07-07 11:25:14.127 GMT-0700
AM","status":"OK","total":1,"data":
[{"tierid":"74117928","tiername":"test
Warm","tiertype":"ectier","volume":"ma
pr.internal.tier.testWarm","dbtopology
":"/data","dbvolumeid":201186661}]}
```

Retrieve information about a cold tier:

CLI

```
# maprcli tier info -name testCold
volume
tiertype dbtopology dbvolumeid
tierid    tiertype bucketname
region    objectstoretype
url
mapr.internal.tier.testCold
cold      /data          13372843
49971858  testCold    testbucket
us-east-1 S3-AWS          http://
s3.amazon.com
```

REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/tier/info?
name=testCold' --user mapr:mapr
{"timestamp":1530987683808,"timeofday"
:"2018-07-07 11:21:23.808 GMT-0700
AM","status":"OK","total":1,"data":
[{"tierid":"49971858","tiertype":"test
Cold","tiertype":"cold","url":"http://
s3.amazon.com","bucketname":"testbucke
t","region":"us-east-1","volume":"mapr
.internal.tier.testCold","dbtopology":
"/
data","dbvolumeid":13372843,"objectsto
retype":"S3-AWS"}]}
```

tier list
Lists the tiers on the cluster.

Syntax

CLI

```
maprcli tier list
[ -cluster <cluster_name> ]
[ -sortby <attribute> ]
[ -sortorder asc|desc ]
```

REST

Request Type	GET
Request URL	http[s]://<host:port>/rest/tier/list?<parameters>

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
sortby	Specifies one of the following attributes to sort the list of tiers by: tierid, tiertype, tiertype, url, throttling, bucketname, region, objectstoretype, volume, topology

Parameter	Description
sortorder	The order to sort the results by. Value can be: <ul style="list-style-type: none"> • asc - for ascending order • desc - for descending order

Output

The command returns the following:

volume	The name of the tiered volume.
tiertype	The type of tier. Value can be one of the following: <ul style="list-style-type: none"> • cold • ectier
dbtopology	The topology of the metadata volume associated with the tier.
dbvolumeid	The ID of the metadata volume associated with the tier.
tierid	The ID of the tier.
tiername	The name of the tier.
bucketname	The name of the bucket. The value is displayed for cold tiers only.
region	The region. The value is displayed for cold tiers only.
objectstoretype	The type of object store (for cold tiers only). Value can be one of the following: <ul style="list-style-type: none"> • S3-AWS • S3-GCS • S3-HDS • S3-IBM • S3-Others • Azure-Blobs
url	The tier URL. The value is displayed for cold tiers only.

Example

Get the list of tiers:

CLI

```
# maprccli tier list
volume
tiertype dbtopology dbvolumeid
tierid      tiername      bucketname
region      objectstoretype
url
mapr.internal.tier.ksTestCold
cold      /data      135415553
30712925  ksTestCold ksekhar-test
us-east-1 S3-AWS      http://
s3.amazonaws.com
```

```
mapr.internal.tier.testCold
cold          /data          192997092
189158428    testCold      testbucket
us-east-1    S3-AWS          http://
s3.amazon.com
mapr.internal.tier.ksTestEC
ectier        /data          87658196
198680137    ksTestEC
```

REST

```
# curl -k -X GET 'https://
abc.sj.us:8443/rest/tier/list' --user
mapr:mapr
{"timestamp":1533055528861,"timeofday"
:"2018-07-31 09:45:28.861 GMT-0700
AM","status":"OK","total":0,"data":
[{"tierid":"30712925","tiername":"ksTe
stCold","tiertype":"cold","url":"http:
//

```

tier modify
Modifies the credentials used to access tier.

Syntax

CLI

```
maprcli tier modify
  -name <tier_name>
  [ -credential
<path_to_credentials_file> ]
  [ -credential_str
<tier_credentials> ]
  [ -cluster <cluster_name> ]
  [ -force true|false ]
  [ -tag <object_store_type> ]
  [ -url <tier_url> ]
```

REST

Request Type	POST
--------------	------

Request URL

```
http[s]://<host:port>/
rest/tier/modify?
<parameters>
```

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
credential	<p>(For cold tier only) The path to the credentials file to use to access the tier.</p> <p> NOTE: You cannot modify the bucket name in the credentials file after the tier is created; only the accesskey and the secretkey can be modified.</p> <p>For more information, see Setting up a Credentials File for Connecting to a Cold Tier Using the CLI or REST API on page 1551.</p>
credential_str	(For cold tier only) The region, bucket, and credentials, access key and secret key, specified in JSON format. Either this or -credential is required to connect to a cold tier.
force	<p>Required to force a change of any of the following:</p> <ul style="list-style-type: none"> • Bucket on the tier where data is offloaded. • Region where the bucket resides. • URL (or endpoint) of the tier. <p>Value can be one of the following:</p> <ul style="list-style-type: none"> • true — to force a change • false — to not change <p>The default value is false.</p>
name	The name of the tier.
tag	<p>(For cold tier only) The tier to connect to. Value can be one of the following:</p> <ul style="list-style-type: none"> • S3-GCS • S3-HDS • S3-IBM • S3-AWS • S3-Others • Azure-Blobs <p>The MAST Gateway uses this to determine the connector library (such as libcurl, etc.) to use.</p> <p> NOTE: You must specify this parameter to connect to Azure.</p>

Parameter	Description
url	<p>(For cold tier only) The URL (or endpoint) of the tier. This can be modified only with the -force option. See Specifying the Vendor/Object Store for a Cold Tier on page 1554 for information on the tier endpoints and supported authentication protocols.</p> <p> NOTE: If the credentials for the new URL are different, specify the new credentials through the credentials file or using the credential_str parameter.</p>

Examples

Modify the credentials (credential file) used to access the tier:

CLI

```
# /opt/mapr/bin/maprcli tier
modify -name testCold -credential
credentials.txt -json
{
  "timestamp":1519670281090,
  "timeofday":"2018-02-26
10:38:01.090 GMT-0800 AM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully updated tier:
'ksTestCold'"
  ]
}
```

REST

```
# curl -X POST 'https://
<clusterserverip>:8443/rest/tier/
modify?
name=testCold&credential=credentials.t
xt' --user <username>:<password>
{"timestamp":1526485277061,"timeofday"
:"2018-05-16 08:41:17.061 GMT-0700
AM", "status":"OK", "total":0, "data":
[], "messages":["Successfully updated
tier: 'testCold'"]}
```

Modify the tier by passing the credentials as a string:

CLI

```
# maprcli tier modify -name
testCold -credential_str
'{"bucketName":"testbucket", "credentia
ls":
{"accessKey":"ABCDEFGHijkl", "secretKey
":"MNOPQRSTUVWXYZ"}}' -json
{
  "timestamp":1526484682668,
  "timeofday":"2018-05-16
08:31:22.668 GMT-0700 AM",
  "status":"OK",
```

```

    "total":0,
    "data":[

    ],
    "messages":[
        "Successfully updated tier:
'testCold'"
    ]
}

```

REST

```

# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/modify?
name=testCold&credential_str=%7B%22buc
k3A%22testbucket%22%2C%22credentials%2
2%3A%7B%22accessKey%22%3A%22ABCDEFGH
IJKLMN%22%2C%22secretKey%22%3A%22PQ
RSTUVWXYZ%22%7D%7D' --user mapr:mapr
{"timestamp":1526485116177,"timeofday"
:"2018-05-16 08:38:36.177 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully updated
tier: 'testCold'"]}

```

tier move

Moves a tier metadata volume to the specified topology. The command can be used to move a metadata volume to faster storage nodes for performance improvement of tier operations, or to move a metadata volume to less occupied nodes in the cluster.

Syntax

CLI

```

maprccli tier move
[ -cluster cluster_name ]
-name <tier name>
-dbtopology <db topology>

```

REST

```

curl -X POST 'https://<host>:<port>/
rest/tier/move?
name=<tier_name>&dbtopology=<rack_path
_of_destination_db_volume_topology>'

```

Usage

To move a tier metadata volume to the specified topology.

```

maprccli tier move
[ -cluster <cluster_name> ]
-name <tier_name>
-dbtopology <path>

```

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.

Parameter	Description
name	The name of the tier to move to the specified topology.
dbtopology	The rack path of the volume to which the tier is to be moved. The default value of the volume rack path is / data.

Output

There is no output when the command runs successfully.

Examples

Move tier, 'ec_tier' to the topology having topology rack path as '/rack_a/mip.storage.abccorp.net'.

CLI

```
# maprcli tier
move -name ec_tier -dbtopology /
rack_a/mip.storage.abccorp.net
"timestamp":1662638774428
"timeofday":"2022-09-08 05:06:14.428
GMT-0700 AM"
"status":"OK"
"total":0
"data":[]
"messages":"moved tier successfully"
```

REST

```
# curl -X POST --user <username>
'https://
apiserver.mip.storage.abccorp.net:8443
/rest/tier/move?
name=ec_tier&dbtopology=/rack_a/
mip.storage.abccorp.net'
{"timestamp":1662638774428,"timeofday"
:"2022-09-08 05:06:14.428 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["moved tier
successfully"]}
```

tier remove

Removes a tier.

NOTE: You cannot remove a tier currently associated with a volume.

Syntax

CLI

```
$ maprcli tier remove
-name <tier_name>
[ -cluster <cluster_name> ]
```

REST

Request Type	POST
Request URL	http[s]://<host:port>/rest/tier/remove?<parameters>

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the tier to remove.

Examples**Remove a tier (specified by name):****CLI**

```
# /opt/mapr/bin/maprcli tier
remove -name testCold -json
{
  "timestamp":1521064355911,
  "timeofday":"2018-03-14
02:52:35.911 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully deleted tier:
'testCold'"
  ]
}
```

REST

```
# curl -X POST 'https://
abc.sj.us:8443/rest/tier/remove?
name=testCold' --user
<username>:<password>
{"timestamp":1526485963448,"timeofday"
:"2018-05-16 08:52:43.448 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully deleted
tier: 'testCold'"]}
```

tier rule create

Creates a rule for offloading data to a tier.

Syntax**CLI**

```
$ maprcli tier rule create
  -name <rule_name>
  -expr <regular_expression>
  [ -cluster <cluster_name> ]
```

REST

Request Type	POST
Request URL	http[s]://<host:port>/rest/tier/rule/create?<parameters>

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.

Parameter	Description	
expr	The criteria for offloading data. The criteria can be defined using a combination of the following:	
	u	<p>Username or user ID, as configured in the OS registry (such as /etc/passwd file, LDAP, etc.), of a specific user.</p> <p>Usage: u:<username or user ID></p>
	g	<p>Group name or group ID, as configured in the OS registry (such as /etc/group file, LDAP, etc.), of a specific group.</p> <p>Usage: g:<groupname or group ID></p>
	a	<p>(atime) Time (in seconds or days) since the files were last accessed. The number of seconds can be specified by appending s to value and the number of days can be specified by appending d to the value.</p> <p>Usage:</p> <ul style="list-style-type: none">"a:<value>s" — specifies atime in seconds"a:<value>d" — specifies atime in days <p> NOTE: If the system time on CLDB and file server nodes are different, the atime rule for offloading data may not work as intended.</p> <p>This tier rule is matched and files are offloaded, when all of the following conditions are met:</p> <ol style="list-style-type: none">atime tracking is enabled at volume levelTime since atime that is configured on the volume is more than the time specified in the ruleDuration since the file was last accessed is more than the time specified in the rule <p>Assume that the atime feature is enabled on the volume and that the time in the rule is set to a:300s.</p>

Parameter	Description
name	The name of the rule.

Examples

Create a rule to offload files older than a year:

CLI

```
/opt/mapr/bin/maprcli tier
rule create -name rule1 -expr
"m:365d" -json
{
  "timestamp":1519681290079,
  "timeofday":"2018-02-26
01:41:30.079 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":[
    "Successfully created rule:
'rule1'"
  ]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/rule/create?
name=rule1&expr=m:365d' --user
mapr:mapr
{"timestamp":1519681475025,"timeofday":
"2018-02-26 01:44:35.025 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
rule: 'rule1'"]}
```

Create a rule to offload files larger than 5 GB:

CLI

```
# /opt/mapr/bin/maprcli tier rule
create -name rule2 -expr "s:5g" -json
{
  "timestamp":1519681586774,
  "timeofday":"2018-02-26
01:46:26.774 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":[
    "Successfully created rule:
'rule2'"
  ]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/rule/create?
```

```
name=rule2&expr=s:5g' --user mapr:mapr
{"timestamp":1519681667766,"timeofday":
"2018-02-26 01:47:47.766 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
rule: 'rule2'"]}
```

Create rule to offload files whose owner is m7user1:

CLI

```
# /opt/mapr/bin/maprcli tier
rule create -name rule3 -expr
"u:m7user1" -json
{
  "timestamp":1519682014521,
  "timeofday":"2018-02-26
01:53:34.521 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":["
    Successfully created rule:
    'rule3'"]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/rule/create?
name=rule3&expr=u:m7user1' --user
mapr:mapr
{"timestamp":1519682095080,"timeofday":
"2018-02-26 01:54:55.080 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
rule: 'rule3'"]}
```

Create rule to offload all files:

CLI

```
# /opt/mapr/bin/maprcli tier rule
create -name rule4 -expr "p" -json
{
  "timestamp":1519682694183,
  "timeofday":"2018-02-26
02:04:54.183 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":["
    Successfully created rule:
    'rule4'"]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/tier/rule/create?
name=rule4&expr=p' --user mapr:mapr
{"timestamp":1519682828031,"timeofday"
:"2018-02-26 02:07:08.031 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
rule: 'rule4'"]}
```

Create rule to not offload any files:

```
# /opt/mapr/bin/maprcli tier rule create -name rule5 -expr "" -json
{
  "timestamp":1519682947271,
  "timeofday":"2018-02-26 02:09:07.271 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully created rule: 'rule5'"
  ]
}
```

Create a rule, called testRule, for offloading all files owned by user m7user1 or for offloading files owned by user mapr and whose size is greater than 5 GB or whose file modification timestamp is greater than 365 (days):

CLI

```
# /opt/mapr/bin/maprcli tier
rule create -name testRule -expr
"u:m7user1 | (u:mapr & (s:5g |
m:365d))" -json
{
  "timestamp":1519683138305,
  "timeofday":"2018-02-26
02:12:18.305 GMT-0800 PM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully created rule:
'testRule'"
  ]
}
```

REST

```
# curl -k -X POST 'https://
10.10.82.24:8443/rest/tier/rule/
create?
name=testRule&expr=u%3Am7user1%7C%28u%
3Amapr%26%28s%3A5g%20%7C%20m%3A365d%29
%29' --user mapr:mapr
{"timestamp":1526488621687,"timeofday"
:"2018-05-16 09:37:01.687 GMT-0700
AM","status":"OK","total":0,"data":
```

```
[], "messages": ["Successfully created rule: 'testRule'"]}]}
```

tier rule info
Retrieves information on a rule (specified by name).

Syntax

CLI

```
maprcli tier rule info
-name <rule_name>
[ -output verbose ]
[ -cluster <cluster_name> ]
```

REST

Request Type	GET
Request URL	http[s]://<host:port>/rest/tier/rule/info?<parameters>

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the rule.
output	The type of output. The default value is verbose.

Output

The command returns the following:

expression	The rules defined using a combination of expressions.
inuse	Whether (true) or not (false) the rule is associated with a volume.
rulename	The name of the rule.
ruleid	The ID of the rule.

Example

Retrieve information on the rule named testRule:

CLI

```
# maprcli tier rule info -name
testRule
expression
  inuse  rulename  ruleid
u:m7user1 | (u:mapr & (s:5g |
m:365d)) true  testRule  2
```

REST

```
# curl -X GET 'https://
server.sj.us:8443/rest/tier/rule/info?
```

```
name=testRule' --user
<username>:<password>
{"timestamp":1528147823598,"timeofday"
:"2018-06-04 02:30:23.598 GMT-0700
PM","status":"OK","total":1,"data":
[{"ruleid":"2","rulename":"testRule",
"expression":"u:m7user1 | (u:mapr &
(s:5g | m:365d))","inuse":"true"}]}
```

tier rule list
Retrieves the list of rules for offloading data.

Syntax

CLI

```
$ maprccli tier rule list
[ -output terse|verbose ]
[ -cluster cluster_name ]
[ -sortby <attribute> ]
[ -sortorder <asc|desc> ]
```

REST

Request Type	GET
Request URL	http[s]://<host:port>/rest/tier/rule/list?<parameters>

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
output	Specifies whether the output should be terse or verbose. Default: verbose.
sortby	The attributes by which to sort the list of tiers. Value can be one of the following: ruleid, rulename, expression
sortorder	The order to sort the results by. Value can be: <ul style="list-style-type: none">asc - for ascending orderdesc - for descending order

Output

The command returns the following:

expression	The rules defined using a combination of expressions.
rulename	The name of the rule.
ruleid	The ID of the rule.

Example

Retrieve the list of tier rules:

CLI

```
# /opt/mapr/bin/maprcli tier rule list
expression
  rulename  ruleid
m:365d
  rule1     1
s:5g
  rule2     2
u:m7user1
  rule3     3
p
  rule4     4

  rule5     5
u:m7user1 | (u:mapr & (s:5g |
m:365d)) testRule 6
```

REST

```
# curl -X GET 'https://abc.sj.us:8443/
rest/tier/rule/list' --user
<username>:<password>
{"timestamp":1519840839491,"timeofday"
:"2018-02-28 10:00:39.491 GMT-0800
AM","status":"OK","total":6,"data":
[{"ruleid":"1","rulename":"rule1","exp
ression":"m:365d"},
{"ruleid":"2","rulename":"rule2","expr
ession":"s:5g"},
{"ruleid":"3","rulename":"rule3","expr
ession":"u:m7user1"},
{"ruleid":"4","rulename":"rule4","expr
ession":"p"},
{"ruleid":"5","rulename":"rule5","expr
ession":""},
{"ruleid":"6","rulename":"testRule","e
xpression":"u:m7user1 | (u:mapr &
(s:5g | m:365d))"}]}
```

tier rule modify

Modifies the criteria in a tiering rule (specified by name).

Syntax

CLI

```
$ maprcli tier rule modify
  -name <rule_name>
  -expr <expression>
  [ -cluster <cluster_name> ]
```

REST

Request Type	POST
Request URL	http[s]://<host:port>/rest/tier/rule/modify?<parameters>

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
expr	<p>The criteria for offloading data. The criteria can be defined using a combination of the following:</p> <ul style="list-style-type: none"> • u — the user who owns the file(s) to offload • g — the group that owns the file(s) to offload • m — the time since the file was modified • s — the size of the file to offload. Use b for bytes, k for kilobytes, m for megabytes, or g for gigabytes. <p>Or, use:</p> <ul style="list-style-type: none"> • p — to offload all the files • "" — empty string to not offload any files <p>Use the following to string multiple criteria for offload:</p> <ul style="list-style-type: none"> • & — to indicate all specified criteria must be met for offload • — to indicate any of the specified criteria is adequate for offload • () — to specify sub-expressions
name	The name of the rule.

Examples

Modify the criteria in the tiering rule, ksTestRule, to offload all files in the volume:

CLI

```
# /opt/mapr/bin/maprccli tier rule
modify -name ksTestRule -expr
"p" -json
{
  "timestamp":1516225073780,
  "timeofday":"2018-01-17
09:37:53.780 GMT+0000",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully updated rule:
'ksTestRule'"
  ]
}
```

REST

```
# curl -X POST 'https://
server.sj.us:8443/rest/tier/rule/
modify?name=ksTestRule&expr=p' --user
<username>:<password>
```

```
{"timestamp":1526489124827,"timeofday":
"2018-05-16 09:45:24.827 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully updated
rule: 'ksTestRule'"]}
```

tier rule remove
Removes the rule for offloading data.

 **NOTE:** You cannot remove a rule that is currently associated with a volume.

Syntax

CLI

```
$ maprcli tier rule remove
  -name <rule_name>
  [ -cluster <cluster_name> ]
```

REST

Request Type	POST
Request URL	http[s]://<host:port>/rest/tier/rule/remove?<parameters>

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the rule to remove.

Examples

Remove the rule named testRule:

CLI

```
# /opt/mapr/bin/maprcli tier rule
remove -name testRule -json
{
  "timestamp":1516225222172,
  "timeofday":"2018-01-17
09:40:22.172 GMT+0000",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":["
    Successfully deleted rule:
    'testRule'"]
}
```

REST

```
# curl -X POST 'https://
server.sj.us:8443/rest/tier/rule/
```

```
remove?name=testRule' --user
<username>:<password>
{"timestamp":1526488467571,"timeofday"
:"2018-05-16 09:34:27.571 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully deleted
rule: 'testRule'"]}
```

trace

Lets you view and modify the trace buffer, and the trace levels for the system modules.

The valid trace levels are:

- DEBUG
- INFO
- ERROR
- WARN
- FATAL

trace dump

Dumps the contents of the trace buffer into the Data Fabric file system log.

Syntax**CLI**

```
maprccli trace dump
[ -host <host> ]
[ -port <port> ]
```

REST

None.

Parameters

Parameter	Description
host	The IP address of the node from which to dump the trace buffer. Default: localhost
port	The port to use when dumping the trace buffer. Default: 5660

Examples

Dump the trace buffer to the Data Fabric file system log:

CLI

```
maprccli trace dump
```

trace info

Displays the trace level of each module.

Syntax**CLI**

```
maprccli trace info
[ -host <host> ]
[ -port <port> ]
```

REST

None.

Parameters

Parameter	Description
host	The IP address of the node on which to display the trace level of each module. Default: localhost
port	The port to use. Default: 5660

Output

A list of all modules and their trace levels.

Sample Output

```
RPC Client Initialize
**Trace is in DEFAULT mode.
**Allowed Trace Levels are:
FATAL
ERROR
WARN
INFO
DEBUG
**Trace buffer size: 2097152
**Modules and levels:

Shmem    : ERROR
Table    : ERROR
Fctest   : ERROR
DONE
```

Examples

Display trace info:

CLI

```
maprccli trace info
```

trace print

Manually dumps the trace buffer to stdout.

Syntax

CLI

```
maprccli trace print
[ -host <host> ]
[ -port <port> ]
-size <size>
```

REST

None.

Parameters

Parameter	Description
host	The IP address of the node from which to dump the trace buffer to stdout. Default: localhost
port	The port to use. Default: 5660
size	The number of kilobytes of the trace buffer to print. Maximum: 64

Output

The most recent <size> bytes of the trace buffer.

```
-----
2010-10-04 13:59:31,0000 Program: mfs on Host: fakehost IP: 0.0.0.0, Port:
0, PID: 0
-----
DONE
```

Examples

Display the trace buffer:

CLI

```
maprccli trace print
```

trace reset

Resets the in-memory trace buffer.

Syntax**CLI**

```
maprccli trace reset
[ -host <host> ]
[ -port <port> ]
```

REST

None.

Parameters

Parameter	Description
host	The IP address of the node on which to reset the trace parameters. Default: localhost
port	The port to use. Default: 5660

Examples**Reset trace parameters:****CLI**

```
maprccli trace reset
```

trace resize

Resizes the trace buffer.

Syntax**CLI**

```
maprccli trace resize
[ -host <host> ]
[ -port <port> ]
-size <size>
```

REST

None.

Parameters

Parameter	Description
host	The IP address of the node on which to resize the trace buffer. Default: localhost
port	The port to use. Default: 5660
size	The size of the trace buffer, in kilobytes. Default: 2097152 Minimum: 1

Examples

Resize the trace buffer to 1000

CLI

```
maprcli trace resize -size 1000
```

trace setlevel

Sets the trace level on one or more modules.

Syntax

CLI

```
/opt/mapr/bin/maprcli trace setlevel  
[ -host <host> ]  
-level <trace level>  
-module <module name>  
[ -port <port> ]
```

REST

None.

Parameters

Parameter	Description
host	The node on which to set the trace level. Default: localhost
module	The module on which to set the trace level. If set to all, sets each module to the specified trace level.

Parameter	Description
level	<p>The new trace level. Set the level to default, to set the trace level of the specified module(s) to its default.</p> <p>If you do not set the level, then INFO is set as the level.</p> <p>You can find the existing trace level of each module, using the command: <code>/opt/mapr/bin/maprccli trace info</code></p> <p>The current modules along with their default trace level are:</p> <ul style="list-style-type: none"> • Global : INFO • RPC : ERROR • MessageQueue : ERROR • CacheMgr : INFO • IOMgr : INFO • Transaction : ERROR • Log : ERROR • Cleaner : INFO • Allocator : ERROR • BTreeMgr : ERROR • BTree : ERROR • BTreeDelete : ERROR • BTreeOwnership : INFO • MapServerFile : ERROR • MapServerDir : INFO • MFSReadAhead : INFO • Container : INFO • Snapshot : INFO • Util : ERROR • Replication : INFO • PunchHole : INFO • KvStore : INFO • Truncate : ERROR • Orphanage : INFO • FileServer : INFO • Heartbeat : ERROR • Defer : ERROR • ServerCommand : INFO • Write : ERROR • DB : INFO

Parameter	Description
port	The port to use. Default: 5660

Examples

Set the trace level of the Log module to INFO:

CLI

```
/opt/mapr/bin/maprcli trace
setlevel -module Log -level info
```

Set the trace level of the BTreeMgr module to FATAL:

CLI

```
/opt/mapr/bin/maprcli trace
setlevel -module BTreeMgr -level FATAL
```

Set the trace levels of all modules to their defaults:

CLI

```
/opt/mapr/bin/maprcli trace
setlevel -module all -level default
```

Set the trace levels of all modules to INFO:

CLI

```
/opt/mapr/bin/maprcli trace
setlevel -module all -level INFO
```

or equivalently:

```
/opt/mapr/bin/maprcli trace
setlevel -module all
```

trace setmode

Sets the trace mode.

There are two modes:

- Default
- Continuous

In default mode, all trace messages are saved in a memory buffer. If there is an error, the buffer is dumped to stdout. In continuous mode, every allowed trace message is dumped to stdout in real time.

Syntax

CLI

```
maprcli trace setmode
[ -host <host> ]
-mode default|continuous
[ -port <port> ]
```

REST

None.

Parameters

Parameter	Description
host	The IP address of the host on which to set the trace mode
mode	The trace mode.
port	The port to use.

Examples**Set the trace mode to continuous:****CLI**

```
maprcli trace setmode -mode continuous
```

urls

Displays the status page URL for the specified service.

Syntax**CLI**

```
/opt/mapr/bin/maprcli urls
[ -cluster
<cluster name> ]
[ -zkconnect
<ZooKeeper Connect String:
'host:port,host:port,host:port,...'> ]
-name <name of
the service link is required for>
[ -validate
<Validate if URL is reachable or not.
default: true> ]
```

REST

Request Type	GET
Request URL	<pre>http[s]://<host>:<port>/ rest/urls/statuspage? <parameters></pre> <p>If you submit the request without statuspage in the request URL, the return value contains a 404 error because the API requires a subcommand (empty or otherwise) to be present even though the subcommand is ignored.</p>

Parameters

Parameter	Description
cluster	The name of the cluster on which to save the configuration.

Parameter	Description
name	The name of the service for which to get the status page: <ul style="list-style-type: none"> cldb
validate	Enables (true) or disables (false) validating whether the URL is reachable.
zkconnect	ZooKeeper Connect String

Examples

Display the URL of the status page for the CLDB service:

CLI

```
# /opt/mapr/bin/maprcli urls -name
cldb
url
https://server.sj.us:7443/cldb.jsp
```

REST

```
curl -X GET 'https://
server.sj.us:8443/rest/urls/
statuspage?name=cldb' --user
<username>:<password>
{"timestamp":1544561148186,"timeofday"
:"2018-12-11 12:45:48.186 GMT-0800
PM","status":"OK","total":1,"data":
[{"url":"https://abc.sj.us:7443/
cldb.jsp"}]}
```

virtualip

Manages virtual IP addresses for NFS nodes.

Table

Field	Description
macaddress	The MAC address of the virtual IP.
netmask	The netmask of the virtual IP.
virtualipend	The virtual IP range end.

virtualip add

Adds a virtual IP address.

Permissions Required

fc or a on the cluster.

Syntax

CLI

```
maprcli virtualip add
[ -cluster <cluster> ]
[ -gateway <gateway> ]
[ -macs <MAC address> ]
-netmask <netmask>
```

```

-virtualip <virtualip>
[ -virtualipend <virtual IP range
end> ]
[ -preferredmac <MAC address> ]
[ -service nfs3|nfs4 ]

```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/virtualip/add?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
gateway	The NFS gateway IP or address
macs	<p>A list of the MAC addresses that represent the NICs on the nodes that the VIPs in the VIP range can be associated with. Use this list to limit VIP assignment to NICs on a particular subnet when your NFS server is part of multiple subnets.</p> <p> NOTE: When adding VIPs with the -preferredmac and -macs options, include the preferred MAC in the MAC pool. Otherwise, VIPs will be distributed among the MACs instead of being assigned to the preferred MAC node.</p>
netmask	The netmask of the virtual IP.
preferredmac	<p>The preferred MAC for this virtual IP. When an NFS server restarts, Data Fabric attempts to move all of the virtual IP addresses that list a MAC address on this node as a preferred MAC to this node. If the new value is null, this parameter resets the preferred MAC value.</p> <p> NOTE: When adding VIPs with the -preferredmac and -macs options, include the preferred MAC in the MAC pool. Otherwise, VIPs will be distributed among the MACs instead of being assigned to the preferred MAC node.</p>
service	<p>The service to assign VIPs to. Value can be one of the following:</p> <p> NOTE: NFSv4 refers to NFS version 4.1.</p> <ul style="list-style-type: none"> • nfs3 — for NFSv3 • nfs4 — for NFSv4 <p>The default value is nfs3, which is used if this option is not specified. You must specify the MAC addresses (macs) with this option.</p>
virtualip	The virtual IP, or the start of the virtual IP range.

Parameter	Description
virtualipend	The end of the virtual IP range.

Example

Add VIP for NFSv3 node:

CLI

```
maprcli virtualip add
  -cluster
mycluster.402.source
  -macs "09:0C:29:3C:47:AB
03:3C:34:76:CF:21 02:0E:22:71:AD:34"
  -netmask 255.255.255.0
  -virtualip 10.1.1.5
  -preferredmac
"02:0E:22:71:AD:34"
```

REST

```
curl -X POST 'https://
server.sj.us:8443/rest/virtualid/add?
cluster=mycluster.402.source&macs=%220
9%3A0C%3A29%3A3C%3A47%3AAB%2003%3A3C%3
A34%3A76%3ACF%3A21%2002%3A0E%3A22%3A71
%3AAD%3A34%22&netmask=255.255.255.0&vi
rtualid=10.1.1.5&preferredmac=%2202%3A0E%
3A22%3A71%3AAD%3A34%22' --user
<username>:<password>
```

Add VIP range for NFSv3 nodes:

CLI

```
maprcli virtualip add
  -cluster
mycluster.402.source
  -service nfs3
  -macs "09:0C:29:3C:47:AB
03:3C:34:76:CF:21 02:0E:22:71:AD:34"
  -netmask 255.255.255.0
  -virtualip 10.1.1.5
  -virtualipend 10.1.1.7
  -preferredmac
"02:0E:22:71:AD:34"
```

REST

```
curl -X POST 'https://
server.sj.us:8443/rest/virtualid/add?
cluster=mycluster.402.source&service=n
fs3&macs=%2209%3A0C%3A29%3A3C%3A47%3AA
B%2003%3A3C%3A34%3A76%3ACF%3A21%2002%3
A0E%3A22%3A71%3AAD%3A34%22&netmask=255
.255.255.0&virtualid=10.1.1.5&virtuali
pend=10.1.1.7&preferredmac=%2202%3A0E%
3A22%3A71%3AAD%3A34%22' --user
<username>:<password>
```

Add VIP for NFSv4 node:

CLI

```
maprcli virtualip add
  -cluster
mycluster.402.source
  -service nfs4
  -macs "09:0C:29:3C:47:AB
03:3C:34:76:CF:21 02:0E:22:71:AD:37"
  -netmask 255.255.255.0
  -virtualip 10.1.2.7
  -preferredmac
"02:0E:22:71:AD:37"
```

REST

```
curl -X POST 'https://
server.sj.us:8443/rest/virtualid/add?
cluster=mycluster.402.source&service=n
fs4&macs=%2209%3A0C%3A29%3A3C%3A47%3AA

A0E%3A22%3A71%3AAD%3A34%22&netmask=255
.255.255.0&virtualid=10.1.2.7&preferre
dmac=%2202%3A0E%3A22%3A71%3AAD%3A37%22
' --user <username>:<password>
```

virtualip edit

Edits a virtual IP (VIP) range. Permissions required: fc or a.

Syntax

CLI

```
maprcli virtualip edit
  [ -cluster <cluster> ]
  [ -macs <MAC addresses> ]
  -netmask <netmask>
  -virtualip <virtualip>
  [ -virtualipend <virtual IP range
end> ]
  [ -preferredmac <MAC address> ]
  [ -service nfs3|nfs4 ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/virtualip/edit?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
macs	A list of the MAC addresses that represent the NICs on the nodes to which the VIPs in the VIP range can be associated. Use this list to limit VIP assignment to NICs on a particular subnet when your NFS server is part of multiple subnets.
netmask	The netmask of the virtual IP.

Parameter	Description
preferredmac	The preferred MAC for this virtual IP. When a NFS server restarts, the Data Fabric system attempts to move all of the virtual IP addresses that list a MAC address on this node as a preferred MAC to this node. If the new value is null, this parameter resets the preferred MAC value.
service	<p>The service to which the VIPs need to be assigned. The Value can be one of the following:</p> <p> NOTE: NFSv4 refers to NFS version 4.1.</p> <ul style="list-style-type: none"> • nfs3 — for NFSv3 • nfs4 — for NFSv4 <p>The default value is nfs3. You must specify the MAC addresses (macs) with this option.</p>
virtualip	The virtual IP, or the start of the virtual IP range.
virtualipend	The end of the virtual IP range.

Examples

Single virtual IP CLI

```
maprcli virtualip edit
                        -cluster
mycluster.402.source
                        -macs
"09:0C:29:3C:47:AB
00:0c:29:9e:96:15"
                        -netmask 255.255.255.0
                        -virtualip 10.1.1.5
```

REST

```
curl -X POST 'https://
server.sj.us:8443/rest/virtualip/
remove?
cluster=mycluster.402.source&macs=%220
9%3A0C%3A29%3A3C%3A47%3AAB%2000%3A0c%3

255.0&virtualip=10.1.1.5' --user
<username>:<password>
```

Virtual IP range CLI

```
maprcli virtualip edit
                        -cluster
mycluster.402.source
                        -macs
"09:0C:29:3C:47:AB
00:0c:29:9e:96:15"
                        -netmask
255.255.255.0
                        -virtualip
10.1.1.5
                        -virtualipend
10.1.1.8
```

REST

```
curl -X POST 'https://
server.sj.us:8443/rest/virtualip/
```

```
remove?
cluster=mycluster.402.source&macs=%220
9%3A0C%3A29%3A3C%3A47%3AAB%2000%3A0c%3
A29%3A9e%3A96%3A15%22&netmask=255.255.
255.0&virtualip=10.1.1.5&virtualipend=
10.1.1.8' --user <username>:<password>
```

virtualip list

Lists the virtual IP addresses in the cluster.

Syntax

CLI

```
maprcli virtualip list
[ -cluster <cluster> ]
[ -columns <columns> ]
[ -filter <filter> ]
[ -limit <limit> ]
[ -nfsmacs <NFS macs> ]
[ -output <output> ]
[ -range <range> ]
[ -sortby <attribute> ]
[ -start <start> ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/virtualip/list[?<parameters>]

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
columns	The columns to display.  NOTE: <ul style="list-style-type: none">The hostname and ip fields are always returned in the query.The value(s) for assignables are not returned as a column.
filter	A filter specifying VIPs to list. See Filters for more information.
limit	The number of records to return.
nfsmacs	Specifies whether (1) or not (0) to return the MAC addresses of servers running NFS. If value is 1, the command returns the MAC addresses of the NFS servers.
output	Whether the output should be terse or verbose.

Parameter	Description
range	<p>Specifies whether (1) or not (0) to return the VIP ranges. The default value is 0, which returns all VIPs individually. If:</p> <ul style="list-style-type: none"> The value is 0, the command returns the assignment of VIPs to hosts (specified by hn, mac, and ip in the output). The value is 1, the command returns the VIP ranges and the assignables, which is the group of nodes amongst which the VIP range (specified by vip and vipe in the output) must be distributed. If assignables is empty in the output, the range of VIPs (specified by vip and vipe in the output) can be assigned to any NFSv3 server. <p> NOTE: The assignables contains the list of MAC addresses only if the VIP assignment is restricted to a group of nodes. You must specify -json with the command to view the assignables.</p>
sortby	Specifies one of the following attributes to sort the list of virtual IP addresses by: vipip, vipendip, vipnetmask, vipgateway, vipnumdevices, viphealth, vipassigneddevname, vipassigneddevip, vipassigneddevmac, vippreferredhostname, vippreferredip, vippreferredmac.
start	The index of the first record to return.

Output

Field	Description
assignables	<p>The group of nodes to assign the VIP range to. If empty, the range of VIPs can be assigned to any NFSv3 server.</p> <p> NOTE: You must specify -json with the command to view the assignables.</p>
hn	The hostname.
ip	The IP address.
mac	The MAC address.
nm	The netmask.
vip	The virtual IP. If output contains VIP range, this is the start of the VIP range.
vipe	The end of the VIP range.

Examples

Return the list of VIPs:

CLI

```
# maprcli virtualip list
hn          ip
vip         mac
nm
atsqa4-164.nfs4ad.com 10.10.88.164

10.10.88.15 255.255.255.0
...      10.10.88.17
10.10.88.18 255.255.255.0
```

REST

```
curl -X
GET 'https://server.sj.us:8443/rest/
virtualip/list?range=1' --user
<username>:<password>
```

virtualip move

Reassigns a virtual IP or a range of virtual IP addresses to a specified Media Access Control (MAC) address.

Syntax

CLI

```
maprcli virtualip move
[ -cluster <cluster name> ]
-virtualip <virtualip>
[ -virtualipend <virtualip end
range>
-tomac <mac>
[ -service nfs3|nfs4 ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/virtualip/move?<parameters>

Parameters

Parameter	Description
cluster	The name of the cluster where the virtual IP addresses are being moved.
service	<p>The service to assign the VIPs to. Value can be one of the following:</p> <div> NOTE: NFSv4 refers to NFS version 4.1.</div> <ul style="list-style-type: none">• nfs3 — for NFSv3• nfs4 — for NFSv4 <p>The default value is nfs3, which is used if this option is not specified.</p>
tomac	The MAC address that the virtual IP addresses are being assigned.
virtualip	A virtual IP address. If you provide a value for -virtualipend, this virtual IP address defines the beginning of the range.

Parameter	Description
virtualipend	A virtual IP address that defines the end of a virtual IP address range.

Examples

Move a range of three virtual IP addresses to a MAC address for the cluster **my.cluster.com**:

CLI

```
maprcli virtualip move -cluster
my.cluster.com -virtualip
192.168.0.8 -virtualipend
192.168.0.10 -tomac 00:FE:ED:CA:FE:99
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/virtualip/move?
cluster=my.cluster.com&virtualip=192.1
68.0.8&virtualipend=192.168.0.10&tomac
=00%3AFE%3AED%3ACA%3AFE%3A99' --user
<username>:<password>
```

virtualip remove

Removes a virtual IP (VIP) or a VIP range. Permissions required: fc or a.

Syntax

CLI

```
maprcli virtualip remove
[ -cluster <cluster> ]
-virtualip <virtual IP>
[ -virtualipend <Virtual IP Range
End> ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/ rest/virtualip/remove? <parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
virtualip	The virtual IP or the start of the VIP range to remove.
virtualipend	The end of the VIP range to remove.

Examples

CLI

```
maprcli virtualip remove -virtualip
10.1.1.5
```

REST

```
https://abc.sj.us:8443/rest/virtualip/
remove?virtualip=10.1.1.5
```

volume

Manages volumes, snapshots and mirrors.

Fields

The following table lists the data fields that provide information about each volume. Each field has two names:

- Field name - displayed in the output of the `volume list` command and used to specify the columns displayed using the `columns` parameter
- Short name - used to specify the columns displayed using the `columns` parameter

The short name is also used when specifying rows with a filter, for example when specifying a set of volumes about which to get information.

Field Name	Short Name	Description
accesstime	va	A value that can be used to determine when this volume was accessed.
actualreplication	arf	The actual current replication factor by percentage of the volume, as a zero-based array of integers from 0 to 100. For each position in the array, the value is the percentage of the volume that is replicated index number of times. Example: arf=5,10,85 means that 5% is not replicated, 10% is replicated once, 85% is replicated twice.
advisoryquota	aqt	The advisory quota for the volume, in MB. A value of 0 indicates there are no soft or advisory quotas for this volume.
AdvisoryQuotaExceededAlarm	aqa	Alarm raised if the volume size is more than the value configured for the advisory quota.
aename	aen	The accounting entity (AE) name.
aetype	aet	The type of accounting entity (AE) . Value can be: <ul style="list-style-type: none"> • 0 - user • 1 - group

allowGrant	ag	Specifies whether a parent volume grants permission for a child volume to inherit its properties. Value can be true or false.
allowReadforExecute	re	When set to true (1), allows execution of SUID binaries with only their executable bit set, on a FUSE filesystem. This parameter works in conjunction with the <code>fuse.mount.setuid</code> FUSE option. For more information, see Configuring the HPE Data Fabric FUSE-Based POSIX Client on page 1876
AlmostFullTopologyAlarm	afta	Timestamp when Topology Almost Full on page 3419 alarm was raised.
atimeTrackingStartTime	atimeinterval	Indicates the time at which <code>atimeUpdateInterval</code> is enabled. <code>aTimeTrackingStartTime</code> is updated to the current time in the following cases: <ul style="list-style-type: none"> Just started tracking <code>atime</code>, which means that the <code>atimeUpdate</code> frequency was previously zero If the value of <code>atimeUpdate</code> frequency is decreased If the value of <code>atimeUpdate</code> frequency is increased and <code>atime</code> has not been tracked for the duration of the new frequency value For more information, see Tuning Last Access Time on page 599.
atimeUpdateInterval	atst	Defines the frequency at which the last file access time is updated. For more information, see Tuning Last Access Time on page 599.
audited	ea	Indicates whether 1 or not (0) auditing is enabled for the volume. See Enabling Auditing for the steps to enable auditing on a volume and on directories, files, and tables in that volume.
auditVolume	av	Indicates whether (1) or not volume accommodates audit logs.
BecomeMasterStuckAlarm	bms	Timestamp when the Volume Become Master Stuck on page 3420 alarm has been raised for the volume.
CannotMirrorAlarm	cma	Timestamp when the "Cannot Mirror" alarm was raised.

coalesceInterval	ci	<p>The interval of time in minutes during which only the first instance of an operation on a node is recorded in audit logs, if auditing is enabled. Subsequent identical operations performed on the same node are ignored during the interval. Setting this field to a larger number helps prevent audit logs from growing quickly.</p> <p> NOTE: The default value is 60 minutes.</p>
CompactionFailureAlarm	cfa	Timestamp when the Compaction Failed on page 3414 alarm has been raised for the volume.
containerAllocationFactor	caf	Indicates the number of containers created for the volume.
ContainersNonLocalAlarm	cnla	Timestamp when the Local Volume containers non-local alarm was raised.
creationTime	ct	The volume creation time (epoch time in seconds). This is only available on volumes created using MapR v6.0.0 or later. For volumes created using older MapR/Data Fabric versions, the volume info on page 2969 and volume list on page 2989 commands will return empty value for this field.
creator	on	Name of the user that created the volume.
creatorcontainerid	ccid	ID for the container.
creatorvolumeuuid	cvid	ID that supports the container chain identification for mirroring. The creatorcontainerid and creatorvolumeuuid fields combined form a unique identifier for the container chain.
CriticallyDegradedEcStripesAlarm	cea	Timestamp when the Data Under-Encoded on page 3416 alarm has been raised for the volume.
criticalReReplTimeOutSec	crt	The timeout (in seconds) before re-replicating critically under-replicated containers only.
cvtotalused		The total space used by the associated cache volume.
dareEnabled	de	Indicates whether (1) or not (0) data-at-rest encryption is enabled for the volume.
data-size-mirrored-mb	dsm	Indicates the amount of data (in MB) that has been mirrored to the volume.
data-size-to-mirror-mb	dstm	Indicates the amount of data (in MB) that is yet to be mirrored to the volume.

DataUnavailableAlarm	dua	Timestamp when the Data Unavailable on page 3415 alarm was raised.
DataUnderReplicatedAlarm	rfa	Timestamp when the Data Under-Replicated on page 3415 alarm was raised.
dbindexlagsecalarmthresh	dilsat	Defines the lag time in seconds for updating secondary indexes after which the Secondary Index Encoding Error on page 3414 alarm is raised.
dbrepllagsecalarmthresh	dlsat	Defines the lag time in seconds for replication after which the Table Replication Lag High on page 3412 alarm is raised.
DegradedEcStripesAlarm	dea	Timestamp when the Warm-Tier Data Node Down on page 3416 alarm has been raised for the volume.
disableddataauditoperations	ddao	The list of operations excluded from auditing. For more information, see Auditing Data Access Operations on page 920 and Selective Auditing of File-System, Table, and Stream Operations Using the CLI on page 1322.
ecscheme	ecs	The erasure coding scheme for the volume if the volume is enabled for warm tiering.
ecstorevolume	ecstore	The name of the backend volume or erasure coded volume associated with the tiering enabled front-end volume.
ecstripedepthmb	ecstripedepthmb	The stripe depth of the erasure coded volume. The default value is 4 MB.
ectopology	ectopo	The rack path to the erasure coded volume.
ectotalused	ecused	The total space, after compression, used by the erasure-coded volume. This includes the disk space used by the parity fragments.
enableddataauditoperations	edao	The list of operations selected for auditing. For more information, see Auditing Data Access Operations on page 920 and Selective Auditing of File-System, Table, and Stream Operations Using the CLI on page 1322.

enforcementmode	em	<p>The enforcement mode when evaluating authorization for data access. Permitted values are as follows:</p> <ul style="list-style-type: none"> • PolicyAceOnly: Determines data access authorization based only on the security policy tags, for the file or directory. Ignores both mode bits and file or directory ACEs in determining access rights, when the resource is tagged with a security policy. Volume level ACEs still apply. • PolicyAceAndDataAce: Evaluates access rights based on the AND of the (file/directory ACEs OR mode bits), and security policy ACEs. • DataAceOnly: Evaluates access rights based on the AND of file/directory ACEs OR mode bits. Use this mode to switch off the policy-based security feature, on a per-volume basis, in an emergency situation. <p>Default: PolicyAceAndDataAce</p>
enforceMinReplicationForIO	esmr	Indicates whether (true) or not (false) to enforce minimum number of replicas for the volume.
fixCreatorId	fcid	An internal flag for volumes to fix the creator container ID.
forceAudit	fa	Indicates whether (1) or not (0) to force audit of operations on all files, tables, and streams in the volume.
FullTopologyAlarm	fta	Timestamp when the Topology Full Alarm on page 3419 was raised.
gateway	gwips	The hostname or IP address and port of the MAST Gateway associated with the volume.
InodesExceededAlarm	ia	Timestamp when the Inodes Exceeded alarm was raised.
label	l	Label associated with the volume. See Using Storage Labels on page 1575 for more information on labels.
LargeRowWarning	lrwarning	Timestamp when the Large Row on page 3417 alarm was raised.
lastSuccessfulMirrorTime	lmt	Last time when the mirror completed successfully.

limitspread	ls	An internal flag for volumes to control the growth of volumes in terms of the number of containers. When this flag is set, CLDB tried to limit the number of new containers created depending on the present size of the volume. If the volume size (the data in the volume) is small, the CLDB tries to reuse space in existing containers thus avoiding the creation of new containers.
localpath	lp	Topology of the volume.
logicalUsed	dlu	Logical size of disk used by this volume in MB.
maxinodesalarmthreshold	miath	The threshold of inodes in use that set off the Inodes Limit Exceeded on page 3417 alarm.
maxnssizembalarmthreshold	mnsszath	The namespace container size, which when exceeded raises the INODES_EXCEEDED alarm.
metricsEnabled	me	Indicates whether (1) or not (0) metrics collection is enabled for the volume.
minreplicas	mrf	Minimum number of replicas before re-replication starts.
mirror-percent-complete	mpc	Percentage complete for the most recent or current mirror operation.
mirrorDataSrcCluster	mdc	Name of the cluster of the originator volume.
mirrorDataSrcVolume	mds	Name of the originator volume. This is used to identify the mirror family in cascaded mirroring.
mirrorDataSrcVolumeId	mdi	ID of the originator volume.
MirrorFailureAlarm	mfa	Timestamp when the Mirror Failure on page 3418 alarm was raised.
mirrorId	mid	Current mirror ID of the volume.
mirrorscheduleid	msid	ID of the schedule that determines when the volume needs to be mirrored.
mirrorSrcCluster	msc	Name of the source cluster from which the current mirroring will happen.
mirrorSrcVolume	src	Name of the source volume from which the current mirroring will happen.
mirrorSrcVolumeId	msi	ID of the source volume from which the current mirroring will happen.
mirrorstatus	mst	Status of the last mirror attempt.

mirrorthrottle	dt	Flag to determine if the throttling need to be done on mirroring. Value can be: <ul style="list-style-type: none"> 0 - disabled 1 - enabled
mirrortype	mrt	Determines the type of volume: <ul style="list-style-type: none"> 0 - Read-write Volume 1 - Mirror Volume 2 - Mirror than can be converted to read-write 3 - Read-write volume that can be converted to mirror
mountdir	p	The path the volume is mounted on.
mounted	mt	A value of 1 indicates the volume is mounted
nameContainerDataThresholdMB	ncdt	Maximum amount of data allowed in the name container.
nameContainerSizeMB	ncsmb	Size of the name container for this volume in MB.
nsMinReplicas	nsmr	Minimum replication level for the namespace container.
nsNumReplicas	nsnr	Replication level for the namespace container.
needsGfsck	nfscck	Indicates whether (true) or not (false) this volume requires a filesystem check.
nextMirrorId	nmid	Mirror ID that is assigned if the mirroring successfully completes the next time.
NoNodesInTopologyAlarm	nna	Timestamp when the No Nodes in Topology on page 3418 alarm was raised.
nslabel	nsi	The name container label. See Using Storage Labels on page 1575 for more information on labels.
nsMinReplicas	nsmr	Indicates the minimum number of name space replicas configured for the volume.
nsNumRelicas	nsnr	Indicates the desired number of name space replicas configured for the volume.
numactivecgcontainers	numactivecgcntrs	The number of active CG containers for the volume.
numcontainers	nc	Number of containers that the volume has.

numreplicas	drf	Desired number of replicas. Containers with this amount of replicas are not re-replicated.
OffloadRecallFailureAlarm	ora	Timestamp when the Offload/Recall Failed on page 3417 alarm has been raised for the volume.
partlyOutOfTopology	poot	A value of 1 indicates this volume is partly out of its topology
quota	qta	Quota for limiting disk size in MB. A value of 0 indicates there are no hard quotas for this volume
QuotaExceededAlarm	qa	Timestamp when the Volume Quota Alarm on page 3421 was raised.
rackpath	rp	The rack path for this volume.
readonly	ro	A value of 1 indicates the volume is read-only.
replicatedlogicalused	replused	Replicated logical used data of this volume
replicatedtotalused	replusedtotal	Replicated total used data of this volume
replicationtype	dcr	Replication type. Value can be <code>low_latency</code> (star replication) or <code>high_throughput</code> (chain replication).
ReplTypeConversionInProgress	rtip	Indicates whether (1) replication type conversion is currently happening.
reReplTimeOutSec	rto	Timeout (in seconds) before attempting re-replication of replica containers. This volume property defines the timeout period until CLDB starts re-replicating the containers on the node of the volume when CLDB stops receiving a heartbeat from the node.
scheduleid	sid	The ID of the schedule, if any, used by this volume.
schedulename	sn	The name of the schedule, if any, used by this volume.
skipWireSecurityForTierInternalOps	swsfti	Indicates whether the skip wire security tier internal ops got enabled for this volume.
SnaprestoreMaxretriesExceededAlarm	sra	Timestamp when the Snapshot Restore Failure on page 3419 alarm was raised.
snapshotcount	sc	The number of snapshots for this volume.
SnapshotFailureAlarm	sfa	Timestamp when the Snapshot Failure on page 3418 alarm was raised.

snapshotused	ssu	Total space used (in MB) by the data owned only by the snapshot and not present in the RW volume. Data shared between the snapshot and RW volume is not counted in this field.
TableIndexEncodingErrorAlarm	vatinee	Timestamp when the the VOLUME_ALARM_TABLE_INDEX_ENCODING_ERROR alarm has been raised for the volume.
TableIndexErrorAlarm	vatinde	Timestamp when the VOLUME_ALARM_TABLE_INDEX_ERROR alarm has been raised for the volume.
TableIndexLagHighAlarm	vatindlh	Timestamp when the VOLUME_ALARM_TABLE_INDEX_LAG_HIGH alarm has been raised for the volume.
TableReplicationAsyncAlarm	vatrepa	Timestamp when the Table Replication Asynchronous on page 3412 alarm was raised.
TableReplicationErrorAlarm	vatrepe	Timestamp when the Table Replication Errors on page 3411 alarm was raised.
TableReplicationLagHighAlarm	vatreplh	Timestamp when the Table Replication Lag High on page 3412 alarm was raised.
tiercompactionoverheadthreshold	tcover	The percentage of offloaded data that must have been deleted on the cluster to qualify the data for compaction (or deletion from the tier).
tiercompactionscheduleid	tcsid	The ID of the schedule to use for running the compactor.
tierenable	tenb	Indicates whether (1) or not (0) storage efficiency through tiering is enabled for the volume.
tierencryption	tenc	Indicates whether (true) or not (false) encryption of data on the tier is enabled.
tierid	tid	The ID of the tier.
tierjobendtime	tjetime	The date and time when the last tiering operation was completed.
tierjoboffloadavgthroughputmbps	tjospeed	The average throughput (MB per second) for offloaded data.
tierjobrecallavgthroughputmbps	tjrspeed	The average throughput (MB per second) for recalled data.
tierjobprogress	tjprog	The completion percentage of the currently running or last tiering operation.
tierjobstarttime	tjstime	The date and time when the currently running or last tiering operation was started.

tierjobstate	tjstatus	<p>The status of the currently running or last tiering operation. Value can be one of the following:</p> <ul style="list-style-type: none"> • Scheduled • Running • FailureFatal • FailureRetriable • Success • Aborted • AbortInProgress • AbortedInternal <p>For more information on these, see Statuses on page 3057.</p>
tierjobtotaloffloadsize	tjsize	The total amount of data offloaded to the tier during the last offload operation.
tierjobtype	tjtype	The type of tiering operation currently running or last performed on the volume.
tierLocal	tloc	The amount of (in MB) physical user data (including recalled data) on the volume in the cluster.
tiername	tname	The name of the tier.
tieroffloadscheduleid	tsid	The ID of the schedule for offloading data to the tier.
tierPurged	tpur	The amount (in MB) of physical user data that is offloaded to the tier.
tierRecall	trec	The amount of (in MB) physical user data that is recalled to the cluster.
tierrecallexpirytime	ret	The amount of time to keep recalled data on the cluster before offloading (if there are changes) or purging (if there are no changes) the data.
tierruleid	rid	The ID of the rule or storage policy.
tiertype	ttype	<p>The type of tier. Value can be either:</p> <ul style="list-style-type: none"> • cold • ectier
totalused	tsu	Total space used for volume and snapshots, in MB.
used	dsu	Disk space used (in MB), not including snapshots.
volumeAces	vace	Displays the ACE values set for this volume.
volumeid	id	The volume ID.

volumename	n	The name of the volume.
volumetype	t	The volume type (for backward-compatibility): <ul style="list-style-type: none"> 0 - Read-write Volume 1 - Mirror Volume
wireSecurity	ws	Indicates whether (1) or not (0) wire-level security is enabled.

Related concepts

[node](#) on page 2560

Manages nodes in the cluster

Related reference

[disk add](#) on page 2418

Adds one or more disks to the specified node. Permissions required: fc or a.

[disk setlabel](#) on page 2420

Adds a label to disks or a storage pool. Permissions required: fc or a.

[label add](#) on page 2551

Registers a label. Permissions required: fc or a.

[volume create](#) on page 2929

Creates a volume.

[volume move](#) on page 3039

Moves the specified volume or mirror to a different topology. Permissions required: m or fc on the volume.

[label list](#) on page 2555

Lists registered labels. Permissions required: fc or a.

[node list](#) on page 2570

Lists nodes in the cluster.

[dump volumeinfo](#) on page 2468

Returns information about volumes and the associated containers. For JSON formatted output, use the -json option from the command line.

[configure.sh](#) on page 3186

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Data Fabric client nodes, and configuring services for a node.

volume audit

Enables or disables auditing on the specified volume.

You must have the fc permission on the cluster to use this command. See [acl](#) for details about this permission.

To learn how to determine whether auditing is enabled for a volume, see [Checking Whether Auditing is Enabled for a Directory, File, or HPE Data Fabric Database Table](#).

Syntax**CLI**

```
maprccli volume audit
[ -cluster <cluster name> ]
-name <volume name>
[-dataauditops <+|-operations>]
[ -enabled <true|false> ]
```

```
[ -forceenable true|false ]  
[ -coalesce <interval in  
minutes> ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/audit?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which the volume is located. This parameter is required if the volume is on a remote cluster. The remote cluster must be listed in the <code>mapr-clusters.conf</code> file for the cluster where you run the command.
coalesce	<p>The interval of time during which READ, WRITE, or GETATTR operations on one file from one IP address or UID are logged only once for a particular operation, if auditing is enabled.</p> <p>For example, suppose that a client application reads a single file three times in 6 minutes, so that there is one read at 0 minutes, another at 3 minutes, and a final read at 6 minutes. If the coalesce interval is at least 6 minutes, then only the first read operation is logged. However, if the interval is between 4 minutes, then only the first and third read operations are logged. If the interval is 2 minutes, all three read operations are logged.</p> <p>Now however, if the client was also writing to the file, irrespective of the coalesce interval for the read operation in the example stated previously, the write operation is logged, as it is a different operation from reading.</p> <p>The default value is 60 minutes. Setting this field to a larger number helps prevent audit logs from growing quickly.</p>

Parameter	Description
dataauditops	<p>The comma separated list of filesystem operations to include (specified with a preceding plus sign (+)) and/or exclude (specified with a preceding minus sign (-)) from auditing.</p> <p> NOTE: If the first operation in the list is to be excluded from auditing, it must be preceded by two minus (- -) signs. Subsequent operations to exclude must be preceded by only a single minus (-) sign, whether or not the first operation was included (using a plus (+) sign) or excluded (using two minus (- -) signs). If neither sign is specified, the given operation is included for auditing.</p> <p>The operations that can be included (+) and/or excluded (-) from auditing are listed here. You can, alternatively, group all the filesystem and table operations using the keyword <code>all</code>, which:</p> <ul style="list-style-type: none"> • If included (+), cannot be specified with a list of other included operations. • If excluded (-), cannot be specified with a list of other excluded operations. <p> NOTE: You can specify a mixed list of included and excluded operations. There are no changes to operations that are not specified with the command.</p>
enabled	<p>Enables or disables the auditing of operations within the volume. You must use either this parameter, the <code>-coalesce</code> parameter, or both.</p> <p>See Enabling Auditing for the steps to enable auditing on directories, files, and tables in a volume.</p> <p>When you set the value to false, auditing of operations within the volume ceases. None of the auditing settings are changed on the directories, files, and HPE Data Fabric Database tables within the volume. If you later run the <code>maprccli volume audit</code> command with <code>-enabled</code> set to true, auditing begins again on the objects that were already enabled for auditing.</p>
forceenable	Enables or disables auditing of all directories, files, tables, and streams in the volume whether or not auditing is enabled at the individual file, table, and/or stream level.
name	The name of the volume.

Examples

Enable Auditing for a volume

The following example shows how to enable auditing for the volume “auditVolume”:

CLI

```
maprccli volume audit -name
auditVolume -enabled true
```

REST

```
curl -X POST 'https://
abc.sj.us:8443/rest/volume/audit?
name=auditVolume&enabled=true' --user
<username>:<password>
```

Modify the list of operations to audit

The following example shows how to specify the operations to audit. Here, create operation is included for auditing and lookup operation is excluded from auditing. There are no changes to operations that are not specified.

CLI

```
maprcli volume audit -name
sampleAuditVolume -dataauditops
+create, -lookup
```

REST

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/audit?
name=sampleAuditVolume&dataauditops=%2
Bcreate%2C%2Dlookup' --user
<username>:<password>
```

volume balancecontainers

Balances the containers, or stops the balancing of containers associated with the volume.

Syntax

CLI

```
maprcli volume balancecontainers
[ -cluster cluster_name ]
  -name <volume name>
  [ -cancel <true|false>. default:
false ]
```

REST API

N/A

Parameters

Parameter	Description
cancel	Stop the balancing of containers associated with the volume. Set this parameter to true to cancel balancing a volume.
cluster	The name of the cluster on which to run the command.
name	The name of the volume.

Examples

Start balancing the containers associated with a volume:

```
maprcli volume balancecontainers -name sampleVol
```

Stop balancing the containers associated with a volume:

```
maprcli volume balancecontainers -name sampleVol -cancel true
```

volume balancinginfo

Fetch currently running or scheduled balancer information for one or more volumes.

NOTE: For best results, use the `-json` option when running the command.

Syntax**CLI**

```
maprcli volume balancinginfo
[ -cluster cluster_name ]
[ -name <volume name> ]
```

REST API

N/A

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the volume.

Output

The command returns the following fields:

Field	Description
spId	The ID of the storage pool.
capacity	The capacity/size of the storage pool in MB.
usedSize	The size of the storage pool that is consumed.
desiredSize	The total size of the containers of a volume that should be allocated on this storage pool.
isUnderweight	Value is true if the storage pool contains less than 50% of the desiredSize for this volume.
isOverweight	Value is true if the storage pool contains more than 1.5 times the desiredSize for this volume.

Examples

Fetch the list of volumes whose balancing is currently in progress or scheduled:

```
maprcli volume balancinginfo -json
```

Fetch the balancing information for a volume:

```
maprcli volume balancinginfo -name snapshotVolume1 -json
```

Output:

```
{
  "timestamp":1502529117881,
  "timeofday":"2017-08-12 09:11:57.881 GMT+0000",
  "status":"OK",
  "total":5,
  "data":[
    {
```

```

        "isOverweight": false
      }
    ]
  }
]
}

```

volume compact

Runs the compactor to remove recalled data on the Data Fabric cluster or stale data on the tier.

Permissions Required

The user running the command must have one of the following:

- Full control (fc) on the cluster or volume
- Volume edit permissions

Syntax

CLI

```
maprcli volume compact
[ -cluster <cluster_name> ]
  -name <vol_name>
    [ -forcerecallexpiry true|false ]
      [ -scanopten <true|false>.
        default:true ]
        [ -batchstartcid start cid for
          batch. default:0 ]
          [ -batchsize batch size.
            default:0 ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/compact?<parameters>

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
forcerecallexpiry	Specifies whether (true) or not (false) to purge recalled data on the Data Fabric cluster. If the command is run with the value for this set to true, the compactor purges recalled data on the Data Fabric cluster whether or not the expiry time for recalled data has been reached. If this is not specified or if the value for this is false, the compactor purges stale data on the tier and recalled data on the Data Fabric cluster if the expiry time for recalled data has been reached or has passed. The default value is false.
name	The name of the volume.
scanopten	The parameter is used for performance optimization. true is the default value, and true indicates that the volume compaction optimizations are enabled. One of the compaction optimizations include skipping containers that do not have enough garbage. This parameter is generally not set to false, except when you wish to disable the performance optimization feature for a particular reason.
batchstartcid	The container ID at which to start the compaction operation for a batch of containers. The parameter is used in conjunction with the batchsize parameter.
batchsize	The batchsize or number of containers for which the compaction process is to be run, starting from and inclusive of container specified as batchstartcid. The parameter is used in conjunction with the batchstartcid parameter.

Examples

Remove stale data on the tier for the volume named sampleVol:

CLI

```
# maprcli volume compact -name
sampleVol -json
{
  "timestamp":1528299575917,
  "timeofday":"2018-06-06
08:39:35.917 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully started
compaction."
  ]
}
```

REST

```
# curl -X POST 'https://
abc.sj.us:8443/rest/volume/compact?
name=sampleVol' --user mapr:mapr
{"timestamp":1528299575917,"timeofday"
:"2018-06-06 08:39:35.917 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully started
compaction."]}
```

Remove recalled data immediately on the volume named sampleVol:

CLI

```
# maprcli volume compact -name
sampleVol -forcerecallexpiry
true -json
{
  "timestamp":1528299765110,
  "timeofday":"2018-06-06
08:42:45.110 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully started
compaction."
  ]
}
```

REST

```
# curl -X POST 'https://
abc.sj.us:8443/rest/volume/compact?
name=sampleVol&forcerecallexpiry=true'
--user <username>:<password>
{"timestamp":1528299765110,"timeofday"
:"2018-06-06 08:42:45.110 GMT-0700
AM","status":"OK","total":0,"data":
[],"messages":["Successfully started
compaction."]}
```

Run compaction for a batch of 100 containers on the bucket 'ec2' starting at container with container ID 2529

CLI

```
# maprcli volume compact -name
ec2 -batchstartcid 2529 -batchsize
100 -json
{
  "timestamp":1753948269170,

```

volume container move

Moves a container. Permissions required: fc or m on the volume.

The volume container move command moves a specified container (cid) from a source file server (fromfileserv) to a destination file server (tofileserv). If the tofileserv parameter is not specified, a destination file server is chosen by the CLDB. If the tofileserv is specified but does not exist, the command fails with an error. If the fromfileserv does not exist or is down, the container move occurs once the source file server comes back up.

Syntax

CLI

```
volume container move
-cid <cid>
-fromfileservid
<fromfileservid>
[ -tofileservid
<tofileservid> ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/container/move?<parameters>

Parameters

Parameter	Description
cid	The container ID.
fromfileserverid	The ID of the file server on which the container to be moved currently resides. The ID is available from the <code>maprcli node list</code> command.
tofilesserverid	The ID of the file server to which to move the container. If not specified, a file server is chosen by the CLDB. The ID is available from the <code>maprcli node list</code> command.

Examples**CLI**

```
maprcli volume container
move -cid 2316 -fromfileserverid
5227152973904547710 -tofilesserverid
875290643748357753
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/container/move?
cid=2316&fromfilesserverid=52271529739045
47710&tofileservicerid=87529064374835775
3' --user <username>:<password>
```

volume container switchprimary

Switches the primary replica for a specified container to another replica in the replica chain.

This command fails if there is only one up-to-date replica for the container.

NOTE: Only the root and the MAPR_USER (user name under which HPE Data Fabric services run) user have permissions to run this command.

Syntax**CLI**

```
maprcli volume container
switchprimary
[ -cluster <cluster_name> ]
-cid <cid>
```

REST

Request Type	POST
Request URL	<code>http[s]://<host>:<port>/rest/volume/container/switchprimary?<parameters></code>

Parameters

Parameter	Description
cluster	The cluster on which to run the command. If this parameter is omitted, the command is run on the same cluster where it is issued. In multi-cluster contexts, you can use this parameter to specify a different cluster on which to run the command.

Parameter	Description
cid	The unique ID number for the container that you want to run the command on.

Example

Switches the primary container for a specified container:

CLI

```
maprccli volume container
switchprimary -cid 2049
```

REST

```
https://abc.sj.us:8443/rest/volume/
container/switchprimary?cid=2049
```

volume create

Creates a volume.

Permissions Required

cv or fc on the cluster.

NOTE: See [acl](#) on page 2273 for more information.

Syntax**CLI**

```
/opt/mapr/bin/maprccli volume create

NOTE: If you are creating a volume on a remote cluster by specifying a user that does not exist on the local cluster (cluster on which you are running the volume create command), the following error message is displayed:

```
"id":22,
"desc":"Invalid AE specified
while trying to create Volume
<volumename>. User <username>
does not exist.
```

Ignore the error if the volume has been created successfully.

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/create?<parameters>

Parameters

Parameter: **advisoryquota**

Default Value: No default value

Possible Values: 0 or any other integer value.

Description: The advisory quota for the volume as integer plus unit. Example: quota=500G;
Units: B, K, M, G, T, P

Setting a quota allows you to configure an alarm when the volume usage exceeds a specific limit. There are two kind of quotas, the advisory quota and the quota, also referred to as a "hard" quota (see the *quota* parameter later on this page). You can choose to set either or both types of quotas. If both quotas are set,

the advisory quota must be less than or equal to the hard quota.

Volume usage that exceeds the advisory quota raises a VOLUME_ALARM_ADVISORY_QUOTA_EXCEEDED alarm. Volume usage that exceeds the hard quota raises a VOLUME_ALARM_QUOTA_EXCEEDED alarm and prevents new writes until space is freed up on the volume. Setting an advisory quota can alert you to take action before a hard quota is reached and new writes to the volume are stopped.

Parameter: ae

Default Value: No default value

Possible Values: Name of the entity that owns the volume.

Description: The accounting entity that owns the volume.

Parameter: aetype

Default Value: No default value

Possible Values:

- 0=user
- 1=group

Description: Type of accounting entity.

Parameter: allowgrant

Default Value: false

Possible Values:

- true
- false

Description: Specifies whether the volume as a parent, grants permission for a child volume to inherit its properties.

Parameter: allowinherit

Default Value: true

Possible Values:

- true
- false

Description: Specifies whether a new volume inherits properties from the parent mount point volume.

Parameter: allowreadforexecute

Default Value: false

Possible Values:

- true
- false

Description: Allows execution of SUID binaries with only their executable bit set, on a FUSE filesystem. This parameter works in conjunction with the `fuse.mount.setuid` FUSE option. For more information, see [Configuring the HPE Data Fabric FUSE-Based POSIX Client](#) on page 1876.

Parameter: auditenabled

Default Value: true

Possible Values:

- true
- false

Description: Specifies whether to turn on auditing for the volume. If you enable auditing at the cluster level with the [audit data](#) on page 2311 command, setting this value to true causes auditing to start for any directories, files, tables, or streams that are already enabled for auditing. If none are yet enabled, enabling auditing on any of them causes auditing of them to start.

Set `auditenabled` to true to enable auditing on directories, files, tables, and streams in the volume.

You must have the `fc` permission on the cluster to use this parameter. See [acl](#) for details about this permission.

Parameter: `autooffloadthresholdgb`

Default Value: 1024 GB

Possible Values: Any positive integer.

Description: The size of the volume in GB (threshold). When this threshold is reached or exceeded, volume data is automatically offloaded by the Automatic Tiering Scheduler. To use the global size threshold (of 1024 GB), set the value to 0.

Parameter: `cluster`

Default Value: No default value

Possible Values: Any valid cluster.

Description: The cluster on which to create the volume.

Parameter: `coalesce`

Default Value: 60 minutes

Possible Values: Set this parameter to a large number of minutes to prevent audit logs from growing quickly.

Description: The interval of time (in minutes) during which READ, WRITE, or GETATTR operations on one file from one IP address or UID are logged only once for a particular operation, if auditing is enabled.

For example, suppose that a client application reads a single file three times in 6 minutes, so that there is one read at 0 minutes, another at 3 minutes, and a final read at 6 minutes. If the coalesce interval is at least 6 minutes, then only the first read operation is logged. However, if the interval is 4 minutes, then only the first and third read operations are logged. If the interval is 2 minutes, all three read operations are logged.

Now however, if the client was also writing to the file, irrespective of the coalesce interval for the read operation in the example stated previously, the write operation is logged, as it is a different operation from reading.

Parameter: `compactionoverheadthreshold`

Default Value: 30%

Possible Values: 0-100%

Description: Specifies the percentage of offloaded data that must have been deleted on the cluster to qualify the data for compaction (or deletion from the tier).

Parameter: `compactionschedule`

Default Value: Automatic Internal Schedule

Parameter: containerallocationfactor

Possible Values: Any valid schedule ID.

Set this parameter to 0 to disable the compactor.

Description: Specifies the schedule to use for running the compactor.

Default Value: 5

Recommended Value: 2* SP count in the volume topology.

Description: Specifies the number of containers to create when the first write from a remote client is sent to the volume. The pre-created containers are distributed equally across topologies, servers, file system instances, and storage pools. CLDB also takes into consideration the load (IO/Space) when selecting target storage pools for containers. The value must be a positive integer.

Parameter: createparent

Default Value: 1

Possible Values:

- 0 - Do not create a parent directory
- 1 - Create a parent directory

Description: Specifies whether or not to create a parent directory to hold the volume link.

Parameter: criticalrereplicationtimeoutsec

Default Value: 0 (No timeout)

Possible Values: Any integer between 300 and 3600 (seconds)

Description: Timeout (in seconds) before re-replicating only the critically under-replicated containers. If you set both `rereplicationtimeoutsec` and `criticalrereplicationtimeoutsec`, and if the value of:

- `rereplicationtimeoutsec` is less than `criticalrereplicationtimeoutsec`, `rereplicationtimeoutsec` overrides the `criticalrereplicationtimeoutsec` setting for both under-replicated and critically under-replicated containers.
- `rereplicationtimeoutsec` is greater than `criticalrereplicationtimeoutsec`, `criticalrereplicationtimeoutsec` overrides the `rereplicationtimeoutsec` setting only for critically under-replicated containers; `rereplicationtimeoutsec` setting is still applicable for under-replicated containers.

Parameter: dare

Default Value: false

Possible Values:

- true
- false

Description: Specifies whether or not to enable data-at-rest encryption for volume. This setting takes effect only if the data-at-rest encryption feature is also enabled at the cluster level. Once enabled, this feature cannot be disabled.

Parameter: dataauditops

Default Value: Default enabled audit ops:

setattr, chown, chperm, chgrp, getxattr, listxattr, setxattr, removexattr, read, write, create, delete, mkdir, readdir, rmdir, createsym, lookup, rename, createdev, truncate, tablecfcreate, tablecfdelete, tablecfmodify, tablecfscan, tableget, tableput, tablescan, tablecreate, tableinfo, tablemodify, getperm, getpathforfid, hardlink, filescan, fileoffload, filerecall, filetierjobstatus, filetierjobabort

Possible Values: Any audit operations that you want to enable.

Description: The comma separated list of filesystem operations to include (specified with a preceding plus sign (+)) or exclude (specified with a preceding minus sign (-)) from auditing.

To exclude the first operation in the list (of operations) from auditing, precede it by two minus (--) signs. To exclude subsequent operations, precede them by only a single minus (-) sign, irrespective of whether the first operation was included (using a plus (+) sign) or excluded (using two minus (--) signs). If neither sign is specified, the given operation is included for auditing.

The operations that can be included (+) or excluded (-) from auditing are listed [here](#). You can, alternatively, group all the operations using the keyword `all`, which:

- If included (+), cannot be specified with a list of other included operations.
- If excluded (-), cannot be specified with a list of other excluded operations.

You can specify a mixed list of included and excluded operations. There is no change to operations that are not specified with the command.

NOTE: Enabling `setattr` automatically enables the following operations:

- `chown`
- `chgrp`
- `chperm`

If you disable `setattr`, these operations are automatically disabled. If you do nothing with `setattr` (neither enable nor disable), you can enable or disable `chown`, `chgrp`, and `chperm` in any combination and they will not affect `setattr`.

For more information, see [Selective Auditing of Filesystem and Table Operations](#).

Default Value: 300 seconds

Possible Values: Any integer value.

Parameter: dbindexlagsecaalarmthresh

Parameter: dbrepllagsecalarmthresh

Description: Specifies the threshold (in seconds) to raise an alarm for index update lag.

Default Value: 900 seconds

Possible Values: Any integer value.

Description: Specifies the threshold (in seconds) to raise an alarm for DB replication lag.

Parameter: ecenable

Default Value: false

Possible Values:

- true
- false

Description: Enable (true) or disable (false) warm tiering for the volume. Either this parameter or `tieringenable` is required to enable warm tiering. If you specify this parameter, you cannot specify `tiername`; when the command runs, a new tier is created for the volume. If you do not specify any rule, the default rule, which is all files (p), is associated with the volume.

Parameter: eclabel

Default Value: HDD

Possible Values: Any label.

Description: The label to use for the erasure-coded volume. See [Using Storage Labels](#) on page 1575 for more information on labels.

The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

Parameter: ecscheme

Default Value: 4+2

Possible Values: Any valid EC scheme.

Description:

NOTE: This parameter is applicable only for EC volumes, and only when you set the `ecenable` parameter to true.

The number of data chunks and the number of parity chunks separated by a plus (+) sign.

For schemes with local parity, the scheme is of the form $x+y+z$, where x is the number of data chunks, y is the number of local parity chunks, and z is the number of global parity chunks.

For information on the supported schemes, see [Erasure Coding Scheme for Data Protection and Recovery](#) on page 1504.

Parameter: ectopology

Default Value: /data/default-rack

Possible Values: Any topology that exists in your environment.

Description: Sets the topology to store the erasure coded volume. Once set, you cannot change the topology of an erasure coded volume using this command. To change the topology of an erasure coded volume, use `volume move` on page 3039.

**NOTE:**

1. This parameter is applicable only for EC volumes.
2. The specified EC topology needs to have sufficient nodes for the selected EC Scheme. For example, 6 nodes for 4+2, 5 nodes for 3+2 etc.

Parameter: enforcementmode*Default Value:* No default value*Possible Values:*

- PolicyAceOnly
- PolicyAceAndDataAce
- DataAceOnly
- PolicyAceAuditAndDataAce

Description: The enforcement mode when evaluating authorization for data access. Permitted values are as follows:

- PolicyAceOnly: Determines data access authorization based only on the ACEs set in security policies. Ignores POSIX mode bits and ACEs directly defined on data objects when determining access rights, if a data object is tagged with at least one security policy. If a data object is not associated with at least one security policy, the system will enforce POSIX mode bits and ACEs directly defined on the data object. Volume-level ACEs are always enforced.
- PolicyAceAndDataAce: Determines data access authorization based on the ACEs set in security policies AND ACEs or POSIX mode bits directly set on data objects.
- DataAceOnly: Determines data access authorization based on the ACEs or POSIX mode bits directly set on data objects. You can use this mode to switch off the policy-based security feature, on a per-volume basis, in an emergency situation.
- PolicyAceAuditAndDataAce: Use this mode when testing security policies. In this mode:
 - ACEs defined directly on data objects are enforced.
 - Data objects associated with security policies are checked for access, and any access denied events are audited, but access itself is allowed.

See the section on [Volume-Level Security Policy Enforcement Mode](#) on page 932 for a discussion on how to determine permission to access a resource, when this flag is set.

Parameter: enforceinreplicationforio*Default Value:* false*Possible Values:*

- true
- false

Description: Specifies whether (true) or not (false) to enforce minimum number of replicas for the (read-write) volume during IO. This flag ensures that further updates (writes) to volume are successful only when the minimum number of copies of the container are available. Setting this parameter to true ensures that if writes succeed, then it has been applied to at least the minimum number of copies; if writes fail, it may have been applied to zero or more copies.

Enabling this parameter, may stall volume dump and volume snapshot create operations, if the minimum number of copies of the container are not available.

If you do not set this parameter on a volume, or if you modified this parameter from false to true, then you need to restart all the nodes where the containers associated with the volume exist, for the changes to take effect.

This flag is ignored on mirror volumes. If there are more than five cluster nodes, this flag is set to true, by default, on the tier volume. If the number of cluster nodes is less than five, this flag is set to false, by default, on the tier volume.

Parameter: filefilter

Possible Values: Any file filter.

Description: Specifies the file filter to use to prevent specific types of files from being stored on the volume. For more information, see [Prevent Storage of Specified Types of Files](#) on page 912. You can associate only one filter for each volume.

Parameter: forceauditenable

Default Value: false

Possible Values:

- true - force audit of all content
- false - do not force audit

Description: Specifies whether (true) or not (false) to force audit of operations on all files, tables, and streams in the volume if auditing is enabled at the cluster and volume levels, irrespective of the audit setting on the individual directory, file, table, and stream.

Parameter: group

Default Value: No default value

Possible Values: Any user with Create Volume privileges.

Description: Space-separated list of group:permission pairs. Use commas to separate permissions. For example: group:permission,permission,...

Default Value: false

Parameter: honorrackreliability
<ec-rack-reliability : true | false>

NOTE: The honorrackreliability parameter considers each rack as a site.

Allocates CGs for maximized resiliency during a site failure. CG containers are spread across multiple sites so that a site does not host more parity containers for a given CG (EC scheme: D+P). Container allocations for a CG with previous software use one container per site for a CG. Managing new allocations in this manner (where `honorrackreliability` is set to `true`) ensures that CG data is available for reads, even in cases where an entire site goes down. For a given EC D+P scheme, CG allocation requires, at least, $\text{Math.ceil}((D+P)/P)$ site for CG creation, and if enough sites are unavailable, CG allocation fails.

NOTE: To use `-honorrackreliability` in a cluster with geographically-dispersed nodes, you must configure a topology with multiple racks having enough nodes in each rack. Specifying the configured topology as `-ectopology` ensures that `RackReliabilitySelector` allocates, at most, P containers in each rack during CG allocations.

NOTE: If a container needs to be reallocated for rebuild, an attempt is made to allocate a new container in the same rack in which the old container resided. If this allocation cannot be done, a new container is allocated into a different rack, such that the selected rack will not have more, than P containers. Otherwise, container allocation fails.

Parameter: `inherit`

Default Value: No default value

Possible Values: Any existing volume name

Description: Specifies the name of the volume from which the new volume inherits properties. When you specify `inherit`, you do not need to specify `allowgrant`. See the following section on Inheritance for more information.

Parameter: `label`

Default Value: default

Possible Values: Any label.

Description: The label to use for the storage pool. See [Using Storage Labels](#) on page 1575 for more information on labels.

The label should contain only the following characters:

A-Z a-z 0-9 _ - .

TIP: Use the special label named anywhere to let a volume reside on any storage pool. Not setting a label, causes a volume to reside only on a storage pool without a label.

Parameter: `localvolumehost`

Default Value: No default value

Possible Values: Any existing volume name

Description: Specifies the name of the local volume host.

Parameter: `localvolumeport`

Default Value: 5660

Possible Values: Any valid port number

Parameter: <code>maxinodesalarmthreshold</code>	<p>Description: Specifies the port number of the local volume host.</p> <p><i>Default Value:</i> 50000000</p> <p>Possible Values: Any positive integer.</p> <p>Description: The number of inodes, which when exceeded raises the INODES_EXCEEDED alarm.</p>
Parameter: <code>maxnssizebalarmthreshold</code>	<p><i>Default Value:</i> 500 GB</p> <p>Possible Values: Any positive integer.</p> <p>Description: The namespace container size, which when exceeded raises the INODES_EXCEEDED alarm.</p>
Parameter: <code>metricsenabled</code>	<p><i>Default Value:</i> false</p> <p>Possible Values:</p> <ul style="list-style-type: none"> • true • false <p>Description: Specifies whether (true) or not (false) to enable metrics collection for a volume.</p>
Parameter: <code>minreplication</code>	<p><i>Default Value:</i> 2</p> <p>Possible Values: Can be any value that you desire based on the replication you need.</p> <p>Description: The minimum replication level. When the replication factor falls below this minimum, re-replication occurs as aggressively as possible to restore the replication level. If any containers in the CLDB volume fall below the minimum replication factor, writes are disabled until aggressive re-replication restores the minimum level of replication.</p> <p>TIP: For more information, see Understanding Replication on page 560.</p>
Parameter: <code>mirrorschedule</code>	<p><i>Default Value:</i> 0</p> <p>Possible Values: Any valid schedule ID.</p> <p>Description: The schedule ID corresponding to the schedule to be used for mirroring. If you specify a mirror schedule ID, then the mirror volume automatically syncs with its source volume on the specified schedule. Pre-assigned IDs include 1 for critical data, 2 for important data, and 3 for normal data. Custom schedules are assigned ID numbers in sequence. To determine the ID number, use the <code>schedule list</code> command.</p>
Parameter: <code>mirrorthrottle</code>	<p><i>Default Value:</i> true</p> <p>Possible Values:</p> <ul style="list-style-type: none"> • true • false <p>Description: Specifies whether mirror throttling is enabled (true) or disabled (false). Throttling is set on the source volume and applies to all its mirrors.</p>
Parameter: <code>mount</code>	<p><i>Default Value:</i> true</p> <p>Possible Values:</p>

- true
- false

Description: Specifies whether to mount the volume (true) or not (false) after creating the volume.

Default Value: No default value

Possible Values: Any valid name

Description: Specifies the name for the volume.

The name should contain only the following characters:

A-Z a-z 0-9 _ - .

For tiering-enabled volumes, the volume name cannot exceed 98 characters. For regular volumes, the volume name should be a maximum of 128 characters.

Default Value: 524288 MB

Possible Values: Any integer value. The value is interpreted as being in MB.

If you set this parameter to 0, there is no limit on the size of user data that can be stored in the name container.

If chunk size is 0, by default, all data is stored in the name container. However, if this property is set, all data is stored in a second container and only the meta data is stored in the name container once the threshold is reached. The size of the second container is not limited by this setting; you must ensure that the size does not grow too large, by limiting the amount of data in the volume.

Description: Limits the size of user data that can be placed in the name container. The value is interpreted as being in MB. If the user data size limit:

- Has not yet been reached, the first 64 KB of data is stored in name container, and the rest of the data is stored in data containers.
- Has already been reached, only meta data is stored in the name container, and the data is stored in data containers. For example, if you set the current name container size to 200GB and the limit to 100GB, then all new user data is stored in data containers.

Default Value: default

Possible Values: Any value.

Description: The label to use for the namespace container. See [Using Storage Labels](#) on page 1575 for more information on labels.

The label should contain only the following characters:

A-Z a-z 0-9 _ - .

Parameter: name

Parameter: namecontainerdatathreshold

Parameter: nslabel

Parameter: nsminreplication

Default Value: 2

Possible Values: Any integer value.

Description: A replication factor of the namespace container. When the replication factor falls below this value, re-replication occurs as aggressively as possible to restore the replication level. If any containers in the CLDB volume fall below the minimum replication factor, writes are disabled until aggressive re-replication restores the minimum level of replication.

When enabled, the CLDB manages the namespace container replication separate from the data container replication. You use this capability when you have low volume replication but want to have higher namespace replication.

Set the value to be the same or larger than the value of the equivalent data replication parameter, `minreplication`.

See also: [Understanding Replication](#) on page 560.

Default Value: 3

Possible Values: Any integer value.

Description: A replication factor of the namespace container. When the number of copies fall below the desired replication factor, but remains equal to or above the minimum replication factor, re-replication occurs after the timeout specified in the `cldb.fs.mark.rereplicate.sec` parameter. This timeout is the time given for a node that is offline to come back online. After this timeout period, the CLDB takes action to restore the replication factor. When enabled, the CLDB manages the namespace container replication separate from the data container replication. This capability is used when you have low volume replication but want to have higher namespace replication. By default, the value of this parameter is the same or larger than the value of the equivalent data replication parameter. However, to set the value of this parameter lower than the replication value, first set `engg.manual.override` to true in `cldb.conf`. See also: [Understanding Replication](#) on page 560.

Parameter: `nsreplication`

Default Value: 0

Possible Values: Any integer between 1 and 100.

Description: Number of containers to be assigned for a CG assign request.

Parameter: `numactivecgcontainers`

Default Value: No default value

Possible Values: Any valid schedule ID. To disable schedule-based offload, set this value to 0.

Description: The ID of the schedule to associate with the volume for offloading volume data to the tier.

Parameter: `offloadschedule`

NOTE: This parameter is required only for Cold/EC tiered volumes.

Parameter: `path`

Default Value: No default value

Possible Values: Any valid path.

Description: The path at which to mount the volume. The path must be relative to / and cannot be in the form of a global namespace path (for example, /mapr/<cluster-name>/).

Parameter: quota*Default Value:* 0

Possible Values: Any integer value along with a unit.

Description: The quota for the volume as integer plus unit. Example: quota=500G; Units: B, K, M, G, T, P

Do not use two-letter abbreviations for quota units, such as GB and MB.

Setting a quota allows you to configure an alarm when the volume usage exceeds a specific limit. There are two kind of quotas: the quota, also referred to as a "hard" quota, and the advisory quota (see the advisory quota parameter earlier on this page). You can choose to set either or both types of quotas. If both quotas are set, the advisory quota must be less than or equal to the hard quota.

Volume usage that exceeds the hard quota raises a VOLUME_ALARM_QUOTA_EXCEEDED alarm and prevents new writes until space is freed up on the volume. Volume usage that exceeds the advisory quota raises a VOLUME_ALARM_ADVISORY_QUOTA_EXCEEDED alarm. Setting an advisory quota can alert you to take action before a hard quota is reached and new writes to the volume are stopped.

When you set a quota for a tiering-enabled volume, the quota is the total space allocated for the volume irrespective of the location (cluster or tier) where the volume data is stored. For example, if you allocate 1GB of hard quota for a tiering-enabled volume, writes fail after you write 1GB of data whether or not the volume data is local (on the cluster) or offloaded (to the tier).

Note that quotas for source and mirror volumes must match.

Parameter: readAce*Default Value:* p (grant access to all users)

Possible Values: Any valid permissions.

Description: Specifies [Access Control Expressions](#)(ACEs) that grant permissions at the volume level to read files and tables in the volume. The default value is p, which grants access to all users.See [ACEs](#).**Parameter: readonly***Default Value:* No default value

Possible Values:

- 0
- 1

Description: Specifies whether the volume is read-only.

- 0 - read/write
- 1 - read-only

Parameter: recallexpirytime*Default Value:* 1 day

Possible Values: Any integer between 1 and 7500.

Parameter: replication

Description: The amount of time (in days) to keep the recalled data before purging or offloading it.

Default Value: 3

Possible Values: Any integer starting at 0.

Description: The desired replication level. When the number of copies falls below the desired replication factor, but remains equal to or above the minimum replication factor, re-replication occurs after the timeout specified in the `cldb.fs.mark.rereplicate.sec` parameter. Note that this timeout is the time given for a node that is offline to come back online. After this timeout period, the CLDB takes action to restore the replication factor.

TIP: For more information, see [Understanding Replication](#) on page 560.

Parameter: replicationtype

Default Value: high_throughput

Possible Values:

- low_latency (star replication)
- high_throughput (chain replication)

Description: The desired replication type. The default setting is high_throughput.

Parameter: rereplicationtimeoutsec

Default Value: 3600 seconds (1 hour)

Possible Values: Any positive integer.

Description: Timeout (in seconds) before attempting re-replication of replica containers. This volume property defines the timeout period until CLDB starts re-replicating the containers on the node of the volume after CLDB stops receiving a heartbeat from the node.

When a node is down, CLDB gives the node an hour to come back online before it takes any action for the containers on this node. You can set this parameter on volumes to reduce the default value to a shorter time period. This option is provided mainly for local volumes, so that when the file system is down, CLDB can give up quickly and decide that the container has no master. This forces the TT to give up on local containers, and take the appropriate recovery action of deleting the mapped volume and creating another one.

Parameter: rootdirgroup

Default Value: User who is running the command

Possible Values: Any valid group

Description: Group that owns the root directory

Parameter: rootdirperms

Default Value: rwxr-xr-x

Possible Values: Any valid permission

Description: Permissions on the volume root directory.

Parameter: rootdiruser

Default Value: User who is running the command

Possible Values: Any valid user

Description: User that owns the root directory.

rootdirsecuritypolicy

Default Value: None

Possible Values: An empty string, or a list of security policy tags.

Description: A comma-delimited list of security policy tags to be associated with the volume root directory. This parameter is not mandatory.

If you do not specify a security policy, the volume is created without initial security policy tags.

Parameter: schedule

Default Value: 0

Possible Values: 0 or a valid schedule ID.

Description: The ID of a schedule. Use the [schedule list](#) command to find the ID of the named schedule that you want to apply to the volume.

To disable the schedule, set this parameter to 0.

Parameter: skipinherit

Default Value: No default value

Possible Values:

- schedule
- tiername

Description: Specifies not to inherit given properties associated with the:

- Parent volume (for other volumes)
- Source volume (for mirror volumes)

Value must be either or both:

- schedule to not inherit snapshot schedule settings
- tiername to not:
 - Inherit tiering properties like tierid, tieroffloadscheduleid, ecshceme, ectopology
 - Set default values for compactionscheduleid and compactionoverheadthreshold

Use comma to separate multiple values.

Parameter: source

Default Value: No default value

Possible Values: Any volume.

Description: The source volume from which a mirror volume receives updates, specified in the format <volume>@<cluster>.

Parameter: tenant

Default Value: No default value

Possible Values: Any valid tenant user.

Description: The tenant is the entity for which resources such as volumes are created. The tenant can be an organization, a department within an organization, or an individual.

This parameter indicates the tenant for whom the volume is being created. All resources within the created volume are owned by the specified tenant.

Parameter: tierencryption*Default Value:* false*Possible Values:*

- true
- false

Description: Specifies whether to enable (true) or disable (false) encryption of data on the object store. This parameter is applicable only for cold-tier volumes. If you enable this parameter, user data is encrypted before being written to the object, and the HTTPS protocol is used for communication with the object store to ensure that data is encrypted both on the wire and on the tier.

You can set this parameter only if you specify a tier name (see the `tiername` parameter) as well. You cannot modify this parameter after you set it.

If you set the value to true, you can also specify a custom key using the `tierkey` parameter. Once set to true, the MAST Gateway uses HTTPS to upload data to the cold-tier. If the cold tier does not support HTTPS, all tier related operations fail. If the cold-tier does not support HTTPS, you must explicitly set the value for this to false at the time of associating a tier with the volume because the default value for this parameter is true.

TIP: For warm tier, use -dare option on the front-end volume to enable or disable encryption of data-at-rest.

Parameter: tieringenable*Default Value:* No default value*Possible Values:*

- true
- false

Description: Enable (true) or disable (false) tiering for the volume. When you specify this parameter, you must also specify the `tiername`. For creating a tiering-enabled mirror volume, specify this parameter if the source volume is enabled for cold-tier; specify either this parameter or `ecenable`, if the source volume is enabled for warm-tier.

Parameter: tieringrule*Default Value:* p (all files)*Possible Values:* Name of any valid rule

Description: The name of the rule (referred to as storage policy in the Control System) to use for offloading data to the tier. If you do not specify a rule, the default rule, which is all files (p), is associated with the volume. See [Creating a Rule in Creating a Storage Tier Policy](#) on page 1564 for more information.

Parameter: tierkey*Default Value:* Auto generated*Possible Values:* Any 32-character HEX string, or let CLDB auto-generate this string

Description: The 32-character HEX string to use for encryption only for cold tier volumes. If you do not specify a string, CLDB generates a 32 character HEX

Parameter: tiername

string to use for encrypting the data to offload to the tier.

Default Value: No default value

Possible Values: Any

Description: The name of the tier to use for offloading data. You can set this name only once and cannot modify it.

For warm tiering, you cannot specify this parameter if `ecenable` is set to `true`.

Parameter: topology

Default Value: /data

Possible Values: Any

Description: The rack path to the volume.

To create a volume in a specific topology, you must have the [Converged Enterprise Edition](#) installed on your system. Without the Converged Enterprise Edition, when you run the `maprcli volume create` command with the `-topology` option, the following error message is returned:

```
ERROR (10010) - Volume Creation
Failed: Setting topology on
               a volume
requires data placement feature.
License not found for data placement.
```

Parameter: type

Default Value: 0

Possible Values:

- mirror
- rw
- 0
- 1

Description: The type of volume to create.

The following values are accepted:

- mirror - standard mirror (read-only) volume (promotable to standard read-write volume)
- rw - standard (read-write) volume (convertible to standard mirror volume)
- 0 - standard (read-write) volume (for backward compatibility)
- 1 - non-convertible mirror (read-only) volume (for backward compatibility)

Parameter: user

Default Value: All permissions (dump, restore, m, a, d, fc) for the administrator who created the volume

Possible Values: Any valid permissions

Description: Space-separated list of `user:permission` pairs.

Parameter: wiresecurityenabled

Use comma to separate permissions. For example:
 user:permission,permission,...

Default Value: true

Possible Values:

- true
- false

Description: Enables (true) or disables (false) on-wire encryption for all files, tables, and streams in the volume for secure clusters.

If true, this setting overrides all file, table, and stream level encryption settings (set using the `hadoop mfs` command) and enables on-wire encryption for all files, tables, and streams. If you disable (false) this parameter at the volume level, but enable it at the file, table, or stream level, the file, table, or stream level encryption setting overrides this setting on those files, tables, and streams where it is enabled; for all other files, tables, and streams where encryption is not enabled at the file, table, or stream level, the on-wire encryption is disabled.

Parameter: writeAce

Default Value: p (grants access to all users)

Possible Values: Any valid permissions

Description: Specifies [Access Control Expressions](#) (ACEs) that grant permission at the volume level to write to files and tables in the volume. The default value is p, which grants access to all users.

See [ACEs](#).

Inheritance

The following table shows the list of inheritable parameters that are (Yes) and are not (No) inherited by a:

- Mirror volume from the source volume on the same cluster
- Mirror volume from the source volume on a different cluster

NOTE: All (non-mirror) volumes inherit all the inheritable properties from the parent volume. For more information on the properties, refer to `volume create` [parameters](#).

Inheritable Properties (which are inherited by non-mirror volumes by default)	Inherited by Mirror Volume on the same cluster as the source volume?	Inherited by Mirror Volume on a different cluster from the source volume?
advisoryquota	Yes	Yes
ae	Yes	No
aetype	Yes	No
allowgrant	Yes	Yes
allowinherit	Yes	Yes
auditenabled	Yes	Yes
coalesce	Yes	Yes
dare	Yes	Yes ¹ , No ²

Inheritable Properties (which are inherited by non-mirror volumes by default)	Inherited by Mirror Volume on the same cluster as the source volume?	Inherited by Mirror Volume on a different cluster from the source volume?
dataauditops	Yes	Yes
dbindexlagsecalarmthresh	Yes	Yes
dbrepllagsecalarmthresh	Yes	Yes
enforcementMode	Yes	Yes
ecscheme	Yes	No
ectopology	Yes	No
group	Yes	Yes
inherit	Yes	Yes
localvolumehost	No	No
localvolumeport	No	No
maxinodesalarmthreshold	Yes	Yes
minreplication	Yes	Yes
mirrorschedule	Yes	No
mirrorthrottle	Yes	Yes
nsminreplication	Yes	Yes
nsreplication	Yes	Yes
ofloadschedule	Yes	No
quota	Yes	Yes
readonly	Yes	Yes
recallexpirytime	Yes	No
replication	Yes	Yes
replicationtype	Yes	Yes
rereplicationtimeoutsec	Yes	Yes
rootdirperms	Yes	Yes
schedule	Yes ³	No
securitypolicy	Yes	Yes
source	Yes	Yes
tierencryption	Yes	No
tieringenable	Yes	No
tieringrule	Yes	No
tierkey	Yes	No
tiername ⁴	Yes	No
topology	Yes	No
type	Yes	Yes
user	Yes	Yes

Inheritable Properties (which are inherited by non-mirror volumes by default)	Inherited by Mirror Volume on the same cluster as the source volume?	Inherited by Mirror Volume on a different cluster from the source volume?
wiresecurityenabled	Yes	Yes

- ¹ If destination cluster is also enabled for data-at-rest encryption, dare setting is inherited by the mirror volume on the destination cluster.
- ² If destination cluster is not enabled for data-at-rest encryption, dare setting is not inherited by the mirror volume on the destination cluster.
- ³ If schedule keyword is specified with the skipinherit parameter, schedule(s) are not inherited while inheriting volume properties from the source volume.
- ⁴ If tiername keyword is specified with the skipinherit parameter:
 - The tiering properties are not inherited by the mirror volume while inheriting volume properties from the tiering-enabled source volume.
 - For volumes enabled for warm-tier, the backend erasure-coded volume is not created.

Examples

NOTE: For REST examples stated below, use the appropriate SSL-related command line option in the following curl command, according to your SSL setup.

Create the volume "test-volume" mounted at "/test/test-volume" with a time of 2 days

CLI

```
/opt/mapr/bin/maprcli volume
create -name test-volume -path /
test/test-volume -type rw
-atimeUpdateInterval 2 -json
{
  "timestamp":152652204072,
  "timeofday":"2020-05-16
06:56:44.072 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":["
    Successfully created volume:
    'test-volume'
  "]
}
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=test-volume&path=/test/
test-volume&type=rw&atimeUpdateInterva
l=2' --user <username>:<password>
{"timestamp":1526522305703,"timeofday"
:"2020-05-16 06:58:25.703 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'test-volume'"]}
```

Create the volume "test-volume" mounted at "/test/test-volume" with EC scheme "6+2+2"**CLI**

```
/opt/mapr/bin/maprcli volume
create -name test-volume -path /test/
test-volume -type rw -ecscheme
"6+2+2" -json
{
  "timestamp":1526522204072,
  "timeofday":"2018-05-16 06:56:44.072
GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully
created volume: 'test-volume'"
  ]
}
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=test-volume&path=/test/
test-volume&type=rw&ecscheme=6+2+2'
--user <username>:<password>
{"timestamp":1526522305703,"timeofday"
:"2018-05-16 06:58:25.703 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'test-volume'"]}
```

Create Volume with a Quota and an Advisory Quota

This example creates a volume with the following parameters:

- advisoryquota: 100M
- name: volumename
- path: /volume/path
- quota: 500M
- replication: 3
- schedule: 2
- topology: /East Coast
- type: rw

CLI

```
/opt/mapr/bin/maprcli volume
create -name volumename -path /
volume/path -advisoryquota 100M -quota
500M -replication 3 -schedule
```

```
2 -topology "/East Coast" -type
rw -json
{
  "timestamp":1526522474660,
  "timeofday":"2018-05-16
07:01:14.660 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
    ],
    "messages":[
      "Successfully created volume:
'volumename'"
    ]
  }
}
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=volumename&path=/
volumepath&advisoryquota=100M&quota=50
0M&replication=3&schedule=2&type=rw'
--user <username>:<password>
{"timestamp":1526522622494,"timeofday"
:"2018-05-16 07:03:42.494 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'volumename'"]}
```

Create the mirror volume "test-volume.mirror" from source volume "test-volume" and mount at "/test/test-volume-mirror"

CLI

```
/opt/mapr/bin/maprccli
volume create -name
test-volume.mirror -source
test-volume@ksTest -path /test/
test-volume-mirror -type mirror -json
{
  "timestamp":1526524458615,
  "timeofday":"2018-05-16
07:34:18.615 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
    ],
    "messages":[
      "Successfully created
volume: 'test-volume.mirror'"
    ]
  }
}
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=test-volume.mirror&path=/test/
test-volume-mirror&type=mirror&source=
test-volume@ksTest' --user
<username>:<password>
```

```
{
  "timestamp":1526524637534,"timeofday":
  "2018-05-16 07:37:17.534 GMT-0700
  PM","status":"OK","total":0,"data":
  [],"messages":["Successfully created
  volume: 'test-volume.mirror'"]}
}
```

Create volumes that inherit from a parent volume

When creating and mounting a volume, the location of the mount path is specified by the `path` parameter. Volumes can be mounted via the web console, the `maprc li` commands, or the REST commands. The `maprc li` commands include `volume create -path` command and the `maprc li volume mount -path` command if the volume was previously created. Sub-volumes (children) can inherit properties from their parent volume.

In the following example, a parent volume and two (2) child volumes are create where the child volume inherit properties from the parent. When the `inherit` flag is explicitly used, the `allowgrant` parameter for the parent volume is not required.

- For child volumes, `c1` and `c2`, inheritance is explicit because the `inherit` option is specified. Thus, `p1.c1` and `p1.c2` volumes will inherit all properties from volume `p1` (note that `p1` is not a parent of `p1.c1`) regardless of whether the `allowgrant` option is set on `p1` or not. In this case, there is an explicit inheritance ant the `allowgrant` flag is ignored and volume properties are inherited.
- For the child volume, `c3`, inheritance is implicit. Meaning, the child volume, `p1.c3`, inherits all properties from the parent volume, `p1`, only if the `allowgrant` option is set on `p1`.

CLI

```
/opt/mapr/bin/maprc li volume
create -name p1 -path /p1
/opt/mapr/bin/maprc li volume
create -name p1.c1 -inherit p1
/opt/mapr/bin/maprc li
volume create -name
p1.c2 -path /p1/c2 -inherit p1
/opt/mapr/bin/maprc li volume
create -name p1.c3 -path /p1/c3
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=p1&path=%2Fp1' --user
<username>:<password>
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=p1.c1&inherit=p1' --user
<username>:<password>
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=p1.c2&path=%2Fp1%2Fc2&inherit=p1'
--user <username>:<password>
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=p1.c3&path=%2Fp1%2Fc3' --user
<username>:<password>
```

In the following example, the `p1.child` volume normally inherits from the `p1` parent volume properties because `p1.child` is mounted under `p1` and a `allowgrant` option is set to `true` on the parent volume. However, if the child volume doesn't want to inherit properties, then set the `allowinherit` option to `false` (default: `true`).

CLI

```
/opt/mapr/bin/maprcli volume
create -name p1 -path /p1 -allowgrant
true
/opt/mapr/bin/maprcli volume
create -name p1.child -path /p1/
p1.child -allowinherit false
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=p1&path=%2Fp1&allowgrant=true'
--user <username>:<password>
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=p1.child&path=%2Fp1%2Fp1.child&a
llowinherit=false' --user
<username>:<password>
```

Create a volume with namespace container replicas**CLI**

```
/opt/mapr/bin/maprcli
volume create -name
testVol -nsminreplication
2 -nsreplication 3 -json
{
  "timestamp":1526525132522,
  "timeofday":"2018-05-16
07:45:32.522 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":[
    "Successfully created volume:
'testVol'"
  ]
}
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?name=testVol&path=/
testVol&nsminreplication=2&nsreplicati
on=3' --user <username>:<password>
{"timestamp":1526525257461,"timeofday":
"2018-05-16 07:47:37.461 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'testVol'"]}
```

Create a volume and set ACEs**CLI**

```
/opt/mapr/bin/maprcli volume
create -name testVol -readAce
p -writeAce 'g:group1&!u:user1' -json
{
  "timestamp":1526525429326,
  "timeofday":"2018-05-16
```

```
07:50:29.326 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully created volume:
'testVol'"
  ]
}
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=testVol&readAce=p&writeAce=g%3Agr
oup1%26%21u%3Auser1' --user
<username>:<password>
{"timestamp":1526525572035,"timeofday"
:"2018-05-16 07:52:52.035 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'testVol'"]}
```

Create a volume with auditing disabled for specific operations**CLI**

```
/opt/mapr/bin/maprcli volume
create -name
test-volume -auditenabled
true -dataauditops --lookup,-read,-wri
te -json
{
  "timestamp":1526525720308,
  "timeofday":"2018-05-16
07:55:20.308 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":[
    "Successfully created volume:
'test-volume'"
  ]
}
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=test-volume&path=/test/
test-volume&auditenabled=true&dataaudi
tops=%2D%2Dlookup%2C%2Dread%2C%2Dwrite
' --user <username>:<password>
{"timestamp":1526525795017,"timeofday"
:"2018-05-16 07:56:35.017 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'test-volume'"]}
```

Create a volume and grant user permissions on the volume:

CLI Example 1

```
/opt/mapr/bin/maprcli volume
create -name testVol1 -path /
testVol1 -user user1:dump
user2:fc -json
{
  "timestamp":1521162402826,
  "timeofday":"2018-03-15
06:06:42.826 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully created volume:
'testVol1'"
  ]
}
```

REST

```
curl -X POST 'https://
10.10.82.24:8443/rest/volume/create?
name=testVol&path=/
testVol&user=user1%3Adump%20user2%3Afc
' --user <username>:<password>
{"timestamp":1526526072608,"timeofday"
:"2018-05-16 08:01:12.608 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'testVol'"]}
```

CLI Example 2

```
/opt/mapr/bin/maprcli volume
create -name testVol -path /
testVol2 -user user1:dump,restore
user2:a,fc -json
{
  "timestamp":1521162467485,
  "timeofday":"2018-03-15
06:07:47.485 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":[
    "Successfully created volume:
'testVol2'"
  ]
}
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=testVol2&path=/
testVol2&user=user1%3Adump%2Crestore%2
0user2%3Aa%2Cfc' --user
<username>:<password>
{"timestamp":1526526256845,"timeofday"
:"2018-05-16 08:04:16.845 GMT-0700
PM","status":"OK","total":0,"data":
```

```
[], "messages": ["Successfully created volume: 'testVol2'"]}]}
```

Create a volume for a tenant

This example creates a volume for a tenant with the following parameters:

- name: volumename
- path: /volumepath
- advisoryquota: 500MB
- quota: 1GB
- replication: 3

CLI

```
/opt/mapr/bin/maprcli volume
create -name tenantVol -cluster
ksTest -path /egTenant -tenantuser
egTenant -advisoryquota 500M -quota

        "total": 0,
        "data": [

        ],
        "messages": [
            "Successfully created volume:
'test-volume'"
        ]
    }

```

REST

```

curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=test-volume&path=/
testVolume&type=rw&wiresecurityenabled
=true' --user <username>:<password>
{"timestamp":1526526748723,"timeofday"
:"2018-05-16 08:12:28.723 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'test-volume'"]}

```

Create a sub-volume and do not inherit schedules from the parent volume:**CLI**

```

/opt/mapr/bin/maprcli volume
create -name p1.c2 -path /p1/
p1.c2 -skipinherit schedule -json
{
    "timestamp":1505196021575,
    "timeofday":"2017-09-11
11:00:21.575 GMT-0700",
    "status":"OK",
    "total":0,
    "data": [

    ],
    "messages": [
        "Successfully created
volume: 'p1.c2'"
    ]
}

```

REST

```

curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=p1.c2&path=/p1/
p1.c2&skipinherit=schedule' --user
<username>:<password>
{"timestamp":1526526980643,"timeofday"
:"2018-05-16 08:16:20.643 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'p1.c2'"]}

```

Create a mirror volume and do not inherit the schedule(s) from the source volume:

CLI

```
/opt/mapr/bin/maprcli volume
create -name p1.m2 -path /p1/
p1.m2 -type mirror -source
p1@ksTest -skipinherit schedule -json
{
    "timestamp":1505196450141,
    "timeofday":"2017-09-11
11:07:30.141 GMT-0700",
    "status":"OK",
    "total":0,
    "data":[
        ],
    "messages":["Successfully created
volume: 'p1.m2'"]
}
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=p1.m2&path=/p1/
p1.m2&type=mirror&source=p1@ksTest&ski
pinherit=schedule' --user
<username>:<password>
{"timestamp":1526527151925,"timeofday"
:"2018-05-16 08:19:11.925 GMT-0700
PM","status":"OK","total":0,"data":
[],"messages":["Successfully created
volume: 'p1.m2'"]}
```

Create a volume and enable tiering, but do not specify the tier type and do not associate an offload rule or schedule:

CLI

```
/opt/mapr/bin/maprcli volume
create -name sampleVol -path /
sampleVol -tieringenable true -json
{
    "timestamp":1519922099117,
    "timeofday":"2018-03-01
08:34:59.117 GMT-0800 AM",
    "status":"OK",
    "total":0,
    "data":[
        ],
    "messages":["Successfully created volume:
'sampleVol'"]
}
```

REST

```
curl -X POST 'https://
10.10.82.24:8443/rest/volume/create?
name=sampleVol&path=/
sampleVol&tieringenable=true' --user
<username>:<password>
```

```
{
  "timestamp":1519922181381,"timeofday":
  "2018-03-01 08:36:21.381 GMT-0800
  AM","status":"OK","total":0,"data":
  [],"messages":["Successfully created
  volume: 'sampleVol'"]}
}
```

Create a volume, enable cold tiering, associate a rule and schedule for offloading data, and set the number of days to keep recalled data:

CLI

```
/opt/mapr/bin/maprccli volume
create -name sampleVol -path /
sampleVol -tieringenable
true -tiername
ksTestCold -tieringrule
rule1 -offloadschedule
2 -recallexpirytime 2 -json
{
  "timestamp":1519922642632,
  "timeofday":"2018-03-01
08:44:02.632 GMT-0800 AM",
  "status":"OK",
  "total":0,
  "data":[
  ],
  "messages":["
    Successfully created volume:
'sampleVol'"]
}
```

REST

```
curl -X POST 'https://

[],"messages":["Successfully created
volume: 'sampleVol3'"]}

```

Create a volume with a security policy:

CLI

```
/opt/mapr/bin/maprccli volume
create -name volTest1 -securitypolicy
LabTest -enforcementmode PolicyAceOnly
/opt/mapr/bin/maprccli volume
info -name volTest1 -columns
enforcementMode,securityPolicyTags -js
on
{
  "timestamp":1536160885967,
  "timeofday":"2018-09-05 08:21:25.967
GMT-0700 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "securityPolicyTags":["LabTest"],
      "enforcementMode":"PolicyAceOnly"
    }
  ]
}
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/create?
name=volTest1&securitypolicy=LabTest&
enforcementmode=PolicyAceOnly' --user
<username>:<password>
curl -X POST 'https://abc.sj.us:8443/
rest/volume/info?
name=volTest1&columns=enforcementmode;
PolicyAceOnly' --user
<username>:<password>
```

volume dump create

Creates a volume *dump file* containing data from a volume for distribution or restoration.

Permissions Required

dump or fc on the volume.

 **NOTE:** In a secure cluster, you must use the HPE Data Fabric user ID. Using root or any other user ID results in the system hanging.

Syntax

CLI

```
/opt/mapr/bin/maprcli volume dump
create
  [ -cluster cluster_name
  [-s startvolumepointname]
  [-e endvolumepointname]
  [-o (for dumpfile on stdout)]
  [-dumpfile dumpfilename (ignored
if -o is used)]
  -name volumename
```

REST

Reque st Type	POST
Reque st URL	http[s]://<host>:<port>/rest/ volume/dump/create?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
dumpfile	The name of the dump file (ignored if -o is used).  NOTE: Provide the absolute path for the dump file. When the absolute path is not provided, the dumpfile is stored in the /opt/mapr/apiserver/bin folder.
e	The name of the state file to create for the end point of the dump.
name	A volume name.
o	This option dumps the volume to stdout instead of to a file.
s	The start point for an incremental dump.

 **NOTE:** The data is not encrypted in the dump file created for a volume enabled for data at rest encryption.

Examples

Create a full dump:

CLI

```
/opt/mapr/bin/maprccli volume dump
create -e statefile1 -dumpfile /tmp/
fulldump1 -name volumeone
```

REST

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/dump/
create?e=statefile1&dumpfile=/tmp/
fulldump1&name=volumeone' --user
<username>:<password>
```

Create an incremental dump:**CLI**

```
/opt/mapr/bin/maprccli volume
dump create -s
statefile1 -e statefile2 -name
volumetwo -dumpfile /tmp/incrdump1
```

REST

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/dump/
create?
s=statefile1&e=statefile2&name=volumet
wo&dumpfile=/tmp/incrdump1' --user
<username>:<password>
```

Create and Maintain Volume Dump File

Describes how to create full dump files and add incremental volume dump files.

About this task

You can use `volume dump create` to create two types of files:

- *full* dump files containing all data in a volume
- *incremental* dump files that contain changes to a volume between two points in time

A full dump file is useful for restoring a volume from scratch. An incremental dump file contains the changes necessary to take an existing (or restored) volume from one point in time to another. Along with the dump file, a full or incremental dump operation can produce a *state* file (specified by the `?-e` parameter) that contains a table of the version number of every container in the volume at the time the dump file was created. This represents the *end point* of the dump file, which is used as the *start point* of the next incremental dump. The main difference between creating a full dump and creating an incremental dump is whether the `-s` parameter is specified; if `-s` is not specified, the volume create command includes all volume data and creates a full dump file. If you create a full dump followed by a series of incremental dumps, the result is a sequence of dump files and their accompanying state files:

dumpfile1 statefile1

dumpfile2 statefile2

dumpfile3 statefile3

NOTE: You can restore the volume from scratch, using the [volume dump restore](#) command with the full dump file, followed by each dump file in sequence.

When you create a dump file for a volume enabled for data at rest encryption, data in the dump file is not encrypted.

NOTE: In a secure cluster, you must use the MapR user ID. Using root or any other user ID results in the system hanging.

To create and maintain an up-to-date dump of a volume:

Procedure

1. Create a full dump file.

Example:

```
maprcli volume dump create -name cli-created -dumpfile fulldump1 -e
statefile1
```

2. Periodically, add an incremental dump file.

Examples:

```
maprcli volume dump create -s statefile1 -e statefile2 -name
cli-created -dumpfile incrdump1
maprcli volume dump create -s statefile2 -e statefile3 -name
cli-created -dumpfile incrdump2
maprcli volume dump create -s statefile3 -e statefile4 -name
cli-created -dumpfile incrdump3
```

...and so on.

volume dump show

Evaluates the validity of a dump file. The command can be run before restoring a dump file to ensure that a valid dump file is being restored.

Syntax

CLI

```
maprcli volume dump show
-dumpfile dumpfilename
[-dumpCid cid_num]
```

NOTE: The `maprccli volume dump show` command output contains the dump file details. Check the end of the output to verify if the dump file is valid or corrupted.

A valid dump file contains the following text at the end of the `maprccli volume dump show` command output.

```
Dump Successful cids: {<cid1>,
<cid2>,...<cidn>}
Dump Failed Cids: {}
```

A corrupted dump file contains the following text at the end of the `maprccli volume dump show` command output.

```
Dump Cids(having corrupted
records): {<cid1>,
<cid2>,...<cidn>} ***** InValid
DumpFile *****
```

You can use a valid dump file to restore a volume. You cannot restore a corrupted dump file. `InValid DumpFile` in the `maprccli volume dump show` command output indicates that the dump file is corrupted.

Parameters

Parameter	Description
<code>dumpfile</code>	The name of the dump file
<code>dumpCid</code>	The Container ID or cid for which details are to be printed from the dump file

Examples

CLI

Check validity of dump file

```
maprccli volume dump show -dumpfile
<dump file name>
```

Show specified CID details from dump file

```
maprccli volume dump show -dumpfile
<dump filename> -dumpCid <dumpCid>
```

volume dump restore

Restores or updates a volume from a dump file. Permissions required: `fc` or `restore` on the volume.

Syntax

CLI

```
maprccli volume dump restore
[ -cluster cluster_name ]
[ -i (read dump from stdin)]
[ -n (create new volume if it
doesn't exist)]
[ -dumpfile dumpfilename (ignored
if -i is used)]
```

```
[-full <true|false> (perform
full volume restore, default:false ]
-name volumename
```

REST

Request Type	POST
Request URL	<code>http[s]://<host>:<port>/rest/volume/dump/restore?<parameters></code>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
dumpfile	The name of the dumpfile (ignored if -i is used).
i	This option reads the dump file from stdin.
n	This option creates a new volume if it doesn't exist.
full	Perform either a full volume restore or an incremental volume restore. The default restore is incremental.
name	A volume name, in the form volumename

NOTE: In a secure cluster, you must use the HPE Data Fabric user ID. Using root or any other user ID results in the system hanging.

Examples**Restore a volume from a full dump file:****CLI**

```
maprcli volume dump restore -name
volume -dumpfile fulldump1 -full true
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/dump/restore?
name=volume&dumpfile=fulldump1&full=tr
ue' --user <username>:<password>
```

Apply an incremental dump file to a volume:**CLI**

```
maprcli volume dump restore -name
volume -dumpfile incrdump1
```

REST

```
curl -X POST 'https://abc.sj.us:8443/
rest/volume/dump/restore?
name=volume&dumpfile=incrdump1' --user
<username>:<password>
```

Restore Volume From a Dump

Describes how to restore from full and incremental dump files.

About this task

There are two ways to use volume dump restore:

- With a full dump file, `volume dump restore` recreates a volume from scratch from volume data stored in the dump file.
- With an incremental dump file, `volume dump restore` updates a volume using incremental changes stored in the dump file.

The volume that results from a `volume dump restore` operation is a mirror volume whose source is the volume from which the dump was created. After the operation, this volume can perform mirroring from the source volume.

When you are updating a volume from an incremental dump file, you must specify an existing volume and an incremental dump file. To restore from a sequence of previous dump files would involve first restoring from the volume's full dump file, then applying each subsequent incremental dump file.

NOTE: In a secure cluster, you must use the Data Fabric user ID. Using root or any other user ID results in the system hanging.

A restored volume may contain mount points that represent volumes that were mounted under the original source volume from which the dump was created. In the restored volume, these mount points have no meaning and do not provide access to any volumes that were mounted under the source volume. If the source volume still exists, then the mount points in the restored volume will work if the restored volume is associated with the source volume as a mirror.

To restore from a full dump plus a sequence of incremental dumps:

Procedure

1. Restore from the full dump file, using the `-n` option to create a new mirror volume and the `-name` option to specify the name.

```
maprcli volume dump restore -dumpfile fulldump1 -name restore1 -n
```

2. Restore from each incremental dump file in order, specifying the same volume name.

```
maprcli volume dump restore -dumpfile incrdump1 -name restore1 maprcli
                                volume dump restore -dumpfile incrdump2 -name
restore1 maprcli volume dump restore
                                -dumpfile incrdump3 -name restore1
```

volume fixmountpath

Corrects the mount path of a volume. Permissions required: `fc` or `m` on the volume.

The CLDB maintains information about the mount path of every volume. If a directory in a volume's path is renamed (by a `hadoop fs` command, for example) the information in the CLDB will be out of date. The `volume fixmountpath` command does a reverse path walk from the volume and corrects the mount path information in the CLDB.

Syntax**CLI**

```
maprcli volume fixmountpath
-name <name>
[ -cluster <clustername> ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/fixmountpath?<parameters>

Parameters

Parameter	Description
name	The volume name.
cluster	The cluster name

Examples**Fix the mount path of volume v1:****CLI**

```
maprcli volume fixmountpath -name v1
```

REST

```
https://abc.sj.us:8443/rest/volume/fixmountpath?name=v1
```

volume info

Displays information about the specified volume. For JSON formatted output, use the -json option when running the command.

Syntax**CLI**

```
maprcli volume info
[ -cluster <cluster name> ]
[ -output verbose. default:
verbose ]
[ -path <mount directory> ]
[ -name <volume name> ]
[ -columns comma separated list
of column names. default: all ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/volume/info?<parameters>

Parameters

You must specify either name or path, but not both.

Parameter	Description
cluster	The cluster on which to run the command.
columns	A comma-separated list of fields to return in the query. See the Fields table on the volume command page. Default: all
name	The volume name for which to retrieve information. When issuing the <code>maprcli volume info -columns</code> and <code>maprcli volume list -columns</code> commands, the column for the volume name is <code>volumename</code> .
output	Indicates whether the output should be terse or verbose. Default: verbose
path	The mount path of the volume for which to retrieve information.

Output

For definitions of the output fields, and short names for use with filters, see the [Fields](#) table on the volume command [page](#).

Examples

Return information on standard volume named `test_vol`:

CLI

```
/opt/mapr/bin/maprcli volume
info -name test_vol -json
{
  "timestamp":1666959376858,

```

Return security policy related information for a volume:

In the following example, the volume named `my_volume` is tagged with two security policies, `Lab_Security_Policy` and `Sensitive_Data`. The enforcement mode was not specified during volume creation, and is set to the default value of `PolicyAceAndDataAce`.

CLI

```

/opt/mapr/bin/maprccli volume
info -name my_volume -json
{
  "timestamp":143018287317,
  "timeofday":"2019-02-05
15:45:22.130 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    "volumename":"my_volume",
    "volumeAces":{"
      "writeAce":"p",
      "readAce":"p",
    "securitypolicy":"Lab_Security_Policy,
Sensitive_Data",
    "enforcementmode":"PolicyAceAndDataAce
"
  },
    ... other properties ...
  ]
}

```

REST

```
curl -k -X GET 'https://
abc.sj.us:8443/rest/volume/info?
name=my_volume' --user mapr:mapr

{"timestamp":143018287317,"timeofday":
"2019-02-05 15:45:22.130 GMT-0700 PM",
  "status":"OK","total":1,"data":
[{"volumename":"my_volume",
  "volumeAces":
{"writeAce":"p","readAce":"p",

"securitypolicy":"Lab_Security_Policy,
Sensitive_Data",

"enforcementmode":""PolicyAceAndDataAc
e"}]]}]}
```

Return snapshot information for a volume when a snapshot restore operation is in progress:

In the following example, the volume named my_volume has a snapshot restore operation in progress, and the snapshot is named s1.

CLI

```
/opt/mapr/bin/maprcli volume
info -name my_volume -json
{
  "timestamp":143018287317,
  "timeofday":"2019-02-05
15:45:22.130 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    "volumename":"my_volume",
    "snapshotRestore":{

"snapshotname":"s1",

"snapshotid":256000049,

"inprogress":true,

"seqnum":602446,

"numcontainerstotal":6,

"numcontainersinprogress":2
    },
    ... other properties ...
  ]
}
```

REST

```
curl -X GET --user <username>
'https://abc.sj.us:8443/rest/volume/
info?name=my_volume'

{"timestamp":143018287317,"timeofday":
"2019-02-05 15:45:22.130 GMT-0700 PM",

"status":"OK","total":1,"data":
[{"volumename":"my_volume",
```

```

        "snapshotRestore":
        {"snapshotname":"s1", "snapshotid":2560
00049,

        "inprogress":true, "seqnum":602446, "num
containerstotal":6,

        "numcontainersinprogress":2}}}]}
```

Return snapshot information for a volume when the snapshot restore operation is NOT in progress:

In the following example, the volume named my_volume does not have a snapshot restore operation in progress.

CLI

```

/opt/mapr/bin/maprcli volume
info -name my_volume -json
{

    "timestamp":143018287317,

    "timeofday":"2019-02-05 15:45:22.130
GMT-0700",

    "status":"OK",

                                "total":1,
                                "data":[

    "volumename":"my_volume",

    "snapshotRestore":{
    "snapshotname":"s1",
    "snapshotid":256000049,
    "inprogress":false,
    "seqnum":602446,
                                },
                                ... other
    properties ...
    ]
}
```

REST

```

curl -X GET --user <username>
'https://abc.sj.us:8443/rest/volume/
info?name=my_volume'

{"timestamp":143018287317,"timeofday":
"2019-02-05 15:45:22.130 GMT-0700 PM",

"status":"OK","total":1,"data":
[{"volumename":"my_volume",

"snapshotRestore":
{"snapshotname":"s1", "snapshotid":2560
00049,
```

```
"inprogress":false,"seqnum":602446}}]]}
```

Return mirroring information for a volume when mirroring is in progress:

In the following example, the volume named `mirrorvol` is the mirror, while `testvol` is the source volume.

CLI

```
/opt/mapr/bin/maprccli volume
info -name mirrorvol -json
{
  "timestamp":143018287317,
  "timeofday":"2019-02-05
15:45:22.130 GMT-0700",
  "status":"OK",
  "total":1,
  "data":[
    "volumename":"mirrorvol",
    .... other properties ....
    "mirrorthrottle":"1",

Adds a label to disks or a storage pool. Permissions required: fc or a.

[label add](#) on page 2551

Registers a label. Permissions required: fc or a.

[volume create](#) on page 2929

Creates a volume.

[volume move](#) on page 3039

Moves the specified volume or mirror to a different topology. Permissions required: m or fc on the volume.

[label list](#) on page 2555

Lists registered labels. Permissions required: fc or a.

[node list](#) on page 2570

Lists nodes in the cluster.

[dump volumeinfo](#) on page 2468

Returns information about volumes and the associated containers. For JSON formatted output, use the -json option from the command line.

[configure.sh](#) on page 3186

Describes the syntax and parameters of the `configure.sh` script that you run for a number of tasks including setting up HPE Data Fabric client nodes, and configuring services for a node.

volume link create

Creates a link to a volume. Permissions required: fc or m on the volume.

Syntax**CLI**

```
maprcli volume link create
[ -cluster <clustername> ]
-path <link path>
-type <type>
-volume <volume>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/link/create?<parameters>

Parameters

Parameter	Description
path	The -path parameter specifies the link path: /link Example: /home/abc/.rw
type	The volume type: writeable or mirror.
volume	The volume name.
cluster	The cluster name.

Examples

Create a link to v1 at the path v1. mirror:

CLI

```
maprcli volume link create -volume
v1 -type mirror -path /v1.mirror
```

REST

```
https://abc.sj.us:8443/rest/
volume/link/create?path=/
v1.mirror&type=mirror&volume=v1
```

volume link remove

Removes the specified symbolic link. Permissions required: fc or m on the volume.

Syntax**CLI**

```
maprcli volume link remove
-path <path>
[ -cluster <clustername> ]
```

REST

Request Type	POST
--------------	------

Request URL	http[s]://<host>:<port>/rest/volume/link/remove?<parameters>
-------------	--

Parameters

Parameter	Description
path	<p>The symbolic link to remove. The path parameter specifies the link path and other information about the symbolic link, using the following syntax: /link/[maprfs::][volume::]<volume type>::<volume name></p> <ul style="list-style-type: none">• link - the symbolic link path *maprfs - a keyword to indicate a special MapR filesystem link• volume - a keyword to indicate a link to a volume• volume type - writeable or mirror• volume name - the name of the volume <p>Example: /abc/maprfs::mirror::abc</p>
cluster	The cluster name.

Examples

Remove the link /abc:

CLI

```
maprcli volume link remove -path /abc/maprfs::mirror::abc
```

REST

```
https://abc.sj.us:8443/rest/volume/link/remove?path=/abc/maprfs::mirror::abc
```

volume list

Lists information about volumes specified by name, path, or filter.

See the Fields table on the [volume](#) on page 2909 page for the fields available to filter. See the [Filters](#) on page 2270 for more information.

Syntax

CLI

```
/opt/mapr/bin/maprcli volume
                             list
                             [ -cluster
cluster_name ]               [ -output verbose.
```

```

default: verbose ]
[ -start start.
default: 0 ]
[ -limit limit.
default: 2147483647 ]
[ -filter none.
default: none ]
[ -nodes nodes ]
[ -columns comma
separated list of column names.
default: all ]
[ -alarmedvolumes
alarmonly. default: false ]

[ -sortby <volumeowner|
volumenumreplicas|volumeminreplicas|
volumerackpath|volumemountdir|
volumename|volumequota|volumeused|
volumequotaadvisory|volumeaename|
volumeaetype|volumeschedule|
volumetype|volumemirrortype|
volumemirrorpercentcomplete|
volumesnapshotcount|volumeid|

volume allowreadforexecute|
volume datacntrl label|
volumenamecntrl label>, column
names of supported fields. ]
[ -sortorder
<asc|desc> ]
[ -honoraces
honoraces. default: false ]

```

NOTE: For JSON formatted output, use the `-json` option when running `volume list` from the command line.

REST

Request Type	GET
Request URL	<code>http[s]://<host>:<port>/rest/volume/list[?<parameters>]</code>

Parameters

Parameter	Description
cluster	The cluster name on which to run the command.
output	Specifies whether the output should be terse or verbose. Default: verbose

Parameter	Description
start	The offset from the starting row according to sort. Default: 0
limit	The number of rows to return, beginning at start. Default: 2147483647
filter	A filter specifying volumes to list. See Filters on page 2270 for more information. Default: none
nodes	A list of nodes. If specified, volume list only lists volumes on the specified nodes.
columns	A comma-separated list of fields to return in the query. See the volume on page 2909 table on the volume page. When issuing the <code>maprcli volume info -columns</code> and <code>maprcli volume list -columns</code> commands, the column for the volume name is <code>volumename</code> .
alarmedvolumes	Specifies whether (1) or not (0) to list alarmed volumes only. Default: 0
sortby	Specifies one of the following attributes to sort the list of volumes by: <code>volumeowner</code> , <code>volumenumreplicas</code> , <code>volumeminreplicas</code> , <code>volumerackpath</code> , <code>volumemountdir</code> , <code>volumename</code> , <code>volumequota</code> , <code>volumeused</code> , <code>volumequotaadvisory</code> , <code>volumeaename</code> , <code>volumeaetype</code> , <code>volumeschedule</code> , <code>volumetype</code> , <code>volumemirrorpercentcomplete</code> , <code>volumesnapshotcount</code> , <code>volumeid</code> , <code>volumenamecontainersize</code> , <code>volumecontainerpath</code> , <code>volumesnapshotused</code> , <code>volumetotalused</code> , <code>volumelogicalused</code> , <code>volumecontainercount</code> , <code>volumemirrorschedule</code> , <code>volumeaccessime</code> , <code>volumenamespacecontainernumreplicas</code> , <code>volumenamespacecontainerminreplicas</code> , <code>volumerereplicationtimeoutsec</code> , <code>volumeecriticalrereplicationtimeoutsec</code> , <code>volumecreatetime</code> , <code>volumedareenabled</code>
sortorder	Specifies whether the list of volumes is sorted in an ascending or a descending order. Sorting of records is based on the value specified for the <code>sortby</code> parameter.
honoraces	The parameter facilitates the filtering of volumes for listing purpose, based on the volume-level permissions of the currently logged in user. When you set the values as true, volume information for the volumes on which the current user has read/write permissions, is displayed. The default value for the <code>honoraces</code> parameter is false.

Output

Information about the specified volumes.

For standard and mirror volumes (not enabled for tiering), the output looks similar to the following:

```

Fields

For definitions of the output fields, and short names for use with filters, see the [Fields](#) table on the [volume command page](#).

Examples

List all volumes

CLI

```
/opt/mapr/bin/maprcli volume
list -json
```

REST

```
https://10.10.82.23:8443/rest/volume/
list
```

List the first ten volumes

The `start` and `limit` parameters are useful for windowing the results. You can list the first ten volumes, then the next ten, and so on.

CLI

```
/opt/mapr/bin/maprcli volume
list -start 0 -limit 10 -json
```

REST

```
curl -X
GET 'https://server.sj.us:8443/rest/
node/list?start=0&limit=10' --user
<username>:<password>
```

Filter by aename

CLI

```
maprcli volume list -filter
'[aename==mapr]' -columns volumeid
volumeid
243256560
139026416
192452723
1
237238261
185847104
83335307
97256251
248672744
206179696

```

Filter the list of volumes that the logged in user has permissions on

CLI

```

# maprcli volume list -honoraces
true -json

```

REST

```

curl -X
GET 'https://server.sj.us:8443/rest/
volume/list?honoraces=true --user
<username>:<password>

```

volume mirror push

Pushes the changes in a volume to all of its mirror volumes in the same cluster, and waits for each mirroring operation to complete.

Use this command when you need to push recent changes.

Syntax

CLI

```
maprcli volume mirror push
[ -cluster <cluster> ]
-name <volume name>
[ -verbose true|false ]
```

REST

None.

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
name	The volume to push.
verbose	Specifies whether the command output should be verbose. Default: true

Output

Sample Output

```
Starting mirroring of volume mirror1
Mirroring complete for volume mirror1
Successfully completed mirror push to all local mirrors of volume volume1
```

Examples

Push changes from the volume "volume1" to its local mirror volumes:

CLI

```
maprcli volume mirror push -name
volume1 -cluster mycluster
```

volume mirror start

Starts mirroring on the specified volume from its source volume.

- License required: Enterprise Edition
- Permissions required: fc or restore on the volume

When a mirror is started, the mirror volume is synchronized from a hidden internal snapshot so that the mirroring process is not affected by any concurrent changes to the source volume. The `volume mirror start` command does not wait for mirror completion, but returns immediately. The changes to the mirror volume occur atomically at the end of the mirroring process; deltas transmitted from the source volume do not appear until mirroring is complete.

To provide rollback capability for the mirror volume, the mirroring process creates a snapshot of the mirror volume before starting the mirror, with the following naming format: `<volume>.mirrorsnap.<date>.<time>`.

Normally, the mirroring operation transfers only deltas from the last successful mirror. Under certain conditions (mirroring a volume repaired by `fsck`, for example), the source and mirror volumes can become out of sync. In such cases, it is impossible to transfer deltas, because the state is not the same for both volumes. Use the `-full` option to force the mirroring operation to transfer all data to bring the volumes back in sync.

NOTE: If you are creating a local mirror of the root volume, root(/) points to the mirror volume, hence root is read-only. For read-write copy of root (/), you must use the special path, /.rw

Syntax

CLI

```
maprcli volume mirror start
[ -cluster <cluster> ]
[ -full true|false ]
-name <volume name>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/mirror/start?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
full	Specifies whether to perform a full copy of all data. If false, only the deltas are copied.
name	The volume for which to start the mirror.

Output

Sample Output

```
messages
Started mirror operation for volumes 'testMirror'
```

Examples

Start mirroring the mirror volume "testMirror":

CLI

```
maprcli volume mirror start -name
testMirror
```

REST

```
https://abc.sj.us:8443/rest/volume/
mirror/start?name=testMirror
```

volume mirror status

Displays the status of the mirroring operation in progress. Use this command to examine the progress of mirroring.

- License required: Enterprise Edition
- Permissions required: fc or restore on the volume

The status command displays the statistics of the mirroring operation including the total number of container IDs to resync, the current status of the mirroring, the number of indoes in use for the mirror, the container ID information for the source and destination volumes, and the error code if any, to name a few.

Syntax

CLI

```
maprccli volume mirror status
[ -cluster cluster_name ]
  -name name
  [ -start start. default: 1 ]
  [ -limit limit. default:
2147483647 ]
  [ -verbose <true/false> if true,
will displayed detailed container
information. default: true ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/mirror/status?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
name	The volume for which to determine the mirror status.
start	The container to start with.
limit	The number of containers for which to display status.
verbose	Whether to display a terse output or display full statistics.

Examples

Check the status of the mirroring on mirror volume "testvol":

CLI

```
maprccli volume mirror status -name
testvol -json

**** Displays mirroring statistics.
****
*** Here, it is resyncing
destination containers ****

mirror/status?name=testvol
```

volume mirror stop

Stops mirroring on the specified volume.

- License required: Enterprise Edition
- Permissions required: fc or restore on the volume

The `volume mirror stop` command lets you stop mirroring (for example, during a network outage). You can use the `volume mirror start` command to resume mirroring.

Syntax

CLI

```
maprcli volume mirror stop
[ -cluster <cluster> ]
-name <volume name>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/mirror/stop?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
name	The volume for which to stop the mirror.

Output

Sample Output

```
messages
Stopped mirror operation for volumes 'testMirror'
```

Examples

Stop mirroring the mirror volume "testMirror":

CLI

```
maprcli volume mirror stop -name
testMirror
```

REST

```
https://abc.sj.us:8443/rest/volume/
mirror/stop?name=testMirror
```

volume modify

Modifies an existing volume. Permissions required: m or fc on the volume.

An error occurs if the name or path refers to a non-existent volume, or cannot be resolved.

Syntax

CLI

```
/opt/mapr/bin/maprcli volume modify

REST

Request Type	POST
Request URL	<pre> http[s]://<host>:<port>/ rest/volume/modify? <parameters> </pre>

Parameters

Parameter: **advisoryquota**

Possible Values: 0 or any other integer value.

Description: The advisory quota for the volume as integer plus unit. Example: quota=500G;
Units: B, K, M, G, T, P

Parameter: **ae**

Possible Values: Name of the entity that owns the volume.

Description: The accounting entity that owns the volume.

Parameter: **aetype**

Possible Values:

- 0=user
- 1=group

Description: Type of accounting entity.

Parameter: **allowgrant**

Possible Values:

- true
- false

Description: Specifies whether the volume as a parent, grants permission for a child volume to inherit its properties.

Parameter: **allowreadforexecute**

Possible Values:

- true
- false

Description: Allows execution of SUID binaries with only their executable bit set, on a FUSE file system. This parameter works in conjunction with the `fuse.mount.setuid` FUSE option. For more information, see [Configuring the HPE Data Fabric FUSE-Based POSIX Client](#) on page 1876.

Parameter: **auditenabled**

Possible Values:

- true
- false

Description: Specifies whether to turn on auditing for the volume. If you enable auditing at the cluster level with the [audit data](#) on page 2311 command, setting this value to true causes auditing to start for any directories, files, tables, or streams that are already enabled for auditing. If none are yet enabled, enabling auditing on any of them causes auditing of them to start.

Set `auditenabled` to true to enable auditing on directories, files, tables, and streams in the volume.

You must have the `fc` permission on the cluster to use this parameter. See [acl](#) for details about this permission.

Parameter: **autooffloadthresholdgb**

Possible Values: Any positive integer.

Description: The size of the volume in GB (threshold). When this threshold is reached or exceeded, volume

Parameter: `cluster`

data is automatically offloaded by the Automatic Tiering Scheduler. To use the global size threshold (of 1024 GB), set the value to 0.

Possible Values: Any valid cluster.

Description: The cluster on which to run the command.

Parameter: `coalesce`

Possible Values: Set this parameter to a large number of minutes to prevent audit logs from growing quickly.

Description: The interval of time (in minutes) during which READ, WRITE, or GETATTR operations on one file from one IP address or UID are logged only once for a particular operation, if auditing is enabled.

For example, suppose that a client application reads a single file three times in 6 minutes, so that there is one read at 0 minutes, another at 3 minutes, and a final read at 6 minutes. If the coalesce interval is at least 6 minutes, then only the first read operation is logged. However, if the interval is 4 minutes, then only the first and third read operations are logged. If the interval is 2 minutes, all three read operations are logged.

Now however, if the client was also writing to the file, irrespective of the coalesce interval for the read operation in the example stated previously, the write operation is logged, as it is a different operation from reading.

Parameter: `compactionoverheadthreshold`

Possible Values: 0-100%

Description: Specifies the percentage of offloaded data that must have been deleted on the cluster to qualify the data for compaction (or deletion from the tier).

Parameter: `compactionschedule`

Possible Values: Any valid schedule ID.

Set this parameter to 0 to disable the compactor.

Description: Specifies the schedule to use for running the compactor. By default, the compactor runs on an automatic internal schedule.

Parameter: `containerallocationfactor`

Recommended value: 2* SP count in the volume topology.

Description: Specifies the number of containers to create when the first write from a remote client is sent to the volume. The pre-created containers are distributed equally across topologies, servers, file system instances, and storage pools. CLDB also takes into consideration the load (IO/Space) when selecting target storage pools for containers. The value must be a positive integer.

Parameter: `criticalrereplicationtimeoutsec`

Possible Values: Any integer between 300 and 3600 (seconds)

Description: Timeout (in seconds) before re-replicating only the critically under-replicated containers. If you set both `rereplicationtimeoutsec` and `criticalrereplicationtimeoutsec`, and if the value of:

- `rereplicationtimeoutsec` is less than `criticalrereplicationtimeoutsec`, `rereplicationtimeoutsec` overrides the `criticalrereplicationtimeoutsec` setting for both under-replicated and critically under-replicated containers.
- `rereplicationtimeoutsec` is greater than `criticalrereplicationtimeoutsec`, `criticalrereplicationtimeoutsec` overrides the `rereplicationtimeoutsec` setting only for critically under-replicated containers; `rereplicationtimeoutsec` setting is still applicable for under-replicated containers.

Parameter: dataauditops

Possible Values: Any audit operations that you want to enable.

Description: The comma separated list of file system operations to include (specified with a preceding plus sign (+)) or exclude (specified with a preceding minus sign (-)) from auditing.

To exclude the first operation in the list (of operations) from auditing, precede it by two minus (- -) signs. To exclude subsequent operations, precede them by only a single minus (-) sign, irrespective of whether the first operation was included (using a plus (+) sign) or excluded (using two minus (- -) signs). If neither sign is specified, the given operation is included for auditing.

The operations that can be included (+) or excluded (-) from auditing are listed [here](#). You can, alternatively, group all the operations using the keyword `all`, which:

- If included (+), cannot be specified with a list of other included operations.
- If excluded (-), cannot be specified with a list of other excluded operations.

You can specify a mixed list of included and excluded operations. There is no change to operations that are not specified with the command.

NOTE: Enabling `setattrr` automatically enables the following operations:

- `chown`
- `chgrp`
- `chperm`

If you disable `setattrr`, these operations are automatically disabled. If you do nothing with `setattrr` (neither enable nor disable), you can enable or disable `chown`, `chgrp`, and `chperm` in any combination and they will not affect `setattrr`.

TIP: For more information, see [Selective Auditing of Filesystem and Table Operations](#).

Parameter: disableddataauditops

Possible Values: Any audit operations that you want to disable.

Description: The comma-separated list of disabled file system audit operations to set. This parameter is an alternate way of setting audit operations as compared to the `dataauditops` option. Plus (+) or minus signs (-) are not allowed for this option. Any audit operation that is specified with this option replaces any existing disabled audit operations configured for this security policy, while any audit operations that are not specified, are enabled.

Merging of the specified audit operations with existing audit operations is not performed, as with the `dataauditops` option.

Parameter: dbindexlagsecalarmthresh

Possible Values: Any integer value.

Description: Specifies the threshold (in seconds) to raise an alarm for index update lag.

Parameter: dbrepllagsecalarmthresh

Possible Values: Any integer value.

Description: Specifies the threshold (in seconds) to raise an alarm for DB replication lag.

Parameter: ecenable

Possible Values:

- true
- false

Description: Enable (true) warm tiering for the volume only if it is already not enabled. When specified, you cannot specify `tiername` to use an existing warm-tier; when the command runs, a new tier and rule are automatically created for the volume.

`ecenable` works only if you have set `tieringenable` to true at the time of volume creation.

When modifying volumes, `ecenable` does not automatically set `tieringenable` to true as in the case of volume creation.

Setting this parameter to false is the same as not specifying this parameter, and does nothing.

Parameter: ecscheme

Possible Values: Any valid EC scheme.

Description: The number of data chunks and the number of parity chunks separated by a plus (+) sign. The default scheme is 4+2. For information on the supported schemes, see [Erasure Coding Scheme for Data Protection and Recovery](#) on page 1504.

NOTE: This parameter is applicable only for EC volumes, and only when you set the `ecenable` parameter to true.

Parameter: ectopology

Possible Values: Any topology that exists in your environment.

Description: Sets the topology of the erasure coded volume if it is not set.

NOTE: This parameter is applicable only for EC volumes.

Once set, you cannot change the topology of an erasure coded volume using this command. To change the topology of an erasure coded volume, use [volume move](#) on page 3039

Parameter: enforcementmode

Possible Values:

- PolicyAceOnly
- PolicyAceAndDataAce
- DataAceOnly
- PolicyAceAuditAndDataAce

Description: The enforcement mode when evaluating authorization for data access. Permitted values are as follows:

- PolicyAceOnly: Determines data access authorization based only on the ACEs set in security policies. Ignores POSIX mode bits and ACEs directly defined on data objects when determining access rights, if a data object is tagged with at least one security policy. If a data object is not associated with at least one security policy, the system will enforce POSIX mode bits and ACEs directly defined on the data object. Volume-level ACEs are always enforced.
- PolicyAceAndDataAce: Determines data access authorization based on the ACEs set in security policies AND ACEs or POSIX mode bits directly set on data objects.
- DataAceOnly: Determines data access authorization based on the ACEs or POSIX mode bits directly set on data objects. You can use this mode to switch off the policy-based security feature, on a per-volume basis, in an emergency situation.
- PolicyAceAuditAndDataAce: Use this mode when testing security policies. In this mode:
 - ACEs defined directly on data objects are enforced.
 - Data objects associated with security policies are checked for access, and any access denied events are audited, but access itself is allowed.

See the section on [Volume-Level Security Policy Enforcement Mode](#) on page 932 for a discussion on how to determine permission to access a resource, when this flag is set.

Parameter: enforceminreplicationforio

Possible Values:

- true
- false

Description: Specifies whether (true) or not (false) to enforce minimum number of replicas for the (read-write) volume during IO. This flag ensures that further updates (writes) to volume are successful only

when the minimum number of copies of the container are available. Setting this parameter to `true` ensures that if writes succeed, then it has been applied to at least the minimum number of copies; if writes fail, it may have been applied to zero or more copies.

Enabling this parameter, may stall `volume dump` and `volume snapshot create` operations, if the minimum number of copies of the container are not available.

If you do not set this parameter on a volume, or if you modified this parameter from `false` to `true`, then you need to restart all the nodes where the containers associated with the volume exist, for the changes to take effect.

This flag is ignored on mirror volumes.

Parameter: `filefilter`

Possible Values: Any file filter.

Description: Specifies the file filter to use to prevent specific types of files from being stored on the volume. For more information, see [Prevent Storage of Specified Types of Files](#) on page 912. You can associate only one filter for each volume.

NOTE: To remove the filter from a volume, use the special filter `""`.

Parameter: `forceauditenable`

Possible Values:

- `true`
- `false`

Description: Specifies whether (`true`) or not (`false`) to force audit of operations on all files, tables, and streams in the volume if auditing is enabled at the cluster and volume levels, irrespective of the audit setting on the individual directory, file, table, and stream.

Parameter: `group`

Possible Values: Any user with Create Volume privileges.

Description: Space-separated list of `group:permission` pairs.

Parameter: `honorrackreliability` <`ec-rack-reliability` : `true` | `false`>

NOTE: The `honorrackreliability` parameter considers each rack as a site.

Description: Allocates CGs for maximized resiliency during a site failure. CG containers are spread across multiple sites so that a site does not host more parity containers for a given CG (EC scheme: D+P). Container allocations for a CG with previous software use one container per site for a CG. Managing new allocation in this manner (where `honorrackreliability` is set to `true`) ensures that CG data is available for reads, even in cases where an entire site goes down. For a given EC D+P scheme, CG allocation requires, at least, $\text{Math.ceil}((D+P)/P)$ site for CG creation, and if enough sites are unavailable, CG allocation fails.

NOTE: To use `-honorrackreliability` in a cluster with geographically-dispersed nodes, you must configure a topology with multiple racks having enough nodes in each rack. Specifying the configured topology as `-ectopology` ensures that `RackReliabilitySelector` allocates the most P containers per rack during CG allocations.

NOTE: If a container needs to be reallocated for rebuild, the new container is allocated in the same rack in which the old container resided. If this allocation cannot be done, a new container can be allocated from a different rack so that the number of containers for the CG in the new rack is less than or equal to the number of P containers. Otherwise, container allocation fails.

Parameter: `maxinodesalarmthreshold`

Possible Values: Any positive integer.

Description: The number of inodes, which when exceeded raises the `INODES_EXCEEDED` alarm.

Parameter: `maxnssizebalarmthreshold`

Possible Values: Any positive integer.

Description: The namespace container size, which when exceeded raises the `INODES_EXCEEDED` alarm.

Parameter: `metricsenabled`

Possible Values:

- `true`
- `false`

Description: Specifies whether (`true`) or not (`false`) to enable metrics collection for a volume.

Parameter: `minreplication`

Possible Values: Can be any value that you desire based on the replication you need.

Description: The minimum replication level. When the replication factor falls below this minimum, re-replication occurs as aggressively as possible to restore the replication level. If any containers in the CLDB volume fall below the minimum replication factor, writes are disabled until aggressive re-replication restores the minimum level of replication.

TIP: For more information, see [Understanding Replication](#) on page 560.

Parameter: `mirrorschedule`

Possible Values: 0 or a valid schedule ID.

Description: The schedule ID corresponding to the schedule to be used for mirroring. If you specify a mirror schedule ID, the mirror volume automatically syncs with its source volume on the specified schedule. Pre-assigned IDs include 1 for critical data, 2 for important data, and 3 for normal data. Custom schedules are assigned ID numbers in sequence. To determine the ID number, use the `schedule list` command. To disable the schedule, set this parameter to 0.

Parameter: `mirrorthrottle`

Possible Values:

- true
- false

Description: Specifies whether mirror throttling is enabled (true) or disabled (false). Throttling is set on the source volume and applies to all its mirrors.

Parameter: namecontainerdatathreshold

Possible Values: Any integer value.

If you set this parameter to 0, there is no limit on the size of user data that can be stored in the name container.

Description: Limits the size of user data that can be placed in the name container. The value is interpreted as being in MB. If the user data size limit:

- Has not yet been reached, the first 64 KB of data is stored in name container, and the rest of the data is stored in data containers.
- Has already been reached, only meta data is stored in the name container, and the data is stored in data containers. For example, if you set the current name container size to 200GB and the limit to 100GB, then all new user data is stored in data containers.

Parameter: nsminreplication

Possible Values: Any integer value.

Description: When the replication factor falls below this value, re-replication occurs as aggressively as possible to restore the replication level. If any containers in the CLDB volume fall below the minimum replication factor, writes are disabled until aggressive re-replication restores the minimum level of replication.

When enabled, the CLDB manages the namespace container replication separate from the data container replication. You use this capability when you have low volume replication but want to have higher namespace replication.

Set the value to be the same or larger than the value of the equivalent data replication parameter, minreplication.

See also: [Understanding Replication](#) on page 560.

Parameter: nsreplication

Possible Values: Any integer value.

Description: The desired namespace container replication level.

When the number of copies falls below the desired replication factor, but remains equal to or above the minimum replication factor, re-replication occurs after the timeout specified in the `cldb.fs.mark.rereplicate.sec` parameter. This timeout is the time given for a node that is down to come back online. After this timeout period, the CLDB takes the action required to restore the replication factor.

When enabled, the CLDB manages the namespace container replication separate from the data container replication. Use this capability when you have low volume replication but want to have higher namespace replication.

By default, the value of this parameter is the same or larger than the value of the equivalent data replication parameter, `replication`. However, to set the value of this parameter lower than the `replication` value, first set `engg.manual.override` to `true` in `cldb.conf`.

See also: [Understanding Replication](#) on page 560.

Parameter: name

Possible Values: Not Applicable.

Description: The name of the volume to modify.

Parameter: numactivecgcontainers

Possible Values: Any integer between 1 and 100.

Description: Number of containers to be assigned for a CG assign request.

Parameter: offloadschedule

Possible Values: Any valid schedule ID. To disable schedule-based offload, set this value to 0.

Description: The ID of the schedule to associate with the volume for offloading volume data to the tier.

NOTE: This parameter is required only for Cold/EC tiered volumes.

Parameter: quota

Possible Values: Any integer value along with a unit.

Description: The quota for the volume as integer plus unit. Example: `quota=500G`; Units: B, K, M, G, T, P

Do not use two-letter abbreviations for quota units, such as GB and MB.

When you set a quota for a tiering-enabled volume, the quota is the total space allocated for the volume irrespective of the location (cluster or tier) where the volume data is stored. For example, if you allocate 1GB of hard quota for a tiering-enabled volume, writes fail after you write 1GB of data whether or not the volume data is local (on the cluster) or offloaded (to the tier).

Note that quotas for source and mirror volumes must match.

Parameter: readAce

Possible Values: Any valid permissions.

Description: Specifies [Access Control Expressions](#) (ACEs) that grant permissions at the volume level to read files and tables in the volume. The default value is `p`, which grants access to all users.

See [ACEs](#).

Parameter: readonly

Possible Values:

- 0
- 1

Description: Specifies whether the volume is read-only.

- 0 - read/write
- 1 - read-only

Parameter: recallexpirytime

Possible Values: Any integer between 1 and 7500.

Parameter: replication

Description: The amount of time (in days) to keep the recalled data before purging or offloading it.

Possible Values: Any integer starting at 0.

Description: The desired replication level. When the number of copies falls below the desired replication factor, but remains equal to or above the minimum replication factor, re-replication occurs after the timeout specified in the `cldb.fs.mark.rereplicate.sec` parameter. Note that this timeout is the time given for a node that is offline to come back online. After this timeout period, the CLDB takes action to restore the replication factor.

TIP: For more information, see [Understanding Replication](#) on page 560.

Parameter: rereplicationtimeoutsec

Possible Values: Any positive integer.

Description: Timeout (in seconds) before attempting re-replication of replica containers. This volume property defines the timeout period until CLDB starts re-replicating the containers on the node of the volume after CLDB stops receiving a heartbeat from the node.

When a node is down, CLDB gives the node an hour to come back online before it takes any action for the containers on this node. You can set this parameter on volumes to reduce the default 1 hour to a shorter time period. This option is provided mainly for local volumes, so that when the file system is down, CLDB can give up quickly and decide that the container has no master. This forces the TT to give up on local containers, and take the appropriate recovery action of deleting the mapped volume and creating another one.

Parameter: schedule

Possible Values: 0 or a valid schedule ID.

Description: The ID of a schedule. Use the [schedule list](#) command to find the ID of the named schedule that you want to apply to the volume.

To disable the schedule, set this parameter to 0.

Parameter: skipwiresecurityfortierinternalops

Possible Values:

- true
- false

Description: Skips wire security for internal operations.

Parameter: source

Possible Values: Any volume.

Description: The source volume from which a mirror volume receives updates, specified in the format `<volume>@<cluster>`.

Parameter: tierencryption

Possible Values:

- true
- false

Description: Specifies whether to enable (true) or disable (false) encryption of data on the object store. This parameter is applicable only for cold-tier volumes. If you enable this parameter, user data is encrypted

before being written to the object, and the HTTPS protocol is used for communication with the object store to ensure that data is encrypted both on the wire and on the tier.

You can set this parameter only if you specify a tier name (see the `tiername` parameter) as well. You cannot modify this parameter after you set it.

If you set the value to `true`, you can also specify a custom key using the `tierkey` parameter. Once set to `true`, the MAST Gateway uses HTTPS to upload data to the cold-tier. If the cold tier does not support HTTPS, all tier related operations fail. If the cold-tier does not support HTTPS, you must explicitly set the value for this to `false` at the time of associating a tier with the volume because the default value for this parameter is `true`.

TIP: For warm tier, use `-data` option on the front-end volume to enable or disable encryption of data-at-rest.

Parameter: `tieringrule`

Possible Values: Name of any valid rule

Description: The name of the rule (referred to as storage policy in the Control System) to use for offloading data to the tier. If you do not specify a rule, the default rule, which is all files (`p`), is associated with the volume. See [Creating a Rule in Creating a Storage Tier Policy](#) on page 1564 for more information.

Parameter: `tierkey`

Possible Values: Any 32-character HEX string, or let CLDB auto-generate this string

Description: The 32-character HEX string to use for encryption only for cold tier volumes. If you do not specify a string, CLDB generates a 32 character HEX string to use for encrypting the data to offload to the tier.

RESTRICTION: You cannot modify the tierkey that is already associated with the volume.

Parameter: `tiername`

Possible Values: Not Applicable

Description: The name of the tier to use for offloading data. You can set this name only once and cannot modify it.

For warm tiering, you cannot specify this parameter if `ecenable` is set to `true`.

Parameter: `type`

Possible Values:

- `mirror`
- `rw`
- `0`
- `1`

Description: The type of volume to create.

The following values are accepted:

- `mirror` - standard mirror (read-only) volume (promotable to standard read-write volume)
- `rw` - standard (read-write) volume (convertible to standard mirror volume)
- `0` - standard (read-write) volume (for backward compatibility)
- `1` - non-convertible mirror (read-only) volume (for backward compatibility)

Parameter: `user`

Possible Values: Any valid permissions

Description: Space-separated list of `user:permission` pairs.Use comma to separate permissions. For example: `user:permission,permission,...`**Parameter: `wiresecurityenabled`***Default Value:* `true`

Possible Values:

- `true`
- `false`

Description: Enables (`true`) or disables (`false`) on-wire encryption for all files, tables, and streams in the volume for secure clusters. This parameter is not supported on insecure clusters.

If `true`, this setting overrides all file, table, and stream level encryption settings (set using the `hadoop mfs` command) and enables on-wire encryption for all files, tables, and streams. If you disable (`false`) this parameter at the volume level, but enable it at the file, table, or stream level, the file, table, or stream level encryption setting overrides this setting on those files, tables, and streams where it is enabled; for all other files, tables, and streams where encryption is not enabled at the file, table, or stream level, the on-wire encryption is disabled.

Parameter: `writeAce`

Possible Values: Any valid permissions

Description: Specifies [Access Control Expressions](#) (ACEs) that grant permission at the volume level to write to files and tables in the volume. The default value is `p`, which grants access to all users.See [ACEs](#).**Parameter: `disableinlineecoffload`**Possible Values: `true` or `false`Description: Disables future inline EC offload for S3 bucket volumes. To disable inline ec offloads, set the value of to `true`. To re-enable inline ec offloads, set the value to `false`.**Examples****Change the source volume of the mirror "test-mirror" and update the `atime` value to 2 days:**

CLI

```
/opt/mapr/bin/maprcli volume
modify -name test-mirror -source
volume-2@my-cluster
-attributeInterval 2
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=test-mirror&source=volume-2@my-cl
uster&attributeInterval=2' --user
mapr:mapr
```

Create a volume with namespace container replicas**CLI**

```
/opt/mapr/bin/maprcli
volume modify -name
testVol -nsminreplication
2 -nsreplication 4 -json
{
  "timestamp":1526528489360,
  "timeofday":"2018-05-16
08:41:29.360 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
    ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=testVol&nsminreplication=2&nsrepl
ication=4' --user mapr:mapr
{"timestamp":1526528556748,"timeofday"
:"2018-05-16 08:42:36.748 GMT-0700
PM","status":"OK","total":0,"data":[]}
```

Modify a volume to allow inheritance by a child volume

Sub-volumes (children) can inherit properties from their parent volume. The `maprcli volume create` and `volume modify` commands provide parameters for setting the inheritance feature. For a child volume to inherit from a parent volume, the parent volume must grant permission, and the child volume must be created specifying the volume name of the parent. In the following example, the parent volume, `parentVol`, grants inheritance to child volumes.

CLI

```
/opt/mapr/bin/maprcli volume
modify -name parentVol -allowgrant
true
```

REST

```
curl -k -X
POST 'https://abc.sj.us:8443/
rest/volume/modify?name=parentVol?
allowgrant=true' --user mapr:mapr
```

Set and modify ACEs on a volume

In the following example, the command sets and modifies access (defined using ACEs) to the volume data. When the command runs, new values:

- Overwrite existing values for access types that were previously set.
- Are set for access types that were not set.

NOTE: There is no change to the readAce access type, which is not specified with the command, irrespective of whether it is set or not.

CLI

```
/opt/mapr/bin/maprcli volume
modify -name testVol -writeAce
'g:group1&(!u:user1|!r:role1)'
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=testVol&writeAce=g%3Agroup1%26%28
%21u%3Auser1%7C%21r%3Arole1%29' --user
mapr:mapr
```

Modify the list of operations that are audited

In the following example, the create operation is included for auditing and the lookup operation is excluded from auditing. There are no changes to operations that are not specified.

CLI

```
/opt/mapr/bin/maprcli volume
modify -name parentVol -dataauditops
+create, -lookup
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=p1&dataauditops=%2Bcreate%2C-look
up' --user mapr:mapr
```

Modify an existing volume to enable on-wire encryption:

CLI

```
/opt/mapr/bin/maprcli
volume modify -name
local2 -wiresecurityenabled true -json
{
    "timestamp":1505205889697,
    "timeofday":"2017-09-12
01:44:49.697 GMT-0700",
    "status":"OK",
    "total":0,
    "data":[
    ]
}
```

REST

```
# curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=p1&wiresecurityenabled=true' --us
er mapr:mapr
{"timestamp":1526569299139,"timeofday"
```

```
: "2018-05-17 08:01:39.139 GMT-0700
AM", "status": "OK", "total": 0, "data": []}
```

Associate an offload rule with a tiering-enabled volume:

CLI

```
/opt/mapr/bin/maprcli volume
modify -name sampleVol -tieringrule
ksTestRule -json
{
  "timestamp": 1526569498559,
  "timeofday": "2018-05-17
08:04:58.559 GMT-0700 AM",
  "status": "OK",
  "total": 0,
  "data": [
  ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=sampleVol&tieringrule=ksTestRule'
--user mapr:mapr
{"timestamp": 1526569554743, "timeofday":
"2018-05-17 08:05:54.743 GMT-0700
AM", "status": "OK", "total": 0, "data": []}
```

Modify a volume to set a schedule for data offload and set number of days to three days to keep recalled data:

CLI

```
/opt/mapr/bin/maprcli
volume modify -name
sampleVol -offloadschedule
3 -recallexpirytime 3 -json
{
  "timestamp": 1526569615285,
  "timeofday": "2018-05-17
08:06:55.285 GMT-0700 AM",
  "status": "OK",
  "total": 0,
  "data": [
  ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=sampleVol&offloadschedule=3&recal
lexpirytime=3' --user mapr:mapr
{"timestamp": 1526569653267, "timeofday":
"2018-05-17 08:07:33.267 GMT-0700
AM", "status": "OK", "total": 0, "data": []}
```

Tag a volume with a security policy

CLI

```
/opt/mapr/bin/maprcli volume
modify -securitypolicy
Lab_Security_Policy -name
my_volume -json
{
  "timestamp":1526569615285,
  "timeofday":"2019-02-15
08:06:55.285 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/modify?
name=my_volume& \

securitypolicy=Lab_Security_Policy'
--user mapr:mapr

{"timestamp":1526569653267,"timeofday"
:"2019-02-15 08:07:33.267 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

The `-securitypolicy` option in the `maprcli volume modify` command sets the volume to be tagged with the specified policies, replacing any security policies that existed before the command was run. This command works as follows, depending on the security policies that are associated with this volume prior to invoking this command.

- If the volume initially has no security policy tags before invoking this command, then it is tagged with the specified security policy (Lab_Security_Policy in our example).
- If the volume initially has two security policy tags before invoking this command, say Lab_Security_Policy and Sensitive_Data, then the Sensitive_Data Policy security policy is disassociated from this volume, and the volume now has only the Lab_Security_Policy tag.
- If the volume initially has one security policy tag, say Sensitive_Data, then the Sensitive_Data security policy is removed and replaced with the security policy Lab_Security_Policy.
- If the volume has one security policy tag, say Lab_Security_Policy, which is the same as the security policy specified in the command, then modifications are not made.

Remove all security policies that are tagged to a volume

To remove all security policy tags from a volume, pass in an empty string as the value of the `securitypolicy` parameter.

For example:

CLI

```
/opt/mapr/bin/maprcli volume
modify -securitypolicy "" -name
my_volume
```

This code removes all security policy tags from the volume named `my_volume`.

REST

```
curl -u mapr:mapr -k 'https://
abc.sj.us:8443/rest/volume/modify?
name=my_volume<securitypolicy=' |
python -m json.tool
% Total % Received % Xferd
Average Speed Time Time Time Current
Dload Upload Total Spent Left Speed
100 111 100 111 0 0
184 0 --:--:-- --:--:-- --:--:-- 190
{
  "data": [],
  "status": "OK",
  "timeofday": "2018-09-03
11:20:13.282 GMT-0700 PM",
  "timestamp": 1536042013282,
  "total": 0
}
```

Disable scheduled snapshot creation

To disable a schedule, set the `schedule` parameter to 0.

For example:

CLI

```
/opt/mapr/bin/maprccli volume
modify -name mapr.apps -schedule 0
/opt/mapr/bin/maprccli volume
info -name mapr.apps -json | grep
schedule

"scheduleid":"0",

"schedulename":"",

"mirrorscheduleid":"0"
```

Remove file filter from a volume

To remove a file filter use the special filefilter `""`.

For example:

CLI

```
/opt/mapr/bin/maprccli volume
modify -name noexec -filefilter ""
```

[disk add](#) on page 2418

Adds one or more disks to the specified node. Permissions required: `fc` or `a`.

[volume create](#) on page 2929

Creates a volume.

volume mount

Mounts one or more specified volumes. Permissions required: `fc` or `m` on the volume.

Syntax

CLI

```
maprcli volume mount
[ -cluster <cluster> ]
-name <volume list>
-path <path list>
[ -createparent 0|1 ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/mount?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
name	The name of the volume to mount.
path	The path at which to mount the volume. The path must be relative to / and cannot be in the form of a global namespace path (for example, /mapr/<cluster-name>/).
createparent	Specifies whether or not to create a parent volume: <ul style="list-style-type: none">0 = Do not create a parent volume.1 = Create a parent volume.

Examples

Mount the volume "test-volume" at the path "/test":

CLI

```
maprcli volume mount -name
test-volume -path /test
{
  "timestamp":1537804971391,
  "timeofday":"2018-09-24
09:02:51.391 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ]
}
```

REST

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/mount?
name=test-volume&path=/test' --user
<username>:<password>
{"timestamp":1537804971391,"timeofday"
```

```
: "2018-09-24 09:02:51.391 GMT-0700 AM", "status": "OK", "total": 0, "data": []}
```

volume move

Moves the specified volume or mirror to a different topology. Permissions required: m or fc on the volume.

Syntax

CLI

```
/opt/mapr/bin/maprcli volume move
-name volumeName
[ -cluster cluster_name ]
[ -eclabel new label for ec-store
volume ]
[ -ectopology <topology> ]
[ -label new label for volume data ]
[ -nslabel new label for volume name
container ]
[ -topology topology ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/move?<parameters>

Parameters

Parameter: cluster

Possible Values: Any valid cluster.
Description: The cluster on which to create the volume.

Parameter: ecolabel

Possible Values: Any label.
Description: The label to use for the erasure-coded volume. See [Using Storage Labels](#) on page 1575 for more information on labels.
The label should contain only the following characters:

```
A-Z a-z 0-9 _ - .
```

Parameter: ectopology

Possible Values: Any topology that exists in your environment.
Description: The new rack path for the erasure-coded volume if you are moving an erasure-coded volume.

 **NOTE:** This parameter is applicable only for EC volumes.

Parameter: label

Possible Values: Any label.
Description: The label to use for the storage pool. See [Using Storage Labels](#) on page 1575 for more information on labels.

The label should contain only the following characters:

A-Z a-z 0-9 _ - .

TIP: Use the special label named anywhere to let a volume reside on any storage pool. Not setting a label, causes a volume to reside only on a storage pool without a label.

Parameter: name

Possible Values: Any valid name

Description: The name of the volume to move. For moving:

- An erasure coded volume, specify the name of the front-end volume.
- The metadata volume associated with a tier, specify the name of the metadata volume.

The name should contain only the following characters:

A-Z a-z 0-9 _ - .

For tiering-enabled volumes, the volume name cannot exceed ninety-eight characters.

Parameter: nslabel

Possible Values: Any value.

Description: The label to use for the namespace container. See [Using Storage Labels](#) on page 1575 for more information on labels.

The label should contain only the following characters:

A-Z a-z 0-9 _ - .

Parameter: topology

Possible Values: Any

Description: The new rack path for the:

- Regular or tiered standard volume, if you are moving a regular or tiered standard volume.
- Regular or tiered mirror volume, if you are moving a regular or tiered mirror volume.
- Metadata volume, if you are moving a metadata volume associated with a tier.

This parameter is not required, if you are moving an erasure-coded volume.

Advisory Note on Storage Labels

When the volume of a label is changed, replicas cannot be migrated within the file server, from one SP with the old label to another SP with the desired label. If there no other SPs, all old copies will not be fully migrated to the new desired label.

Examples

CLI

```
maprcli volume move -name
testVolume -topology /newPath
```

REST

```
curl -k -X 'https://abc.sj.us:8443/
rest/volume/move?
name=testVolume&topology=%2FnewPath'
--user mapr:mapr
```

volume offload

Offloads data in the volume to the tier.

Permissions Required

The user running the command must have one of the following:

- Full control (fc) on the cluster or volume
- Volume edit permissions

Syntax

CLI

```
maprcli volume offload
[ -cluster cluster_name ]
[ -ignorerule <true|false> ]
-name <volume_name>
[ -scanopten <true|false>.
default: true ]
```

```
[ -force <true|false>. default:
false ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/offload?<parameters>

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
ignorerule	<p>Specify whether (true) or not (false) to ignore existing rules associated with the volume for offloading data. If value is:</p> <ul style="list-style-type: none">• true, all data in the volume is offloaded and rules associated with the volume for offload are ignored.• false, data is offloaded based on the rules set up for offloading data. <p>Default value is false.</p>
name	The name of the volume.
scanopten	<p>The parameter is used for performance optimization. true is the default value, and true indicates that the volume compaction optimizations are enabled. One of the compaction optimizations include skipping containers that do not have enough garbage. This parameter is generally not set to false, except when you wish to disable the performance optimization feature for a particular reason.</p>
-force	<p>Set the value as true to initiate a manual offload or compaction on the inline erasure coded volume. Inline erasure coding offloads auto-resume once the initiated offload/compaction is done.</p> <div> NOTE: Scheduled compactions on IEC volumes takes precedence and proceed stopping the current IEC offloads, IEC offloads auto resume once the scheduled compaction is done</div>

Example

Offload a volume:

CLI

```
# /opt/mapr/bin/maprcli volume
offload -name sampleVol -json
{
  "timestamp":1501104289006,
  "timeofday":"2017-07-26
02:24:49.006 GMT-0700",
  "status":"OK",
```

```
    "total":0,
    "data":[

    ],
    "messages":["Successfully started
offload."
    ]
}
```

REST

```
# curl -X POST 'https://
abc.sj.us:8443/rest/volume/offload?
name=sampleVol' --user
<username>:<password>
{"timestamp":1519947659597,"timeofday"
:"2018-03-01 03:40:59.597 GMT-0800
PM","status":"OK","total":0,"data":
[],"messages":["Successfully started
offload."]}
```

volume recall

Recalls the offloaded data for the specified volume.

Permissions Required

The user running the command must have one of the following:

- Full control (fc) on the cluster or volume
- Volume edit permissions

Syntax

CLI

```
maprcli volume recall
[ -cluster cluster_name ]
-name <volume_name>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/recall?<parameters>

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the volume.

Example

Recall a volume:

CLI

```
# /opt/mapr/bin/maprcli volume
recall -name sampleVol -json
{
  "timestamp":1520007453541,
  "timeofday":"2018-03-02
08:17:33.541 GMT-0800 AM",
  "status":"OK",
  "total":0,
  "data":[

  ],
  "messages":["
    Successfully started recall."
  ]
}
```

REST

```
# curl -X POST 'https://
abc.sj.us:8443/rest/volume/recall?
name=sampleVol' --user
<username>:<password>
{"timestamp":1520007538784,"timeofday"
:"2018-03-02 08:18:58.784 GMT-0800
AM","status":"OK","total":0,"data":
[],"messages":["Successfully started
recall."]}
```

volume remove
Removes the specified volume or mirror. Permissions required: d or fc on the volume.

Syntax

CLI

```
maprcli volume remove
[ -cluster <cluster> ]
[ -force true|false ]
[ -filter <filter> ]
[ -deletes3bucket true|false ]
-name <volume name>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/remove?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
force	Forces the removal of the volume, even if there are dependencies.
name	The volume name.

Parameter	Description
filter	All volumes with names that match the filter are removed.
deletes3bucket	The default value is false. When the deletes3bucket parameter is set to true, all buckets associated with the volume are deleted. The flag can be used to recursively delete non-WORM(write once read many) buckets associated with the volume, along with the volume itself, only when non-WORM buckets are associated with the volume. The volume deletion fails when WORM buckets are associated with the volume to delete.

Examples

The following command removes the volume by the name, testVolume.

CLI

REST

```
maprcli volume remove -name testVolume
```

```
https://abcdcorp.sj.us:8443/rest/
volume/remove?name=testVolume
```

The following command removes the volume by the name, testVolume, and all non-WORM buckets associated with testVolume.

CLI

REST

```
maprcli volume
remove -name -deletes3bucket true
testVolume
```

```
https://abcdcorp.sj.us:8443/
rest/volume/remove?
deletes3bucket=true&name=testVolume
```

volume rename

Renames the specified volume or mirror. Permissions required: fc or d on the volume.

NOTE: If you rename a volume, you must [unmount](#) and [re-mount](#) the volume to allow applications and/or users to continue accessing the volume.

Syntax

CLI

```
maprcli volume rename
[ -cluster <cluster> ]
-name <volume name>
-newname <new volume name>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/rename?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
name	The volume name.
newname	The new volume name. For tiering-enabled volumes, volume name cannot exceed ninety-eight characters.

Examples**Rename a standard volume:****CLI**

```
# maprcli volume
rename -name testVolume -newname
newVolumeName -json
{
  "timestamp":1537994815889,
  "timeofday":"2018-09-26
01:46:55.889 GMT-0700 PM",
  "status":"OK",
  "total":0,
  "data":[
    ]
}
```

REST

```
# curl -X POST 'https://
server.sj.us:8443/rest/volume/rename?
name=testVolume&newname=newVolumeName'
--user <username>:<password>
{"timestamp":1537994918599,"timeofday"
:"2018-09-26 01:48:38.599 GMT-0700
PM","status":"OK","total":0,"data":[]}
```

volume showmounts

Returns a list of mount points for the specified volume.

NOTE: The three dots in the output indicate hierarchical mounts within a volume. Use `-json` to format the output.

Syntax**CLI**

```
maprcli volume showmounts
[ -cluster <cluster name> ]
-name <volume name>
-json
```

REST

Request Type	GET
Request URL	<code>http[s]://<host>:<port>/rest/volume/showmounts?<parameters></code>

Parameters

Parameter	Description
cluster	The name of the cluster hosting the volume.
json	(Required) Returns the output in JSON format.
name	The name of the volume to return a list of mount points for.

Examples

Return the mount points for volume mapr.user.volume for the cluster my.cluster.com:

CLI

```
maprcli volume showmounts -cluster
my.cluster.com -name
mapr.user.volume -json
```

REST

```
curl -X GET 'https://abc.sj.us:8443/
rest/volume/showmounts?
cluster=my.cluster.com&name=mapr.user.
volume' --user <username>:<password>
```

volume snapshot create

Creates a snapshot of the specified volume, using the specified snapshot name.

- License required: Enterprise Edition
- Permissions required: fc or m on the volume

Syntax**CLI**

```
maprcli volume snapshot create
[ -cluster <cluster> ]
[ -retain <positive_integer>mi|h|
d|w|m|y ]
-snapshotname <snapshot>
-volume <volume>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/ rest/volume/snapshot/ create?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.

Parameter	Description
retain	<p>Specifies how long to retain the snapshot data. Value can be specified in:</p> <ul style="list-style-type: none"> Minutes by appending <code>mi</code> to the integer. For example, <code>30mi</code> can be specified as the value for this parameter to retain snapshot data for 30 minutes. Hours by appending <code>h</code> to the integer. For example, <code>1h</code> can be specified as the value for this parameter to retain snapshot data for 1 hour. Days by appending <code>d</code> to the integer. For example, <code>2d</code> can be specified as the value for this parameter to retain snapshot data for 2 days. Weeks by appending <code>w</code> to the integer. For example, <code>4w</code> can be specified as the value for this parameter to retain snapshot data for 4 weeks. Months by appending <code>m</code> to the integer. For example, <code>10m</code> can be specified as the value for this parameter to retain snapshot data for 10 months. Years by appending <code>y</code> to the integer. For example, <code>7y</code> can be specified as the value for this parameter to retain snapshot data for 7 years. <p>If this is not specified, snapshot data will never expire.</p>
snapshotname	The name of the snapshot to create.
volume	The volume for which to create a snapshot.

Examples

Create a snapshot called "test-snapshot" for volume "test-volume":

CLI

```
maprcli volume
snapshot create -snapshotname
test-snapshot -volume test-volume
{
  "timestamp":1537805380237,
  "timeofday":"2018-09-24
09:09:40.237 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
]
}
```

REST

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/
snapshot/create?
volume=test-volume&snapshotname=test-s
napshot' --user <username>:<password>
{"timestamp":1537805548885,"timeofday"
:"2018-09-24 09:12:28.885 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

volume snapshot list

Displays info about a set of snapshots.

You can specify the snapshots by volumes or paths, or by specifying a filter to select volumes with certain characteristics.

Syntax**CLI**

```
/opt/mapr/bin/maprcli volume snapshot
list
[ -cluster <cluster name> ]
[ -columns <fields> ]
( -filter <filter> ]
[ -path <volume path list> ]
[ -volume <volume list> ]
[ -limit <rows> ]
[ -output (terse|verbose) ]
[ -start <offset> ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/volume/snapshot/list[?<parameters>]

Parameters

Either volume or path can be used if you wish to specify the snapshots. In addition, filter can be used with volume and path, or independently.

Parameter	Description
cluster	The cluster on which to run the command.
columns	A comma-separated list of fields to return in the query. See the Fields on page 3049 table below. Default: none
filter	A filter specifying snapshots to list. See Filters on page 2270 for more information.
limit	The number of rows to return, beginning at start. Default: 2147483647
output	Specifies whether the output should be terse or verbose. Default: verbose
path	A comma-separated list of paths for which to list snapshots.
start	The offset from the starting row. Default: 0
volume	A comma-separated list of volumes for which to list snapshots.

Fields

The following table lists the fields used in the columns parameter, and returned as output.

Field Name	Short Name	Description
snapshotid	id	Unique snapshot ID.
sharedSize	shSz	Size of data (in MB) that the snapshot shares with previous snapshots.
volumename	vn	Name of the read-write volume associated with the snapshot.
ownername	on	Owner (user or group) associated with the volume.
cumulativeReclaimSizeMB	cs	Disk space (in MB) used/owned by the snapshot
snapshotname	n	Snapshot name.
ownedsize	owSz	Size of data (in MB) owned by a snapshot, as opposed to sharedSize (owned by previous snapshots).
ownertype	ot	Owner type for the owner of the volume: <ul style="list-style-type: none"> 0=user 1=group
volumeid	vid	ID of the volume associated with the snapshot.
creationtime	ct	Snapshot creation time. Date time string (verbose output) or milliseconds since 1970 (terse output).
volumepath	vp	Path to the volume associated with the snapshot.
expirytime	et	The time until which the snapshot should be maintained. Expired snapshots are purged (deleted) periodically. Date time string (verbose output), or milliseconds since 1970 (terse output); 0 = never expires.
volumeSnapshotAces	N/A	ACE permissions for read and write on the volume snapshot. Use <code>-json</code> to view the ACE permissions.

Output

This sample output is based on using the following code to create a snapshot called `uservolume` for the volume named `users`.

```
/opt/mapr/bin/maprcli volume snapshot create -snapshotname
uservolsnap -volume users
```

Sample Output

Examples

List all snapshots:

CLI

```
maprcli volume snapshot list
```

REST

```
curl -X GET 'https://abc.sj.us:8443/
rest/volume/snapshot/list' --user
<username>:<password>
{"timestamp":1537984492448,"timeofday"
:"2018-09-26 10:54:52.448 GMT-0700
AM","status":"OK","total":3,"data":
[{"ownername":"mapr","ownertype":"1","

SnapshotAces":
{"readAce":"p","writeAce":"p"}}]]}
```

List all snapshots and format the output:

```
maprcli volume snapshot list -json
```

volume snapshot preserve

Preserves one or more snapshots from expiration.

Specify the snapshots by volumes, paths, filter, or IDs.

- License required: Enterprise Edition
- Permissions required: fc or m on the volume

Syntax**CLI**

```
maprcli volume snapshot preserve
[ -cluster <cluster> ]
( -filter <filter> | -path
<volume path list> | -snapshots
```

```
<snapshot list> | -volume <volume list> )
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/snapshot/preserve[?<parameters>]

Parameters

Specify exactly one of the following parameters: volume, path, filter, or snapshots.

Parameter	Description
cluster	The cluster on which to run the command.
filter	A filter specifying snapshots to preserve. See Filters on page 2270 for more information.
path	A comma-separated list of paths for which to preserve snapshots.
snapshots	A comma-separated list of snapshot IDs to preserve.
volume	A comma-separated list of volumes for which to preserve snapshots.

Examples

Preserve two snapshots by ID:

First, use `volume snapshot list` to get the IDs of the snapshots you wish to preserve. Example:

```
# maprcli volume snapshot list
snapshotid ownedsize sharedSize volumename ownertype cumulativeReclaimSizeMB volumeid snapshotname
creationtime                                volumepath volumeSnapshotAces
2560000049 0 0 egVol mapr 1
0 29379677 egVol-snapshot Wed Sep 26 10:42:52 PDT
2018 /egVol ...
2560000051 0 0 users mapr 1
0 212450174 uservolsnap Wed Sep 26 10:45:27 PDT
2018 /user ...
2560000050 0 0 egVol mapr 1
0 29379677 egVolSnapshot Wed Sep 26 10:43:12 PDT
2018 /egVol ...
```

Use the IDs in the `volume snapshot preserve` command. For example, to preserve the first two snapshots in the above list, run the commands as follows:

CLI

```
maprcli volume
snapshot preserve -snapshots
2560000049,2560000051 -json
{
  "timestamp":1537986060505,
  "timeofday":"2018-09-26
```

```
11:21:00.505 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ]
}
```

REST

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/
snapshot/preserve?
snapshots=256000049,256000051' --user
<username>:<password>
{"timestamp":1537986132998,"timeofday"
:"2018-09-26 11:22:12.998 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

volume snapshot remove
Removes one or more snapshots.

- License required: Enterprise Edition
- Permissions required: fc or m on the volume

Syntax

CLI

```
maprcli volume snapshot remove
[ -cluster <cluster> ]
( -snapshotname <snapshot name> ]
[ -snapshots <snapshots> ]
[ -volume <volume name> ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/snapshot/remove[?<parameters>]

Parameters

Specify both snapshot name and volume, or just snapshot ID.

Parameter	Description
cluster	The cluster on which to run the command.
snapshotname	The name of the snapshot to remove. You must also specify the volume name using the volume parameter.
snapshots	A comma-separated list of IDs of snapshots to remove.
volume	The name of the volume from which to remove the snapshot. This is required if you are removing snapshot by specifying the snapshot name (using snapshotname parameter).

Examples

Remove the snapshot named "test-snapshot" associated with volume named "test-volume":

CLI

```
maprcli volume
snapshot remove -snapshotname
test-snapshot -volume test-volume
```

REST

```
curl -X POST 'https://
abc.sj.us:8443/api/volume/snapshot/
remove?
snapshotname=test-snapshot&volume=tes
t-volume' --user <username>:<password>
```

Remove two snapshots by ID:

First, use `volume snapshot list` to get the IDs of the snapshots you wish to remove. Example:

```
# maprcli volume snapshot list
snapshotid ownedsize sharedSize volumename ownername
ownertype cumulativeReclaimSizeMB volumeid snapshotname
creationtime volumePath volumeSnapshotAccess
256000049 0 0 egVol mapr 1
0 29379677 egVol-snapshot Wed Sep 26 10:42:52 PDT
2018 /egVol ...
256000051 0 0 users mapr 1
0 212450174 uservolnap Wed Sep 26 10:45:27 PDT
2018 /user ...
256000050 0 0 egVol mapr 1
0 29379677 egVolSnapshot Wed Sep 26 10:43:12 PDT
2018 /egVol ...
```

Use the IDs in the `volume snapshot remove` command. For example, to remove the first two snapshots in the above list, run the commands as follows:

CLI

```
maprcli volume snapshot
remove -snapshots 256000049,256000051
{
  "timestamp":1537986405764,
  "timeofday":"2018-09-26
11:26:45.764 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
  ]
}
```

REST

```
# curl -X POST 'https://
server.sj.us:8443/rest/volume/
snapshot/remove?
snapshots=256000049,256000051' --user
<username>:<password>
{"timestamp":1537987406574,"timeofday":
"2018-09-26 11:43:26.574 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

volume tierjobterminate

Terminates an ongoing offload or recall operation for a volume (specified by name).

Permissions Required

The user running the command must have one of the following:

- Full control (fc) on the cluster or volume
- Volume edit permissions

Syntax**CLI**

```
maprccli volume tierjobterminate
[ -cluster cluster_name ]
  -name name
  [ -abortforever <true|false>.
default: false ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/ rest/volume/ tierjobterminate? <parameters>

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the volume.
abortforever	When the value is set to true, the command stops existing inline erasure coding (IEC) offloads, and disables further IEC offloads. The default value is false. This is an optional parameter.

Example**Stop offloading data to the tier:****CLI**

```
/opt/mapr/bin/maprccli volume
tierjobterminate -name sampleVol -json
{
    "timestamp":1503504450211,
    "timeofday":"2017-08-23
04:07:30.211 GMT+0000",
    "status":"OK",
    "total":0,
    "data":[
    ],
    "messages":["Successfully started
```

```
to terminate."
    ]
}
```

REST

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/
tierjobterminate?
name=sampleVol' --user
<username>:<password>
{"timestamp":1503504450211,"timeofday"
:"2017-08-23 04:07:30.211
GMT+0000","status":"OK","total":0,"dat
a":[],"messages":["Successfully
started to terminate."]}
```

volume tierjobstatus

Retrieves the status of the currently running operation (such as offload, recall, or terminate) for a volume.

Permissions Required

The user running the command must have one of the following:

- Full control (fc) on the cluster or volume
- Volume edit permissions

Syntax

CLI

```
maprcli volume tierjobstatus
[ -cluster <cluster_name> ]
-name <volume_name>
[ -verbose true|false ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/ rest/volume/ tierjobstatus? <parameters>

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the volume.
verbose	Specifies whether the command output should be verbose. The value for this must be true to retrieve the status of a compaction operation. The default value is false.

Output

The command returns the following:

state	The status of the offload, recall, or terminate operation. See Statuses on page 3057 below for more information.
offloadedDataSize	The amount of data offloaded. This is returned only when returning the status of an offload operation.
progress	The percentage of containers that have been processed so far.
recalledDataSize	The amount of data recalled. This is returned only when returning the status of a recall operation.
reclaimedDataSize	The amount of data purged. This is returned only when returning the status of a compaction job.
startTime	The date and timestamp for when the offload operation started.
endTime	The date and timestamp for when the offload operation completed.
gateway	The IP address of the MAST Gateway used for the tiering operation.

Statuses

The value for the state field (statuses) can be one of the following:

State	Description
Scheduled	<p>Indicates the job request has reached CLDB, but has not yet been forwarded to any MAST Gateway service. For example:</p> <p>CLI</p> <pre>{ "timestamp":153209 3619983, "timeofday":"201 8-07-20 06:33:39.983 GMT-0700 AM", "status":"OK", "total":1, "data":[{ "compaction":{ "state":"Scheduled ", "scheduleTime":"20 18-07-20 06:33:38.953 GMT-0700", "gateway":"10.10.1 08.116:8660" } }] }</pre> <p>REST</p> <pre>{"timestamp":15320 93619983,"timeofda y":"2018-07-20 06:33:39.983 GMT-0700 AM","status":"OK", "total":1,"data": [{"compaction": {"state":"Schedule d","scheduleTime": "2018-07-20 06:33:38.953 GMT-0700","gateway ":"10.10.108.116:8 660"}}]}</pre>

State	Description
<div>Running</div> <div> NOTE: For a volume linked to a bucket on which inline erasure coding is enabled, the status is always running as the process is ongoing.</div>	<div>Indicates the offload or recall job has been forwarded to MAST Gateway service. The MAST Gateway service can either still be waiting for resources to run the job or is actually performing the requested job. For example:</div> <div>CLI<pre>{ "timestamp":1532095481297, "timeofday":"2018-07-20 07:04:41.297 GMT-0700 AM", "status":"OK", "total":1, "data":[{ "offload":{ "state":"Running", "progress":"61%", "startTime":"2018-07-20 07:00:02.277 GMT-0700", "gateway":"10.10.108.115:8660", "compaction":{ "state":"Success", "progress":"100%", "startTime":"2018-07-20 06:34:06.628 GMT-0700", "endTime":"2018-07-20 06:40:25.334 GMT-0700", "reclaimedDataSize":"0 MB", "gateway":"10.10.108.115:8660" } } }] }</pre></div> <div>When inline erasure coding is enabled, the command output resembles the following:</div> <div><pre>\$ maprcli volume tierjobstatus -name e mapr.s3bucketVol.00000002 -ison -ve</pre></div>

State	Description
FailureFatal	<div><p>Indicates the job has failed with non-retriable error. You must resolve the issue and retry the operation. For example:</p><div><div>CLI</div><pre>{ "timestamp":1531778057385, "timeofday":"2018-07-16 09:54:17.385 GMT+0000 PM", "status":"OK", "total":1, "data":[{ "offload":{ "state":"FailureFatal", "progress":"50%", "startTime":"2018-07-16 21:54:01.779 GMT+0000", "endTime":"2018-07-16 21:54:05.339 GMT+0000", "offloadedDataSize":"0 MB", "gateway":"10.10.88.198:8660" } }] }</pre></div><div><div>REST</div><pre>{"timestamp":1531778057385,"timeofday":"2018-07-16 09:54:17.385 GMT+0000 PM","status":"OK","total":1,"data":[{"offload":{"state":"FailureFatal","progress":"50%","startTime":"2018-07-16 21:54:01.779 GMT+0000","endTime":"2018-07-16 21:54:05.339 GMT+0000","offloadedDataSize":"0 MB","gateway":"10.10.88.198:8660"}}]}</pre></div></div>

State	Description
FailureRetriable	<div><p>Indicates the job has failed with an error for which CLDB will retry the job based on the configuration parameters, <code>cldb.gateway.retry.count</code> and <code>cldb.gateway.retry.waittime</code>. But if the job is restarted manually or terminated, CLDB will not retry. For example:</p><div><div>CLI</div><pre>{ "timestamp":1532624516372, "timeofday":"2018-07-26 10:01:56.372 GMT-0700 AM", "status":"OK", "total":1, "data":[{ "offload":{ "state":"FailureRetry, RetryCount:5", "progress":"50%", "startTime":"2018-07-25 17:43:27.924 GMT-0700", "endTime":"2018-07-25 17:43:59.108 GMT-0700", "offloadedDataSize":"0 MB", "gateway":"10.10.25.29:8660" } }] }</pre></div><div><div>REST</div><pre>{"timestamp":1532624656640,"timeofday":"2018-07-26 10:04:16.640 GMT-0700 AM","status":"OK", "total":1,"data":[{"offload":{ "state":"FailureRetry, RetryCount:5", "progress":"50%", "startTime":"2018-07-25 17:43:27.924 GMT-0700", "endTime":"2018-07-25 17:43:59.108 GMT-0700", "offloadDataSize":"0 MB", "gateway":"10.10.25.29:8660" }}</pre></div></div>

State	Description
Success	<div><div>Indicates the job has been successfully completed. For example:</div><div>CLI<div><pre>{ "timestamp":1531311128469, "timeofday":"2018-07-11 12:12:08.469 GMT+0000 PM", "status":"OK", "total":1, "data":[{ "offload":{ "state":"Success", "progress":"100%", "startTime":"2018-07-11 12:10:26.290 GMT+0000", "endTime":"2018-07-11 12:10:35.521 GMT+0000", "offloadedDataSize":"353.16 MB", "gateway":"10.10.20.12:8660" }, "compaction":{ "state":"Success", "progress":"100%", "startTime":"2018-07-11 12:12:01.335 GMT+0000", "endTime":"2018-07-11 12:12:02.264 GMT+0000", "reclaimedDataSize":"353.097 MB", "gateway":"10.10.20.12:8660" } }] }</pre></div></div></div>

State	Description
Terminated	<p>Indicates the job has been terminated. For example:</p> <p>CLI</p> <pre>{ "timestamp":1503504464179, "timeofday":"2017-08-23 04:07:44.179 GMT+0000", "status":"OK", "total":1, "data":[{"offload":{ "state":"Terminated", "startTime":"2017-08-23 04:06:06.867 GMT+0000", "endTime":"2017-08-23 04:06:38.910 GMT+0000", "gateway":"10.10.88.199:8660" }}] }</pre> <p>REST</p> <pre>{"timestamp":1503504464179,"timeofday":"2017-08-23 04:07:44.179 GMT+0000","status":"OK","total":1,"data":[{"offload":{"state":"Terminated","startTime":"2017-08-23 04:06:06.867 GMT+0000","endTime":"2017-08-23 04:06:38.910 GMT+0000","gateway":"10.10.88.199:8660"}}]}</pre>

State	Description
TerminateInProgress	<p>Indicates that the terminate operation is in progress. For example:</p> <p>CLI</p> <pre>{ "timestamp":1533005375001, "timeofday":"2018-07-30 07:49:35.001 GMT-0700 PM", "status":"OK", "total":1, "data":[{ "offload":{ "state":"TerminateInProgress", "progress":"98%", "startTime":"2018-07-30 19:02:37.108 GMT-0700", "gateway":"10.10.101.121:8660" } }] }</pre> <p>REST</p> <pre>{"timestamp":1533005375001,"timeofday":"2018-07-30 07:49:35.001 GMT-0700 PM","status":"OK", "total":1,"data":[{"offload":{"state":"TerminateInProgress","progress":"98%","startTime":"2018-07-30 19:02:37.108 GMT-0700","gateway":"10.10.101.121:8660"}}]}</pre>

State	Description
TerminatedInternal	<p>Indicates the offload operation was terminated by another internal process, such as when promoting a mirror volume to a read-write volume when offload is in progress. For example:</p> <p>CLI</p> <pre>{ "timestamp":151548 8569411, "timeofday":"201 8-01-09 01:02:49.411 GMT-0800", "status":"OK", "total":1, "data":[{"recall":{ "state":"Terminate dInternal", "progress":"36%", "startTime":"201 8-01-09 01:01:57.824 GMT-0800", "endTime":"2018-0 1-09 01:02:43.329 GMT-0800", "gateway":"10.10.1 08.150:8660" }}] }</pre> <p>REST</p> <pre>{"timestamp":15154 88569411,"timeofda y":"2018-01-09 01:02:49.411 GMT-0800","status" :"OK","total":1,"d ata":[{"recall": {"state":"Terminat edInternal","progr ess":"36%","startT ime":"2018-01-09 01:01:57.824 GMT-0800","endTime ":"2018-01-09 01:02:43.329 GMT-0800","gateway ":"10.10.108.150:8 660"}}]}</pre>

Example**CLI**

```
# maprcli volume tierjobstatus -name
testVol -json -verbose true
{
  "timestamp":1533005419522,
  "timeofday":"2018-07-30
07:50:19.522 GMT-0700 PM",
  "status":"OK",
  "total":1,
  "data":[

```

volume tierstats

Retrieves statistics on the offload and recall operation.

Permissions Required

The user running the command must have one of the following:

- Full control (fc) on the cluster or volume
- Volume edit permissions

Syntax**CLI**

```
maprcli volume tierstats
    [ -cluster cluster_name ]
    -name <volume_name>
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/volume/tierstats?<parameters>

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the volume.

Output

The command returns the following:

offloadThroughput	The amount of data (in MB) offloaded per second.
totalTierDataSize	The total size of tiered data (in MB).
totalTierReclaimableSize	The size of deleted data (in MB) that is under the compaction operation threshold.
recallThroughput	The amount of data (in MB) recalled per second.

Example

Retrieve statistics for a volume specified by name:

CLI

```
# /opt/mapr/bin/maprcli volume
tierstats -name sampleVol -json
{
    "timestamp":1520275614872,
    "timeofday":"2018-03-05
06:46:54.872 GMT+0000",
    "status":"OK",
    "total":1,
    "data":[
        {
            "totalTierDataSize":"404.323 MB",
```

```
"offloadThroughput":"17.063 MB/s",
"recallThroughput":"14.071 MB/s"
}
]
```

REST

```
curl -X GET 'https://
server.sj.us:8443/rest/volume/
tierstats?name=sampleVol' --user
<username>:<password>
{"timestamp":1520275614872,"timeofday"
:"2018-03-05 06:46:54.872
GMT+0000","status":"OK","total":1,"dat
a":[{"totalTierDataSize":"404.323
MB","offloadThroughput":"17.063 MB/
s","recallThroughput":"14.071 MB/s"}]}
```

Retrieve statistics for a volume after a compaction operation:**CLI**

```
# maprcli volume tierstats -name
test1 -json
{
    "timestamp":1527048672887,
    "timeofday":"2018-05-23
04:11:12.887 GMT+0000 AM",
    "status":"OK",
    "total":1,
    "data":[
        {
            "totalTierDataSize":"3001.926 MB",
            "totalTierReclaimableSize":"100 MB",
            "offloadThroughput":"31.064 MB/s"
        }
    ]
}
```

REST

```
curl -X GET 'https://
server.sj.us:8443/rest/volume/
tierstatus?name=test1' --user
<username>:<password>
{"timestamp":1527048672887,"timeofday"
:"2018-05-23 04:11:12.887 GMT+0000
AM","status":"OK","total":1,"data":
[{"totalTierDataSize":"3001.926
MB","totalTierReclaimableSize":"100
MB","offloadThroughput":"31.064 MB/
s"}]}
```

volume tierjobabort

Terminates an ongoing offload or recall operation for a volume (specified by name).

Permissions Required

The user running the command must have one of the following:

- Full control (fc) on the cluster or volume
- Volume edit permissions

Syntax

CLI

```
maprcli volume tierjobabort
[ -cluster cluster_name ]
  -name name
    [ -abortforever <true|false>].
default: false ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/tierjobabort?<parameters>

Parameters

Parameter	Description
cluster	The name of the cluster on which to run the command.
name	The name of the volume.
abortforever	When the value is set to true, the command stops existing inline erasure coding (IEC) offloads, and disables further IEC offloads. The default value is false. This is an optional parameter.

Example

Stop offloading data to the tier:

CLI

```
/opt/mapr/bin/maprcli volume
tierjobabort -name sampleVol -json
{
    "timestamp":1503504450211,
    "timeofday":"2017-08-23
04:07:30.211 GMT+0000",
    "status":"OK",
    "total":0,
    "data":[
    ],
    "messages":["Successfully started
to abort."
]
}
```

REST

```
curl -k -X POST 'https://
abc.sj.us:8443/rest/volume/
tierjobabort?name=sampleVol' --user
mapr:mapr
{"timestamp":1503504450211,"timeofday"
:"2017-08-23 04:07:30.211
GMT+0000","status":"OK","total":0,"dat
a":[],"messages":["Successfully
started to abort."]}
```

volume unmount

Unmounts one or more mounted volumes. Permissions required: fc or m on the volume.

Syntax

CLI

```
maprcli volume unmount
[ -cluster <cluster> ]
[ -force 0|1 ]
-name <volume name>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/unmount?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
force	Specifies whether (1) or not (0) to force the volume to unmount.
name	The name of the volume to unmount.

Examples

Unmount the volume "test-volume":

CLI

```
maprcli volume unmount -name
test-volume
{
  "timestamp":1537804903335,
  "timeofday":"2018-09-24
09:01:43.335 GMT-0700 AM",
  "status":"OK",
  "total":0,
  "data":[
    ]
}
```

REST

```
curl -X POST 'https://
server.sj.us:8443/rest/volume/unmount?
name=test-volume' --user
<username>:<password>
{"timestamp":1537805053854,"timeofday"
:"2018-09-24 09:01:43.335 GMT-0700
AM","status":"OK","total":0,"data":[]}
```

volume upgradeformat

Upgrades and old-type volume to a new-type volume, which can in turn be used as a promotable mirror volume. Permissions required: m or fc on the volume.

Syntax

CLI

```
maprcli volume upgradeformat
[ -cluster <cluster> ]
-name <volume name>
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/upgradeformat?<parameters>

Parameters

Parameter	Description
cluster	The cluster on which to run the command.
name	The volume name.

Examples

CLI

```
maprcli volume upgradeformat -name
vol999 -json
```

REST

```
https://abc.sj.us:8443/rest/volume/
upgradeformat?name=vol999
```

volume snapshot restore

Restores a volume from a snapshot using the CLI.

For an overview on the Snapshot Restore functionality, refer to [Restoring a Volume From a Snapshot](#) on page 593.

To restore a snapshot using the Control System, refer to [Restoring Volume Snapshots Using the Control System](#) on page 1537.

To check the progress of a snapshot restore operation, use the [volume snapshot restorestatus](#) on page 3073 command.

Syntax

CLI

```
/opt/mapr/bin/maprcli volume snapshot
restore
[ -cluster <cluster> ]
( -snapshotname <snapshot name> ]
[ -volume <volume name> ]
```

REST

Request Type	POST
Request URL	http[s]://<host>:<port>/rest/volume/snapshot/restore[?<parameters>]

Parameters

Parameter	Description
cluster	The cluster on which to run the command. This parameter is not mandatory. If not specified, the current cluster is used by default.
snapshotname	The name of the snapshot to use for restoring a volume. You must also specify the volume name using the volume parameter.
volume	The name of the volume to restore from a snapshot.

Example

CLI

The following example command restores a snapshot named s3 to a volume named vol2:

```
/opt/mapr/bin/maprcli volume snapshot
restore -volume vol2 -snapshotname
s3 -json
{
  "timestamp":1549970648390,
  "timeofday":"2019-02-12
11:24:08.390 GMT+0000 AM",
  "status":"OK",
  "total":0,
  "data":[
    ],
  "messages":["Snapshot Restore
queued for volume vol2, snapshot name
s3"]
}
```

REST

```
curl -X
POST 'https://server.sj.us:8443/
rest/volume/snapshot/restore?
```

```
snapshotname=s3&volume=vol2' --user
<username>:<password>
```

Related concepts

[Restoring a Volume From a Snapshot](#) on page 593
Provides a synopsis of restoring a volume from a snapshot. Describes the implications, and the prerequisites.

Related tasks

[Restoring Volume Snapshots Using the Control System](#) on page 1537
Describes how to restore snapshots of volumes using the Control System.

Related reference

[volume snapshot restorestatus](#) on page 3073
Displays the progress of the snapshot restore operation, in terms of percentage.

volume snapshot restorestatus

Displays the progress of the snapshot restore operation, in terms of percentage.

For an overview on the Snapshot Restore functionality, refer to [Restoring a Volume From a Snapshot](#) on page 593.

To restore a snapshot using the Control System, refer to [Restoring Volume Snapshots Using the Control System](#) on page 1537.

To restore a snapshot, use the [volume snapshot restore](#) on page 3071 command.

Syntax

CLI

```
/opt/mapr/bin/maprccli volume snapshot
restorestatus
[ -cluster <cluster> ]
[ -volume <volume name> ]
[ -verbose <true/false> ]
```

REST

Request Type	GET
Request URL	http[s]://<host>:<port>/rest/volume/snapshot/restorestatus[?<parameters>]

Parameters

Parameter	Description
cluster	The cluster on which to run the command. This parameter is not mandatory. If not specified, the current cluster is used by default.
volume	The name of the volume that is being restored from a snapshot.
verbose	Displays container statistics in addition to percentage.

Examples

CLI

The following example command displays the status of the snapshot restore operation on a volume named vol2. See the example in [volume snapshot restore](#) on page 3071 for the command that triggered the snapshot restore operation.

```
/opt/mapr/bin/maprcli volume snapshot
restorestatus -volume vol2 -json
{
  "timestamp":1549970683260,
  "timeofday":"2019-02-12
11:24:43.260 GMT+0000 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "targetsnapshot":"s3",
      "progress":"100%"
    }
  ]
}
```

REST

```
curl -X
GET 'https://server.sj.us:8443/
rest/volume/snapshot/restorestatus?
volume=vol2' --user
<username>:<password>
```

The following command displays the container statistics of volume vol2 using the verbose flag.

CLI

```
/opt/mapr/bin/maprcli volume snapshot
restorestatus -volume vol2 -verbose
true -json
{
  "timestamp":1549970690705,
  "timeofday":"2019-02-12
11:24:50.705 GMT+0000 AM",
  "status":"OK",
  "total":1,
  "data":[
    {
      "targetsnapshot":"s3",
      "progress":"100%",
      "numcontainerstotal":6,
      "numcontainersinprogress":0,
      "numcontainerssuccess":6,
      "numcontainersinretrywait":0
    }
  ]
}
```

REST

```
# curl -X GET 'https://abc.sj.us:8443/
rest/volume/snapshot/restorestatus?
```

```
volume=vol2&verbose=true' --user
<username>:<password>
```

Related tasks

[Restoring Volume Snapshots Using the Control System](#) on page 1537

Describes how to restore snapshots of volumes using the Control System.

[volume snapshot restore](#) on page 3071

Restores a volume from a snapshot using the CLI.

MinIO Client (mc) Commands

Lists mc commands that you can use to perform operations, such as creating and editing buckets and accounts in HPE Data Fabric Object Store.

HPE Data Fabric Object Store provides MinIO client commands that you run from `/opt/mapr/bin/`, as shown in the following example:

```
/opt/mapr/bin/mc ls --recursive salesobject -json

//Lists all buckets recursively from the Object Store deployment with alias
salesobject.
```

TIP:

- A user cannot run the mc commands until the user's access to the mc commands is enabled, as described in [Enabling the HPE Data Fabric Object Store](#) on page 269.
- The following mc commands operate on delete markers or versioned objects when used with the `--versions` or `--version-id` option:
 - [mc cp](#) on page 3151
 - [mc ls](#) on page 3137
 - [mc rm](#) on page 3149

Use the following mc commands to manage accounts and resources in HPE Data Fabric Object Store:

mc alias

Creates and manages user and service aliases.

mc alias set

Sets a user or service alias.

NOTE: By default, the API server uses `https://` for URLs. To make `https://` work, run:

```
cp /opt/mapr/conf/ca/chain-ca.pem to the user's ~/.mc/certs/CAs/
directory
```

Syntax

CLI

```
mc alias set ALIAS URL ACCESSKEY
SECRETKEY
```

FLAGS:

```

--path value
bucket path lookup supported by the
server. Valid options are '[auto, on,
off]' (default: "auto")
--api value                                API
signature. Valid options are '[S3v4,
S3v2]'
```

```

--config-dir value, -C value  path
to configuration folder (default: "/"
root/.mc")
--quiet, -q
disable progress bar display
--no-color
disable color theme
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h                                show
help
```

Parameters

Parameters	Description
ALIAS	<p>The name to associate to the user or service.</p> <p>The specified string cannot match any existing host aliases. Use the alias list command to view the current host aliases before adding a new host.</p> <p>This parameter is mandatory.</p>
URL	<p>The URL for the Object Store endpoint.</p> <p>This parameter is mandatory.</p>
ACCESSKEY	<p>The access key for authenticating to the Object Store service. The ACCESSKEY must correspond to a user or role on the Object Store service.</p> <p>This parameter is mandatory.</p>
SECRETKEY	<p>The corresponding secret for the specified ACCESSKEY.</p>
path	<p>Use DNS or path style URL for bucket lookups. The valid value is one of:</p> <ul style="list-style-type: none"> on: use path style URL for bucket lookup off: Use DNS for bucket lookup auto: Allow the command to automatically determine the appropriate style to use. <p>Default: auto</p>

Parameters	Description
api	The Amazon S3 signature version to use when connecting to the Object Store service. The valid value is one of: <ul style="list-style-type: none"> s3v2: use path style URL for bucket lookup s3v4 Default: s3v4
config-dir	The path to the configuration folder. Default: /root/.mc
quiet	Disables progress bar display.
no-color	Disables color in the output.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Examples

1. Alias a user with access key A7363534 and secret key S42525252 to the finance service endpoint:

CLI

```
/opt/mapr/bin/mc alias
set finuser https://
findept.storage.beamraft.com:9000
A7363534 S42525252 -json
```

2. Add the Object Store service under the salesobject alias, to use DNS style bucket lookup:

CLI

```
mc alias set salesobject https://
localhost:9000 minio minio123 --api
"s3v4" --path "off" -json
```

mc alias list

Lists all aliases.

CLI

```
mc alias list [ALIAS]

FLAGS:
  --config-dir value, -C value path
to configuration folder (default: "/
root/.mc")
  --quiet, -q
disable progress bar display
  --no-color
disable color theme
  --json
enable JSON lines formatted output
  --debug
enable debug output
```

```
--insecure
disable SSL certificate verification
--help, -h          show
help
```

Parameters

Parameters	Description
ALIAS	The alias to list. Without this parameter, the command lists all aliases.
config-dir	The path to the configuration folder. Default: /root/.mc
quiet	Disables progress bar display
no-color	Disables color in the output
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

Examples

1. List all aliases:

CLI

```
/opt/mapr/bin/mc alias list
```

2. List a specific alias called financedept:

CLI

```
/opt/mapr/bin/mc alias list
financedept
```

mc alias remove
Removes an alias.

CLI

```
mc alias remove ALIAS

FLAGS:
  --config-dir value, -C value  path
                                to configuration folder (default: "/
                                root/.mc")
  --quiet, -q                  disable
                                progress bar display
  --no-color                    disable
                                color theme
  --json                        enable
                                JSON lines formatted output
  --debug                      enable
                                debug output
  --insecure
```

```
disable SSL certificate verification
--help, -h                        show
help
```

Parameters

Parameters	Description
ALIAS	The alias to remove. This parameter is Mandatory.
config-dir	The path to the configuration folder. Default: /root/.mc
quiet	Disables progress bar display
no-color	Disables color in the output
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

Examples

Remove an alias financedept.

CLI

```
/opt/mapr/bin/mc alias remove
financedept
```

mc admin account

Creates and manages accounts.

mc admin account create

Creates an account.

The mc administrator runs this command to create accounts.

NOTE: Any account other than default account is disallowed in case of a global namespace.

Syntax

CLI

```
mc admin account create TARGET
account_name [ domain=<domain_name> ]
[ admin=<user_name> ] \
  [ storage_class="key1:
val1,key2: val2" ]
[ default_bucket_policy=<json_file> ]
\
  [ access_controls=<json_file> ]

account_name:
  Name of the account to be created

domain:
```

```

The domain in which the account
needs to be created

admin:
  The LDAP username to be designated
  as the account root. Default: cluster
  admin (mapr)

storage_class keys:
  quota      : <x> (in MB)
  advisory_quota : <y> (in MB)
  label      : <storage_label>
  metaLabel  : <storage_label
for meta data containers>
  ecLabel    : <storage label
for ec volume>
  ec_scheme  : <data_parity +
global_parity [+local_parity]
  min_repl   : <minimum repl
factor>
  desired_repl : <desired repl
factor>
  topology   : <topology>
  ecTopology  : <topology for ec
volume>
  dareEnabled : <Data at Rest
Encryption>

FLAGS:
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h          show
help

```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command creates the account. This parameter is mandatory.
account_name	The name of the account to create. This parameter is mandatory.
domain	The name of the domain under which the account must be created.
admin	The name of the LDAP user to designate as the account administrator. By default, the mapr user is the administrator, till you create your own admin user.
storage_class	Optional storage parameters to be specified as key-value pairs for the account. Data Fabric creates bucket volumes using these parameters.
default_bucket_policy	The bucket policy to set as default for the account.

Parameter	Description
access_control	Specifies who can manage users/groups/policies/keys in this account.  NOTE: For in-depth information on access controls, read Administering Account Resources on page 648.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Examples

1. Create an account sales in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc admin account
create salesobject sales
```

2. Create an account sales in the Object Store deployment with alias *salesobject*, with specific storage class values:

CLI

```
/opt/mapr/bin/mc admin account
create salesobject sales
storage_class="label=hdd,quota=42894
1,ec_scheme=6+2+2"
```

mc admin account delete

Deletes an account.

The Object Store administrator runs this command to delete accounts. An account is deleted only if there are no users, buckets or buckets under it.

Syntax

CLI

```
mc admin account delete - delete
account

USAGE:
  mc admin account delete TARGET
account_name [ domain=<domain_name> ]

account_name:
  Name of the account that needs to
  be deleted

domain:
  The domain to which the account
  belongs.

FLAGS:
  --json
  enable JSON lines formatted output
```

```
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h          show
help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store deployment from which the command deletes the account. This parameter is mandatory.
account_name	The name of the account to delete. This parameter is mandatory.
domain	The name of the domain to which the account being deleted belongs.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Examples

1. Delete an account sales from the Object Store deployment with alias *salesobject*:

CLI

```
mc admin account delete
salesobject 'sales'
```

2. Delete an account sales in the Object Store deployment with alias *salesobject*, from the domain *north_america*:

CLI

```
mc admin account
delete salesobject sales
domain=north-america
```

mc admin account modify

Modifies an account for a domain.

The Object Store administrator runs this command to modify accounts.

NOTE: You cannot modify storage class options with this command. Use the [mc admin account modify-storageclass](#) command to modify the storage class options.

After you modify the default bucket policy for the account, then all the new buckets that get created from that moment will inherit the modified policy. Existing buckets will continue to use the old bucket policy.

Syntax**CLI**

```
mc admin account modify TARGET
account_name [ domain=<domain_name> ]
[ admin=<user_name> ] \

[ default_bucket_policy=<json_file> ]
[ access_controls=<json_file> ]

account_name:
    The account whose meta data needs
    to be modified

FLAGS:
    --json
    enable JSON lines formatted output
    --debug
    enable debug output
    --insecure
    disable SSL certificate verification
    --help, -h          show
    help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store deployment on which the command modifies an account. This parameter is mandatory.
account_name	The name of the account to modify. This parameter is mandatory.
domain	The name of the domain under which the account must be modified.
admin	The name of the LDAP user to designate as the new account administrator. By default, the mapr user is the cluster administrator and the administrator of all accounts.
default_bucket_policy	The bucket policy to set as default for all buckets in the account.
access_control	The access control list to set for all resources in the account.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

Example

Set the root/admin of the account *sales* in the Object Store deployment with alias *salesobject* to LDAP user *joe*:

CLI

```
mc admin account modify salesobject
sales admin=joe
```

mc admin account modify-storageclass

Modifies storage class parameters for an account.

The Object Store administrator runs this command to modify storage class parameters for an account.

NOTE: To modify all other account parameters, see the [mc admin account modify](#) on page 3082 command.

Syntax**CLI**

```
mc admin account
modify-storageclass TARGET
account "key1:value1,key2:value2"
[ domain=<domain_name> ]

account:
    The account whose storage class
    arguments need to be modified.

keys:
    quota           : <x> (in MB)
    advisory_quota  : <y> (in MB)
    label           : <storage_label>
    metaLabel       : <storage_label
for megta data containers>
    ecLabel         : <storage label
for ec volume>
    ec_scheme       : <data_parity +
global_parity [+local_parity]
    min_repl        : <minimum repl
factor>
    desired_repl    : <desired repl
factor>
    topology        : <topology>
    ecTopology      : <topology for ec
volume>
    dareEnabled     : <Data at Rest
Encryption>

FLAGS:
    --json
enable JSON lines formatted output
    --debug
enable debug output
    --insecure
disable SSL certificate verification
    --help, -h          show
help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store deployment on which the command modifies the storage class. This parameter is mandatory.
account_name	The name of the account to modify. This parameter is mandatory.

Parameter	Description
storage_class	The storage parameters to be specified as key-value pairs for the account. See quota , advisory quota , label , EC scheme , minimum replication factor , and the desired replication factor for explanations.
domain	The name of the domain under which the account must be modified.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Example

Modify desired replication factor to 5 for the account *sales* in the Object Store deployment with alias *salesobject*:

CLI

```
mc admin account modify-storageclass
salesobject sales "desired_repl:5"
```

mc admin account list

Lists all accounts for a domain.

Syntax

CLI

```
mc admin account list TARGET
[ domain=<domain_name> ]

domain:
  The domain whose accounts need to
  be listed

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store for which the command lists accounts. This parameter is mandatory.
domain	The name of the domain for which the accounts must be listed. Without this parameter, only accounts in the primary domain are listed.
json	Enables JSON formatted output.

Parameter	Description
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Examples

1. List all accounts in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc admin account list
salesobject
```

2. List all accounts in the Object Store deployment with alias *salesobject* for the domain *sales*:

CLI

```
/opt/mapr/bin/mc admin account list
salesobject domain='sales'
```

mc admin account info

Lists account information for a specified account.

Syntax

CLI

```
mc admin account info - list the info
of an account
```

USAGE:

```
mc admin account info TARGET
account [ domain=<domain_name> ]
```

account:

The account whose info needs to be fetched and displayed

FLAGS:

```
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h          show
help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the account exists. This parameter is mandatory.
account	The account for which to retrieve the information. This parameter is mandatory.
domain	The name of the domain under which the account exists.

Parameter	Description
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Examples

Display information for the account *sales* under the domain *north_america* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc admin account
info salesobject sales
domain=north_america -json
```

mc admin bucket quota
Manage bucket quota.

Syntax

CLI

```
mc admin bucket quota TARGET [--fifo
QUOTA | --hard QUOTA | --clear]

QUOTA
  quota accepts human-readable
  case-insensitive number
  suffixes such as "k", "m", "g", "t"
  referring to the metrics unit KB,
  MB, GB and TB respectively. Adding
  an "i" to these prefixes, uses the IEC
  units, so that "gi" refers to
  "gigibyte" or "GiB". A "b" at the end
  is
  also accepted. Without suffixes the
  unit is bytes.

FLAGS:
  --fifo value  set fifo quota,
  allowing automatic deletion of older
  content
  --hard value  set a hard quota,
  disallowing writes after quota is
  reached
  --clear       clears bucket quota
  configured for bucket;
  --json       enable JSON lines
  formatted output
  --debug       enable debug output
  --insecure    disable SSL
  certificate verification
  --help, -h    show help
```

Parameters

Parameter	Description
fifo	This option from the original minio command is not supported in Data Fabric.
hard	On setting this quota, the bucket can hold objects upto the specified hard quota only. The older objects are retained when you set the hard quota.  NOTE: If you attempt to upload objects to the bucket such that the total size of all objects present in the bucket exceeds the hard quota, an error is displayed, and the object(s) due to which the hard quota is exceeded, is not stored on the bucket. In this case, you can choose to increase the hard quota, and then attempt to reload the object(s) to the bucket.
clear	Use this option to clear the bucket quota and reset it to 0.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

IMPORTANT:

If bucket quota is more than account quota/volume quota, the account quota/volume quota get precedence.

For example, if you have created a bucket and set quota on backend volume quota as 5GB and the bucket quota to 10GB, the volume quota gets enforced first and you are unable to upload more than 5GB even though bucket quota is 10GB. Similarly, if you create a bucket inside an account and have set account quota as 5GB and bucket quota as 10GB, the account quota is enforced. You are unable to upload more than 5GB even though bucket quota is 10GB.

1. Display bucket quota configured for mybucket on the object store 'myminio':

CLI

```
mc admin bucket quota myminio/
mybucket
```

2. Set hard quota of 1 GB for the bucket,'mybucket' on the object store 'myminio':

CLI

```
mc admin bucket quota myminio/
mybucket --hard 1GB
```

3. Clear bucket quota configured for the bucket 'mybucket' on the object store 'myminio':

CLI

```
mc admin bucket quota myminio/
mybucket --clear
```

mc admin audit

Describes how S3 auditing works in HPE Data Fabric Object Store. Provides the command for bucket and account operations auditing. Also provides the command to view the audit status of bucket and account operations.

Starting in Data Fabric 7.3.0, Object Store supports auditing of S3 operations at the global, account, and bucket levels. You can run the `mc admin audit set alias` command to set auditing flags at each level. Flags are disabled by default.

The following table lists the flag levels with descriptions:

Flag Level	Description	Operations Audited	Supported Flags
Global	Controls all levels of auditing. When enabled, this flag audits operations on the MOSS server, accounts, and buckets. When disabled, no operations are audited.	<ul style="list-style-type: none"> Create account Delete account Changes to account properties 	auditable
Account	Controls auditing of operations at the account level. When enabled, operations on accounts are audited. Use <code>forceauditable</code> to override the global audit setting for accounts. When the <code>forceauditable</code> flag is enabled at the account level, all operations at the account and bucket levels are audited regardless of the bucket level audit setting. For example, if the <code>auditable</code> flag is disabled at the bucket level, all account-level and bucket-level operations are audited.	<ul style="list-style-type: none"> IAM operations: <ul style="list-style-type: none"> Create users/groups/policies Delete users/groups/policies Edit users/groups/policies 	auditable, forceauditable
Bucket	Controls auditing at the bucket level. When enabled, operations on buckets are audited.	<ul style="list-style-type: none"> Create object Delete object Changes to object properties 	auditable

You can also run the `mc admin audit info alias` command to get the audit status of buckets and accounts.

Audit Logs

The CLDB creates a volume for audit records when the first MOSS server registers with the cluster. When the MOSS server starts, it creates a folder in the audit volume that stores audit logs for each node:

```
/var/mapr/local/mapr.s3.audit/
```

For example:

```
# hadoop fs -ls /var/mapr/local/mapr.s3.audit/
drw-r--r-- - mapr mapr          1 2023-04-11 07:25 /var/mapr/local/
mapr.s3.audit/<FQDN-1>
drw-r--r-- - mapr mapr          0 2023-04-11 07:22 /var/mapr/local/
mapr.s3.audit/<FQDN-2>
drw-r--r-- - mapr mapr          0 2023-04-11 07:22 /var/mapr/local/
mapr.s3.audit/<FQDN-3>
```

```
drw-r--r-- - mapr mapr          0 2023-04-11 07:22 /var/mapr/local/
mapr.s3.audit/<FQDN-4>
```

Audit Commands

The following topics provide the commands to enable auditing of account and bucket operations in HPE Data Fabric Object Store:

mc admin audit

Enables and disables auditing for HPE Data Fabric Object Store operations.

Syntax

CLI

```
mc admin audit set alias \
[ bucket=<bucket name> ] \
[ account=<account name> ] \
[ auditenable=<true/false> ] \
[ forceauditenable=<true/false> ] \
[ retentionPeriod=<days> ] \
[ alarmingAuditVolumeSize=<size in
mb> ]

FLAGS:
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h          show
help
```

Parameters

Parameter	Description
bucket	Bucket on which to set the auditenable flag.
account	Account on which to set the auditenable or forceauditenable flag.
global	If both the account and bucket are not specified, auditing is applied globally.
auditenable	Sets auditing at the global, account, or bucket level.
forceauditenable	Forces auditing at the account level only. Overrides the global audit setting.
retentionPeriod	Specifies the number of days to retain the audit logs.
alarmingAuditVolumeSize	Specifies the size (MB) limit for the audit volume. When the limit is reached, the system raises an alarm.

Examples

CLI

Enable auditing of operations at the global level (to audit account and bucket operations):

```
mc admin audit set alias
auditenable=true retentionPeriod=10
```

CLI

Disable auditing on account operations only:

```
mc admin audit set alias
account='sales' forceauditenable=false
```

CLI

Enable auditing on bucket operations:

```
mc admin audit set alias
bucket='mybucket' auditenable=true
retentionPeriod=20
```

mc admin audit info

Lists the audit status for global, bucket, and account level.

Syntax

CLI

```
mc admin audit info
alias [ bucket=<bucket name> ]
[ account=<account name> ]

FLAGS:
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h          show
help
```

Parameters

Parameter	Description
bucket	Displays the auditenable flag status for the bucket specified.
account	Displays the auditenable and forceauditenable flag status for the account specified.
None.	If no parameter is specified, displays the status of global level auditing.

Examples

CLI

Shows the auditenable flag status for a bucket named mybucket:

```
mc admin audit info
alias --bucket='mybucket'
```

CLI

Shows the auditenable and forceauditenable flag status for an account named myaccount:

```
mc admin audit info
alias --account='myaccount'
```

mc admin ilm-scanner

The `mc admin ilm-scanner` command manages the object store lifecycle scanner. The `mc admin ilm-scanner` command provides subcommands to start, stop, monitor, and control scan throttling.

mc admin ilm-scanner start

Command to start the lifecycle scanner for a specific bucket.

Syntax

```
mc admin ilm-scanner start TARGET/BUCKET
```

NOTE: If a scan is already running for the target bucket, the command returns an error.

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command creates or updates a policy. This parameter is mandatory.
BUCKET	The bucket to be scanned. Starting the scanner without a bucket name is not supported. This is a mandatory parameter.

Examples

1. Start the ilm scanner for the bucket *mybucket* located in the object store having the alias *myminio*:

CLI

```
mc admin ilm-scanner start myminio/
mybucket
```

JSON output

```
$ mc admin ilm-scanner start --json
myminio/mybucket
{
  "status": "success",
  "bucket": "mybucket"
}
```

2. Error example.

CLI

```
$ mc admin ilm-scanner start
myminio/mybucket
mc: Unable to start lifecycle
scanner: lifecycle scanner is
disabled at cluster level.mc admin
ilm-scanner start myminio
```

3. Error example - starting the scanner without providing a bucket name:

CLI

```
$ mc admin ilm-scanner start myminio
mc: bucket name is required
for scanner start. Invalid
arguments provided, please refer
```

```
`mc <command> -h` for relevant
documentation.
```

4. Error example - scanner is already running for the target bucket

CLI

```
$ mc admin ilm-scanner start
myminio/mybucket
mc: Unable to start lifecycle
scanner: operation in progress.
```

mc admin ilm-scanner stop

Command to stop or abort the lifecycle scanner for a specific bucket or for all running scans.

Syntax

```
mc admin ilm-scanner stop TARGET [BUCKET]
```

NOTE: If no scan is running for the target bucket, the command returns an error. Aborted scans log the partial deletion stats (objects deleted, size reclaimed) before stopping.

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store . This parameter is mandatory.
BUCKET	The bucket to be scanned. This is an optional parameter. When no bucket is specified, the command stops all running scans.

Examples

1. Stop the ilm scanner for the bucket *mybucket* located in the object store having the alias *myminio*.

CLI

```
$ mc admin ilm-scanner stop myminio/
mybucket
lifecycle scanner stop for mybucket
is requested
```

2. Stop all running scans for the object store having the alias *myminio*.

CLI

Text output

```
$ mc admin ilm-scanner stop myminio
lifecycle scanner stop for all
buckets is requested
```

JSON output

```
$ mc admin ilm-scanner stop --json
myminio/mybucket
{
  "status": "success",
```

```
"bucket": "mybucket"
}
```

3. Error output when no scan is running.

CLI

```
$ mc admin ilm-scanner stop myminio/
mybucket
mc: Unable to stop lifecycle
scanner: no lifecycle instance
running.
```

mc admin ilm-scanner status

Retrieves the current status of the lifecycle scanner. Supports global overview, per-bucket detail, and verbose mode with active bucket breakdowns.

Syntax

```
mc admin ilm-scanner status [FLAGS] TARGET [BUCKET]
```

Following are the status values displayed:

Table

Status	Description
idle	Scanner is not running any scan
active	Scanner is currently running one or more scans
disabled	Scanner is disabled cluster-wide

Table

Status	Description
completed	Last scan finished successfully
aborted	Last scan was aborted
failed	Last scan failed with an error
none	No scan has run yet

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command creates or updates a policy. This parameter is mandatory.
BUCKET	The bucket to be scanned. This is an optional parameter. When no bucket is specified, the command stops all running scans.
--verbose, -v	Use either --verbose or -v to display per-bucket details for all active scans at the object store level.
--json	Use to display the output in JSON format.

Examples**Sample output for global status****Text output**

CLI

```
$ mc admin ilm-scanner status myminio
Scanner status: active, Buckets under
scan: 3, Throttle min wait: 5s,
Throttle max wait: 20s
```

JSON output

CLI

```
$ mc admin ilm-scanner status --json
myminio
{
  "op": "status",
  "status": "active",
  "num_buckets_under_scan": 3,
  "scan_delay_min": "5s",
  "scan_delay_max": "20s"
}
```

Sample output for global status - verbose**Text output**

CLI

```
$ mc admin ilm-scanner
status --verbose myminio
Scanner status: active, Buckets under
scan: 3, Throttle min wait: 5s,
Throttle max wait: 20s
  Active bucket details:
    Bucket: bucket-a, Objects
deleted: 142, Size reclaimed: 3.5
GiB, Current throttle: 5s
    Bucket: bucket-b, Objects
deleted: 38, Size reclaimed: 512 MiB,
Current throttle: 5s
    Bucket: bucket-c, Objects
deleted: 10, Size reclaimed: 128 MiB
```

JSON output

CLI

```
$ mc admin ilm-scanner
status --json --verbose myminio
{
  "op": "status",
  "status": "active",
  "num_buckets_under_scan": 3,
  "scan_delay_min": "5s",
  "scan_delay_max": "20s",
  "buckets": [
    {
      "bucket": "bucket-a",
      "status": "active",
      "objects_deleted": 142,
      "size_reclaimed": "3.5 GiB",
      "scan_delay_current": "5s"
    }
  ]
}
```

```

    },
    {
      "bucket": "bucket-b",
      "status": "active",
      "objects_deleted": 38,
      "size_reclaimed": "512 MiB",
      "scan_delay_current": "5s"
    },
    {
      "bucket": "bucket-c",
      "status": "active",
      "objects_deleted": 10,
      "size_reclaimed": "128 MiB"
    }
  ]
}

```

Sample output for per-bucket status - never scanned

Text output

CLI

```

$ mc admin ilm-scanner status myminio/
mybucket
Scanner status for bucket mybucket:
idle

```

JSON output

CLI

```

$ mc admin ilm-scanner status --json
myminio/mybucket
{
  "bucket": "mybucket",
  "status": "idle"
}

```

Sample output for per-bucket status -idle, last scan completed

Text output

CLI

```

$ mc admin ilm-scanner status myminio/
mybucket
Scanner status for bucket mybucket:
idle, Last scan status: completed,
Objects deleted: 350, Size reclaimed:
12.8 GiB, Last scan time: 2026-03-30
14:22:05

```

JSON output

CLI

```

$ mc admin ilm-scanner status --json
myminio/mybucket
{
  "bucket": "mybucket",
  "status": "idle",
  "last_scan_status": "completed",
  "last_scan_time": "2026-03-30
14:22:05",
}

```

```
"objects_deleted": 350,
"size_reclaimed": "12.8 GiB"
}
```

Sample output for scanner disabled

Text output

CLI

```
$ mc admin ilm-scanner status myminio
Scanner status: disabled, Throttle
min wait: 5s, Throttle max wait: 20s
```

mc admin ilm-scanner set-throttle

Set the minimum and maximum wait times between lifecycle scans at the cluster/fabric level. The wait times control how aggressively the scanner operates.

Syntax

You can configure the throttle setting at the cluster level only. You cannot configure the throttle for individual buckets.

```
mc admin ilm-scanner set-throttle TARGET --min-wait VALUE --max-wait VALUE
```

NOTE: You must specify the parameters --min-wait and --max-wait together. Values must be positive integers with ms or s suffix.

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command creates or updates a policy. This is a mandatory parameter.
--min-wait	Minimum wait time between scans. The value must be specified in milliseconds or seconds. (For example, 500ms, 5s). This is a mandatory parameter.
--max-wait	Maximum wait time between scans. The value must be specified in milliseconds or seconds. (For example, 500ms, 5s). This is a mandatory parameter.

Example

Set minimum wait time for throttle to 500 milliseconds and maximum wait time to 5 seconds:

Text output

CLI

```
$ mc admin ilm-scanner set-throttle
myminio --min-wait 500ms --max-wait 5s
scanner throttle set - min: 500
milliseconds, max: 5 seconds
```

JSON output

CLI

```
$ mc admin
ilm-scanner set-throttle --json
```

```
myminio --min-wait 500ms --max-wait 5s
{
  "op": "throttle",
  "status": "success",
  "minWaitSeconds": 0.5,
  "maxWaitSeconds": 5
}
```

mc admin policy

Creates and manages user and group policies .

mc admin policy add

Creates accounts, domains, and user policies.

The Object Store administrator runs this command to create a policy. The command throws an error if the policy already exists.

Syntax**CLI**

```
mc admin policy add TARGET POLICYNAME
POLICYFILE account=<account_name>

                domain=<domain_name>
POLICYNAME:
  Name of the canned policy on the
  HPE Object Store server.

POLICYFILE:
  Name of the policy file associated
  with the policy name.

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h                show
  help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command creates or updates a policy. This parameter is mandatory.
POLICYNAME	The name of the policy to create or update. This parameter is mandatory.
POLICYFILE	The file in JSON format containing the policy. This parameter is mandatory.
account	The account to which this policy applies.
domain	The domain to which this policy applies.
json	Enables JSON formatted output
debug	Enables output for debugging

Parameter	Description
insecure	Disables SSL verification
help	Shows this help

Examples

1. Create the *listbuckets* policy that is in the file */tmp/listbuckets.json* in the Object Store deployment with alias *salesobject*:

CLI

```
mc admin policy add salesobject
listbuckets /tmp/listbuckets.json
```

2. Create the *listbuckets* policy that is in the file */tmp/listbuckets.json* in the Object Store deployment with alias *salesobject*, and applicable to the domain *primary*:

CLI

```
mc admin policy add salesobject
listbuckets /tmp/listbuckets.json
domain=primary -json
```

mc admin policy update

Updates accounts, domains, and user policies.

The Object Store administrator runs this command to update a policy. The command throws an error if the policy does not exist.

Syntax

CLI

```
mc admin policy update TARGET
POLICYNAME POLICYFILE
account=<account_name>

                        domain=<domain_name>
POLICYNAME:
    Name of the canned policy on the
    HPE Object Store server.

POLICYFILE:
    Name of the policy file associated
    with the policy name.

FLAGS:
    --json
    enable JSON lines formatted output
    --debug
    enable debug output
    --insecure
    disable SSL certificate verification
    --help, -h          show
    help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command updates a policy. This parameter is mandatory.
POLICYNAME	The name of the policy to update. This parameter is mandatory.
POLICYFILE	The file in JSON format containing the policy. This parameter is mandatory.
account	The account to which this policy applies.
domain	The domain to which this policy applies.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

Examples

1. Updates the *listbuckets* policy that is in the file */tmp/listbuckets.json* in the Object Store deployment with alias *salesobject*:

CLI

```
mc admin policy update salesobject
listbuckets /tmp/listbuckets.json
```

2. Update the *listbuckets* policy that is in the file */tmp/listbuckets.json* in the Object Store deployment with alias *salesobject*, and applicable to the domain *primary*:

CLI

```
mc admin policy update salesobject
listbuckets /tmp/listbuckets.json
domain=primary -json
```

mc admin policy remove

Removes a policy.

The Object Store administrator runs this command to remove a policy. A policy can only be removed if it is not attached to any user or group.

Syntax

CLI

```
mc admin policy remove TARGET
POLICYNAME [ account=<account_name> ]
[ domain=<domain_name> ]

POLICYNAME:
    Name of the policy to be removed.

account:
    Name of the account to which
    the policy belongs. Default Value:
    'default'
```

```
domain:
  Name of the domain to which the
  policy and account belong. Default
  Value: 'primary'

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store from which the command removes a policy. This parameter is mandatory.
POLICYNAME	The name of the policy to remove. This parameter is mandatory.
account	The account in which this policy was created.
domain	The domain to which this policy account belongs.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Examples

1. Remove the *listbuckets* policy from the Object Store deployment with alias *salesobject*:

CLI

mc admin policy remove salesobject
listbuckets

2. Remove the *listbuckets* policy from the Object Store deployment with alias *salesobject*, which is applicable to the domain *primary* and account *northamerica*:

CLI

mc admin policy remove salesobject
listbuckets domain='primary'
account='northamerica' -json

mc admin policy list
List all policies.

Syntax**CLI**

```
mc admin policy list - list all
policies

USAGE:
  mc admin policy list
  TARGET [ account=<account_name> ]
  [ domain=<domain_name> ]

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store from which to retrieve the policies. This parameter is mandatory.
account	The account from which to retrieve the list of policies. Omitting this parameter, lists only IAM policies present in the default account.
domain	The domain from which to retrieve the list of policies.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Examples

1. List all IAM policies on the Object Store deployment with alias *salesobject*. The policies are listed from the *primary* domain for the default account:

CLI

```
mc admin policy list salesobject
```

2. List all IAM policies for the domain *primary* from the Object Store deployment with alias *salesobject* for the *default* account:

CLI

```
mc admin policy list salesobject
domain='primary'
```

3. List all policies for the domain *primary* from the Object Store deployment with alias *salesobject* for the *northamerica* account:

CLI

```
mc admin policy list
salesobject domain='primary'
account='northamerica'
```

mc admin policy info

Returns information for a specified policy, along with the users and groups to which the policy is attached.

Syntax**CLI**

```
mc admin policy info - show info on a
policy

USAGE:
  mc admin policy info TARGET
POLICYNAME [ account=<account_name> ]
[ domain=<domain_name> ]

POLICYNAME:
  Name of the policy on the Object
  Store server.

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store from which the command retrieves policy information. This parameter is mandatory.
POLICYNAME	The name of the policy for which to retrieve the information. This parameter is mandatory.
account	The account to which this policy belongs.
domain	The domain to which this policy account belongs.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Examples

1. Display the information for the *listbuckets* policy from the Object Store deployment with alias *salesobject*:

CLI

```
mc admin policy info salesobject
listbuckets
```

2. Display the information for the *listbuckets* policy from the Object Store deployment with alias *salesobject*, which is applicable to the domain *primary*:

CLI

```
mc admin policy info salesobject
listbuckets domain='primary' -json
```

mc admin policy set

Sets a policy for a user or a group.

Syntax

CLI

```
mc admin policy set - set IAM policy
on a user or group
```

USAGE:

```
mc admin policy set TARGET
POLICYNAME [ users=user1,user2 ]
[ groups=group1,
group2 ] [ account=<account_name> ]
[ domain=<domain_name> ]
[ principalsaccount=<user/group
account> ]
```

POLICYNAME:

Name of the policy on the MinIO server.

users:

List of users to which the policy must be attached.

groups:

List of Groups to which the policy must be attached.

account:

Name of the account whose policy is being attached.

domain:

Name of the domain to which the account belongs.

principalsaccount:

Name of the account of the users or groups, if it is different from the policy's account.

Currently, the allowed value for this is 'default'.

FLAGS:

```
--json
enable JSON lines formatted output
--debug
```

```

enable debug output
--insecure
disable SSL certificate verification
--help, -h          show
help

```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command sets the policy. This parameter is mandatory.
POLICYNAME	The name of the policy to set. This parameter is mandatory.
users	Comma separated list of users to which the policy must be set. Specify either a user or a group (using the groups parameter), or both.
groups	Comma separated list of groups to which the policy must be set. Specify either a user (using the user s parameter) or a group or both.
account	Name of the account where the policy is created.
domain	Name of the domain to which account belongs.
principalsaccount	Name of the account of the users or groups, if different from the policy's account. Currently, the allowed value for this is default.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

Examples

1. Set the *listbuckets* policy for users *james* and *daniel* on the Object Store deployment with alias *salesobject*:

CLI

```

/opt/mapr/bin/mc admin policy
set salesobject listbuckets
users='james,daniel' -json

```

2. Set the *listbuckets* policy for users *james* and *daniel* in account *naphthara* on the Object Store deployment with alias *salesobject*:

CLI

```

/opt/mapr/bin/mc admin
policy set salesobject
listbuckets users='james,daniel'
account='naphthara' -json

```

mc admin policy unset

Detaches a policy from a user or a group.

Syntax**CLI**

```
mc admin policy unset TARGET
POLICYNAME [ users=user1,user2 ]
[ groups=group1,
group2 ] [ account=<account_name> ]
[ domain=<domain_name> ]
[ principalsaccount=<user/group
account> ]
```

POLICYNAME:
Name of the policy to be detached.

users:
List of users from which the policy must be detached.

groups:
List of groups from which the policy must be detached.

account:
Name of the account to which the policy belongs.

domain:
Name of the domain to which the account belongs.

principalsaccount:
Name of the account of the users or groups, if it is different from the policy's account.
Currently, the only allowed value is 'default'.

FLAGS:
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h show help

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store from which the command detaches the policy. This parameter is mandatory.
POLICYNAME	The name of the policy to detach. This parameter is mandatory.
users	Comma separated list of users from which the policy must be detached. Specify either a user or a group (using the groups parameter), or both.

Parameter	Description
groups	Comma separated list of groups from which the policy must be detached. Specify either a user (using the user's parameter) or a group or both.
account	Name of the account whose policy is being detached.
domain	Name of the domain to which account belongs.
principalsaccount	Name of the account of the users or groups, if different from the policy's account. Currently, the allowed value for this is default.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

Examples

1. Detaches the *listbuckets* policy from users *james* and *daniel* on the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc admin policy
unset salesobject listbuckets
users='james,daniel'
```

2. Detaches the *listbuckets* policy from users *james* and *daniel* in account *naphthara* on the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc admin
policy unset salesobject
listbuckets users='james,daniel'
account='naphthara'
```

mc version

Manages bucket versioning.

mc version enable

Enables versioning for a bucket.

Syntax

CLI

```
mc version enable TARGET
```

FLAGS:

```
--json          enable JSON lines
formatted output
--debug         enable debug output
--insecure      disable SSL certificate
verification
--help, -h      show help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command enables versioning. This parameter is mandatory.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

Examples

1. Enable versioning on bucket *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc version enable
salesobject/northamerica
```

mc version suspend

Suspends versioning for a bucket.

Syntax

CLI

```
mc version suspend TARGET

FLAGS:
  --json      enable JSON lines
              formatted output
  --debug     enable debug output
  --insecure  disable SSL certificate
              verification
  --help, -h  show help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command suspends versioning. This parameter is mandatory.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

Examples

1. Suspend versioning on bucket *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc version suspend
salesobject/northamerica
```

mc version info
Query the status of versioning for a bucket.

Syntax

CLI

```
mc version info TARGET

FLAGS:
  --json          enable JSON lines
                  formatted output
  --debug         enable debug output
  --insecure      disable SSL certificate
                  verification
  --help, -h      show help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command queries versioning. This parameter is mandatory.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

Examples

1. Query versioning on bucket *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc version info
salesobject/northamerica
```

mc admin user
Creates and manages users for each account.
mc admin user add
Adds a user to an account.

The Object Store administrator runs this command to add both IAM users to accounts and domain users to the default account.

 **NOTE:** IAM users cannot be added to the default account.

Syntax

CLI

```
mc admin user add - add a new user
```

USAGE:

```
mc admin user add TARGET
USERNAME [ account=<account_name> ]
[ domain=<domain_name> ]
```

USERNAME:

Name of the user to be created.

account:

Name of the account in which the user needs to be created

domain:

Name of the domain in which the said account is present.

FLAGS:

```
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h          show
help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Storeon which the command adds the user. This parameter is mandatory.
USERNAME	The user name to add. This parameter is mandatory.
account	The name of the account to which to add the user.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Example

Add a user *joe* to the *northamerica* account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin user
add salesobject joe
account='northamerica' -json
```

mc admin user addgroups

Adds IAM groups to a IAM user.

The Object Store administrator runs this command to add IAM groups to IAM users.

Syntax**CLI**

```
mc admin user
addgroups TARGET USERNAME
GROUPS [ account=<account_name> ]
[ domain=<domain_name> ]

USERNAME:
    The user to whom new groups need to
    be added.

GROUPS:
    List of comma separated groups to
    be added to the user.

FLAGS:
    --json
    enable JSON lines formatted output
    --debug
    enable debug output
    --insecure
    disable SSL certificate verification
    --help, -h          show
    help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Storeon which the command adds the groups. This parameter is mandatory.
USERNAME	The user name to which the groups must be added. This parameter is mandatory.
GROUPS	The comma separated list of groups to add. This parameter is mandatory.
account	The name of the account to which to the user belongs.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Example

Add groups *firestorm* and *freezone* to a user *joe* in the *northamerica* account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin user addgroups
salesobject joe 'firestorm,freezone'
account='northamerica'
```

mc admin user removegroups

Removes IAM groups from IAM users.

The Object Store administrator runs this command to remove IAM groups from IAM users.

Syntax

CLI

```
mc admin user removegroups - remove
group of a user

USAGE:
  mc admin user
  removegroups TARGET USERNAME
  GROUPS [ account=<account_name> ]
  [ domain=<domain_name> ]

USERNAME:
  The user whose groups need to be
  removed.

GROUPS:
  List of comma separated groups to
  be removed from the user.

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Storeon which the command removes the groups. This parameter is mandatory.
USERNAME	The user name from which the groups must be removed. This parameter is mandatory.
GROUPS	The comma separated list of groups to remove. This parameter is mandatory.
account	The name of the account to which to the user belongs.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

Example

Remove groups *firestorm* and *freezone* from a user *joe* in the *northamerica* account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin user
removegroups salesobject
joe 'firestorm,freezone'
account='northamerica'
```

mc admin user disable

Disables an IAM user account.

The Object Store administrator runs this command to disable an IAM user. Disabled users cannot manage their keys nor can they login to the Object Store.

Syntax**CLI**

```
mc admin user disable TARGET USERNAME
account=<account name> domain=<domain
name>
```

```
FLAGS:
  --json
    enable JSON lines formatted output
  --debug
    enable debug output
  --insecure
    disable SSL certificate verification
  --help, -h
    show help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command disables the user. This parameter is mandatory.
USERNAME	The user name to disable. This parameter is mandatory.
account	The name of the account in which the user exists. This parameter is mandatory.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Example

Disable a user *joe* in the *northamerica* account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin user disable
salesobject joe account='northamerica'
```

mc admin user enable

Enables an IAM user account.

The Object Store administrator runs this command to enable a user.

Syntax

CLI

```
mc admin user enable TARGET
USERNAME [account=<account name>
domain=<domain name>]

FLAGS:
  --json
    enable JSON lines formatted output
  --debug
    enable debug output
  --insecure
    disable SSL certificate verification
  --help, -h
    show help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command enables the user. This parameter is mandatory.
USERNAME	The user name to enable. This parameter is mandatory.
account	The name of the account in which the user exists.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Example

Enable a user *joe* in the *northamerica* account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin user enable
salesobject joe account='northamerica'
```

mc admin user remove

Removes an IAM user account.

The Object Store administrator runs this command to remove an IAM user. On removal, the ownership of the resources belonging to the user is transferred to the administrator of the account to which the user belongs.

Syntax

CLI

```
mc admin user remove TARGET
USERNAME [account=<account name>
domain=<domain name>]
```

```

FLAGS:
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h          show
help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command removes the user. This parameter is mandatory.
USERNAME	The user name to remove. This parameter is mandatory.
account	The name of the account in which the user exists.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Example

1. Removes a user *joe* from the *northamerica* account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin user
remove salesobject joe
account='northamerica'
```

mc admin user list

Lists all users belonging to an account.

Syntax

CLI

```
mc admin user list - list all users

USAGE:
  mc admin user list
TARGET [account=<account name>
domain=<domain name>]

FLAGS:
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
```

```
disable SSL certificate verification
--help, -h                               show
help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store from which the command lists the user. This parameter is mandatory.
account	The name of the account from which to list users. The account is assumed to be the default account, if you do not specify this parameter.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

Examples

1. List all users from the default account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin user list
salesobject
```

2. List all users from the northamerica account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin user list
salesobject account='northamerica'
```

mc admin user info

Displays information for a specified user.

Syntax

CLI

```
mc admin user info TARGET
USERNAME [account=<account name>
domain=<domain name>]

FLAGS:
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h                               show
help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store from which the command retrieves the user information. This parameter is mandatory.
USERNAME	The user name for which to retrieve the information. This parameter is mandatory.
account	The name of the account to which the user belongs. The account is assumed to be the default account, if you do not specify this parameter.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

Examples

1. List user information for user *joe* from the default account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin user info
salesobject joe
```

2. List user information for user *joe* from the northamerica account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin user
info salesobject joe
account='northamerica'
```

mc admin creds

Creates and manages access keys for users

mc admin creds add-access-key

Creates the access key for a user.

The Object Store administrator runs this command to create the access key for a user. Every user can have a maximum of two keys at any time.

Syntax

CLI

```
mc admin creds add-access-key - add a
new access key for user
```

USAGE:

```
mc admin creds add-access-key
TARGET user=<user_name>
[ account=<account_name> ]
[ domain=<domain_name> ]
```

```

user:
    User whose access key needs to be
    added

account:
    The account to which the user
    belongs.

FLAGS:
    --config-dir value, -C value path
    to configuration folder (default: "/
    root/.mc")
    --quiet, -q
    disable progress bar display
    --no-color
    disable color theme
    --json
    enable JSON lines formatted output
    --debug
    enable debug output
    --insecure
    disable SSL certificate verification
    --help, -h                show
    help

```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command creates the access key. This parameter is mandatory.
user	The user name for which the access key needs to be created. This parameter is mandatory.
account	The name of the account to which the user belongs. The account is assumed to be the default account, if you do not specify this parameter.
domain	The name of the domain under which the account exists.
config-dir	Path to the configuration directory (/root/.mc by default)
quiet	Disables progress bar display
no-color	Disables color in the output
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

Examples

1. Create the access key for user *joe* from the default account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin creds
add-access-key salesobject joe -json
```

2. Create the access key for user *joe* from the *northamerica* account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin creds
add-access-key salesobject joe
account='northamerica' -json
```

mc admin creds delete-access-key

Delete the access key for a user.

The Object Store administrator runs this command to delete the access key for a user.

Syntax

CLI

```
mc admin creds delete-access-key
TARGET access-key

user:
    Access key that needs to be deleted

FLAGS:
    --config-dir value, -C value path
    to configuration folder (default: "/
    root/.mc")
    --quiet, -q
    disable progress bar display
    --no-color
    disable color theme
    --json
    enable JSON lines formatted output
    --debug
    enable debug output
    --insecure
    disable SSL certificate verification
    --help, -h show
help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command deletes the access key. This parameter is mandatory.
access-key	The access key to delete. This parameter is mandatory.
config-dir	Path to the configuration directory (/root/.mc by default)
quiet	Disables progress bar display
no-color	Disables color in the output
json	Enables JSON formatted output

Parameter	Description
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

Example

Delete the access key *XyAbZpo123tuY* in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin creds
delete-access-key salesobject
XyAbZpo123tuY
```

mc admin creds list-access-key

Lists the access keys belonging to a specified user.

Users can run this command to list their access keys.

Syntax**CLI**

```
mc admin creds list-access-key - list
the access keys of a user
```

USAGE:

```
mc admin creds
list-access-key TARGET
user [ account=<account_name> ]
[ domain=<domain_name> ]
```

user:

User whose access key needs to be listed

account:

The account to which the user belongs.

FLAGS:

```
--config-dir value, -C value path
to configuration folder (default: "/
root/.mc")
--quiet, -q
disable progress bar display
--no-color
disable color theme
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h show
help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store from which the command lists the access key. This parameter is mandatory.
user	The user name for which the access key needs to be listed. This parameter is mandatory.
account	The name of the account to which the user belongs. The account is assumed to be the default account, if you do not specify this parameter.
domain	The name of the domain under which the account exists.
config-dir	Path to the configuration directory (/root/.mc by default).
quiet	Disables progress bar display.
no-color	Disables color in the output.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Examples

1. List the access key for user *joe* from the default account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin creds
list-access-key salesobject
joe -json
```

2. List the access key for user *joe* from the northamerica account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin creds
list-access-key salesobject joe
account='northamerica' -json
```

mc admin creds enable-access-key

Enables an access key.

Users can run this command to enable their access keys.

Syntax

CLI

```
mc admin creds enable-access-key -
enable an access key
```

USAGE:

```
mc admin creds enable-access-key
TARGET access-key
```

```

user:
  Access key that needs to be enabled

FLAGS:
  --config-dir value, -C value path
  to configuration folder (default: "/
  root/.mc")
  --quiet, -q
  disable progress bar display
  --no-color
  disable color theme
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h show
  help

```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command enables the access key. This parameter is mandatory.
access-key	The access key to enable. This parameter is mandatory.
config-dir	Path to the configuration directory (/root/.mc by default)
quiet	Disables progress bar display
no-color	Disables color in the output
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

Example

Enable the access key *XyAbZpo123tuY* in the Object Store deployment with alias *salesobject*.

CLI

```

/opt/mapr/bin/mc admin creds
enable-access-key salesobject
XyAbZpo123tuY

```

mc admin creds disable-access-key

Disables an access key.

Users can run this command to disable their access keys.

Syntax**CLI**

```
mc admin creds disable-access-key -
disable an access key

USAGE:
  mc admin creds disable-access-key
  TARGET access-key

user:
  Access key that needs to be disabled

FLAGS:
  --config-dir value, -C value path
to configuration folder (default: "/
root/.mc")
  --quiet, -q
disable progress bar display
  --no-color
disable color theme
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h show
help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command disables the access key. This parameter is mandatory.
access-key	The access key to disable. This parameter is mandatory.
config-dir	Path to the configuration directory (/root/.mc by default)
quiet	Disables progress bar display
no-color	Disables color in the output
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

Example

Disable the access key *XyAbZpo123tuY* in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin creds
disable-access-key salesobject
XyAbZpo123tuY
```

mc admin group

Creates and manages user groups.

mc admin group create

Creates an IAM group under an account.

Syntax**CLI**

```
mc admin group create - create a new
group under an account
```

USAGE:

```
mc admin group create TARGET
GROUPNAME [account=<account_name>]
[domain=<domain_name>]
```

FLAGS:

```
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h          show
help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which the command creates a group. This parameter is mandatory.
GROUPNAME	The name of the group to create. This parameter is mandatory.
account	The name of the account to which the group belongs. This parameter is mandatory.  NOTE: You cannot create IAM groups under the default account.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

ExampleCreate a group *hydsales* in the *asiapac* account in the Object Store deployment with alias *salesobject*.**CLI**

```
/opt/mapr/bin/mc admin group create
salesobject hydsales account=asiapac
```

mc admin group info

Displays IAM group information.

Syntax**CLI**

```
mc admin group info TARGET
GROUPNAME [account=<account_name>]
[domain=<domain_name>]

FLAGS:
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h          show
  help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store from which the command fetches group information. This parameter is mandatory.
GROUPNAME	The name of the group to fetch information. This parameter is mandatory.
account	The name of the account to which the group belongs. This parameter is mandatory.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Example

Get information on group *hydsales* in the *asiapac* account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin group info
salesobject hydsales account=asiapac
```

mc admin group list

Lists all IAM groups.

Syntax**CLI**

```
mc admin group list - display list of
groups

USAGE:
  mc admin group list
  TARGET [account=<account_name>]
  [domain=<domain_name>]
```

```

FLAGS:
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h
show help

```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store from which the command lists groups. This parameter is mandatory.
account	The name of the account from which to list groups. This parameter is mandatory.
domain	By default groups are listed from the primary domain. To list only the groups applicable to another specific domain, enter the domain name for which the groups should be listed.
json	Enables JSON formatted output
debug	Enables output for debugging
insecure	Disables SSL verification
help	Shows this help

Example

List all groups under the *northamerica* account in the *primary* domain in the Object Store deployment with alias *salesobject*

CLI

```

/opt/mapr/bin/mc admin group list
salesobject account=northamerica
domain=primary

```

mc admin group remove

Removes an IAM group.

Syntax

CLI

```

mc admin group remove TARGET
GROUPNAME [account=<account_name>]
[domain=<domain_name>]

FLAGS:
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification

```

```
--help, -h      show
help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store from which the command removes a group. This parameter is mandatory.
GROUPNAME	The name of the group to remove. This parameter is mandatory.  NOTE: The group is removed only if there are no users in it.
account	The name of the account to which the group belongs.
domain	The name of the domain under which the account exists.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Example

Remove a group *hydsales* from the *asiapac* account in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin group
remove salesobject hydsales
account=asiapac -json
```

mc admin recovery

Manages bucket recovery.

mc admin recovery start

Starts the bucket recovery.

Syntax

CLI

```
mc admin recovery start - start
bucket recovery

USAGE:
  mc admin recovery start TYPE TARGET

TYPE
  type accepts value as either "full"
  or "mini"

FLAGS:
  --json      enable JSON lines
formatted output
  --debug     enable debug output
```

```
--insecure  disable SSL certificate
verification
--help, -h  show help
```

Parameters

Parameter	Description
TYPE	Either start a <i>full</i> recovery or a <i>mini</i> recovery. In a mini recovery, the system scans for buckets to recover every hour. The system picks up buckets that were created or modified in the last hour and examines them for any recovery to perform. The recovery deletes dangling delete markers. In a full recovery, the system scans ALL buckets every week and examines them for any recovery to perform. Similar to the mini recovery, the system deletes all incomplete multipart uploads and dangling delete markers.
TARGET	The alias of a configured HPE Data Fabric Object Store on which bucket to recover exists. This parameter is mandatory.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Example

1. Start *full* recovery for a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin recovery
start full salesobject/northamerica
```

2. Start *mini* recovery for a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc admin recovery
start mini salesobject/northamerica
```

mc admin recovery stop
Stops the bucket recovery.

Syntax

CLI

```
mc admin recovery stop - stop bucket
recovery

USAGE:
mc admin recovery stop TARGET
```

```

FLAGS:
  --json      enable JSON lines
              formatted output
  --debug     enable debug output
  --insecure  disable SSL certificate
              verification
  --help, -h  show help

```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store on which bucket that is under recovery exists. This parameter is mandatory.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Example

Stop recovery for a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

CLI

```

/opt/mapr/bin/mc admin recovery stop
salesobject/northamerica

```

mc retention

Sets and manages the retention lock for buckets and objects.

mc retention set

Sets a retention lock for a bucket or object.

Syntax

CLI

```

mc retention set [FLAGS] [governance
| compliance] VALIDITY TARGET

FLAGS:
  --recursive, -r
    apply retention recursively
  --bypass
    bypass governance
  --version-id value, --vid value
    apply retention to a specific object
    version
  --rewind value
    roll back object(s) to current
    version at specified time
  --versions
    apply retention object(s) and all its
    versions
  --default
    set bucket default retention mode
  --json

```

```
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h
show help
```

VALIDITY:
This argument must be formatted like Nd or Ny where 'd' denotes days and 'y' denotes years e.g. 10d, 3y.

Parameters

Parameter	Description
recursive	Apply the retention lock recursively to all objects.
bypass	Allows a user with the <code>s3:BypassGovernanceRetention</code> permission to modify the object. Requires the Governance Retention mode.
version-id	Apply retention only to the specified version of the object.
rewind	Rollback objects to the version that was present in the specified point of time.
versions	Apply retention to all versions of the object.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

1. Set governance mode to 1 day as the default for all objects in a bucket named finance:

CLI

```
/opt/mapr/bin/mc retention
set governance 1d newmooss/
finance --default
```

GOVERNANCE mode is enabled for 1DAYS.

- ## 2. Set retention for a specific version of an object:

CLI

```
/opt/mapr/bin/mc retention
set governance 30d
newmoss/worm1/f2 --version-id
0000000000000000000002
```

Object retention successfully

```
set for newmoss/worm1/f2
(version-id=00000000000000000002).
```

mc retention clear

Clears a retention lock from a bucket or object.

Syntax

CLI

```
mc retention clear [FLAGS] TARGET

FLAGS:
  --recursive, -r
clear retention recursively
  --version-id value, --vid value
clear retention of a specific object
version
  --rewind value
roll back object(s) to current
version at specified time
  --versions
clear retention of object(s) and all
its versions
  --default
set default bucket locking
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h
show help
```

Parameters

Parameter	Description
recursive	Clear the retention lock recursively from all objects.
version-id	Clear retention only from the specified version of the object.
rewind	Rollback objects to the version that was present in the specified point of time.
versions	Clear retention from all versions of the object.
default	Clear default bucket lock.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

1. Clear the default retention mode from a bucket named finance:

CLI

```
/opt/mapr/bin/mc retention clear
newmooss/finance --default

Object lock configuration
cleared successfully.
```

2. Clears retention from a specific version of an object:

CLI

```
/opt/mapr/bin/mc retention
clear newmooss/worm2/f2 --version-id
00000000000000000003

Object retention successfully
cleared for newmooss/worm2/f2
(version-id=00000000000000000003).
```

mc retention info
Displays retention information for a bucket or object.

Syntax

CLI

```
mc retention info [FLAGS] [governance
| compliance] VALIDITY TARGET

FLAGS:
--recursive, -r
show retention info recursively
--version-id value, --vid value
show retention info of specific
object version
--rewind value
roll back object(s) to current
version at specified time
--versions
show retention info on object(s) and
all its versions
--default
show bucket default retention mode
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h
show help
```

Parameters

Parameter	Description
recursive	Displays retention information recursively for all objects
version-id	Displays retention information only for the specified version of the object

Parameter	Description
rewind	Rollback objects to the version that was present in the specified point of time
versions	Displays retention information for all versions of the object
default	Show the default retention mode for the bucket
json	Enable JSON formatted output
debug	Enable output for debugging
insecure	Disable SSL verification
help	Show this help

Examples

1. Display the default retention mode for a bucket named *finance*:

CLI

```
/opt/mapr/bin/mc retention info
newmooss/finance --default

GOVERNANCE mode is enabled for
1DAYS.
```

2. Display retention info for a specific version of an object:

CLI

```
/opt/mapr/bin/mc retention
info newmooss/worm2/f2 --version-id
000000000000000000000004

Name : newmooss/worm2/f2
Version : 000000000000000000000004
Mode : GOVERNANCE, expiring in
19 days
```

mc legalhold

Sets and manages the legal hold for buckets and objects.

A legal hold prevents an object version from being deleted or overwritten. There is no retention period associated with a legal hold. The legal hold remains in effect until removed.

mc legalhold set

Sets a legal hold for an object.

Syntax

CLI

```
mc legalhold set [FLAGS] TARGET

FLAGS:
  --recursive, -r
  apply legal hold recursively
  --version-id value, --vid value
  apply legal hold to a specific object
  version
  --rewind value
```

```
apply legal hold on an object version
at specified time
--versions
apply legal hold on multiple versions
of an object
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h
show help
```

Parameters

Parameter	Description
recursive	Apply the legal hold recursively to all objects.
version-id	Apply the legal hold to the specified version of the object.
rewind	Rollback objects to the version that was present in the specified point of time.
versions	Apply the legal hold to all versions of the object.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

1. Set legal hold on a specific object.

CLI

```
/opt/mapr/bin/mc legalhold set
newmoss/worm2/f2

Object legal hold successfully
set for f2.
```

2. Set legal hold for a specific version of an object:

CLI

```
/opt/mapr/bin/mc legalhold
set newmoss/worm2/f2 --version-id
00000000000000000005

Object legal hold
successfully set for f2
(version-id=00000000000000000005).
```

mc legalhold clear
Clears the legal hold from an object.

Syntax**CLI**

```
mc legalhold clear [FLAGS] TARGET

FLAGS:
  --recursive, -r
clear legal hold recursively
  --version-id value, --vid value
clear legal hold of a specific object
version
  --rewind value
clear legal hold on an object version
at specified time
  --versions
clear legal hold on multiple versions
of object(s)
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h
show help
```

Parameters

Parameter	Description
recursive	Clears the legal hold recursively from all objects.
version-id	Clears legal hold only from the specified version of the object.
rewind	Rolls back objects to the version that was present in the specified point of time.
versions	Clears legal hold from all versions of the object.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Show this help.

Examples

1. Clear the legal hold from a specific object:

CLI

```
/opt/mapr/bin/mc legalhold clear
newmoss/worm2/f2

Object legal hold successfully
cleared for f2.
```

2. Clear the legal hold from a specific version of an object:

CLI

```
/opt/mapr/bin/mc legalhold
clear newmoss/worm2/f2 --version-id
00000000000000000005

Object legal hold
successfully cleared for f2
(version-id=00000000000000000005).
```

mc legalhold info
Displays legal hold information for an object.

Syntax

CLI

```
/opt/mapr/bin/mc legalhold info
[FLAGS] TARGET

FLAGS:
  --recursive, -r
show legal hold status recursively
  --version-id value, --vid value
show legal hold status of a specific
object version
  --rewind value
show legal hold status of an object
version
                                at
specified time
  --versions
show legal hold status of multiple
versions of object(s)
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h
show help
```

Parameters

Parameter	Description
recursive	Displays legal hold information recursively for all objects.
version-id	Displays legal hold information only for the specified version of the object.
rewind	Rolls back objects to the version that was present in the specified point of time.
versions	Displays legal hold information for all versions of the object.
json	Enables JSON formatted output.
debug	Enables output for debugging.
insecure	Disables SSL verification.
help	Shows this help.

Examples

1. Display the legal hold information for a specific object:

CLI

```
/opt/mapr/bin/mc legalhold info
newmoss/worm2/f2

[ OFF ] f2
```

- 2. Display the legal hold information for a specific version of an object:**

CLI

```
/opt/mapr/bin/mc legalhold
info newmoss/worm2/f2 --version-id
0000000000000000000007

[ ON ] 0000000000000000000007 f2
```

mc ls

Lists buckets and objects on a local cluster or a remote fabric of the global namespace (GNS).

Syntax

Use the command to list buckets and objects from the local cluster or a cluster/fabric from a cluster group/global namespace.

NOTE: To list the fabrics/clusters and the external S3 servers that have been imported into the global namespace, use gns as the bucket name.

CLI

```
mc ls [FLAGS] TARGET [TARGET ...]

FLAGS:
  --account value          list
                             buckets of the account
  --versions               list
                             all versions
  --recursive, -r         list
                             recursively
  --summarize
                             display summary information (number
                             of objects, total size)
  --json
                             enable JSON lines formatted output
  --debug
                             enable debug output
  --insecure
                             disable SSL certificate verification
  --help, -h              show
                             help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store deployment from which the command lists buckets and objects. This parameter is mandatory. To list buckets and objects from a remote cluster/fabric in the global namespace use the format <fabricname>-<bucketname> instead of only the <bucketname> after the alias, that is <alias>/<fabricname>-<clustername>. When bucketname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified bucketname.
account	The account from which buckets and objects are listed. If not specified, buckets and objects from all accounts are listed.
versions	List all versions of an object, including those with delete markers.
recursive	Recursively lists objects from all folders and not just the top level folder.
summarize	Display the total size and number of objects in the target.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

1. List buckets in the object store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc ls
salesobject -json
```

2. List all buckets in the account *asia* in the object store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc ls --account asia
salesobject -json
```

3. List all buckets recursively from the object store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc ls --recursive
salesobject -json
```

4. List all buckets recursively from the object store deployment with alias *salesobject* and display the total number of objects and the total size:

CLI

```
/opt/mapr/bin/mc
ls --recursive --summarize
salesobject -json
```

5. List all objects from the object store deployment with alias *salesobject* containing the bucket *bucket1* from the cluster *cluster1* and display the total number of objects and the total size:

CLI

```
/opt/mapr/bin/mc ls salesobject/
cluster1-bucket1/ -json
```

6. List all buckets from the object store deployment with the alias named *clalias* on the cluster named *securecluster*

CLI

```
/opt/mapr/bin/mc ls clalias/
securecluster/
```

7. List all objects, that is, the list of fabrics and external S3 servers on the global namespace (gns) on the object store deployment with alias named *clalias*

CLI

```
/opt/mapr/bin/mc ls clalias/gns/
```

mc stat

Displays object meta data for a bucket or object on local cluster or remote fabric in the global namespace.

Syntax

CLI

```
mc stat [FLAGS] TARGET [TARGET ...]

FLAGS:
  --versions
  stat all versions
  --version-id value, --vid value
  stat a specific object version
  --recursive, -r
  stat all objects recursively
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h
  show help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store deployment from which the command displays object meta data. This parameter is mandatory. To display metadata for objects from a remote cluster/fabric in the global namespace use the format <i><fabricname>-<bucketname></i> instead of only the <i><bucketname></i> after the alias, that is <i><alias>/<fabricname>-<clustername></i> . When bucketname and objectname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified bucketname and objectname.

Parameter	Description
versions	Display meta data for all versions of objects.
version-id	Display meta data for the specified version of the object.
recursive	Display meta data for all objects from all folders and not just the top level folder.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

NOTE: Inline erasure coding is available from HPE Data Fabric release 8.1. The `mc stat` command output for an S3 bucket displays if inline erasure coding and erasure coding is enabled or disabled for the bucket.

1. Display object meta data for top level objects in bucket *mybucket* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc stat salesobject/
mybucket
```

2. Display object meta data for an object with specific version *CL3sWgdSN2pNntSf6UnZAuh2kcu8E8si* in bucket *mybucket* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc stat --version-id
"CL3sWgdSN2pNntSf6UnZAuh2kcu8E8si"
salesobject/mybucket
```

3. Display object meta data for all objects recursively in bucket *mybucket* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc stat --recursive
salesobject/mybucket
```

4. Display object meta data for all objects recursively in bucket *mybucket* from remote fabric *sales* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc stat --recursive
salesobject/sales-mybucket
```

5. Display object meta data for the bucket *mybucket* from remote fabric *sales* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc stat salesobject/
sales-mybucket
```

6. Display object meta data for the object *myobject* contained in the bucket *mybucket* from remote fabric *sales* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc stat salesobject/
sales-mybucket/myobject
```

mc mb

Creates buckets on local cluster/fabric or on remote fabrics present on the global namespace.

Syntax

CLI

```
mc mb [FLAGS] TARGET

FLAGS:
  --account value          specify
                           account that bucket should be created
                           in
  --ignore-existing, -p    ignore if
                           bucket/directory already exists
  --with-lock, -l          enable
                           object lock
  --disable-versioning, -d disable
                           object versioning
  --cluster value          cluster
                           where bucket should be created
  --storage-optimized-ec   create
                           storage-optimized EC bucket
  --json                   enable
                           JSON lines formatted output
  --debug                  enable
                           debug output
  --insecure               disable
                           SSL certificate verification
  --help, -h              show help
```

Parameters

Parameter	Description
TARGET	The target string that includes the alias of a configured HPE Data Fabric Object Store deployment on which the command creates buckets. This is a mandatory parameter. To create buckets from a remote cluster/fabric in the global namespace use the format <fabricname>-<bucketname> instead of only the <bucketname> after the alias, that is <alias>/<fabricname>-<bucketname>. When bucketname is mentioned without the fabric name, Data Fabric creates a bucket with the specified name on the local cluster.
account	The account on which the bucket is to be created. If not specified, buckets are created in the default account.
ignore-existing	Ignores creation if the bucket already exists.
with-lock	Enables object locking for the bucket.
disable-versioning	Disables bucket versions. By default, bucket versions are enabled.

Parameter	Description
cluster	Name of the cluster or fabric to which the bucket belongs.
storage-optimized-ec	Set to true to enable inline erasure coding on the bucket. The default value is true. If the value is set to false, erasure coding is enabled.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

ATTENTION: When you name a bucket, do not include `mapr .` as a prefix for the bucket name. For example, `mapr . bucket1` is not supported.

Examples

NOTE: For the following examples, the object store deployment is identified by the alias *salesalias*.

1. Create a bucket named *northamerica* in the Object Store deployment with alias *salesalias*:

CLI

```
/opt/mapr/bin/mc mb salesalias/
northamerica
```

2. Create a folder called *brickfire* inside the bucket named *northamerica* in the Object Store deployment that is identified by the alias *salesalias*:

CLI

```
/opt/mapr/bin/mc mb salesalias/
northamerica/brickfire
```

3. Create a bucket named *northamerica* on the remote fabric *sales* on the default account in the Object Store deployment with alias *salesalias*:

CLI

```
/opt/mapr/bin/mc
mb --account=default salesalias/
northamerica --cluster sales
```

4. Create a bucket named *myregionbucket* with object versioning disabled:

CLI

```
mc mb --disable-versioning myminio/
myregionbucket
```

5. Create a bucket named *mybucket* on the account named *myaccount*:

CLI

```
mc mb --account myaccount myminio/
mybucket
```

6. Create a bucket named *mybucket* on Amazon S3 cloud storage:

CLI

```
mc mb s3/mynewbucket
```

7. Create a bucket named *miniocloud* on Google Cloud storage:

CLI

```
/opt/mapr/bin/mc
mb --disable-versioning --account=de
fault salesalias/sales-northamerica
```

8. Create a new directory including its missing parents (equivalent to 'mkdir -p').:

CLI

```
mc mb /tmp/this/new/dir1
```

9. Create multiple directories including the missing parents (behavior similar to 'mkdir -p').:

CLI

```
mc mb /mnt/sdb/mydisk /mnt/sdc/
mydisk /mnt/sdd/mydisk
```

10. Create a bucket named *miniocloud* on Google Cloud storage:

CLI

```
/opt/mapr/bin/mc
mb --disable-versioning --account=de
fault salesalias/sales-northamerica
```

11. Create an instant tiered bucket named *myregionbucket*. Inline erasure coding is enabled in this case:

CLI

```
mc mb --ectype=instant myminio/
myregionbucket
```

12. Create a schedule tiered EC bucket named *myregionbucket*. non-inline erasure coding/scheduled tiering is enabled and inline erasure coding/instant tiering is disabled in this case:

CLI

```
mc mb --ectype=scheduled myminio/
myregionbucket
```

mc ub

Updates the properties of buckets on a local cluster/fabric or on a remote fabric present on the global namespace.

Syntax

CLI

```
mc ub [FLAGS] TARGET [TARGET...]
```

FLAGS:

```
--enable-versioning, -v
    enable object version
--suspend-versioning, -s
    suspend object version
--set-compression value, -z
```

```

value          set MapR fs
compression type, off/on/lz4/zlib
  --set-object-chunk-size value, -c
value          set object chunk size
(default: 256 MB)
  --set-max-inline-object-size
value, -i value set max inline
object size (default: 0)
  --set-max-in-db-object-size
value, -d value set max in DB
object size (default: 0)
  --json
                        enable JSON lines formatted
output
  --debug
                        enable debug output
  --insecure
                        disable SSL certificate
verification
  --help, -h
                        show help

```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store deployment on which the command updates the properties of buckets. This parameter is mandatory. To update properties of buckets from a remote cluster/fabric in the global namespace use the format <fabricname>-<bucketname> instead of only the <bucketname> after the alias, that is <alias>/<fabricname>-<clustername>. When bucketname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified bucketname.
enable-versioning	Enables versioning on the given bucket.
suspend-versioning	Suspends versioning on the given bucket.
set-compression	Compression to use when saving objects in the bucket. Either lz4 or zlib or off (no compression). The default compression is lz4.
set-object-chunk-size	Chunk size is used when saving objects to disk. For example, if chunk size is set to 256MB, an object of size 512MB is written to disk in parallel in two 256MB chunks. The default chunk size is 256MB for jumbo objects. For large objects, chunks size is always set to zero. Zero indicates no chunking. After you change the chunk size, all new uploads will use the updated value; existing objects will continue to use the previously set chunk size. Updating the chunk size only affects jumbo objects uploaded with multi-part upload disabled (mc cp --disable-multipart).
set-max-inline-object-size	The maximum size of tiny objects to be stored in the database instead of in the bucket. Default value is 128 bytes. The value can be set up to maximum of 1 MB. The value of 0 indicates that objects are not stored in the database.

Parameter	Description
set-max-in-db-object-size	The maximum size of small objects to be stored in the database instead of in the bucket. Default value is 16KB. The value can be set up to maximum of 8 MB. The default of 0 indicates that objects are not stored in the database.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

NOTE: Changing the `set-max-inline-object-size` and the `set-max-in-db-object-size` values is typically only required if there are performance issues with small objects (1KB - 16KB). Consult with HPE before you change these parameters. Note that the values of the parameters should follow the condition:

`max-inline-object-size < max-in-db-object-size < chunk size`

For example:

```
/opt/mapr/bin/mc ub alias <bucketName> --set-max-inline-object-size
16384 --set-max-in-db-object-size 16385
```

Examples

1. Suspend versions for a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc
ub --suspend-versioning salesobject/
northamerica
```

2. Set *zlib* compression for objects in a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc
ub --set-compression zlib
salesobject/northamerica
```

3. Set chunk size to 512 MB for objects in a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc
ub --set-object-chunk-size
536870912 salesobject/northamerica
```

4. Set chunk size to 512 MB for objects in a bucket named *northamerica* on a remote fabric named *sales*, in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc
ub --set-object-chunk-size
```

```
536870912 salesobject/  
sales-northamerica
```

mc rb

Removes buckets from a local cluster or a remote fabric in the global namespace..

Syntax

CLI

```
mc rb [FLAGS] TARGET [TARGET...]  
  
FLAGS:  
  --force  
    forcefully deletes a non-empty bucket  
  --dangerous allow  
    site-wide removal of objects  
  --json  
    enable JSON lines formatted output  
  --debug  
    enable debug output  
  --insecure  
    disable SSL certificate verification  
  --help, -h show  
  help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store deployment from which the command removes buckets. This parameter is mandatory. To remove buckets from a remote cluster/fabric in the global namespace use the format <fabricname>-<bucketname> instead of only the <bucketname> after the alias, that is <alias>/<fabricname>-<clustername>. When bucketname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified bucketname.
force	Deletes a non-empty bucket forcefully. This option first empties the bucket and then deletes it.  CAUTION: With this option, a bucket may or may not be deleted if object uploads are in-progress to the same bucket.
dangerous	Removes all buckets from the target.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

1. Remove a bucket named *northamerica* and its contents from the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc rb --force
salesobject/northamerica
```

2. Remove all buckets from all accounts in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc
rb --dangerous --force salesobject
```

3. Refer to [Delete Bucket to Reclaim Space](#) on page 688 to delete a non-WORM on page 8511 bucket in a volume.
4. Remove a bucket named *northamerica* and its contents on the remote fabric *sales* from the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc rb --force
salesobject/sales-northamerica
```

mc policy

Manages anonymous access to buckets and objects.

Syntax

CLI

```
USAGE:
  mc policy [FLAGS] set PERMISSION
  mc policy [FLAGS] set-json FILE
  mc policy [FLAGS] get TARGET
  mc policy [FLAGS] get-json TARGET
  mc policy [FLAGS] list TARGET

FLAGS:
  --recursive, -r  list recursively
  --json           enable JSON lines
  --debug          enable debug output
  --insecure       disable SSL
  --help, -h       show help

PERMISSION:
  Allowed policies are: [none,
  download, upload, public].

FILE:
  A valid HPE Object Store policy
  JSON filepath.
```

Parameters

Parameter	Description
PERMISSION	The canned policy to set. One of: <ul style="list-style-type: none"> • none • download • upload • public
FILE	The path to a file containing a valid JSON Object Store policy. <div>  NOTE: You can either set the canned policy directly using the PERMISSION parameter or use a custom policy file with the FILE parameter. </div>
TARGET	The alias of a configured HPE Data Fabric Object Store deployment from or on which the command retrieves or sets policies. This parameter is mandatory.
recursive	List all folders recursively instead of just the top-level folder.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

1. Set the download policy for a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc policy set
download salesobject/northamerica/
```

2. Set a custom policy contained in the file */sales/policies/confidential.json* for a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc policy set-json /
sales/policies/confidential.json
salesobject/northamerica/
```

3. Get the policy for a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc policy get
salesobject/northamerica/
```

4. Get the policy in JSON format for a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc policy get-json
salesobject/northamerica/
```

5. List policies for a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc policy list
salesobject/northamerica/
```

6. List public object URLs recursively for a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc policy
list --recursive links salesobject/
northamerica/
```

mc rm

Removes objects from a bucket. Operates on versioned objects in buckets on a local cluster or a remote fabric in the global namespace.

Syntax

CLI

```
mc rm [FLAGS] TARGET [TARGET ...]

FLAGS:
  --versions
  remove all versions of an object
  --version-id value, --vid value
  delete a specific version of an object
  --recursive, -r
  remove recursively
  --force
  allow a recursive remove operation
  --dangerous
  allow site-wide removal of objects
  --fake
  perform a fake remove operation
  --stdin
  read object names from STDIN
  --bypass
  bypass governance
  --json
  enable JSON lines formatted output
  --debug
  enable debug output
  --insecure
  disable SSL certificate verification
  --help, -h
  show help
```

Parameters

ATTENTION: In Object Store, versioning and delete markers work the same as they do in S3 – If you remove a directory or object from a versioned bucket using the `mc rm` command, a delete marker is placed against that directory or object while all previous versions of the directory or object are retained. These retained versions occupy space that jobs cannot reclaim when they run against the versioned bucket. If you want jobs to reclaim space, you must use the `--versions` option to remove all versions of a directory or object when you run the `mc rm` command, for example:

```
/opt/mapr/bin/mc rm --recursive --force --versions <alias>/
<versionedbucket>/<directory>
```

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store deployment from which the command removes objects. This parameter is mandatory. To remove objects from a remote cluster/fabric in the global namespace use the format <code><fabricname>-<bucketname>/<objectname></code> instead of only the <code><bucketname>/<objectname></code> after the alias, that is <code><alias>/<fabricname>-<bucketname>/<objectname></code> . When the bucketname and objectname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified bucketname and objectname.
versions	Removes all versions of an object that exist in the bucket.
recursive	Removes objects recursively. When using <code>--recursive</code> , you must also use <code>--force</code> . For versioned buckets, <code>--recursive</code> produces a delete marker for each object removed. If you want to recursively remove all objects and all versions of the objects from the bucket, you must also include the <code>--versions</code> option.
force	Force a recursive remove operation.
dangerous	Removes all objects from the target.
fake	Simulate a remove operation but do not actually remove them.
stdin	Read objects from STDIN.
bypass	Bypass governance settings and delete the object.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

1. Remove objects recursively from the bucket *songs* matching the prefix *Jim* from the Object Store deployment with alias *classmusic*:

CLI

```
/opt/mapr/bin/mc
rm --recursive --force classmusic/
songs/Jim/
```

2. Remove all objects from all accounts in the Object Store deployment with alias *classmusic*:

CLI

```
/opt/mapr/bin/mc
rm --recursive --force --dangerous
classmusic
```

3. Remove object *salesspeech.mp4* with governance mode set from the Object Store deployment with alias *northamerica*:

CLI

```
/opt/mapr/bin/mc rm --bypass
northamerica/salesspeech.mp4
```

4. Remove object *salesspeech.mp4* with version ID *f20f3792-4bd4-4288-8d3c-b9d05b3b62f6* set from the Object Store deployment with alias *northamerica*:

CLI

```
/opt/mapr/bin/mc rm northamerica/
salesspeech.mp4 --version-id
"f20f3792-4bd4-4288-8d3c-b9d05b3b62f
6"
```

5. Remove object *salesspeech.mp4* with governance mode set in bucket *qfoursales* of remote cluster *sales* from the Object Store deployment with alias *northamerica*:

CLI

```
/opt/mapr/bin/mc
rm --bypass northamerica/
sales-qfoursales/salesspeech.mp4
```

mc cp

Copies objects to and from buckets on local cluster or remote fabric in the global namespace.

Syntax

NOTE: The size limits for an object to upload are as follows.

Single object put : 5 GiB

Single part size : 5 GiB

Multi part complete object size : 5 TiB

CLI

```
mc cp [FLAGS] SOURCE [SOURCE...]
TARGET

FLAGS:
  --version-id value, --vid value
  select an object version to copy
  --recursive, -r
  copy recursively
```

```

--attr value
add custom metadata for the object
--preserve, -a
preserve filesystem attributes (mode,
ownership, timestamps)
--disable-multipart
disable multipart upload feature
--md5
force all upload(s) to calculate
md5sum checksum
--retention-mode value
retention mode to be applied on the
object (governance, compliance)
--retention-duration value
retention duration for the object in
d days or y years
--legal-hold value
apply legal hold to the copied object
(on, off)
--tags value
add tags for the object
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h
show help

```

Parameters

Parameter	Description
SOURCE	The source from which an object is copied. This can be the filesystem or the alias of a configured HPE Data Fabric Object Store deployment. This parameter is mandatory. To copy objects from a remote cluster/fabric in the global namespace, use the format <code><fabricname>-<bucketname>/<objectname></code> instead of only the <code><bucketname>/<objectname></code> after the alias, that is <code><alias>/<fabricname>-<bucketname>/<objectname></code> . When bucketname and objectname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified bucketname and objectname.
TARGET	The destination to which an object is copied. This can be the filesystem or the alias of a configured HPE Data Fabric Object Store deployment. This parameter is mandatory. To copy objects from a remote cluster/fabric in the global namespace use the format <code><fabricname>-<bucketname>/<objectname></code> instead of only the <code><bucketname>/<objectname></code> after the alias, that is <code><alias>/<fabricname>-<clustername>/<objectname></code> . When bucketname and objectname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified bucketname and objectname.
version-id	The object version to copy.

Parameter	Description
recursive	Copy objects recursively and not just the top-level folder.
attr	Add custom metadata for the object.
preserve	Preserve filesystem attributes such as mode, timestamps and ownership when copying.
disable-multipart	Disable the multipart upload feature.
md5	Calculate the md5 checksum when uploading.
retention-mode	The retention mode - either governance or compliance - to apply to the object.
retention-duration	Set the duration of the retention mode in days (d) or years (y).
legal-hold	Set legal hold for the object.
tags	Add tags for the object.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

1. Copy local folders *fin1* and *fin2* recursively to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc cp --recursive
fin1/ fin2/ salesobject/
northamerica/
```

2. Copy a list of Excel files (.xls) with specified metadata, separated by ";" from the *profit* folder to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*

CLI

```
/opt/mapr/bin/mc cp --attr
"key1=value1;key2=value2" profit/
*.xls salesobject/northamerica/
```

3. Copy the file *secret.txt* with object lock mode set to governance with retention duration 1 day, from the *profit* folder to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc
cp --retention-mode
governance --retention-duration
1d profit/secret.txt salesobject/
northamerica/
```

4. Copy the file *secret.txt* with legal hold enabled, from the *profit* folder to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc cp --legal-hold
on profit/secret.txt salesobject/
northamerica/
```

5. Copy the file *secret.txt* with legal hold enabled, from the *profit* folder to a bucket named *northamerica* on a remote cluster named *sales*, in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc cp --legal-hold
on profit/secret.txt salesobject/
sales-northamerica/
```

6. Copy the object *testobject* from the *usa* bucket on the remote fabric *sales* to a bucket named *northamerica* on the same remote fabric *sales*, in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc cp salesobject/
sales-usa/testobject salesobject/
sales-northamerica/
```

mc mv

Move objects between buckets.

Syntax

CLI

```
mc mv [FLAGS] SOURCE [SOURCE...]
TARGET

FLAGS:
  --recursive, -r      move
recursively
  --attr value         add custom
metadata for the object
  --preserve, -a       preserve
filesystem attributes (mode,
ownership, timestamps)
  --disable-multipart  disable
multipart upload feature
  --json               enable JSON
lines formatted output
  --debug              enable debug
output
  --insecure           disable SSL
certificate verification
  --help, -h          show help
```

Parameters

Parameter	Description
SOURCE	The source from which an object is moved. This can be the filesystem or the alias of a configured HPE Data Fabric Object Store deployment. This parameter is mandatory. To move objects from a remote cluster/fabric in the global namespace, use the format <code><fabricname>-<bucketname>/<objectname></code> instead of only the <code><bucketname>/<objectname></code> . When bucketname and objectname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified objectname.
TARGET	The destination to which an object is moved. This can be the filesystem or the alias of a configured HPE Data Fabric Object Store deployment. This parameter is mandatory. To move objects from a remote cluster/fabric in the global namespace, use the format <code><fabricname>-<bucketname>/<objectname></code> instead of only the <code><bucketname>/<objectname></code> after the alias, that is <code><alias>/<fabricname>-<bucketname>/<objectname></code> . When bucketname and objectname is mentioned without the fabric name, Data Fabric checks the local cluster for the specified bucketname and objectname.
recursive	Move objects recursively and not just the top-level folder.
attr	Add custom metadata for the object.
preserve	Preserve filesystem attributes such as mode, timestamps and ownership when moving.
disable-multipart	Disable the multipart upload feature.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

1. Move local folders *fin1* and *fin2* recursively to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc mv --recursive
fin1/ fin2/ salesobject/
northamerica/
```

2. Move a list of Excel files (*.xls*) with specified metadata, separated by ";" from the *profit* folder to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*

CLI

```
/opt/mapr/bin/mc mv --attr
"key1=value1;key2=value2" profit/
*.xls salesobject/northamerica/
```

3. Move a file named *secret.txt* with attributes preserved from the *profit* folder to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc mv --preserve
profit/secret.txt salesobject/
northamerica/
```

4. Move a file named *secret.txt* with attributes preserved from the *profit* folder to a bucket named *northamerica* in a remote cluster named *sales* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc mv --preserve
profit/secret.txt salesobject/
sales-northamerica/
```

mc head

Displays the first *n* lines of an object.

The `mc head` command automatically decompresses *gzip* and *bzip2* compressed objects.

Syntax

CLI

```
mc head - display first 'n' lines of
an object
```

USAGE:

```
mc head [FLAGS] SOURCE [SOURCE...]
```

FLAGS:

```
-n value, --lines value
print the first 'n' lines (default:
10)
--version-id value, --vid value
select an object version to display
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h
show help
```

Parameters

Parameter	Description
SOURCE	The alias of a configured HPE Data Fabric Object Store deployment from which the command reads objects. This parameter is mandatory.
lines	The number of lines to read from the object. The default value is 10.
version-id	The object version to read.
json	Enable JSON formatted output.
debug	Enable output for debugging.

Parameter	Description
insecure	Disable SSL verification.
help	Show this help.

Examples

1. Display the first seven lines from a *gzip* compressed object named *secret.csv.gz* that is present in a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc head --lines
7 salesobject/northamerica/
secret.csv.gz
```

2. Display the first twelve lines from a *gzip* compressed object named *secret.csv.gz* with version ID *3ddac055-89a7-40fa-8cd3-530a5581b6b8* that is present in a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc head --lines
12 --version-id="3ddac055-89a7-40f
a-8cd3-530a5581b6b8" salesobject/
northamerica/secret.csv.gz
```

mc cat

Displays the contents of an object.

Syntax

CLI

```
mc cat [FLAGS] SOURCE [SOURCE...]

FLAGS:
  --version-id value, --vid value
display a specific version of an
object
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h
show help
```

Parameters

Parameter	Description
SOURCE	The alias of a configured HPE Data Fabric Object Store deployment from which the command reads objects. This parameter is mandatory.
version-id	The object version to display.
json	Enable JSON formatted output.
debug	Enable output for debugging.

Parameter	Description
<code>insecure</code>	Disable SSL verification.
<code>help</code>	Show this help.

Examples

1. Stream an object *kubectl-pres.mp4* present in a bucket named *cloudarch* in the Object Store deployment with alias *firebrick* to mplayer standard input. :

CLI

```
/opt/mapr/bin/mc cat firebrick/
cloudarch/kubectl-pres.mp4 |
mplayer -
```

2. Display the contents of an object *secret.csv* with version ID *3ddac055-89a7-40fa-8cd3-530a5581b6b8* that is present in a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc
cat --version-id="3ddac055-89a7-40f
a-8cd3-530a5581b6b8" salesobject/
northamerica/secret.csv
```

3. Concatenate files *eng1.img*, *eng2.img*, and *eng3.img*, and save the concatenated file as *complete.img* on a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc cat
eng*.img > salesobject/northamerica/
complete.img
```

mc pipe

Stream standard input (STDIN) to an object.

Syntax

CLI

```
mc pipe [FLAGS] [TARGET]

FLAGS:
  --json
    enable JSON lines formatted output
  --debug
    enable debug output
  --insecure
    disable SSL certificate verification
  --help, -h
    show help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store deployment to which the target is copied. This parameter is mandatory.

Parameter	Description
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

1. Write contents of STDIN to an object named *notes.txt* that is in a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc pipe salesobject/
northamerica/notes.txt
```

2. Stream MySQL database dump to the file *accounts.sql* that is in a bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

CLI

```
mysqldump -u root -p *****
accountsdb | /opt/mapr/bin/mc
pipe salesobject/northamerica/
accounts.sql
```

3. Copy an iso file *deb.iso* from the local filesystem to a bucket named *northamerica* in the Object Store deployment with alias *engr*.

CLI

```
cat deb.iso | /opt/mapr/bin/mc pipe
engr/northamerica/deb.iso
```

mc find

Find objects meeting the specified criteria.

Syntax

CLI

```
USAGE:
mc find PATH [FLAGS]

FLAGS:
--exec value          spawn
an external process for each matching
object (see FORMAT)
--ignore value        exclude objects matching the wildcard
pattern
--name value          find
object names matching wildcard pattern
--newer-than value    match
all objects newer than L days, M
hours and N minutes
--older-than value    match
all objects older than L days, M
hours and N minutes
--path value          match
```

```

directory names matching wildcard
pattern
    --print value                print
in custom format to STDOUT (see
FORMAT)
    --regex value                match
directory and object name with PCRE
regex pattern
    --larger value                match
all objects larger than specified
size in units (see UNITS)
    --smaller value                match
all objects smaller than specified
size in units (see UNITS)
    --maxdepth value                limit
directory navigation to specified
depth (default: 0)
    --json
enable JSON lines formatted output
    --debug
enable debug output
    --insecure
disable SSL certificate verification
    --help, -h                    show
help

```

UNITS

--smaller, --larger flags accept human-readable case-insensitive number suffixes such as "k", "m", "g" and "t" referring to the metric units KB, MB, GB and TB respectively. Adding an "i" to these prefixes, uses the IEC units, so that "gi" refers to "gibibyte" or "GiB". A "b" at the end is also accepted. Without suffixes the unit is bytes.

--older-than, --newer-than flags accept the string for days, hours and minutes
i.e. 1d2h30m states 1 day, 2 hours and 30 minutes.

FORMAT

Support string substitutions with special interpretations for following keywords.

Keywords supported if target is filesystem or object storage:

```

{}      --> Substitutes to full
path.
{base}  --> Substitutes to
basename of path.
{dir}   --> Substitutes to
dirname of the path.
{size}  --> Substitutes to object
size of the path.
{time}  --> Substitutes to object
modified time of the path.

```

Keywords supported if target is object storage:

{url} --> Substitutes to a shareable URL of the path.

Parameters

Parameter	Description
PATH	The path to search for objects. This path can be on the local filesystem or be the alias of a configured HPE Data Fabric Object Store deployment. This parameter is mandatory.
exec	Spawn an external process for each matching object.
ignore	Ignore objects matching this wild card specification.
name	Find objects matching this wild card specification. This parameter is mandatory.
newer-than	Find all objects that are newer than the specified days, hours or minutes.
older-than	Find all objects that are older than the specified days, hours or minutes.
path	Find directory names that match the wildcard pattern.
print	Print the search results in a custom format.
regex	Find objects and directories that match the specified regular expression.
larger	Find objects that are larger than the specified size.
smaller	Find objects that are smaller than the specified size.
maxdepth	Restrain directory navigation to the specified depth. For example, the value 3 limits the searching to 3 levels deep from the top-level directory. The default value of 0 indicates no limit.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

- Find all occurrences of the object *foo.jpg* in all buckets in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc find
salesobject --name foo.jpg
```

- Find all objects in the Object Store deployment with alias *salesobject* that are older than 2 days, 5 hours and 10 minutes and exclude the ones with the *.jpg* extension:

CLI

```
/opt/mapr/bin/mc find
salesobject --older-than
2d5h10m --ignore "*.jpg"
```

- 3. Find only the object names without the directory component in the bucket named *northamerica* in the Object Store deployment with alias *salesobject*.

CLI

```
/opt/mapr/bin/mc find salesobject/
northamerica --name "*" -print
{base}
```

- 4. Find all images with the *.jpg* extension in the bucket named *northamerica* in the Object Store deployment with alias *salesobject* and simultaneously copy the images to the bucket named *philo* in the Object Store deployment with alias *asia*:

CLI

```
/opt/mapr/bin/mc find
salesobject/northamerica --name
 "*.jpg" --watch --exec "mc cp {}
 philo/asia"
```

mc share
Generates URLs for temporary access to objects.
mc share download
Generates URLs for download access.

Syntax

CLI

```
mc share download [FLAGS] TARGET
[TARGET...]

FLAGS:
  --recursive, -r
share all objects recursively
  --version-id value, --vid value
share a particular object version
  --expire value, -E value
set expiry in NN[h|m|s] (default:
"168h")
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h
show help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store deployment from which to download the object. This parameter is mandatory.

Parameter	Description
recursive	Share all objects recursively.
version-id	Share a specific version of an object.
expire	Set the time in hours, minutes and seconds when the URL expires. The default expiry time is 168 hours (7 days).
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

1. Share all objects in a top level bucket named *northamerica* in the Object Store deployment with alias *salesobject* with 20 minutes expiry:

CLI

```
/opt/mapr/bin/mc share
download --expire=20m salesobject/
northamerica/
```

2. Share all objects in recursively in all folders from a bucket named *northamerica* in the Object Store deployment with alias *salesobject* with 120 minutes expiry:

CLI

```
/opt/mapr/bin/mc share
download --expire=20m --recursive
salesobject/northamerica/
```

mc share upload

Generate the **curl** command to upload objects without requiring access/secret keys.

Syntax

CLI

```
mc share upload [FLAGS] TARGET
[TARGET...]

FLAGS:
  --recursive, -r
    recursively upload any object
    matching the prefix
  --expire value, -E value
    set expiry in NN[h|m|s] (default: "168h")
  --content-type value, -T value
    specify a content-type to allow
  --json
    enable JSON lines formatted output
  --debug
    enable debug output
  --insecure
    disable SSL certificate verification
  --help, -h
    show help
```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store deployment to which to upload the object. This parameter is mandatory.
recursive	Recurively upload all objects that match the prefix.
expire	Set the time in hours, minutes and seconds when the <i>curl</i> command expires. The default expiry time is 168 hours (7 days).
content-type	The content type that is permitted to be uploaded.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

1. Generate a *curl* command to allow upload access for a single object named *secret.gz* to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*, with *10 days* expiry time:

CLI

```
/opt/mapr/bin/mc share
upload --expire=10d salesobject/
northamerica/secret.gz
```

2. Generate a *curl* command to allow upload access of only *.png* images to a folder called *images* in a bucket named *northamerica* in the Object Store deployment with alias *salesobject*, with *10 days* expiry time :

CLI

```
/opt/mapr/bin/mc share
upload --content-type=image/png --ex
pire=10d salesobject/northamerica/
secret.gz
```

3. Generate a *curl* command to allow uploading objects that match the key prefix '**backup/**' to a bucket named *northamerica* in the Object Store deployment with alias *salesobject*. The command expires in *2 hours*:

CLI

```
mc share
upload --recursive --expire=2h
salesobject/northamerica/backup/
```

mc share list

List shared objects.

Syntax

CLI

```
mc share list COMMAND
```

COMMAND:
 upload: list previously shared access to uploads.
 download: list previously shared access to downloads.

Parameters

Parameter	Description
upload	List previously shared uploads.
download	List previously shared downloads.

Examples

1. List previously shared downloads, that have not expired yet.

CLI

```
/opt/mapr/bin/mc share list download
```

2. List previously shared uploads, that have not expired yet.

CLI

```
/opt/mapr/bin/mc share list upload
```

mc sql

Runs SQL queries on objects.

Syntax

CLI

```
mc sql [FLAGS] TARGET [TARGET...]

FLAGS:
  --query value, -e value      sql
  query expression (default: "select *
  from s3object")
  --recursive, -r              sql
  query recursively
  --csv-input value            csv
  input serialization option
  --json-input value           json
  input serialization option
  --compression value         input
  compression type
  --csv-output value           csv
  output serialization option
  --csv-output-header value    optional csv output header
  --json-output value          json
  output serialization option
  --json                       enable JSON lines formatted output
  --debug                      enable debug output
  --insecure                   disable SSL certificate verification
  --help, -h                   show
```

```
help
```

SERIALIZATION OPTIONS:

For query serialization options, refer to <https://docs.min.io/docs/minio-client-complete-guide#sql>

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store deployment on which the command runs SQL queries. This parameter is mandatory.
query	The query to run. The default query is <code>select * from s3object</code>
recursive	Query all folders recursively instead of just the top-level folder.
csv-input	The CSV input format.
json-input	The JSON input format. Required when querying JSON documents.
compression	Specifies if the queried object is compressed. Valid values are NONE GZIP BZIP2. Default value is NONE.
csv-output	The format for CSV output.
csv-output-header	The CSV output header. If not specified, the first row of the CSV is used as the header.
json-output	The format for JSON output.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Usage Notes

Review the following notes related to the use of the `mc sql` command before you run any queries:

Parquet files

Before you run any queries against Parquet files, set `export MINIO_API_SELECT_PARQUET=on` in the `/opt/mapr/conf/env.sh` file and restart the Object Store server. You can restart the Object Store server from the Services page in the Control System or from the CLI by running the following command:

```
/opt/mapr/bin/maprcli node
services -nodes <space-delimited list
of node names> -s3server restart
```

JSON documents

When you query a JSON document, you must include the `--json-input` parameter and `type=document`, as shown in the following example:

```
/opt/mapr/bin/mc sql --json-input
type=document --query "select *
from S3object" alias0/mybucket/
example5.json
```

Examples

1. Query a set of objects recursively that are in a bucket named *northamerica* in the Object Store deployment with alias *salesobject*:

CLI

```
/opt/mapr/bin/mc
sql --recursive --query "select
* from S3object" salesobject/
northamerica/
```

2. Query a compressed object *books1.json.bz2* that is in *bzip2* format present in the bucket named *comics* in the Object Store deployment with alias *royallibrary*:

```
/opt/mapr/bin/mc sql --compression bzip2 --query "select id, cat from
s3object" royallibrary/comics/books1.json.bz2
```

3. Query the *data.csv* object in the *lpd* bucket for the alias *powerconsumption*. For the input, specify a semicolon (;) as the delimiter (fd), newline as the record delimiter (rd), and use file header (fh) in the query.

CLI

```
/opt/mapr/bin/mc sql --csv-input
"rd=\n,fh=USE,fd=;" \
--json-output "rd=\n\n" --query
"select * from S3object"
powerconsumption/lpd/data.csv
```

4. Query the *data.csv* object in the *lpd* bucket for the alias *powerconsumption*. For the input, specify a semicolon (;) as the delimiter (fd), newline as the record delimiter (rd), and use file header (fh) in the query. For the output, specify the CSV output header. When you specify the CSV output headers as "col1,col2,col3", the first row of the CSV file is interpreted as the header.

CLI

```
/opt/mapr/bin/mc sql --csv-input
"rd=\n,fh=USE,fd=;" \
--csv-output
"rd=\n" --csv-output-header
"device_id,uptime,lat,lon" \
--query "select * from S3object"
powerconsumption/lpd/data.csv
```

5. Query a JSON document type.

CLI

```
/opt/mapr/bin/mc sql --json-input
type=document --query \
"select * from S3object" alias0/
```

```
mybucket/example3.json
```

```
{
  "owner": null,
  "brand": "BMW",

    "TransmissionType": "Automatic",
    "Turbo Charger": "true",
    "Number of Cylinder": 4
  }
}
```

mc tag

Manages tags assigned to buckets and objects.

Run the `/opt/mapr/bin/mc tag -h` command on the command line to view the list of `mc tag` commands.

Related reference

[mc tag set](#) on page 3168

Assigns a tag to a bucket or an object on a local cluster or a remote fabric in the global namespace.

[mc tag list](#) on page 3170

Lists tags assigned to a bucket or an object on a local cluster or a remote cluster in the global namespace.

[mc tag remove](#) on page 3172

Remove tags assigned to objects and buckets on local or remote fabric/cluster on the global namespace.

mc tag set

Assigns a tag to a bucket or an object on a local cluster or a remote fabric in the global namespace.

Syntax

CLI

USAGE:

```
/opt/mapr/bin/mc tag set [FLAGS]
TARGET TAGS
```

```

FLAGS:
  --versionid value, --vid value  set
tags on a specific object version
  -- rewind value                set
tags on a specific object version at
specific time
  --versions                      set
tags on multiple versions for an
object
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h
show help

```

Parameters

Parameter	Description
versionid or vid	The object version ID.
rewind	Use the rewind flag to set tags on a specific object version at specific time.
versions	Use versions to specify multiple version numbers.
target tags	the tag or tags to assign to the bucket or the object. Upto 10 tags can be assigned. Multiple tags can be separated using an ampersand. For target, use the format <alias>/<bucket name> for a local cluster and <alias>/<clustername>-<bucketname> for a remote cluster on the global namespace.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show command help.

Examples

1. Assign tags to an object.

CLI

```

/opt/mapr/bin/mc tag set play/
testbucket/testobject
"key1=value1&key2=value2&key3=value3
"

```

2. Assign tags to a particular version of an object.

CLI

```

/opt/mapr/bin/mc tag
set --version-id
"ieQq7aXsyhDdt47YURGlrucYY3GxWHa"
play/testbucket/testobject

```

```
"key1=value1&key2=value2&key3=value3"
"
```

3. Assign tags to a object versions older than one week.

CLI

```
/opt/mapr/bin/mc tag
set --versions --rewind 7d play/
testbucket/testobject
"key1=value1&key2=value2&key3=value3"
"
```

4. Assign tags to a bucket.

CLI

```
/opt/mapr/bin/mc tag set myminio/
testbucket
"key1=value1&key2=value2&key3=value3"
"
```

5. Assign tags to a bucket.

CLI

```
/opt/mapr/bin/mc tag set myminio/
testbucket
"key1=value1&key2=value2&key3=value3"
"
```

6. Assign tags to a bucket named *testbucket* on remote cluster *sales* with object store alias named *myminio*.

CLI

```
/opt/mapr/bin/mc tag set myminio/
sales-testbucket
"key1=value1&key2=value2&key3=value3"
"
```

7. Assign tags to the object *testobject* with version id *ieWHA* contained in the bucket named *testbucket* on remote cluster *sales* with object store alias named *myminio*.

CLI

```
/opt/mapr/bin/mc tag
set --version-id "ieWHA" myminio/
sales-testbucket/testobject
"key1=value1&key2=value2&key3=value3"
"
```

mc tag list

Lists tags assigned to a bucket or an object on a local cluster or a remote cluster in the global namespace.

Syntax

CLI

USAGE:

```
/opt/mapr/bin/mc tag list [COMMAND
```

```

FLAGS] TARGET

FLAGS:
  --versionid value, --vid value
list tags of a specific object version
  --rewind value
list tags of a specific object
version at specific time
  --versions
list tags on all versions for an
object
  --json
enable JSON lines formatted output
  --debug
enable debug output
  --insecure
disable SSL certificate verification
  --help, -h
show command help

```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store deployment for which the tags are to be listed. This parameter is mandatory.For target, use the format <alias>/<bucketname> for a local cluster and <alias>/<clustername>-<bucketname> for a remote cluster on the global namespace.
versionid or vid	The object version ID for which tags are to be listed
rewind	Use the rewind flag to list tags on a specific object version at specific time
versions	Use versions to specify multiple versions
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show command help.

Examples

1. Lists tags assigned to an object.

CLI

/opt/mapr/bin/ mc tag list myminio/
testbucket/testobject

2. List the tags assigned to particular version of an object.

CLI

/opt/mapr/bin/mc tag
list --version-id
"ieQq7aXsyhlhDt47YURGlrucYY3GxWHa"
myminio/testbucket/testobject

3. List the tags assigned to an object versions that are older than one week.

CLI

```
/opt/mapr/bin/mc tag
list --versions --rewind 7d myminio/
testbucket/testobject
```

4. List the tags assigned to an object in JSON format.

CLI

```
/opt/mapr/bin/ mc tag list --json
myminio/testbucket/testobject
```

5. List the tags assigned to a bucket in JSON format.

CLI

```
/opt/mapr/bin/ mc tag list --json
s3/testbucket
```

6. List the tags assigned to a bucket in a cluster named *sales* in JSON format.

CLI

```
/opt/mapr/bin/ mc tag list --json
s3/testbucket
```

7. List the tags assigned to a bucket named *testbucket* on a fabric named *sales* associated with object store alias *myobjstore*

CLI

```
/opt/mapr/bin/ mc
tag list myobjstore/
sales-testbucket
```

8. List the tags assigned to the object *testobject* from the bucket named *testbucket* on the fabric named *sales* associated with the object store alias *myobjstore*

CLI

```
/opt/mapr/bin/ mc tag
list myobjstore/sales-testbucket/
testobject
```

mc tag remove

Remove tags assigned to objects and buckets on local or remote fabric/cluster on the global namespace.

Syntax

CLI

```
USAGE:
/opt/mapr/bin/mc tag remove [FLAGS]
TARGET

FLAGS:
--versionid value, --vid value
remove tags of a specific object
version
--rewind value
remove tags of a specific object
version at specific time
--versions
```

```

remove tags on all versions for an
object
--json
enable JSON lines formatted output
--debug
enable debug output
--insecure
disable SSL certificate verification
--help, -h          show
command help

```

Parameters

Parameter	Description
TARGET	The alias of a configured HPE Data Fabric Object Store deployment for which the tags are to be removed. This parameter is mandatory. For target, use the format <alias>/<bucketname> for a local cluster and <alias>/<clustername>-<bucketname> for a remote cluster on the global namespace.
versionid or vid	The object version ID for which to tags are to be listed
rewind	Use the rewind flag to list tags on a specific object version at specific time
versions	Use versions to specify multiple version numbers
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show command help.

Examples

1. Remove the tags assigned to an object named *testobject* in a local cluster bucket named *testbucket*, on an object store with alias *myobjstore*.

CLI

```

/opt/mapr/bin/ mc tag remove
myobjstore/testbucket/testobject

```

2. Remove the tags assigned to a particular version of an object.

CLI

```

/opt/mapr/bin/mc tag
remove --version-id
"ieQq7aXsyhlhDt47YURGlrucYY3GxWHa"
myminio/testbucket/testobject

```

3. Remove the tags assigned to an object named *testobject* on bucket named *testbucket* for object versions that are older than one week on an object store with alias *myobjstore*.

CLI

```

/opt/mapr/bin/mc tag
remove --versions --rewind 7d
myobjstore/testbucket/testobject

```

- Remove the tags assigned to a bucket named *testbucket* on the local cluster on an object store with alias *myobjstore*.

CLI

```
/opt/mapr/bin/mc tag remove
myobjstore/testbucket
```

- Remove the tags assigned to a bucket named *testbucket* on the remote fabric named *sales* on an object store with alias *myobjstore*.

CLI

```
/opt/mapr/bin/mc tag
remove myobjstore/
sales-testbucket
```

- Remove the tags assigned to the object *testobject* for object version *ieQa* in the bucket named *testbucket* on the remote fabric named *sales* on an object store with alias *myobjstore*.

CLI

```
/opt/mapr/bin/mc tag
remove --version-id
"ieQa" myobjstore/sales-testbucket/
testobject
```

mc cors

Manages Cross-Origin Resource Sharing (CORS) configuration.

Run the `/opt/mapr/bin/mc cors -h` command on the command line to view the list of `mc cors` commands.

```
NAME:
  mc cors - manage bucket CORS configuration

USAGE:
  mc cors COMMAND [COMMAND FLAGS | -h] [ARGUMENTS...]

COMMANDS:
  set          set a bucket CORS configuration
  set-json     set a bucket CORS configuration json
  get          get a bucket CORS configuration
  get-json     get a bucket CORS configuration JSON
  remove       remove a bucket CORS configuration
  help, h     Shows a list of commands or help for one command

FLAGS:
  --json       enable JSON lines formatted output
  --debug      enable debug output
  --insecure   disable SSL certificate verification
  --help, -h   show help
```

mc cors set

Sets the Cross-Origin Resource Sharing (CORS) configuration for a bucket.

Syntax

CLI

```
USAGE:
  mc cors set ALIAS/BUCKET CORSEFILE
  mc cors set-json ALIAS/BUCKET
```

CORSFILE**FLAGS:**

```
--json      enable JSON lines
formatted output
--debug     enable debug output
--insecure  disable SSL certificate
verification
--help, -h  show help
```

Parameters

Parameter	Description
CORSFILE	The path to the XML file containing the CORS configuration.
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

1. Set the CORS configuration for the bucket named mybucket with alias myminio, where the CORS configuration input is in the xml format file /path/to/cors.xml:

CLI

```
mc cors set myminio/mybucket /
path/to/cors.xml
```

Example of the CORS configuration input from the xml format file:

```
<CORSConfiguration>
<CORSRule>
<AllowedOrigin>https://localhost:8000</AllowedOrigin>
<AllowedHeader>Authorization</AllowedHeader>
<AllowedHeader>User-Agent</AllowedHeader>
<AllowedHeader>SHA256</AllowedHeader>
<AllowedHeader>X-Mapr-Account</AllowedHeader>
<AllowedHeader>X-Amz-Date</AllowedHeader>
<AllowedMethod>GET</AllowedMethod>
<MaxAgeSeconds>3000</MaxAgeSeconds>
<ExposeHeader>X-Amz-Server-Side-Encryption</ExposeHeader>
<ExposeHeader>x-amz-request-id</ExposeHeader>
</CORSRule>
</CORSConfiguration>
```

2. Set the CORS configuration for the bucket named mybucket with alias myminio, where the CORS configuration input is in the json format file /path/to/cors.json:

CLI

```
mc cors set-json myminio/mybucket /
path/to/cors.json
```

Example of the CORS configuration input from the json format file:

```
{
  "CORSRules": [
    {
      "AllowedOrigins": ["*"],
      "AllowedHeaders": ["Authorization"],
      "MaxAgeSeconds": 3000,
      "AllowedMethods": ["PUT", "GET"],
      "ExposeHeaders": ["Access-Control-Allow-Origin"]
    },
    {
      "AllowedOrigins": ["*", "https://8689432rmsan@example.com"],
      "AllowedHeaders": ["Content-Type", "x-amz"],
      "AllowedMethods": ["PUT"],
      "MaxAgeSeconds": 3000
    }
  ]
}
```

mc cors get

Returns the Cross-Origin Resource Sharing (CORS) configuration information for a bucket.

Syntax

CLI

USAGE:

```
mc cors get ALIAS/BUCKET
mc cors get-json ALIAS/BUCKET
```

FLAGS:

```
--json      enable JSON lines
              formatted output
--debug      enable debug output
--insecure   disable SSL certificate
              verification
--help, -h   show help
```

Parameters

Parameter	Description
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

1. Set the CORS configuration information for the bucket named mybucket with alias myminio:

CLI

```
mc cors get myminio/mybucket
```

Example of the CORS configuration information returned:

```
<CORSConfiguration>
<CORSRule>
```

```
<AllowedOrigin>https://localhost:8000</AllowedOrigin>
<AllowedHeader>Authorization</AllowedHeader>
<AllowedHeader>User-Agent</AllowedHeader>
<AllowedHeader>SHA256</AllowedHeader>
<AllowedHeader>X-Mapr-Account</AllowedHeader>
<AllowedHeader>X-Amz-Date</AllowedHeader>
<AllowedMethod>GET</AllowedMethod>
<MaxAgeSeconds>3000</MaxAgeSeconds>
<ExposeHeader>X-Amz-Server-Side-Encryption</ExposeHeader>
<ExposeHeader>x-amz-request-id</ExposeHeader>
</CORSRule>
</CORSConfiguration>
```

mc cors remove

Deletes the Cross-Origin Resource Sharing (CORS) configuration for a bucket.

Syntax

CLI

```
USAGE:
  mc cors remove ALIAS/BUCKET

FLAGS:
  --json          enable JSON lines
                  formatted output
  --debug         enable debug output
  --insecure      disable SSL certificate
                  verification
  --help, -h     show help
```

Parameters

Parameter	Description
json	Enable JSON formatted output.
debug	Enable output for debugging.
insecure	Disable SSL verification.
help	Show this help.

Examples

1. Remove the CORS configuration for the bucket named mybucket with alias myminio:

CLI

```
mc cors remove myminio/mybucket
```

mc ilm

Set of commands to manage object lifecycle rules for s3 buckets.

Syntax

The mc ilm is a set of commands that is used to add, edit, list, import, export, and delete bucket lifecycle rules.

```
mc ilm COMMAND [COMMAND FLAGS | -h] [ARGUMENTS...]
```

COMMANDS:

```

add          add a lifecycle configuration rule to existing (if any)
rule(s) on a bucket
edit        modify a lifecycle configuration rule with given id
ls          lists lifecycle configuration rules set on a bucket
rm          remove (if any) existing lifecycle configuration rule
export      export lifecycle configuration in JSON format
import      import lifecycle configuration in JSON format

```

FLAGS:

```

--json enable JSON lines formatted output
--debug enable debug output
--insecure disable SSL certificate verification
--help, -h show help

```

mc ilm add

Adds an object lifecycle management rule to a bucket.

Syntax

Run `mc ilm add` to add an object lifecycle rule.

```
mc ilm add [COMMAND FLAGS] TARGET
```

FLAGS:

```

--prefix value          object prefix
--tags value            format
'<key1>=<value1>&<key2>=<value2>&<key3>=<value3>', multiple values allowed
for multiple key/value pairs
--size-lt value         objects with size less
than this value (in bytes) will be selected for the lifecycle action
--size-gt value         objects with size
greater than this value (in bytes) will be selected for the lifecycle action
--expire-date value     format 'YYYY-MM-DD' the
date of expiration
--expire-days value     the number of days to
expiration
--noncurrent-expire-days value the number of days to
remove noncurrent versions (default: 0)
--noncurrent-expire-newer value number of newer
non-current object versions to retain (default: 0)
--expire-delete-marker remove delete markers with no
parallel versions
--abort-incomplete-multipart-upload-days value abort any incomplete
multipart uploads that have not aborted in number of days (default: 0)
--disable               disable the rule
--enable                enable the rule
--json                  enable JSON lines
formatted output
--debug                 enable debug output
--insecure              disable SSL
certificate verification
--help, -h              show help

```

Parameters

Parameter	Description
--prefix	Restrict the management rule to a specific object prefix. Prefix can also be specified as part of the alias/ bucket/ prefix. This is an optional parameter.

Parameter	Description
--tags	<p>One or more ampersand(&) delimited key-value pairs describing the object tags to use for filtering objects to which the lifecycle configuration rule applies. This is an optional parameter.</p> <p> NOTE: Tags are not populated for delete markers and incomplete multi-part objects that still in progress. The --tags option is mutually exclusive with --expire-delete-marker and abort-incomplete-multipart-upload-days.</p>
--size-lt	Select fully uploaded objects smaller than the specified value. Enter the value as a number and a unit, such as 1m for 1 MB. This option is mutually exclusive option with --expire-delete-marker and abort-incomplete-multipart-upload-days. This is an optional parameter. Unit is added as a suffix to the number and indicated as follows: k for KB, m for MB, g for GB, t for TB, ki for KiB, mi for MiB, gi for GiB, ti for TiB.
--size-gt	Select fully uploaded objects larger than the specified value qualify for the expiration rule. Enter the value as a number and a unit, such as 5GiB for 5 gibibytes. This option is mutually exclusive option with --expire-delete-marker and abort-incomplete-multipart-upload-days.
--expire-date	Indicates at what date the object is to be deleted. Deletes all objects that are eligible for deletion on or before the specified date. This is an optional parameter.
--expire-days	The number of days after which the object expires.
--noncurrent-expire-days	The number of days to retain a non-current or older object version. The option marks the older object version for deletion after the specified number of days elapse. This is an optional parameter.
--noncurrent-expire-newer	The maximum number of non-current object versions to retain, when ordered from newest to oldest. Retains the newest of the number of past versions of a file. After retaining the maximum number of non-current versions, any remaining older or non-current object versions are marked for expiration. Updating the number for this flag only impacts the unmarked versions of objects. Any versions already marked for expiration do not change if you increase the number to retain. For example, if the value for this parameter is 3, the last 3 versions of the object would be retained and the object versions that are older than the last 3 would be marked for deletion/expiry. This is an optional parameter.
--expire-delete-marker	This option is used to remove the delete marker.
--abort-incomplete-multipart-upload-days	The number of days after which an incomplete multi-part object upload must be aborted.
--disable	Use this option to disable the object lifecycle rule.
--enable	Use this option to enable the object lifecycle rule.
--help	Use this option to display the command help.

Example

Expire all the current versions for objects in bucket **bkt1**, where the folder name starts with **meetingnotes** and the current object version is older than 90 days.

CLI

```
$ mc ilm add --prefix "meetingnotes/"
aliasName/bkt1 --expire-days "90"
```

Expire the current objects in bucket **bkt1** with tags **dept=finance** and **priority=high** and size > 50 GB that are more than 90 days old.

CLI

```
$ mc ilm add aliasName/bkt1 --tags
'dept=finance&priority=high' --size-gt
53,687,091,200 --expire-days 90
```

Expire current objects created 365 days back and expire objects that became non-current 30 days back. (Current objects are retained for a year but the non-current versions expire after 30 days.)

CLI

```
$ mc ilm
add --prefix "doc/" --expire-days
"365" --noncurrent-expire-days "30"
aliasName/mybucket
```

Remove delete markers for objects in bucket **bkt1**, where the delete marker is the only version of the object that remains

CLI

```
$ mc ilm add aliasName/
bkt1 --expire-delete-marker
```

mc ilm edit

Syntax

Run `mc ilm edit` to list all object lifecycle rules.

```
mc ilm edit [COMMAND FLAGS] TARGET
```

FLAGS:

<code>--id value</code>	id of the rule to be modified
<code>--prefix value</code>	object prefix
<code>--tags value</code>	format
<code>'<key1>=<value1>&<key2>=<value2>&<key3>=<value3>'</code>	multiple values allowed for multiple key/value pairs
<code>--size-lt value</code>	objects with size less than this value (in bytes) will be selected for the lifecycle action
<code>--size-gt value</code>	objects with size greater than this value (in bytes) will be selected for the lifecycle action
<code>--expire-date value</code>	format 'YYYY-MM-DD' the date of expiration
<code>--expire-days value</code>	the number of days to expiration
<code>--noncurrent-expire-days value</code>	the number of days to remove noncurrent versions (default: 0)
<code>--noncurrent-expire-newer value</code>	number of newer non-current object versions to retain (default: 0)
<code>--expire-delete-marker</code>	remove delete markers

```

with no parallel versions
--abort-incomplete-multipart-upload-days value  abort any incomplete
multipart uploads that have not aborted in number of days (default: 0)
--disable                                         disable the rule
--enable                                          enable the rule
--json                                           enable JSON lines
formatted output
--debug                                          enable debug output
--insecure                                       disable SSL certificate
verification
--help, -h                                     show help

```

Parameters

Parameter	Description
--id	the rule ID of the object lifecycle rule to modify.
--prefix	The object prefix. This is an optional parameter.
--tags	<p>One or more ampersand(&) delimited key-value pairs describing the object tags to use for filtering objects to which the lifecycle configuration rule applies. This is an optional parameter.</p> <p> NOTE: Tags are not populated for delete markers and incomplete multi-part objects that still in progress. The --tags option is mutually exclusive with --expire-delete-marker and abort-incomplete-multipart-upload-days.</p>
--size-lt	Select fully uploaded objects smaller than the specified value. Enter the value as a number and a unit, such as 1m for 1 MB. This option is mutually exclusive option with --expire-delete-marker and abort-incomplete-multipart-upload-days. This is an optional parameter. Unit is added as a suffix to the number and indicated as follows: k for KB, m for MB, g for GB, t for TB, ki for kiB, mi for MiB, gi for GiB, ti for TiB.
--size-gt	Select fully uploaded objects larger than the specified value qualify for the expiration rule. Enter the value as a number and a unit, such as 5GiB for 5 gibibytes. This option is mutually exclusive option with --expire-delete-marker and abort-incomplete-multipart-upload-days.
--expire-date	Deletes all objects that are eligible for deletion on or before the specified date. This is an optional parameter.
--expire-days	The number of days after which the object expires.
--noncurrent-expire-days	The number of days to retain a non-current or older object version. The option marks the older object version for deletion after the specified number of days elapse. This is an optional parameter. The default value is 0.

Parameter	Description
--noncurrent-expire-newer	The maximum number of non-current object versions to retain, when ordered from newest to oldest. Retains the newest of the number of past versions of a file. After retaining the maximum number of non-current versions, any remaining older or non-current object versions are marked for expiration. Updating the number for this flag only impacts the unmarked versions of objects. Any versions already marked for expiration do not change if you increase the number to retain. For example, if the value for this parameter is 3, the last 3 versions of the object would be retained and the object versions that are older than the last 3 would be marked for deletion/expiry. This is an optional parameter. The default value is 0.
--expire-delete-marker	This option is used to remove the delete marker.
--abort-incomplete-multipart-upload-days	The number of days after which an incomplete multi-part object upload must be aborted.
--disable	Use this option to disable the object lifecycle rule.
--enable	Use this option to enable the object lifecycle rule.
--help	Use this option to display the command help.

Example**Modify the expiration date for an existing rule with id "meetingnotes"**

CLI

```
$ mc ilm edit --id
"meetingnotes" --expire-date
"2020-09-17" s3/mybucket
```

Modify the expiration days for an existing rule with id "meetingnotes"

CLI

```
$ mc ilm edit --id
"meetingnotes" --expire-days "300" s3/
mybucket
```

Disable an existing rule with id "meetingnotes"

CLI

```
$ mc ilm edit --id
